**Fig. 2** The histology of placenta, the immunohistochemical staining for CD31, and  $\alpha$ -SMA of placentas on day 19 in pregnant mice. **A** The histology of placenta, **B** the immunohistochemical staining for CD31, and **C**  $\alpha$ -SMA of placentas on day 19 in pregnant mice. HE (hematoxylin and eosin) staining of placenta in pregnant mice ( $10 \times 20$  magnification) showed that microvessels formed irregular webs, least in number, and intravascular agglutination of red blood cells in the placenta of PIH1 group. The placenta in PC group had a denser microvessel network than that in PIH1 group. CD31 immunostaining

of placenta: ( $10 \times 10$  magnification). CD31-positive microvessels in the placentas of PC group were greatest in number and finely distributed, while in PIH1 group, CD31-positive microvessels were least in number and irregularly distributed.  $\alpha$ -SMA immunostaining of placenta: ( $10 \times 10$  magnification).  $\alpha$ -SMA-positive-microvessels in the placentas of PC group were greatest in number and finely distributed, while in PIH1 group,  $\alpha$ -SMA-positive-microvessels were least in number and irregularly distributed
