Correction to: Virus propagation: threshold conditions for multiple profile networks

Angeliki Rapti[1] (ID) · **Kostas Tsichlas[2]** · **Spyros Sioutas[3]** · **Giannis Tzimas[4]**

Correction to: Knowledge and Information Systems
https://doi.org/10.1007/s10115-018-1274-y

In the original publication, part figures were incorrectly positioned in Figure 2. The correct Fig. 2 is given below.

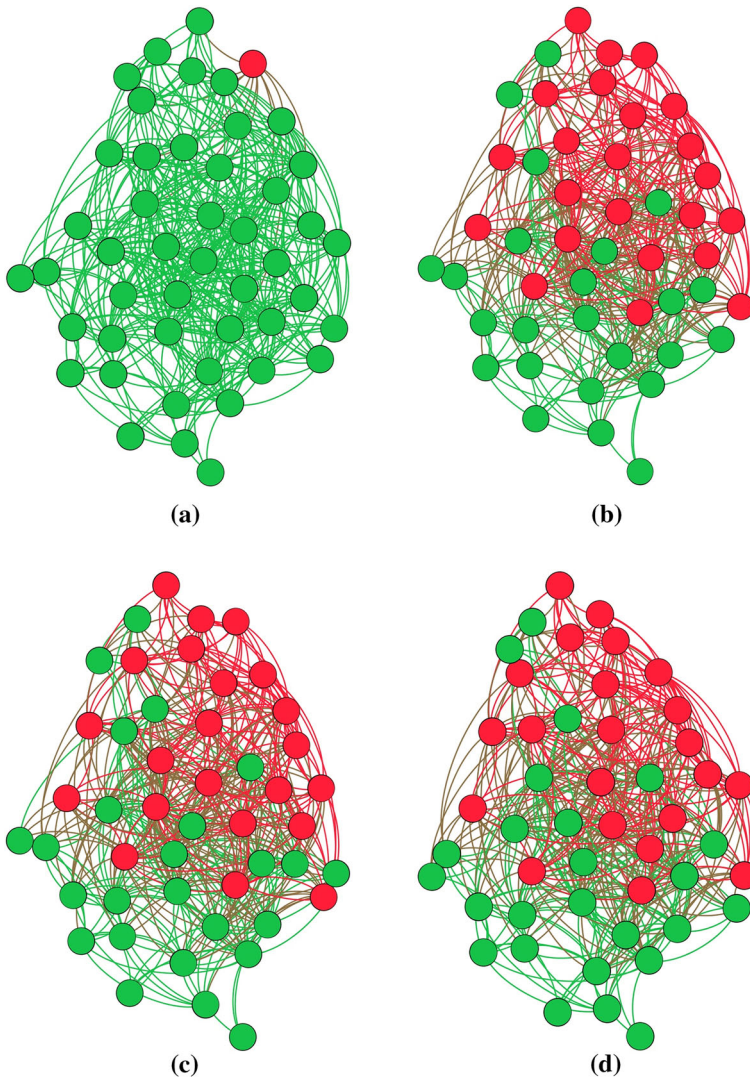

Fig. 2 A small subgraph of 47 nodes from the Enron email network in various phases of the infection process. Green nodes are susceptible nodes while red nodes are infected nodes. In figure **a** is the initial round (round 0) of the infection process and there is only one infected node in the network. In figure **b**, we observe round 2000 where the virus has spread in a greater part of the network. In figures **c**, **d** the infection has spread through a large part of the network and the system has reached a steady state where the amount of infected nodes is almost equal
