True bible of the fractures of the acetabulum, this book is due to the collaboration of 21 authors specialized and considered in the diagnosis and the treatment of these fractures. It is divided into 25 chapters, since the recall of the surgical anatomy, the concepts biomechanical, the radiological diagnosis and classifications according to Böhler, Letournel and that of AO/OTA. After the approaches, the principal isolated types are then studied one after the others, with each time the same plan: anatomico-radiological characteristics, criteria, pathological mechanism, effect on the stability of the hip, biomechanics, indications therapeutic, technical and osteosynthesis. The fractures of two columns, those of the elderly,

the child. Follow now; then peri-prosthetic complications and fractures.

This imposing work, very complete, is to be put in the professional library of any traumatologist, experienced and trainees.
