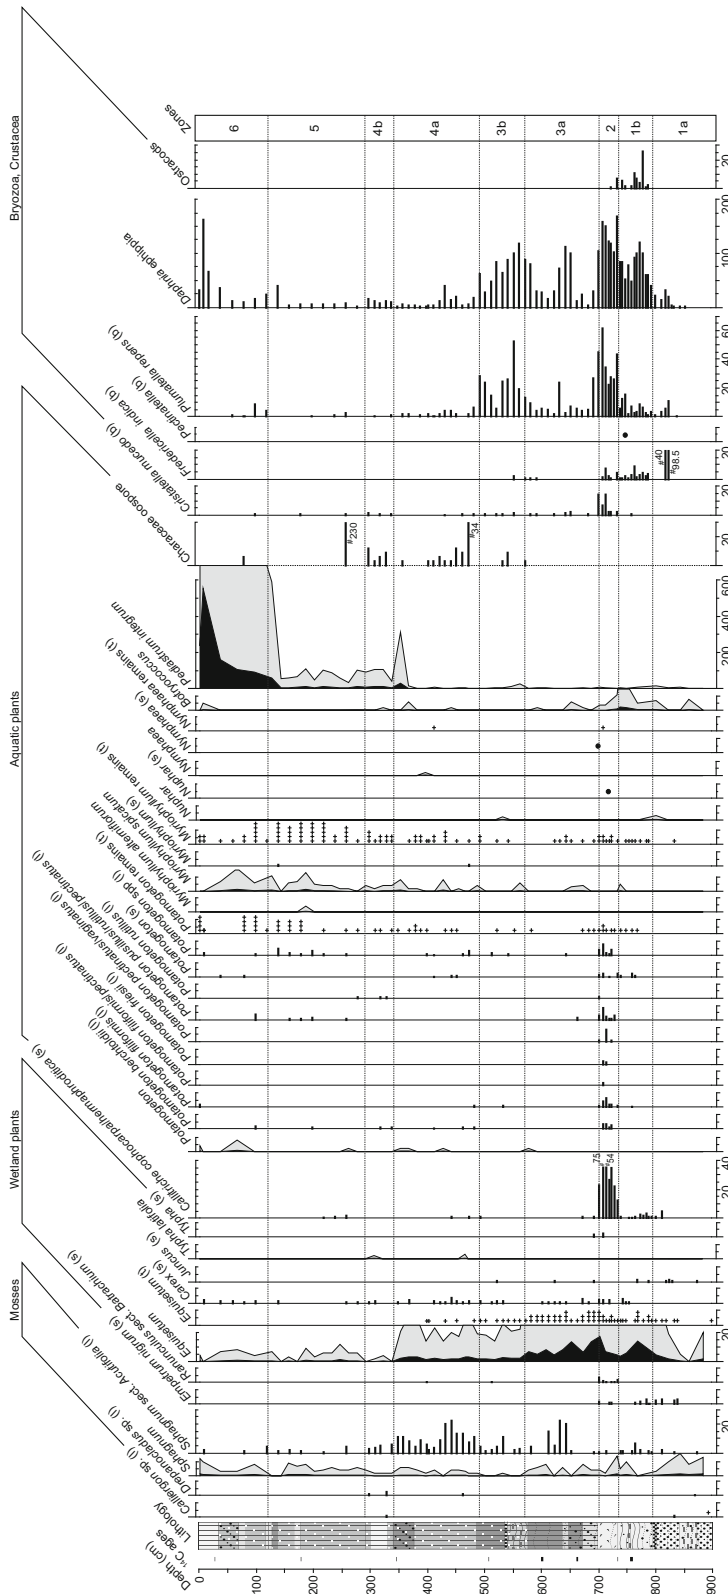

Fig. 3 A selection of plant micro- and macrofossils from Lake Loitsana, NE Finland. Plant macrofossil results are presented as bars showing concentrations per 10 cm³ or as relative abundance of tissues and leaf remains; *filled circle* = single occurrence, + = rare (i.e. B5), ++ = occurring (6–10), +++ = abundant (11–20), ++++ = dominant (21–50), +++++ = the main constituent of the sample. Types of remains are expressed as (b) = bryozoa statoblasts, (l) = leaves, (s) = seeds or (t) = tissue. Analyst: Shyhrete Shala. Microfossils are displayed by curves; shaded curves represent tenfold exaggeration. Analyst: J. Sakari Salonen

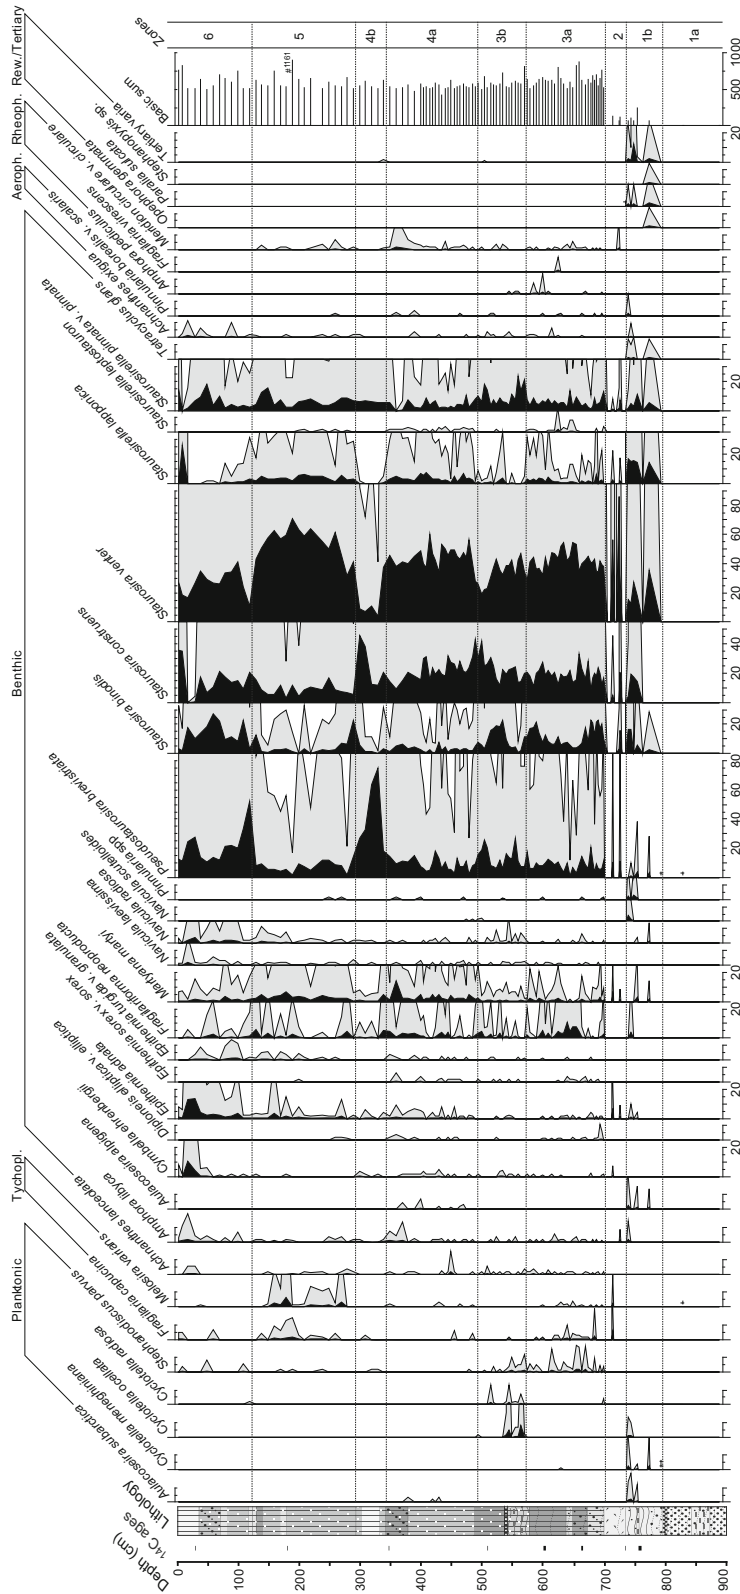

Fig. 4 Percentage diagram of selected diatom taxa, with a minimum abundance of 1 % in any analysed sample, from the sediment record of Lake Loitsana. The taxa are grouped according to living habitat and reworked/Tertiary taxa. Shaded bars represent tenfold exaggeration. Analyst: Shyhyrete Shala
