Introduction

Whilst it is obvious that a bureaucratic fondness for abbreviations has exposed their use to sharp, and deserved, ridicule, they nonetheless can satisfy a genuine need. In virology, it is a commonplace that abbreviations for virus names make the literature both easier to read and more succinct to present.

The International Committee for Taxonomy of Viruses (ICTV) is responsible for controlling, approving and recording the names of virus taxa and has a formal International Code that guides this activity. However, there is an important distinction between formal names for taxa and abbreviations, for which ICTV does not have a constitutional responsibility. ICTV does publish abbreviations in its Reports, and is often asked for guidance concerning the “correct” abbreviation to use. Nonetheless, these are advisory rather than mandatory.

Traditionally, abbreviations have been regarded as strictly local to a particular paper, chapter or thesis. Thus at one time “AMV” was used equally for *Arabis mosaic virus*, *Alfalfa mosaic virus* and *Avian myeloblastosis virus*, but not in the same piece of writing. Equally, “CMV” is a commonly used abbreviation for *Cucumber mosaic virus*, but is also used for Cytomegalovirus. Currently, there are about 4000 virus names in the ICTV lists and it is impractical to define unique abbreviations for them all. But within a discipline it should be possible. And if abbreviations are to be used, it is obviously a great convenience if an agreed standard abbreviation can be used for any particular virus in all published work.

For plant virology, a set of principles has been developed to guide in the creation of new abbreviations and in attempts to standardize usage. These principles have been published [1, 2], and those discussed here are based on them.

Plant virus names abbreviations: the principles

1. Abbreviations should be as simple as possible.
2. An abbreviation must not duplicate any other previously coined and still in current usage.
3. The word “virus” in a name is abbreviated as “V”.
4. The word “viroid” in a name is abbreviated “Vd”.

As with principles in general, these are qualified and extended by a set of guidelines. Although not followed in every instance, the Guidelines indicate how the abbreviations used in the 7th ICTV Report (3) were derived, and how it is felt that virologists should proceed when creating new abbreviations.

Plant virus names abbreviations: the guidelines

1. When similar virus names contain the terms “mosaic” and “mottle” “M” is chosen for “mosaic” and “Mo” for “mottle”, except where Guidelines 7 and/or 8 apply. For example, *Cowpea mosaic virus* and *Cowpea mottle virus* are abbreviated as CPMV and CPMoV, respectively. However there are still a few abbreviations in which “Mo” is not used for “Mottle”, as there was no need to do so. These will remain unchanged unless change becomes necessary.
2. The word “ringspot” is abbreviated as “RS” in many but not all instances, even if “R” could have sufficed.
3. The word symptomless is abbreviated as “SL” in many but not all instances, even if “S” could have sufficed.
4. The second or third letter, or sometimes the second consonant or last letter, of the host plant name, in lower case, can be used to differentiate certain conflicting abbreviations, e.g., CdMV for *Cardomum mosaic virus* (Table 2 lists discrepancies in the currently used abbreviations for plant names).
5. Abbreviations that use the same letters, but differ only by the case used (upper or lower) should be avoided.
6. Abbreviations for single words should not normally exceed 2 letters.
7. Secondary letters in abbreviations are omitted when their use would make the abbreviation excessively long, generally more than 5 letters. For example CGMMV is preferred to the longer CGMoMV, even though this complies with Guideline 1.
8. Abbreviations in current and widespread usage are retained except where their use could cause confusion. However, abbreviations can and have been changed in common usage. The purpose of the advisory list is to suggest targets for the harmonization of abbreviations. It is accepted that some abbreviations are unlikely ever to be changed.
9. When a particular combination of letters has been adopted for a particular plant species, new abbreviations for virus names containing the same host name will normally use the same combination.
10. When several viruses have the same name and are differentiated by a number, the abbreviations will have a hyphen between letters and numbers, e.g., *Plantain virus 6* and *Plantain virus 8* are abbreviated as “PIV-6” and “PIV-8” .
11. When viruses are distinguished by a letter, this letter is added at the end of the abbreviation without an hyphen, e.g., *Plantain virus X* is abbreviated “PIVX”, in agreement with most of the cases in common usage in plant virology, (PVY, PVX, PVM, PVS, etc.).
12. When viruses are distinguished by their geographical origin or any other combination of letters, a minimum number of letters (2 or 3) is added to the virus abbreviation and a hyphen is used between the two sets of letters when they are added after the word “virus”, e.g., *Tomato yellow leaf curl virus* from Thailand is abbreviated “TYLCV-Th”. (Abbreviations for country names are given in Table 3).

13. When a virus name comprises a disease name and the words “associated virus”, these are abbreviated as “aV”. For example, *Grapevine leafroll associated virus 2* is abbreviated to “GLRaV-2”.
14. In some instances, where a plant name has been abbreviated as two capital letters, this usage is retained as an exception, e.g., “CPRMV” for *Cowpea rugose mosaic virus*.

Abbreviations for virus names

Table 1 is an alphabetical listing of all virus names classified in the forthcoming ICTV 7th Report, together with the abbreviations selected for inclusion in the report following the principles outlined above. The abbreviations in Table 1 are those selected for use in the 7th ICTV Report [3], and therefore represent an advisory listing for authors of papers in plant virology. They do not carry the same official imprimatur as do taxon names decided officially by ICTV [3, 4], but it is hoped that the Plant Virology community find the listing useful guidance and a step towards harmonization and common standards.

Continued

Table 1 (continued)

| Plant virus name | Abbreviation | Family | Genus ^a |
|-------------------------------------|--------------|-----------------|--------------------|
| Watermelon silver mottle virus | (WSMoV) | Bunyaviridae | Tospovirus |
| Weddel waterborne virus | (WWBV) | Tombusviridae | Carmovirus |
| Wheat American striate mosaic virus | (WASMV) | Rhabdoviridae | Cytorhabdovirus |
| Wheat chlorotic streak virus | (WCSV) | Rhabdoviridae | Nucleorhabdovirus |
| Wheat dwarf virus | (WDV) | Geminiviridae | Mastrevirus |
| Wheat rosette stunt virus | (WRSV) | Rhabdoviridae | Nucleorhabdovirus |
| Wheat spindle streak mosaic virus | (WSSMV) | Potyviridae | Bymovirus |
| Wheat streak mosaic virus | (WSMV) | Potyviridae | Tritimovirus |
| Wheat yellow leaf virus | (WYLV) | Closteroviridae | Closterovirus |
| Wheat yellow mosaic virus | (WYMV) | Potyviridae | Bymovirus |
| White bryony mosaic virus | (WBMV) | — | Carlavirus |
| White bryony virus | (WBV) | Potyviridae | Potyvirus |
| White clover cryptic virus 1 | (WCCV-1) | Partitiviridae | Alphacryptovirus |
| White clover cryptic virus 2 | (WCCV-2) | Partitiviridae | Betacryptovirus |
| White clover cryptic virus 3 | (WCCV-3) | Partitiviridae | Alphacryptovirus |
| White clover mosaic virus | (WCIMV) | — | Potexvirus |
| White clover virus L | (WCIVL) | — | Unassigned |
| Wild cucumber mosaic virus | (WCMV) | — | Tymovirus |
| Wild potato mosaic virus | (WPMV) | Potyviridae | Potyvirus |
| Winter wheat mosaic virus | (WWMV) | — | Tenuivirus |
| Winter wheat Russian mosaic virus | (WWRMV) | Rhabdoviridae | Nucleorhabdovirus |
| Wissadula golden mosaic virus | (WGMV) | Geminiviridae | Begomovirus |
| Wisteria vein mosaic virus | (WVMV) | Potyviridae | Potyvirus |
| Wound tumor virus | (WTV) | Reoviridae | Phytoreovirus |
| Yam mosaic virus | (YMV) | Potyviridae | Potyvirus |
| Youcai mosaic virus | (YoMV) | — | Tobamovirus |
| Yucca bacilliform virus | (YBV) | Caulimoviridae | Badnavirus |
| Zea mays virus | (ZMV) | Rhabdoviridae | Nucleorhabdovirus |
| Zinnia leaf curl virus | (ZiLCV) | Geminiviridae | Begomovirus |
| Zoysia mosaic virus | (ZoMV) | Potyviridae | Potyvirus |
| Zucchini lethal chlorosis virus | (ZLCV) | Bunyaviridae | Tospovirus |
| Zucchini yellow fleck virus | (ZYFV) | Potyviridae | Potyvirus |
| Zucchini yellow mosaic virus | (ZYMV) | Potyviridae | Potyvirus |
| Zygocactus symptomless virus | (ZSLV) | — | Potexvirus |

^aSpecies or viruses not assigned to a particular genus are shown as “unassigned”, with an indication in the column “family” as to their broader classification

Table 2. List of plant names abbreviations discrepancies used in plant virus names

- A and Ar for artichoke
- A and Ant for *Anthoxanthum*
- A and Ant for *Anthriscus*
- A and Ap (once) for apple
- A and Aq for *Aquilegia*
- B, Ba and Bar (once) for barley
- B, Be (once) and for bean
- B, Bt (once) and for beet
- B, and Bl for blueberry
- C and Car (once) for carnation. Car is used only once but, for the type species of the genus *Carmovirus*
- C, and Ct for carrot

Continued

Table 2 (continued)

-
- C and Cas for *Cassia*
 - C and Ch for chicory
 - C and Ci for citrus
 - C and Cl for *Clitoria*
 - C and Co for cocksfoot (since Co is also used for coffee and cole, Ck could be the new abbreviation)
 - C and CP for cowpea
 - C and Cu for cucumber
 - D and Des (once) for *Desmodium*
 - D (once) and Di for *Digitaria*
 - E (once) and Euo for *Euonimus*
 - F and Fre for *Freesia*
 - H and Hn (once) for honeysuckle
 - H and Hp for hop
 - L and Lyc for *Lychnis*
 - M and Ma for *Malva*
 - M and Mb for mungbean
 - N and Na (once) for *Nandina*
 - N and Ne (once) for *Nerine*
 - P and Pan (once) for *Panicum*
 - P, Pa (once) and Pap (once) for papaya
 - P (once) and Par for parsnip
 - P (once) and PF for passion fruit
 - P and Pe (once) for pea
 - P and Pe for peanut
 - P and Pel for *Pelargonium*
 - P and Pep for pepper
 - P and Pet for *Petunia*
 - P and PP for pigeon pea
 - Pl used for *Plantago* and plantain (i.e. the scientific and vernacular name of the same host)
 - P and Pop for poplar
 - P and Pru (once) for *Prunus*
 - R (once) and Ra for radish
 - R (once) and Ran (once) for *Ranunculus*
 - R and Rp (once) for raspberry
 - S and Sh for shallot
 - S and Son (once) for *Sonchus*
 - S and So (once) for southern
 - S and Sb for soybean
 - S and Sq (once) for squash
 - T and To for tomato
 - T and Tra (once) for *Tradescantia*
 - T and Tu (once) for turnip
 - Wm and W for watermelon
-
