This book is the meeting between interventional radiology and the traumatologic surgery. The authors want to show the place of interventional radiology in the assumption of responsibility of the multiple traumas.

This book treats in a first part of the general information (history of interventional radiology, mechanisms at the origin of traumatology and means of reanimation). In a second part is described the importance of the assessment of thoracic imagery, abdominal and vascular as well as importance of the scintiscanning. The various interventional techniques of radiology are then described in the various types of trauma: head, neck, cardiac, vascular, failure, liver, kidney... One then realizes importance of the embolisation vascular in these types of traumas but also of the importance of the stents in the arterial and venous

deficits of perfusion. On the other hand, in the genito-urinary traumas or in the young child, the interest is more moderate. The future is probably in hybrid rooms making it possible to make an assessment to carry out gestures of interventional radiology then to operate.

This book will interest all the doctors brought to deal heavy traumatology and multiple traumas.
