Correction to: European Child & Adolescent Psychiatry
<https://doi.org/10.1007/s00787-019-01340-6>

In the original publication, there are some incorrect information given. The correct information is that five years after arrival in Norway, 15% (15.2) scored above cutoff for depression symptoms, and 22% (21.7) scored above cutoff for anxiety symptoms.

There are three places that need correction:

1. In the right column of Table 1, it should be “21.7 (10)” rather than “24.4 (10)” for anxiety.
2. In the text, under the section: Mental health status 5 years after arrival, and predictors we wrote: As can be seen in table 1, approximately 24% scored over cutoff

for depression symptoms, 15% over cutoff for anxiety symptoms. The correct is 15% scored over cutoff for depression and 22% over cutoff for anxiety symptoms.

3. Under discussion we wrote:

For example, 15% reported depressive symptoms above the clinical cutoff, 24% reported anxiety symptoms above the clinical cutoff, and 42% reported clinically significant levels of posttraumatic stress symptoms.

The number for anxiety should read: 22% and not 24%.
