Locations and algae fed on are given for species being observed as the dominant macroalgae browser when using cameras, species observed as feeding on macroalgae or being identified by the authors as browser based on gut content. Species whose bites have been observed to influence macroalgae biomass loss are listed in bold

GBR great barrier reef

^a Species identified using cameras

^b Species identified based on gut content

^c Species listed by Green and Bellwood (2009) includes species from personal observations by Choat and Bellwood
