The original version of this paper unfortunately captured the equation incorrectly and is given below:

Equations of growth parameter

WG = final weight (g) –initial weight (g)
ADG = [final weight (g) –initial weight (g)] / Days
SGR = [$\ln$ final weight (g) – $\ln$ initial weight (g)] / Days $\times$ 100
FCR = total feed fed (g) / weight gain (g)
FE = weight gain (g) / total feed (g)
PER = wet weight gain (g) / crude protein fed
SR = [Number of survived fish / Initial number of fish] $\times$ 100

The original article has been corrected.

The online version of the original article can be found at <https://doi.org/10.1007/s00580-017-2566-4>
