Fig. 4 Images of strain elastography in segmental AIP. Elastography shows a small spotted, mainly blue pattern in the swollen body and tail of the pancreas (arrow) (arrowhead: intact pancreatic head)

Fig. 5 Images of focal AIP. **a** US shows a hypoechoic mass lesion in the pancreatic tail (arrow). **b** EUS shows a hypoechoic solid lesion with an uneven margin (arrow) compressing the main pancreatic duct

(arrowhead). **c** CT shows only the detoured main pancreatic duct (arrowhead) without an obvious mass lesion

Fig. 9 US images of type2 IgG4-SC. US shows a hypoechoic mass lesion in the pancreatic head (arrow) with a diffusely distributed thickened wall throughout the extrahepatic and intrahepatic bile ducts (arrowheads). **a** Distal bile duct, **b** perihilar bile duct, and **c** intrahepatic bile duct

Fig. 10 Images of parenchymal-echo type of IgG4-SC. US shows hypoechoic wall thickening (arrow) mimicking a bile duct carcinoma **a** and diffusely enlarged hypoechoic pancreatic parenchyma with the

penetrating duct sign (arrow) **b**. ERC shows distal bile duct obstruction (arrow) with multiple pancreatic duct stenosis (arrowhead) (**c**)

Fig. 11 Bile duct wall thickening without obvious stenosis. The pancreatic head appears severely swollen (arrow), and the dilated extrahepatic bile duct (arrowhead) shows three-layered (high-low-high

pattern) wall thickening with a markedly thickened middle layer (**a**). **b** Short-axis image using a linear probe (arrowhead: extrahepatic bile duct)

Fig. 12 Images of GB in IgG4-SC. The GB shows marked thickening of the middle layer (arrow) with debris echoes (arrowhead) (**a**). Image of high-resolution linear probe (**b**)
