Dear Editor,

We would like to share ideas on “The Influence of Restrictive Pulmonary Dysfunction on Osteoporotic Thoracic Vertebral Fractures [2].” Laorueangthana et al. [2] concluded that “*The extension angle of the SR group became significantly more extended than that of the ... after SR TKA may be different from that of the MR TKA prosthesis.*” With different prosthetic techniques, it is no doubt that there will be variation in derived angles. Assessment of other parameters that might affect clinical outcome is necessary. In addition to pre-operative extension angle, there are also additional factors to be considered. Good examples are posterior tibial slope [3], joint line convergence angle and posterior condylar offset [1]. Also, surgical experience of surgeon might also affect the outcome.

Declarations

Conflict of interest The author declares that they have no conflict of interest.
