

BMI and Serum Lipids

Sir,

I read the recent publication by Azita *et al* on BMI and serum lipid with a great interest. Azita *et al* mentioned that "it is necessary to measure serum lipid profile in obese and overweight children."¹ Indeed, the problem of lipidemia in pediatrics is a new concern. Correlation between serum lipid and BMI is studied in some previous works. In a Chinese study, the relationship between serum lipid and BMI could not be identified although the obesity and overweight among the studied children could also be observed.²⁻³ Similar null correlation was also reported from a Japanese study.⁴ Due to the changing world, the obesity and overweight have become the new problem in pediatrics. However, the relationship between BMI and serum lipid needs further study for clarification.

Author's Reply

Sir,

Childhood obesity is increasing in the world and is associated with cardiovascular risk factors like hypertension and dyslipidemia. In studies in Venezuela¹ and Taiwan² the incidence of dyslipidemia in obese children was significantly higher than children with normal weight. Due to increasing rate of obesity in children in recent years in the world, I think it is very important to find the risk factors of it. I recommend doing more studies about the relationship between obesity and dyslipidemia in children in different countries because difference in different studies may be related to race.
