Fig. 4 Age patterns in self-reported health risk taking across countries. Values are percentage (%) of health risks (drinking alcohol, getting in the car with a drunk driver, smoking cigarettes, and having unprotected sex) endorsed. Slopes represent estimated regression coefficients (centered at the slope for 10-year-olds) for age and age² adjusted for gender, parental education, and intellectual ability. The model was estimated separately for each country. *Countries for which there was a significant quadratic effect of age

Fig. 5 Age patterns in self-reported antisocial risk taking across countries. Values are percentage (%) of antisocial risks (vandalizing, stealing, fighting, walking through a dangerous neighborhood, and threatening someone) endorsed. Slopes represent estimated regression coefficients (centered at the slope 10-year-olds) for age and age² adjusted for gender, parental education, and intellectual ability. The model was estimated separately for each country. *Countries for which there was a significant quadratic effect of age. **The quadratic effect is significant for females, but not males
