In the published version of this article, the Key messages details are incorrect.

The correct Key messages details are shown below:

### Key messages

- It is currently an unsolved problem to predict the specific clinical outcome of individual patients before continuing treatment for macular edema associated with BRVO.
- A classifier created with handcrafted features-based support vector machine (SVM) classified patients with BRVO into two groups, one with good visual outcomes and the other with poor visual outcomes.
- The accuracy of the classifier was 0.806.
- The patients' clinical information and the morphology of the outer retinal layer in OCT images within 2 degrees of the center of the macula at the first resolution of the ME were useful information for the classification of different prognosis of BCVA over time during continued anti-VEGF treatment.

This is being corrected in this publication.
