Fig. 1 FKB causes strong anti-proliferative and apoptotic effects in human lung cancer H460 cells. **a** The chemical structure of flavokawain B(FKB). **b** The inhibitory effect of FKB on non-small cell lung cancer H460 cells. H460 cells were treated with 0.1 % DMSO and FKB, as indicated, for 48 h. The MTT assay was then performed to examine the growth (as % viability). Each point is the mean $\pm$ SE of four independent

experiments. Each *bar* represents the mean $\pm$ SE from three independent experiments. Each sample count was performed in duplicate. **c** Cell cycle distribution was analyzed by FCS. Each *bar* represents the mean $\pm$ SE from three independent experiments. **d** Live cell morphology and DAPI staining of H460 cells. Scale bar 100 μ m
