Unfortunately, a section under the heading “Materials and method” has been published with errors. The complete correct paragraph is given below.

Quantitative chemical characterization by HPLC

Flavonoids and phenolic contents of *Ls.Me* were detected through gradient HPLC method. Sample was prepared following reported method and was filtered using syringe filters before injection (10 µL) (Sultana et al. 2008). HPLC (LC-10A, Shimadzu, Japan) fitted with Shim-Pack CLC-ODS column (C-18, Shimadzu, Japan) having dimensions

25 cm × 4.6 mm internal diameter × 5 µm particle diameter was used for separation of flavonoids and phenolic compounds at room temperature. Flow rate was set as 1 ml/min and gradient mobile phase consisting of solvent A (Water: acetic acid in a 94:6 ratio having pH 2.27) and solvent B = acetonitrile 100%, 0–15 min = 15% B, 15–30 min = 45% B, 30–45 min = 100% B was used for separation of different compounds. UV–visible detector (SPD-10AV) set at 280 nm was used for detection of different compounds. Compounds were identified by comparing the retention time of peaks with reference standards.
