Monday July 6th

### Track A – Biological Sciences

**PA6 001** TRAJECTORIES OF CHANGES IN HEALTH STATUS IN OLDER CANADIANS  
A. MITNITSKI\* (Dalhousie University, Halifax, Canada)  
X. SONG(1), K. ROCKWOOD(1) - (1) Dalhousie University (Halifax, Canada)

**Introduction:** Changes in health with aging are ubiquitous. On average, they are presented by decline: physiological impairment, illnesses, functional limitations and an exponential increase in the mortality rate. Even so, different people of the same chronologic age change differently. Here we suggest a stochastic dynamic model to predict changes in individual health states and mortality, given baseline health status. We illustrate how the model allows up to ten years' projection of health status and mortality risk. **Materials & Methods:** We analyzed the data from the National Population Health Survey, a large Canadian study conducted in five waves from 1994 to 2004 (n=4,444) from age 55 y.o. Thirty-three dichotomized variables (coded as deficits), including medical conditions, disabilities and health history were used to calculate each individual's health status, represented by a deficit accumulation count. Probabilities of transitions in the deficit counts were calculated using a non-homogeneous time and state dependent Poisson process. **Results:** The survival probability and the probability of transitions between different health states were calculated as a function of time and state dependent on only four readily interpretable parameters: two represent health transitions of survivors and two other represent the probability of death. The model allows us to estimate the probability of any degree of change, including improvements. The parameters of the model can be adjusted for covariates to analyze the factors influencing changes in health at any degree and in all directions. The performance of the model was exceptionally high, "explaining" more than 99% of variance. **Conclusions:** The kinetics of the model parameters indicates that the changes over time are consistent with a general stochastic Poisson mechanism. This makes possible the prediction of changes in health with a high degree of precision and a means of evaluating interactions of important risk factors.

**PA6 002** SMOKING HABITS AND MORTALITY AMONG THE OLDEST OLD – DOES PREVIOUS SMOKING HISTORY MATTER?  
R. JACOBSEN\* (University of Southern Denmark, Odense, Denmark)  
B. JEUNE(1), K. CHRISTENSEN(1) – (1) University of Southern Denmark (Odense, Denmark)

**Introduction** Little evidence is present on risk factors for death for the oldest old. The studies done suggest that many of the traditionally risk factors for death among oldest old have a diminished if any effect. For current smoking habits none effect have been observed and it has been hypothesized that smokers alive at 90 is a highly selected group able to withstand the harmful effects of smoking. In this study we further address the paradox that a well known unhealthy lifestyle does not influence risk for death among the oldest old by using various measures of smoking habits. **Methods and materials** The study population comprised all persons born in 1905, which were alive in 1998 and agreed to participate in the study (63%). Based on various kinds of self reported smoking habits we followed up for death from 1998 to 2008, stratifying by age and sex. The death rates were regressed against the various smoking measures and the stratified variables using multiplicative Poisson regression models. **Results** We found further support for a diminishing effect on death rates of various smoking measures at very old ages even though some increased effects were found for current heavy smokers when compared to never smokers (Rate ratio: 1.3, 95% CI: 1.02-1.66). Generally, light smokers had a tendency for a lower risk of dying when compared to never smokers. Also, a tendency for increased risk of dying with increasing pack years was found. **Conclusion** We found that smoking history still show an effect at 90, however the effect is very small when compared to the effects seen at younger age groups. Ours results generally support the hypothesis of a selections pressure leaving only smokers alive with genetic and/or environmental characteristics that protect them against the toxicity from smoking.

**PA6 003** THE SINGLE NUCLEOTIDE POLYMORPHISM RS1050450 IN GPX1 IS ASSOCIATED WITH HUMAN LONGEVITY  
M. SOERENSEN\* (Southern University of Denmark, Odense C, Denmark)  
T. STEVNSNER(2), V. BOHR(3), K. CHRISTENSEN(1), L. CHRISTIANSEN(1) - (1) Danish Aging Research Center, Epidemiology, Institute of Public Health, University of Southern Denmark (Odense C, Denmark); (2) Danish Aging Research Center, Danish

Center for Molecular Gerontology, Department of Molecular Biology, University of Aarhus (Aarhus C, Denmark); (3) Laboratory of Molecular Gerontology, Biomedical Research Center, National Institute on Aging, NIH (United States of America)

**Introduction** Genetic factors contribute to variation in life span by approximately 25%, a contribution believed to be minimal before age 60 years and most profound from age 85 years. The free radical theory of aging states that reactive oxygen species (ROS) play a key role in age-related accumulation of cellular damage, and consequently influence aging and longevity. Therefore, variation in genes encoding proteins protecting against ROS could be expected to influence variation in aging and longevity. The human GPX1 gene contains a C599T SNP resulting in a Pro200Leu substitution. rs1050450 is associated with age-related diseases and appear to affect the activities of the encoded variant proteins. Here we investigate the possible association of rs1050450 with human longevity. **Material and Methods** rs1050450 was genotyped in 1613 individuals of the Danish 1905 Birth Cohort, a prospective survey of all Danes born in 1905 and being alive in 1998. The survivors were followed either to death or to January 30<sup>th</sup> 2008. At the end of follow-up 1552 (96.2%) were deceased. rs1050450 was genotyped using Taqman based allele discrimination and mortality risk was estimated using the Cox proportional hazard model. **Results** Decreased mortality was observed for TT and CT individuals (HR (CT) = 0.87; HR (TT) = 0.88), while the combined TT/CT genotype group showed a HR of 0.93 (P = 0.008, 95% CI: [0.88-0.98]). When looking at males and females separately it was observed that the decreased survival of TT/CT individuals was most pronounced for males. **Conclusion** This longitudinal study indicates that the rs1050450 might be a risk factor for mortality in the oldest old and hence that genetic variation in GPX1 may be affect variation in life span. Supported by NIA (P01 AG08761-18) and VELUX foundation (95-10311419)

**PA6 004** THE ROLE OF NEUROACTIVE STEROIDS IN THE PROCESSIONS OF LEARNING AND MEMORY OF OLD RATS  
V. SASHKOV\* (Institute of Developmental Physiology of Russian Academia Education, Moscow, Russian Federation)  
N. SELVEROVA(1), T. DZGANDAROVA(2) - (1) Institute of age physioly of Russian Academia Education (Moscow, Russian Federation); (2) Stavropol State University (Moscow, Russian Federation)

**Involutional period of development** is accompanied by reformation of functional systems, providing accustoming behavior processes of learning and memory. Out the same time changing the level and correlation of steroid hormones of the process of ageing is accompanied by disruption in behavioral adaptation and conditional reflectory activity. In connection with it we studied the dynamic level of neuroactive steroids in blood plasma and some other structures of old rats brain in the processions of learning and relearning of conditional reflection. To do this were used 40 males and females rats of «Vistar» line at the age of 1,5-2 year. Conditional reflexes was being formed in the course of 5 days in the Morris water marl, and for the next 3 days was redoing early acquired skill. At all stages of realization of conditional activity we were testing corticosterone, testosterone and estradiol in blood plasma, homogenate of hypothalamus, hippocampus, amygdale, cingulated and frontal cortex. Received data were statistically analyzed with the help of «SPSS-13.0». The research results let us find out slowing down of conditional activity formation of avoiding water by old male rats with comparing to female ones, however during the redoing of early acquired skill any sexual differences were not found out. Besides, at all stages of conditional activity realization the old rats of both sexes tested the changing of steroid hormone level as in blood plasma as in hypothalamus, hippocampus, amygdale, cingulated and frontal cortex with comparing to the control. The increasing of testosterone in brain in condition of its constant plasma level in the process of formation and relearning conditional points at the possibility of testosterone formation as in males as in females brains in their involutional period of development. The data of correlational analysis point at the ability to learning and relearning of males and females old rats with dynamic of corticosterone, testosterone and estradiol in brain and blood plasma. The received data testified the hypothesis of elective and sexdimorf involvement of neuroactive steroids and some separate brain structures in formation of conditional activity and rats memory in their involutional period of development.

**PA6 005** THE CELL PROLIFERATION AND APOPTOSIS IN THE PRESENCE OF AMINO ACIDS IN ORGANOTYPIC CULTURE OF TISSUES OF DIFFERENT AGE  
V. KHAVINSON\* (St.Petersburg Institute of Bioregulation and Gerontology of the North-Western Branch , S-Petersburg, Russian Federation)  
N. CHALISOVA(2), V. LESNYAK(1) - (1) North-Western Branch (S-Petersburg, Russian Federation); (2) St.Petersburg Institute of Bioregulation and Gerontology of the North-Western Branch (S-Petersburg, Russian Federation)

The regulation of repair processes in tissues of organism through the stimulation of cell proliferation or its inhibition in apoptosis is accomplished by regulatory peptides. An information on different effects of amino acids on some cellular processes is currently appearing. The adequate method for quantitative determination of the effect of preparations being examined is the organotypic culturing of tissue. Changes in the amount of cells in explant growth zone serve as a criterion of the screening evaluation of the biological activity of substances. The effect of 20 L-amino acids on the dynamics of development of spleen explants from 1- and 21-day-old rats on an organotypic tissue culture was studied. The area index (AI) was calculated in arbitrary units as ratio of area of whole explant to the area of the central zone. Asparagine, lysine, arginine, and glutamic acid have the oppositely directed effects that depended on degree of tissue maturity on these processes. At concentrations of 0.05 ng/ml, these amino acids produce an inhibitory effect on cell proliferation in immature (from 1-day-old rats) spleen tissue, by 28-35% compared with control. The same four amino acids induced an opposite effect on the explants of mature tissue: they stimulated cell proliferation, AI was greater by 32-40% compared with control. An immunohistochemical assay of the expression of proapoptotic protein p53 in the growth zone of explants from 21-day-old rats revealed that introduction into the culture medium of asparagine, lysine, arginine, glutamic acid did not affect expression of p53. In 1-day-old rats a sharp increase in the area of expression of p53 was observed, by 52-120% compared with control. One can suppose that four out of 20 amino acids encoded by DNA can regulate proliferation.

#### **PA6 006 GLYCATION AND AGING: THE PRESENT AND THE FUTURE**

E. BOULANGER\* (Lille Medical School, Lille, France)  
C. GAXATTE(1), F. PUISIEUX(1) - (1) Aging Biology, Lille Medical School (Lille, France)

Advanced glycation end-products (AGEs) are involved in cell alteration during diabetes mellitus (glycotoxin) and renal failure (uremic toxin) and participate to the endothelial dysfunction leading to diabetic macro but also micro-angiopathy. These aging toxins also accumulate in tissues and organs during rheumatoid arthritis and Alzheimer disease. No exclusive AGE classification is actually available. Non-enzymatic glycation and glycoxidation with glucose auto-oxidation represent the two main pathways resulting in AGE formation. RAGE (receptor for AGEs) activation altered cell and organ functions by a pro-inflammatory, procoagulant and pro-fibrosis factors cell response. AGEs can also have deleterious effects through glycated protein accumulation or in situ protein glycation. Many in vitro or animal studies demonstrated that AGE deleterious effects can be prevented by glycation inhibitors, AGE cross-link breakers or AGE-RAGE interaction inhibition. New molecules are actually studied as new strategy to prevent or treat the deleterious effects of these aging toxins.

#### **PA6 007 CHROMOSOMES MODIFICATION AT THE OLD AGE**

T. LEZHAVA\* (Tbilisi State University, Tbilisi, Georgia)

Introduction: The object of present investigation is to study mutation level (chromosome aberration covering telomere regions), modifications of chromosome structure (level of condensed chromatin) and reparation under the influence of bioregulators and heavy metals in culture lymphocyte from old individuals. Methods and materials: The methods: of electron microscopy and differential scanning microcalorimetry; of C-and Ag-positive NORs bending; transcriptional activity of DNA-dependent RNA polymerase; of unscheduled DNA synthesis and the frequency of SCE under the single and combined effect of heavy metal salts (NiCl<sub>2</sub> and CoCl<sub>2</sub>) and bioregulators (Epitalon, Livagen, Vilon) have been used in lymphocyte cultures from individuals at the age 80 and over. Results: The analysis of obtained results showed: Chromosome progressive heterochromatinization (condensation of eu- and heterochromatin regions) occurs at aging; 2. Decrease of repair processes and increase in frequency of chromosome aberrations in aging is secondary to the progressive heterochromatinization; 3. Chromosome heterochromatinization is the area where one should seek solutions for the prolongation of the span of life; 4. CoCl<sub>2</sub> alone and combination with the bioregulators (Epitalon, Livagen, Vilon) have different chromosomal target regions proceeding from the intensity of SCE induction, deheterochromatinization of precentromeric and telomeric heterochromatin in lymphocytes of old individuals. Conclusion: Chromosome progressive heterochromatinization is a key factor of aging.

#### **PA6 008 APOPTOSIS INCREASE IN TUMORS OF AGED COMPARED TO YOUNG MICE IS INVERSELY PROPORTIONAL TO AKR LYMPHOMA MALIGNANCY**

O. ITZHAKI\* (Tel-Aviv University, Tel-Aviv, Israel)  
O. ITZHAKI (1), T. KAPTZAN(1), E. SKUTELSKY(1), J. SINAI(1), G. SCHIBY(1), M. HUSZAR(1), A. SIEGAL(1), J. LEIBOVICI(1) - (1) Tel-Aviv University (Tel-Aviv, Israel)

Introduction While incidence of neoplasia is known to increase with age, tumor growth and metastatic spread proceed, paradoxically, at a slower rate in aged as compared to young patients. This intriguing phenomenon is observed in many human and experimental tumors. We have shown this particular behavior in the AKR lymphoma and B16

melanoma. Understanding the mechanisms of this phenomenon is of importance in itself and even more so in view of the possibility that these mechanisms may eventually suggest modalities for age-adjusted anti-tumoral therapy. We have shown that one such mechanism is increased tumor cell apoptosis in the old animals. In the present study we tried to verify whether the induction of tumor cell apoptosis in the aged depends on the malignancy of the tumor. We used variants of malignancy of the AKR lymphoma and tested the degree of apoptosis in young and old mice in several such variants. Methods and Materials The following variants of AKR lymphoma were used: TAU-47, TAU-44 and TAU-33 of low, intermediate and high malignancy, respectively. Apoptotic cell death was assessed according to various cellular (Apoptag staining, DNA flow cytometry) and molecular (ladder type DNA fragmentation, Bcl-2, Fas receptor and caspases 8, 3 and 9 expression) characteristics. Results We found that tumor cell apoptosis was increased in tumors of old as compared to those of young mice in all variants. However this age-dependent increased apoptosis was inversely proportional to AKR lymphoma malignancy. Conclusions Our results may indicate that the tumor inhibitory capacity of the old organism microenvironment is limited by the aggressiveness of the tumor. It is therefore expected that inducing tumor cell apoptosis as a therapeutic modality in the old can be more effective at early stages of tumor development than at late ones.

#### **PA6 009 GROWTH ARREST-SPECIFIC GENE 6 PLAYS A ROLE IN AGEING KIDNEY THROUGH ADVANCED GLYCATION ENDPRODUCTS**

H. ARAI\* (Kyoto University Graduate School of Medicine, Kyoto, Japan)  
T. MATSUBARA(1), T. KITA(2) - (1) Kyoto University Graduate School of Medicine (Kyoto, Japan); (2) Kyoto University Graduate School of Medicine (Kyoto, Japan)

Introduction: Cellular and molecular basis of ageing kidney remains largely uncharacterized. We reported that growth arrest-specific gene 6 (Gas6) plays a key role in the development of glomerulonephritis and diabetic nephropathy. Here we examined whether Gas6 is involved in the development of glomerulosclerosis associated with ageing. Methods: Glomeruli were isolated from young (1 month) and aged (12 months) mice, and the expression of Gas6 was quantified by real-time PCR. Wild type (WT) and Gas6 knockout (KO) mice were sacrificed at 3, 12, and 24 months. Glomerular surface area and cell number were examined by morphometric analyses. Phosphorylation of Akt was assessed by Western blot analysis. Renal accumulation of advanced glycation end products (AGEs) was quantified by dot blot assay. Transcriptional activity of type IV collagen (Col4) was measured by reporter assay. Results: Glomerular expression of Gas6 was increased by 2 folds at 12 months compared with at 1 month in WT mice. Glomerular surface area and cell number were also progressively increased at 12 and 24 months compared with at 3 months in WT mice. However, the increase in KO mice was significantly less than in age-matched WT mice. Consistently, more phosphorylation of Akt was found in aged glomeruli of WT mice, but not of Gas6 KO mice. Renal AGE accumulation was also increased with ageing. However, renal expression of AGEs was not different between WT and KO mice. In vitro, AGEs increased expression of Gas6 in mesangial cells from WT mice. The transcriptional activity of Col4 was also increased by AGEs in mesangial cells from WT mice, but not in those from KO mice. Conclusions: These results suggest that Gas6 is involved in the development of age-associated glomerular damages via AGE accumulation, and that Gas6 could be a novel therapeutic target for ageing kidney.

#### **PA6 010 A POSSIBLE INVOLVEMENT OF HEAT SHOCK PROTEINS IN PROCESS OF SENESCENCE**

V. SEMENKOV\* (Russian Gerontological Scientific Clinical Centre of Ministry Health and Social Maintenance, Moscow, Russian Federation)  
E. KOVALENKO(1), A. SAPOZHNIKOV(1) - (1) Shemyakin and Ovchinnikov Institute of Bioorganic Chemistry of RAS (Moscow, Russian Federation)

Involvement of heat shock proteins (HSP) in regulation of cell and organism ageing is an actual problem of modern gerontology. It is known that HSP can control the level of reactive oxygen species (ROS) producing by phagocytes. The goal of this work was to study the influence of normal or modified proteins of autologous serum (AS) on ROS production by neutrophils. Neutrophils of 96-98% pure were isolated from peripheral blood of patients from 16 to 95 years old. Neutrophils were activated by zymosan or AS heated at 100°C during 30 sec or irradiated with 200-280 nm ultraviolet light (UV) before interaction with neutrophils. Cell expression of HSP70 was detected by flow cytometry. Production of ROS by neutrophils was decreased after their treatment by heated and UV irradiated AS comparing with the cells treated with normal AS. Heating of the neutrophils at 42°C from 10 sec to 5 min before the AS treatment resulted in significant reduction of ROS synthesis. Short term heat stress for 10 or 30 sec was quite enough for suppression of ROS production. Flow cytometry analysis showed that heat shock increased HSP70 expression in neutrophils, and it is noteworthy that this effect was higher in young group than in old one. The level of intracellular ROS and expression of HSP70 in neutrophils were changed in the opposite direction after heat shock and treatment by AS. Our results suggest that the known phenomenon, namely enhancing ROS synthesis by phagocytes in senescence, might be caused by frequent stresses and reduction of function of antistress genes. Following decrease of HSP synthesis might result in enhancement of function of NADPH oxidase, the main enzyme of ROS production. Damaging factors of environment

can induce cell stress in organism by action on autologous serum proteins ("serum" mechanism of ageing).

**PA6 011 TOP-DOWN CONTROL ANALYSIS OF AGING EFFECT ON MITOCHONDRIAL OXIDATIVE PHOSPHORYLATION IN RAT SKELETAL MUSCLE**

G. GOUPILLOU\* (CNRS UMR 5536 RMSB, Université Bordeaux II, Bordeaux, France)

I. BOURDEL-MARCHASSON(2), R. ROULAND(1), G. CALMETTES(1), J. FRANCONI(1), P. DIOLEZ(1) - (1) CNRS UMR 5536 RMSB, Université Bordeaux 2 (Bordeaux, France); (2) CNRS UMR 5536 RMSB, Université Bordeaux 2, Pôle de gérontologie clinique CHU de Bordeaux (Bordeaux, France)

**Introduction:** The aging process of skeletal muscle, characterized by a progressive loss of muscle mass and functionality, is highly complex and remains poorly understood. Several experimental findings seem to implicate oxidative phosphorylation dysfunctions, but no clear consensus has been reached. **Methods:** Effect of aging on mitochondrial oxidative phosphorylation was investigated on isolated mitochondria from rat gastrocnemius muscle. Firstly, membrane potential, oxidation and phosphorylation rates were monitored simultaneously to determine the effect of aging on the oxidative phosphorylation parameters. Top-Down control analysis, an integrative approach extensively used in our laboratory, was applied to determine the modifications of the internal oxidative phosphorylation regulation induced by aging. In this approach, the oxidative phosphorylation is described as a branched system composed of three large modules - the substrate oxidation, the phosphorylation and the proton leak modules - linked by a common intermediate, the proton-motive force. **Results:** Maximal oxidative phosphorylation activity was found significantly decreased in older rats ( $752.9 \pm 80.0$  vs  $615.4 \pm 124.5$  nmolATP/min/mg), but no modification of mitochondrial efficiency was observed with aging (ATP/O ratio:  $1.75 \pm 0.10$  vs  $1.76 \pm 0.25$ ). Proton leak kinetic was also found to be unaltered with aging. However, the major result was obtained using Top-Down control analysis, which has revealed dysfunction of the phosphorylation module under intermediate phosphorylation activity inducing a dysregulation of oxidative phosphorylation in older rats. This dysfunction appears to be physiologically relevant since under *in vivo* conditions, mitochondrial oxidative phosphorylation operates below maximal rates. **Conclusion:** This dysregulation of oxidative phosphorylation with aging is certainly responsible of an impaired adaptation of mitochondrial response toward modifications in the required cellular ATP turnover, and in turn may disturb important cellular functions.

**PA6 012 ROLE OF HYOTHALAMIC NEUROPEPTIDE Y IN THE BENEFICIAL EFFECTS OF CALORIE RESTRICTION**

T. CHIBA\* (Nagasaki University Graduate School of Biomedical Sciences, Nagasaki, Japan)

H. YAMAZA(1), I. SHIMOKAWA(1) - (1) Department of Investigative Pathology, Nagasaki University Graduate School of Biomedical Sciences (Nagasaki, Japan)

Calorie restriction (CR) decreases morbidity and increases the lifespan in many organisms including laboratory rodents. These effects of CR are thought to largely depend on insulin/insulin-like growth factor-I (IGF-I) and leptin signaling. From an evolutionary viewpoint, the effect of CR might be effective for thrifty genotype animals that are adaptive during periods of limited nutrient supply, although such animals are prone to obesity under ad libitum (AL) fed conditions. To elucidate whether the insulin and leptin sensitivities are indispensable for the metabolic adaptation to CR, we investigated the effects of CR on insulin and leptin resistant obese Zucker rats. Male 6-week-old lean (+/+) and obese (fa/fa) Zucker rats were fed AL or CR using the Charles River-LPF diet. Rats were euthanized at 6-months of age and plasma parameters, gene and protein expression changes in the neuroendocrine system, adipose tissue and liver were investigated. CR did not fully improve insulin resistance in (fa/fa) rats. Nonetheless, CR in (fa/fa) rats showed a similar response to CR in (+/+) rats, including the induction of neuropeptide Y (NPY) expression in the hypothalamic arcuate nucleus and metabolism related gene expression changes. Moreover, the NPY up-regulation augmented the plasma corticosterone levels concomitantly with the suppression of pituitary growth hormone (GH) expression, thereby modulating the adipocytokine production to induce tissue-specific insulin sensitivity. Thus, central NPY activation via peripheral signaling might play a crucial role in the effects of CR, even in insulin and leptin resistant conditions.

**PA6 013 A STRUCTURAL, PHYSICAL BASIS FOR CELLULAR REPLICATIVE SENESCENCE**

A. ARANDA-ANZALDO\* (Universidad Autónoma del Estado de México, Toluca, Mexico)

A. MAYA-MENDOZA(1) - (1) Laboratorio de Biología Molecular, Facultad de Medicina, Universidad Autónoma del Estado de México (Toluca, Mexico)

In the interphase the DNA of higher eukaryotes is organized in supercoiled loops anchored to a nuclear substructure commonly known as the nuclear matrix (NM). The DNA is anchored to the NM by non-coding sequences known as matrix attachment regions or MARs. There is no specific consensus sequence for MARs but it has been established that

only a subset of all potential MARs is actually involved in the attachment of DNA to the NM, these loop attachment regions or LARs define structural DNA loop domains. We have studied the organization of structural DNA loops in primary rat hepatocytes as a function of animal age. Hepatocytes are normally quiescent but preserve a proliferating potential that can be elicited *in vivo* by partial hepatectomy leading to liver regeneration. Yet such a regenerating potential declines with age. We found that natural ageing in the rat liver correlates with a progressive strengthening of the NM framework and the stabilization of the DNA loop-NM interactions. Both phenomena correlate with gradual loss of proliferating potential and progression towards terminal differentiation in the hepatocytes. Our results indicate that an increasing number of potential MARs are actualized as LARs as a function of age leading to a highly structured and thus stable nuclear organization. Since a general trend of physical systems is towards the reduction of asymmetries, a topological configuration in which most potential MARs are actually bound to the NM is a more symmetrical and stable structural attractor. However the structural stability of the cell nucleus opposes the dynamics necessary for major structural transitions resulting in mitosis (such as DNA replication and karyokinesis that involves nuclear disassembly and reassembly), suggesting that thermodynamic constraints leading to a better partitioning and distribution of structural stress within the cell nucleus may constitute a physical basis for replicative senescence.

**PA6 014 ANXIETY, DEPRESSION AND MEDIAL TEMPORAL LOBE ATROPHY IN NORMAL YOUNG-OLD ADULTS: THE PATH THROUGH LIFE STUDY.**

N. CHERBUIN\* (Australian National University, Canberra, Australia)

C. RÉLADE-MESLIN(1), P. SACHDEV(2), K. ANSTEY(1) - (1) Australian National University (Canberra, Australia); (2) University of New South Wales (Sydney, Australia)

**Introduction** Anxiety and depression have been associated with increased and decreased hippocampal and amygdalar volume in younger populations. In old age, anxiety, depression and medial temporal lobe (MTL) atrophy have been shown to be associated with cognitive decline and dementia. However, it is not clear whether this relationship holds in cognitively normal older adults and whether anxiety, depression and MTL atrophy can predict each other and future cognitive decline. One avenue to investigate this issue is to examine whether baseline anxiety and depression levels predict future change in MTL atrophy or vice versa. **Methods** Anxiety, depression and MTL atrophy were investigated in 347 cognitively healthy individuals (60-64 years) participating in a longitudinal investigation of mental health and ageing. Anxiety and depression levels were measured with the Goldberg anxiety and BPHQ scales, and MTL atrophy was assessed by manually tracing the hippocampus and amygdala on T1-weighted MRI scans. Measures were taken at baseline and four years later. The association between anxiety, depression and MTL atrophy was investigated by hierarchical regression while controlling for age, sex, education, and intra-cranial volume. Results Strong associations between baseline ( $R = .71$ ,  $p < .01$ ) and change ( $R = .44$ ,  $p < .01$ ) in anxiety and depression scores were detected. Change in MTL volume was significantly predicted by anxiety (LHip: Beta = .120,  $p < .01$ ; RHip: Beta = .115,  $p < .01$ ) and depression (LHip: Beta = .108,  $p < .01$ ; Hip: Beta = .125,  $p < .01$ ; RAM: Beta = .103,  $p < .05$ ) levels, with greater anxiety and depression at baseline being associated with less MTL atrophy. MTL atrophy did not predict change in anxiety or depression. **Conclusion** Contrary to relationships found in dementia, in community-based young-old adults higher anxiety and depression were associated with less MTL atrophy and are therefore unlikely to be sensitive early makers of neurodegeneration in epidemiological samples.

**PA6 015 AGING, BIOSTRUCTURE AND CARCINOGENESIS**

O. GALAVINA\* (Kharkov National University, V.N.Karazin, Kharkov, Ukraine)

Aging is accompanied by significant increase in susceptibility to cancer. We suppose this phenomenon is caused by changes of biostructure of cells that take place under aging. To a certain extent about a state of biostructure one may judge by the fraction of bound water that is supposed to be a part of biostructure. A difference between the quantities of water that pass from the tissue to 42% and 25% sucrose solution represents this fraction which was referred as Fraction "Vita". Fraction "Vita" decreased in the tissues of albino rats in ontogenesis (Galavina 2007, 2008). In order to ascertain the state of biostructure of tumor cells we study the fractions of bound water in tumors (1) that spontaneously arise and in Guerin's carcinoma (2). It is revealed that they have very low level of Fraction "Vita" ( $3.65 \pm 0.11\%$  in (1) and  $2.37 \pm 0.16\%$  in (2)) and very high level of fraction that extracted by 25% sucrose solution ( $71.27 \pm 0.57\%$  in (1) and  $74.80 \pm 0.45\%$  in (2)). Such low level of Fraction "Vita" testifies about a decrease of quantity and change in quality of biostructure that take place under tumor transformation. This change of biostructure may be considered as an increase of entropy under tumorigenesis. Both tumors and age tissues have low level of Fraction "Vita" and this fact leads to the supposition that state of biostructure of age cells promotes their tumor transformation. Administration of hydrocortisone provokes the decrease of Fraction "Vita" only in liver of old rats. So in old animal any stress may conduce to tumor transformation. It appears very likely that species-specific differences of

biostucture determine species-specific life span potential and species-specific differences in susceptibility to malignant transformation.

**PA6 016 DECAY OF FREE RECALL WITH SPARING OF MEMORY ENCODING AS A FEATURE OF NORMAL AGING: CLUES FROM THE ENHANCED CUED RECALL TEST**

V. LINO\* (Oswaldo Cruz Foundation, Rio de Janeiro, Brazil)  
R. O SOUZA(2), L. C ALVES(1) - (1) Oswaldo Cruz Foundation (Rio de Janeiro, Brazil);  
(2) Federal University of the State of Rio de Janeiro. (Rio de Janeiro, Brazil)

Introduction: The Enhanced Cued Recall Test (ECRT) assesses pathological forgetfulness by the recall of 16 items encoded by a visuo-verbal semantic encoding strategy. It controls for fluctuations of attention during encoding, thus providing a robust measure of genuine memory impairments. The ECRT further distinguishes encoding (typical of Alzheimer's disease) from retrieval (typical of fronto-temporal dementia) deficits. Objective: To test the effects of age, gender, and education on the following ECRT subscores: free recall [immediate (FRIMM) and delayed (FRDEL)], total recall (TOT: free plus cued recall), and recognition (REC). Method: We studied 104 volunteers (74 women) leading independent lives (Lawton Inventory) and with normal Mini-Mental State scores. Participants were grouped as "adults" (N = 32; age: 33±11 years, education: 14±2 years) and "elders" (N = 72; age: 72±7 years, education: 5±5 years). Results: Adults and elders differed statistically on free recall [FRIMM: 39±4 and 32±5 items ( $p < 0.001$ ); FRDEL: 14±2 and 12±2 items ( $p < 0.001$ )], but not on TOT and REC. Conclusion: Normal aging was associated with a decline in free recall, but not in recognition and encoding. ECRT tapped this dissociation and may help differentiating forms of dementia according to the mechanism of forgetfulness.

**PA6 017 ROLE OF SMALL PEPTIDES FOR EPIGENETIC REGULATION**

V. KHAVINSON\* (Saint Petersburg Institute of Bioregulation and Gerontology, Saint Petersburg, Russian Federation)  
V. MALININ(1) - (1) Saint Petersburg Institute of Bioregulation and Gerontology (Saint Petersburg, Russian Federation)

Experimental studies of small peptides proved that they control gene expression and protein synthesis. Peptides Glu-Trp, Lys-Glu, Ala-Glu-Asp-Gly and Ala-Glu-Asp-Pro alter gene expression profile in myocardium and in brain if administered *in vivo*. Administration of peptides to transgenic mice contributed to 2-4-fold suppression of HER-2/neu mammary gland cancer gene expression, which correlated with reduced adenocarcinoma size. Peptides administered to mice and rats increased IL-2 and c-fos genes expression in lymphocytes and hypothalamic structures, which stipulates immunomodulating, oncomodifying and stress protective properties of these substances. Human fibroblasts, treated with peptide Epitalon, showed telomerase activity induction and a 2.5-fold increase in the mean telomere length as compared to the control. This caused an increase in the quantity of cell divisions by 42.5%, i.e. the overcoming of Hayflick's limit. The study of peptides' effect on the expression of different genes and on DNA synthesis in various experimental models prompted an assumption, that small peptides are activators and agonists of transcription factors. Complementary site-specific binding of a peptide molecule in the DNA major groove is a primary start signal for binding the transcription factor with the promoter. Experiments revealed the formation of a complex, consisting of a tetrapeptide and DNA double helix. Binding of a peptide and double helix is accompanied by a hyperchromic effect, which is an evidence of local splitting of the double helix, launching the mechanism of protein synthesis in cells. Peptide preparations of the thymus and pineal gland, administered to old and very old patients restored the melatonin level, antioxidant system indices, as well as immune, endocrine and cardiovascular system status and brain functions, thus leading to a 2-fold decrease in the death rate in these age groups.

**PA6 018 AGE-DEPENDENT CELLULAR ENERGY METABOLISM IN NEWLY ECLOSED AND OLD HONEYBEES (APIS MELLIFERA)**

C. HSU\* (Chang Gung University, Tao-Yuan, Taiwan)  
Y. CHAN(1), Y. CHUANG(1), Y. HSIEH(1) - (1) Chang Gung University (Tao-Yuan, Taiwan)

Energy metabolism plays an important role in cellular senescence and honeybee (*Apis mellifera*) has been proposed as a model animal for the study of aging. However, the cellular energy metabolism of newly eclosed and old workers in honeybees is unknown. Here, we use biochemical and microscopic techniques to investigate energy metabolism in the trophocytes and fat cells of newly eclosed and old honeybees. Microscopic studies showed that newly eclosed workers had lower mitochondrial density and higher mitochondrial membrane potential. Biochemical studies showed that newly eclosed workers presented higher ATP levels, NAD<sup>+</sup>levels, NAD<sup>+</sup>/NADH ratio, and SirT1, as well as lower ATP synthase, NADH dehydrogenase, and FoxO. These results concluded that the efficiency of cellular energy metabolism is higher in newly eclosed workers, and lower efficient molecules accumulated with cellular ageing in honeybees.

**PA6 019 AGING ALTERS PPARGAMMA IN RODENT AND HUMAN ADIPOSE TISSUE BY MODULATING THE BALANCE IN SRC-1**

F. PICARD\* (Université Laval, Québec, Canada)  
S. MIARD(1), L. DOMBROWSKI(1), S. CARTER(1), L. BOIVIN(1) - (1) Université Laval (Québec, Canada)

Introduction: Age is an important risk factor for the development of metabolic diseases (e.g. obesity, diabetes, atherosclerosis). Yet, little is known about the molecular mechanisms occurring upon aging that affect energy metabolism. Although visceral white adipose tissue (vWAT) is known for its key impact on metabolism, recent studies have indicated it could also be a key regulator of lifespan, suggesting that it can serve as a node for age-associated fat accretion. Here we show that aging triggers changes in the transcriptional milieu of the nuclear receptor PPARgamma in vWAT, which leads to a modified potential for transactivation of target genes upon ligand treatment. Methods: We used 3T3-L1 adipocytes treated with H2O2 as "aged adipocytes" as well as adipose tissue from young or middle-aged mice (12 mo old), rats (18 mo old) and humans (40 yr old). Results: We found that in vWAT of these four models, aging induced a specific decrease in the expression of steroid receptor coactivator-1 (SRC-1), whose recruitment to PPARgamma is associated with improved insulin sensitivity and low adipogenic activity. In contrast, aging and oxidative stress did not impact on PPARgamma expression and PPARgamma ligand production. Loss of PPARgamma /SRC-1 interactions increased the binding of PPARgamma to the promoter of the adipogenic gene aP2. Conclusions: These findings suggest that strategies aimed at increasing SRC-1 expression and recruitment to PPARgamma upon aging might help improve age-associated metabolic disorders. Research funded by the Canadian Institute for Health Research

**PA6 020 AGE- AND CASTE-DEPENDENT SIGNATURES OF DNA REPAIR GENE EXPRESSION AND MITOCHONDRIAL MAINTENANCE IN HONEYBEE MUSCLE**

R. AAMODT\* (Norwegian University of Life Sciences, Aas, Norway)

Introduction: The expression signature of nine DNA repair genes in the wing muscle of the honeybee (*Apis mellifera*) were investigated in a comparative study of long-lived queens and short-lived workers during the aging trajectory. The main aim of the study was to look for genes being specifically downregulated during worker aging and differentially expressed in queens and workers. Materials and methods: Expression measurements were performed by competitive PCR or MassArray, which provides very sensitive measurements of a limited number of genes per array, and is therefore especially suited for studies of low-expression genes like DNA repair genes. The results were followed up by a scanning for mitochondrial mutations in workers and queens using Solexa high-throughput sequencing. Results: Genes involved in base excision repair, mismatch repair and two homologues of human ABH genes, potentially involved in RNA repair, were studied. An ortholog of nth1, as well as a gene encoding a protein which seems to be a fusion of one domain homologous to mammalian mth1/nudix/bacterial mutT and another domain homologous to the mitochondrial ribosomal protein gene s23, showed a distinct downregulation during the aging trajectory in workers and had higher levels of expression in queens than in workers. Two orthologues of human ABH/E.coli alkB, anpg, msh1 and ogg1 had stable expression levels during the ageing trajectory, while, intriguingly, we observed very high levels of apn1 in winter worker bees. The downregulation of the mth1/rps23 suggested a genetically controlled downregulation of mitochondrial maintenance. To investigate this, we have performed a Illumina high-throughput resequencing of wing muscle mitochondria DNA in workers and queens at selected time points along the ageing trajectory. The results indicate at least a 50% reduction of intact mitochondrial fragments in foragers compared to young workers, winter bees and queens. Conclusion: This work shows that there may be sophisticated priorities in genome maintenance during honeybee ageing, and that high-throughput resequencing may be a powerful technology for the study of age-dependent genome maintenance in somatic tissues.

**PA6 021 RESPONSE OF MUSCLE-SPECIFIC E3 LIGASE MAFBX/ATROGIN-1 AND MURF1 TO PRESSURE-INDUCED DEEP TISSUE INJURY**

P. SIU\* (Hong Kong Polytechnic University, Hong Kong, China)  
E. TAM(1), J. NG(1), B. TENG(1), X. PEI(1), I. BENZIE(1), A. MAK(1) – (1) Hong Kong Polytechnic University (Hong Kong, China)

Pressure ulcer is a complex and significant health problem particularly in aging population. The cellular signaling and molecular mechanisms responsible for deep pressure ulcer remain to be elucidated. The present study tested the hypothesis that the muscle-specific E3 ligase is activated in pressure-induced deep tissue injury. Adult Sprague Dawley rats were subjected to an experimental model to induce pressure-induced deep tissue injury. The tibialis region of right hind limb of animals was exposed to 100 mmHg of static pressure for 6 hours per day on two consecutive days. The compression pressure was continuously monitored by a 3-axial force transducer equipped in the loading indentor. The left hind limb served as intra-animal control. Tissues underneath the compressed region were collected after the compression procedure and used for histological, fluorescent immunocytochemical, and real time RT-PCR gene expression analyses. Morphological abnormalities were demonstrated in muscle tissue following the compression. These

included rounding of cross-sectional shape of muscle fibers, accumulation of nuclei in the increased interstitial space and central internalization of peripherally located nuclei in muscle fibers. Our immunocytochemical analysis demonstrated that the protein content of MAFbx/atrogin-1 and MuRF1 was significantly increased by 41% and 53%, respectively, in the compressed muscle tissue relative to the control muscle tissue. No significant difference was found in the mRNA content of MAFbx/atrogin-1 and MuRF1 between the compressed and control muscle tissues. Our data demonstrating the upregulation of MAFbx/atrogin-1 and MuRF1 proteins suggest that E3 ligase signaling pathway in muscle tissue may be involved in the underlying mechanism of pressure-induced deep tissue injury.

**PA6 022 CHANGE IN DEHYDROEPIANDROSTERONE SULFATE IS ASSOCIATED WITH CHANGING FUNCTION IN THE OLDEST OLD**

J. SANDERS\* (University of Pittsburgh, Pittsburgh, United States)  
R. BOUDREAU(1), A. CAPPOLA(2), A. ARNOLD(3), P. CHAVES(4), J. ROBBINS(5), M. CUSHMAN(6), A. NEWMAN(1) - (1) University of Pittsburgh (Pittsburgh, United States of America); (2) University of Pennsylvania (Philadelphia, United States of America); (3) University of Washington (Seattle, United States of America); (4) Johns Hopkins University (Baltimore, United States of America); (5) University of California Davis (United States of America); (6) University of Vermont (United States of America)

**Introduction:** Serum dehydroepiandrosterone sulfate (DHEAS) is a putative biomarker of aging though correlates of DHEAS change are not well understood. We describe relationships between DHEAS change and functional change in a very old cohort. **Methods:** DHEAS and functional outcomes (gait speed, grip strength, 3MSE score, DSST score) were measured in 1997-98 and 2006-07 in 991 subjects enrolled in the Cardiovascular Health Study All Stars study [mean (SD) age 85.2 (3.6) years in 2006-07]. We used linear regression to test the association of DHEAS change with functional change over the 9 year period, adjusting for baseline covariates (age, gender, smoking, body mass index, fasting glucose, total cholesterol, total number of medications, hypertension, kidney disease, chronic pulmonary disease, cerebrovascular disease, coronary heart disease, diabetes, arthritis, cancer, depression). **Results:** Mean (SD) DHEAS for women in 1997-98 was 0.555 (0.414) ug/ml and for men was 0.845 (0.520) ug/ml. In the entire cohort, each 0.25ug/ml drop in DHEAS was associated with a 0.021m/s decrease in gait speed ( $p=0.005$ ) and a 0.463kg decrease in grip strength ( $p=0.001$ ). We found a significant interaction between DHEAS change and gender in models of cognitive change and thus stratified results: in men, DHEAS change was not associated with cognitive change; in women, each 0.25ug/ml drop in DHEAS was associated with a 1.13 point drop in 3MSE score ( $p=0.0006$ ) and a 1.25 point drop in DSST score ( $p=0.002$ ). Results did not change substantially with adjustment for baseline DHEAS. **Conclusion:** Over 9 years in a sample of very old individuals, DHEAS change was significantly associated with physical function change in men and women, and with cognitive change in women.

**PA6 023 ON THE NATURE OF AGING**

I. SEMSEI\* (Gerontology Science Coordination Center, Nyiregyhaza, Hungary)

Senescence is a complex process and the aging hypotheses concentrated only on one or very few elements of this process. Asking the wrong question, simplifying by model creation etc. all contributed to a poor solution as to why aging occurs. Most of the theories, however, approached and sometimes solved a small part of the problem of aging. Disregarding them would be the same mistake as considering them as a solution of the senescence-problem. It seems that aging occurs because the information level of the system is not good enough to ensure the existence of the human body indefinitely in time against the deteriorating entropy effects. The aging process is a gradual drifting away of the system from the developmentally differentiated state which is a result of the evolution. The information level of the system continuously changes in time; it is altered by external and internal factors, programmed events of the system, perturbations caused by the adaptation process as well as by the fluid character of the genome. Consequently, the maximum life span is determined by the information level of the system, it is influenced by the external and internal factors and it is limited by the weakest element of the chain. Modification of the aging process is possible by optimization of the system but the maximum life span of about 120 years could be lengthened only by changing the information level of the human body.

**PA6 024 FRAILTY SYNDROME AND INFLAMMATORY MARKERS: TNF-ALFA AND STNFR1 ANALYSES IN FRAIL WOMEN FROM COMMUNITY**

L. LUSTOSA\* (Universidade Federal de Minas Gerais - Belo Horizonte - MG, Belo Horizonte - Minas Gerais, Brazil)  
L. PEREIRA(1), F. COELHO(1), A. PARENTONI(2), D. PEREIRA(1), J. SILVA(1), V. GONÇALVES(1) - (1) Universidade Federal de Minas Gerais (Belo Horizonte, Brazil); (2) Centro Universitário de Belo Horizonte (Belo Horizonte, Brazil)

**Background:** Frailty is generally defined as a state of high vulnerability for adverse health outcomes, including physical disability and mortality. Additionally, an important parameter is related to inflammatory markers. Increased levels of TNF-alfa are frequently associated with loss of strength and muscle activity. Given the known relations of inflammation and frailty, the aim of the present study was investigate the differences

between frail subgroups (not-frail -NF, pre-frail -PF and frail -FF) and levels of TNF-alfa e sTNFR1. **Methods:** 20 elderly women aged 66 to 81y. were classified in 3 subgroups (not frail - NF, pre-frail - PF, frail - FF) according to Fried et al., 2001 phenotype. The sample was constituted of 03 NF, 12 PF and 05 FF. Serum levels of TNF-alfa and sTNFR1 were measured by ELISA. The comparison between more groups was done using ANOVA. Statistical analyses were performed using the Statistical Package for the Social Sciences, SPSS 13.0 software (SPSS Inc., Chicago, IL, USA). Differences between two groups were evaluated using the Bonferroni. Statistical significance was set at  $p<0.05$ . **Results:** There was statistically significant difference between groups in sTNFR1 ( $p=0.007$ ) assays, but there was no significant difference between age ( $p=0.654$ ), IMC ( $p=0.843$ ) and TNF-alfa ( $p=423$ ). Bonferroni test showed that PF and FF were different ( $p=0.008$ ). Increased levels of sTNFR1 were found in FF elderly in comparison to PF ones. **Conclusions:** Results demonstrate that frail women had higher levels of sTNFR1 than PF, and this could be an important feature of frailty. Also, the differences observed between TNF-alfa and sTNFR1 indicate that sTNFR1 is the most sensitive marker of immunosenescence and also frailty.

**PA6 025 EVOLUTION OF ASYMMETRIC DAMAGE SEGREGATION**

A. RASHIDI\* (Institute for Ageing and Health, Newcastle upon Tyne, United Kingdom)  
T. KIRKWOOD(1), D. SHANLEY(1) - (1) Institute for Ageing and Health (Newcastle upon Tyne, United Kingdom)

**Introduction:** Evolutionary origins of ageing are linked to asymmetric segregation of damage at mitosis. Damaged structures that escape degradation tend to form insoluble aggregates and, if the cell survives to divide, will be inherited by the daughter cells. The effects of stochastic fluctuations (in segregation of damage) that arise in small systems with low numbers of aggregates have not been sufficiently taken into account in previous work. Furthermore, the contribution of resource allocation trade-offs to evolution of asymmetry is not known. **Methods and materials:** We developed a stochastic model consisting of 1000 unicellular organisms in an environment with limited resources. The mode of damage segregation is initially symmetric, subject to mutations afterwards. Cellular events are extrinsic death (e.g. due to cell-cell competition for resources), proliferation, damage accumulation, intrinsic death (i.e. due to the accumulated damage), and mutation in the gene controlling segregation asymmetry. The segregation coefficient,  $\sigma$ , ranged between 0.5 (each unit of damage has equal chances of ending up in each of the two daughter cells) and 1 (all damage segregating into one of the cells) and was averaged over the population. The population was monitored until  $\sigma$  reached a plateau, representing the outcome of evolution. **Results:** In contrast to previous models, we observed that the entire continuum between complete symmetry and compete asymmetry were possible outcomes of evolution depending on model parameters. Damage severity, high rates of damage accumulation, and slow proliferation rates are factors that increase the selection force for asymmetry. **Conclusion:** Our results fit the data on three organisms (*S. cerevisiae*, *S. pombe*, and *Candida albicans*) that use different segregation strategies. Given the trade-off between reproductive and maintenance investments, and their same-direction effects on selection pressure, the model highlights the prominent role of environmental stress on evolution of asymmetry.

**PA6 026 AGE-RELATED IMPAIRMENT OF THE LATE PHASE OF LTP IN PS1 KNOCK-IN MOUSE MODEL OF ALZHEIMER'S DISEASE**

A. AUFRRET\* (CNRS, Université Paris 6, Paris, France)  
V. GAUTHERON(1), J. MARIANI(2), C. ROVIRA(1) - (1) UMR7102 CNRS-UPMC, équipe DVSN (Paris, France); (2) Assistance Publique-Hôpitaux de Paris Hôpital Charles Foix, Unité d'Explorations Fonctionnelles (Ivry sur Seine, France)

Presenilin 1 (PS1) mutations are responsible for a majority of early onset familial Alzheimer's disease (FAD) cases. Increasing evidence points to synaptic plasticity impairment as one of the first events in AD before neurodegeneration. Here, we investigated long term potentiation (LTP), a mechanism that underlies learning and memory, in hippocampal CA1 neurons of PS1 M146V Knock-in mice (PS1KI). The role of PS1 is not well understood, as PS1KI mice show age-dependent memory impairment in hippocampus-dependent spatial tasks which paradoxically coincides with an increase in early-LTP (E-LTP). Our study focus on a particular form of LTP, the late-LTP (L-LTP) which is thought to be critical for the storage of long term memory. We performed extracellular recordings in CA1 hippocampal slices from both PS1KI mice and control littermate mice (+/+). E-LTP was induced after a 100Hz burst applied to the schaeffer collateral. L-LTP was induced by four trains at 100Hz. PS1KI mice showed an increase in E-LTP at 6 months of age as compared to +/+ littermates. By contrast, at 9 months of age, E-LTP increase did not persist in PS1KI mice. The L-LTP was impaired in PS1KI at an early stage. We observed an impairment of the maintenance phase at 3 months of age. As the mice age, we observed an impairment of both the induction phase and maintenance phase. As previously described for spatial tasks, PS1KI mice show age-dependant impairment of L-LTP which is thought to be critical for long term memory. PS1KI showed also a transient increase of E-LTP. This result contrasts with the effect of amyloid peptide which is known to greatly decrease E-LTP. This study suggests that mutant PS1 influences

synaptic plasticity involving additional mechanisms than solely an increase in amyloidogenesis.

**PA6 027 STOP OF THE ONTOGENESIS CLOCK, PREDECESSOR MAMMAL'S HIBERNATION POSSIBLE KEY FOR ABOLITION OF AGEING?**

V. GOLUB\* (Laboratory of zoological production, Cherkasy, Ukraine)

The analysis of the data specifying occurrence at of some species of mammals of a special euthermal condition, previous hibernation or replacing hibernation is resulted. This condition is characterized by inhibition of cell proliferation, reduction stress reactivity and decrease in metabolism, changes in immune system (seasonal thymus involution). It is shown, that young individuals of some kinds (fat dormouse, red voles, shrews), entering into the given condition (for its designation the new term «neobiosis» is offered), have characteristic biphasic growth with a long delay (apparently, caused by inhibition of cell proliferation), which can last (depending on action of external factors) not certain time. Reversible growth arrest, which duration no limited, can specify on «a stop of the ontogenesis clock» at these animals. The output from neobiosis renews growth (2nd phase), thus the calendar age of animal exceeds their biological age. It is supposed, the given mechanism is started by increase in somatostatin (SST) synthesis with inhibition thus of growth hormone (GH), thyroid stimulating hormone (TSH) and melatonin, and with loss a circadian function suprachiasmatic nucleus of the hypothalamus (SCN). Keywords Hibernation, euthermia, reversible stop of growth, somatostatin, SCN

**PA6 028 RELATIONSHIP OF ALPHA-SYNUCLEIN PATHOLOGY BETWEEN EPICARDIUM AND DORSAL VAGAL NUCLEI**

Y. FUJITA\* (Gunma University Graduate School of Medicine, Maebashi, Japan)

M. TAKATAMA(2), K. OKAMOTO(1) - (1) Gunma University Graduate School of Medicine (Maebashi, Japan); (2) Geriatric Research Institute and Hospital (Maebashi, Japan)

Introduction There is increasing evidence that Parkinson disease (PD) is a multiple system disorder with progressive degeneration of the dopaminergic nigrostriatal systems and wide spread pathology. In the brain, alpha-synuclein (a-syn) pathology (Lewy bodies and Lewy neurites) may occur early in the dorsal vagal nuclei (DVN). On the other hand, it is also reported that degeneration of cardiac sympathetic nerve (CSN) begins early in the disease process of PD. Anatomically, the CSN interconnects with DVN, therefore, we immunohistologically examined the relationship between DVN and CSN. Material and methods Left ventricular walls of heart and medulla oblongata including DVN in 204 consecutive autopsied patients from Geriatric Research Hospital (mean age of 72.3 years) were immunostained with antibodies against a-syn, tyrosine hydroxylase (TH) and phosphorylated neurofilament. Results Fifty (25%) of 204 cases had a-syn pathology in DVN, and 10 cases (5%) had a-syn-positive aggregates in CSN. TH-immunoreactivities were preserved in 9 of 10 cases that had a-syn-positive aggregates in CSN, and 2 of these 10 cases had no a-syn pathology in DVN. TH-immunoreactive nerve fibers were decreased in 31 cases (15%) in CSN. Among these 31 cases, 22 had a-syn pathology in only DVN (71%), one case had a-syn-positive aggregates in only CSN, and one case had both a-syn pathology in DVN and a-syn-positive aggregates in CSN. Conclusion In this study, TH-immunoreactivities were decreased approximate 15 % in elderly human population. Our results also suggest that a close relationship between a-syn pathology in DVN and the decreases of TH-immunoreactivities in CSN, and a-syn-positive aggregates in CSN may precede the decreases of TH-immunoreactivities.

**PA6 029 AGING, DIABETES MELLITUS AND ENDOTHELIAL DYSFUNCTION: AN UNEXPECTED RELATIONSHIP**

M. EL ASSAR \* (FUNDACIÓN PARA LA INVESTIGACIÓN BIOMÉDICA DEL HOSPITAL UNIVERSITARIO DE GETAFE, GETAFE, MADRID, Spain)

S. VALLEJO(1), M. CASTRO(2), L. RODRÍGUEZ(2) - (1) Fundación para la Investigación Biomédica del Hospital Universitario de Getafe (Getafe-Madrid, Spain); (2) Servicio de Geriatría del Hospital Universitario de Getafe (Getafe-Madrid, Spain)

Introduction: Diabetes and aging share some factors involved in producing endothelial dysfunction. This fact raises the question about the ability of diabetes to induce endothelial dysfunction in the elderly. Objective: To test the effect of diabetes on the endothelial function in microvessels from old patients. Methods: Microvessels were obtained from 57 patients (range: 21-85). Patients were divided in several groups: Group 1 (healthy < 65 yr), group 2 (healthy > 65 yr), group 3 (> 65 yr with diabetes; DM), group 4 (> 65 yr with hypertension; HT), group 5 (> 65 with DM and HT), and group 6 (> 65 with DM, HT plus 1 or more cardiovascular risk factors). Vessels were mounted in a myograph. Responses to Bradykinin (BK: 0.01-3 µM) were tested in vessels precontracted with KCl (35-50 mM) and expressed as the mean ± SEM of pD<sub>2</sub> values. To test the implication of oxidative stress, especially superoxide anions, some vessels were preincubated with SOD (100 U/ml). To check whether the effect of highly glycosylated oxyhaemoglobin (GHHb), involved in endothelial dysfunction by means of oxidative stress, is age dependent, the microvessels from group 1 and 2 were preincubated with 14% GHHb. Results: pD<sub>2</sub> for BK were 7.516±0.093; 7.184±0.088; 6.983±0.150; 6.978±0.054; 7.020±0.369; 6.730±0.211 for groups 1-6 respectively. Preincubation with SOD in groups 2, 3, and 4,

improved vasodilations evoked by BK. Preincubation with 14% GHHb significantly reduced the BK-evoked vasodilations in group 1, but not in group 2. Conclusions: Diabetes alone does not seem to add any effect to the endothelial dysfunction associated to aging. It is necessary the coexistence of diabetes with one or more cardiovascular risk factors in the elderly to impair endothelial function.

**PA6 030 AGEING AS THE SHRINKAGE OF THE HOMEODYNAMIC SPACE**  
S. RATTAN\* (Aarhus University, Aarhus, Denmark)

The survival and longevity of an organism depends on a complex network of maintenance and repair systems (MARS). These pathways include genomic and epigenomic repair, protein degradation, antioxidant defences and stress response. MARS gives rise to a so-called homeodynamic space, which is representative of the buffering capacity against intrinsic and extrinsic causes of disturbances. Shrinkage of the homeodynamic space is considered to be the universal characteristic of ageing. This is because ageing at the molecular level is characterized by the progressive accumulation of molecular damage in nucleic acids, proteins, lipids and carbohydrates. The main sources of damage are environmental and metabolically generated free radicals, spontaneous errors in biochemical reactions, and various nutritional components, such as glucose and its metabolites. Accumulation of molecular damage and increased molecular heterogeneity is the main cause of the shrinkage of the homeodynamic space. This then leads to increased vulnerability, altered cellular functioning, reduced stress tolerance, emergence of diseases and ultimate death. Approaches for testing and developing effective means of intervention, prevention and modulation of ageing aim to prevent or reverse the shrinkage of the homeodynamic space, and to maintain the biological abilities of maintenance and repair.

**PA6 031 INDIVIDUAL LIFE HISTORY, BEHAVIOR, AND BIOMARKERS OF AGEING**  
N. GONCHAROVA\* (Research Institute of Medical Primatology, Sochi, Russian Federation)

The purpose of the research was studying interrelationships between peculiarities of individual life, adaptive behaviour, functioning of the hypothalamic-pituitary-adrenal axis (HPA) and erythrocyte antioxidant enzyme system in different age periods. Fifty young mature (6-8 years) and 37 old (20-27 years) healthy female rhesus monkeys, including eight animals that were exposed to severe stress in neonatal period – maternal deprivation and growing up separately from adult individuals, were investigated. Forty-one per cent of both young and old animals, including the majority of animals, exposed to neonatal stress (75%), showed the depressive-like behaviour (D). At young age the highest values of coefficient cortisol/dehydroepiandrosterone sulfate (F/DHEAS) (due to the increase in F concentration and the decrease of DHEAS level in blood plasma) were revealed. During ageing the sharp increase in F/DHEAS, smoothing circadian rhythm of plasma F, increase in glutathione reductase activity (GR), that is, the parameters considered as biomarkers of ageing, were observed. Twenty per cent of the young and old animals including those, exposed to neonatal stress (12.5%), demonstrated the aggressive behaviour (AG). At young age the minimal values of F/DHEAS (due to the highest DHEAS level) were revealed. During ageing the most expressed decrease in concentration DHEAS was observed. Thirty-nine of the young and old animals including those, exposed to neonatal stress (12.5%), showed the adequate behaviour. At young age F/DHEAS was intermediate between values of this ratio in D and AG animals and the least increase was registered with ageing; insignificant age-related changes were seen in GR and circadian rhythm of F. Thus, D was accompanied with the most expressed age-related disturbances in HPA functioning and GR; neonatal stress increased sharply probability of development of D, neuroendocrine and antioxidant age-related alterations.

**PA6 032 GRAY MATTER VOLUMETRIC CHANGES ON NON-DEMENTED ELDERS: THE GENDER INFLUENCE ON THE CEREBRAL CORTEX**  
P. CURIATI\* (São Paulo University Medical School, São Paulo, Brazil)  
J. TAMASHIRO(1), P. SQUARZONI(1), P. MENEZES(2), F. DURAN(1), C. LEITE(3), L. SANTOS(1), H. VALLADA(1), M. SCAZUFCA(2), G. BUSATTO(1), T. ALVES(1) - (1) LIM-21 - Neuroimaging in Psychiatry Laboratory, Psychiatry Department, Clinical Hospital, São Paulo University Medical School (São Paulo, Brazil); (2) Epidemiology Section, University Hospital, São Paulo University (São Paulo, Brazil); (3) Radiology Department, Clinical Hospital, São Paulo University Medical School (São Paulo, Brazil)

Introduction. Cerebral changes related to normal aging have been the subject of considerable interest due to the need for early diagnostic criteria for neurodegenerative disorders, such as Alzheimer's and Parkinson's diseases. Previous studies have reported regional gray matter (rGM) loss in both frontal and parietal cortices, and rGM preservation in limbic and paralimbic structures. However, more often than not, those studies did not account for the gender influence on their results and investigated samples either relatively small or across the span of life. Methods and materials. In order to describe an accurate pattern of volumetric changes that occur in the seventh and eighth decades, we have studied the influence of gender on rGM loss and relative preservation in a community-based sample of 102 subjects with a narrow age range (65-75 years of age), all classified according to ICD-10 as psychiatric and neurologically normal. They underwent to a

magnetic resonance scan, and voxel-based analyses of Pearson correlation product was performed between age and rGM covaried by total rGM volume. Findings were reported after a family-wise correction for multiple comparisons. Results. rGM decrease in males was greater in the right orbital frontal cortex, in the Heschl's gyri, in the right superior temporal gyrus and in the left parahippocampal gyrus, while in females the left thalamus, the right triangular and the bilateral opercular frontal cortices were predominantly involved. Gender-specific age-related rGM preservation encompassed the bilateral paracentral lobule in males and the inferior temporal gyrus in females. Conclusions. Age-related rGM loss was influenced by gender and heterogeneous, with some areas more vulnerable than others, and specific regions being relatively spared. The findings described in previous studies with healthy adults or large age-range samples may not apply to the elderly population.

**PA6 033 ELDERLY EPILEPSY: INTEREST OF QUANTITATIVE ELECTROENCEPHALOGRAPHY (QEEG)**

C. FOGUET\* (Hospital University of Besancon - Jean Minjoz's hospital, Besancon, France)  
C. FOGUET (1), D. FERRIBY(2), J. GOMEL(2), M. BECKER SCHEINDER(1), F. PIETTE(3), C. SEBBAN(4) - (1) University hospital of Besançon - Geriatric department (BESANCON, France); (2) Neurology department – Tourcoing Hospital (TOURCOING, France); (3) Internal medicine and geriatric departments - Charles Foix Hospital- APHP (25000, France); (4) Functional exploitations department - Charles Foix Hospital- APHP (IVRY SUR SEINE, France)

Introduction: The incidence of epilepsy increases with advancing age and its diagnosis in the elderly is often elusive. Seizure imitators are especially frequent and ancillary tests for diagnosis as electroencephalogram (EEG) may show normal age –related variants, sometimes making results difficult to interpret in advanced age. In addition the interictal conventional EEG is often normal in elderly's epilepsy patients. Quantitative electroencephalogram (qEEG) would play a significant role in EEG-based clinical diagnosis. The principal aim of this study was to evaluate the relation between interictal qEEG and ictal epilepsy in the elderly. Methods and materials: 20 patients over 60 years old, with de novo epilepsy were submitted to EEG recordings. Complete conventional EEG and qEEG were blindly interpreted by two independent and experienced electroencephalographers. The peak of low frequency interictal qEEG have been studied; we determine whether interictal quantitative EEG are predictive of ictal epilepsy. The conventional EEG sensitivity has been compared to quantitative EEG sensitivity analysis by Mc-Nemar statistic test. Results: 80% of patients were aged between 70 to 84 years old; most of them were women with a rate of 3/2. In 60 % of patients, qEEG shows interictal lower frequency predicting ictal epilepsy. qEEG has been shown to be more sensitive than conventional EEG (50%) on the occurrence of epileptic seizures in the elderly, but not statistically significant. Conclusion: In complement of diagnosis means existent, quantitative EEG analysis would increase the yield of diagnosis of elderly epilepsy. When performed by electroencephalographers, this method may provide more reproducible ictal EEG data in a clinical setting than the conventional EEG does. Nevertheless further larger investigations will ascertain the relevance of this conclusion.

**PA6 034 STNFR-1 IS AN EARLY INFLAMMATORY MARKER IN COMMUNITY VERSUS INSTITUTIONALIZED ELDERLY WOMEN.**

F. COELHO\* (Universidade Federal de Minas Gerais, Belo Horizonte, Brazil)  
F. NARCISO (1), D. OLIVEIRA(1), D. PEREIRA(1), M. TEIXEIRA(2), D. SOUZA (3), L. PEREIRA(1) - (1) Departamento de Fisioterapia da Escola de Educacao Fisica, Fisioterapia e Terapia Ocupacional da Universidade Federal de Minas Gerais, UFMG (Belo Horizonte, Brazil); (2) Departamento de Bioquímica e Imunologia do Instituto de Ciencias Biologicas da UFMG (Belo Horizonte, Brazil); (3) Departamento de Microbiologia do Instituto de Ciencias Biologicas da UFMG (Belo Horizonte, Brazil)

Introduction: An increased circulating levels of inflammatory cytokines has been associated with sarcopenia, functional disability, and mortality in the elderly. We evaluated, in this study, sTNFR-1, IL-6 levels and hand grip in the elderly. We also investigated the influence of age on such factors. Methods and Materials: A convenience sample of 110 elderly women ( $71.17 \pm 7.44$  years) was selected. The sample was constituted of 56 community and 54 institutionalized living elderly. Serum levels of sTNFR1 and IL-6 were measured by ELISA. For the measurement of hand muscle strength, the JAMAR' dynamometer was used. Differences between two groups were evaluated using the t-student test. Correlation analyses were performed using Pearson's correlation analysis. Results: Plasma concentrations of inflammatory markers were significantly higher in institutionalized elderly (sTNFR:  $479 \pm 22$  pg/mL; IL-6:  $6.3 \pm 0.8$  pg/mL) in comparison to community residents (sTNFR:  $329 \pm 24$  pg/mL; IL-6:  $2.5 \pm 0.4$  pg/mL)  $p < 0.0001$ . The institutionalized elderly had reduced muscle strength ( $15 \pm 0.8$  Kgf) in comparison to community elderly ( $23 \pm 0.6$  Kgf);  $p < 0.05$ . It was observed that only sTNFR1 was sensitive to detect the difference in the 60 year group (community  $280 \pm 29.6$  pg/mL and institutionalized  $393.1 \pm 31.3$  pg/mL;  $p < 0.05$ ). The levels of IL-6 and hand grip were only different on the groups of 70 and 80 years. Conclusions: our results

demonstrate that being institutionalized have an impact over levels of inflammatory mediators and hand grip in the analyzed subjects.

**PA6 035 SIMPLE SCREENING FOR DRY MOUTH**

W. SAKAMOTO\* (Institute of QOL, Ishikari, Japan)  
T. KANEHIRA(2), T. YAMAGUCHI(2), J. TAKEHARA(2), Y. FUJII(1), K. ASANO(3), S. YUKAWA(4) - (1) Fuji Women's University, Institute of QOL (Ishikari, Japan); (2) Preventive Dentistry, Hokkaido University (Sapporo, Japan); (3) Division of Applied Bioscience, Hokkaido University (Sapporo, Japan); (4) Wakayama Medical University (Wakayama, Japan)

Objective: The application of a novel assay system for screening of dry mouth. Study design: A novel assay system comprised of 3 spots containing 30 microg of starch and 49.6 microg of potassium iodide per spot on filter paper and a coloring reagent, based on the color reaction of iodine-starch and theory of paper chromatography, was designed. For 41 subjects hospitalized in private institutions, we investigated the relationship between resting whole salivary rates and the number of colored spots on the filter. Results: A significant negative correlation was observed between the number of colored spots and the resting salivary flow rate ( $n=41$ ;  $r = -0.803$ ,  $p < 0.01$ ). For all subjects with dry mouth ( $n=9$ ) having cutoff values  $< 100$  microL/min for the salivary flow rate, three colored spots appeared on the paper, whereas for healthy subjects there was one colored spot or less. Conclusion: This novel assay system might be effective for screening of dry mouth not only in healthy, but also in bedridden and disabled, elderly people.

**PA6 036 A NEW CLASS OF MRI STRIATAL DOPAMINERGIC RECEPTOR IMAGING AGENTS**

M. SHAFIEE ARDESTANI\* (Tehran University of Medical Sciences, Faculty of Pharmacy, Tehran, Islamic Republic of Iran)  
M. AMANLOU(1), A. JABBARI(1), S. SADAT EBRAHIMI(1) - (1) Tehran University of Medical Sciences (Tehran, Islamic Republic of Iran)

Receptor imaging is an important area of research and usually used for better diagnosis or follow up the treatment in many diseases especially degenerative brain diseases like Parkinson's or Alzheimer's diseases. Preparation and imaging procedures of the routine radioligands such as 18F-LDOPA or 11C-Lacropride produce some difficulties such as low half life, high cost and radiation. In this study, a new class of contrast media agents for dopaminergic receptor imaging Gd3+-DTPA-(Levodopa)n=1, 2, 3 were designed and synthesized. Their toxicity was investigated and not found toxic at all In Vitro or In Vivo. The compounds had good therapeutic functions comparing to the unbind levodopa. The effects of compounds on T1 relation time was investigated and compared to the absence or presence of standard Gd3+-DTPA in vitro and in vivo and were found suitable. Then In vitro cell uptake ability was investigated in Substantia Nigra Pars Compacta (SNc) dopaminergic neurons and also compared to Gd3+-DTPA. The compounds were taken up by dopaminergic neurons significantly ( $P < 0.0001$ ) more than Gd3+-DTPA. Finally in vivo imaging studies were performed in normal and parkinsonian rats (at different stages). The qualities of images were found so suitable and staging the disease was possible. It is worthwhile to notify that the best image quality were obtained from GD3+-DTPA-Levodopa)2. Due to results of Gd3+-DTPA-(Levodopa) n=1, 2, 3 also having not any radioactive half life or radiation and low cost this class seems to have a very good future in SNc MRI imaging in Parkinsonian patients.

**PA6 037 TELOMERIC AND SUBTELOMERIC STRUCTURAL CHANGE WITH AGING IN CHRONICALLY ILL PATIENTS**

T. MAEDA\* (Kyushu University, Beppu, Japan)  
J. OYAMA(1), Y. HIGUCHI(1), N. MAKINO(1) - (1) Kyushu university (Beppu, Japan)

Introduction: Telomere in somatic cells becomes shorter with aging of human and other species. However, it is unclear whether subtelomeric methylation status in human somatic cells changes with aging. In order to assess aging-related telomeric structural change, mean telomere length, telomere length distribution, and subtelomeric methylated status of healthy Japanese and hospitalized chronically ill patients are studied. Methods and Materials: Genomic DNA isolated from peripheral white blood cells of 148 healthy Japanese and 44 hospitalized patients was subjected to Southern blot probed with telomere DNA using methylation-sensitive and -insensitive isoschizomer, and the methylation-related alterations of terminal restriction fragment lengths with ageing was analyzed. Results: With aging, long telomeres decrease and short telomeres increase, and contents of telomeres with methylated subtelomere increase in long telomeres. These telomeric and subtelomeric changes tend to be enhanced in some pathophysiological conditions. Conclusion: Our trial indicates that the telomere-length distribution analysis with methylation-sensitive and -insensitive isoschizomer can be a useful tool to assess subtelomeric methylation status of the somatic cell population. The results indicate that the subtelomeric methylation of peripheral blood cells is an indicator for ageing-associated genomic change and provoke us to postulate that telomere neighboring less methylated

subtelomere is prone to be shortened faster with aging and with certain pathophysiological conditions.

**PA6 038 COGNITIVE POTENTIEL (P300): A VALUABLE METHOD TO EVALUATE CEREBRAL SENESCENCE**  
C. DE JAEGER\* (Centre d'évaluation gérontologique, Paris, France)

As adults age, central nervous system function slows appreciably. This phenomenon has been assessed with a wide variety of behavioral paradigms and originates from neurobiological factors related to aging. Given the growth of the elderly population and the concomitant increase in the proportion of cognitively impaired individuals, accurate measurement of the mental changes stemming from aging is an important scientific and social problem. Neuroelectric measures have provided some of the most direct evidence for the relationship between central nervous system function and age-related cognitive changes. They have played an increasingly important role in the quantification and understanding of these effects. The P300 component of the ERP has demonstrated considerable utility in the study of aging because it is thought to result from neural activity associated with attentional and memory processes. P300 amplitude age-variation indexes changes in neural activity across the scalp, the timing of its peak provides a measure of mental processing speed that is independent of behavioral responding, and characterization of its normative values has yielded baseline measures against which cognitive illness can be evaluated. Much progress has been made in the 30 years since the P300 potential was discovered. The P300 component is often elicited with a simple discrimination task. This procedure has been dubbed the "oddball" paradigm because two stimuli are presented in a random series such that one of them occurs relatively infrequently, that is, the oddball. The P300 is measured by quantifying its amplitude and latency. There is a very strong relationship between P 300 and cerebral aging. The P 300 can also help discriminating between neurodegenerative diseases and depression or normal cerebral aging who are all with memory impairments. Our team think that P 300 should be part of all brain studies.

**PA6 039 STUDY OF THE TELOMERE LENGTH AND DIFFERENT MARKERS OF OXIDATIVE STRESS IN PATIENTS WITH PARKINSON DISEASE**  
A. BENETOS \* (CHU de Brabois, Vandoeuvre Lès Nancy, France)  
G. WATFA(1), C. DRAGONAS(3), R. NZIETCHUENG(2), R. DITTRICH (4),  
C. ALECU (1), C. SIEBER (3), A. BENETOS(1) - (1) CHU de Brabois, Service de Gériatrie (Vandoeuvre Lès Nancy, France); (2) Inserm U 684 - Faculté de Médecine de Nancy (Vandoeuvre Lès Nancy, France); (3) : Institute for Biomedicine of Aging, Department of Internal Medicine, Geriatrics (Germany); (4) University of Erlangen-Nuremberg (Nuremberg, Germany)

Introduction: Oxidative stress and generation of reactive oxygen species are believed to be implicated in Parkinson disease (PD). On the other hand, it has been postulated that telomere length (TL) may be a bio-indicator of aging since it records the cumulative burden of oxidative stress and inflammation. This clinical study is one of the first to evaluate both the dynamic of telomeres and different markers of oxidative stress in patients with PD. Methods and materials: A total of 69 men and women, aged  $78 \pm 7.5$  years, 34 with PD and 35 age-matched controls, were studied. TL was measured by Southern Blotting from DNA samples extracted from white blood cells. Superoxide dismutase (SOD) activity, levels of glutathione and of total protein carbonyls in plasma were determined by using the Cayman Chemical assay Kit according to the manufacturer's instructions. Nitrotyrosine in plasma was measured with a specific enzyme immunoassay (Cayman Chemical). Results: TL was not significantly different in PD patients compared to controls ( $6.03 \pm 0.79$  vs.  $6.45 \pm 0.73$  kb, respectively,  $p=0.12$ ). TL was correlated with age in controls ( $r = -0.548$ ,  $p = 0.03$ ), but not in PD patients. With age, in PD patients, the activity of SOD was significantly decreased and the levels of nitrotyrosine were increased. No association was found between oxidative stress markers and telomere attrition. Conclusion: Despite a trend toward shorter telomeres in PD patients, we could not find statistically significant differences as compared to the control subjects, possibly because of the small size of the population. The absence of telomere attrition with age among PD patients could reflect a telomere regulation by other than age mechanisms. Our study indicates also that there is an imbalance, with age, between antioxidant defense and production of oxidation in PD patients.

**PA6 040 BIOMARKERS OF HUMAN AGEING: THE NEWCASTLE 85+ STUDY**  
C. MARTIN-RUIZ\* (Newcastle University, Newcastle upon Tyne, United Kingdom)  
T. KIRKWOOD(1), K. DAVIES(1), J. COLLERTON(1), T. VON ZGLINICKI(1), T. (1) - (1) Newcastle University (United Kingdom)

The Newcastle 85+ Study on the biological, clinical and psychosocial factors that contribute to human healthy ageing started in May 2006. During its Phase 1 the study has recruited a cohort of around 800 individuals of 85 years of age that were assessed throughout interviews, functional tests and blood samples. In comparison to many other studies of the same kind, our study has a special focus on Biomarkers of Ageing. In addition to many routine haematological and biochemical markers, a wide range of novel candidate markers has been included such as markers of inflammaging (cytokines TNF- and IL-6), markers of immunosenescence (subpopulations of NK cells and CD27+/− cells

within CD4 and CD8 subsets), markers of oxidative stress (F2-isoprostanes as indicators of levels of lipid peroxidation; blood cell telomere length) and levels of DNA repair capacity in white blood cells. With this comprehensive approach, both the cross-sectional and longitudinal components of this study will provide us with an unprecedented insight into those factors contributing to healthy ageing. At this point we present a comprehensive statistical analysis of all data collected for these biomarkers in an attempt to set a profile of biomarkers that best defines healthy ageing.

**PA6 041 STABLE MAGNETIC ISOTOPES AS THE BASIS FOR THE NEW ANTI-AGING BIOTECHNOLOGY**

L. TUMANOV\* (Institute of Problems of Chemical Physics, RAS, Moscow Region, Russian Federation)  
V. KOLTOVER(1), T. BOGATYRENKO(1), E. KUDRYASHOVA(2),  
U. SHEVCHENKO(2) - (1) Institute of Problems of Chemical Physics, RAS (Chernogolovka, Moscow Region, Russian Federation); (2) Orenburg State University (Orenburg, Russian Federation)

Chemical reactions obey the law of conservation of the total angular momentum (spin): the spin state of reactants must be identical to that of products. As a result, acceleration of reactions can be achieved via magnetic fields of nuclear spins of magnetic nuclei. Among three stable isotopes of magnesium, Mg-24, Mg-25 and Mg-26 with natural abundance 78.7, 10.1 and 11.2%, only Mg-25 has a nuclear spin magnetic moment ( $I = 5/2$ ). Two other isotopes are spinless ( $I = 0$ ) and, for this reason, nonmagnetic. We have for the first time shown that the cells of *E. coli*, which grows on the medium containing 25Mg-sulphate, multiply by about 20 per cent faster than the cells which grows on the nonmagnetic Mg-24 or Mg-26 isotopes. The magnetic isotope works as much more effective cofactor in oxidative phosphorylation, as it was shown for mitochondria (Buchachenko et al, 2004). Moreover, the cells grown on Mg-25 demonstrate essentially less activity of superoxide dismutase, by about 40 per cent, when compared to the cells grown on Mg-24 or Mg-26. Inasmuch as activity of SOD is adjusted to the intracellular level of superoxide radicals, the lower activity of SOD can be considered as evidence for lower production of the radicals as the faulty by-products of respiration. It means that the energy park's bio-nanoreactors work not only more effective but more reliable too while supplied with the magnetic isotope of magnesium by comparison with the case of the nonmagnetic isotopes. Thus, owing to the nuclear spin, magnesium-25 produces the preventive antioxidant effects. It opens the way toward the new anti-aging drug technology based on stable magnetic isotopes. This work was sponsored by Russian Foundation for Basic Research, project 07-03-00897.

**PA6 042 DYNAMICS OF MITOCHONDRIAL CRISTAE, THEIR CONTRIBUTION TO PROTEIN EXCHANGE WITHIN MITOCHONDRIA.**

J. BEREITER-HAHN\* (Institute for Cell Biology and Neurosciences , Frankfurt am Main, Germany)  
D. DIKOV(1), S. MAI(1), M. JENDRACH(1), V. SUKHORUKOV(1), I. WITTIG(2) - (1) Goethe University Frankfurt (Frankfurt am Main, Germany); (2) Center for Biological Chemistry (Frankfurt am Main, Germany)

The rescue hypothesis of mitochondrial exchange states that impaired mitochondrial proteins may be replaced by functional ones via fusion and fission processes of mitochondria. Indeed, fusion and fission are a prerequisite for long lasting cell survival in culture. Measurements of diffusion of proteins within the outer and the inner membrane of mitochondria using fluorescence recovery after photobleaching (FRAP) revealed values too high as to be in line with the concept of respiratory supercomplexes. These could be due to incomplete integration of the fluorescent labeled proteins into the membranes or to hitherto unknown membrane dynamics. Using blue native gel analysis the first explanation could be excluded. Analysis of high speed confocal laser-scan images of mitochondria in living HeLa cells with differently labeled inner membrane and matrix revealed high speed motions of the inner membrane compartment, changing within a few milliseconds. The location where cristae appear remains constant up to several minutes, however the orientation and probably the size of cristae changes very fast as shown by high resolution videos. We hypothesise that the mass of the cristae membrane may become laterally distributed and reassembling in short time. An alternative is a fast bending mechanism. According to Monte Carlo simulations the first mechanisms seems to be an acceptable possibility as well. A decision between these possibilities is not possible because of the limitations of light microscope resolution. Thus the inner mitochondrial compartment is much more dynamic than assumed so far, giving rise to fast exchange processes which are supposed to add to longevity of cells.

**PA6 043 COMPLEXITY, CHAOS, AND FRACTALITY IN AGING: FRACTAL LACUNARITY CAN MEASURE PHYSIO/PATHOLOGIC AGING**

A. ZAIA\* (INRCA - Italian National Research Centers on Aging, Ancona, Italy)

Aging can be considered as a temporal evolution of a complex system governed by the laws of deterministic chaos. The advent of fractal mathematics has been accepted by most scientists and fractal dimension has been becoming the most common tool to measure variations of complexity with aging and pathology. Lacunarity, another fractal property,

can measure fractal space filling capacity and lacunarity analysis has been recently introduced as a more general technique to describe complex patterns with random and fractal properties. An original method has been developed in our center to verify the potential of lacunarity in measuring complexity of biomedical structures physiopathologically altered with aging. The method uses a hyperbola model function to approximate the curvilinear plot of lacunarity function. The hyperbola formula contains three coefficients ( $\alpha$ ,  $\beta$ ,  $\gamma$ ) that computed as the solution of a least squares problem univocally characterize the complex structure analysed. The method has been applied to trabecular bone of vertebra MR images from subjects of different age and physiopathologic status. Among the three coefficients, the parameter  $\beta$  undergoes the most significant variation. Parameter  $\beta$  correlates with both age and physio-pathologic status with a decreasing trend of  $\beta$  values from young to old subjects and from healthy young to perimenopausal to osteoporotic patients. The healthy old subjects show a  $\beta$  value higher than the younger osteoporotic patients. The diffusion of paradigms such as complexity, chaos, and fractals in gerontologic field has opened up new perspectives and suggests innovative approaches to understand and study aging in a global vision of the phenomenon. Lacunarity analysis represents a promising tool to give insight into the search of good biomarkers useful to discriminate between physiologic and pathologic aging as well as between age-related and age-associated diseases.

**PA6 044 HIGHER EXPRESSION OF MACROMOLECULAR FORMS AND C-TERMINAL DOMAIN OF PLASMA FIBRONECTIN MORE FREQUENTLY ASSOCIATED WITH ALZHEIMER**

J. LESZEK\* (University Medicine, Wroclaw, Poland)

**Introduction:** Aberrant angiogenesis of the cerebrovascular system could initiate neurovascular events leading to neurovascular disorders. Fibronectin(FN) is known to exert a strong angiogenic influence on endothelial cells in the CNS. FN is a multidomain and multifunctional glycoprotein and conformational changes precede its function. **Objective:** In the present study, alterations in the expressions of the carboxy-terminal(CT-FN), collagen(Collagen-FN), cellular(Cell-FN) and fibrin(Fibrin-FN) domains of plasma fibronectin and the expression of the molecular forms of plasma fibronectin in an Alzheimer's patients(AD), compared with vascular dementia(VaD) and age-matched control groups were analysed. **Methods:** FN domain concentrations were determined by ELISA using a panel of domain-specific monoclonal antibodies. Western immunoblotting using a monoclonal antibody was performed to analyse the FN molecular forms. **Results:** In the AD and VaD groups, the mean values of the concentrations of CT-FN and Collagen-FN were significantly higher than those in the age-matched control group. Immunoblotting revealed the presence of 272-kDa and 311-kDa FN bands besides the 237-kDa and 218-kDa bands corresponding to healthy individuals. The 272-kDa band was present in 89.7% of AD, 75% of VaD and 63.6% of control samples, whereas the 311-kDa FN band was in 72.4% of AD, 33.3% of VaD and in 22.7% of controls. Densitometry analysis of FN immunoblotting showed that the relative amounts of the 311-kDa and 272-kDa FN bands in the AD group were significantly higher than in the VaD and control groups. **Conclusion:** The plasma FN status can reflect the molecular processes associated with AD state and with aging. The findings seems to be a promising test qualifies as a screening tool for disease risk.

**PA6 045 ORAL POLYAMINE DECREASES MORTALITY IN AGED MICE AND THE INCIDENCE OF AGE-ASSOCIATED PATHOLOGIES**

K. SODA\* (Saitama Medical Center, Jichi Medical University, Saitama, Japan)  
Y. DOBASHI(1), Y. KANO(1), F. KONISHI(1) - (1) Saitama Medical Center, Jichi Medical University (Saitama-city, Japan)

**OBJECTIVES:** Natural polyamines, spermine and spermidine, rich in beans and fermented foods have anti-inflammatory properties, including the suppression of the expression of leukocyte function function-associated antigen-1 and the production of pro-inflammatory cytokines. Because such polyamine-rich foods seem to suppress age-associated diseases and help prolong longevity, we tested the effects of dietary polyamines on longevity in mice. **METHODS:** Male JC1:ICR mice were fed standard rodent chow until they were 24 weeks old. They were then divided into three groups and fed either high, normal, or low polyamine chow. The low polyamine chow was prepared by eliminating polyamine-rich materials from the standard chow and replacing them with materials with low polyamine concentrations. For the normal polyamine chow, synthetic spermine and spermidine were mixed in doses of 0.002 % (w/w) and 0.008 % respectively, with the low polyamine chow. The high polyamine chow had spermine and spermidine mixed in doses of 0.015 % and 0.06 %, respectively. **RESULTS:** The body weights of mice in all three groups were similar. Mice in the high polyamine group lived longer than mice in the other two groups ( $p = 0.011$ : generalized Wilcoxon). Survival was significantly longer in the high polyamine group than in the low polyamine group ( $p = 0.032$ ) and the normal polyamine group ( $p = 0.003$ ). However, survival in the normal polyamine and low polyamine groups was similar ( $p = 0.432$ ). At 88 weeks old, age-associated pathologies, such as glomerulosclerosis and the decreased expression of senescence marker protein 30, were less frequent in kidneys and livers of mice fed high polyamine chow than those fed low or normal polyamine chow, while at age 20 weeks, neither pathology was found.

**CONCLUSIONS;** Polyamines may be natural anti-aging substances that help prolong longevity and decrease age-associated diseases.

**PA6 046 ORAL POLYAMINE DECREASES THE DEATH IN AGED MICE AND AGING-ASSOCIATED PATHOLOGY**

K. SODA\* (Saitama Medical Center, Jichi Medical School, Saitama, Japan)

**OBJECTIVES:** Polyamines, spermine and spermidine, are generally rich in beans and fermented foods. Epidemiologic studies have shown that such polyamine-rich foods seem to suppress aging-associated diseases and help prolong longevity. Polyamines have ability to suppress inflammatory mediators such as leukocyte function associated antigen-1 and pro-inflammatory cytokines. Because inflammation appears to play an important role in the progression of aging-associated diseases, we tested the effects of dietary polyamines on the longevity. **METHODS:** Male JC1:ICR mice were divided into three groups and fed with standard rodent chow until they grew to 24 weeks old. Then, the mice were fed either with high, normal, or low polyamine chow. The low polyamine chow was prepared by eliminating polyamine-rich materials from the standard chow and replacing them with materials of which polyamine concentrations are low. For the normal polyamine chow, synthetic spermine and spermidine were mixed in doses of 0.002 % (w/w) and 0.008 % respectively, with the low polyamine chow. And, for the high polyamine chow, spermine and spermidine were mixed in doses of 0.015 % (w/w) and 0.06 %, respectively. **RESULTS:** The body weight change among three groups were similar. After 26 weeks of being fed the experimental chows (50 weeks of age), blood polyamine concentrations in mice fed with the high polyamine chow were higher than those of the other two groups. Between around 50 to 80 weeks of age, the survival rate of mice fed with the high polyamine chow was significantly higher than that of the other two groups of mice. Histopathological and immunohistochemical examination revealed that the numbers of glomerulus and the amount of a protein decease with aging (SMP30) in the kidney of mice fed with high polyamine chow were well-preserved. **CONCLUSIONS:** Dietary polyamines help prolong longevity.

**PA6 047 "SCIENCE AGAINST AGING" - A COMPLEX INTERDISCIPLINARY PROGRAM OF FUNDAMENTAL RESEARCH**

M. BATIN\* (N.N. Petrov Research Institute of Oncology of the Russian Ministry of Health, Saint-Petersburg, Russian Federation)  
A. MOSKALEV(2), V. NOVOSELTSEV(3), A. MICHALSKI(3), E. TERESHINA(4) - (2) Institute of biology of Komi Science Center of Ural Division of RAS (Syktyvkar, Russian Federation); (3) Institute of Control Sciences RAS (Moscow, Russian Federation); (4) Gerontology Research Center (Moscow, Russian Federation)

A complex interdisciplinary program of fundamental research directed at increasing lifespan covers major research areas (genetics, immunology, stem cells, proteomics etc.) with concrete goals and tasks defined in each of them. However, creation and moreover implementation of such a program is impossible without changing the existing attitude to the role and purpose of gerontology. Aging is an extremely complicated process. It was formed during evolution and it comprises all levels of life organization. Now it is described by numerous theories and studied in dozens of laboratories. But until now there has been no unified plan of action aimed at a comprehensive study of processes taking place in the organism during aging. A complex, large-scale, interdisciplinary program of scientific research is necessary for the complex study of aging. It is essential to plan and to coordinate scientific research into aging in the world, and to organize the effective international and interdisciplinary cooperation of scientists in order to carry out this project. We would like to bring to your attention the first edition of such program prepared by Russian scientists presenting the non-governmental organisation "For Lifespan Increase".

**PA6 048 MUSCLE STRENGTH BUT NOT FUNCTIONAL CAPACITY IS ASSOCIATED WITH PLASMA IL-6 LEVELS OF COMMUNITY-DWELLING ELDERLY WOMEN**

L. PEREIRA\* (Federal University of Minas Gerais Brazil, Belo Horizonte, Brazil)  
D. OLIVEIRA(1), F. NARCISO(1), F. COELHO(1), J. DIAS(1), M. SANTOS(1), D. PEREIRA(1), R. DIAS(1) - (1) Physical Therapy Department of Federal University of Minas Gerais (Belo Horizonte, Brazil)

**Introduction:** The association of plasma interleukin-6 (IL-6) levels, muscle strength and functional capacity was investigated in a cross sectional study of community-dwelling elderly women from Belo Horizonte,Brazil. Community-dwelling are older people who present controlled chronic diseases with no negative impact in physical, psychosocial and mental functionality. Psychological and social stress due to unsuccessfully aging can represent a risk for immune system disfunctions. **Methods/Materials** IL-6 levels, isokinetic muscle strength of knee flexion/extension, and the functional tests were measured in 57 participants ( $71.21 \pm 7.38$  years). Serum levels of IL-6 were done within one single assay(mouse monoclonal antibody against IL-6; High-Sensitivity, Quantikine®, R & D Systems USA;intra-assay coefficient of variance CV% 6.9-7.4; inter-assay CV% 9.6-6.5; sensitivity 0.016-0.110pg/ml mean=0.039pg/ml). Muscle strength was assessed with the isokinetic dynamometer Biodek System 3 Pro®. After the Shapiro-Wilk normality test was

applied, correlations were investigated, Spearman and Kruskal-Wallis tests. Post hoc analysis was performed using the Dunn test. Results A significant negative correlation was observed between plasma IL-6 levels ( $1.95 + 1.77\text{pg/ml}$ ) and muscle strength for knee flexion ( $70.70 + 21.14\%$ ;  $r = -0.265$ ;  $P = 0.047$ ) and extension ( $271.84\% + 67.85\%$ ;  $r = -0.315$ ;  $P = 0.017$ ). No significant correlation was observed between IL-6 levels and the functional tests (time to rise from a chair  $14.65 + 2.82\text{s}$  and gait velocity  $0.95 + 0.14\text{m/s}$ ). Conclusions The increase in the levels of IL-6 showed a significant inverse correlation with muscle strength, as assessed using an isokinetic dynamometer in community dwelling health elderly women. These results emphasize the need to recognize the action of inflammatory mediators on muscle.

**PA6 049 INTAKE LEVELS AND MAJOR FOOD SOURCES OF ENERGY AND NUTRIENTS IN THE RAJASTHANESE ELDERLY (INDIA).**

M. LATA\* (M.S.J.College, Bharatpur, India)  
A. BHATIA(1) - (1) M.S.J.College (Bharatpur, India)

In almost every country, the proportion of people aged over 60 years is growing faster than any other age group; India is not an exception of this. The purpose of this study is to examine dietary intake levels and major food sources of energy and nutrients for the Rajasthani elderly in order to relate nutrient intakes to food choices and to provide suggestions for dietary improvement. Method: The data were derived from the 48-hour recalls from 413 subjects (236 males and 177 females) aged 60 and above. Result: The results revealed that cereals/roots, meat, other protein-rich foods and fats/oils contributed most to daily energy intake. Meat and cereals/roots were the major food sources of protein. The highest ranked food sources for minerals are listed as follows: dairy products, vegetables and milk for calcium; dairy products and cereals/roots for phosphorous; vegetables and meat for iron; and vegetables, cereals/ roots, other protein-rich foods and. The elderly were found to consume more salt, dairy products and vegetables, but less poultry and meat. Conclusion: the dietary patterns of the elderly are in general "healthier". Nonetheless, elderly population needs to increase their intake of calcium, magnesium, vitamins E and B6, and dietary fiber, and decrease their consumption of salt. Promoting the ingestion of whole-grain and nut products may be a useful strategy to improve the nutritional status of the Rajasthani elderly. Keywords : Elder , dietary intake, nutrient

**PA6 050 CONCEPT OF AGE-RELATED PATHOLOGY AND ACCELERATED**

**AGEING PREVENTION, REDUCTION OF PREMATURE MORTALITY**  
L. KOZLOV\* (Saint Petersburg Institute of Bioregulation and Gerontology, Saint Petersburg, Russian Federation)  
V. KHAVINSON(1), O. MIKHAILOVA(1), G. RYZHAK(1) - (1) Saint Petersburg Institute of Bioregulation and Gerontology (Saint Petersburg, Russian Federation)

Introduction Recent medical and demographic situation in Russia is characterized by high premature mortality among people of working age, reduced birth rate, and low average life span. All these factors alongside growing number of old and elderly people lead to depopulation and deficit of labor resource. The demographic shifts are inevitably accompanied by changes in the structure of morbidity and hence relate directly to the present and future challenges for public health. Methods and Materials Long-term evidence-based studies of application of peptide bioregulators-geroprotectors, developed at the St.Petersburg Institute of Bioregulation and Gerontology were conducted to estimate their role in prevention of premature ageing and improvement of life quality. These bioregulators reveal a unique property to partially restore a decreased with age protein synthesis in the organism, which is accompanied by improved functional activity of organs and tissues. Results More than 30-year experience has shown that their experimental application contributed to normalization of the main organism functions, reduction of tumors occurrence and increase in mean life span by 15-30%. Administration of the bioregulators to people contributed to improvement of brain, immune and cardio-vascular systems functioning, osseous tissue state, and led to almost a two-fold reduction of death rate during a 12-year period of observation. Basing on these data there has been developed a Concept "Prevention of age-related pathology and accelerated ageing, reduction of premature mortality due to biological factors, and expanding healthy period of life for the population of Russia". Conclusion The objective of the Concept is to improve the quality of life, to expand the period of healthy life of elderly people, as well as to enhance the economic effectiveness of utilization of labor resources due to decreased morbidity and disability and premature death rates.

**PA6 051 HIGH BLOOD PRESSURE IN AGING IS ASSOCIATED WITH AN UP-REGULATION OF AT1 AND DOWN-REGULATION OF D1 RECEPTORS IN THE KIDNEY**

M. ASGHAR\* (University of Houston, Houston, United States)  
G. CHUGH(1), D. DIZ(2), M. LOKHANDWALA(1) - (1) University of Houston (Houston, United States of America); (2) Wake Forest University School of Medicine (Winston-Salem, United States of America)

Introduction: Aging, per se, leads to a decline in physiological functions including altered sodium homeostasis in the kidney associated with an increase in blood pressure (BP). Sodium homeostasis and thus BP is maintained by the balance between dopamine D1

receptor (natriuretic) and angiotensin II AT1 receptor (anti-natriuretic) function in the kidney tubules. Although the underlying mechanism for age-associated increase in BP is not known, we hypothesized that an imbalance in renal D1 and AT1 receptors in rats during aging would favor elevated BP. Methods and Materials: Radioligand, biochemical and western blotting methodologies were used in the study. Results: Aged (21-month) Fischer 344 x Brown Norway F1 hybrid (FBN) rats had higher BP compared to their younger (3-month) counterparts. AT1 receptor numbers were higher and angiotensin II stimulated sodium transporter Na,K-ATPase to a greater degree in renal proximal tubules (RPTs) of aged rats. Markers of oxidative stress (protein carbonyls and 8-isoprostanate) and stress-activated transcription factor NF $\kappa$ B were increased in RPTs of aged rats. Hypertensive (mRen2) 27 transgenic rats studied at 4 and 17 months showed age-related increase in malondialdehyde levels (an oxidative stress marker) and AT1 receptors, and decreases in D1 receptors in RPTs. Stress kinase p38 and stress-activated transcription factor NF $\kappa$ B were up-regulated in RPTs of aged (mRen2)27 rats. Conclusion: These results document age-associated oxidative stress in the RPTs that involves p38 and NF $\kappa$ B, and an associated up-regulation of AT1 receptors and down-regulation of D1 receptors. These age-related changes may provide an underlying mechanism for altered sodium homeostasis and higher BP in aging. (NIH/NIA AG25056, AG29904 and NHLBI HL51952 supported the studies).

**PA6 052 THE EFFECT OF WHOLE BODY VIBRATION AMPLITUDE AND FREQUENCY ON LEG MUSCLE ACTIVITY AND ACCELERATION THROUGHOUT THE BODY**

R. POLLOCK\* (King's College London, London, United Kingdom)  
F. MARTIN(1) - (1) Guy's & St Thomas' Foundation Trust (London, United Kingdom)

Whole body vibration (WBV) has been reported to improve muscle strength, power, balance and bone mineral density and therefore could be beneficial for frail older people. Contradictory findings have been reported, probably due to differences in the populations and protocols used. Vibration can have negative effects and the accelerations experienced throughout the body are unknown. We investigated the effect of high (5.5mm) and low (2.5mm) amplitudes and different frequencies (5-30Hz) on leg muscle activity and acceleration at different body segments. Surface EMG of the soleus, gastrocnemius lateralis, anterior tibialis, rectus femoris, biceps femoris and gluteus maximus muscles was recorded from 12 subjects ( $31 \pm 12$  years,  $1.76 \pm 0.09\text{m}$ ,  $72.7 \pm 17.6\text{kg}$ , mean  $\pm$  SD) and compared to that of a maximal voluntary contraction (MVC) of each muscle. The average rectified acceleration, expressed in g ( $1\text{g} = 9.81\text{ m/s}^2$ ), at the toe, ankle, knee, hip and head was recorded on 15 subjects ( $37 \pm 12$  years;  $1.74 \pm 0.08\text{m}$ ;  $68.1 \pm 8.3\text{kg}$ ) using 3D motion analysis. Increased EMG activity during vibration (~5-50% MVC) was greatest in the lower leg. This was linearly related to frequency except in gluteus maximus and biceps femoris. Activity at high amplitude vibration was greater, but not always significantly ( $p < 0.05$ ). Accelerations were 0.2-9g and greatest in the knee and hip at 10-15Hz. Head acceleration was significantly less ( $<0.33\text{g}$ ,  $p < 0.01$ ) than all other body positions. The greater vibration below the knee is associated with more muscle activity, which damps transmission throughout the body and minimises acceleration of the head, and may result from voluntary or reflex contractions. High amplitude and frequencies generated most muscle activity although it would be unlikely to strengthen young healthy individuals, but may be effective for frail older people.

**PA6 053 AMBIENT TEMPERATURE INFLUENCES CELLULAR METABOLISM IN CANINE DERMAL FIBROBLAST**

T. TSAI\* (Chang-Gung University, Kwei-Shan Tao-Yuan, Taiwan)  
C. HSU (1) - (1) Chang-Gung University (Kwei-Shan Tao-Yuan, Taiwan)

Temperature reduction can extend the lifespan of organisms. How ambient temperature affects cellular metabolism to extend lifespan remains unknown. Here, histochemical and biochemical techniques were used to assay age-related markers, energy metabolic molecules, and cellular degradation function in canine dermal fibroblast cultured at low ( $35^\circ\text{C}$ ) and high ( $39^\circ\text{C}$ ) ambient temperature. The results showed that the expression of senescence-associated , galactosidase, lipofuscin, reaction oxygen species, lipid peroxidation, protein oxidation, and superoxide dismutases activity decreased at low temperature. Mitochondrial membrane potential, mitochondrial density, and ATP level increased at low temperature. Lysosomal function and proteosome activity increased at low temperature. These data suggested that low temperature could retard cellular aging via the increase of energy metabolic efficiency and cellular degradation function, whereas high temperature increased cellular aging via converse effect.

**PA6 054 AGE RELATIONS OF CEREBRAL BLOOD FLOW, CEREBROSPINAL FLUID MOBILITY AND CRANIAL COMPLIANCE**

Y. MOSKALENKO\* (Institute of Evolutionary Physiology and Biochemistry, Russian Acad.Sci., St.Petersburg, Russian Federation)  
G. WEINSTEIN(1), T. KRAVCHENKO(1), N. SAMUS(1), N. RIABCHIKOVA(2), A. PANOV(1), V. SEMERNIA(1), A. FEILDING(3), P. HALVORSON(3) - (1) Institute of Evolutionary Physiology and Biochemistry, Russian Acad.Sci. (St.Petersburg, Russian Federation); (2) Institute of Evolutionary Physiology and Biochemistry, Russian Acad.Sci.

(St.Petersburg, Russian Federation); (3) Institute of Evolutionary Physiology and Biochemistry, Russian Acad.Sci. (St.Petersburg, Russian Federation)

Introduction. Cerebral blood flow(CBF), Cerebrospinal fluid mobility(CSFm) and skull biomechanics (CC), significantly change with age. Their comparative contribution to brain metabolic supply have not been clarified due to methodical difficulties. This study reports evaluation of CSFm, CC and CBF changes over ages ranging from adult to the elderly using new noninvasive methodology. Method. Comparative evaluation of aging changes of CBF, CSFm and CC was based on simultaneous recordings of transcranial dopplerogram (TCD) in S1 segment of middle cerebral artery (MCA) and rheoencephalogram (REG) with electrodes positioned fronto-mastoidally on human head. Computer-aid analysis, basing on Chart 5.1 and Canvas 6-11 software, of TCD and REG comparative changes during cardiac pulse for evaluation of CSFm and CC was used. 98 healthy persons of both sexes in age ranges 25 – 85 years were investigated. Results. The data obtained show that CBF gradually decreases with age while both CSFm and CC may vary. By age 40-50 CSFm and CC decrease by 10-15%. In this age group a slight decrease of cognitive brain function was observed, which correlate with decrease CSFm and CC values. After 50 CSFm and CC increase again. By age 70-85 CBF in MCA has decreased by about 25-30%, while CSFm and CC has increased up to 20-25% and 25-35%, respectively. In the elderly group, persons with the comparatively smallest increases of CSFm and CC correlated with significance of brain cognitive dysfunction. Conclusion. The peculiarities of age relations between CBF, CSFm and CC suggest that decreasing CBF, due to changing mechanical properties of cerebral vascular wall, is compensated by increases of cranial compliance and CSF mobility within the skull in order to support brain tissue metabolic supply. Decrease of CSFm and CC in elderly may be reason for cognitive dysfunction.

**PA6 055 CIRCULATING LEVELS OF IL-18 AND APOE GENOTYPE IN ALZHEIMER'S PATIENTS**

M. REALE\* (University , Chieti, Italy)

L. VELLUTO(1), C. IARLORI(1), V. BELLANTE(1), D. GAMBI(1) - (1) University (Chieti, Italy)

Introduction: Multiple genetic and environmental factors are likely to contribute to the development of Alzheimer's disease (AD). The most important known risk factor for AD is the presence of the E4 isoform of apolipoprotein E (apoE). Interleukin-18 (IL-18), a pro-inflammatory cytokine that plays an important role in the T-cell-helper type 1 response, is a new member of the family of cytokines produced in the brain and its involvement in ageing and in neurodegenerative brain diseases has also been highlighted recently. A number of studies associate Alzheimer's disease with APOE polymorphism and alleles which favour the increased expression of immunological mediators such as cytokines. Methods and Materials: 20 AD patients with clinical diagnosis of according to DMS IV-R and NINCDS-ADRDA (MMSE score > 18) and 10 not demented HC subjects (MMSE score ≥28), matched for sex and age were enrolled. Plasma levels of IL-18 were measured with commercially available ELISA kits. INNO-LiPA ApoE is used for the identification of apolipoprotein E genotypes epsilon2, epsilon3, and epsilon4 in blood samples. Results: We found that plasma concentrations of IL-18 were higher in AD patients versus healthy controls. In the AD group, both ApoE4 non-carriers and ApoE4 carriers exhibited higher IL-18 levels than HC group. When comparing ApoE4 carriers to non-carriers, in the AD group we find that ApoE4 carriers have higher plasma IL-18 levels than non-carriers Conclusions: Our study provides evidence supporting the hypothesis that AD disease is associated with an inflammatory response, and suggests an important role for IL-18 in the pathophysiology of AD. Further studies should be performed as they may add a valuable light to the complex mechanisms involving immune dysregulation and leading to the pathogenic pathways of AD.

**PA6 056 DOES HELICOBACTER PYLORI CHRONIC INFECTION PLAY A ROLE IN ALZHEIMER DEMENTIA OCCURRENCE ?**

N. SALLES\* (CHU Bordeaux, Pessac, France)

L. LUC(1), B. ALICE(2), J. ALEXANDRE(2), D. JEAN-FRANÇOIS(1), M. FRANCIS(2) - (1) INSERM U-593 (Bordeaux, France); (2) INSERM U-853 (Bordeaux, France)

Introduction: Principal cause of dependency, Alzheimer disease has an increasingly high impact on elderly population. Among the recent hypotheses, a potential relationship between H. pylori infection and dementia has been suggested via inflammatory, pro-oxidant and vitamin deficiency mechanisms. Objective: To study the relationship between H. pylori infection and risk of Alzheimer dementia. Patient-methods: A cohort of subjects older than 65 (PAQUID) has been followed since 1988 in south west of France. Socio-demographic status, co-morbidities, and complete cognitive assessment over the 17 years period of follow-up were collected. H. pylori infection was detected by serology (ELISA) and immunoblot at inclusion. Statistical analyses: descriptive, multivariate and survival analysis (Cox) were carried out. Results: A 6.5 years). H.<sub>total</sub> of 605 subjects were included (mean age 73.9 years). H. pylori infection was diagnosed in 391 (64.6%) subjects, and was significantly associated with age ( $p=0.02$ ), and with lower subject's socio economic level i.e., both lower education ( $p<0.0001$ ) and incomes ( $p<0.0001$ ). After adjustment for age and sex, hypertension was statistically associated with chronic H. pylori infection (RR 1.7; 95% CI, 1.1-2.6) ( $p=0.01$ ). During subject's follow-up (17 years), the incidence rate of dementia was 19.1%. After adjustment for age, gender, education, the presence of H. pylori

chronic infection was statistically associated with dementia (HR 1.7; 95% CI 1.1-2.7) ( $p=0.02$ ). The presence of vascular co morbidity did not modify the risk. Conclusion: These prospective results showed that H. pylori chronic infection may be a risk factor for Alzheimer disease, interventional study should be done to confirm this association.

**PA6 057 CAN 'BLUE-ENRICHED' OR CONTROL WHITE LIGHT INFLUENCE SLEEP, MOOD AND ALERTNESS IN OLDER PEOPLE?**

K. LEDERLE\* (University of Surrey, Guildford, United Kingdom)

B. MIDDLETON(1), T. SLETTEN(2), V. REVELL(1), D. SKENE(1) - (1) University of Surrey (Guildford, United Kingdom); (2) Monash University (Melbourne, Australia)

Sleep disturbances increase with age. Daytime light treatment may alleviate these by targeting the circadian system and non-visual processes which are most sensitive to blue light. The current study assessed the ability of 'blue-enriched' light (colour temperature 17000K) and control light (4000K) to influence sleep, mood and 60 years) with self-reported sleep/alertness in older people (problems (Pittsburgh Sleep Quality Index > 5). Fifteen healthy volunteers participated in an 11-week at-home study (randomised, cross-over design). Volunteers were exposed daily to the light condition (~ 400 lux) for 2 h in the morning and evening for 3 weeks followed by 2 weeks of washout. Participants completed daily sleep diaries, mood and alertness scales, the Karolinska Sleepiness Scale and continuously wore an activity/light monitor (Actiwatch-L). Weekly means were compared using RM one-way ANOVA with post-hoc Bonferroni comparison (data on n=12, 65.3 ± 4.0 years; 7F, 5M). Proc GLM was used to test for carry-over effects (t-test) and to compare light conditions (corrected for baseline). Compared to baseline control light significantly improved subjective sleep-efficiency, reduced sleep-latency and advanced subjective and actigraphic wake-up-time. During washout cheerfulness increased in the morning compared to the 3 weeks of control light; calmness improved in the morning and at lunchtime compared to the second week of control light. No carry-over effect was observed for any parameter. There were few statistically significant differences between the two light conditions. Control light was significantly better than 'blue-enriched' light improving actigraphic sleep efficiency and cheerfulness at lunchtime whereas 'blue-enriched' light significantly decreased sleepiness in the morning compared to control light. In conclusion, light treatment, particularly the control light, has some beneficial effects on sleep, mood and alertness in older people suffering from sleep problems.

**PA6 058 HELICOBACTER PYLORI CHRONIC INFECTION AND ALZHEIMER DEMENTIA: PRELIMINARY RESULTS.**

C. ROUBAUD-BAUDRON\* (INSERM U-853, Bordeaux, France)

K. PIERRE(1), M. FRANCIS(2), S. NATHALIE(2) - (1) 2Centre de Mémoire, de Ressource et de Recherche, Université Claude Bernard Lyon1 (Lyon, France); (2) INSERM-U-853 (Bordeaux, France)

Introduction: Actually, there is evidence that Helicobacter pylori (H. pylori) infection has a critical role in different extragastric diseases. Recent case control studies reported an association between H. pylori chronic infection and vascular or Alzheimer dementia. Chronic H. pylori infection, especially CagA strains, would induce an inflammatory cascade (production of pro-inflammatory and pro-oxidant substances), and chronic atrophic lesions (vitamin B12 deficiency and hyperhomocysteinemia). If the relation "H. pylori-Dementia" is proven, H. pylori infection, simple to diagnose and to treat, could be one of the tracks of dementia prevention. Methods: We studied serum and cerebrospinal fluid (CSF) of 75 patients with Alzheimer's disease in collaboration with Neurobiotec, Lyon. For each included patient we assessed: 1) Clinical data (vascular comorbidities, global cognitive assessment); 2) Biological data in serum (C-reactive protein level, B12 vitamin and homocysteine levels, Apolipoprotein E4, and cytokines (IL6, ), and biological data in CSF (cytokines, phospho-Tau<sub>200</sub>IL8, TNF protein, and amyloid beta peptide levels). ELISA and Immunoblot test (Cag A antibody) were used to diagnose H. pylori infection, either in the serum and CSF of all the included patients; 3) Brain MRI data. Statistical analyses were used to compare H. pylori-infected and non infected patients using SPSS 14.0 software. Results are actually in progress. Conclusion: This study will permit to better understand the link between chronic H. pylori infection and Alzheimer dementia.

**PA6 059 STRATEGIES TO REVERSE IRON- AND AGE-INDUCED RECOGNITION MEMORY DEFICITS: THE USE OF ROSUVASTATIN**

M. DE LIMA\* (Universidade Federal do Rio Grande do Sul, Porto Alegre, Brazil)

R. RECH(1), A. DORNELLES(1), V. GARCIA(1), G. VEDANA(1), L. ALCALDE(1), N. SCHRODER(1) - (1) Pontifícia Universidade Federal do Rio Grande do Sul (Porto Alegre, Brazil)

Introduction: Increased levels of iron have been reported in several neurodegenerative disorders, such as Parkinson's and Alzheimer's diseases, as well as in normal brain aging. Previous studies of our research group have demonstrated that neonatal iron loading induces cognitive deficits in the adulthood (3 months old). Here, we evaluate the effects of neonatal iron treatment on cognition in aged rats (24 months old). Since statins are beginning to show benefits in a wide range of neurologic conditions, we also evaluate the effects of Rosuvastatin on iron- and age-induced memory deficits. Methods and materials: Male Wistar rats received vehicle or 10.0 mg/kg Fe+2/kg orally at postnatal days 12 to 14.

When the animals were 23 months old, they received daily injections of saline or Rosuvastatin (0.2 or 2.0 mg/kg/intraperitoneally) for 21 days. 24h after the last injection, they were trained in a novel object recognition task. Test sessions were applied at 1.5h (Short-term Memory) and 24h after training (Long-term Memory). Results: The Vehicle-Saline group showed long-term recognition memory deficits. The Iron-Saline group showed impaired recognition memory at both short- and long-term memory tests. Vehicle-Rosuvastatin and Iron-Rosuvastatin groups showed an improvement in recognition memory. Conclusion: Aged rats naturally present recognition memory deficits. However, aged animals that received iron in the neonatal period presented more severe memory deficits, suggesting that iron potentiates age-associated memory impairments. Interestingly, the groups that received Rosuvastatin at the old age, presented a better performance in the task, indicating that Rosuvastatin was able to improve recognition memory deficits induced by aging or iron loading. The present findings give support for the use of statins as neuroprotective agents against age-associated neurological and cognitive deficits.

**PA6 060** CHANGE IN H-P-A ACTIVITY IN RATS CAUSED BY OXIDATIVE STRESS DURING AGING, AND ITS PREVENTION BY VITAMIN E  
S. URANO\* (Shibaura Institute of Technology, Saitama-city, Japan)  
T. TAKAHASHI(1), N. KOBAYASHI(1) - (1) Shibaura Institute of Technology (Saitama-city, Japan)

Change in H-P-A Activity in Rats Caused by Oxidative Stress during Aging, and Its Prevention by Vitamin E Shiro Urano, Takeyuki Takahashi, Naoko Kobayashi Shibaura Institute of Technology, Aging & Health Science Research Center, Saitama, Japan [Introduction] To determine whether oxidative stress during aging involves dysfunction of hypothalamic-pituitary-adrenal (HPA) axis in association with the emergence of cognitive deficit. [Method and Results] When young rats were subjected to hyperoxia as an oxidative stress, thiobarbituric acid reactive substances (TBARS), conjugated diene and lipid hydroperoxides (LOOH) in the hypothalamic, pituitary and adrenal were markedly increased, respectively. Vitamin E inhibited such an increase in lipid peroxides in each organ. Either the level of corticotrophin releasing hormone (CRH) in the hypothalamus or plasma level of adrenocorticotrophic hormone (ACTH) and corticosterone in young rats markedly elevated by hyperoxia. In contrast, young rats fed vitamin E-supplemented diet showed no abnormal hormone secretion even after subjected to hyperoxia. Furthermore, glucocorticosteroid receptors (GR) in pyramidal cells at the CA1 region of the hippocampus in the young rats were markedly decreased by the oxidative stress. Similar phenomena were also observed in the normal aged rats and young rats fed vitamin E-deficient diet kept in ordinary atmosphere. The vitamin E-supplementation prevented the decrease in GR in the hippocampus caused by hyperoxia. [Conclusion] These results suggest that oxidative stress induces oxidative damages in hippocampus and the H-P-A axis during aging followed by pyramidal cell apoptosis, resulting in a cognitive deficit in rats, and that negative-feedback inhibition on HPA activity was markedly dampened due to an increase in a plasma corticosterone level caused by a loss of GR.

**PA6 061** ANTI-LIPOLYtic EFFECT OF eNOS DERIVED FROM ADIPOCYTES ACT THROUGH PROTEIN S-NITROSYLATION, ASSOCIATED WITH REGULATION OF FATTY LIVER.  
Y. YAMADA\* (Department of Geriatric Medicine, Graduate School of Medicine, The University of Tokyo, Tokyo, Japan)  
M. ETO(1), Y. ITO(1), S. MÖCHIZUKI(1), H. OTA(1), S. OGAWA(1), K. IIJIMA(1), K. KOZAKI(2), K. TOBA(2), M. AKISHITA(1), Y. OUCHI(1) - (1) Department of Geriatric Medicine, Graduate School of Medicine, The University of Tokyo (Tokyo, Japan); (2) Geriatric medecine, Graduate School of Medicine, The University of Kyorin (Tokyo, Japan)

Introduction: Obesity/Metabolic syndrome (MetS) is a most important evolving risk factor for cardiovascular disease such as the major cause of elderly death. We investigate the role of eNOS on lipolysis and the relationship between fatty liver, which causes insulin resistance due to metabolic syndrome. Methods and Results: At 3T3L1 preadipocyte, eNOS were dramatically upregulated during the differentiation. eNOS inhibition (L-NIO and siRNA) significantly augmented lipolysis (270% and 400%, P<0.01). N-ethylmaleimide or auranofin significantly inhibited the effect of NOS inhibitor and reduced lipolysis (12% and 2%, P<0.01). To investigate these effects in vivo, C57BL/6 mouse were assigned to three groups (each n=8). The control group (CG) received normal chow (12 weeks), the obesity group (OG) received high fat diet (HFD) (12 weeks), and the dietetic treatment group (DTG) received HFD (8 weeks) and then normal chow (4 weeks). After 16 weeks, OG gain weight, increased in total fat mass and in fatty liver change significantly than CG, whereas DTG had no significant change. Interestingly, eNOS expression in epididymal fat tissue were decreased in OG compared with CG, whereas significantly recovered in DTG. Changes of Intracellular liver TG (degree for fatty liver) were similar to eNOS expression, OG was higher than CG, whereas DTG had recovered (300%, P<0.01; 14%, P<0.01). Conclusion: eNOS in adipocytes plays anti-lipolytic action through protein S-nitrosylation. Obesity increase fatty liver through potentiating lipolysis due to the reduction of eNOS expression, however, it is recovered by dietetic treatment. Activation of eNOS in adipocytes might be a new therapeutic strategy for MetS and cardiovascular disease.

## Track B – Health Sciences and Geriatric Medicine

### PB6 062 NUTRITIONAL STATUS IN ELDERLY INPATIENTS WITH MILD COGNITIVE IMPAIRMENT

G. ORSITTO\* (Ospedale , Gioia del Colle, Italy)  
F. FULVIO(1), D. TRIA(1), V. TURI(1), A. VENEZIA(1), C. MANCA(1) - (1) ASL Bari (Gioia del Colle, Italy)

Introduction. Malnutrition is prevalent in hospitalized elderly people in which leads to complications, increases mortality and is associated with dementia. However, it's still unclear the association between malnutrition and preclinical phase of dementia, particularly mild cognitive impairment (MCI), in the elderly. This study aimed to compare the prevalence of malnutrition in elderly inpatients with MCI, dementia (D) and without cognitive impairment (C). Methods and materials. All patients consecutively admitted to Geriatric Unit of "Paradiso" Hospital, Gioia del Colle, ASL Bari, between May 2007-08, underwent the comprehensive geriatric assessment to evaluate medical, cognitive, affective and social aspects. Mini Nutritional Assessment (MNA) was used to classify subjects as well-nourished (score=24-30), at risk for malnutrition (score=17-23.5), or malnourished (score <17). Diagnosis of MCI was made according to the Petersen criteria, diagnoses of dementia according to NINCDS-ADRDA, NINDS-AIREN and DSM-IV. Results. 623 patients (males=267, females=356, mean age=76.3±7.0 years, range=65-101 years) with diagnoses of MCI=71, D=94 or C=458 were enrolled. The average MNA scores were indicative of risk for malnutrition, with significantly lower MNA scores in patients with cognitive impairment (MCI=20.0±4.4, D=18.5±4.1, C=22.4±3.8; p<0.004). Dividing patients according to the nutritional status assessed by MNA, 17% was well-nourished, 58% at risk for malnutrition, 25% malnourished. MCI patients had significantly lower frequency of well-nourished (MCI=10% vs C=22%; p=0.03) and higher frequency of malnourished (MCI=47% vs C=19%; p<0.0001) than C. No differences in nutritional status were found among patients with MCI and dementia. Conclusions: Malnutrition is prevalent in hospitalized elderly patients. Nutritional status is even poorer in patients with MCI and dementia.

### PB6 063 AMINOFF SUFFERING SYNDROME (ASS) A NEW PATHOLOGICAL ENTITY IN END-STAGE DEMENTIA

B. AMINOFF\* (Sheba Medical Center, Tel-Hashomer and Human Suffering and Satisfaction Research Center, El-Ad, Ramat Gan, Israel)

Introduction: There is insufficient clinical evidence for suffering in dying dementia patients and key criterions of irreversible medical condition, which may lead to inappropriate evaluation and insufficient palliative treatment. Purpose of study is to evaluate the suffering syndrome of terminal dementia patients (MMSE=0/30, FIM=18/126) over time, from admission to a geriatric ward and on during six months follow up. Methods and materials: A prospective study of consecutive end-stage dementia patients, admitted to a general geriatric department of a tertiary hospital. Patients were evaluated weekly by the Mini Suffering State Examination scale (MSSE) which developed by us. Results: Two hundreds patients have been studied. During six months follow up survived 88 (44%) and died 112 (56%) of end stage dementia (ESD) patients whom admitted to geriatric department. The MSSE scale score of six months survived ESD patients was low with MSSE=3.41±2.02 at day of admission and decreased during six months follow up to MSSE=2.77±1.90, P=0.003. In contrary, the MSSE scale score of died ESD patients was high with MSSE=4.97±2.46 at day of admission to geriatric department and increased until last day of life until MSSE=5.93±2.39, with significant difference P < 0.0001. Conclusion: Our proposal Aminoff suffering syndrome in terminal dementia is the new pathological and geriatric symptomatology and entity which characterized by high MSSE scale score, irreversible and intractable aggravation of suffering and medical condition until death and less than six months survival. Aminoff suffering syndrome could be key criterion for enrolling ESD patients for palliative treatment. New alternative setting approaches as Relief of Suffering Units should be developed for end stage and dying dementia patients being in Aminoff suffering syndrome.

### PB6 064 MINI-SUFFERING STATE EXAMINATION: POSSIBLE KEY CRITERION FOR 6 MONTHS SURVIVAL AND MORTALITY IN END-STAGE DEMENTIA

B. AMINOFF\* (Sheba Medical Center, Tel-Hashomer and Human Suffering and Satisfaction Research Center, El-Ad, Ramat Gan, Israel)

Introduction: Six months of survival as a key criterion is extremely important for decision-making for enrolling critically ill patients to palliative settings. Methods and materials: Prospective cohort study with 6 months of follow-up during a 24-month period performed in Division of Geriatric Medicine in a tertiary general hospital. One-hundred and three consecutively admitted bedridden patients with end-stage dementia were evaluated. Patients were evaluated weekly by the Mini Suffering State Examination scale (MSSE) which developed by us and presented in world and regional congresses in Berlin (1999), Jerusalem (2000), Vancouver (2001), Stockholm (2002), Tokyo (2003), Las-Vegas (2004),

Rio-de-Janeiro (2005), Madrid (2006), Saint-Petersburg (2007), Trondheim (2008), the Committee for Labor, Social Services and Health of the Israeli Knesset (2005) and published in Journals Archives of Gerontology and Geriatrics (2004, 38, 2, 123-130), Age and Ageing (2006, 35, 6, 597-601) and our book – Measurement of Suffering in end-stage Alzheimer's Disease, Dyonon, Tel-Aviv, 2007. Interrelations between Mini-Suffering State Examination score at admission and six month's survival and mortality were evaluated. Results: A significant difference was proved among survival curves of subgroups of patients according to the mini scores (0-3, 4-6, 7-10). Survival was shorter and mortality higher in patients with a high Mini-Suffering State Examination score, as shown by the Kaplan-Meier method using the Log Rank ( $p=0.001$ ) and Breslow tests ( $p=0.001$ ). Conclusion: The Mini-Suffering State Examination scale is useful for predicting the last 6 months of survival and mortality of end-stage dementia patients.

**PB6 065** DIAGNOSTIC OF ALZHEIMER DISEASE IN QUÉBEC. EVALUATION OF PRACTICE PROFIL OF MEDICAL SPECIALISTS  
G. LACOMBE\* (Institut université de gériatrie de Sherbrooke, Sherbrooke, Canada)

Abstract not received

**PB6 066** ASSESSING THE RELATIONSHIP BETWEEN HEALTH UTILITIES, QUALITY OF LIFE, AND HEALTH CARE COSTS IN ALZHEIMER'S DISEASE  
E. MILLER\* (Brown University, Providence, United States)  
L. SCHNEIDER(1), R. ROSENHECK(2) - (1) Keck School of Medicine, University of Southern California (Los Angeles, United States of America); (2) NEPEC, VA Connecticut Health Care System (West Haven, United States of America)

Introduction To examine the relationship between multiple measures of health care costs and health utilities, quality of life, and other factors in Alzheimers Disease (AD). Methods Data were obtained from caregiver proxy raters at baseline and 3- 6- and 9-months post-random assignment concerning 421 AD patients, living with at least one caregiver in a non-institutional setting, who participated in the CATIE-AD trial of antipsychotic medication in the U.S. Spearman rank correlations and mixed models (using logged costs) were used to examine the correlates of service use. Correlates include the AD-Related Quality of Life Scale (ADRQoL), Health Utilities Index (HUI)-III, Neuropsychiatric Inventory, Mini Mental Status Examination, and AD-Cooperative Study Activities of Daily Living Scale. Results Total monthly health care costs averaged \$1,204.51 during the study period, ranging from \$0.0 to highs exceeding \$73,000.00 per month. Average monthly costs for specific services were: \$494.39, inpatient hospital; \$200.71, nursing home; \$58.81, residential care; \$753.91, total institutional; \$242.53, outpatient; and \$208.08, ancillary drugs. On average, total costs tended to be lower for female patients ( $\beta=-.325$ ) with better physical functioning ( $\beta=-.017$ ) and higher HUI-III scores ( $\beta=-.820$ ) and higher for less cognitively impaired individuals ( $\beta=.037$ ) with better qualities of life ( $\beta=.021$ ). Whereas older patients tended have higher outpatient costs ( $\beta=.025$ ), those with better physical functioning tended to have lower institutional costs ( $\beta=-.019$ ). Higher HUI-III scores were inversely related to both outpatient and institutional expenditures ( $\beta=-.692$ ,  $\beta=-.970$ ). Female patients tended to have lower ancillary drug costs ( $\beta=-.427$ ); those with greater psychiatric symptoms ( $\beta=.016$ ) and better qualities of life ( $\beta=.017$ ) higher drug costs. Conclusion Findings suggest that the HUI-III could be combined with other known correlates of costs to inform resource allocation decisions associated with AD.

**PB6 067** GERIATRICS D REFUSAL PHENOMENON WITH END STAGE DEMENTIA PATIENTS  
B. AMINOFF\* (Sheba Medical Center, Tel-Hashomer and Human Suffering and Satisfaction Research Center, El-Ad, Ramat Gan, Israel)

In memory to Geriatrics D department which refused and closed due to failure coping with suffering of end stage and dying dementia patients, caregiver staff, and family members. The "Geriatrics D Refusal phenomenon" of end stage dementia (ESD) patients has never been described in medical literature. Refusal phenomenon is entirely clear-cut different from the well-known "burn out syndrome", and it is separate and independent part of abuse and neglect of elderly patients. In the Geriatrics D Refusal phenomenon every effort is made in order not to admit ESD patients and there are numerous techniques are employed of getting rid these patients from the department. In the Geriatrics D Refusal phenomenon, both sides –the Health Insurance Funds and caregiver hospital staff reject the importance of the challenge to provide appropriate care to ESD patients. The refusal phenomenon of ESD patients by health services is one of main causes of suffering of in end stage dementia. We developed novel objective tool for measuring suffering in ESD Mini Suffering Examination (MSSE) which was published in our book – Measurement of Suffering in end-stage Alzheimer's disease, Dyonon, Tel-Aviv, 2007. The results of our research regarding of measuring suffering of dying dementia patients: was proven that MSSE score on the day of admission was  $5.62 \pm 2.31$ , and increased to  $6.89 \pm 1.95$  at the last day of life ( $P < 0.0001$ ). According to MSSE scale, 63.4% of patients died with high level of suffering, respectively. Only one respond for these disturbed results was closing of

geriatric department in which developed MSSE scale and provided objective experimental suffering measuring of ESD patients.

**PB6 068** RISK FACTORS AND RESILIENCE: HEALTH OUTCOMES IN FAMILY CAREGIVERS OF PEOPLE WITH DEMENTIA  
P. SHUTER\* (Queensland University of Technology, Brisbane, Australia)  
H. EDWARDS(1), S. SACRE(1) - (1) Queensland University of Technology (Brisbane, Australia)

Introduction Recent research has identified a range of factors that contribute to the risk of family caregivers of people with dementia developing complicated grief, which has in turn been associated with a range of negative health consequences. The aim of the research project represented in this paper was to determine the predictors of complicated grief and its correlation with health outcomes in this group, and to examine the role of resilience. Methods and materials The first study in this project was a scoping study which incorporated semi-structured interviews with older family caregivers of people with severe dementia or whose relative with dementia had died in the last year. Results of these interviews informed data collection for the second, larger quantitative follow up study of health outcomes in a cohort of family caregivers following bereavement. Results This paper reports on preliminary findings of these two studies which indicate that the issues demonstrating the most impact on family caregivers of people with dementia are not those directly related to day to day care giving tasks. Issues that indicated a greater impact were: characteristics of the caregiver and care recipient, quality of the relationship, death sequelae, encounters with formal care providers - particularly those related to palliative care, and ambiguous loss and disenfranchised grief. Significant issues that also appeared, in varying combinations, to impact on ability of caregivers to move on following bereavement included role appraisal, attitude to the role, support networks and spiritual faith. Conclusion This study highlights the complexity of issues associated with care giving for a person with dementia. Focus on these issues presents the opportunity for further research to identify timely and effective interventions for this group that potentially reduce aged care costs by addressing health risks in caregivers and delaying care facility placement of their relative with dementia.

**PB6 069** MILD DEMENTIA AND OUTCOMES OF GETTING LOST WHILE DRIVING  
L. HUNT\* (Pacific University, Hillsboro, United States)  
A. BROWN(1) - (1) Pacific University (Hillsboro, United States of America)

Introduction: Research on driving and dementia reports that drivers who have early Alzheimer disease (AD) may continue to drive for extended periods of time as long as their driving is evaluated or monitored. It is known that the earliest symptoms of AD include loss of recent memory and the inability to recognize familiar environments. AD patients may become disoriented in unfamiliar environments and later have difficulty finding their way in familiar environments. Functionally, this means that drivers start out driving and forget where they intended to go, do not recognize or attend to their own familiar neighborhood streets and landmarks, and consequently become lost. Demented drivers may ask for directions to return home. Yet, they cannot remember information provided and continue to drive becoming more confused and disoriented. Getting lost may result in death or injury. Methods: The data for this study was found through an extensive Internet search for all incidents published in newspapers in which an older adult diagnosed with dementia or Alzheimer disease became lost while driving. To find all relevant data three main strategies were used including exploring Internet search engines, missing person's databases, and publication databases. Multiple combinations of the following search terms were used: dementia, Alzheimer, missing, lost, found, driving, drive, drove, car and truck. Results: We examined 207 reports of lost demented drivers over ten years. One hundred and fifteen were found alive, 35 injured; 29 were found dead; and 63 were not found. Miles driven and days missing were also reported. Conclusion: The tragedies cited in the sample of newspaper articles told stories showing that the effects of dementia on driving navigation need more exploration. The cognitive load of being lost may contribute to accidents.

**PB6 070** SOCIAL INEQUALITIES AND CORRELATES OF COGNITIVE DISABILITY IN THE ELDERLY  
S. BELBRAOUET\* (Université De Moncton, Moncton, Canada)  
J. RAVAUD(1), N. CHAU(2), L. GROUP(2) - (1) INSERM, U750, CERMES, IFR25-IFRH (Villejuif, France); (2) INSERM, U669 (Paris, France)

Introduction: This study assessed social inequalities in cognitive disability and the role of lifestyle factors in mediating those disparities. 60 years), randomly selected $\geq$ Methods and materials: 1,697 subjects (from the Lorraine population completed a postal questionnaire including socio-demographic characteristics, height, weight, socio-occupational category, diseases, smoking, alcohol abuse, perceived income, and cognitive disability. Data were analyzed using the logistic model. Results: Cognitive disability was common (46.6%) and there were strong social inequalities: odds ratio adjusted for age and sex, vs. upper professionals, was: 1.29 (95%CI 0.71-2.36) for intermediate professionals, 1.75 (1.12-2.74) for manual workers, 1.70 (1.08-2.70) for employees, 2.94 (1.71-5.09) for farmers, 1.50

(0.86-2.60) for craftsmen/tradesmen, 2.44 (1.40-4.25) for housewives who never worked, and 1.47 (0.93-2.31) for other/unknown professionals. Among the covariates studied those with significant adjusted odds ratios were: women (1.34, 1.07-1.68), aged 70-79 (1.21, 0.98-1.51) and aged 80+ (1.71, 1.22-2.39) vs. aged 60-69, primary education (1.43, 1.15-1.77), alcohol abuse (2.44, 1.54-3.86), musculoskeletal disorders (1.22, 0.98-1.53), and other diseases (1.52, 1.23-1.87). Conclusion: Disparities in cognitive disability mainly concern manual workers, employees, farmers and housewives. Lifestyle factors do play a role in explaining those disparities.

**PB6 071 ACTIVITY PARTICIPATION IN RESIDENTS WITH DEMENTIA: ANALYSIS OF RESIDENT ANALYSIS INSTRUMENT (RAI) DATA**  
P. WIELANDT\* (University of Alberta, Edmonton, Canada)

**Introduction** The benefits of engaging in activity programs for long-term care residents with dementia are well documented. Indeed many researchers have shown that activity participation can positively influence residents' quality of life, reduce behavioral symptoms and increase self-esteem. Despite this, numerous studies have reported that long-term care residents often spend most of their day alone, engaged in more passive activities and are often rather bored. The RAI data which is widely used in North America collects various information including resident's functional limitations (range of movement and voluntary movement), the use of mobility equipment (mobility methods) and activity participation (average time spent in activities, preferred activity context and activity types. Currently some long-term care facilities in Canada are investigating methods to increase activity levels in residents and are considering using RAI data to inform their decisions. This paper will report on a study which used RAI data to determine whether there was an association between resident's functional abilities, their use of mobility equipment and time spent participating in activity. **Methods and Materials** Anonymized RAI data collected April to June 2007 were analyzed using SPSS (version 14.0) to provide a profile of long-term care residents' functional limitations and activity participation levels. **Results** Findings were consistent with those found in the current literature with the majority of residents spending less than one third of their time engaged in purposeful activity. Anomalies in recorded RAI data regarding residents' functional status and their involvement in activity programs provided were also noted. **Conclusions** Whilst the RAI is useful in collecting data improvements are recommended to ensure that more in depth and meaningful information is collected surrounding residents' functional abilities and activity participation.

**PB6 072 THE RELATIONSHIP BETWEEN MILD COGNITIVE IMPAIRMENT (MCI) AND FUNCTIONAL CAPACITIES**  
S. PAKZAD\* (Université de Moncton, Moncton, Canada)  
P. BOURQUE(1), M. RICHARD(1), D. COLLETTE(1) - (1) Univ. de Moncton (Moncton, Canada)

Mild cognitive impairment (MCI) is generally referred to as a transition stage between normal cognitive performance and dementia in the classification of cognitive function in clinical research. MCI subjects still maintain their capacity to complete everyday activities in a normal manner or may show mild functional incapacities. However the use of functional activities as a means to distinguish MCI subjects from those affected by dementia remains ambiguous in the research literature. The purpose of this study is to evaluate the degree of functional incapacity in MCI subjects by examining the evolution of the MCI subjects' cognitive capacities over time as well as the relationship between cognitive difficulties and functional capacity. Sixty-three subjects participated in the first assessment. Among them, 19 were diagnosed with MCI, 21 with Alzheimer's disease and 23 were in the control group. The Activities of Daily Living (ADL) scale and the Mini Mental State Examination (MMSE) were used to assess cognitive functions. The functional capacity of MCI subjects was compared to Alzheimer's subjects and to a control group. Among the MCI subjects assessed during the first evaluation, 16 of them were re-assessed six months later in order to verify the evolution of their cognitive functions and their functional capacity. Among those, 5 had developed a form of dementia six months later. The results from this study show that MCI subjects suffered a significant loss in their functional capacity in contrast to the control group. The results are discussed.

**PB6 073 THE MEASUREMENT OF THE RECOGNITION OF FACIAL EXPRESSION OF EMOTIONS IN THE ALZHEIMER'S DEMENTIA**  
P. GRANATO\* (Centre Hospitalier de Valenciennes, Valenciennes, France)  
O. GODEFROY(1), S. VINAKAR(2), M. BOUCART(3), R. BRUYER(4) - (1) CHU Amiens, Neurologie (Amiens, France); (2) Psycho-geriatric (USA); (3) CNRS-UMR 8160 (Lille, France); (4) Unité de neurosciences (Louvain, Belgium)

**Background:** The existence of a deficit of the visual recognition of the facial emotions (DVRFE) in the Dementia of the Alzheimer's type is a known fact. However, the quantification of such deficit is not possible. **Objectives and methods:** To measure a (DVRFE) in the Alzheimer's Dementia (AD) a beginning is made using Method of Analysis and Research of the Integration of the Emotions (MARIE). This tool (MARIE) is based on a continuum of chimerical images created starting from two real images and their mixture in variable proportions. This continuum is a series of images of facial emotional expressions. The subject makes a binary choice. The material comprises 9 series of 19 images each. Participants: 12 AD subjects (H/F = 7/5; age 68±3 years; educational

level; MMSE: 26±2.4; MATTIS: 130±10; Picture Naming = 33±4; Grober and Buschke; and 12 paired healthy subjects (HS) (H/F = 7/5; age 66±6; schooling = 7/4/1; MMSE: 30; MATTIS: 144; Picture Naming = 80; Grober and Buschke). **Results:** Recognition of the emotion by the HS and AD subjects for each emotional series. The visual recognition of the facial emotions is already impaired at an early stage of the disease. AD subjects would be definitely less sensitive to the emotions as manifested by increase in the threshold for identification. The average differential is 16% of answers. The disorder of the recognition of the emotions seems related to the severity of the verbal episodic memory as well as the decline of total intellectual efficiency (cognitive impairment). **Conclusion:** The concurrent measurement of the MATTIS, the verbal episodic memory and the visual recognition of the facial emotions could clinch early positive diagnosis of AD in private clinics at the very onset of Dementia of the Alzheimer's type.

**PB6 074 COMPARISON OF MOTOR PERFORMANCE IN UPPER AND LOWER EXTREMITIES UNDER DUAL-TASK FOR PATIENTS WITH MILD ALZHEIMER DISEASE**

W. ALICE M K\* (Chang Gung Memorial Hospital., Taoyuan, Taiwan)  
A. WONG(1), T. FU(1), C. WU(1), C. HUANG(2), M. CHIOU(2), H. FUNG(2) - (1) Chang Gung University (Taoyuan, Taiwan); (2) Chang Gung Memorial Hospital (Taoyuan, Taiwan)

**Background/Aims:** Alzheimer disease (AD) is a progressive disease that threatens the elderly worldwide in self care. Early diagnosis and early treatment are the key for a better quality of life in AD population. People with dementia are noted not only have memory and cognitive dysfunction, movement and executive disorder are also found. In this study we examine the motor performance of patients with mild AD patients in order to establish an effective diagnostic device for the early stage of AD. **Methods:** The motor performance of both mild AD patients (n=10) and normal (n=10) counterpart were analyzed with the gait analysis device (Vicon MX system) and trail making test. **Results:** We found that backward counting with 3 digits during gait performance in mild AD patients revealed remarkable difference in velocity, cadence, coefficient of variation of stride length and stride time than control group, but not in forward counting with 3 digits test. For upper extremity performance, all trail making tests were very sensitive to detect the difference of reaction time between mild AD group to control group. **Conclusion:** Dual tasks of gait and trail making test performance revealed obvious impairment of executive motor function in very mild AD patients. These inexpensive and portable testing devices could be used as an adjuvant diagnostic tool for early AD.

**PB6 075 STRATEGY STIMULATION OF MEMORY: WORKSHOPS FOR GAMES AND GAMES FOR THE ELDERLY DIAGNOSED WITH LEARNING AMENDMENT TAKE THE JOINT HEALTH UNIT OF WANSBECK-FEDERAL DISTRICT**

N. MOREIRA MATOS\* (Unidade Mista de Saude de Taguatinga, Samambaia Norte, Brazil)  
L. SAMARA RAMALHO DOS SANTOS FIGUEIREDO, S. MONTEIRO SILVA

The aging of the population is a world-wide phenomenon, one of the main consequences of the growth of this segment is the increase of the prevalence of disorders related to the cognition. The memory is one of the most important cognitives functions of the man, however in this phase the frequent complaints and the mnemonic deficit are common, being able to generate Light Cognitivo Upheaval decurrent of the physiological processes of the normal aging or a period of training of transition for the dementias. In this study it had the participation of 16 aged ones with diagnosis of Light Cognitivo Upheaval, with superior age the 60 years and superior or equal frequency 50% during the meeting. The research was composed for ten workshops of games and tricks of stimulation of memory objectifying to compare the mnemonic performance, to know the socio-economic-demographic profile of the integrant ones and to appraise the perception of the aged ones on its memory. It is a search social of quasi-qualitative base with the method search action. The appraise of the participants was carried through the half-structuralized script of interview and specific tests of cognition applied before and after the workshops, as: Mini-Mental State Examination (MEEM), Clock Drawing Test (TDR), Memory of Words (original instrument) adapted for Memory of Figures and Verbal Fluency. The results had disclosed that in the group the majority was of the feminine sex with average age of 68 years, married, inactive professionally and with low degree of scholar. The mnemonic performance was observed positively in the Test of Memory of Figures and Verbal Fluency, however in TDR and MEEM it showed unchanged after the interventions, except in the sub-item of the MEEM, attention and calculation where it detected a expressive improvement.

**PB6 076 TO BE (AT HOME) OR NOT TO BE: AN EXAMINATION OF THE MEANINGS, DECISION MAKING PROCESSES, AND EXPERIENCES OF PERSONS WITH DEMENTIA AT THE POINT OF RELOCATION TO A RESIDENTIAL CARE FACILITY**

F. AMINZADEH\* (The Ottawa Hospital, Ottawa, Canada)  
W. DALZIEL(1), F. MOLNAR(2), L. GARCIA(3), M. EISNER(4) - (1) Regional Geriatric Program of Eastern Ontario (Canada); (2) Elisabeth Bruyere Research Institute (Canada); (3) University of Ottawa (Canada); (4) Alzheimer Society of Ottawa (Canada)

**Objectives:** This study explored the perspectives of persons with dementia (PWD) on the meanings and experiences associated with relocation to a residential care facility (RCF).

**Methods:** A qualitative design was employed, which involved in-depth interviews with 16 PWD at their homes within two months prior to relocation. The work of Strauss and Corbin (1998) guided the analysis process. **Results:** At the time of relocation, living at home had become a paradoxical experience for most participants. On the one hand, they had profound, multifaceted and interrelated attachments to their homes (which encapsulated a sense of comfort, choice, control, connection, competence, constancy and continuity). On the other hand, with the progressive decline in their functional competence and other changes in their life circumstances, living at home had increasingly become a source of distress, confinement, isolation, dependency, and intrusion. Participants viewed relocation to a RCF as a major residential change and life transition requiring significant adaptive efforts. Despite individual variations, for most participants, relocation to a RCF: a) symbolized the end of an era and a long established way of life; b) signaled the inevitable downward trajectory of old age, c) meant living a more protected, dependent, structured, and communal lifestyle in a place that is associated with "hospitality" and "rest", and d) presented a life course challenge that could be dealt with by drawing on one's sense of identity as a "survivor". Two key processes ("agency" and "exploration") and three perceptions ("legitimation", "temporality", and "desirability") seem to shape main patterns of response to the relocation decision. **Conclusion:** The findings raise awareness of the subjective meanings of residential transitions in the experience of aging with dementia, and inform supportive interventions to optimize housing decisions for PWD in order to promote successful adaptation to their new living environments.

**PB6 077 HUNTINGTON'S DISEASE: REPORT OF FOUR CASES AMONG BROTHERS**

T. BRUM\* (Hospital São José do Avaí, Itaperuna, Brazil)

A. BRUM(1), L. COSTA(1), V. LOPES (1), M. BARROS(1), D. SUETH(1), M. VIEIRA(1), O. FAVORETO(1) - (1) Hospital São José do Avaí (Itaperuna, Brazil)

**INTRODUCTION:** Huntington's chorea, described by George Huntington in 1872, with an incidence of 5 to 10 cases per 100,000 habitants, is a degenerative, progressive disorder of the nervous system with a dominant autosomic heritage of complete penetration. There are no data in Brazil about its real prevalence or incidence. **MATERIAL AND METHODS:** Case report. **OBJECTIVE:** To describe the presence of this disease in 4 members of a family constituted of 7 brothers. **RESULTS:** ECS, male, 54 years old, married, black, retired driver, graduated, came to the outpatient visit with his wife, referring an episode of convulsive crisis for 6 years, when he started with an anticonvulsant therapy. He also reported a recent memory deficit and humoral liability. His wife confirmed the complaints and informed that the patient has shown choreiform movements of the face and upper members for 5 years. During the physical exam, no changes in the cardiorespiratory, respiratory and abdominal systems were noted. The patient was showing autopsychic orientation preserved, temporal disorientation, gait ataxia, dysmetria, dysdiadochokinesia, upper elastic hypertonia of the upper and lower members, patellar hiperreflexia, presence of choreiform movements of the face and members (especially in the upper members), with power and sensitiveness preserved in the four segments. MEEM 14/30 8-points verbal fluency test, concrete thoughts. A very important fact in his familiar history is the presence of Huntington's disease in 3 brothers with a confirmed molecular diagnosis. The CT of the brain showed right temporal atrophy, the brain perfusion SPECT showed perfusion changes in the ganglion of the compatible base with HD and brain-vascular pathology and molecular diagnosis showed repetitions 29/41. **CONCLUSION:** Considered the most common hereditary neurovegetative disease and with a progressive evolution, it is very important to optimize the diagnosis, conduct and genetic of the patients.

**PB6 078 CASE STUDIES FROM THE FIELD TO INFORM THE PRODUCTION OF AN EDUCATIONAL RESOURCE FOR TERTIARY STUDENTS ON DEMENTIA CARE**

B. WALTER\* (Flinders University Adelaide Australia, Adelaide, Australia)

A. DE BELLIS(1), S. BRADLEY(1), A. WOTHERSPOON(1), P. GUERIN(1), J. PATERSON(1), M. CECCHIN(2) - (1) Flinders University Adelaide Australia (Bedford Park, Australia); (2) South Australian & Northern Territory Dementia Training Study Centre (Glenside, Australia)

**Introduction:** Undergraduate healthcare students often lack knowledge and experience of how to interact with a person with dementia. An educational resource was created utilising case studies from healthcare professionals with experience of people with dementia. The resulting filmed case scenarios and accompanying workbook illustrate the theory of person-centred care for undergraduate healthcare students across multiple healthcare disciplines. **Methods and Materials:** Literature about the application of person-centred care was reviewed. Ethical approval was gained and an interdisciplinary advisory group, consisting of healthcare professionals with experience of people with dementia, acted as a focus group and provided case studies of their experiences. This group met bi-monthly to advise, monitor and develop the educational resource. A total of 35 case studies were produced by 18 healthcare professionals from 14 disciplines across 15 organisations. These scenarios were analysed for themes, then scripted and re-enacted as short docu-dramas for a DVD that interrelated with the workbook. **Results:** The case studies were analysed thematically into five behavioural categories: aggression/violence, absconding/repetitive behaviour; negotiation/transportation; resisting/concerning behaviours; and,

food/language/understanding. Each theme was scripted and re-enacted into five case scenarios to demonstrate interactions between healthcare professionals and a person with dementia. Positive person-centred care, as well as malignant psychosocial interactions that can cause deterioration in the wellbeing of a person with dementia, were illustrated. The theoretical underpinning in the workbook correlated with the DVD and reflection exercises for students. **Conclusion:** This educational resource interrelated knowledge of the theory of person-centred care with real life case studies provided by healthcare professionals. It provided students with strategies on how to interact positively with people with dementia to maintain their dignity and personhood. Evaluation by academic key personnel and student cohorts across healthcare disciplines was undertaken before online conversion.

**PB6 079 DOES DEMENTIA CARE MAPPING ADEQUATELY CAPTURE SUBJECTIVE REPORTED PATIENT EXPERIENCE IN HOSPITAL?**

R. WOOLLEY\* (University of Leeds, Bradford, United Kingdom)

J. GREEN(1), D. BROOKER(2), J. YOUNG(1) - (1) Academic Unit of Elderly Care and Rehabilitation, University of Leeds (Bradford, United Kingdom); (2) Bradford Dementia Group, University of Bradford (Bradford, United Kingdom)

**Introduction:** Reliable methods are required to improve dignity and person-centred care for older hospitalised people. Dementia Care Mapping (DCM), an observation-based practice development tool, might provide one such method but requires further investigation. Our research objective was to explore the validity of DCM with self-reported patient experience. **Methods and materials:** 58 elderly patients were observed ("mapped") for 84 hours. Semi-structured interviews with seven cognitively intact patients and unstructured conversations with 51 patients were conducted. Concurrent validity was investigated by comparing reported experience with quantitative mapping data. The adequacy of DCM to capture important aspects of patients' reported experience was investigated using framework analysis. **Results:** There was congruence between observed and reported types of activities, but not their frequency. There was less congruence between quantitative assessments of well-being. Reported examples of being treated with or without dignity or respect were consistent with observed staff actions. Patients framed their well-being in terms of their independence and quality of care provided by staff (which are captured by DCM), health status and perceived potential for recovery/returning home (which are not). **Conclusion:** We conclude that DCM has the capacity to record relevant patient issues in a systematic way; but it is not comprehensive and does not identify all the issues of importance for well-being.

**PB6 080 THE FEASIBILITY OF CARE MAPPING ON ELDERLY CAREWARDS**

R. WOOLLEY\* (University of Leeds, Bradford, United Kingdom)

J. GREEN(1), D. BROOKER(2), J. YOUNG(1) - (1) Academic Unit of Elderly Care and Rehabilitation, University of Leeds (Bradford, United Kingdom); (2) Bradford Dementia Group, University of Bradford (Bradford, United Kingdom)

**Introduction:** The United Kingdom National Health Service is committed to ensuring patients receive hospital care in a dignified manner. Methods of quantifying and developing dignity in hospital wards are required. Care mapping, otherwise known as dementia care mapping (DCM), is an observational practice development method designed to improve person-centred care for people with dementia in formal care settings. Our research objective was to investigate the feasibility of DCM in elderly care hospital wards, including with patients who have health conditions other than dementia. **Methods and materials:** 58 patients (12 with dementia) in three general hospital elderly care wards and two community hospitals were observed (mapped) using DCM for 84 observation hours between 08:35-19:50 over 21 days. **Results:** 414 patient hours (4,968 five-minute time frames) were mapped. There were no major data collection issues other than the relatively high proportion (942/2,376 (40%) time frames) of missing data in the community hospitals due to time patients spent away from the area being mapped. All 3,624 (73%) of the time frames with patient observed data could be coded utilising the existing DCM Behaviour Category Codes and Mood/Engagement Value coding frameworks. **Conclusion:** The results from this preliminary study are promising and indicate that the DCM method is potentially feasible for use in elderly care hospital wards, particularly in general hospitals, without the need for major modifications to the coding frameworks or method of undertaking data collection.

**PB6 081 INCIDENCE AND PREDICTORS OF EXCESS DISABILITY IN NURSING HOME RESIDENTS WITH DEMENTIA**

S. SLAUGHTER\* (University of Alberta, Edmonton Alberta, Canada)

**Introduction:** The inability to walk adversely affects the well-being of the growing number of individuals with dementia. This study aimed to inform prevention and treatment efforts by estimating the incidence and identifying predictors of walking and eating disability in excess of that attributable to dementia. **Method:** During a one-year, prospective cohort study of 120 nursing home residents with middle-stage dementia ability to walk was monitored biweekly. Individual and facility-specific predictors of disability were identified using Cox proportional hazard regression models. **Results:** Among 120 residents, 40.8% (95% CI: 32.7% - 50.2%) developed a walking disability within one year of observation. Approximately half (27.0%; 95% CI: 19.7% - 36.5%) of this disability was not attributable

to dementia. Adjusting for individual and facility-specific predictors of disability, residents with more advanced dementia were estimated to experience 2.1 (95% CI: 1.18 – 3.83) times the hazard of walking disability. Predictors of walking disability included more comorbidities (hazard ratio (HR): 1.8; p=0.05) and less supportive environments (HR: 2.3; p=0.01). Predictors of walking excess disability included using antidepressant drugs (HR: 2.1; p=0.05), not using cognitive enhancer drugs (HR: 2.7; p=0.03), and living in a less supportive environment (HR: 2.0; p=0.07). Conclusion: As more than half of the walking disability in residents with middle-stage dementia was not attributable to their dementia, there are opportunities to target modifiable predictors of disability. Walking disability in nursing homes may be reduced by attending to comorbid conditions, creating supportive dementia environments, considering the use of cognitive enhancer drugs, and being vigilant for adverse effects when treatment with antidepressants is necessary. This research was funded by the Alberta Heritage Foundation for Medical Research.

**PB6 082 "COGNITIVE DECLINE AND GERIATRIC ASSESSMENT IN A MEXICAN UNIVERSITY GERIATRIC UNIT"**  
**G. DANIEL\*** (Centro Regional para el Estudio del Adulto Mayor, Monterrey, Mexico)  
**R. SALINAS(1), B. GONZÁLEZ(1) - (1)** Centro Regional para el Estudio del Adulto Mayor (Mexico)

Introduction: Cognitive decline has been associated with several diseases during the ageing process, for primary care clinicians there are some barriers to evaluate an elderly patient using the MMSE screening test, due to the multiple pathologies that have been involved. Methods and Materials: This is an observational and retrospective analysis from the database obtained during a 6 month period in the Geriatric Unit of the University Hospital U.A.N.L.; we analyzed 1311 ambulatory patients over 60 years of age from February to July 2008 and a MMSE evaluation was carried out during the first visit. A frequency and Chi square tests were performed using SPSS 13. Results: We obtained 372 males, 936 females, the mean of age was 75.97 years old and 4.44 the mean of level of education. The correlation showed depression and dementia as the principal cause of cognitive decline. Depression was a frequent diagnosis in all processes of cognitive decline with 139 patients (36.1%) in MMSE 26-30, 81 (35.4%) in MMSE 22 to 25, 117 (45.5%) with MMSE 17-21, 124 (46.6%) and finally 47 (55.3%) in MMSE 0 to 10. Alzheimer's disease was the most frequent diagnosis of dementia and its prevalence increased during the cognitive decline process: 9 patients (2.5%) with MMSE 26 to 30, 9 (3.9%) with MMSE 22-25, 37 (14.4%) with MMSE 17-21, 85 (31.8%) with MMSE 11-16 and 35 (41.2%) with MMSE 0-10. Conclusion: MMSE is a screening test in the geriatric assessment and can be used by medical practitioners to evaluate cognitive decline but never to diagnose or to start treatment. The patients may be sent to specialized centers for the memory study to improve the diagnosis' quality and intervention.

**PB6 083 POSATIRELIN (L-PYRO-2-AMINOADIPYL-L-LEUCYL-L-PROLINAMIDE) TREATMENT FOR PERSONS WITH DEMENTIA: A SYSTEMATIC REVIEW AND META-ANALYSIS**  
**I. ÅULUM\*** (The University of Western Ontario, Canada)  
**D. FORBES(1) - (1)** The University of Western Ontario (Canada)

INTRODUCTION: Posatirelin (l-pyro-2-aminoadipyl-l-leucyl-prolinamide) is a synthetic tripeptide with neurotrophic, cholinergic, and catecholaminergic properties that has shown potential in improving cognition and behaviour in both animal and human experiments. Posatirelin may therefore be a viable treatment in delaying cognitive decline (as well with other symptoms) associated with dementia. The purpose of this review is to assess the evidence of efficacy of posatirelin treatment in improving function, cognition, mood, behaviour, quality of life, and mortality in older persons with dementia as well as examining adverse drug reactions. METHODS AND MATERIALS: The Specialized Register of the Cochrane Dementia and Cognitive Improvement Group (CDCIG), The Cochrane Library, MEDLINE, EMBASE, PsycINFO, CINAHL and LILACS were searched on 5 June 2008 for relevant trials. Many other trial registers were also searched. The selection criteria included all relevant, randomized controlled trials in which posatirelin treatment was compared to a placebo for the effect of improving function, cognition, mood, behaviour, quality of life, and mortality in older persons with dementia of any type. RESULTS AND CONCLUSIONS: Four trials (n=686) were included. Meta-analysis revealed that posatirelin significantly improves function, cognition, and mood in patients with any dementia type. A sub-group analysis of trials (n=3) revealed significance pertaining to Vascular Dementia and not Alzheimer's Disease. There were no significant reports of adverse drug reactions in 3 trials that reported adverse effects. Since not all included studies incorporated both of these dementia types, further research is necessary to determine what type and level of dementia would benefit from posatirelin treatment. The results of these trials should be replicated before any clinical recommendations can be made.

**PB6 084 DANCE PERFORMANCE AS AN INTERVENTION IN THE CARE OF ELDERLY PERSONS WITH DEMENTIA**  
**T. RAVELIN\*** (University of Applied Sciences, Kajaani, Finland)  
**A. ISOLA(1), J. KYLMÄ(2) - (1)** Oulu University (Oulu, Finland); (2) Kuopio University (Kuopio, Finland)

There is a need to improve interventions in the care of elderly persons with dementia. Dance is one of the nursing interventions used in elderly care. The aim of this study was to

describe and evaluate the use of dance performance as an intervention in the care of elderly persons with dementia. The task of the research was to describe and evaluate how demented elderly persons experience dance performances and describe dance performance and its essence as an intervention. The method was qualitative evaluation research. The informants of the study were demented elderly persons (13), their family members (4), nurses (7) and practical nurse students (3). There were four dance performances in the nursing home. They were based on elderly persons' memories of seasons. Data were collected using individual interviews of elderly persons, videotaping, heart rate measurements and focus group interviews of family members, nurses and students. The experiences of the demented elderly persons were connected to dance performance as an activity, dance performance, performers, themselves and to the audience and surroundings. Dance performance was evaluated as process intervention, which has an effect on the elderly person and his/hers interaction with the others and also on the family members. Dance performance and its implementation as an intervention in the care of elderly persons with dementia has its own special features. Watching the dance performance is an active event to the demented elderly person. Feelings, memories and sense of community with the others aroused by dance performance are positively significant in the nursing care context. Dance performance is an interactive psychosocial intervention which promotes well-being and elicits resources of the elderly person with dementia. This study has produced information to gerontological nursing. With this information dance performance can be used in similar situations as a goal-directed intervention.

**PB6 085 BEYOND TRADITIONAL MEASURES OF VALIDITY: ADDRESSING VALUES AND ETHICS IN CRITICAL ASSESSMENT OF MEASUREMENT TOOLS**  
**B. ZUR\*** (University of Western Ontario, Waterloo, Ontario, Canada)  
**A. JOHNSON(1), E. ROY(2), D. LALIBERTE RUDMAN(1) - (1)** University of Western Ontario (Canada); (2) University of Waterloo (Canada)

Introduction: Aging in place has become an important priority, yet it needs to be recognized that aging persons with cognitive impairments face challenges impeding their ability to safely do so. Assessing the capacity for seniors with dementia to age in place is an ethical issue and demands that health care professionals critically consider the measurement tools that inform such assessment. This presentation argues that traditional approaches to critical evaluation of measurement tools used in rehabilitation literature are insufficient to inform the development and use of such tools to assess the capacity for safe, independent living. Such approaches often neglect to consider the values embedded within measurement tools and the ethics involved in their use. Methods: After providing an overview of traditional concepts of measurement theories, a framework for construct validity developed by Samuel Messick is explored. Conclusion: This framework of construct validity enables more comprehensive critical analysis of measurement tools, particularly in its attention to the social consequences of test use and scores. Practice implications: The applicability of this framework to the examination of assessments designed to assess the capacity of persons with dementia will be discussed. Authors: Ms. Briana Zur (presenter), CIHR Fellowship in the Area of Aging, Veterans and Dementia, Dr. Andrew Johnson, Dr. Eric Roy, Dr. Debbie Laliberte Rudman

**PB6 086 AKTIVA: A CONTROLLED INTERVENTION-STUDY FOR PREVENTION OF DEMENTIA IN THE ELDERLY [AKTIVA: AKTIVE KOGNITIVE STIMULATION – VORBEUGUNG IM ALTER]**  
**V. TESKY\*** (Klinik für Psychiatrie der Uniklinik Frankfurt /Main, Frankfurt am Main, Germany)  
**W. BANZER(2), J. PANTEL(1) - (1)** AG Gerontopsychiatrie (Frankfurt am Main, Germany); (2) Institut für Sportwissenschaften, Abteilung Sportmedizin (Frankfurt am Main, Germany)

Introduction: The incidence of dementia increases with increasing age. At present, there is no chance of healing the two most common forms of dementia: Alzheimer's disease and Vascular dementia. The prevention of dementia with potential preventive strategies is of high importance to reduce the individual risk. Besides the treatment of established risk factors (overweight, high blood pressure, diabetes, high cholesterol), cognitive activity in the context of leisure activities seems to be a potential preventive strategy. Therefore, a special intervention-program for the elderly was developed, accomplished and evaluated which has its main focus on cognitive activity induced by leisure activities. AKTIVA represents a manual for cognitive stimulation in everyday life and leisure time. The participants were informed about their individual possibilities of prevention and were systematically instructed and reinforced to increase cognitive stimulating activities as part of their daily routines. In addition, some participants got guidance regarding healthy nutrition and sport. Methods: The intervention study consists of 307 men and women from the older population (M = 72 years, SD = 7 years). It is a randomized, controlled pre-post-follow-up design conducted from March 2008 to November 2008. All participants were randomly assigned to 1 of 3 conditions: AKTIVA-intervention-program (N = 126), AKTIVA-intervention-program plus nutrition and sport guidance (N = 84), no-intervention-program control-group (N = 97). The AKTIVA-program consists of 10 training sessions (8 + 2). Main Outcome Measure: Cognitive performance, mental state, life satisfaction and subjective memory decline. Results: At the time of the congress first

results will be available. Hitherto the participants enjoyed the AKTIVA-program and 80% of the informants would recommend it.

**PB6 087 BENEFITS OF ORAL COBALAMIN ON COGNITIVE FUNCTION IN ELDERLY PERSONS WITH VITAMIN B12 DEFICIENCY**

C. JEHL\* (Pôle de Gériatrie, Hôpital de la Robertsau, Strasbourg, France)  
C. MARTIN-HUNYADI(1), T. VOGEL(1), E. ANDRES(2), M. BERTHEL(1),  
G. KALTENBACH(1) - (1) Pôle de Gériatrie, Hôpital de la Robertsau (Strasbourg, France); (2) Service de Médecine Interne-Diabétologie-Maladies Métaboliques, Hôpital Civil (Strasbourg, France)

Introduction Vitamin B12 deficiency is common in elderly persons and has been associated with cognitive impairment. However, evidence from trials of the effects of cobalamin supplementation on cognitive function is limited and inconclusive. Materials and methods We set out to investigate the effects of cobalamin replacement therapy on cognitive function of older people with cognitive impairment and cobalamin deficiency by an open prospective study. Ten patients aged >75 years with cognitive impairment (MMSE score from 10 to 25) and cobalamin deficiency (<0,16µg/L) were recruited. They received 1000µg of oral vitamin B12 daily for 6 days, then weekly for 3 months, then monthly for 3 months. Cognitive function was assessed before and after 3 and 6 months of treatment by Mini Mental State Examination, Verbal Fluency Test and Frontal Assessment Battery at bedside. Results Mean cobalamin serum levels had significantly increased from 0,12+/-0,03µg/L at baseline to 0,22+/-0,15µg/L after 6 months ( $p=0,004$ ). This trial showed an improvement on the MMSE score from 20,44+/-2,9 at baseline to 22,6+/-3,5 after 3 months of treatment ( $p=0,06$ ). The mean MMSE score after 6 months was 21,94+/-3,0 ( $p=0,07$ ). Patients also improved on verbal fluency and FAB score but this was not statistically significant. Conclusion Although the trial was restricted to a small number of patients, we found nearly significant improvement on MMSE score after 3 and 6 months of oral cobalamin supplementation. Moreover, previous studies showed that cobalamin supplementation was unlikely to prevent further cognitive deterioration in patients with long-standing dementia, but could improve cognitive function in patients having mild dementia symptomatic <2years. Therefore all patients with cognitive impairment should be investigated for cobalamin deficiency.

**PB6 088 VALIDATION OF A SHORT COGNITIVE ASSESSMENT TOOL IN THE INDIGENOUS POPULATIONS OF FAR NORTH QUEENSLAND**

E. STRIVENS\* (Cairns and Hinterland Health Service District, Cairns, Australia)  
M. STEVENSON(1), K. SMITH(3), D. LOGIUDICE(4), O. ALMEIDA(5), N. LAUTENSCHLAGER(5), L. FLICKER(3) - (1) Cairns and Hinterland Health Service District (Cairns, Australia); (3) School of Medicine and Pharmacology, University of Western Australia (Crawley, Australia); (4) National Ageing Research Institute (Parkville, Australia); (5) School of Psychiatry and Clinical Neurosciences, University of Western Australia (Australia)

Aims: The burden of dementia is now beginning to become apparent in Australia ageing Indigenous population. The Kimberley Indigenous Cognitive Assessment tool (KICA) has been validated in older Indigenous people of both the Kimberley region of Western Australia, and in the Northern Territory, and appears to be a reliable and valid tool for the assessment of dementia in these groups. Its usefulness has not been determined in Far North Queensland. A short version (sKICA) was developed, specifically for General Practitioners, to screen for cognitive changes. This, combined with an Informant Questionnaire (KICA-IQ), was trialled in the Indigenous Populations of Far North Queensland. Methods: The sKICA and KICA-IQ were tested in 55 Indigenous subjects, over 45 years of age and with varying degrees of cognitive impairment, across Cape York and the Torres Strait. Subjects were interviewed using the sKICA and KICA-IQ, and then reviewed by a Geriatrician, blinded to the previous assessment. Consensus diagnoses were determined by two specialists (geriatrician/old age psychiatrist) using DSM IV/ICD 10 criteria. Results: The sKICA-Cog had a sensitivity of 82.4% and specificity of 88.5%, with a cut-off score of 21/22 out of 25. The free recall item effectively discriminated 88% of dementia cases. , was 0.76. Internal consistency, as assessed by Cronbach's The KICA-IQ had a sensitivity of 88.2% and specificity of 84.6%, with a cut-off score of 3/4 out of 16. Conclusion: The sKICA and KICA-IQ appear to be reliable assessment tools for cognitive impairment in the Indigenous populations of Far North Queensland.

**PB6 089 DEMENTIA IN A SENEGALESE ELDERLY POPULATION 65 YEARS AND OVER: PREVALENCE AND RISK FACTORS**

K. TOURE\* (University CAD of Dakar, Dakar, Senegal)  
C. MAMADOU(2), Z. MARIA VICTORIA(3), B. YVES(4), T. ANTA(1), N. MOUHAMADOU MANSOUR(5) - (1) department of public health and preventive medicine (Dakar, Senegal); (2) department of Internal medicine (Dakar, Senegal); (3) Department of Social and Preventive medicine (Montreal, Canada); (4) Department of Geriatric medicine (Montreal, Canada); (5) department of Neurology (Senegal)

Introduction. With the ageing of the population, we conducted a study to assess the prevalence and identify the risk factors of dementia among Senegalese elderly population. Methodology. The study was cross-sectional and intended, through a two-wave process of

data collection, to collect data from March 01 2004 to December 31 2005 among 507 Senegalese elderly population aged 65 years and over utilizing the Medico-social and University Center of IPRES for health care. Sociodemographic, toxic habits, physical activity, social network, medical history, familial history of dementia data were collected with a structured questionnaire completed with a clinical exam and neuropsychological testing. Dementia was diagnosed using DSM IV-R criteria. Results, Forty five patients (8.9%) had dementia. The whole population has a mean age of 72.4 years ( $\pm 5.2$ ), mostly male, married, and non-educated. Hypertension, arthritis, gastro-intestinal diseases, respiratory diseases and cataract were the main health conditions reported in the past medical history. Smoking was important; alcohol consumption was rare, but walking was the main physical activity. The elderly population had a high diversity of ties and frequency of contact with the relatives and friends. Age (OR= 4.26; IC= 1.36-13.30), education, (OR= 2.76; IC= 1.23-6.20), epilepsy (OR= 11.72; IC= 2.10-65.23) and family history of dementia (OR= 7.56; IC= 3.42-16.75) were independently associated with dementia. Conclusion. The results showed the high prevalence of dementia. They confirm the role of age, education, epilepsy and genes in its dementia. Keywords. Dementia, prevalence, risk factors, Senegal.

**PB6 090 ASPIRIN, STEROIDAL AND NON-STEROIDAL ANTI-INFLAMMATORY DRUGS FOR TREATING ALZHEIMER'S DISEASE: A SYSTEMATIC REVIEW**

D. JATURAPATPORN\* (Baycrest hospital, Toronto, Canada)  
M. ISAAC(1), N. TABET(2) - (1) Old age psychiatry, Sussex partnership NHS (Eastbourne, United Kingdom); (2) University of Brighton (Eastbourne, United Kingdom)

Introduction: There were evidences from retrospective studies implicating that the use of aspirin, steroid and non-steroidal anti-inflammatory medications might have a role for treating Alzheimer's disease. Methods and materials: MEDLINE, EMBASE, CENTRAL, PsycINFO, CINAHL, LILACS, mRCT, ISRCTN and ClinicalTrials.gov were searched to identify relevant randomized controlled trials (RCTs). All searches used the terms (anti-inflammatory agent\* OR aspirin OR cyclooxygenase 2 inhibitor\* OR Non-steroidal anti-inflammatory agent\* OR steroid anti-inflammatory agent\*) AND (Alzheimer\* OR dementia OR ((cognit\* or memory\* or mental\*) and (declin\* or impair\* or los\* or deteriorat\*)) AND (random\* OR randomized OR double blind\* OR single blind\* OR placebo\* OR controlled)). Results: Our inclusion criteria resulted in 16 RCTs from 488 review studies. Interventions assessed in these studies were grouped into 4 categories: aspirin (3 studies), steroids (3 studies), traditional NSAIDS (6 studies), and selective Cox-2 inhibitor (5 studies). Risk of bias assessment tool used to assess study's validity and quality showed the range from low (5 studies), high (8 studies) and unclear risk of bias (3 studies). For all categories, there was no significant cognitive improvement although there was a positive trend for aspirin in the first 6 months. High risk of bias studies provided more positive outcome than those of low risk. Patients on aspirin experienced more significant bleeding side effects while patients on steroids tended to have more confusion, agitation and paranoid reaction. NSAID patients had more common side effects such as abdominal pain, nausea, elevated creatinine and liver enzymes, while selective COX-2 inhibitor patients had more side effects relating heart problem. Conclusions: Given current evidence, the use of aspirin, steroids, and non-steroidal drugs is not supported in treating dementia of Alzheimer's patients. The side effect seems to be more significant in intervention group.

**PB6 091 MELANIN HAS THE UNEXPECTED CAPABILITY OF TRANSDUCE PHOTONIC ENERGY INTO CHEMICAL ENERGY**

A. SOLIS-HERRERA\* (Centro de Estudios de la Fotosíntesis Humana, S.C., Aguascalientes, Mexico)  
M. ARIAS-ESPARZA(1), R. SOLIS- ARIAS(1), P. SOLIS-ARIAS(1) - (1) Centro de Estudios de la Fotosíntesis Humana, S.C. (Aguascalientes, Mexico)

Introduction: Melanin is an amorphous substance that is present in the eukaryotic cell. Their relationship structure-activity remains controversial, but the unexpected finding of a dissociative water molecule property started up a great interest, because their pharmacological stimulation increases the redox capability of the eukaryotic cell 4 times or more. Methods: Prospective study, longitudinal, about the three main causes of blindness. Initiated in 1990. Materials: 4635 patients, digital angiography, fluorescein, indocyanin green. Results: The activity of melanin is very important both in health and illness of human eye (body). The pharmacological stimulation of human photosynthesis, produces a notable improvement in various diseases, not only of the eye, but all human body. Given that the increase of the cytoplasmic levels of molecular hydrogen generates better mitochondrial function. Other diseases not directly linked to mitochondrial enzymes may feature dysfunction of mitochondria. These include schizophrenia, bipolar disorder, dementia, Alzheimer's disease, Parkinson's disease, epilepsy, stroke, cardiovascular disease, retinitis pigmentosa, and diabetes mellitus. The common thread linking these seemingly-unrelated conditions is cellular damage causing oxidative stress and the accumulation of reactive oxygen species. Importantly, the mitochondrial electron transport chain is thought to be the main source of intracellular superoxide. These oxidants then damage the mitochondrial DNA, resulting in mitochondrial dysfunction and cell death. Conclusion: The Pharmacological modulation of human photosynthesis, which is: the capability of eukaryotic cell to take energy from water is a new and exciting therapeutic method that breaks the ground. It's implications in various age related diseases, like AD,

PD, OAD, Cardiac failure, and probably many others, represent promissory hope to increased quality of life in the elderly population.

**PB6 092 ACETYLCHOLINESTERASE INHIBITORS' USE FOR ALZHEIMER'S DISEASE IN THE SOUTH OF TUNISIA: ANALYTIC STUDY**

R. GOUIAA\* (Caisse Nationale de Securite Sociale - Tunisie, Merkez El Alia - Sfax, Tunisia)

Introduction: Acetylcholinesterase inhibitors (AChEIs) are used for Alzheimer's disease in Tunisia since about ten years. In this retrospective study, we analyze the frequency, the diagnosis and the medical treatment of Alzheimer's disease in the South of Tunisia. Methods and materials: To get AChEIs, insured patients have to deposit an application to the National Health Insurance Fund (CNAM) where a special commission agrees to give medication after studying files. The application has to be renewed each six months. During a period of three years and three months, 133 files were studied. Results: The special commission of the CNAM received only 133 requests from a population over two million persons from the South of Tunisia, which means many cases are still under diagnosed or untreated. From the 133 applications, 60 (47.24%) were satisfied, with 31 men and 29 women (Sex-Ratio: 1.06); 16 (26.6%) have not renewed their application one year after the first agreement. 48 (37.8%) applications were not in accordance with the legal mentions of the AChEIs then rejected. Conclusion: We conclude that Alzheimer's disease is still under diagnosed and many cases are untreated by the AChEIs. This situation needs more efforts and training in the field of geriatrics and dementia for a better diagnosis and management of Alzheimer's disease in Tunisia.

**PB6 093 THE RELATIONSHIP OF BLOOD PRESSURE AND PULSE TO COGNITIVE FUNCTION IN A NATIONALLY REPRESENTATIVE SAMPLE OF US ADULTS**

K. LANGA\* (University of Michigan, Ann Arbor, Michigan, United States)

M. KABETO(1), D. LLEWELLYN(2) - (1) University of Michigan (Ann Arbor, United States of America); (2) University of Cambridge (Cambridge, United Kingdom)

Introduction: There is growing evidence that cardiovascular (CV) health is closely linked to brain health, but there are few large-scale population-based studies with direct measures of CV health and cognitive function to study this relationship. Methods: We used data on a nationally representative sample of N=7,203 individuals aged 50+ from the 2006 wave of the Health and Retirement Study (HRS) to determine the cross-sectional relationship of measured blood pressure (BP) and pulse to performance on the HRS cognitive test. BP was measured 3 times using an automated cuff. The lowest of the 3 BP measurements was used. Cognitive function was measured using a battery of validated neuropsychological tests of verbal memory, time orientation, and verbal fluency. Results: Hypertension (systolic blood pressure [SBP] > 140 mm Hg) was associated with a 1-point poorer performance on the 27-point cognitive scale compared to individuals with normal (SBP 100-139) or low (SBP<100) blood pressure ( $p < .01$ ). This negative relationship remained statistically significant even after controlling for a wide-range of sociodemographic and health (chronic conditions and use of hypertension medications) variables. Similarly, a 10 beats / min increase in pulse was associated with a 0.13 point decrease in performance on the cognitive scale ( $p < .05$ ), and this negative relationship remained significant after controls for the same confounders. Conclusions: Elevated blood pressure and pulse were associated with significantly poorer cognitive function in this nationally representative sample of US adults. This suggests that optimal treatment of hypertension may prevent or delay cognitive impairment in later life. Possible causal pathways for this BP-Pulse-Cognition relationship, and modification of this relationship by age and medications will be presented.

**PB6 094 BOLD RESPONSE CHANGES WITH AGEING EVIDENCED DURING A SEMANTIC FLUENCY TASK**

C. HOMMET\* (CHU Tours, Tours, France)

F. DOMENGIE(1), G. DE MARCO(2), K. MONDON(3), T. CONSTANS(3), J. COTTIER(1), C. DESTRIEUX(4) - (1) CHU Neuroradiology (Tours, France); (2) Université de Picardie (Amiens, France); (3) Internal Geriatric Medicine (Tours, France); (4) INSERM U 630 (Tours, France)

Aging is often considered as "negative". We studied age-related changes during a language task using fMRI. 22 young (22-35y) and 21 old (76-91y) right-handed subjects without cognitive decline performed a silent word generation task during fMRI with blocked paradigm (1.5-T GE). Individual activation maps were first computed and used for a second GLM analysis (with age as regressor) to localize clusters depicting age-related changes. Signal time course was analyzed in these clusters. We therefore divided blocks two halves for analysis. First half (0-15s): There was no age-related change in the inferior frontal gyrus usually involved in this task. As age increased, higher levels of activations were observed in 6 clusters that were grouped according to a similar time-course of MR signal : Clusters of group 1 were located in both temporo-occipital regions and in medial parietal lobe. In young subjects, the initial peak of the average Bold response was followed by a signal decrease below the baseline. In older, this signal drop was missing suggesting a lack of redistribution of cognitive resources from cortical areas normally active at rest

(default state network) to areas specially involved in the task. Clusters of group 2 were bilaterally located in posterior lateral fissure and in right post central sulcus. The average Bold signal remained close to the baseline for younger whereas it increased in older, suggesting compensatory mechanism. Second half (15-30s): There were significant age-related changes in Broca's area. Bold signal remained constant in young subjects for the whole block whereas it rapidly decreased in older suggesting a lack of compensatory mechanisms. We demonstrated differences in language activation pattern between young and old subjects with different dynamic of Bold response during language.

**PB6 095 A SURVEY OF PREVALENCE AND RISK FACTORS OF COGNITIVE IMPAIRMENT, DEMENTIA AND DEPRESSION IN HOSPITALIZED VETERANS**

K. JENG\* (Taichung Veterans General Hospital, Taichung, Taiwan)

W. LEE(1), J. TSAI(1) - (1) Taichung Veterans General Hospital (Taichung, Taiwan)

In order to have a better care for veterans, we surveyed the prevalence and risk factors of depression, dementia and cognitive impairment in hospitalized elderly veterans. One thousand two hundred and eighty-six patients aged 65 and older with written consents were included for the study between January and December, 2007. Method: Psychiatric problem was diagnosed within the first 24 hours after admission and treated accordingly. All patients underwent a global geriatric evaluation including clinical history, physical examination, laboratory tests, surgical risk evaluation, and functional and mental evaluations. Mental status of mild cognitive impairment (MCI), dementia and depression was evaluated by Clinical Dementia Rating Scale (CDR), Geriatric Depression Scale (GDS), Instrumental Activities of Daily Living (IADL), Family APGAR and American Psychiatric Association Age-Related Cognitive Decline (ARCD DSM IV), Mini-Mental State Examination (MMSE). Patients were evaluated with mental status with three levels of test from nurses, research assistants and psychiatrists. Results: The mean age of patients was  $78.76 \pm 4.84$  years old (ranged from 65 to 97). Seven hundred and eleven (55.3%) patients had normal mental status. MCI had a prevalence of 18.7%, dementia of 13.1% and depression, 12.8%. Risk factors of dementia were associated significantly with lack of exercise, head injury, BMI and stroke ( $p < 0.01$ ). Depression was associated significantly with single, diabetes and stress ( $p < 0.01$ , 0.03 and 0.01, respectively). Blood pressure, cardiac, hepatic, renal and arthritic diseases showed no association with mental status in these patients. Conclusion: The study suggests that exercise practice is the key for normal mental status among elderly patients. Exercise may slow down the progression of dementia by increasing circulation, reducing blood sugar, lipid levels and preventing stroke and diabetes. Encouragement of participating social or church activities would help these patients.

**PB6 096 PREVALENCE OF DEMENTIA AMONG PUERTO RICAN VETERANS**

J. CARRION-BARALT\* (University of Puerto Rico / Medical Sciences Campus; VA Caribbean Healthcare System, San Juan, Puerto Rico)

E. SUAREZ(1), R. DEL RIO(1) - (1) University of Puerto Rico Medical Sciences Campus (San Juan, Puerto Rico)

INTRODUCTION Dementia prevalence rates vary greatly in different regions of the world. Even within a single country like the United States (US), significant differences in prevalence of dementia have been noted among races. This study sought to estimate prevalence of dementia among Puerto Rican Veterans receiving medical care at the Department of Veterans Affairs Medical Center in San Juan, Puerto Rico (SJVAMC). A secondary goal of this study was to compare the prevalence of dementia between these SJVAMC users and all Veterans in the US. METHODS AND MATERIALS Sample: All Puerto Rican Veterans aged 65 and over who visited the SJVAMC between October 1, 2005 and March 30, 2007. Assignment of diagnosis: Veterans were assigned a diagnosis of dementia if they had one or more of the following ICD-9 dementia codes: 290.XX, 291.2, 294.XX, 331.XX, 046.1, or 046.3. Statistical analyses: Overall prevalence of dementia and prevalence by subtype and by age group were calculated from SJVAMC data and compared with the existing rates for US Veterans. RESULTS Prevalence rates of dementia were higher in the SJVAMC than in the VA system-wide in each age group and also among the whole sample (12.69% vs. 7.3%). The age-adjusted Standardized Morbidity Rate (SMR) was 1.49. The percentage of vascular dementia cases was higher in the SJVAMC (15.14% vs. 11.9%). CONCLUSION The results of this study suggest that prevalence of dementia is significantly higher among PR veterans than among VA system-wide users. A second finding was that vascular dementias are more prevalent among PR veterans. These differences merit further study and its implications could be crucial for the establishment of public health policies in Puerto Rico and among Hispanic communities in the US.

**PB6 097 FAMILY RELATIONSHIPS: STABILITY IN THE EYE OF THE DEMENTIA STORM?**

S. DAHLKE\* (University of British Columbia, Vancouver, Canada)

A. PHINNEY(1), E. KELSON(1) - (1) University of British Columbia (Vancouver, Canada)

Relationships with family members contribute to the meaning in individuals everyday lives. Despite this, much of the research on dementia has traditionally focused on biological causes. More recently the notion of personhood has gained attention leading researchers to focus on the relationships that are possible within dementia. If family relationships are

explored, research often centers on the caregiver strain experienced by family members. A small growing body of research suggests that dementia is experienced relationally both by the individual and by family members. More research about this phenomenon is needed to support families experiencing dementia. Methods and Materials: This study is part of a larger qualitative investigation of how people with dementia engage in meaningful activities. This naturalistic study uses interpretive phenomenological methods to explore the experiences of two families in which a father is experiencing dementia. The purpose of the inquiry is to examine the influence of family relationships in a person with dementia's experience of meaningful activities. Five in-depth interviews and participant observation were conducted with each person who was experiencing dementia. Family members were also interviewed in-depth. Results: Interpretive analysis revealed commonalities and distinctions between the two individuals with dementia's ability to engage in meaningful activities. Both participants found meaning and comfort from their involvement with family members. In one participant's world the stability of his family and their long history together enabled him to continue his engagement in meaningful activities. In another participant's world, family relationships and family members' understanding of dementia limited his ability to stay engaged in activities he found meaningful. Conclusion: Meaningful activity is understood and experienced both by the person experiencing dementia and the family through the lens of their historical relationships.

#### **PB6 098 THE DRIVING AND DEMENTIA TOOLKIT**

A. BYSZEWSKI\* (Regional Geriatric Program of Eastern Ontario, Ottawa, Canada)  
F. MOLNAR(1), W. DALZIEL(1), F. AMINZADEH(1), M. HING(1),  
S. MARSHALL(2), K. ROBINSON(3), L. HUNT(2) - (1) Regional Geriatric Program of Eastern Ontario (Ottawa, Canada); (2) The Rehabilitation Centre (Ottawa, Canada); (3) The Alzheimer Society (Ottawa, Canada)

Introduction: The diagnosis of dementia does not necessarily imply an automatic license suspension. However the health professional must ask if the person with dementia (PWD) drives, and if so, the person's safety should be evaluated. This is a challenging area of dementia care. Methods: An interdisciplinary team of clinicians and researchers from the following disciplines have developed a toolkit to bridge the gap in addressing this challenging area of dementia care: geriatrics, psychiatry, family medicine, occupational therapy, nursing and the Ottawa chapter of the Canadian Alzheimer Society. Results: The toolkit contains background information on driving and dementia, an algorithm on how to navigate the process, an office based Dementia and Driving Checklist, recommendations on how to communicate with the PWD and family caregivers, and finally resources on alternative transportation means and other community services for PWD and family caregivers. Conclusions: This toolkit provides invaluable information, strategies and tools to health professionals in addressing the issue of driving safety in PWD.

#### **PB6 099 ETIOLOGY AND PREDICTORS OF URINARY INCONTINENCE IN PATIENTS WITH DEMENTIA**

K. MIU\* (Kwong Wah Hospital, Hong Kong, Hong Kong)  
S. LAU(2), S. SZETO(1) - (1) Kwong Wah Hospital (Hong Kong); (2) Our lady of Maryknoll Hospital (Hong Kong)

Introduction Urinary incontinence associated with dementia is a significant problem and resulted in medical co-morbidities. The aim of this study is to determine the prevalence of urinary incontinence and to identify the etiology and factors associated with urinary incontinence in dementia patients. Materials and Methods Patients were recruited from the memory clinic of a regional hospital in Hong Kong with MMSE scores from 10 to 26. Basic demographic data, types and duration of dementia, usage of cholinesterase inhibitor and other drugs with anti-cholinergic effects, carer stress measurement by Zarit Burden interview and presence of urinary incontinence in the previous 6 months were recorded. Urodynamic studies were carried out with measurements on the postvoid volume, detrusor pressure and peak flow rate. The urodynamic diagnoses were also recorded. Results 144 subjects with a mean age of 78 years (SD 6.8) were included. 36.8 % were male. 48 (33.3%) has urinary incontinence. There was no statistically significant difference between continent and incontinent groups with respect to age, MMSE, duration of dementia, usage of cholinesterase inhibitor and usage of drugs with anti-cholinergic effects. Use of walking with aids (OR 2.9), presence of nocturia (OR 4.1) and carer stress (OR 1.03) were independent predictors of urinary incontinence. Urodynamic studies were done in 38 subjects with incontinence. It showed that 21 had overactive bladder, 13 had bladder outlet obstruction, 2 with low compliance bladder, 2 with small bladder capacity, 4 with detrusor hyperactivity and impaired contractility. Conclusion Urinary incontinence commonly occurs in dementia subjects. Poor mobility and presence of nocturia increase the risk of urinary incontinence. Correction of the possible reversible factors may help to reduce the prevalence of urinary incontinence in patients and reduce carer stress.

#### **PB6 100 DOMINANCE AND BURDEN DOES DOMINANCE IN PARTNERSHIP MODIFY CAREGIVER BURDEN IN DEMENTIA?**

A. WETTSTEIN\* (Stadtärztlicher Dienst, Zürich, Switzerland)  
D. DYNTAR(1) - (1) Stadtärztlicher Dienst Zürich (Zürich, Switzerland)

Introduction: Three-fifths of the dementia patients live at home and are cared for by their families, most often by their partners. The caregiver's burden is high and it depends on

various factors. In this study we can show the effect of a factor not previously investigated - that dominance in the partnership has an influence on the caregiver's burden. Methods and Materials: This is a retrospective pilot study with a cross-sectional design. All 62 patients (31 men, 31 women) had a diagnosis of Alzheimer's disease. The dominance in the partnership before the onset of the illness is measured by the healthy partner's response to two questionnaires: Dominance scale (Hamby) and STDL (Share of Tasks of Daily Life) scale. Results: The higher the patient's dominance before the onset of the Alzheimer's disease, the greater the burden felt by the caregiver. With the scores of two questionnaires to measure dominance as well as the NOSGER-score (rating of dementia severity in 6 dimensions by caregiver), we can explain 76% of the caregiver's burden variance. The predictors of the dominance explain 36% of the caregiver's burden variance, MMS or CDR-score only 1%. Conclusion: The factors of dominance in the relationship are more important for the caregiver's burden than the cognitive impairment measured by MMS and CDR. A feature of the relationship is much more important for the burden felt by the caregiver than the severity of dementia. We can postulate, that the relationship (and we did not measure the quality but the ratio of dominance) is more predictive for the caregiver's burden than the severity of the dementia. These findings determine the need of psychological support for the caregiver in addition to medical care for the patient.

#### **PB6 101 BREAKING BARRIERS TO MEDICAL MANAGEMENT OF ALZHEIMER**

S. OAKES\* (University of Texas Health Science Center San Antonio, San Antonio, United States)

Introduction: During the interactive educational session, I will discuss that an estimated five million Americans diagnosed with Alzheimer's disease (projected to rise to 16 million by 2050,) is causing an increased burden on primary care physicians to recognize the symptoms and accurately diagnose Alzheimer's disease and other dementias. Latinos are at increased risk for developing dementia. Recent data from the University of Pennsylvania: the average age of onset of Alzheimer's in Latinos was 68.8 years and 73.5 years for whites. Latinos are expected to develop dementia at twice the rate of whites. Therefore, early diagnosis and treatment need to become priorities for clinicians who serve Latino patients and their caregivers. Further, I will provide instruction on how to break down language barriers and overcome cultural barriers; medically manage patients with Alzheimer's disease; and maximize available healthcare resources, thereby optimizing care and improving outcomes for Latino patients with Alzheimer's disease and their caregivers. My goal is to provide a comprehensive presentation that includes realistic recommendations which can be incorporated into your daily practice. Specifically, participants will learn about • Overcoming obstacles to cultural beliefs in the diagnosis of Alzheimer's disease • Implementing management strategies for the spectrum of Alzheimer's disease symptoms • Describing the rationale for treatment of Alzheimer's disease This presentation was delivered in 6 different cities through South United States as part of a continue medical education program targeting over 100 clinicians from different specialties psychiatry, primary care, neurology, nursing. This program has been sponsored by the American Academy of Physician Education.

#### **PB6 102 SCREENING OF ALZHEIMER'S DISEASE IN THE ELDERLY WITH DIABETES MELLITUS USING SELF-REPORTED QUESTIONNAIRE**

T. MATSUZAWA\* (Kobe university hospital, KOBE, Japan)  
T. SAKURAI(1), K. YOKONO(1) – (1) Kobe university hospital (Kobe, Japan)

Introduction: Diabetes has been proposed to increase the risk of Alzheimer's disease (AD). However, adverse effects of cognitive decline are often overlooked in management of chronic illness such as diabetes. For detection of AD, information on recent impairment of memory and activities of daily living (ADL) from the caregivers is crucial, but such interviews are not always accessible in the ambulatory care. The aim of this study is to develop a self-reported questionnaire for screening AD consisting of brief cognitive tests and succinct physical parameters. Methods: 496 diabetic elderly were recruited in Kobe university hospital. For screening of AD, we used a computer-based screening program. Accordingly, 25 were diagnosed as possible AD according the criteria from NINCDS-ADRDA and 380 were normal in cognitive function. On the first visit, participants were asked to fill out a questionnaire regarding memory disturbance and instrumental ADL. Information on therapy of diabetes and complications was obtained from clinical chart. Temporal orientation was also tested. A multivariate logistic regression was used to examine the independent association of these clinical variables with AD. Results: AD group was characterized by higher age, shorter duration of education, lower diastolic blood pressure, and impaired temporal orientation. Drug compliance, preparing meal, shopping, financial management, and habitual use of memorandum were significantly impaired in AD. Backward regression identified six factors (age, diastolic blood pressure, drug compliance, preparing meals, habitual use of memorandum, and temporal orientation) independently associated with AD. ROC analysis revealed the satisfactory discrimination of AD among diabetic elderly (95.0% of sensitivity and 86.6% of specificity). Conclusion: We have developed a self-reported questionnaire containing physical parameters, instrumental ADL, and temporal orientation, which is available for screening of AD among

elderly diabetes. However, the clinical usefulness of this index needs to be validated by large-scale prospective studies.

**PB6 103 ASSOCIATION BETWEEN DIABETES MELLITUS, PRE-DIABETES AND ALZHEIMER'S DISEASE**

J. RORIZ-FILHO\* (University of São Paulo, Ribeirão Preto - SP, Brazil)  
S. TEÓFILO DE SÁ RORIZ(1), M. FOSS(1), M. FOSS FREITAS(1), E. BORGES DE OLIVEIRA(1), P. FERNANDES FORMIGUERI(1), R. REBOUÇAS LOBO(1), E. FERRIOLLI(1), N. KILZA DA COSTA LIMA(1), A. SANTOS(1), J. MORIGUTI(1) - (1) School of Medicine of Ribeirão Preto at University of São Paulo (Ribeirão Preto, Brazil)

Introduction: Diabetes mellitus(DM), pre-Diabetes(PD) and Systemic Hypertension(SH) can be risk factors for Alzheimer's Disease(AD). We investigated the association between these conditions using cerebral Quantitative Magnetic Resonance Imaging(QMRI) and neuropsychological evaluation. Methods and materials: 64 Volunteers, both sexes, 60-75 years old, were divided in groups: AD(n=10), DM(n=13), DM+SH(n=12), PD(n=9), PD+SH(n=10), and healthy controls (HC)(n=10). Gray (GMP) and White Matter Percentage(WMP), Brain Parenchyma Fraction(BPF), Gray (GMR) and White Matter Relaxometry(WMR) and Gray (GMMTR) and White Matter Magnetization Transfer Ratio(WMMTR), were compared using ANOVA. Results: AD was different from HC by GMP( $p<0.01$ ), BPF( $p<0.01$ ), GMR( $p<0.01$ ), WMR( $p<0.01$ ), GMMTR( $p<0.02$ ) and WMMTR( $p<0.01$ ). DM+SH was different from HC by BPF( $p<0.01$ ), GMR( $p<0.01$ ), WMR( $p<0.01$ ), GMMTR( $p<0.01$ ) and WMMTR( $p<0.03$ ). WMMTR differentiated DM from HC( $p<0.01$ ). GMR differentiated AD from DM+SH( $p<0.04$ ). GMP( $p<0.01$ ), GMR( $p<0.01$ ) and WMR( $p<0.02$ ) differentiated AD from DM. PD/PD+SH were differentiated from AD by: GMP (PD/PD+SH;  $p<0.01$ ), GMR (PD+SH;  $p<0.02$ ) and (PD;  $p<0.01$ ); WMR (PD;  $p<0.01$ ); GMMTR (PD+SH;  $p<0.03$ ) and (PD;  $p<0.04$ ) and WMMTR (PD+SH;  $p<0.02$ ) and (PD;  $p<0.04$ ). DM+SH presented cognitive dysfunction on attention and executive functions (Stroop Test). Conclusion: AD presents WM subcortical lesions (vascular type). QMRI is useful in diagnosing myelin breakdown and in identifying patients with AD. The findings suggest an association between PD, DM and AD.

**PB6 104 QUALITY OF LIFE IN DEMENTIA: CLINICAL AND ECONOMIC FINDINGS FROM NEW ZEALAND**

F. GALLRACH\* (University of Canterbury, Christchurch, New Zealand)  
R. KIRK(1), A. HORNBLOW(1), M. CROUCHER(2) - (1) Health Sciences Centre - University of Canterbury (Christchurch, New Zealand); (2) Psychiatry of Old Age Academic Unit, Psychiatry Service for the Elderly - Canterbury District Health Board, Christchurch School of Medicine and Health Sciences - University of Otago (Christchurch, New Zealand)

Introduction: To date, multivariate analyses of quality of life (QoL) in dementia are relatively rare. This study aims to measure QoL of persons with dementia and their family-caregivers. In addition, the study examines, what interventions from primary and secondary care in New Zealand are helpful for enhancing QoL, and what these interventions cost. Methods: Questionnaires investigating various QoL-domains were administered to outpatients, recently diagnosed with dementia, and their caregivers at baseline and 12 months follow-up. Economic factors, including the time spent caring and direct and indirect costs were estimated using questionnaires and diaries. Results: Fifty-three patient/caregiver dyads were included. 3MS ranged from 49 to 91; CDR from 0.5 to 3. At baseline, all but one measurement confirmed the predicted correlations. Patients' QoL was strongly correlated with the stage of illness, depression, neuropsychological behaviours, functioning and their caregiver's QoL and burden. Caregivers' QoL was linked to patients' QoL and daily functioning, and carers' burden and subjective informal support. Joint income/pension and financial burden of care were (negatively) correlated with carers' QoL, depression, and burden. The level of cognitive impairment and the level of formal support were not associated with patients' or caregivers' QoL. Preliminary findings from the follow-up period will show if these correlations remain stable over 12 months. Conclusions: Depression in patients and caregivers, each other's QoL, patients' neuropsychological behaviours and functioning, as well as caregivers' burden, and the level of informal care can predict QoL in dementia. Reducing the intensity of informal care - by treating depression and difficult behaviours in patients - might reduce caregivers' stress and burden. Developing financial incentives that reward informal caregivers for their time spent caring could be a key factor in supporting informal caregivers in their role and therefore delaying institutionalization.

**PB6 105 BEHAVIOR PROBLEMS IN DEMENTIA. DIFFERENCES BETWEEN A POLYVALENT GERIATRIQUE MEDICINE STRUCTURE AND A COGNITIVE PSYCHOGERIATRIC UNIT.**

S. MAMAN\* (Hopital Plaisir-Grignon, Plaisir, France)  
A. SIMON(1) - (1) Hopital Plaisir-Grignon (Plaisir, France)

Dementia is a major public health issue. Behavior problems frequently come with dementia pathologies. These phenomena are hardly predictable and stress factors for the nursing teams. Methods and materials : Compare methods of behavior problems care between a polyvalent geriatric medicine unit and a psychogeriatric unit. Clinical audit on 30 cases from

February to April 2008, by nurses and doctors filling an assessment grid on behavior problems care. Results : Most frequent behavior problems met in both structures are cries, aggressiveness, and wandering. Most problematic cases in polyvalent geriatric medicine units regard wandering possibly leading to escaping away from the unit. Relational care is firstly achieved in polyvalent geriatric medicine units in 92% of cases, 80% in psychogeriatric units. When drugs are to be prescribed in polyvalent geriatric medicine units, neuroleptics are ordered in 88% of cases, among which 38% in intramuscular. In psychogeriatric units, neuroleptics are only ordered in 25% of cases, among which 5% in intramuscular. Restraints are used in both units, more frequently in psychogeriatric units, probably due to heavier problems. Nursing staff in psychogeriatric units have a better knowledge regarding the pathology causing behavior problems. They are also better trained to handling these problems. Conclusion : A cognitive psychogeriatrics structure is crucial in behavior problems care. Differences in the care process are mainly due to the environmental characteristics of the structure, and to the specific training of the nursing staff.

**PB6 106 COGNITIVE TESTING IN PARKINSON DISEASE DEMENTIA**

G. KALTENBACH\* (University Hospital of Strasbourg, Strasbourg, France)  
M. KIESMANN(1), J. CHANSON(2), T. VOGEL(1), M. BERTHEL(1) - (1) Department of Geriatrics (Strasbourg, France); (2) Department of Neurology (Strasbourg, France)

Introduction :To compare the clinical and cognitive features of patients with Parkinson disease dementia (PDD) and PD without dementia, as defined by the new Movement Disorders Society (MDS) recommendations. Methods and Materials : Amongst 22 patients fulfilling prior DSMIV criteria for PDD we distinguished the patients also fulfilling MDS criteria (group I; n=14) from the other ones (group II; n=8). We compared the both groups using seven backwards, pentagons, 3- words recall of MMSE, Free and Cued Selective Reminding Test (FCSRT), copy of the Rey- Osterrieth Complex Figure Test (ROCFT), Mattis Dementia Rating Scale (MDRS)total score. Results : In group I mean age was 77 +/- 4.57 (versus 79 +/- 4.17 in group II) , sex ratio M/W 0.55 (vs 0.33) , PD duration 9.5 +/- 3.83 years (vs 12 +/- 6.78), age at beginning of PD 68 +/- 7.09 (vs 68 +/- 9.70), Hoehn & Yahr stage 3.1 +/- 0.51 (3.1 +/- 0.70), there was 2.1 in group I antiparkinsonian treatments vs 2.5 in group II. Seven backwards score was normal for 2 patients(14%) in group I versus 7(87 %) group II, pentagons copy in 2(14%) vs 5(62%), 3-words recall normal score in 3(22%)vs 5(62%), 3FCST was normal (up to 40) in 3(21%) vs 6(75%) ; ROCFT was under the 3-5 percentiles in all group I and 5(62%) were above 19-28 percentiles ; MDRS total score was normal for none in group I versus 5(62%) in group II. Conclusion : PD age at onset, sex, duration, H&Y stage are not statistically significant. Seven backwards subtest, MDRS total score, copy ROCFT score seem useful to characterize cognitive disorders with statistically significant values between cognitive disorders related to PDD and PD without dementia.

**PB6 107 ENHANCING COGNITIVE REASONING IN OLDER ADULTS: CAN PLAYING GAMES HELP?**

L. HOHAUS\* (Griffith University, Brisbane, Australia)  
T. GRACE(1) - (1) Griffith University (Brisbane, Australia)

Introduction: Cognitive reasoning skills are critical for complex decision making. They are particularly important for independent community living but decline with normal ageing. Hence training programs which are easy to administer and enjoyable could prove highly beneficial. The purpose of this study was to determine whether brief training in playing the popular game sudoku could enhance cognitive reasoning in both younger and older adults. It was expected that cognitive reasoning would improve with training but that younger adults could potentially benefit even more from training than older adults. Method: A fully randomised controlled trial was conducted with 30 young adults ( $M = 19.8$  years) and 40 older adults ( $M = 67.8$  years) Participants completed measures of sudoku and the WASI Matrix Reasoning subtest twice at a two week interval. Those allocated to training were asked to complete sudoku problems of increasing difficulty using advanced tactics demonstrated in guidelines provided during the interval. Results: A series of two way (Age x Training) ANOVAs on change scores over time showed that training significantly improved performance on both cognitive reasoning tasks for younger and older adults. In addition an interaction between age and training was demonstrated on the Sudoku measure, with younger adults improving more with training. Further, a main effect for age was found on the WASI . Conclusion: Training in playing sudoku enhances cognitive reasoning in both younger and older adults. Young people may improve their sudoku playing more than older adults with sudoku training, but older adults may be able to improve cognitive reasoning skills as assessed through the WASI cognitive reasoning subtest as much as young people can. These findings are very promising, suggesting that older adults have considerable cognitive plasticity in cognitive reasoning, and that playing games like Sudoku may stimulate enhanced cognitive performance.

**PB6 108 REVERSIBLE COGNITIVE IMPAIRMENT DUE TO THALIDOMIDE**

M. SÖDERLUND\* (Hospital Italiano de Buenos Aires, Buenos Aires, Argentina)  
M. GUAJARDO(1), D. SEINHART(1), M. SCHAPIRA(1), D. FANTL(1), L. CAMERA(1) - (1) Hospital Italiano de Buenos Aires (Buenos Aires, Argentina)

Introduction: Thalidomide is an interesting therapeutic option for some disorders such as multiple myeloma (MM). Only one case of reversible dementia secondary to thalidomide

has been reported. Objective: to describe a case of a reversible cognitive impairment in a patient treated with thalidomide for MM. Methods and results: A 82 years old woman started dexamethasone and thalidomide for MM. She had a previous history of hypertension and depression. Two months later the patient's daughter noticed that she was unable to take care of herself and she had serious memory deficits. She had also problems for taking her medications and for managing money. A cognitive evaluation while she was only taken thalidomide (dexamethasone had been withheld one month before) showed an alteration in attention, memory, and executive functions: MMSE 26/30, CDR 1, digit span direct (DD) 4, indirect (ID) 3. Rey Auditory Verbal Learning (RAVLT) test 1-5 24 words (percentile 5), RAVLT 6 and 7, 3 and 0 points (< percentile 5). Trail Making Test A and B (TMT), 90 and 315 seconds (percentile 10 and < 5). Phonologic (PF) and Semantic (SF) Fluency test in one minute, 18 and 14 (percentile 5 and 25). Clock drawing test (CDT) 6/7 points. No sign of depression was found. Thalidomide was stopped. She was reassessed one month later: MMSE 28/30. DD 6, ID 4. RAVLT 1-5 40 points (percentile 50); RAVLT 6 and 7, 4 and 5 worths (percentile 10). TMT A and B, 60 and 205 seconds (percentile 50 and 5). PF and SF 18 and 15 worth (percentile 5 and 25). CDT 6/7 points. Moreover, the patient was able to live alone again recovering her autonomy. Conclusions: Thalidomide may be associated with reversible cognitive impairment. Signs and symptoms improve after removing it.

#### **PB6 109 THE DETERMINANTS OF END STAGE RENAL DISEASES PATIENTS WITH DEMENTIA**

S. YEH\* (National Sun Yat-sen University, Kaohsiung , Taiwan)  
I. YEH(1), Y. LI(2) - (1) Koo Foundation Sun Yat-sen Cancer Center (Taipei, Taiwan); (2) National Sun Yat-sen University (Kaohsiung , Taiwan)

Introduction: End stage renal disease (ESRD) is a prevalent chronic, debilitating, and life-threatening condition that profoundly affects the patient's behavior, mood, cognitive processing, working capability, socioeconomic status, and quality of life. The purposes of this study were to examine the prevalence of ESRD with dementia, to investigate the difference between ESRD patients with and without dementia, and to determine the risk factors of ESRD patients with dementia. Methods and materials: We conducted secondary data analysis using administrative database from Bureau of National Health Insurance in Taiwan between 2000, 2002, 2004, and 2006. We firstly selected the patients diagnosed as ESRD and dementia, and then merged the data sets. Descriptive analysis was used to analyze the prevalence rate. T-tests and chi-square tests were used to explore the differences or association in demographic status, comorbidity, hospital characteristics and utilization between ESRD patients with and without dementia. Logistic regression was used to examine the risk factors of ESRD patients with dementia. Results: The prevalence of ESRD with dementia were 0.35%, 0.46%, 0.89%, and 1.08% for years 2000, 2002, 2004, and 2006, respectively. ESRD patients with and without dementia was significant difference in age, comorbidities, outpatient visits, and medical expenditures. Results from logistic regression indicated that patients were older, more comorbidities, using hemodialysis as their treatment therapy, and more outpatient visits had higher probability associated with dementia across all years. Conclusion: The prevalence of ESRD with dementia was lower than National's prevalence rate. ESRD patients who were older, had more comorbidities, had more outpatient visits, and undergone hemodialysis should receive more attention on dementia issue.

#### **PB6 110 STUDY OF MENTAL AND REGULAR TRAINING (SMART) IN PEOPLE WITH MILD COGNITIVE IMPAIRMENT: PRELIMINARY SCREENING RESULTS**

K. SIMPSON\* (University of Sydney, Sydney, Australia)  
M. FIATARONE SINGH(1), M. VALENZUELA (2), B. BAUNE (3), N. SINGH (4), H. BRODATY (5), P. SACHDEV (2), W. WEN (2) - (1) Faculties of Health Sciences and Medicine, University of Sydney (Sydney, Australia); (2) Neuropsychiatric Institute, University of New South Wales and Prince of Wales Hospital (Sydney, Australia); (3) Department of Psychiatry; School of Medicine, James Cook University (Sydney, Australia); (4) Senior Staff Specialist in Aged Care, Balmain Hospital (Sydney, Australia); (5) Aged Care Psychiatry and School of Psychiatry, University of New South Wales and Prince of Wales Hospital (Australia)

Introduction The aim of the SMART trial is to determine whether mental, physical or combined mental and physical training can prevent or slow cognitive decline in older adults at high risk of dementia. Methods and Materials 200 people with subjective memory complaint and mild cognitive changes determined by neuropsychiatrists, without an identified cause or dementia diagnosis will be randomly assigned to 6-months of supervised computer-based mental exercises, weight-lifting exercise, both interventions together, or a control condition for 90minutes, 3/week. Participants will have their cognitive abilities tested at baseline, 6-months, and 18-months, to determine whether long-term benefits occur. Results and Conclusion To date, 495 individuals have been telephone screened; mean age 69±8years, 63% female, mean Informant Bayer IADL score (functional deficits attributable to cognition) 1.7±0.9, and mean Telephone Interview Cognitive Status score (TICS) 26±4 out of 39 (equivalent to MMSE score 28). As planned, our cohort is in the range of the MMSE (>24) that is considered "not demented". Informant Bayer IADL was unrelated to age, gender or TICS. TICS was inversely related to age ( $r=0.22, p=0.005$ ); and TICS was significantly higher in women than in men ( $26±4$  vs.  $25±4, p=0.05$ ), but when controlled for age, this relationship was non-significant ( $p=0.10$ ). Seventeen eligible subjects (3% of those

screened) have been identified; main reasons for ineligibility include inability to commit (33%), too far to travel (17%), too physically active (9%), medical (8%), and below age cutoff (6%). Fifty-one percent of those screened in-person were ineligible, primarily because they were cognitively intact (mean MMSE score  $29.6±0.7$ ) Eight participants have commenced the intervention and no adverse events have occurred. Preliminary results are expected in 2010.

#### **PB6 111 CHARACTERISTICS OF ALZHEIMER'S DISEASE PATIENTS WITH A RAPID WEIGHT LOSS DURING A SIX-YEAR FOLLOW-UP**

O. GUÉRIN\* (University of Nice Sophia-Antipolis, Nice, France)  
A. SANDRINE(3), S. STÉPHANE(1), C. FREDERIC(4), C. CHRISTELLE(3), G. SOPHIE(4), V. BRUNO(4) - (1) University of Nice-Sophia Antipolis (France); (3) INSERM U558, Toulouse (France); (4) CHU Toulouse (France)

Background and aims: Weight loss in Alzheimer's disease (AD) may either be progressive or rapid, with different implications. The aim of this study was to characterize massive weight loss ( $\geq 5$  kg over 6 months) during a 6.5-year follow-up. Methods: 395 patients with AD (mean age 75.4 years) were included in a prospective single-centre cohort study (mean follow-up 2.5 years). A standardized gerontologic assessment was performed every six months, including nutritional, neuropsychological, functional, and caregiver burden evaluations, along with recording all intercurrent events before weight loss. Results: Among the 127 cases of weight loss (for 110 subjects, 27.8% of the population), we identified 60 cases of intercurrent illnesses and 88 cases of behavioral and psychological symptoms of dementia (BPSD) during the six months before weight loss. Three factors were independently associated with rapid weight loss: higher initial weight (HR=1.06, 95%CI [1.02,1.08]), higher Prognosis Inflammatory and Nutritional Index (HR=2.16, 95%CI [1.26,3.72]) and a higher Cohen-Mansfield agitation inventory score, reflecting BPSD (HR=1.05, 95%CI [1.01,1.10]). Cholinesterase inhibitors appeared as protective (HR=0.33, 95%CI [0.15,0.73]). Rapid weight loss was predictive of death at 6 months (HR=3.01, 95%CI [1.73,5.22]). Conclusion: BPSD play an important role in rapid weight loss and should be managed effectively. Biological assessment of malnutrition may be warranted.

#### **PB6 112 OPINIONS OF SPOUSAL CAREGIVERS OF PERSONS WITH ALZHEIMER'S DISEASE RELATED TO THE SERVICE SYSTEM – A QUALITATIVE ANALYSIS**

M. RAIVIO\* (Social Insurance Institution of Finland, Lahti, Finland)  
M. LAAKKONEN(1), K. PITKÄLÄ(2) - (1) University of Helsinki, Department of General Practice and City of Helsinki, Health Center, Laakso Hospital (Finland); (2) University of Helsinki,Department of General Practice (Finland)

Introduction: Dementia caregiving families are often dependent on services available. However, their subjective opinions about the service system has yet been studied fairly little. The aim of this study is to describe the opinions related to the service system of spousal caregivers of persons with Alzheimer's disease. Material and methods: A cross-sectional survey was performed to a random sample (N=1943) Alzheimer patients' spouses in Finland in 2005. In addition to structured questions related to the service needs and satisfaction with the services received, an open-ended question was inquired: "What kind of problems have you faced with the services?" These responses were analyzed qualitatively. Results: The response rate was 74%. Of them, 515 offered a written opinion of their service situation. The mean age of caregivers was 78.2 years and 63% were females. The opinions included critics to the service system: both to outpatient health and social services (N=140) as well as about problems related to the respite care or getting permanent nursing home bed (N=16). Caregivers criticized the decisions of social benefits, secrecy around the decisions and lack of money in communities (N=104). Bureaucracy was raised up in many responses. According to the opinions it was very difficult to get information related to the services (N=71). Non-constructive attitudes from health care workers were experienced among some caregivers (N=36). Suggestions were given to enhance the official service situation. Caregivers' own voice could be heard in their responses. Examples of the opinions will be given in the congress. Conclusions: The officially organized services meet the needs of spousal caregivers of demented individuals insufficiently. The opinions and needs of caregivers should be listened more carefully in order to improve the service system.

#### **PB6 113 CLINICAL UTILITY OF VOXEL-BASED SPECIFIC REGIONAL ANALYSIS SYSTEM FOR ALZHEIMER**

H. KANETAKA\* (Tokyo Medical University, Tokyo, Japan)  
H. HANYU(1), T. AKAI(1), T. SATOU(1), K. HIRAO(1), T. IWAMOTO(1) - (1) Tokyo Medical University (Tokyo, Japan)

Introduction: Voxel-based Specific Regional Analysis System for Alzheimers Disease (VSRAD) has recently been developed as an adjunctive diagnostic tool for early Alzheimers disease (AD) in Japan. This method, using three-dimensional (3D) MRI with statistical parametric mapping (SPM), provides objective information of brain atrophy. VSRAD can automatically calculate mean Z-score in the parahippocampal gyri. We investigated a correlation of Z-score with the severity of cognitive impairment to determine

whether VSRAD is useful for the clinical diagnosis of AD. Methods and materials: Forty-eight patients with mild very mild AD (MMSE score 26.8+/-1.6, range 28-25), 68 patients with mild AD (MMSE score 22.1+/-1.5, range 24-20), 33 patients with moderate to severe AD (MMSE 15.8+/-2.3, range 19-11) and 18 normal controls underwent 3D-MRI. First, VSRAD was used to conduct voxel by voxel analysis and Z-score mapping of all 3D-MRI images. Necessary Control Normal Database for the mapping was previously built into the software. Secondly, positive Z-score mean in the ROI was calculated. Results: Mean Z-scores were 1.83+/-1.35 in very mild AD patients, 2.13+/-1.31 in mild AD patients, 2.91+/-1.54 in moderate to severe AD patients, and 0.72+/-0.48 in normal controls, respectively. Z-scores in all AD groups were significantly higher than those in normal controls. In addition, Z-scores of parahippocampal gyri correlated significantly with MMSE scores. Conclusion: VSRAD is a useful method for the early diagnosis of AD, and also detect pathological atrophy of parahippocampal gyri reflecting the severity of the disease.

#### **PB6 114 PROGNOSIS OF MILD COGNITIVE DEFICIT ABOUT THE EVOLUTION TO ALZHEIMER'S DISEASE**

J. VILLALOBOS COMAS\* (University of Sinu, Montería, Colombia)  
D. SOTOMAYOR MERINO(1), G. HERNANDEZ BRANGO (1), L. DIAZ MORADT(1)- (1) University of Sinu (Montería - Códoba , Colombia)

Mild Cognitive Deficit (MCD) is a memory disorder which can develop Alzheimer's disease. In this study we evaluate 86 patients with MCD, following with neuropsychological tests during two years, and a factor of conversion around 20% was found in this period. Predominant factors of risk with epidemiologic significance for the progression to Alzheimer disease are social stress, change of usual place and disorders of verbal and visuo-spatial memory. Objectives: Determine the predominant factors of risk which affect the evolution of MCD to Alzheimer disease. Materials and Method eighty six patients were tested taking into account all the criteria for the diagnosis of MCD. Previously two tests were applied: Yesavage test and Mini-Mental Standard Examination (MMSE). A survey was applied in this people and includes sex, age, profession or trade, educative level, etc. The statistical analysis was made with de software Stata, version 8.0. Results: Eighty six persons participated in the study, distributed in 32 men and 48 women. Six patients die for cardiovascular disease (2), pulmonary disease (2) and stroke (2). We found a prevalence of MCD of 34%. We follow the patients for two years. Sixteen patients developed Alzheimer's disease, 6 patients in the first twelve months and 10 patients during the second year of following. In the study of the variables, values of statistical significance was obtained in the levels of hypertension, diabetes, alcoholism, social stress, change of place, displacement and high points in the evaluation of the visual and verbal memory. Conclusions: In our environment have a high prevalence of MCD, for this is important the study of psycho-biological or neuro-psychological processes which involve the mental health. Between the risk factors found, is necessary take educational and public health measures to prevent hypertension, diabetes and alcoholism.

#### **PB6 115 PREVIOUS HEPATITIS A VIRUS INFECTION IS RELATED TO SLOWER PSYCHOMOTOR SPEED IN ELDERLY**

C. HSIEH\* (Kaohsiung Medical University Hospital, Kaohsiung, Taiwan)  
C. LIU(1), T. FANG(1), Y. YU(2), C. LAI(1), H. KUO(3) - (1) Kaohsiung Medical University (Kaohsiung, Taiwan); (2) National Yang-Ming University (Taipei, Taiwan); (3) National Taiwan University Hospital (Taipei, Taiwan)

Introduction: Patients with chronic viral hepatitis are at a higher risk of cognitive dysfunction. Little is known about the association between hepatitis A virus (HAV) infection and cognitive function. Methods and materials: From the National Health and Nutrition Examination Survey, 1999-2002, we selected study participants ( $\geq 60$  years,  $n = 1529$ ) without hepatitis B, C or D virus infection, without previous hepatitis A vaccination, and without abnormal liver function. HAV-seropositive participants represented people with previous HAV infection. Cognitive function was measured by the Digit Symbol Substitution Test (DSST). Lower cognitive performance was defined if DSST scores fell below the 25th percentile of the study population. Results: HAV-seropositive participants had lower DSST scores than HAV-seronegative participants (mean, 39.8 vs. 51.1,  $P < 0.001$ ). We designated HAV-seronegative participants as the reference group. Univariate analysis demonstrated that the odds ratio (OR) of lower cognitive performance was 3.99 (95% confidence interval [CI], 2.86 to 5.57,  $P < 0.001$ ) and the coefficient of DSST score was -11.3 (95% CI, -13.2 to -9.3,  $P < 0.001$ ) for the HAV-seropositive participants. In a multivariate model, the adjusted OR of lower cognitive performance was 1.54 (95% CI, 1.04 to 2.29,  $P = 0.027$ ) while the adjusted coefficient of DSST score was -2.01 (95% CI, -3.66 to -0.37,  $P = 0.016$ ) for the HAV-seropositive participants. Conclusions: HAV seropositivity is associated with slower psychomotor speed among the US community-dwelling elders.

#### **PB6 116 LIGHTHOUSE PROJECT ON DEMENTIA, ULM, GERMANY – IMPROVEMENT OF ADVICE AND DIAGNOSTICS FOR PEOPLE SUFFERING FROM DEMENTIA AFTER THE CLASSIFICATION OF THEIR LEVEL OF CARE (ULTDEM STUDY).**

A. LUKAS\* (Bethesda Geriatric Hospital Ulm, Geriatric Center Ulm, Germany, Ulm, Germany)

C. V. ARNIM(2), M. OTTO(2), R. KILIAN(4), M. RIEPE(4), R. MUCHE(3), M. JAMOUR(5), S. MAYER(5), T. NIKOLAUS(1) - (1) Bethesda Geriatric Klinik Ulm (Ulm, Germany); (2) Neurologische Universitätsklinik Ulm (89073, Germany); (3) Biometrie Universität Ulm (Ulm, Germany); (4) Klinik für Psychiatrie und Psychotherapie Universität Ulm/Günzburg (Germany); (5) Geriatrische Rehabilitation Krankenhaus Ehingen (Germany)

Introduction: The Geriatric Center Ulm scientifically supported a three-year pilot study (ProjektDEMENZ Ulm), in which numerous findings on the system of care regarding people suffering from dementia and their relatives were determined. One of the most important conclusions is the significant lack of information on the well-functioning network of the care system in Ulm. The full potential of the network is not being exploited. The situation in the Alb-Donau-Kreis – the area surrounding Ulm – is very similar.

Objective: Our aim is to improve the utilization of the system of care for those suffering from dementia in Ulm/Alb-Donau-Kreis by using a newly designed advisory approach. Patients and family members are provided with the relevant information at the time it is actually required by combining the advisory service with care level classification. The purpose of the study is to prove the effectiveness of this procedure by using a prospective, open, randomized, controlled, interventional study. Methods: After the randomization, the interventional group is given comprehensive, individual advice about available treatment possibilities for people suffering from dementia. In addition, they have the opportunity to re-evaluate their present diagnostic procedure. The participants of the control group receive the standard treatment. Inclusion criterion is the application of a care level (level 0 or 1). Recruitment will take one year. A final assessment will be taken every six months. Outcome measures: using parallel targets e.g. quality of life, cost-effective, using support possibilities. Results: Since the study is going to last until the end of the Year 2009, only preliminary data are available. A successful conclusion to the project will lead to easy implementation in neighbouring areas, because existing care systems do not have to be adapted in any way. (Supported by the Ministry of Health, Germany)

#### **PB6 117 BULLOUS PEMPHIGOID AND DEMENTIA IN ELTERS**

C. FERNANDEZ-VIADERO\* (Parayas Psychiatric Hospital, Camargo-Cantabria, Spain)  
F. ARCE-MATEOS(2), M. BECERRA(3), M. BOLADO(1), R. VERDUGA(4), D. CRESPO(4) - (1) Parayas Psychiatric Hospital, Government of Cantabria (Camargo-Cantabria, Spain); (2) Pathology Department, Valdecilla University Hospital (Santander, Spain); (3) Primary Care, Government of Cantabria (Santander, Spain); (4) Department Anatomy Cell Biology, University of Cantabria (Santander, Spain)

INTRODUCTION: Bullous pemphigoid (BP) is an autoimmune subepidermal blistering disease seen primarily in elderly persons and is clinically characterized by the development of blisters. The coexistence of BP with various neurological disorders has been reported, although the relationship between these entities has yet to be explained. Our aim was to study the relation between the occurrence on BP in an institutionalized population and its possible association with dementia in these patients. METHODS: We performed a ten-year prospective study of all elders with blistering disease living in a nursing home. Standard skin biopsy procedure and direct immunofluorescence study of blisters were performed. Clinical variables were: dementia diagnosis, according DSM-IV criteria, and cause of death, if the patient died in the ten year period. This information was obtained from clinical records. Chi-square, t-test for independent samples and survival analysis were performed. RESULTS: We followed during the ten-year period a total population of 477 elder. Of them, 59 (52 women and 7 men) presented with skin blisters. After excision-biopsy of one blister per person, 31 showed pathologic criteria for BP. There was neither age difference between elders with or without BP, nor in survival or pursuing months after diagnosis (85.9 vs 86.3 years and 17.5 vs 24.5 months respectively,  $p: 0.81$  and  $p: 0.22$ ). Cross tab between BP and dementia does not show differences by Pearson chi-square (value: 0.69, 1 df,  $p: 0.40$ ). Survival curves in the group of BP and the group of non immune blisters were similar CONCLUSIONS: BP showed a high incidence in our institutionalized elder population. We did not find differences in survival time after diagnosis when comparing BP and non immune blisters, and there was no relationship between BP and dementia.

#### **PB6 118 AN AUDIT OF NATIONAL GUIDANCE ON STRUCTURAL IMAGING IN PATIENTS WITH SUSPECTED DEMENTIA**

A. PRASANNA\* (Wolverhampton Primary Care Trust, Wolverhampton, United Kingdom)  
A. EJAZ(1), A. PATEL(1) - (1) Birmingham & Solihull Mental Health NHS Trust (Birmingham, United Kingdom)

Introduction: In their guidelines 'Dementia: supporting people with dementia and their carers in health and social care' (2006) the National Institute of Clinical Excellence (NICE) state that structural imaging should be used in assessment of elderly patients with suspected dementia to exclude other cerebral pathologies and help establish subtype diagnosis. Magnetic Resonance Imaging (MRI) is preferred to assist with early diagnosis and detect subcortical vascular changes, although Computerised Tomography (CT) scanning could be used. However, a cost utility analysis (Foster 1999) indicates that imaging is most useful in under-65's with uncertain clinical diagnosis. We set out to establish adherence to NICE guidelines on structural imaging in patients with suspected dementia referred to the older adult service in Birmingham & Solihull Mental Health

Foundation Trust. Method: In June 2008, we audited all new referrals with suspected dementia to our service between September 2007 and June 2008. Data was recorded and cross-checked with medical and electronic records. We expected to find 100% criteria to meet with the standard. Results: Of 40 referrals with suspected dementia, mean age was 79 years (range 65 – 93). Structural imaging to confirm diagnosis was requested in 26 cases (65%); 19 patients had CT scan of the head, 1 patient had MRI, 4 patients were awaiting scan and 1 patient refused the CT scan appointment. Diagnosis of dementia (Alzheimer's, Vascular and Mixed type) was confirmed using the results of the structural imaging in 20 patients. In 15 patients diagnosis had been confirmed on clinical basis. Conclusion: For the 35% patients who were not offered structural imaging and were diagnosed with Vascular dementia, a possible change in diagnostic classification following a CT scan would have allowed access to anti-dementia drugs. However, this may not be the preferred choice based on clinical opinion and cost utility.

#### **PB6 119 DEVELOPING CHAIN OF CARE FOR HOME-DWELLING PATIENTS WITH DEMENTIA**

J. RIIHIMÄKI\* (City of Helsinki Health Center, Helsinki, Finland)  
A. NIEMELÄ(1), E. SALMINEN(1), M. ISO-AHO(1), K. TOLONEN(1), K. PITKÄLÄ(1) - (1) City of Helsinki Health Center (Helsinki, Finland)

Introduction: In Helsinki the number of dementia patients will increase 25% in 10 years. Dementia will intensify the need for social and health care services. Yet, only half of the patients are properly diagnosed, and there is accumulating evidence of underused treatment models which may improve dementia patients' care. For example, dementia care coordinator and comprehensive geriatric assessment can postpone institutional care of these patients. Even small changes in the therapeutic practice could significantly reduce the costs of treatment and improve these patients' quality of life. Methods and material: In Helsinki, in 2005-8 home nursing was reorganized and includes now seven physicians specialized in geriatrics, and five dementia care coordinators. A project to develop the chain of care among patients with dementia was started in order to intensify the diagnostics of dementia, and to improve the quality of care. A half-a-year education with activating learning methods was created for home nursing teams to improve their knowledge and skills in dementia. Structured feedback was collected from the teams participating the education (Likert scale). Results: Multiprofessional team developed the model for chain of care for dementia patients (N>3500) in Helsinki home nursing unit. Diagnostics were implemented by the home nurses and geriatricians during the normal home visits. The principles in the development of the chain of care were to improve continuity and comprehensiveness of care. The professionals participating the educational process benefitted from training: especially in internalizing the guideline of dementia care (mean 3.5), in learning about behavioural symptoms of dementia (3.8), and in applying the learned issues on their own patients (3.8). A detailed analysis of the project and educational feedback will be presented. Conclusions: It is possible to implement evidence-based practice in geriatric home nursing even in a short period of time.

#### **PB6 120 REDUCING SUNDOWNER SYNDROME IN ALZHEIMER'S WITH SLEEP AND REST**

P. MELLOR\* (Age Concern Pty Ltd, Ormond , Australia)  
J. GREENHILL(1) - (1) Flinders University Rural Clinical School (Renmark, Australia)

Introduction This study was designed to address the major care issue of late afternoon disturbed and dysfunctional behaviours in residents with Alzheimer's and non-Alzheimer's dementia, by the introduction of managed, person focused rest and sleep routines. The research was based on Progressively Lowered Stress Threshold model (Hall, 1987), for sufferers of Alzheimer's disease and related disorders. The use of a theoretical model for planning, implementing and evaluating care for clients with a dementia syndrome should provide guidelines for interventions and a mechanism for evaluating outcomes Method A series of case studies was used in a rural based aged care facility, where residents with dementia were not in a specific unit. Of the five major stressor groups identified as causing disturbed and dysfunctional behaviours this study focused on fatigue as the cause of late afternoon disturbed and dysfunctional behaviours (Sundowner Syndrome). The six (6) residents selected for the study were permitted to wake spontaneously in the morning and had rest periods introduced during each afternoon. The Cohen Mansfield Agitation Inventory (CMAI) was used to measure the behaviours pre and post intervention. Results There was better than expected results, with marked changes in each person's behaviours. Changes included episodes of wandering being reduced by 50% in some of the residents and cursing and verbal aggression episodes being reduced from 15 to 8 episodes. The interventions worked at various levels for each of the residents but had no detrimental effect of night time sleep. Conclusion While there were only six (6) case studies, with marked but varying levels of effect for each resident, this had a flow on effect of reducing staff stress and provided an alternative to the use of chemical and physical restraints. Further research is required.

#### **PB6 121 BLOOD MERCURY LEVEL AND RISK OF DEMENTIA: THE CANADIAN STUDY OF HEALTH AND AGING.**

E. KRÖGER\* (Laval University, Quebec, Canada)  
R. VERREAULT(1), P. AYOTTE(2), É. DEWAILLY(2), J. LINDSAY(3), D. LAURIN(4) - (1) Laval University, Centre of Excellence in Aging (Québec, Canada); (2)

Laval University, Faculty of Medicine (Québec, Canada); (3) University of Ottawa, Department of Epidemiology and Community Medicine (Ottawa, Canada); (4) Laval University, Faculty of Pharmacy (Québec, Canada)

Introduction: Mercury exposure may be involved in the pathophysiology of neurodegenerative diseases including Alzheimer's disease (AD). Fish consumption may protect against dementia, partly because fish is rich in omega-3 polyunsaturated fatty acids (n-3 PUFA). However, fish can be contaminated with methylmercury. Methods and materials: The Canadian Study of Health and Aging (CSHA) is a population study of a representative sample of persons aged 65+ years, conducted from 1991 to 2002. We evaluated the association between blood mercury level and the incidence of dementia or AD in the CSHA while adjusting for n-3 PUFA, apolipoprotein E epsilon4 allele and other confounders. Analyses were based on 669 subjects with complete clinical assessment, who had provided blood samples and for whom follow-up information was available. Results & conclusion: After a mean follow-up of 4.8 years, there were 150 incident cases of dementia, including 106 cases of AD. The median blood mercury level was 3.2 nanomol/L (interquartile range, 1.5 – 6.1 nanomol/L), well below reference values for toxicity. Mercury level was not associated with an increased risk of dementia. In contrast, in Cox regression models with age as the time scale and adjustment for n-3 PUFA and other confounders, a mercury level in the highest quartile was associated with a reduced risk of dementia (hazard ratio of 0.54 (95% confidence interval: 0.34, 0.86)). Risk reductions were similar for AD. These associations were modified by n-3 PUFA blood level, as significant risk reductions were limited to subjects presenting above median levels of both mercury and n-3 PUFA, two biomarkers of fish consumption. These results do not provide evidence for an adverse association between comparatively higher mercury levels and incident dementia, but may indicate a protective effect of fish consumption.

#### **PB6 122 GLOMERULAR FILTRATION RATE (GFR) MEASUREMENT AND ESTIMATION IN HEALTHY ADULTS WITH AGING**

S. XUEFENG\* (Kidney Institute and Key Lab of PLA, Beijing, China)  
X. SUN(1), Y. CHEN(1), X. CHEN(1), J. WANG(1) - (1) Kidney Institute and Key Lab of PLA (Beijing, China)

Introduction -Mounting evidence showed that GFR declines during aging, but whether the cause is aging per se is still unknown. So we conducted cross-sectional study in Beijing to determine the relationship between GFR and age, the associated factors and the accurate method of GFR in healthy adults. Methods and materials-201 healthy subjects were selected from 1627 community-dwelling population, aged 30-88.8 years. Renal function was determined using the technetium 99m labeled-diethylenetriamine pentaacetic acid (99mTc-DTPA). Estimated GFR was evaluated with the Cockcroft-Gault(CG)equation, Modification of Diet in Renal Disease (MDRD) equation, and plasma clearance of creatinine (Ccr). Blood sample analysis was performed for cystatin C, biomarkers of inflammatory and endothelial cells function. Protein intake was assessed with Food Frequency Questionnaire (FFQ); Carotid artery intima-media thickness (IMT) and plaque formation were assessed with ultrasonography. Results- In healthy adults, Measured and estimated GFR declined with age after 40 years( $P<0.001$ ), while Cystatin C serum level had positive correlation with age( $p<0.001$ ). In the multiple regression model, age, cystatin C, uric acid, CRP and body mass were associated with 99mTc- DTPA -GFR. GFR of those subjects who ingested over 1.1g/(kg/day) of protein people declined more slowly than those below 1.1g/kg per day. Carotid artery intima-media thickness and plaque formation had no association with GFR in multiple variate analysis. As for the area under ROC, the best parameter for estimation of GFR was Ccr, MDRD equation was less accurate in all methods( $P<0.001$ ). Conclusion: In healthy adults, measured and estimated GFR decreased with aging, which was associated with protein intake, but not atherosclerosis. CG, MDRD equation and Ccr can be used to estimate GFR, but there was significant bias with 99mTc- DTPA -GFR.

#### **PB6 123 WELLNESS IN OLDER WOMEN: BEING AND DOING**

J. FOOTTIT\* (Queensland University of Technology, Kelvin Grove, Australia)  
J. ABBEY(1), D. ANDERSON(1) - (1) Queensland University of Technology (Kelvin Grove, Australia)

Introduction: As a result of increased longevity and better healthcare there are growing numbers of women who will live beyond 85 years of age. The study to be reported examined perceptions of wellness in older adults and found that women aged 85-90 had lower perceptions of wellness than those 65-70, 70-75 or 80-85. This finding was further examined with a qualitative approach and these results will be reported Method: .Focus groups were conducted with women (N=24) and men (N=4) aged 85-90 to explore the findings of the earlier survey. A realist method of thematic analysis was used to report the experiences, meaning and realities of the participants. Themes were identified from the insights it provided into how older women viewed wellness. Results: For older women perceptions of wellness related more to being able to do what they wanted to do than to how they viewed health; co-morbidities did not impact on their perception of wellness unless it interfered with their ability to do what they wanted to; social networks of friends and family were very important, with sub-themes of wanting to be involved in the lives of their children and grandchildren, and needing to manage loneliness as a result of changing life circumstances and loss of long term irreplaceable friendships. Older old women

viewed shopping centres as social hubs that they used to remain in touch with the community, to manage loneliness and for exercise. Loneliness was a significant contributor to how the women experienced their perception of wellness. Conclusion: For older adults, in particular older women, to stay well, an holistic approach is needed that includes paying attention to the social environment, opportunities for safe socialising and supporting older adults to stay active and engaged with their communities.

**PB6 124 OPPOSITE EFFECTS OF METABOLIC SYNDROME AND CALORIE RESTRICTION UPON THE PREVALENCE OF DISABILITY: BRAZIL AND JAPAN AS OPPOSED POPULATIONAL MODELS OF BIOLOGICAL AGING.**

M. RORIZ-CRUZ\* (Brazilian Federal University of Rio Grande do Sul State., Porto Alegre, Brazil)  
I. ROSSET(2), T. WADA(3), T. SAKAGAMI(3), J. RORIZ-FILHO(2), E. MORAES(1), R. RODRIGUES(2), T. KITA(3), M. CHAVES(1), K. MATSUBAYASHI(3) - (1) Brazilian Federal University of Rio Grande do Sul State (Porto Alegre, Brazil); (2) University of São Paulo (Brazil); (3) Kyoto University (Japan)

Introduction: Japanese people have the lowest prevalence of obesity and Metabolic Syndrome (Met.S), and the highest life expectancy in the developed world. In this sense, Japan can be considered a populational model of calorie restriction. In contrast, the Southern Brazilian region has one of the world highest prevalences of obesity and Met.S. We aimed to evaluate how much calorie intake, Basal Metabolic Rate (BMR), and Met.S might contribute to explain the apparently large different prevalence of Functional Dependence (FD) between Brazilian (42.0%) and Japanese elderly (6.5%), as previously described by different researchers using similar ADL scales. Methods: We evaluated 422 community-dwelling elderly in Brazil and 410 in Japan. FD was evaluated using validated ADL, IADL, and Neurosensorial scales. Diet was evaluated using the Japanese-Brazilian Diet Frequency Questionnaire. All reported p-values were < 0.05. Results: FD was 2.7-3.7 times more common in Brazil than in Japan. Mean BMI was 27.9 Kg/m<sup>2</sup> in Brazil and 22.6 in Japan, and percentage of fat mass was 32.8% and 26.9%, respectively. Prevalence of Met.S was 39.3% in Brazil, but only 7.3% in Japan. Mean 'caloric intake/height in meters' was 1,717 Kcal/day in Brazil, but only 1,141 in Japan. Adjusted mean BMR was estimated to be 31.4 Kcal/kg in Brazil and 21.9 in Japan. Conclusions: Japanese elderly had a 33.6% lower 'height-adjusted caloric intake' and a 30.3% lower BMR than Brazilians. Met.S explained 65.1% of the FD prevalence gap between Brazil and Japan. The much higher prevalence of FD in Brazil, as compared with Japan, points toward a more accelerated biological aging among Brazilians, which is in accord with their higher caloric intake and BMR.

**PB6 125 PERCEPTION OF SKIN AGEING IN A POPULATION AGED OVER 60 YEARS IN FRANCE: SURVEY RESULTS**

A. SCHMITT\* (PIERRE FABRE DERMO COSMETIQUE, TOULOUSE, France)  
V. MENGEAUD(3), V. BRUNO(1), V. CAROLINE(2), S. ANNE-MARIE - (1) Hôpital Casselardit (Toulouse, France); (2) Hôpital Casselardit (Toulouse, France); (3) Pierre Fabre Dermo Cosmétique (France);

Study objective: People aged between 60 and 75 years form an active population. When they retire they wish to enjoy a new episode in their lives and to maintain for as long as possible a physical and mental state. Worries about appearance are quite justified and use of cosmetic products and procedures is growing rapidly. We conducted a national survey in order to gain a more detailed knowledge of perception of the signs of skin ageing, habits with regard to sun exposure, and cosmetic routines in the French over-60 age group. Methods: Survey conducted from May to October 2008. 18,000 questionnaires were sent out with the magazine "Ageing with Success" to clubs for the elderly in all regions of France. This questionnaire was intended for men and women over the age of 60 years. Results: 506 questionnaires completed were analysed. Mean age was 72.6 years; 84.2% women and 15.7% men. Results showed that the French over-60 population has had little exposure to the sun. Sixty years was the mean age at which this population seemed to become aware of the signs of skin ageing such as wrinkles, loosening of the skin and pigment spots. As regards cosmetic routines, 78% of the senior population, largely women, used cosmetic products on the face, 52% on the body. Moisturisers and nourishing products were used. As regards cosmetic treatments, less than 4% of the population said they had undergone aesthetic treatment such as cosmetic surgery, laser treatment, peels, Botox or hyaluronic acid injection. Discussion: Surprisingly, 60 years seems to be the age at which men and women both start to notice the signs of skin ageing. Population of mean age 72 years had had very little recourse to aesthetic treatments.

**PB6 126 ELDERLY BLADDER PHAECHROMOCYTOMA : A CASE REPORT**

C. FOQUEM\* (Hospital University of Besancon - Jean Minjoz's hospital, BESANCON, France)  
F. KLEINCLAUSS(2), F. MONNIER(1), M. DEGOIS(1), L. PETIT(1), H. CLERSON(1), H. BITTARD(2), M. BECKER-SCHNEIDER(1) - (1) University hospital of Besancon -

Geriatric department (BESANCON, France); (2) University hospital of Besancon - Urology department (Besancon, France)

Introduction: Bladder phaeochromocytoma is a rare bladder tumour resulting from neuroectodermic cells; approximately 220 cases have been reported in literature. It is exceptionally diagnosed after 65 years of age. The oldest patient previous reported is 81-year-old. Methods and materials: We report a case of bladder phaeochromocytoma in an 87-year-old man, diagnosed during an encephalopathy hypertension assessment. Results: Common presenting features of this tumour include: hematuria or catecholamine hypersecretion symptoms related to micturition. However the clinical manifestations of this rare neoplasm are often elusive. Diagnostic modalities include measurement of plasma and urinary catecholamine, cystoscopy, computed tomographic (CT) scanning, and [131I] meta-iodobenzylguanidine (MIBG) radioactive scintigraphy. The treatment of choice is partial cystectomy, with appropriate control of blood pressure and blood volume. Postoperative follow-up is required, as recurrence has been observed. In our observation, the resection of the bladder tumour was postponed due to the patient's important comorbidities. Conclusion: Although exceptional, bladder pheochromocytoma could be diagnosed in the elderly. Our patient is the oldest with a bladder phaeochromocytoma ever reported.

**PB6 127 CAN WE LIMIT POSTOPERATIVE DELIRIUM IN PATIENTS MORE THAN 75 YEARS AFTER SURGERY FOR DIGESTIVE CANCER ?**

T. CUDENNEC\* (CHU Ambroise Paré, Boulogne Billancourt, France)  
S. MOULIAS(1), A. BROUSQUET(1), S. BENOIST(1), B. NORDLINGER(1), L. TEILLET(1) - (1) CHU Ambroise Paré (Boulogne Billancourt, France)

The purpose of this prospective study was to determine the incidence and risk factors of delirium after digestive surgery in elderly patients with cancer. Methods: During the 2 years of the study, 108 patients aged more than 75 years were included. Inclusion criteria were major elective surgery and a score over than 10/30 at the Mini Mental State Examination (MMSE). Before surgery, they received a geriatric assessment including an assessment of autonomy with the Activities of Daily Living (ADL) and the Instrumental Activities of Daily Living (IADL), cognitive function (MMSE), mood by the mini-Geriatric Depression Scale (mini-GDS), functional autonomy (Timed Get up and go test), comorbidities and lifestyle. A new geriatric assessment was carried out within four postoperative days. The Confusion Assessment Method was used to confirm the diagnosis of delirium. Results: The mean 5 years. Among these patients, 73 have age of patients was 81 colorectal resection, 15 oesogastric resection, 12 pancreatic surgery and 7 liver surgery. Delirium was observed in 27 patients (25%). In all cases, delirium symptoms were reversible at one month. In multivariate analysis, 3 independent risk factors of postoperative delirium have been identified: ASA score ( $p = 0.03$ ), functional autonomy ( $p = 0.01$ ) and use of tramadol to control pain after surgery ( $p = 0.0002$ ). Morbidity and mortality were not statistically different between patients who experienced delirium or not. Postoperative length of stay was  $19 \pm 11$  days in patients with delirium and  $13 \pm 8$  days in others ( $p = 0.01$ ). Conclusion: A preoperative geriatric assessment is desirable before surgery for digestive cancer after age 75 when autonomy is reduced or ASA > 2. Tramadol should be prohibited in post-operative course for this population. Delirium during this period is not correlated to surgical complication but extends the length of hospitalization.

Salvini", Garbagnate Milanese (garbagnate milanese, Italy); (5) Chef of Social Management of "A.S.L. Provincia di Milano n° 1" (Italy); (6) Department of Heart-Intensive Therapy – Hospital "A. O. Ospedale Niguarda Ca' Granda (Italy)

It's known that the aging of the organism is accompanied to a greater probability to contract diseases (tumour, insanities, cardiovascular diseases) in whose pathogeneses the immune system often carries out a not secondary role; with the aging, in fact, the ability of the immune system would come to get lost to discriminate among "self" and "not self", made this that it would justify on one side, the presence auto-antibodies directed towards own structures of the organism; and from the other the progressive inability to produce antibodies towards exogenous antigens. The present study has tried to estimate if the advanced age and much being left over greater frequency of auto-antibodies. 245 subjects have participated to the study apparently heal of age comprised between the 18 and 98 years subdivided into 3 groups: group A n=70 (ages 18 - 65 average  $44.8 \pm 3.87$ ); group B n=136 (ages 66 - 85 average  $78.79 \pm 4.2$ ); group C n=39 (ages more 86 average  $89.5 \pm 1.96$ ). All the patients have been recruited near the Assisted Sanitary Residence "S.Pertini", the National Institute of the Tumors; these patients were in good conditions of health and they were not subordinates to therapies in a position to interfering with the immune system. We have estimated the frequency of positiveness for ANA (n=211),

ASMA (n=157), APCA (n=150), Antibodies anti-LKM (n=149), ENA (n=68), Antibodies anti-nDNA (n=105), HTGA (n=158). Our data have not evidenced meaningful differences in the presence of auto-antibodies in the different age classes, in exception of the ANA, for which we have observed an increase of the positiveness correlated age: group A=3,6%, group B=30,1%, group C=34,5% (p less 0.05).

**PB6 129 USEFULNESS OF FRAILTY MARKERS IN THE ASSESSMENT OF THE HEALTH AND FUNCTIONAL STATUS OF OLDER CANCER PATIENTS REFERRED FOR CHEMOTHERAPY: A PILOT STUDY**

F. RETORNAZ\* (Centre Gerontologique Départemental, Marseille, France)  
J. MONETTE(2), G. BATIST(2), M. MONETTE(2), N. SOURLIA(2), D. SMALL(2), S. CAPLAN(2), D. WAH CHOW WAH(2), M. PUTS(2), H. BERGMAN (2) - (2) Jewish General Hospital, McGill University (Montreal , Canada)

Background: Older cancer patients seen in an oncology clinic seem to be healthier and less disabled than traditional geriatric patients. Choosing the most sensitive tools to assess their health status is a major issue. This cross-sectional study explores the usefulness of frailty markers in detecting vulnerability in older cancer patients. Methods: The study included cancer patients  $\geq 70$  years old referred to an oncology clinic for chemotherapy. Information on comorbidities, disability in instrumental activities of daily living (IADL) and activities of daily living (ADL), and seven frailty markers (nutrition, mobility, strength, energy, physical activity, mood, and cognition) was collected. Patients were classified into four hierarchical groups: 1- No frailty markers, IADL, or ADL disability; 2- Presence of frailty markers without IADL or ADL disability; 3- IADL disability without ADL disability; 4- ADL disability. Results: Among the 50 patients assessed, 6 (12.0%) were classified into Group 1, 21 (42.0%) into Group 2, 15 (30.0%) into Group 3, and 8 (16.0%) into Group 4. In Group 2, 7 patients (33.3 %) had one frailty marker, and 14 (66.7%) had two or more. The most prevalent of the frailty markers were nutrition, mobility, and physical activity. Conclusion: The assessment of seven frailty markers allowed the detection of potential vulnerability among 42% of older cancer patients that would not have been detected through an assessment of IADL and ADL disability alone. A longitudinal study is needed to determine whether the use of frailty markers can better characterize the older cancer population and predict adverse outcomes due to cancer treatment.

**PB6 130 EXPERIENCE OF XEROSTOMIA, MANAGEMENT AND OUTCOME IN PATIENTS WITH HEAD AND NECK CANCER POST RADIATION**

P. KATHASEMA\* (Ramathibodi School of Nursing, Faculty of Ramathibodi Hospital, Mahidol University , Bangkok , Thailand)  
P. PUTWATANA (1), D. JUNHAVAT (1) - (1) Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University (Bangkok, Thailand)

The purpose of non experimental descriptive crosssectional study design was to describe experience of xerostomia, management and outcome, and its relationship in patients with head and neck cancer post radiation. The model of symptom management revised by Dodd, et al. (2001) was applied as the conceptual framework of the study. The participants included 100 patients with head and neck cancer post radiation, recruited by means of purposive sampling from Otolaryngology at In and Outpatient Department, Department of Radiology of a university hospital. Data were collected using a set of questionnaires, which included a patients' profile form, xerostomia-related quality of life questionnaire, xerostomia questionnaire, a symptom management strategies questionnaire during January to April 2008. Descriptive statistics and Pearson Product Moment Correlation were used in data analysis. Results showed that, the major of the participants were male (70%), ages between 18 to 77 years, had nasopharyngeal cancer(41%), and received combination treatment with chemotherapy and radiation therapy. The actual range of experience of xerostomia score were 5 to 95 (mean=51.45, SD. = 22.32). The top five most favorable methods for management were: 1) foods containing water, sipping water (99%); 2) avoiding spicy food, salty taste (98%); 3) mouth rinsing and avoiding alcoholic drinking and tobacco smoking (96%); 4) toothbrushing after meal (95%); and 5) following up with dentist (92%). The sources of knowledge in managing the symptom were physicians (84%) and nurses (61%). More than half (57%) reported that their xerostomia had gained improvement. The overall xerostomia related quality of life actual score was 1 to 56 (Mean=17.61, S.D =11.13). There were significant correlation between xerostomia and quality of life, xerostomia and dose of radiation. The findings suggested that all patients had mild to severe xerostomia. There are baseline data to develop the practice guideline.

**PB6 131 UNKNOWN GERIATRIC SYNDROMES DEPICTS BY COMPREHENSIVE GERIATRIC ASSESSMENT IN ELDERLY CANCER PATIENTS. PRACTICE OF A FRENCH PILOT UNIT OF GERIATRIC ONCOLOGY**

M. CECILE\* (Institut Paoli-Calmettes, Marseille, France)  
F. ROUSSEAU(1), C. BRATICEVIC(1), D. BALDACCI(1) - (1) Institut Paoli-Calmettes (marseille, France)

Introduction : In 2006, nine Pilot Unit of Geriatric Oncology were created to promote education information and clinical research in geriatric oncology. In Marseille it is based on the coordination of a geriatrician an oncologist and a nurse practitioner. We report on the first 170 elderly patients seen during one year. Methods and Materials: Patients were

seen on request of oncologists, hematologists, or geriatrician. A comprehensive geriatric assessment and a social questionnaire were administered by nurse practitioner. Functional dependencies were assessed by Katz Index and Lawton Index. Cognition was assessed with the mini COG. The mini GDS screened for depressive symptoms. Pain was assessed with EVA and nutrition was evaluated through the Mini-MNA. Comorbidities and comedications were listed. At the end of the consultation a treatment schedule was proposed. Results : 170 patients were referred. Median age was 83, 106 were female, 33% had more than 3 co-morbidities, 82% had more than 4 co-medications. 60% had no disability on ADL and 86% had at least one disability on IADL. 54% of patients present malnutrition and 26% had cognitive impairment. 26% of patients had probability of depression. 43% had gynecological tumors, 36% genitourinary tumor, 11% colorectal carcinoma and 10% had other tumors. 51.7% had metastatic involvement. 52% of patients received chemotherapy, 12% hormonal therapy, 17% radiation or radiochemotherapy, and 19% best supportive care. Social intervention was needed in 22% of patients. Supportive cares were initiated in 10% of patients. Patients with cognitive impairment (40) received less chemotherapy, more hormonal therapy, radiation therapy and supportive care. Conclusion : Our study depicts geriatrics and oncologists characteristics of elderly cancer patients. A longitudinal study is necessary to describe patients' outcomes according to their geriatric assessment. Involvement of nurse practitioner was crucial making geriatric assessment feasible and less time consuming in an oncologist environment.

**PB6 132 LYMPHOMA OF THE PITUITARY STALK: ABOUT ONE CASE AND REVIEW OF THE LITERATURE**

S. KRYPCIAK\* (Henri Mondor's Hospital, Creteil, France)  
P. CAILLET(1), J. VOURIOT(1), C. AJZENBERG(1), M. BERLE(1), E. PAILLAUD(2) - (1) Henri Mondor's Hospital (Cretail, France); (2) Albert Chenevier's Hospital (Cretail, France)

Introduction : Tumors of the pituitary stalk are rare and it is sometimes difficult to determine the cause.Methods and materials: We have reported a case of a primary lymphoma of the pituitary stalk in a 78 years old patient with a review of the literature. Results: only 8 similar cases have been published. In this series, symptoms were dominated by headache, asthenia and diplopia. Biologically, anterior pituitary hyposecretion and/or hyperprolactinemia were found in the majority of cases. In terms of imagery, only 3 patients presented an initial and isolated lesion of the stalk. The histological evidence was provided by a trans-sphenoidal biopsy in case of hypothalamic or pituitary associated lesion, or by a trans-cranial biopsy in the event of an isolated lesion. As an alternative, a lumbar puncture could be performed, less invasive but also less performant. Current treatment relies on chemotherapy with intra-venous methotrexate and intra-thecal methotrexate infusion if the cytology is positive in the cerebrospinal fluid. Radiation therapy can be prescribed depending on age. Unfortunately, the results remain disappointing with a median survival of 9 months. Conclusion: primary lymphomas of the pituitary stalk are rare and have very bad prognosis.

**PB6 133 LEVEL OF FUNCTIONING AND MORTALITY AMONG US STROKE SURVIVORS**

K. MULHORN\* (Drexel University, Philadelphia, United States)  
D. LEVINE(2) - (2) The Ohio State University College of Medicine (Flint, MI, )

Objectives: 1) To assess the association of health care access and mortality in a recent national sample of US stroke survivors. 2) To determine whether this association differs for disabled and non-disabled US stroke survivors. 3) To identify factors associated with increased mortality among US stroke survivors that may inform potential health policy solutions. Scientific Rationale: In 2004, 5.7 million US stroke survivors required comprehensive care and secondary prevention including risk factor modification. Stroke survivors have an increased risk of cardiovascular events that increase their morbidity, mortality, and health care costs. Our research has found that a significant proportion of disabled and non-disabled US stroke survivors have reduced access to health insurance, physician care and medications. Little is known regarding the relationship between health care access and mortality among US community-dwelling stroke survivors and whether this relationship varies by neurological disability. We will examine the association of health care access and mortality in US stroke survivors using a population-based survey. Methods: Among 3,222 stroke survivors aged  $\geq 18$  years who responded to the National Health Interview Survey (NHIS) 1997-2000, we will measure 2-year mortality using the NHIS Linked Mortality Files which link records of adult NHIS participants with death records from the National Death Index. The main outcome will be all-cause mortality and the secondary outcome will be cardiovascular mortality. The primary dependent variable will be health insurance status. The secondary dependent variables will be inability to afford medications, no general doctor visit, no medical specialist visit and out-of-pocket medical expenses. With Cox regression analysis, we will adjust associations between access measures and death for age, sex, race/ethnicity, and other measures.

**PB6 134 RISK FACTORS OF CAROTID INTIMA-MEDIA THICKENING AND PLAQUES FORMATION IN HEALTHY ADULTS**

X. SUN\* (Kidney Institute and Key Lab of PLA, Beijing, China)  
Y. CHEN(1), X. CHEN(1), X. BAI(2), H. LIN(3), J. WANG(1) - (1) Kidney Institute and Key Lab of PLA (Beijing, China); (2) the First Affiliated Hospital, China Medical

University (Shenyang, China); (3) the First Affiliated Hospital of Dalian Medical University (China)

**Introduction**—Although assessment of carotid artery intima-media thickness (CIMT) is a surrogate marker of atherosclerosis, the information on the multiple risk factors of CIMT in healthy adults is limited. Whether there is difference in CIMT among regions in North China is still unknown. So we conducted a population-based study to evaluate the prevalence and risk factors of CIMT and plaques formation in healthy Chinese people and determine the difference among three regions in North China. Methods and Materials—412 healthy adults were selected from 2876 non-institutionalized residents in Beijing, Shenyang and Dalian after health questionnaire survey and detailed physical examination, with an age range of 30-88.1 years old, including 183 male and 229 female. Imaging CIMT by B-mode carotid ultrasonography and other procedures were standardized. Traditional risk factors, inflammatory markers and nutrients intake were assessed as well. Results—The prevalence of the maximum CIMT  $\geq 0.9$ mm and  $\geq 1.0$ mm was 42.2%, 23.3%, respectively. The traditional risk factors had an positive association with IMT in male and female in the univariate analysis, but disappeared in the multiple regression models. Multivariable linear model revealed that IMT was associated with age, HDL, waist circumference and region in female, but associated with age, uric acid as well as region in male. Maximum CIMT was higher in Beijing ( $0.963 \pm 0.010$ mm), lower in Dalian ( $0.832 \pm 0.014$ mm), lowest in Shenyang ( $0.714 \pm 0.013$ mm). After adjusting the traditional risk factors and nutrients intake, the difference was still significant ( $p < 0.05$ ). Age, region and serum uric acid were independent risk factors of plaque formation. Conclusion—In community-dwelling clinically-healthy Chinese people, age and region are the most important factors of atherosclerosis. Moreover, the risk factors of CIMT between men and women are different.

**PB6 135 OPTIMIZATION OF THE USE OF B-TYPE NATRIURETIC PEPTIDE LEVELS FOR RISK STRATIFICATION AT DISCHARGE IN ELDERLY PATIENTS WITH DECOMPENSATED HEART FAILURE**

S. DESTRAC\* (Centre hospitalier val d'ariège, Foix, France)  
M. COURNOT(1), J. FERRIÈRES(2) - (1) centre hospitalier val d'ariège (foix, France);  
(2) inserm 558 (Toulouse, France)

**Background** In elderly patients hospitalized for decompensated heart failure, B-type natriuretic peptide (BNP) levels at discharge and the change in BNP during hospitalization may provide different information and may need to be taken into account simultaneously to best reflect the response to therapy. The aim of this study was to determine whether the most accurate risk stratification is obtained using BNP level after stabilization on treatment, the change in BNP under optimal treatment, or a combination of both markers. Methods This prospective cohort study included 157 consecutive patients aged  $>70$  (mean, 83 years), hospitalized for decompensated heart failure. Clinical, radiologic, biologic and ultrasonography data were collected on admission and at discharge. Results The median BNP level on admission was 1057 pg/ml, and the mean change during hospitalization was -42%. Cardiac death or readmission were independently predicted by both predischarge BNP (best threshold :  $>360$  pg/ml), HR 3.35 (1.94-5.75) and the change in BNP levels (best threshold : 50%, HR 2.52 (1.59-4.01)). The highest event rate was observed in patients with both a predischarge BNP  $>360$  pg/ml and a decrease  $<50\%$  during hospitalization (HR 5.97 (2.98-11.94)) compared with patients with a predischarge BNP  $<360$  pg/ml and a decrease  $>50\%$  after adjustment for potential confounders. The remaining patients constituted an intermediate risk group (HR 3.13 (1.44-6.77)). Conclusion Predischarge BNP and inhospital BNP change should not be interpreted independently from each other. The highest risk group includes patients with a high predischarge BNP level corresponding to more than the half of the BNP on admission. These patients would benefit from close monitoring for signs of decompensation.

**PB6 136 CHORMIC DISEASES, AGING, LIFE QUALITY**

J. ALBERTE\* (Universidade Estadual de Campinas - UNICAMP, Campinas, Brazil)  
M. GUARIENTO

This study intended to evaluate the effect of common chronic diseases (CD) in elder's quality of life (QOL). Two groups of elders (age 60 – 80 years old) were evaluated: 48 old people from the Geriatric Ambulatory (GA) of the State University Hospital in Campinas (SP); 58 old members from the Third Age Group (TAG) of SESC in Campinas (SP). The evaluation was based in an interview about the known co-morbidities and the used medications, besides the WHOQOL – bref questionnaire. In matter of CD, the study showed that 20.6% from TAG and 29.2% from GA were diabetic; 20.69% from TAG and 43.75% from GA presented a cardiac disease; 39.66% from TAG and 70.83% from GA presented arterial hypertension ( $p=0.001$ ); 17.24% from TAG and 37.50% from GA were depressive ( $p=0.001$ ); and 27.6% from TAG and 33.3% GA presented any other kind of CD. In terms of medicine, 34.2% from TAG and 8.7% from GA took one medicine per day; 28.9% from TAG and 31.4% from GA took three medicines per day; and 20.6% from TAG and 58.3% from GA took six or more medicines per day ( $p<0.001$ ). The WHOQOL-bref showed in the physical domain: 67.92 points to TAG elders and 48.21 points to GA elders ( $p<0.001$ ); in the psychological domain: 68.97 points to TAG elders and 57.90 points to GA elders ( $p<0.001$ ); in the social domain: 64.51 points to TAG elders and 61.98

points to GA elders; in the environmental domain 66.06 points to TAG and 52.60 to GA ( $p<0.001$ ). It is necessary to develop strategies for the prevention of CD.

**PB6 137 PROGNOSTIC ROLE OF EXERCISE CARDIOPULMONARY VENTILATORY PARAMETERS IN ELDERLY PATIENTS WITH CHRONIC HEART FAILURE**

A. SCARDOVI\* (S Spirito Hospital, Rome, Italy)  
A. CELESTINI(1), S. SCIARRETTA(2), A. FERRAIRONI(1), R. DE MARIA(1), L. BORDI(1), N. ASPROMONTE(1), S. PERNA(2), R. RICCI(1), M. GUAZZI(1) - (1) S Spirito Hospital (rome, Italy); (2) S Andrea Hospital (rome, Italy)

**INTRODUCTION:** The cardiopulmonary test (CPX) is one of the main tools for the prognostic stratification of patients (pts) suffering of chronic heart failure (CHF). The aim of our study was to determine the most reliable prognostic CPX parameters in elderly CHF pts, who were able to undergo stress testing. **METHODS:** We studied 324 elderly CHF outpatients, median age 75 (72-78) years, 29.1% female, 33% diabetics, 49% ischaemic CHF; **RESULTS:** median value of LV ejection fraction (EF) was 40%. All pts underwent peak/maximum CPX using a cycle-ergometer with 10 WATTS/min increases. Median peak oxygen consumption (PVO<sub>2</sub>) was 12 ml /kg/min. The median slope of the regression line relating to the relationship between ventilation and CO<sub>2</sub> production, (VE/VCO<sub>2</sub> slope) was 33.83. The median VE/VCO<sub>2</sub> slope/PVO<sub>2</sub> ratio was 2.78. We tested the predictive value of the ventilatory parameters for the combined end-point of cardiovascular mortality and HF hospitalizations. 117 events occurred during a median follow-up of 24 months. Bivariate Cox analysis showed that values below the pVO<sub>2</sub> median value (HR 0.63, CI 95% 0.44-0.91,  $p<0.05$ ), above the VE/VCO<sub>2</sub> slope median value (HR 2.16, CI 95% 1.47-3.16,  $p<0.001$ ) and above the VE/VCO<sub>2</sub> slope/PVO<sub>2</sub> median value (HR 1.36, CI 95% 1.15-1.60,  $p<0.001$ ) were significant predictors of the combined end-point. After adjustment for age, gender, LVEF and diabetes, the VE/VCO<sub>2</sub> slope and the VE/VCO<sub>2</sub> slope/PVO<sub>2</sub> were independently and directly associated with a worse prognosis. **CONCLUSIONS:** the VE/VCO<sub>2</sub> slope and the VE/VCO<sub>2</sub> slope/PVO<sub>2</sub> proved to be important parameters in the assessment of the prognosis of elderly pts affected by CHF.

**PB6 138 HOT WEATHER WARNING MIGHT HELP TO REDUCE MORTALITY AMONG THE OLDER POPULATION IN HONG KONG**

P. CHAU\* (The University of Hong Kong, Hong Kong, Hong Kong)  
J. WOO(1) - (1) The Chinese University of Hong Kong (Hong Kong, Hong Kong)

**Introduction** There was evidence on the relationship between extreme hot weather and the increase in mortality, particularly from ischaemic heart disease (IHD) and cerebrovascular disease (stroke). In France, the 2003 heat wave killed about 14,800 people, who were mainly older people. Older people are more vulnerable mainly because they have diminished capacity to detect outside temperature and deteriorated ability to regulate body temperature. Furthermore, the limited adaptive ability may also be affected by pre-existing diseases and/or the use of medications. While the summer in Hong Kong, which has a sub-tropical climate, is not fatally stressful, mortality among the older people has shown to be associated with weather stress in summer. On the other hand, some researchers suggested that early warning systems might reduce mortality. In this study, the relationship between Very Hot Weather Warning (VHWW) and mortality was examined in the context of Hong Kong. **Methods and Materials** An observational study was conducted on the daily number of deaths due to IHD and stroke in the Hong Kong older population (aged 65 or above) during summer in 1997 to 2005. Multiple linear regression models were used to study the association between VHWW and the daily mortality rates from IHD and from stroke respectively. **Results** Among the identified 4,281 deaths from IHD and 4,764 deaths from stroke, it was found that absence of VHWW was associated with an increase of 1.633 deaths from IHD and 1.289 deaths from stroke per 1,000,000 population per day. **Conclusions** VHWW might help to reduce mortality among the older population in Hong Kong. Public education is required to inform the older people and their caregivers to take appropriate preventive measures. Warning systems tailored for the older people could also be considered.

**PB6 139 NOCTURNAL BLOOD PRESSURE DIPPING ANALYSIS IN THE ELDERLY**

M. MORILLO\* (Federal University of São Paulo, São Paulo, Brazil)  
C. UEHARA(1), C. ALMADA FILHO(1), M. CENDOROGLO(1), R. MIRANDA(1) - (1) Federal University of São Paulo (São Paulo, Brazil)

**Introduction** During sleep period there is a physiological decline in blood pressure. Such absence is associated with increased cardiovascular risk. Our objective was to assess nocturnal blood pressure dipping status through ambulatory blood pressure monitoring (ABPM) in adults and elderly. **Methods** 860 consecutive ABPM readings performed at a diagnosis service were assessed. Three age groups were created, which were analyzed regarding the use or not of antihypertensive medication: youngsters aged 15 to 39 (n=180); adults - 40 to 59 (n=397); and elderly - 60 or older (n=283). Nocturnal blood pressure (considered 23-7h) systolic and diastolic dipping was compared among the groups. Continuous data described by minimum, maximum, median, mean, standard deviation. The groups were compared considering continuous variables through two-factor analysis of variance (age and use of antihypertensives) and analysis of covariance to gender, BMI and

smoking. Results Mean nocturnal systolic dipping (NSD) for youngsters, adults and elderly was: with antihypertensives = 11.7/12.4/8.8%, without = 13.7/12.3/10.0%. NSD of subjects aged 60 years or older was lower ( $p < 0.001$ ) when compared to the other groups, even when adjusted for covariates ( $p < 0.001$ ). Mean NDP for youngsters, adults and elderly was: with antihypertensives = 16.2/14.4/11.4%, without 16.5/14.8/12.3%. NDP of subjects aged 60 years or older was lower ( $p < 0.001$ ) when compared to younger subjects, even when adjusted for covariates ( $p < 0.001$ ). When all groups were compared, NDP decreased progressively with age regardless the use of medication. Conclusions Elderly subjects experienced lower nocturnal blood pressure systolic and diastolic dipping when compared to youngsters. Aging produces a progressive reduction of day-night blood pressure difference. Higher cardiovascular risk in the elderly may be in part due to lower nocturnal dipping.

#### **PB6 140 CARDIOVASCULAR RISK FACTORS AND SUBCLINICAL ATHEROSCLEROSIS IN HIGH-FUNCTIONING OLDER ADULTS: THE ALBACETE STUDY**

P. ABIZANDA\* (Complejo Hospitalario Universitario Albacete, Albacete, Spain)  
P. ATIENZAR(1), L. CASADO(2), E. MARTÍNEZ-SÁNCHEZ(1), G. PATERNA(1),  
L. ROMERO(1), C. LUENGO(1), P. SÁNCHEZ-JURADO(1), I. GARCÍA-NOGUERAS(1), J. ESQUINAS(1), E. MARTÍNEZ-ALARCOS(3) - (1) Geriatrics Department, Complejo Hospitalario Universitario Albacete (Albacete, Spain); (2) Radiology Department, Complejo Hospitalario Universitario Albacete (Albacete, Spain); (3) Residencia San Vicente Paúl (02001, Spain)

**INTRODUCTION:** We aimed to determine the prevalence of subclinical atherosclerosis in a high-functioning older adults cohort, its relation with cardiovascular risk factors and its rate of progresión. **METHODS AND MATERIALS:** Longitudinal cohort study comprising 246 community-dwelling high-functioning older adults aged 65 to 88, without clinical atherosclerotic disease. All underwent a carotid ultrasound study at entry and 176 had the study repeated 24 months later. **RESULTS:** 146 subjects (59.3%) had almost a plaque in the basal study. Mean value for the sum of all the plaques diameter was 3.82 mm. Right intima-media thickness was 0.89 mm and left 0.91 mm. 47.2% of subjects had maximal intima-media values greater than percentile 75. Cardiovascular risk factors presented a lineal association with plaques. Without risk factors, 32% had plaque, with one 54.2%, with two 61.6% and with three or more 69.3% ( $p=0.001$ ). Only hypertension was associated with plaques adjusted for the rest of cardiovascular risk factors (OR 2.0; CI95% 1.2-3.6;  $p=0.013$ ). 20 subjects (11.4%) presented a new plaque at 24 months. Intima-media thickness progressed 0.02 mm annually. Those with plaques had an adjusted greater risk of incrementing the sum of all the plaques diameter at 2 years (OR 58.0; CI95% 19.7-170.5;  $p<0.001$ ). **CONCLUSION:** Subclinical atherosclerosis is frequent in high functional elderly subjects and is associated with clasic cardiovascular risk factors. Controlling for these factors could reduce atherosclerosis in the elderly.

#### **PB6 141 SUBCLINICAL ATHEROSCLEROSIS, A PREDICTOR OF FUNCTIONAL DECLINE IN HIGH-FUNCTIONING OLDER ADULTS: THE ALBACETE STUDY**

P. ABIZANDA\* (Complejo Hospitalario Universitario Albacete, Albacete, Spain)  
G. PATERNA(1), E. MARTÍNEZ-SÁNCHEZ(1), E. LÓPEZ-JIMÉNEZ(1),  
P. ATIENZAR(1), L. CASADO(2), J. ESQUINAS(1), I. GARCÍA-NOGUERAS(1),  
E. MARTÍN-SEBASTIÁ(1), M. LEÓN(1) - (1) Geriatrics Department, Complejo Hospitalario Universitario Albacete (Albacete, Spain); (2) Radiology Department, Complejo Hospitalario Universitario Albacete (Albacete, Spain)

**INTRODUCTION:** Subclinical atherosclerosis is associated with frailty status in cross-sectional studies, but the relationship between subclinical atherosclerosis and functional limitation has not been determined in longitudinal studies. **METHODS AND MATERIALS:** Longitudinal cohort study.171 high-functioning community older adults without clinical atherosclerotic disease. All received a carotid ultrasound study. Subclinical atherosclerosis was determined by the presence or absence of atherosclerotic plaques and the sum of the diameters of all the plaques (SDP) in the carotid bilateral tree. Functional limitation was assessed with the Timed Up and Go (TUG) at entry and one year. We analyzed the relationship between subclinical atherosclerosis and slowdown in the performance of TUG from basal to one year, adjusted for demographic, functional and cognitive covariables. **RESULTS:** Mean age 73.7. 110 women (64.3%). Lawton 7.3. MMSE 25.7. 97 subjects had at least one plaque at entry (56.7%). Mean SDP was 2.18 mm. Mean TUG at entry was 9.8 secs, and at one year 10.1. 30 subjects (17.5%) performed the TUG more than 2 secs slower at one year from basal: 24 with plaque (24.7%) and 6 without plaque (8.1%) ( $p=0.005$ ). Those with plaque had an adjusted risk 3.9 higher of performing the TUG slower than those without plaque (CI95% 1.5-10.3;  $p=0.007$ ). Those that slowdown the TUG had a SDP 1.60 mm greater (3.49 vs 1.90; CI95% 0.56-2.63;  $p=0.003$ ). For each increment of 2 mm in the SDP, subjects had an adjusted risk 1.9 greater of performing the TUG slower at one year (CI95% 1.3-2.7;  $p=0.001$ ). **CONCLUSION:** Subclinical atherosclerosis is an independent predictor of functional limitation at one year in high-functioning older adults.

#### **PB6 142 FRAILTY AND SUBCLINICAL ATHEROSCLEROSIS IN HIGH-FUNCTIONING OLDER ADULTS: THE ALBACETE STUDY**

**INTRODUCTION:** The relationship between frailty status and subclinical atherosclerosis using carotid ultrasound has only been assessed using stenosis>75% as a criteria, but its association with atherosclerotic plaque as a marker of prodromal atherosclerotic disease has not been determined. **METHODS AND MATERIALS:** Cross-sectional cohort study. 246 community-dwelling high-functioning older adults independent in basic ADLs, without clinical atherosclerotic disease. All received a carotid ultrasound study. Subclinical atherosclerosis was determined by the presence or absence of atherosclerotic plaques. We analyzed the relation between subclinical atherosclerosis and frailty criteria: unintentional weight loss >4.5 kg in the last year, exhaustion assessed with the CES-D, kilocalories of total physical activity in the last week (men <1729 kcal, women < 1435 kcal), slow gait measured with the Timed up and go (men >11.23 secs, women >11.29 secs), low hand grip strength (men <24 kg, women <15 kg). Prefrailty status was considered if subjects met 2 criteria and frailty if three or more. **RESULTADOS:** Mean age 74.2 years (range 65-88). 156 women (63.4%). Lawton 7.2. MMSE 25.5. Hypertension 125 (50.8%), diabetes 34 (13.8%), dislipemia 84 (34.1%), active smokers 7 (2.8%), BMI 28.9. 146 subjects had at least one plaque in the bilateral carotid tree (59.3%). Participants with plaque were more frequently prefrail (26.2% vs 15.2%;  $p=0.040$ ) and frail (9.2% vs 2.0%;  $p=0.023$ ). Subjects with plaque had an increased risk of being prefrail (OR 2.2; CI95% 1.1-4.6;  $p=0.035$ ) and frail (OR 5.0; CI95% 1.1-23.6;  $p=0.044$ ). **CONCLUSION:** The presence of plaques in the carotid tree as a marker of subclinical atherosclerosis is associated with the frailty status in high-functioning older adults.

#### **PB6 143 THE CORRELATION BETWEEN ANEMIA AND CLASS OF MYOCARDIAL FAILURE IN GERIATRIC PATIENTS**

B. POTIC\* (CHC , Belgrade, Serbia)  
S. TOMIC(1), N. DESPOTOVIC(1), G. MIHAJLOVIC(1), J. VUKCEVIC(1),  
M. DAVIDOVIC(1) - (1) CHC (Belgrade, Serbia)

**Introduction:** Aging has an specific effect on blood production:the important procent of the bone marrow cells decreases and stimulation with erythropoietin results in less iron incorporation than in younger.The most important consequence is myocard failure and hypertrophy. **Method and material:** We analysed 142 patients which were hospitalized during 2007 year with diagnosis heart failure and anemia. There were 13 patients aged of 65 to 70 years, 22 patients aged 71 to 75 years,48 patients who were 76 to 80 years old,40 patients from 81 to 85 years old and 19 patients more than 85 years old. There were 62% female and 38% male. We graduated myocardial failure according to NYHA(New York Heart Association) and results were: first class-29 patients,second class-27 patients,third class-41 patients and fourth-45 patients.Patients in third and fourth NYHA class had longer than 10 years duration of anemia(50%normocytic,40%microcytic,5% megaloblastic,5%hemolytic).The other patients had shorter duration of anemia. **Results:**For data analyses we used following statistical methods:Spearman's test correlation,Kendall's test,Chi-Square test,Fisher's exact test.These tests proved that there is significant correlation between anemia and it's duration and class of myocardial failure(NYHA), $p$  less than 0,001. **Conclusion:** Myocardial failure and hypertrophy are consequences of abnormalities of mitochondrial structure- enlarged ,cristae are spare,broken,deformed and swollen.It is a reason of clinical changes in patients.

#### **PB6 144 LONG-TERM USE OF NON-STEROIDAL ANTI-INFLAMATORY DRUGS AND THE RISK OF MYOCARDIAL INFARCTION IN THE GERIATRIC POPULATION**

B. POTIC\* (CHC , Belgrade, Serbia)  
N. MARKOVIC(1), N. DESPOTOVIC(1), P. ERCEG(1), S. ZDRAVKOVIC(1),  
M. DAVIDOVIC(1) - (1) CHC (Belgrade, Serbia)

**Introduction:**There are data which indicate that chronic use of NSAID leads to an increased occurrence of myocardial infarction. **Methods and materials:** We analysed two groups of patients with myocardial infarction:first group was with 50 patients which used NSAID (diclofenac,ibuprofen and naproxen),and the second,with 50 patients which did not use NSAID.In the first group there were 65% female and 35% male,aged 65 to 72 years.The most frequent used were diclofenac-70% of patients,ibuprofen 20% and naproxen 10% patients.Diclofenac was used longer,1;8years continually until the beginning of infarction.Typical risk factors were less represented in this group.High blood pressure was in 20% of patients,diabetes in 15% and nicotine in 14% of patients.The second group with 50% patients with diagnosis of acute myocardial infarction,NSAID were not used . The patients were older, 72 to 90 years old.The risk factors were more frequently found.High blood pressure 60%,diabetes in 30% and nicotine 40%. **Results:**Statistical analyses proved ( $p < 0,001$ ) that long term use of NSAID increase risk of myocardial infarction. They also show that the patients in the first group were younger and had less risk factors for acute myocardial infarction. **Conclusion:** This data support fact that NSAID ,which are more

used by female ,increase risk for myocardial infarction in younger patients with less other risk factors

**PB6 145 SYSTEMATIC REVIEW OF INFORMATION PROVISION FOR STROKE PATIENTS AND THEIR CAREGIVERS**

J. SMITH\* (University of Leeds, Bradford, United Kingdom)

A. FORSTER(1), J. YOUNG(1), P. KNAPP(1), A. HOUSE(1), J. WRIGHT(2) - (1) University of Leeds (Leeds, United Kingdom); (2) Bradford Institute for Health Research (Bradford, United Kingdom)

Introduction Research shows that patients and their families lack understanding of stroke and feel ill-prepared for life after hospital discharge. The most effective way to educate stroke patients and their families has not been established. Methods We conducted a systematic review of randomised trials of information provision for stroke patients and/or carers using Cochrane methodology. Trials were identified by a search of relevant databases and other sources. Assessment of eligibility and methodological quality, and data extraction was carried out independently by two investigators. Studies were categorised by intervention as 'passive' information (provided on one occasion only with no subsequent follow-up or reinforcement procedure) or 'active' information (there was a purposeful attempt to allow assimilation and an agreed plan for clarification and consolidation). The primary outcomes were knowledge about stroke and impact on health, specifically mood. Meta-analyses were undertaken for the domains of knowledge, mood, satisfaction, and mortality. A narrative synthesis was carried out for other outcomes. Results Seventeen trials were identified and 11 contributed data to the meta-analyses. There were significant effects in favour of the intervention on patient knowledge (SMD 0.29, 95% CI 0.12 to 0.46), caregiver knowledge (SMD 0.74, 95% CI 0.06 to 1.43), patient depression scores (WMD -0.52, 95% CI -0.93 to -0.10), and one aspect of patient satisfaction (OR 2.07, 95% CI 1.33 to 3.23). Post-hoc subgroup analyses showed that strategies which actively involved patient and caregivers had a significantly greater effect on patient anxiety ( $P < 0.05$ ) and depression ( $P < 0.02$ ) than passive strategies. Conclusion Although the best way to provide information is still not clear, the results of this review suggest that strategies which actively involve patients and caregivers should be used in routine practice.

**PB6 146 SODIUM CONSUMPTION IN HYPERTENSIVE OLDER ASIANS**

P. SRIKAN\* (The University of Tennessee at Knoxville, Knoxville, United States of America)

B. CALLEN(1) - (1) College of Nursing, the University of Tennessee at Knoxville (Knoxville, United States of America)

Introduction: The purpose of this paper is to review the data on the amount of sodium consumption in hypertensive older Asians. In Western counties such as Finland, England, and Germany research has demonstrated the success of reducing sodium intake among their older populations. In Asia, where there is wide diversity of ethnicity, cultural background and dietary habits, less is known about sodium consumption in hypertensive older adults. Methods and materials: A literature review was conducted using the databases Medline, CINAHL, Psycinfo, Science Direct, Journal archive, and Science Link Japan for the years 2003-2008. Key search words were sodium intake, salt intake, sodium consumption, dietary salt, salty diet, sodium restriction, and sodium reduction. Results: Six articles were found: four from in Japan, the other two from China and Hong Kong. Findings were that the amount of sodium consumption among hypertensive older Asian adults is still higher than 5 g/day to 6 g/day (100mmol) that is recommended by WHO and the National Heart, Lung and Blood Institute respectively. In Japan, only 2.3% of hypertensive older adults followed for 3.5 years had sodium, as measured by urinary sodium excretion (U-Na), less than 6 g/d. U-Na was higher in males than females. Treated hypertensive clients had less U-Na than in untreated for hypertension. Hypertensive older adults with metabolic syndrome (MS) had U-Na higher than those without MS. In Hong Kong, U-Na of hypertensive vegetarians was higher than those of normotensive vegetarian older adults. In China, Isolated Systolic Hypertensive older adults consumed more sodium than normotensive persons. Conclusion: The goal to decrease sodium consumption in hypertensive older Asian adults to less than 6 g/day has not been met yet. Sodium intake varies by gender, medical condition, and dietary habits.

**PB6 147 CONSUMPTION PREVALENCE OF FOOD RICH IN FIBERS IN THE ADULT POPULATION OF A CARDIOLOGY INSTITUTE FROM SÃO PAULO CITY**

D. MAGNONI\* (Instituto de Metabolismo e Nutrição, São Paulo, Brazil)

P. OLIVEIRA, C. CUKIER, M. BEYRUOTE, C. KOVACS, M. ROMUALDO, S. PATRICIA, F. CASSULO

Introduction: Diets rich in fiber can reduce the incidence of not transmissible chronic diseases, such as hypertension, diabetes and some kind of cancer. The physiologic effect can be evidenced by the reduction of cholesterol and glucose absorption. Although many researches have been evidenced the benefits of the regular ingestion of fibers, least we know about the profile of consumption from the populations. Objective: To estimate the prevalence of consumption of food rich in fibers. Methodology: Transversal study with 2922 patients of both the sexes, realized in the period from June to July, 2007. The participants answered a pre-tested questionnaire for the study. A 95% confidence interval

was utilized. Results: It was demonstrated that 64% of the patients uses fruits diary, 66.2% uses it with the peel and 73.8 when eat orange they eat the white part. The poor ingestion of integral foods such as wheat bran and grains was detected in 57%. The consumption of leguminous as beans and peas was observed in 93.7% being 65.1% every day consumption. The vegetable as lettuce, kale and escarole, 95% admit to consume and 61.9% uses every day, in the case of the legumes as carrot, beetroot and chayote, are used by 95.6% and 60.1% use every day. Discussion: The food fibers are important elements into an adequate diet, helping the reduction of serum cholesterol and glucose levels and the insulin levels, important sign in the prevention and treatment of numerous chronic diseases as type 2 diabetes, obesity and dyslipidemia. Conclusion: The alimentary practice reveals that the study population's diet had an elevated prevalence of consumption of food rich in fiber with exception of the whole foods that remain not making.

**PB6 148 ADAPTATION, VALIDITY AND RELIABILITY OF THE ANGINA PECTORIS CHARACTERISTICS QUESTIONNAIRE**

T. NAJAFI GHEZELJEH\* (Karolinska institutet, Huddinge, Sweden)

I. EKMAN (2), M. YADAVAR NIKRAVESH (3), A. EMAMI (4) - (2) GOTHENBURG UNIVERSITY (Gothenburg, Sweden); (3) Iran University of Medical Science, Nursing and Midwifery College (Tehran, Islamic Republic of Iran); (4) Seattle University (Seattle, United States of America)

Introduction: Research aimed at evaluating Angina Pectoris (AP) symptoms in patients with Coronary Heart Disease (CHD) requires a comprehensive assessment tool applicable to this population. Because no single existing measure assessed the full range of symptom characteristics important to our study, we combined measures to examine specific aspects of AP symptoms. The purposes of this study are: 1) to describe the process of translating the questionnaires from English to the Farsi language; and 2) to evaluate substantial psychometric works (face, content and construct validity, internal consistency and test-retest reliability) for the entire instrument and each part of it. Methods and materials: For this study we combined the modified Rose Questionnaire (MRQ), and the Short Form-McGill Pain Questionnaire (SF-MPQ) and accompanying symptom checklist. A cross-cultural adaptation of the instruments was carried out before developing the final version of them. Two phases were involved: test and retest. To these ends, one hundred and ten CHD patients with AP were assessed by this hybrid measure. The test-retest reliability of the instrument was estimated for measurement after 15 days. Results: An analysis of the results indicated that a content valid instrument had been developed. There was a significantly high correlation between scores in the SF-MPQ and there were associations between items in the MRQ. Internal consistency was found adequate at both assessments (alpha Cronbach= 0.65) for test and retest. There was no significant difference between test and retest. The Intra-class Correlation Coefficient ranged from 0.76-0.98 with narrow confidence interval and small standard error of measurement. Conclusions: The Iranian version of AP characteristics questionnaire is valid and reliable; it is capable of describing characteristics of AP symptoms. It can be utilized with confidence in Iranian CHD patients for assessing AP symptom.

**PB6 149 SHORT-TERM PROGNOSIS IN ELDERLY PATIENTS WITH EARLY POST-INFARCTION ANGINA**

P. ERCEG\* (Belgrade, Serbia)

N. DESPOTOVIC(1), D. MILOSEVIC(1), Z. VASILJEVIC(2), P. MITROVIC(2), V. VUKCEVIC(2), G. MIHAJLOVIC(1), S. ZDRAVKOVIC(1), M. NIKOLIC-DESPOTOVIC(1), J. VUKCEVIC(1), M. DAVIDOVIC(1) - (1) (Belgrade, Serbia); (2) Institute for Cardiovascular Diseases (Belgrade, Serbia)

Introduction: Previous studies have shown that early post-infarction angina (EPA) was a predictor of poor short-term prognosis among patients with acute myocardial infarction (AMI). However, there is a little evidence about prognostic significance of EPA in the elderly. The aim of our study was to determine if EPA has an influence on short-term prognosis in elderly patients with AMI. Methods and Materials: The study population consisted of 51 patients with AMI, aged 60 years or more. Early post-infarction angina occurred in 31 subjects (Group 1), while it was not present in 20 subjects (Group 2). Clinical characteristics of patients and in-hospital events (death and recurrent infarction) were recorded. Combined event was defined as an occurrence of recurrent infarction or death. Groups were compared by appropriate statistical tests (Student's t test and Chi square test). Results: There was no difference in in-hospital mortality (9.7 vs. 10.0%; p=NS), recurrent infarction rates (9.7 vs. 5.0%; p=NS), and combined event rates (19.4 vs. 15.0%; p=NS) between the Group 1 and the Group 2. Conclusion: Early post-infarction angina in elderly is not associated with adverse short-term prognosis.

**PB6 150 OPTIMIZATION OF HIGH INTENSITY INTERVAL TRAINING IN CORONARY HEART DISEASE**

L. BOSQUET\* (University of Poitiers, Poitiers, France)

T. GUIRAUD(1), M. JUNEAU(1), A. NIGAM(1), S. MEKARY(2), M. GAYDA(1), P. MEYER(1), D. CURNIER(2) - (1) Montreal Heart Institute (Montreal, Canada); (2) University of Montreal (Montreal, Canada)

Purpose: High intensity interval training (HIT) has been shown to be more effective than moderate intensity continuous training (MCT) for improving peak VO<sub>2</sub> and endurance in

patients with coronary heart disease (CHD). However, no evidence supports the prescription of one specific protocol of interval training in this population. The purpose of this study was to compare the cardiopulmonary responses to four different HIT protocols in order to identify the most optimal one in CHD patients. Methods: Nineteen stable CHD patients (17 males, 2 females,  $65 \pm 8$  years) performed 4 different HIT protocols, all with exercise phases at 100% of maximal aerobic power (MAP), but with different durations of intervals (15 s for protocol A and B and 60 s for protocol C and D) and types of recovery (0% of MAP for protocols A and C and 50% of MAP for protocols B and D). Results: A passive recovery phase resulted in a longer total exercise time compared to an active recovery phase, irrespective of the duration of the exercise and recovery periods (15 or 60 seconds,  $p < 0.05$ ). Total exercise time also tended to be higher with mode A relative to mode C ( $p = 0.06$ ). Despite differences in total exercise time between protocols, time spent at a high percentage of VO<sub>2max</sub> was similar between HIT protocols except for less time spent above 90% and 95% of VO<sub>2max</sub> for mode C when compared to modes B and D. Conclusion: When considering perceived exertion, patient comfort and time spent above 80% of VO<sub>2max</sub>, mode A appeared to be the optimal HIT protocol for these coronary patients.

#### **PB6 151 MELATONIN EFFICACY IN OLD PATIENTS WITH POSTINFARCTIONAL CARDIOSCLEROSIS**

R. ZASLAVSKAYA\* (Hospital 60, Moscow, Russian Federation)

G. LILITZA (1), M. TEJBLUM(1) - (1) Hospital 60 (Moscow, Russian Federation)

Objectives of present work is an investigation of M influence on clinical symptoms, morphofunctional disturbances in myocard, system of peroxidal oxidation in lipides (POL) and antioxidant defence (AOD) on the background of traditional therapy (TT) of old patients with postinfarctional cardiosclerosis (PIC) and heart failure (HF). Material and methods. 42 pts IHD, PIC, HF, functional class (f.c.) II-IV (by NYHA), stenocardia f.c. II-III were investigated. All the pts were divided into 2 randomized groups depending on M doses. 21 pts of the 1-st group obtained M in a dose of 6 mg 21 pts of the 2-nd group received M in a dose of 3 mg. Before and 20 days after of therapy ECG-monitoring, doppler-EchoCG, level of malone dialdegid (MDA), antioxidant enzymes in red cells and tolerance to physical load were examined. Results. Number of nitroglycerin tablets reduced in pts of the 1-st group and had tendency to reduction in pts of the 2-nd group. In these two groups there were decreased numbers of episodes in ST-elevation. Number of episodes in ST-depression reduced in the 1-st group and had tendency to reduction in the 2-nd group. There were revealed reduction of end diastolic and end systolic sizes and volumes. Ejection fraction (EF) increased in the 1-st group (from 52,9 to 55,4%). MDA level reduced in two groups. An increase in activity of Cu, Zn-SOD was significant, especially in the 1-st group. Conclusion. M on the background of TT produced antianginal, antischismic effects in pts with IHD, PIC, HF, improved clinical symptoms and reduced the number of ST-depression and ST-elevation episodes by their disappearance.

#### **PB6 152 EVALUATING THE NEGATIVE PREDICTIVE VALUE OF SERUM B-NATRIURETIC PEPTIDE IN COMMUNITY-DWELLING OLDER PATIENTS**

A. BLUNDELL\* (University of Nottingham, Nottingham, United Kingdom)

A. GORDON(1), W. SUNMAN(1), B. LOBO(2), T. HITCH(1), R. MORRIS(1), T. MASUD(1) - (1) Nottingham University Hospitals NHS Trust (Nottingham, United Kingdom); (2) Derbyshire County NHS Primary Care Trust (Chesterfield, United Kingdom)

Introduction Community population studies suggest a role for B-natriuretic peptide (BNP) in diagnosing heart failure. Older patients present comorbidities that may confound interpretation of serum-BNP. We aimed to evaluate the diagnostic value of BNP in older people referred to outpatients. Methods Patients with dyspnoea were recruited from geriatric outpatient clinics. NYHA classification was recorded and serum BNP measured (Siemens ADVIA Centaur automated BNP assay, where  $>100$  pg/mL is abnormal). Echocardiography was performed in a standardised manner. Serum BNP and echocardiography reports were categorised as dichotomous variables based upon presence/absence of heart failure. These were cross-tabulated, using echocardiography as the "gold standard", to derive sensitivity, specificity, positive and negative predictive values (PPV, NPP) for serum BNP. Associations between BNP and echocardiographic measurements were sought using Fisher's exact test. Results 56 BNP results (34 females) were obtained. Mean age was 82.5 ( $SD \pm 10.85$ ). 32 patients had all echocardiographic parameters recorded. 24 had incomplete 2D measurements due to poor echocardiographic windows. Cross-tabulating BNP with fractional shortening demonstrated 77.8% sensitivity and 56.5% specificity for heart failure. PPV and NPP (95%CI) were 41.2 (17.8-64.6) and 86.7% (69.5%-100%) respectively. A non-significant trend association was apparent between fractional shortening and serum BNP ( $p=0.08$ ). Conclusion In this pilot study of older outpatients, a poor PPV suggests that serum BNP is not reliable for diagnosis of heart failure. However, a relatively high NPP suggests BNP could be potentially useful in excluding heart failure, and may be helpful where echocardiography is unavailable. This supports previous suggestions that BNP could be used to exclude cardiac failure in older

community-dwelling patients. Further larger studies, taking into account the effect of confounding co-morbidity variables, are now required.

#### **PB6 153 CURRENT CONCEPT ABOUT PREVENTION AND TREATMENT OF ATRIAL FIBRILLATION**

T. ZUBIASHVILI\* (Acad.N.Kipshidze National center of Therapy, Tbilisi, Georgia)

N. KIPSHIDZE(1) - (1) Acad.N.Kipshidze national center of Therapy (bilisi, Georgia)

One of the significant pathologies depending on the age is atrium fibrillation (AF). It is well known that AF is a sad "privilege" of the elderly age. If in people less than 60 prevalence of AF is 1%, in population over 80, this figure exceeds 6%. Therefore, among the aged population, such complications, as infarction, stroke, and thromboembolism are observed very often. Through there were conducted numerous researches, in geriatric cardiology the issue of AF, causes of AF development and treatment in the elderly patients require deep scientific researches. On the basis of epidemiological studies conducted by the staff of Georgian Association of Gerontologists (2000 - 2006), there was determined that AF prevalence among the subpopulation regarded by gerontology is 14.5%. There were determined specific causes of AF development. The aim of the given paper was to study the reasons of atrial fibrillation arising in old (60-74 years) and senile (75-89 years) patients and possibility of prevention paroxysms of atrial fibrillation and its complications with help of prolonged selective beta-blocker Corvitol (Berlin-chemi) pro daily doses 50-100 mg. The results which were received after the examination and treatment of 152 patients who were under stationary and dispensary treatment at the Research Institute of Experimental and Clinical Therapy for 12 months. As a result of treatment the AF paroxysms were eliminated in 89.8% of cases (139 patients), what allowed to avoid such heavy complications, as stroke, thromboembolism, and infarction. The use of "Corvitol" gives stable antiarrhythmic and hypotensive effect in old and senile patients, provides the regression of the left ventricular hypertrophy with improvement of its paramters and systolic and diastolic function, which is especially important for the studied contingent of the patients

#### **PB6 154 DEPRESSION AND ARTERIAL HYPERTENSION IN THE ELDERLY**

V. DONCA\* (University of Medicine and Pharmacy, Cluj Napoca, Romania)

N. CONSTANTEA(1), D. RADULESCU(1), S. CRISAN(1), C. BODOLEA(1), A. MACARIE(1), E. BUZDUGAN(1), D. LUCACIU(1), S. DONCA(1), L. STOICESCU(1), D. BUNEA(1) - (1) University of Medicine and Pharmacy (Cluj Napoca, Romania)

Introduction. The association between depression and cardiovascular pathology was evaluated by several clinical studies, but the link between depression and hypertension has been less investigated. Hypertension and depression have increased prevalence especially in the elderly, so the relationship between them is crucial. Methods and materials. The studied group consisted of 145 elderly patients: 109 with hypertension and 36 with normal blood pressure (BP). BP was measured using ambulatory Holter BP monitoring, being followed: mean systolic BP (MSBP), mean diastolic BP (MDBP), the dipper or non-dipper pattern of BP. Depression (diagnostic and degree) was evaluate using the geriatric scale for evaluating depression. Results. Depression was found in 42 patients with hypertension and in only 6 with normal BP ( $p < 0.01$ ). The depression score was higher in hypertensive patients compared with non-hypertensive patients (17.2 vs. 14.25) ( $p < 0.01$ ). Depression was found in 25 women with hypertension and in 3 without hypertension ( $p < 0.05$ ). There was no statistical significance between prevalence of depression in elderly men with or without hypertension ( $p > 0.05$ ). No direct relation between increased MSBP or MSDP values and depression scores was found ( $r = -0.23$ ;  $r = -0.44$ ). Depression was registered in 30 patients with isolated systolic hypertension (ISH) and in 12 elderly with systolic-diastolic hypertension (SDH) ( $p < 0.01$ ). Depression occurred in most hypertensive subjects (76.74%) and in all non-hypertensive subjects that presented the non-dipper pattern of BP. Conclusion. Depression occurs more frequently in hypertensive elderly than in non-hypertensive elderly. Depression in hypertensive elderly does not correlate with MSBP or MDBP values. Depression has increased statistical prevalence in elderly with ISH as compared with elderly with SDH. Depression in hypertensive and non-hypertensive elderly is more frequently associated with the non-dipper pattern of BP.

#### **PB6 155 LONG-TERM USE OF PINEAL GLAND (PG) PREPARATION EPITHALAMIN REDUCES MORTALITY RATES AMONG ELDERLY CORONARY ARTERY DISEASE (CAD) PATIENTS**

O. KORKUSHKO\* (State Institution , Kyiv, Ukraine)

V. KHAVINSON(2), V. SHATILO(1), I. ANTONJUK-SHCHEGOLOVA (1) - (1) State institution (Kyiv, Ukraine); (2) St-Petersburg Institute of Bioregulation and Gerontology (St-Petersburg, Russian Federation)

Experimental studies demonstrated favorable effects PG preparation Epithalamine (EP) on aging processes. Due to long-term use of EP, average and maximal lifespan of animals increased significantly. Purpose: Based on long-term observation, to compare mortality dynamics in groups of elderly patients on and without EP. Subjects and Methods: Total 79 CAD patients with stable angina of 2nd functional class participated in the study. At the beginning of study (1991-1992) the patients' age was 60 to 74 years. After baseline examination they were randomized in two groups: 39 patients on EP and 40 subjects on

placebo. EP and placebo were injected by courses (once in 6 months, altogether 6 courses) during 3 years (1992-1994). The follow-up clinical observation continued till the year 2005. All patients of both groups received aspirin, nitrates, beta-blockers and ACE inhibitors. Physical working capacity was evaluated by bicycle ergometry. Blood plasma melatonin (BPM) was measured by radio immune method at 9 am, 3 pm, and 9 pm. Results: Before EP use, 85% of elderly CAD patients had low nocturnal BPM level (lower 30 ng/l). After first and subsequent EP courses, BPM concentration increased more than 2-fold. Simultaneously the exercise performance increased by 16% and continued keeping the higher level. Conversely, a 3-year follow-up over the patients who did not receive EP revealed a further decrease of physical working capacity by 9%. In 2005 year, 12 years after the start of EP use, 30 of 39 persons (77%) survived, whereas in control group only 22 of 40 subjects (55%) survived,  $p<0.05$ . Long-term use of EP led to an almost 2-fold decrease of mortality from CAD. Conclusion: In elderly CAD patients with low nocturnal BPM level treatment with EP leads to increase PG function.

#### **PB6 156 ANALYSIS OF WARFARIN DRUG INTERACTIONS IN GERIATRIC PRESCRIBING**

I. URTANE\* (Riga Stradins University, Riga, Latvia)  
J. ANSABERGS(2), R. MEDNE(1), J. ROTBERGS(1), U. TEIBE(1), A. ŠTOKMANE(1)  
- (1) Riga Stradins University (Riga, Latvia); (2) Paul Stradins Clinical University Hospital (Riga, Latvia)

Introduction Warfarin-drug interactions are often encountered in the care of elderly potentially causing hospital admissions and death. Drug interactions may be categorized as either pharmacokinetic (changes in serum warfarin concentrations) or pharmacodynamic (changes in hemostasis or platelet function). The aim of the study was to investigate mechanisms of warfarin-drug interactions and identify possible warfarin interactions with other prescription medications for cardiology ward patients in a hospital setting. This study could facilitate medication prescription decisions and assist with appropriate monitoring to avoid serious adverse reactions. Methods and materials. This study included 100 patients from an inpatient cardiology unit, who received warfarin concomitantly with other drugs for the time period from May, 20008 to September, 2008. A questionnaire was used to gather data from patients' medical histories such as gender, age, clinical diagnosis, current medications, value of International Normalized Ratio (INR). Results. For patients who received combinations of warfarin with other drugs such as amiodarone (25%), anti-inflammatory drugs like aspirin (4%), statins (13%), proton pump inhibitor (omeprazole 4%), it is recommended that the daily warfarin dose be reduced to avoid increased bleeding risk. In this study, these drug combinations were found to be associated with a higher prevalence of hemorrhage compared with warfarin used alone. Patients' age, gender, other diseases such as diabetes, hypertension, liver disease, impairment of coagulation system, history of bleeding, thyroid disorders may affect warfarin sensitivity, resulting in increased or decreased warfarin requirements. Conclusion. Warfarin play a significant role in the prevention and treatment of thromboembolic disease among elderly. Collaboration of a clinical pharmacist and physician in management of drug interactions can enhance the efficacy and safety of warfarin therapy.

#### **PB6 157 EVALUATION OF ROSUVASTATIN TREATMENT IN THE CORRECTION OF ENDOTHELIAL DYSFUNCTION IN ELDERLY PATIENTS WITH ATHEROSCLEROSIS**

K. KAPANADZE\* (Acad. N. Kipshidze National center of Therapy, Tbilisi, Georgia)  
N. KIPSHIDZE(1) - (1) Acad. N. Kipshidze National center of Therapy (Tbilisi, Georgia)

Endothelial dysfunction and dislipidemia are one of the main reasons of coronary artery sclerosis in elderly patients. Changes of vascular diameter are depended on a fine balance between vasodilating and vasoconstricting substances. One of the important vasoconstrictor regulators of the vasculature is the peptide ET-1 which is synthesized in endothelial cells and might contribute to the exaggerated vasoconstriction associated with acute coronary syndromes. The aim of the study was to study endothelial dysfunction correcting effects of Rosuvastatin in elderly patients with stable angina pectoris. Materials and methods: We studied 48 patients (28 males/20 females, age range 63-81 years, with stable angina pectoris. Concentration of Endothelin-1 (ET-1) was measured in peripheral blood before and after 2 week Rosuvastatin treatment and flow-mediated vasodilatation of brachial artery was studied in relation to the changes of its diameter after 2-min occlusion, that was performed prior to and 24-h post Rosuvastatin administration. Mean indices of (ET-1) in peripheral blood was  $0.63 \pm 0.12$  and dilation degree of brachial artery was  $7.171 \pm 0.71$  % before intervention. Patients were treated with 10 mg Rosuvastatin once daily for 2 weeks. Results: Analyses of the data obtained revealed statistically evident difference between the results obtained pre-and post-treatment initiation (2 weeks treatment course): post-treatment level of ET-1 was  $0.55 \pm 0.05$  ( $P < 0.01$ ) and dilation degree of brachial artery was  $(10.20 \pm 0.96)$  %, ( $P = 0.18$ ). Conclusion: Hence, 2-week treatment with Rosuvastatin decreases levels of ET-1 in peripheral blood and significantly increases the degree of flow-mediated vasodilatation of brachial artery even after 24-h post

Rosuvastatin administration, which might play a great role in patients with stable angina pectoris especially in elderly population.

#### **PB6 158 TAKO-TSUBO STRESS CARDIOMYOPATHY: A MIMIC OF ACUTE CORONARY SYNDROME IN THREE ELDERLY WOMEN**

N. KOENIG\* (Hôpital Charles Foix, Ivry-sur-Seine, France)  
M. SIRIWARDANA(1), P. GAUTHIER(1), S. BÉRIGAUD(1), A. GOURONNEC(1), E. PAUTAS(1) - (1) Hôpital Charles Foix (AP-HP) (Ivry-sur-Seine, France)

Introduction: TakoTsubo syndrome or stress cardiomyopathy was first described in 1991 in Japanese patients. Tako Tsubo usually occurs in postmenopausal women after a severe physical or psychological stress. The mechanism seems to be linked to age and sex hormones. Its name refers to the typical left ventricular apical ballooning which looks like a traditional Japanese octopus-catching pot. Tako Tsubo cardiomyopathy is a transient left ventricular dysfunction characterized by an apical and midventricular hypokinesis or dyskinesia, and by a basal hyperkinesis. The clinical presentation mimics an acute coronary syndrome but the favourable prognosis and the treatment differ. Methods: We report three cases of Tako Tsubo in women older than 80 with typical imaging of ventriculography, and we also review diagnosis criteria, therapeutic management, and pathophysiological hypotheses.

#### **PB6 159 COMBINED USE OF COUMARIN AND TOPICAL AZOLES IN ELDERLY PATIENTS: BE AWARE OF OVERANTICOAGULATION!**

E. PAUTAS\* (Hôpital Charles Foix, Ivry-sur-Seine, France)  
J. ALEXANDRA(2), I. GOUIN-THIBAULT(3), M. LORIOT(4), A. GOURONNEC(1), M. SIRIWARDANA(1), V. SIGURET(3) - (1) hôpital Charles Foix (AP-HP) (Ivry-sur-Seine, France); (2) hôpital Bichat (AP-HP) (Paris, France); (3) Inserm U765 (Paris, France); (4) Inserm U775 (Paris, France)

Introduction: Overanticoagulation is a major concern in elderly patients receiving coumarin therapy. Potentiation of coumarin anticoagulants by systemic azole antifungal agents is well documented. However, few data are available about coumarin interactions with topical azole agents. We describe 6 cases of overanticoagulation with coumarin therapy in elderly patients treated with topical azole. Methods and materials: we conducted a 25-month prospective study in patients > 80 years presenting with an INR value > 5.0 and receiving both coumarin anticoagulant and topical antifungal azole. Demographic, therapeutic and clinical data were collected. CYP P450 2C9 polymorphism was performed. For each selected patient, the probability of the proposed potentiation was rated. Results: 6 patients (mean aged 89 years) were selected, receiving either econazole lotion, cream, powder, or bifonazole cream. Interestingly, we observed that econazole or bifonazole was consistently applied to large areas, under disposable diapers in half the cases. INR values were between 6.7 and > 20. In all cases, oral anticoagulant was withdrawn and vitamin K was administered. No bleeding complication occurred in any of the 6 patients. In 4 cases, confounding factors of overanticoagulation were noted, as drugs (including antibiotics or omeprazole) or uncontrolled inflammation, but topical azoles may have increased the potentiation of anticoagulant effect by these factors. According to causation criteria, the probability of coumarin potentiation by topical azole was rated as probable in 2 patients, and possible in the others. Conclusion: physicians should be aware of this probably underestimated potentiation of coumarin anticoagulant effect by topical antifungal azoles and should closely monitor INR variation during the treatment period.

#### **PB6 160 ACUTE CORONARY SYNDROME IN SENIORS ABOVE 75 YEARS OF AGE**

H. MATEJOVSKA KUBESOVA\* (Masaryk University, Medical faculty, Brno, Czech Republic)  
P. KALA(1), P. WEBER(1) - (1) Masaryk University, Medical Faculty (Brno, Czech Republic)

Background: The aim of our retrospective study was to realize the actual situation in patients above 75 years of age having acute coronary syndrome under conditions of cooperation of two departments of Faculty Hospital Brno. Patients and methods: We evaluated retrospectively the group of 126 patients, 35 men and 91 women (average age 82.5±5.5 years) hospitalized at our department because of diagnosis „chest pain“ or „acute coronary syndrome“ within years 2005-2007. We traced risk factors, previous medications, solution of acute coronary syndrome, contraindications of intervention, treatment following acute coronary syndrome. Results: acute coronary syndrome was diagnosed in 92 patients of studied group and coronary intervention underwent 41 patients (44.6%). Two thirds achieved the optimal result, 3 of 41 (7.3%) were recommended to aortocoronary bypass surgery and in 4 patients of 41 (9.8%) partial recanalization was achieved and aortocoronary bypass surgery recommended. The number of complications and mortality of invasive coronary methods did not differ from younger patients – mortality achieved 4.3%. The conservative treatment was preferred in resting 51 patients (55.4%) and we analyzed reasons. The most frequent reason were serious cognitive disturbances – 9 of 51 (17.4%), other frequent reasons: polymorbidity, uncertain time relations and acute infection – 8 of 51 (15.7%) each, less frequent reasons: minimal coronary lesion, previous immobilization, sudden death, refusion from intervention by patient, unclear ECG,

recommendation of conservative approach from previous coronaryographies. The following treatment kept better guidelines of national and international cardiology societies. Conclusions: Patients of age above 75 years treated for acute coronary syndrom showed important interindividual differences, their symptoms were frequently influenced by underlying disease, especially by acute infective complications. Results of patients treated by coronary intervention were very satisfactory – 66% achieved optimal result.

**PB6 161 CARDIOVASCULAR DRUGS IN PATIENTS OF GERIATRIC DEPARTMENT (GD) AND IN NURSING HOME (NH)**

I. BARTOSOVIC\* (St Elisabeth's University College of Health and Social Work, Bratislava, Slovakia , Skalica , Slovakia)  
S. KRAJCIK (1), P. MIKUS (2) - (1) Geriatric Department, Slovak Medical University , Bratislava, Slovakia (Bratislava 37, Slovakia); (2) Geriatric Department, Faculty hospital Bratislava , Slovakia (Bratislava , Slovakia)

The cardiovascular drugs were the most frequent used group (38,9% of all drugs used in GD) Only 1% of the GD patients did not have cardiovascular disease. ACEI were used by 46,6% of GP patients 28,9% patient in GD used furosemid and 18% of patients there used hydrochlorothiazid and 15,4% of GD patients were treated by spironolacton. Diuretics we used by 321% of patients in NH .28,9 % of GD patients used betablockers and 27,9% used calcium channel blockers. Nitrates were used by 18,5% patients in GD and 43% patients in NH . 3,5% of patients in GD were treated by digoxin (22,4% in NH). 1,4% of patients in GD (60% of patients with hyperlipidaemia) were on hypolipidaemic medication.

**PB6 162 ARE GERIATRIC CHARACTERISTICS TAKEN INTO ACCOUNT FOR AVK THERAPY DECISION OF PATIENTS WITH ATRIAL FIBRILLATION?**

S. DE BREUCKER\* (Erasme University Hospital Brussels, Brussels, Belgium)  
G. HERZOG(1), T. PEPERSACK(1) - (1) Erasme University Hospital (Brussels, Belgium)

Introduction: Anticoagulation therapy with anti vitamin K (AVK) for the prevention of thromboembolism in patients with atrial fibrillation (AF) is based on information derived from numerous well-constructed randomized control trials. Despite this conclusive evidence of efficacy, several studies have shown that "realworld" use of AVK in patients with AF is suboptimal. Our hypothesis was that geriatric characteristics (functional impairment, cognitive disorders, malnutrition, risk for falls, depression) could be an explanation of the underprescription of AVK for old patients with AF. Objective: To analyze the patient-related barrier to underprescription of AVK therapy focusing special attention to their geriatric characteristics. Methodology: Retrospective study of 768 consecutive geriatric patients admitted in an acute geriatric unit of an academic hospital between April 2006 and November 2008. Data from comprehensive geriatric assessment were collected from computerized medical charts. Results: Among the 768 medical charts, 111 (14%) patients presented with AF. Forty nine percents of them did not receive any AVK treatment at admission. Functional dependence for activities of daily living did not differ between the groups. The proportions of geriatric problems (cognitive, malnutrition, depression and falls) did not differ between the groups. The proportions of high risk conditions to develop embolic events (congestive heart failure, hypertension, age older than 75 years, diabetes, and previous stroke) did not differ between the groups. Discussion: Almost the half of the patients presenting AF who were admitted in our unit did not receive any anticoagulation therapy. Our results did not confirm the hypothesis that geriatric characteristics could represent barriers to AVK use. Moreover, the classical high risk factors seemed not to influence the therapeutic decision before admission. More research is needed to identify and to clarify the relative importance of patient-, physician-, and health care system-related barriers.

**PB6 163 RELATION OF CBF, CSF MOBILITY AND SKULL MECHANICS WITH COGNITIVE BRAIN FUNCTION IN AGED PERSONS**

N. RIABCHIKOVA\* (Institute of Evolutionary Physiology and Biochemistry, Russian Acad.Sci., St.Petersburg, Russian Federation)  
G. WEINSTEIN(1), T. KRAVCHENKO(1), N. SAMUS(1), A. FEILDING(3), P. HALVORSON(4), A. PANOV(1), V. SEMERNIA(1) - (1) Institute of Evolutionary Physiology and Biochemistry, Russian Acad.Sci. (St.Petersburg, Russian Federation); (3) Institute of Evolutionary Physiology and Biochemistry, Russian Acad.Sci. (Russian Federation); (4) Institute of Evolutionary Physiology and Biochemistry, Russian Acad.Sci. (St.Petersburg, Russian Federation)

Introduction. Recently it has been shown that the brain metabolic supply depends on, besides blood flow(BF), also on cerebrospinal fluid mobility(CSFm) and cranial compliance (CC) which change with age. So, brain cognitive dysfunction may be based on age-related CSFm and CC. Their role in the development of aging-related cognitive disorders was unclear until now. This report evaluates the significance of CSFm and CC in age-related cognitive dysfunction by new non-invasive methodology. Method. Measuring of BF in the middle cerebral artery (MCA) and calculations of CSFm and CC in comparative units were based on simultaneous recordings of transcranial dopplerogram (TCD), segment S1 MCA and rheoencephalogram (REG), fronto-mastoid electrode position, for evaluation of dynamics of pressure/volume relation in skull during a cardiac cycle by computer aid analysis with specially adapted software. Cognitive brain function

was determined by "Prognosis-1" method. 44 persons both sexes in age ranges 76-84 were investigated. Results. It was found that by age 77-80 BF in the MCA had already decreased by 24-28%, and further reductions in CBF are insignificant in this age group. Variations of CSFm and CC were considerably larger than CBF variations, and CSFm and CC values did correlate with the level of brain cognitive dysfunction. Values for initial onset of cognitive disorders were: CSFm=0.42±0.11 and CC=0.64±0.14(n=16), for moderate level: CSFm=0.31±0.09 and CC=0.48±0.11(n=14), for pronounced level: CSFm=0.20±0.08 and CC=0.32±0.09(n=14). Conclusion. The data obtained show that with aging decreases of CSF mobility and Cranial Compliance, while accompanied by diminished CBF, play a significant role in the development of age-related cognitive disorders including dementia.

**PB6 164 EFFECTS OF PERINDOPRIL ON CARDIAC EVENTS IN PATIENTS OLDER THAN 65.**

M. BERTRAND\* (Hôpital Cardiologique, Lille, France)  
W. REMME, R. FERRARI, M. SIMOOONS, K. FOX

Introduction EUROPA trial has demonstrated that perindopril 8mg once daily, an ACE inhibitor with high-tissue affinity, significantly decreased the risk of major cardiac events (cardio-vascular death, myocardial infarction (MI) and resuscitated cardiac arrest) by 20% in patients with stable coronary heart disease (CAD) without apparent heart failure. The objective of this subgroup analysis is to assess the effect on cardiac events adding perindopril 8mg to standard therapy in the subgroup of EUROPA patients above 65 years old. Methods We conducted a retrospective analysis of EUROPA study patients according to their age. Mean age in EUROPA is 60 years old. Among the 12218 patients of EUROPA, we identified 3831 (31%) patients who were older than 65. Among them 1696 patients (14%) were above 70. Results Out of the 3831 patients older than 65, 1944 received perindopril, 1887 placebo. Their baseline characteristics were similar to overall EUROPA population for demographics (apart from age), medical history and medications at screening. Mean age was 71 years, 62% of patients had an history of MI and 54% a previous revascularisation, 66% had hypertension. The relative risk reduction (RRR) with perindopril was of 18.2%, [95% CI: 2;32] p=0.034 for the composite endpoint of cardiovascular death, MI and resuscitated cardiac arrest, of 18.5%, [95% CI: -4;36] for fatal and non fatal MI and 41.7%, [95% CI: 9;63] for new onset of heart failure (respectively 10.7%, 6.3%, 1.6% of events in perindopril group and 12.9%, 7.6%, 2.7% in placebo group). Consistent results were obtained in patients with a previous MI or revascularisation and in the subgroup of patients above 70. Conclusion Perindopril 8mg daily is beneficial for prevention of cardiac events in all stable CAD patients including those above 65 years.

**PB6 165 THE BNP BLOOD LEVEL IN VERY ELDERLY PEOPLE IS INDEPENDENT OF THE CREATININE BLOOD LEVEL**

M. ESCANDE\* (CHG Brunet, Allauch, France)  
E. MICHELE(1), B. EMMANUEL(2), G. GEORGES(3) - (1) CHG Brunet (Allauch, France); (2) biology laboratory portland (United States of America); (3) laboratoire d'analyse médicale (Allauch, France)

The elevation of the Brain Natriuretic Peptide (BNP) has a diagnostic and prognostic significance in heart failure (HF). In the very elderly people, there is frequently a renal impairment with an elevation of BNP. To further determine if there is a correlation between creatininemia and BNP levels, we compared both values in a prospective study of 152 patients admitted in our Geriatric Department. We divided the patients into four groups, according to the level of hypertension (HTA) and HF, as per Fragmingham Criteria: G1 : HTA and HF patients (n=66); G2 HTA and non-HF patients (n=33); G3 non-HTA and HF (n=31), and G4 non-HTA and non-HF (n=22, control group). We compared the BNP value measured by BIOSITE assay to the creatininemia value in those groups. We found no statistically significant difference between the average creatinine blood level (ave±sd: 98±45µmol/l, n=148) in the four different groups using a variance analysis test (p=0.34, n=148). While we did not observe any significant elevation of the BNP level in the group with HTA and no HF (group 2, 172pg/ml, p=0.87), there was a significant increase of the average BNP level in the groups with HF (group 1: 411pg/ml, p<0.02 and group 3: 472pg/ml, p<0.001) compared to the control (group 4: 157pg/ml), as expected. However, we did not notice any significant correlation between the creatinine level and the BNP level in any group. This study clearly shows that the creatinine level is not correlated to the BNP level in very elderly people, unlike the NT-PRO BNP value which is dependant on the renal function, support the requirement of the BNP dosage in very elderly people to determine of HF.

**PB6 166 EFFICACY OF CV RISK REDUCING ANTIHYPERTENSIVE TREATMENT AMONG ELDERLIES IN HUNGARY**

B. SZEKACS\* (1.)Semmelweis University, Faculty of Medicine ; 2.) St Imre teaching Hosp., Budapest, Hungary)  
E. KEKES(1), I. JANOSI(2), I. KISS(3) - (1) IMS Kft, (Budapest, Hungary); (2) Planimeter Kft (Budapest, Hungary); (3) A)Semmelweis Univ., Faculty of Med., Dept. Geriatric Med.; B) St.Imre Hosp. Dept Nephrology &Hypertension (Budapest, Hungary)

Introduction Antihypertensive treatment used to reduce the CV risk among hypertensive elderlies, is usually not satisfactory. Objective to survey the CV risk and the efficacy and

implementation of guidelines of the antihypertensive treatment used among hypertensive elderly. Methods 3578 elderly's records registered in 2007 were analyzed using the database of the Hypertension Registry of HSH. Evaluating viewpoints were the CV risk, the distribution of blood pressure levels resulted in therapeutically, the number as well as point of action of antihypertensive drugs used generally or in cases of hypertension with special organ damages. Results The incidence of high global CV risk was great among the elderly hypertensives: metabolic syndrome in males-M 29%, in females-F 39%, CRF (e.GFR<60ml/min) M22%, F36.2%, CHD: M20.6%, F18.5%, PAD M 22.2%, F16.9%. About half of the patients in each age-decade over 60 years with treated hypertension had blood pressure over 140/90 mmHg. The low combination rate of antihypertensives (as intensity of treatment) was unacceptably frequent in those cases when BP<sub>syst</sub> remained over 140 mmHg. Example: in case of patients with a BP<sub>syst</sub> of 160-179mmHg, the use of few, max. 2 drugs was surprisingly high (27.2% at age 60-70years; 26.2% at 70-80 years; 29.2% >80years). The quality (point of action) of the antihypertensive treatment was also not found to be optimal in those cases, when special target-organ damage occurred in the hypertensive elderly (for example: in CRF the preference rate of beta receptor blockers within the 2-3 drug combinations was relatively too high. Conclusion The relatively great proportion of hypertensive elderlys with high CV global risk and not sufficiently controlled BP levels must be reduced by improving both the intensity and the quality of their antihypertensive treatment.

**PB6 167 THE CAUSE OF OLD AGE DEGENERATIVE AORTIC VALVE DISEASE**  
A. FOKIN\* (Carolinas Medical Center, Charlotte, NC, United States)  
F. ROBICSEK(2) - (2) Carolinas Medical Center (United States of America)

Introduction: In the modern era of aortic valve surgery the gold standard in both the understanding of aortic valve pathology and in the efforts to correct the same is "aortic root stress" rather than "aortic root hemodynamics". Our goal is to investigate how stress acts on the aortic valve and its consequences in the elderly. Methods: The authors present in vitro and in vivo experiments as well as clinical observations and computer modeling of the function of both tricuspid and the bicuspid aortic valves, and the effects the aging aortic wall may exert upon the leaflets. Results: The experimental and modeling observations indicate that old age degenerative disease of the tri-leaflet aortic valve is not a primary atherosclerotic condition as it is generally regarded, but a process initiated by fibrosis and loss of compliance of the aortic wall at the level of the sinuses due to aging of the individual. This leads to cessation of the physiological "pull-and-release" action of the commissures, induces a stress-overload on the leaflets and eventually causes degeneration of the aortic cusps. A similar process may also occur whenever the ascending aorta is replaced with a rigid, tubular prosthesis. Conclusion: Degenerative aortic valve stenosis and calcification is not a primary condition, but is induced by stiffening of the wall of the aortic sinuses as it occurs in the elderly population.

**PB6 168 PARAOXONASE 1 AND ANTI-INFLAMMATORY EFFECT OF HDL WITH AGING**  
S. LOUED\* (Research centre on Aging, Sherbrooke, Canada)  
M. ISABELLE(1), H. BERROUGUI(1), A. KHALIL(2) - (1) Research Centre on Aging (sherbrooke , Canada); (2) Geriatric service (Sherbrooke, Canada)

Aging is the dominant risk factor for atherosclerosis. Epidemiological and clinical studies have revealed that there is an inverse relationship between plasma HDL levels and cardiovascular disease .It has been shown that HDL posses antioxidative and anti-inflammatory properties in which the paraoxonase (PON1), one of its associated enzymes, has been suspected to play a crucial role, but the exact mechanism of action has yet to be identified. Objective: The aim of this study was to evaluate the capacity of purified PON1 to prevent inflammation in the presence of oxidised lipids and to investigate the effect of aging on the anti-inflammatory activity of PON1. Methods: PON1 was purified from plasma of young (20-25years) and elderly healthy subjects (65-85 years). LDL oxidation was initiated by incubation with copper ion, and monitored by the measurement of conjugated diene formation. The lysophosphatidylcholine formation was analysed by HPLC with an evaporative light scattering detector. The ICAM-1 expression by Eahy926 cells was determined by flow cytometry. The anti-inflammatory effect of PON1 was compared as a function of age of donors. This result was confirmed by using recombinant PON1 (re-PON1) produced in Escherichia coli system. Results: Purified PON1 reduced significantly lipid peroxidation, as measured by the conjugated diene level, for both LDL and HDL (35.5% and 77.7% reduction respectively compared to control). Moreover, our results show that PON1 decreased significantly the expression of ICAM-1 induced by oxidised phospholipids. This inhibitory effect was increased in the presence of lecithin cholesterol acyltransferase (LCAT) and apoA-1. Reconstituted HDL as well as LCAT and PAF-AH inhibitors were used to determine the interaction between PON1 and HDL proteins. Conclusion: The anti-inflammatory of HDL is due to the action of PON1 in combination with other HDL-associated proteins.

**PB6 169 THE EDUCATION OF SUBJECTS OVER 75 YEARS WITH ESSENTIAL HYPERTENSION. PROSPECTIVE STUDY OF 50 CASES IN A UNIT ACUTE GERIATRIC MEDICINE.**  
F. CAPRIZ-RIBIERE\* (CHU Nice, Nice, France)  
C. FRANÇOISE(1), D. GAELLE(1), V. VALERIE(1), B. PATRICE(1) - (1) CHU Nice (Nice, France);

Clinical studies have shown that reducing blood pressure decreased the incidence of cardiovascular events and dementia (4) in patients aged 60 to 80 years in systolic and systolo-diastolic hypertension (1 and 3).A more recent study has demonstrated that treated hypertension among people aged 80 or older is also beneficial (2). The HTA requires daily good adherence to treatments and monitoring to prevent the occurrence of complications, even at an advanced age. Methods: It is a prospective study analyzing 50 patients 75 years or more of age hospitalized Short Stay Unit Gériatrique with hypertension. The intermediate results relate to 25/50 patients. The questionnaire was based on 4 points of education: nutrition, physical activity, self-monitoring blood pressure and treatment adherence. A single (nurse) intervened in two education sessions during hospitalization, using an individualized education for each patient according to his knowledge, the cognitive status, the presence of caregivers and the comorbidities. Results: The mean age is 84.5 years, and 37 % of patients suffer from cognitive impairment (71% moderate and 14% severe dementia). Some educational reminders were necessary in 14% of patients, 26% have a good compliance and surveillance without real understanding of the pathology. Concerning the management of hypertension at home, 26% are totally dependent on another person against 42% partly. Forty-two percent of the caregivers participating in education sessions and 25% learns self-monitoring blood pressure. Conclusion: This study confirms the value of individualized education to inform and empower elderly patients about their hypertension. The role of caregiver is essential because it is a source of motivation and in case of cognitive disorders in evolution. The health professional at home seems unavoidable in the of default family. A follow-distance education will be necessary necessary to know the impact of such intervention in elderly

**PB6 170 EVALUATION OF CAROTID PLAQUE IN THE ELDERLY USING NEWLY-DEVELOPED THREE-DIMENSIONAL ULTRASONOGRAPHY**  
A. TOMOTAKA\* (Tokyo Medical University, Tokyo, Japan)  
D. WATANABE(1), S. KOYAMA(1), T. UMAHARA(1), T. IWAMOTO(2), T. HASHIMOTO(2), J. AKIMOTO(2), J. HARAOKA - (1) Departments of a Geriatric Medicine,Tokyo Medical University (Tokyo , Japan); (2) Departments of a neuro surgery,Tokyo Medical University (Tokyo , Japan)

Background and Purpose: Severe carotid artery stenosis (CS), seen frequently in the elderly, is an important cause of ischemic stroke. When CS is detected, morphological evaluation of carotid plaque is valuable for preventing vascular events. Therefore, we studied carotid plaque morphology using newly-developed three-dimensional ultrasonography(3D-US) to evaluate the usefulness of this method in comparison with MRI, angiographical, and histopathological findings. Methods: Twelve consecutive elderly patients with CS (aged, 73.7±6 years), who were scheduled to undergo carotid artery endarterectomy (CEA) or carotid artery stenting (CAS), were studied using 3D-US Volson 730 Expert, 3D4D probe, BB-MRI(black-blood method:1.5-T whole-body MRI unit), and digital subtraction angiography before revascularization. Results: The texture of each slice of tomographic ultrasound imaging of 3D-US was compatible with that of BB-MRI and histopathological findings of CEA cases respectively; hypo echogenic area of 3D-US corresponded with both hyper intensity area of BB-MRI and histopathological finding (lipid core). In addition, 3D-US demonstrated the whole volume and surface structure of carotid plaque similar to findings depicted by DSA. Conclusion: 3D-US considered to be useful for evaluating easily and noninvasively real-time carotid plaque morphology in the elderly.

**PB6 171 HEART RATE AND PROGNOSIS AFTER MYOCARDIAL INFARCTION**  
Z. MIKES\* (Faculty of Medicine,Comenius University, Bratislava, Slovakia)  
P. MIKES<sup>(1)</sup> - (1) I st Department of Internal Medicine,Faculty of Medicine,Comenius University (Bratislava, Slovakia)  
Introduction:Heart rate(HR) is a commonly used parameter in clinical medicine. A special attention is payed to HR from the begin of clinical use of betablockers,discovering of If channels and a knowledge of their usefulness in patients (pts) with coronary artery disease. Method: We studied two groups of pts. A: 492pts(average age 62.9 yrs), hospitalized with acute myocardial infarction(AMI).We evaluated the cardiovascular risk profile,drug history before the admission,physical finding at the time of admission,type of AMI,ECG and echocardiographic findings. B group consisted of 302 pts discharged from hospital after suffering an AMI. Average follow-up time was 10 years.Cardiovascular risk profile,ECG,spiroergometry,heart rate and derived parameters,e.g.Robinson index(RI)-marker of myocardial oxygen consumption(resting HRxresting systolic blood pressure)-were evaluated. Test of binomic division,Mann-Whitney test,Kolmogorov-Smirnov test and Student parametric and nonparametric tests were used for statistic evaluation. Results:In-hospital mortality was higher in diabetics in comparison with nondiabetic pts(29% vs 17%, p<0.001).History of hypertension and dyslipidaemia before admission to hospital was a marker of worse prognosis.HR was higher in pts with diabetes in comparison with nondiabetics(p<0.001),and in both groups in those pts who died(p<0.005). In the group B there was a worse longterm prognosis in pts with lower physical capacity(p<0.005). The difference in resting HR of survivors and deceased was on the border of significance(p=0.05), high RI at rest and low RI at the peak of exercise were predictor of worse prognosis (p<0.05). Conclusion:Higher resting heart rate and derived

parameters are predictors of worse in-hospital as well as longterm prognosis after myocardial infarction in elderly pts.

**PB6 172 THE RELATIONSHIPS OF ALBUMINURIA AND GLOMERULAR FILTRATION RATE IN JAPANESE OLDER PEOPLE**

N. ONODERA\* (Nippon Medical School, Tokyo, Japan)

H. NAKANO(1), N. MATUMURA(1), K. OBA(1) - (1) Nippon Medical School (Tokyo, Japan)

Introduction: Albuminuria is used to screen chronic kidney disease, but evidence of the clinical impact of this test on developing of age is lacking. We examined the association between albuminuria and glomerular filtration rate in older people. Methods and materials: We studied 308 outpatients, aged 55 to 95 years. Subjects were divided into 3 groups by age; 55-64 yr (group A; n=47, 60.1yr), 65-74 yr (group B; n=104, 70.0yr), 75 yr or older (group C; n=157, 81.0yr). Estimated glomerular filtration rate (eGFR) was calculated according to the modified equation 7 MDRD formula. We also divided subjects into two groups by eGFR; less than 60 mL/min per 1.73m<sup>2</sup> (low-eGFR group) and high-eGFR group. The multiple regression analysis was used to eGFR as dependent variable and AER, uric acid, ARB/ACE-I use, hemoglobin as independent variables. Results: The association between eGFR and urinary albumin/creatinine ratio (ACR) was seen only in group A. The frequency of ARB/ACE-I use was significantly higher in high-GFR group than in low-GFR group in group A and B. The eGFR, ACR, and uric acid were significantly lower in high-GFR group than low-GFR group in group A and B. In group C, uric acid was significantly lower and hemoglobin was significantly higher in high-GFR group. ACR was not significantly different between high-GFR and low-GFR group in group C. On multiple regression analysis, ACR was significant predictor of eGFR in group C (OR=0.76, 95%CI 0.02 to 0.13). Conclusion: The clinical impact of albuminuria for chronic kidney disease (CKD) is relatively weak in 75 years and older. However, albuminuria is a significant predictor for CKD in the elderly.

**PB6 173 THE RELATIONSHIP BETWEEN HOSPITALIZATION OF ELDERLY PATIENTS WITH CARDIOVASCULAR DISEASES AND THEIR THERAPEUTIC COMPLIANCE**

I. ALEXA\* (University of Medicine and Pharmacy Iasi, Romania, Iasi, Romania)

L. PANAGHIU(2), G. UNGUREANU(1) - (1) University of Medicine and Pharmacy (Iasi, Romania); (2) (Iasi, Romania)

65 years admitted≥Methods: A retrospective study of 922 patients aged for cardiovascular diseases (CVD) was conducted. We aimed to examine the causes of non-compliance and the contribution of non-compliance in hospital admission. Data on compliance was collected through a questionnaire on compliance, beliefs, knowledge, and self-care behavior and compared with information from past medical records or from family members. Results: The mean age of the study group was 74.5 years, M:F ratio was 42:58. 9% were living alone and 59% completed[65-91] high school. The average number of different drugs prescribed was 4.3 and the average number of pills taken daily was 5.8. Ninety patients (9.76%) were hospitalized for aggravation of their CVD disease due exclusively to non-compliance and 148 (16.05%) had other factors that led to non-compliance (e.g. nausea and vomiting, dizziness, negative stress). The non-compliant population (n = 90 patients) lived equally in urban and rural area. Most of them were 70 to 80 years old (48.89%), did not complete high school (72.22%) and had a very low income (< 350 RON). Most of these patients had ischemic heart disease (46.67%), hypertension (18.89%), arrhythmias (17.77%) and dilatative cardiomyopathy (16.67%). The main self reported causes of drug non-compliance were inadequate income (34.2%), inadequate instruction (17.7%), too many drugs (17.7%) and physical barriers (visual disturbances or arthritis) (11.11%). Conclusions: The results of our study suggest that better education about the role of dietary recommendations and about the necessity of respecting medical regimen should help in decreasing non-compliance all along with decreasing hospitalization and medical costs.

**PB6 174 EFFECTIVENESS OF A MANAGEMENT PROGRAM AFTER HOSPITAL DISCHARGE IN OLDER PATIENTS WITH HEART FAILURE**

J. GONZÁLEZ-GUERRERO\* (Complejo Hospitalario de Cáceres, Cáceres, Spain)

T. ALONSO-FERNÁNDEZ(1), O. GEA(1), I. QUINTANA(1), N. GARCÍA-MAYOLÍN(1), J. RIBERA-CASADO(2) - (1) Complejo Hospitalario de Cáceres (Cáceres, Spain); (2) Hospital Clínico San Carlos de Madrid (Madrid, Spain)

Introduction: Disease management programs after hospital discharge in high-risk heart failure (HF) patients can reduce readmissions and mortality rates. We aimed to assess the effectiveness of a management program after hospital discharge in older patients with HF. Methods and materials: Randomized controlled clinical trial. Preliminary data of the study involved 40 HF patients: 21 patients were allocated to receive an intervention consisting of a comprehensive hospital discharge planning and close follow-up at a day-hospital, and 19 patients to usual care. Results: After 12 months of follow-up, intervention group patients were less likely to present events (readmission or death) as compared with the control group (8 vs. 16 patients), which represents 46% event reduction (IC 95%: 1.9 - 39.4; p: 0.008), mainly through mortality reduction (IC 95%: 0.03-0.68; p: 0.02). At 1 year,

the probability of remaining free of events was significantly higher in the intervention as compared with the control group (log rank 9.25; p: 0.002). Conclusion: Compared with the usual care group, patients exposed to disease management program were less likely to experience an event.

**PB6 175 DEEP VEIN THROMBOSIS OF LOWER LIMBS IN THE ELDERLY: A TUNISIAN RETROSPECTIVE STUDY**

N. KHALFALLAH\* (Charles nicolles hospital, Tunis, Tunisia)

M. HASSAYOUNE(1), L. BEN HASSINE(1), A. HARMEL(1), E. CHERIF(1), S. AZZABI(1), Z. KAOUACHE(1), C. KOOLI(1) - (1) Charles Nicolle's hospital (Tunis, Tunisia)

Introduction: Deep vein thrombosis (DVT) of lower limbs is frequent in elderly. The purpose of this work is to study the etiological and therapeutic features of DVT in elderly. Methods and materials: A retrospective analysis of 54 patients ≥ 65 years hospitalized in an Internal Medicine Department from 2000 to 2008 for DVT of the lower limbs (group 1) and comparison of results with a control group of 59 patients <65 years with DVT (group 2). All the DVT have been documented by venous doppler ultrasonography. Results: In the group 1: - The average age was 73.8 years ± 5.75; the sex ratio was 0.58. - Risk factors for DVT were represented by: immobilization (35%), diabetes (30%), cancer (28%), obesity (24%), venous insufficiency (20%), recent surgery (13%), personal history of DVT (7%), hyperhomocysteinemia (5.5 %), heart failure (5.5%) and nephrotic syndrome (4%). - At least 3 risk factors have been found in 26% of patients. The comparison with the control group showed that only two risk factors were significantly more frequent in group 1: cancer (p = 0.01) and immobilization (p = 0.05). In group 1, the total number of risk factors was higher (p = 0.0001), the length of hospital stay was longer (p = 0.0006) and the average dose of vitamin K antagonists was lower (p = 0.04). Conclusion: These results are consistent with those of the literature. Older people have more risk factors for DVT. A preventive anticoagulation is indicated in case of immobilization, especially in the presence of other risk factors. It is also advised to actively search for an underlying cancer in presence of any DVT in the elderly.

**PB6 176 HEALTH AND LIFE QUALITY OF HYPERTENSIVE AND NORMOTENSIVE ELDERLY THAT LIVES IN A TROPICAL REGION (MANAUS-AM)**

F. CASTRO\* (Universidade do Estado do Amazonas, Manaus, Brazil)

A. SOUZA(1), J. OLIVEIRA(1), M. RIBEIRO(1), M. QUEIROZ(1), E. HOLANDA(1), R. CABRAL(1), E. MAIA-RIBEIRO(1), M. ROCHA(2), I. CRUZ(2), E. RIBEIRO(1) - (1) Universidade do Estado do Amazonas (Manaus, Brazil); (2) Universidade Federal de Santa Maria (Santa Maria, Brazil)

Introduction: hypertension is an important cardiovascular risk factor associated with gene-environmental interactions. For this reason in this study the association among life style, health and life quality variables were analyzed between hypertensive and normotensive elderly that lives in a Tropical region (Manaus-AM) were analyzed. Methods and materials: a case-control study was performed from subjects previously included in the project named "Projeto Idoso da Floresta" (n=1509) that investigated the health conditions of elderly inserted in the Estratégia de Saúde da Família (ESF-SUS) de Manaus-A. Data were obtained from structured interview, anthropometric, blood pressure and biochemical (lipid and glycemia) evaluations. Results: from 1509 elderly 894 (59.8%) were identified with hypertension (HAS) and (601) 40.2% as normotensives. Men elderly presented 57.7% (400) HAS prevalence whereas in women this prevalence were 61.6% (494). From hypertensive elderly 461 (87.0%) and 298 (81.9%) normotensives reported higher alcoholic beverage consumption. Hypertensive elderly (men and women) presented higher prevalence of coronary arterial disease (CAD) and stroke. Additionally, hypertensive women present higher obesity prevalence. In 119 (20%) of elderly that self-reported to be normotensive the blood pressure level was elevated (>140mmHg). In the elderly that self-reported to be hypertensive the no control blood pressure occurred in 241 (27.1%). Conclusion: the hypertension on elderly evaluated here was associated to cardiovascular morbidities similar to results observed in other urbanized Brazilian'regions and must to be ESF-SUS permanent focus of attention to minimize its morbidity effect.

**PB6 177 FEATURES OF ELDERLY DIABETIC PATIENTS IN A MEDIUM-STAY STROKE REHABILITATION PROGRAMME**

A. TRUYOLS\* (HOSPITAL GENERAL DE MALLORCA, PALMA, Spain)

L. VICH(1), A. GALMES(2), F. ALBERTI(1), J. CARBONERO(1), F. PALACIOS(1), L. FELIU(1) - (1) Hospital General de Mallorca. Servei de Salut de les Illes Balears (Palma, Spain); (2) Servei d'Epidemiologia. Govern de les Illes Balears (Palma, Spain)

Introduction: To estimate the prevalence of diabetes mellitus (DM) in elderly included in a stroke rehabilitation programme and the prevalence of vascular risk factors (VRF), complications and outcomes in DM patients. To compare the principal features between diabetic and non-diabetic patients. Methods and materials: Transversal study, inpatients older than 64 in a medium stay stroke unit, 2003-2007. Variables studied: VRF, ischemic stroke (IS), lacunar stroke, affected territory in IS; neurological status at admission (NIH scale), complications (respiratory, urinary, recurrent stroke, confusion, depression) and

outcomes (mortality, Barthel index at discharge Bid, corrected Heinemann index Hic, functional gain FG). Comparison of means: t-Student test; of proportions: z test. Results: Patients included: 252. Prevalence of DM: 37.7%. In DM patients: mean age 76.3 (DT 6.74), men 54.3%; mean of VRF 3.5 (DT 1.36); HTA 78.8%, obesity 36.2%, dyslipemia 35.1%, AF 24.5%, previous stroke 34%; IS 89.4%; lacunar 21.7%; carotid territory 71.3%; NIH 7.8 (DT 5.26); mean of complications 0.81 (DT 1.05), recurrent stroke 6.4%, respiratory infection 9.6%, urinary infection 17%, confusion 24.5%, depression 33%; mortality zero, Bid 51.2 (DT 28.1), Hic 45.1 (DT 31.5), FG 27.7 (DT 19.8). Differences between DM and non-DM: VRF (3.5 vs. 1.4, p 0.0000), IS (89.4 vs. 75.9, p 0.01) and carotid territory affected (71.3 vs. 93 p 0.0000). Conclusion: DM is a frequent VRF, associated often to other VRF. There are differences in type of stroke and affected territory. The presence of DM hasn't shown as a bad prognosis factor in included in our rehabilitation programme.

#### PB6 178 SELF PERCEPTION OF HEALTH OF THE OLDEST OLD

M. DAVIDOVIC\* (KBC Zvezdara, Beograd, Serbia)  
L. ZIKIC(1), S. JANKEVIC(1), P. ERCEG(2), N. DESPOTOVIC(2), D. MILOSEVIC(2) - (1) Institute of Gerontology, Home Treatment and Care (Beograd, Serbia); (2) KBC Zvezdara, Department for geriatrics (Beograd, Serbia)

The main aim of the Study is evaluation of basic health, functional and social status of the elderly patients (N=645) admitted in Institute of Gerontology, Home Treatment and Care (IGHTC )Belgrade. Particular attention have been paid to health and social status of the "oldest old" (90+age) patients in comparing to the group of the "young old" (60-74age). The data presented in the paper has been collected by a questionnaire administered to Institute's patient's age 60 and more at their admission. The questionnaire is a modified version of the constructed by WHO . Analysis of data on self perception of health between the "oldest old" patients and "young old" has given us interesting results which generally show that "oldest old" have better self perception of health compared to the "young old". Namely, there is statistically significant difference between the two groups concerning the answers to the question "Do you feel pretty healthy now?" Percentage representing positive answer was higher in the study population of "oldest old", 90+age (SP-32.4%), than in the control group of "young old" persons of 60-74 years (CG-14.1%). There is also statistically high significant difference ( $p<0.001$ ) between the observed groups in relation to the question "How do you estimate your present health?". In the study population, i.e. in the group of "oldest old" it is significantly larger percentage of the questioned who estimated their health as average or pretty well (SP-54.1%), in relation to the control group of "young old" (CG-19.4%). At the same time there is statically higher percentage of "young old" who estimate their health as bad (CG-58.8%) than "oldest old" (SP-16.2%). Generally, the interviewed patients of 60-74 claim to have more complaints.

#### PB6 179 ADIPOSE ENDOCRINE FUNCTION, INSULIN-LIKE GROWTH FACTOR-1 AXIS, THYROID FUNCTION, AND EXCEPTIONAL SURVIVAL BEYOND 100 YEARS OF AGE

Y. ARAI\* (Keio University School Of Medicine, Tokyo, Japan)  
M. TAKAYAMA(1), Y. GONDO(2), H. INAGAKI(2), S. NAKAZAWA(1), K. YAMAMURA(1), K. SHIMIZU(1), T. KOJIMA(3), Y. MASUI(2), Y. EBIHARA(1), N. HIROSE(1) - (1) Division Of Geriatric Medicine, Keio University School Of Medicine (Tokyo, Japan); (2) Tokyo Metropolitan Institute Of Gerontology (Tokyo, Japan); (3) Comparative Systems Biology Team, Genomic Science Center, Riken (Yokohama, Japan)

**Introduction:** Observational studies have demonstrated similarities between the underpinning of frailty and biological features of centenarians, suggesting that adaptability to age-related multiple physiological decline may be a core component of successful aging. The aim of this study is to determine whether hormonal pathways potentially involved in energy homeostasis contributes to survival beyond 100 years of age. **Methods:** We assessed a total of 252 centenarians (range 100-108 years) using a complete set of biomarkers of adipose endocrine function, the insulin-like growth factor-1 (IGF-1) axis, and thyroid function. Conventional risk factors at baseline were also assessed. The subjects were followed up for all-cause mortality every 12 months by telephone contact. **Results:** During 2253 days of follow-up, 208 centenarians (82.5%) died. The lowest tertile of leptin and the highest tertile of tumor necrosis factor-alpha were associated with higher mortality risk among centenarians after adjusting for age (per 6 months increase), sex, education, smoking, activities of daily living (ADL), cognitive function, and comorbidities [the hazard ratio (HR), 1.6, 95% confidence interval (CI), 1.14-2.35; and HR 1.45, 95% CI, 1.00-2.08, respectively]. The lowest tertiles of both IGF-1 and IGF binding protein 3 (IGFBP3) were also associated with increased mortality. In contrast, thyroid function was not associated with mortality in centenarians. The adipose risk score, indicating cumulative effects of adipokine dysregulation, was strongly associated with increased mortality risk; ADL; cognitive function; and levels of albumin, cholinesterase, high-density lipoprotein-cholesterol, C-reactive protein, interleukin 6, and IGF-1 at baseline. **Conclusions:** The results suggested that preservation of adipose endocrine function and the IGF-1 axis may

be potentially important for maintaining health and function and promoting survival at an extremely old age.

#### PB6 180 SUCCESSFUL AGING AND RED WINE CONSUMPTION IN HEALTHY CENTENARIANS

E. PETRUZZI\* (Geriatric Cardiology and Medicine Unit, Florence, Italy)  
P. PAMELA(1), M. STEFANO UMBERTO(2), M. FRANCESCA(1), N. IGINIO(2), P. IACOPO(3), P. MARIO(1), M. NICCOLO(3) - (1) Dept. of Clinical Physiopathology, Clinical Biochemistry Unit (Florence, Italy); (2) Geriatrics Unit, USL 4 "Area Pratese" Prato General Hospital (Prato, Italy); (3) Dept. of Critical Care Medicine and Surgery, Geriatric Cardiology and Medicine Unit (Florence, Italy)

**Introduction.** Free radical damage is important in cell and whole organism senescence. The antioxidant activity of phenolic substances of red wine can protect against that damage. Successful Aging may be achieved by applying the guidelines against the disorders and diseases of the late age and by adopting a diet rich of antioxidant substances. Subjects and Methods. We studied serum total antioxidant capacity (TAC) in 26 healthy centenarians of both genders (9 men, 17 women) who had been moderate red wine consumers (< 500 ml/day of Chianti). All were cognitively intact and could give written informed consent to participate in the study. Their dietary habits including alcoholic beverage consumption were recorded and classified, into three groups: (i) Group A: moderate drinkers with dietary habits unchanged, (n = 3 males, 10 females); (ii) Group B: : moderate drinkers with reduced diet (n = 3 males, 4 females); and (iii) Group C: abstainers with reduced diet (n = 3 males, 3 females). Results. TAC was reduced in mol/l) and abstainers<sup>centenarians</sup>, both moderate drinkers (302.4±32.3 (142.0±24.1&micromol/l) in comparison to control subjects (439±127 &micromol/l). The "in vivo" studies in humans show the positive effect of red wine assumption on serum TAC, attributed to polyphenols. Conclusion. Concerning long-term red wine consumption in centenarians, we can conclude that the reduced antioxidant capacity present in centenarian moderate drinkers, and also in abstainers, can be explained by several metabolic deficiencies occurring in centenarians. Furthermore, the antioxidant substances may have had a protective role on some functions essential to prolonged survival but also genetic factors may have accounted for successful aging.

#### PB6 181 HOSPITAL ADMISSION IN CENTENARIANS: CHARACTERISTICS AND OUTCOMES

O. TORRES\* (Hospital de la Santa Creu i Sant Pau, Barcelona, Spain)  
G. FUSTER(1), R. PRATS(1), E. FRANCIA(1), D. RUIZ(1), M. CABEZA(1), I. MARINA(1), M. BARCELÓ(1), J. MASCARÓ(1), . (1) - (1) Hospital de la Santa Creu i Sant Pau (Barcelona, Spain)

**Introduction:** Despite the rapidly increasing numbers of centenarians little is known about characteristics and outcomes of those requiring hospital admission. **Methods:** A longitudinal study in centenarians consecutively admitted to our hospital from January 06 to December 08 was performed. We analysed reason for hospitalization, socio-demographic characteristics, Barthel Index (I) 15 days before admission, APACHEII, Charlson I, length of stay, survival and discharge destination. Vital status was assessed at 6 and 18 months from records and/or telephone contact. Two patients were lost to follow up. **Results:** Thirty patients were included (mean age 101.9±1.8; 86.7% female). Barthel I was 20.7±23.3, 70% of patients were community-dwelling and 4 lived alone. Reasons for admission were respiratory infection (12 patients), other infections(4), hip fracture(6) and heart failure(3). At admission: APACHEII was 12.6±4.5 and CharlsonI was 1.2±1. The most prevalent comorbidities were dementia(8) and heart disease(8). In-hospital mortality was 36.7%(11) and 57.9% of survivors(11) were institutionalised. Length of stay was 11.4±10 days. There were three survivors at 6 months and 1 at 18 months follow-up. Mortality was 64.3%(18) at 6 months and 85.7%(24) at 18 months. Age at death was 102.4±2 and occurred mainly in autumn and winter(75%). Deaths occurred 97.3±146.8 days after discharge and 2 groups were identified: A)death within 65 days(16 patients) and B)>=130 days (8 patients). Patients with worst outcomes were institutionalised and had lower albumin levels ( $p<0.03$ ). No other significant differences were seen. **CONCLUSION:** Although the reason for admission was treatable acute diseases, hospitalization was a terminal event for over half the group, particularly in institutionalised and malnourished centenarians.

#### PB6 182 OCULAR FINDINGS IN PATIENTS FROM 80 TO 108 YEARS OLD

M. CYPEL\* (UNIFESP, São Paulo, Brazil)  
P. DANTAS(2), C. LOTTENBERG(1), L. RAMOS(3), R. BELFORT(1) - (1) VISION INSTITUTE/ Federal University of São Paulo, São Paulo, Brazil. (Brazil); (2) Ophthalmology Department Santa Casa de Misericórdia de São Paulo , São Paulo, Brazil. (Brazil); (3) Epidemiology Department- Federal University of São Paulo, São Paulo, Brazil. (Brazil)

**Purpose:** Determine vision conditions and ocular findings in patients older than 80 years of age. **Methods:** 150 patients, divided in three groups: 70 between 80 and 89 years (Group 1); 50 between 90 and 99 years (Group 2) and 30 over 100 years old (Group 3) were

submitted to an ophthalmological exam. Results: The gender ratio was 61.4% females in Group 1, 70% in Group 2 and 83.3% in Group 3. Arterial hypertension was the most common systemic disease in all three groups. Cataract surgery had been performed in 23% in Group 1, 54% in Group 2 and 46.67% in Group 3. The initial Best Corrected Far Visual Acuity (BCFVA) was 20/40 or better at least in one eye in 47% patients from Group 1, 20% in Group 2 and none in Group 3. After refraction changed to: 64% in Group 1, 30% in Group 2 and none in Group 3. The percentage of blind patients considering the BCFVA (< 20/400) was: 5.8% in Group 1, 8% in Group 2 and 23.3% in Group 3. The initial Best Corrected Near Visual Acuity (BCNVA) was 20/40 or better at least in one eye in 75% of Group 1, 58% of Group 2 and 26.7% from Group 3. After refraction it changed to 76% (114): 88.6% Group 1, 72% Group 2 and 53.4% Group 3. Age related macular degeneration was found in 31% in Group 1, 66% in Group 2 and in 100% in group 3. Conclusions: Visual acuity improved with refraction allowing better quality of life. AMD and cataract were the main cause of visual impairment and blindness. Current findings indicate that we should concentrate efforts in accurate refractive prescriptions, cataract and AMD for patients that age.

#### **PB6 183 PREDISPOSING FACTORS ASSOCIATED WITH DELIRIUM AMONG DEMENTED LONG-TERM CARE RESIDENTS**

P. VOYER\* (Laval University, Quebec City, Canada)

S. RICHARD(1), L. DOUCET(2), P. CARMICHAEL(1) - (1) Centre for Excellence on Aging (Quebec City, Canada); (2) Centre de santé et de services sociaux de la Vieille-Capitale (Quebec City, Canada)

Introduction: Delirium is a common and serious problem in long-term care settings. Identification of risk factors for delirium is important because it enables health care professionals to quickly recognize individuals at risk for delirium and implement preventive interventions to avoid its development. The purpose of this study was to investigate the predisposing factors for delirium among demented long-term care residents and to assess the cumulative effect of these factors on the likelihood of having delirium. Method and materials: One hundred and fifty five long-term care residents aged 65 and older with a diagnosis of dementia participated in this cross sectional study. Logistic regression analyses were performed to assess the association between the 21 predisposing factors considered and the presence of delirium. Delirium was defined as meeting the Confusion Assessment Method criteria for either definite or probable delirium. A risk score was also computed as the number of risk factors for which an individual was considered at risk and a logistic regression model was fitted using the risk score as the independent variable. Results: The prevalence of delirium in this sample was 70.3%. Age (OR: 1.07; 95% CI: 1.05-1.10) and severity of dementia (OR: 1.05; 95% CI: 1.03-1.07) were found to be the most important risk factors of delirium among those individuals. The likelihood to be in delirium increased with the number of risk factors present (OR: 1.67; 95% CI: 1.11-2.51). Modifiable risk factors identified were: level of functional autonomy, pain, depression, behavioural disturbances, number of medications, dehydration, fever and malnutrition. Conclusion: Our results suggest that in addition to advanced age and severity of dementia, delirium is associated with other modifiable risk factors.

#### **PB6 184 SUICIDE IN OLD AGE: ILLNESS OR AUTONOMOUS DECISION OF THE WILL?**

R. GUNDULA\* (LSF (Landesnervenklinik Sigmund Freud), Austria)

Depression, often accompanied by suicidal behavior or recurring thoughts about suicide, is one of the most common psychic impairments in old age. Statistics in Austria tell us clearly: Suicidal candidates among the elderly are likely to succeed. Especially in men, suicide has become a significant cause of death. In an age where traditional family structures are beginning to fall apart, and where the elderly increasingly feel to be a "burden" to society, unable to find their place, we tend to look at suicide more and more as a voluntary and autonomous decision, thus rationalizing it as in: "This life I would not want to live either." But is it permissible for physicians to consider a patient, who has acted suicidal, to be "not ill," or to have acted "with good reason"? My discussion shall critically revisit the concept of "rational suicide." What I hope to illuminate is the tension between medical care for, and autonomy of the patient that physicians have to negotiate in their work.

#### **PB6 185 DELIRIUM IN ELDERLY: PREVALENCE IN HOSPITALIZED PATIENTS AT THE ORTHOPEDICS INFIRMARY**

L. VICTOY\* (Goiania Urgencies Hospital, Goiania, Brazil)

J. ARRUDA(1), Z. SANTANA(1), R. SILVA(1), E. COSTA(1), G. MOURA(1) - (1) Goiania Urgencies Hospital (Goiânia, Brazil)

Introduction: delirium, despite being under-diagnosed, is a frequent condition in hospitalized elderly patients and it is also a marker of worse diagnosis during hospitalization and after discharge. Casuistry and Method: All patients who were 60 years old or older than 60 hospitalized at the orthopedics infirmary from Goiania Urgencies Hospital, Brazil, from February 2006 to March 2008 were analyzed. Information about number of hospitalized elderly patients, gender, age, presence or not of delirium was investigated. Then it was verified the presence of the following risk factors in patients who had delirium: age equal or over 70, ethilism history, polypharmacy, infections,

cardiopathies, presence of fluid and electrolyte disorders, histamine-2 receptor antagonists, use and presence of auditive and visual deficiency. Results: From an amount of 89 patients, 10 presented delirium (11.24%). Risk factors more frequent among patients were: age over 70 (80%) and presence of infection (80%). Other factors analyzed were: presence of fluid and electrolyte disorders (40%), presence of visual deficiency (40%), use of histamine-2 receptor antagonists (40%), auditive deficiency (30%), presence of cardiopathies (30%), polypharmacy (20%) and ethilism (10%). Discussion and Conclusion: Delirium prevalence in hospitalized elderly at the orthopedics infirmary from February 2006 to March 2008 was of 11.4%, not differing from the literature. All risk factors investigated can be related to delirium development, what have also been repeatedly showed in several papers. It is interesting that besides age over 70 and infection, there was a great prevalence of histamine-2 receptor antagonists use (40%). Association between histamine-2 receptor antagonists and delirium is probably due to its anticholinergic properties. Delirium increases the hospitalized patient mobimortality and knowing how to identify it and its risk factors is a decisive condition for good clinical evolution of hospitalized elderly.

#### **PB6 186 GERONTOTHERAPY IN WORKING AGING MALES AND FEMALES**

I. ROJA\* (Riga Stradiņu University, Rehabilitation Institute, Riga, Latvia)

J. ZALKALNS, Z. ROJA

Introduction. In Latvia nowadays in geriatric medicine is watching rapid growth number of working aging males and females suffering from age related psychological vulnerability with reduced capacity of the organism to withstand stress. Ageing working individuals in good general medical health are vulnerable to such types of stressors as psychotraumatic events at workplace and family life and suffer from anxiety, depressing mood, panic disorder. The management of the working aging males and females nowadays requires a comprehensive biopsychosocial approach: psychopharmacological treatment and psychotherapy - cognitive hypnotherapy (CH). Material and Methods. During last two years 38 patients were treated and observed: 20 working males and 18 females aged between 62 and 74 having anxiety and panic attacks, avoidant behaviour after psychotraumatic events at workplace and family life. Hamilton Anxiety Scale (HAM-A) and stress monitoring (SM) were used to asses the expression of anxiety and stress level. For 22 patients, males and females (A group) eight weeks treatment course included psychopharmacological treatment - selective serotonin reuptake inhibitor (SSRI) Paroxetine, combined with CH sessions and couple therapy - from the first therapy course day. 16 patients, males and females, representing control group (B group) received eight weeks only psychopharmacological treatment. Results. 19 patients from A group developed a positive feeling without depressing mood, anxiety and panic symptoms already after 4 weeks of combined treatment course. Catamnesis data show that all A group's patients after eight weeks treatment course use regularly self-relaxation. Only 5 patients of control group after therapy course had improvement of psychoemotional health. Conclusion. Psychopharmacological treatment, combined with cognitive hypnotherapy and couple therapy from the first therapy course day, is an effective modern short-term gerontotherapy for working aging males and females suffering from depressing mood , anxiety and panic attacks after psychotraumatic events at workplace and family life.

#### **PB6 187 REGENERATE: ASSESSING THE PHYSICAL AND MENTAL HEALTH OF CHRONIC STROKE SURVIVORS WITH DEPRESSION**

J. SIMS\* (Monash University, Notting Hill, Australia)

M. GALEA(2), N. TAYLOR(3), K. DODD(3), S. JESPERSEN(4), L. JOUBERT(2), J. JOUBERT(5), V. TEOH(6), J. MILGROM(2) - (2) LaTrobe University (Melbourne, Australia); (3) LaTrobe University (Melbourne, Australia); (4) Eastern Health (Melbourne, Australia); (5) University of Melbourne (Australia); (6) National Ageing Research Institute (Australia)

Introduction: The rehabilitation of stroke survivors has traditionally focused on improving their functional health. However, without holistic management, survivors' overall health and wellbeing may be disadvantaged, limiting their social participation and impacting on future prognosis. The Regenerate study aimed to assess whether a 10 week progressive resistance training program (PRT) could reduce depressive symptoms in chronic stroke survivors with depression. An associated prospective study aimed to identify psychosocial predictors of health-related quality of life (HRQoL) in chronic stroke survivors, to examine differences between non-depressed and depressed participants, and explore changes over time for HRQoL and psychosocial variables. Methods: Participants with depression (45) were randomised to PRT or wait-list control group. One hundred and thirty five entered the observational study. HRQoL, depressive status, social support, optimism, self-esteem, and perceived control data were measured at baseline, 10 weeks and 6 months. Stroke severity, stroke type, comorbidity, exercise status, and demographic information were also obtained. Results: Twice as many PRT participants maintained a reduction in depressive symptoms at 6 month follow up, but the difference was not significant after adjusting for baseline scores. There were also modest improvements in physical health and recovery scores. In the observational study, psychosocial factors consistently and significantly predicted HRQoL at all time points, accounting for 27% to 61% of the variance. Key determinants of HRQoL were depressive status, self-esteem, and perceived control. Compared to non-depressed participants, depressed participants displayed significantly poorer scores for HRQoL, social support, optimism, self-esteem, perceived control, physical and emotional functioning. Participants' physical health, social participation, depressive status, and

optimism improved over the 6 month study period. Conclusions: To optimize stroke recovery, health professionals should target post-stroke depression and psychosocial adjustment to stroke: these interventions have the potential to improve HRQoL for chronic stroke survivors.

**PB6 188** HEALTH, ECONOMIC STRESS AND LIFE SATISFACTION AFFECTING DEPRESSION TENDENCY OF ELDERLY TAIWANESE:A LONGITUDINAL STUDY  
B. LUE\* (National Taiwan University College of Medicine, Taipei, Taiwan)  
L. CHEN(1), S. WU(1) - (1) Institute of Health Policy and Management, National Taiwan University (Taipei, Taiwan)

Introduction The aging people have to face impacts from declining physical functions, worsening economic status and dimming prospect about life. This study aimed to explore whether the perceived health decline, economic stress and life satisfaction affect the changes of depression tendency Methods and materials We used the nation-wide longitudinal survey (the Survey of Health and Living Status of the Elderly in Taiwan) data in 1999 and 2003. A total of 2,373 subjects aged 65 or more who had completed the depression scale (CES-D10) both in 1999 and 2003 were the study subjects. Depression was dependent variable. Demography and changes in residency, occurrence of new diseases, social supports, perceived health and economic stresses, life satisfaction, ADL and IADL were the independent variables. Logistic regressions were used to analyze the affecting factors of depression in 2003 and the changes of the depression tendency from 1999 to 2003. Results There were 151(6.4%) subjects in 1999 and 191(8.05%) subjects in 2003 had depression. Among 151 subjects, 4.2% became better but 5.9% became worse. The factors affecting depression were age reached to 75-79, lower education level, increased perceived health and economic stresses, decreased emotional support, less life satisfaction, increased disability of IADL and had depression in 1999. The above factors also accounted for those who were getting worse from 1999 to 2003. However, the significant factors affecting subjects of depression in 1999 but not in 2003 were female, or married with living spouse, decreased health and economic stresses and increased emotional supports. Conclusion Our findings showed that the psychosocial care, in terms of the perception of aging and their psychological needs, is more important issues to be concerned. Mental health intervention and promotion will be the most important strategy for better elderly healthcare.

**PB6 189** LONELINESS, DEPRESSIVE SYMPTOMS AND RELATION TO DISABILITY RETIREMENT DUE TO DEPRESSION IN LATER LIFE  
T. LYRYA\* (University of Jyväskylä, Jyväskylä, Finland)  
T. TÖRMÄKANGAS(1), J. KAPRIO(2) - (1) (Finland); (2) (Finland)

Introduction: Loneliness is a risk factor for depression. It is unknown if there is a common genetic component between loneliness and depressive symptoms. In the genetically controlled data, we explored the association between loneliness and depressive symptoms and how this association is related to depression related disability retirement. Material and methods: Among 12 504 respondents, aged 33 to 60 years, who participated in the Finnish Twin Cohort Study in years 1981 and 1990 there were 232 monozygotic (MZ) and 569 dizygotic (DZ) pairs discordant for depressiveness based on the Beck Depression Index. Information on retirement events due to depression was obtained from Finnish nationwide official pension registers for 9094 individuals. We assessed association between loneliness and depressiveness using generalized linear mixed models for binary matched pairs. The share of common phenotype variable-specific genetic effects was estimated by using quantitative trait modeling. Relative risk survival regression model using the Cox proportional hazard model was used to assess the association of depressive symptoms and loneliness with the time to disability pension. Twin pairs were treated as clustered observations to adjust for twin dependence. Results: MZ and DZ twins discordant with depressiveness had OR 4.89 and 5.99, respectively, for being lonely, suggesting that genetic influences do not contribute to relation between depressiveness and loneliness, which was supported by results from heritability models. Univariate models indicated significant genetic contribution to depressiveness, but no such contribution to loneliness. People having both depressive symptoms and loneliness had three times higher risk for depression-related disability retirement. Conclusion: Loneliness and depressiveness correlate highly independent of genetic and shared environmental factors. Loneliness further increases risk for disability retirement for those having depressive symptoms.

**PB6 190** COSTS AND YIELD OF 2 SCREENING METHODS FOR DEPRESSIVE SYMPTOMS IN PEOPLE ? 75 YEARS OF AGE IN GENERAL PRACTICE  
G. VAN DER WEELE\* (Leiden University Medical Center, Leiden, The Netherlands)  
M. DE WAAL(1), W. VAN DEN HOUT(2), R. VAN DER MAST(3), P. ASSENDELFT(1),  
J. GUSSEKLOO(1) - (1) Leiden University Medical Center, department of Public Health and Primary Care (Leiden, The Netherlands); (2) Leiden University Medical Center, department of Medical Decision Making (Leiden, The Netherlands); (3) Leiden University Medical Center, department of Psychiatry (Leiden, The Netherlands)

Objective To examine costs and yield of two screening methods for clinically relevant depressive symptoms in subjects 75-79 years compared to subjects ≥80 years in general practice. Methods In 73 general practices 10,681 subjects ≥75 years, not currently treated

for depression, were invited for screening using the 15-item Geriatric Depression Scale (GDS-15). In direct screening subjects were invited by response card (+ reminder by telephone) followed by a home visit. In stepped screening subjects received the GDS by post (+ postal reminder) and visited only if the self-administered GDS-score was ≥4 points. During home visits the GDS was administered by an interviewer and considered as 'screen-positive' if the score was ≥5 points. Results Among subjects 75-79 years participation rates were 54% for both screening modes ( $p=0.57$ ), whereas direct screening yielded 6% screen-positives among participants and stepped screening 4% ( $p=0.04$ ). Among subjects ≥80 years 54% participated in direct screening and 46% in stepped screening ( $p<0.001$ ), yielding 6% and 5% screen-positives respectively ( $p=0.26$ ). Per GP practice with 160 elderly ≥75 years estimated costs for direct and stepped screening are €13 and €7 respectively per screened subject, €500 and €341 respectively per screen-positive subject. The more expensive direct screening has a somewhat higher yield; each additional screen-positive subject costs €819. Conclusion With both direct and stepped screening about 1 in 20 untreated elderly of ≥75 years in general practice was found screen-positive for clinically relevant depressive symptoms. Stepped screening diminishes screening costs per screen positive with 32%. Among subjects 75-79 years participation was equal for both methods, but the yield with direct screening was somewhat higher. Among subjects ≥80 years participation is higher with direct screening, however not resulting in a higher yield.

**PB6 191** GENERAL HEALTH STATUS AND VASCULAR DISORDERS AS CORRELATES OF LATE-LIFE DEPRESSION IN A NATIONAL SURVEY SAMPLE  
V. HIRANI\* (UCL, London, United Kingdom)  
R. STEWART(1) - (1) Institute of Psychiatry (King's College London) (London, United Kingdom)

Introduction Clinically significant depression is common in later life and associated with substantial distress, disability and is increased in people with worse physical health. However, it has been suggested that people with existing cerebrovascular disease or higher levels of vascular risk may have a greater than expected risk of depression. This suggests that there should be a stronger than expected co-occurrence of depressive symptoms and vascular risk factors in older populations which has important implications for the prevention of late-life depression. However, community surveys of older populations have frequently found no clear associations between depression and conventional cardiovascular risk factors, despite strong associations with reported previous stroke. We sought to investigate the associations of depressive symptoms with cardiovascular disorders and risk factors: in particular, the extent to which these were independent of general health status and/or accounted for the association between general health status and depression. Methods A secondary analysis of data from the Health Survey for England 2005: a nationally representative cross-sectional population survey comprising 4269 adults aged ≥65 living in private households. Measurements: Data collected included depressive symptoms (10-item Geriatric Depression Scale), self-reported general health and vascular disease / risk factors, resting blood pressure and lipid profile. Results: Case level depressive symptoms were associated with reported previous stroke, ischemic heart disease and diabetes. These associations were attenuated substantially when adjusted for general health status. On the other hand, the association between worse subjective health and depressive symptoms was not altered following adjustment for vascular disease / risk status. Conclusion: Depressive symptoms in this large national sample were more independently associated with worse general health than with cardiovascular disorders. They were not associated convincingly with vascular risk factors.

**PB6 192** FISH INTAKE AND THE RISK OF DEPRESSION IN THE ELDERLY. THE NUAGE STUDY OF NUTRITION AS A DETERMINANT OF SUCCESSFUL AGING.  
A. CÔTÉ\* (University of Sherbrooke, Faculty of Medicine and Health Sciences, Sherbrooke, Québec, Canada)  
F. GAGNON(1), H. PAYETTE(2) - (1) University of Sherbrooke, Faculty of Medicine and Health Sciences (Sherbrooke, Québec, Canada); (2) Research Center on Aging, Health and Social Services Center-University Institute of Geriatric of Sherbrooke (Sherbrooke, Québec, Canada)

Introduction: Conflicting results exist regarding a potentially protective association between fish intake and risk of depression. None of the studies, including only two prospective designs, have examined polychlorinated biphenyls (PCBs) contaminating fish as possible confounders. Objectives: 1) Describe the cross-sectional relationship between depression and usual fish intake; 2) Assess the effect of fish intake on depression incidence over two years; 3) Examine the potential of PCBs exposition to modulate this relationship. Methods: Secondary analyses of generally healthy community-dwelling elderly people from 6 equally distributed age/sex strata ( $70\pm2$ ;  $75\pm2$ ;  $80\pm2$ ) recruited in 2003 into the NuAge cohort for a 5-y longitudinal study on nutrition and aging. Those with complete nutritional data at baseline ( $n=1778$ ; 99.2%) were included. Fish intake was measured using three non-consecutive 24h dietary recalls at baseline. Affective symptoms were assessed at baseline, 1st and 2nd yr of follow-up using a cut-off score >10/30 on the Geriatric Depression Scale. PCBs exposition was assessed by matching consumption of fish with estimations of PCBs concentrations in fish according to the most recent Total Diet Study of Health Canada. Regression analyses for survey sample design with stratification were carried out. Results: At baseline, prevalence of depression was 10.3%,

and incidence was 4.4% at 1st yr of follow-up and 5.2% at 2nd yr. Cumulative two year incidence was 9.4 %. Prevalence of depression at baseline (12.5 % vs 7.8 %; p = 0.001) and two years cumulative incidence (11.3 % vs 7.3 %; p = 0.014) were higher in women than in men. Relationships between fish intake, and prevalence and incidence of depression will be presented while controlling for PCBs exposition. Supported by Canadian Institutes of Health Research

**PB6 193 THE WILL TO LIVE AS AN INDICATOR OF WELLBEING AND PREDICTOR OF SURVIVAL IN OLD AGE**  
S. CARMEL\* (Ben Gurion University, Beer Sheva, Israel)

Introduction Conceptually, the will to live (WTL) is defined as the psychological expression of a natural instinct of human beings - the striving for life, which is comprised of rational and irrational components, and can be self-assessed. Considering that the WTL not only expresses a state of general wellbeing, but also one's commitment to life and desire to continue living, we hypothesized that it is a unique indicator of elderly persons' wellbeing and predictor of survival. Methods & Materials These hypotheses were put to test in four randomized studies conducted on Israeli elders: Two cross-sectional studies conducted between the years 2006-2008 (N= 1255, N=860), and three longitudinal studies conducted between the years 1994-1996, 2006-2008, one of them a large scale national study (N=1134). Results The findings from these studies systematically show that the will to live significantly correlates with well established indicators of wellbeing. It weakens with age, being weakest among the oldest-old. Furthermore, relatively weak social groups in the population, such as women and new immigrants, report a weaker WTL in comparison to their counterparts. The WTL was also found as a good predictor of long-term survival (7.5 years), especially among elderly women after controlling for age, health and psychosocial variables. Conclusions Based on the systematically repeated findings, we conclude that the will to live is an important indicator of general wellbeing due to its diagnostic and prognostic values. In addition, the tool to measure the WTL is short and simple, and well accepted by elderly persons. We, therefore, recommend using it in daily practice.

**PB6 194 THE NEW ISRAELI LAW "THE DYING PATIENT" AND RELIEF OF SUFFERING UNITS**  
B. AMINOFF\* (Sheba Medical Center, Tel-Hashomer and Human Suffering and Satisfaction Research Center, El-Ad, Ramat Gan, Israel)

The new Israeli Law "The Dying Patient" provides avenues for possible medical, ethical and Halachic (Jewish religious law) solutions in view of the complexity of the treatment of an end-stage dementia (ESD) patient. The establishment of a hospice-like setting for dementia patients in Israel, based on palliative treatment only, similar to the Jewish hospices in the United States of America, is extremely important. This paper proposes a new, alternative approach and setting for patients with ESD that could pertain to the Israeli setting and could possibly also be acceptable in other countries. Key points: 1. Screening the suffering level of dying patients by means of the Mini Suffering State Examination (MSSE) scale developed by us for revealing which patients have a high level of suffering (MSSE = 7-10) 2 Patients with a high level of suffering (MSSE = 7-10) should be hospitalized in "Relief of Suffering Units" 3. Period of hospitalization in such a unit is estimated to be 1 month 4. Patients whose suffering level diminishes during hospitalization in these units could be discharged 5. The desirable approach to dying patients in "Relief of Suffering Units" will be to seek solutions for diminishing the high suffering level of the patients Treatment in the Relief of Suffering Units would be in accordance with the principles determined in the New Israeli Law. These units would be the source for integral medical, nursing, religious, ethical, psychological and sociological research, seeking methods to cope with the horrendous burden of suffering of dying patients, their families and the nursing staff. Our proposal was published in book – Measurement of Suffering in end-stage Alzheimer's Disease, Dyonon, Tel-Aviv, 2007.

**PB6 195 EXPERIENCES OF OLDER PEOPLE IN RESIDENTIAL CARE HOMES (THE EPOCH STUDY): MAPPING THE LIVING DYING TRANSITION.**  
K. FROGGATT\* (Lancaster University, Lancaster, United Kingdom)  
C. GOODMAN(1), E. MATHIE(1), J. WRIGHT(1), D. THOMPSON(1), A. MENDOZA(1), D. WESTWOOD(1), M. COWE(1), S. BARCLAY(2), S. ILIFFE(3), J. MANTHORPE(4) - (1) University of Hertfordshire (Hatfield , United Kingdom); (2) University of Cambridge (Cambridge, United Kingdom); (3) Royal free and University College Medical School (London, United Kingdom); (4) Kings College (London, United Kingdom)

Background Many older people aged over 85 years live in a care home. Dying is part of care home life and an important aspect of the overall quality of care provided. Recent initiatives in England seek to improve access to palliative care services, and the quality of care for residents towards the end of life. How individuals experience and engage with this living and dying transition in a care home over time, has received little attention. Methods This prospective study documents the experiences, care received and services used by older people living in seven residential care homes in the East of England, over a one year period. Multiple methods of data collection used include care note reviews (n=200), interviews with

older people (n=70), care home staff (n=35) and NHS primary care staff (n=14), and documentary review. The purposively selected sample of older people will be interviewed three times during the year. To date 4 care homes have been visited and 44 older people, and 19 staff have been interviewed. It is 87 residents have consented to a review of their care notes in the home. Findings Present within older people's experiences and views of living in a care home are accounts of losses and to a lesser extent dying. Inherent in these accounts are seemingly contradictory threads of satisfaction and dissatisfaction with care. This mirrors the acceptance and denial of dying also presented by the same residents. Even residents with dementia were able to recount their experiences of living and loss in this setting. Conclusions Understanding the details of older people's experiences of living in a care home informs understandings of the dying faced by these people.

**PB6 196 END OF LIFE CARE FOR AGING VETERANS IN RESIDENTIAL CARE**  
M. GIBSON\* (St. Joseph's Health Care London, London, Canada)  
E. GORMAN(1), A. FERON(2) - (1) King's University College, University of Western Ontario (London, Canada); (2) St. Joseph's Health Care London (London, Canada)

Introduction: Many people who live in residential care facilities die in these same facilities. While excellent practice models to guide the provision of end of life care exist (e.g., the Canadian Hospice and Palliative Care Association "Square of Care" model), it is a concern that there is limited research on how to implement recommended practices within distinct service environments or for population subgroups. Aging war veterans are one such subgroup. Methods: Focus groups were conducted with family members (spouses and daughters) of older men who lived and/or had died in a residential care facility for Canadian war veterans. Two data-generating sessions were facilitated by clinician volunteers who received training in qualitative interviewing. The sessions were audiotaped and transcribed, then analyzed thematically by the authors (a geropsychologist working in veterans care (MG), thanatology academic with nursing and social work background (EG), and a palliative care social worker (AF)). A member-checking session confirmed identified themes. Results: Recurrent themes included ambivalence about the institutionalization of a loved one, including where they should be when they die, relationship challenges including changing family and spousal dynamics and expectations of health care providers, comfort and dignity issues especially positioning the dying process within a larger framework of overall quality of care, tension between needs for privacy and community, and military service as a defining event for the veterans. Conclusions: The findings confirmed much that is consistent with the literature and clinical practice recommendations but also revealed nuances that reflect the distinct characteristics of the care environment, including gender (male residents, female family members and predominantly female health care providers) and cohort (veteran) issues. The findings support the importance of seeking stakeholder input and making adaptations to fit the local context when implementing clinical practice guidelines.

**PB6 197 WHEN DOCTORS AND DAUGHTERS DISAGREE: "YOU DON'T KNOW MY MOM; I KNOW MY MOM."**  
P. ABADIR\* (Johns Hopkins University, Baltimore, United States)  
M. MCNABNEY(1), T. FINUCANE(1) - (1) Johns Hopkins University (Baltimore, United States of America)

When an elderly patient becomes acutely ill near the end of life, three features are commonly present: prognosis is poor but uncertain, treatments that might prolong life are burdensome, and the patient has become incapacitated. A choice between two general strategies is then forced. One strategy focuses on comfort and dignity with a higher likelihood of death. The other accepts burdensome treatment with the hope of meaningful benefit. Devoted and well-intentioned family members are often in attendance as this forced choice is considered by and on behalf of acutely ill patients whose decisional capacity is uncertain. The "Standard Paradigm" of American medical ethics generally considers advance directives to be direct expressions of an incapacitated individual's preferences, and thus morally preferable to decisions made by family. Family decision-making is generally inferential, and may be influenced by family members' preferences. We describe a case where two daughters overruled a patient's carefully constructed advance directives, leading to a hectic, burdensome illness. In the end, the mother understood her children's needs and was willing, at least in retrospect, to have met those needs. Advance directives depend on the idea that an individual has well-formed and immutable preferences that are specifiable in advance. This may be inaccurate. In many families, vital decisions are made in "council". For some patients, benefiting the family may be a compelling consideration, and the best way to benefit a family during future illness may not be known when a patient completes an advance directive. We offer suggestions for working through disagreements with well loved family members, acknowledging that their interests may be highly relevant to an accurate presumption about the patient's wishes

**PB6 198 HOSPICE IN 21ST CENTURY AMERICA: PASSION AND BUSINESS IN THE END OF LIFE CARE**  
I. PERSIDSKY\* (House Calls Medical Corporation, Long Beach, United States)

Advances in health science and medical technology made end of life care in developed countries a rather expensive endeavor, often resulting in futile care. Very pragmatic

approach, taken by Medicare in the US to curb rising cost, resulted in mushrooming of hospice agencies. However, they did not always achieve financial goal, especially in case of elderly patients with diagnosis other than terminal cancer. This paper assesses financial viability and quality of care in a for-profit business model of a small hospice agency in Southern California. Majority of the patients had end stage dementia and a variety of terminal cardio-pulmonary conditions with or without adult failure to thrive. We concluded that, although on the surface, desire for higher profit, and quality of patient care are mutually exclusive, in a competitive environment of medical industry they complement each other in more than one way. (1) Desire to eliminate inpatient care with high overhead, favored care in the patients home. (2) Competing ancillary providers (pharmacies, equipment suppliers, etc.) delivered higher quality of services to the patients. (3) Seemingly wasteful mandated multidisciplinary approach, involving physicians, nurses, social workers, etc., greatly increased productivity. (4) High patient and family satisfaction assured "word of mouth" referrals, expanding patients' base. (5) Drive for aggressive enrollment in the program was controlled by adherence to strictly defined evidence based qualifying criteria. Business oriented model of hospice is capable of delivering end of life care which is focused on the patient and family and provide the best emotional and physical comfort at the time when they are mostly needed. The same model should achieve maximum cost savings for the insurance through adherence to well established criteria for enrollment.

#### **PB6 199 END-OF-LIFE COSTS AND HEALTH STATUS IN COMMUNITY LIVING ELDERLY**

L. LAFORTUNE\* (Université de Montréal, Montréal, Québec, Canada)  
F. BÉLAND(1), J. ANKRI(2), H. BERGMAN(3) - (1) Université de Montréal, Health Administration (Montréal, Canada); (2) Université de Versailles-Saint-Quentin; INSERM U687 (Paris, France); (3) McGill University (Montréal, Canada)

Heavy utilization of health services is concentrated in the frailest segment of the population and those nearing the end of their life. Numerous studies have looked at chronic diseases, disability and their association with service utilization. Yet, relatively few looked of the associations between health status and end-of-life costs. Our objective is to study the relationship between health status and service utilization among decedent and surviving community-living elderly presenting with complex care needs. Methods. Data for this study is the randomized controlled trial of SIPA, a system of integrated care for frail older people (Montréal, Canada; 1999-2001). Health status was measured during home-based interviews using standardized instruments. Service utilization data measured over 22 consecutive months originate from administrative databases and patient charts. We used two-part econometric models to compare average daily costs of institution- and community-based services for decedents (n=242) and surviving (n=931) elderly, which we grouped into four homogenous categories of health status using latent class analysis. Results. Survivors' and decedents' costs of care trends according to health status go in opposite directions. Severely disabled survivors cost significantly more compared to their relatively healthy counterparts. In contrast, the highest end-of-life costs, driven by acute hospitalizations, belong to the relatively healthy, independent of age. Among survivors and among decedents, the oldest old (85+) cost significantly less compared to younger age groups. Combined, these results support the notion of a compression of costs due to morbidity in the oldest decedents. Conclusions. This is the first description of the relationship between health status and end-of-life care in frail community-living elderly. The implication of our findings for public policy is that the dual concern of health status and end-of-life practices is amenable to evidenced-based interventions.

#### **PB6 200 LIVING WITH ADVANCED CHRONIC OBSTRUCTIVE PULMONARY DISEASE (COPD): PATIENTS CONCERN REGARDING DEATH AND DYING.**

C. GARDINER\* (The University of Sheffield, Sheffield, United Kingdom)  
M. GOTTL(1), S. BARNES(1), D. HALPIN(2), S. PAYNE(3), C. RUSE(4), D. SEAMARK(5), N. SMALL(6) - (1) The University of Sheffield (United Kingdom); (2) Royal Devon and Exeter Hospitals (United Kingdom); (3) Lancaster University (United Kingdom); (4) Sheffield Teaching Hospitals (United Kingdom); (5) Honiton Surgery (United Kingdom); (6) University of Bradford (United Kingdom)

Introduction: A palliative care approach, as used routinely in cancer, is also valid for other life ending conditions such as chronic obstructive pulmonary disease. Prognosis in COPD is poor and many patients perceive shortcomings in the education they receive about aspects of their condition. This study explores the experiences of patients with moderate and severe COPD, particularly with regard to fears surrounding death and dying. Method: Semi-structured interviews were conducted with 21 patients with moderate ( $FEV1 < 50\%$ ) or severe ( $FEV1 < 30\%$ ) COPD. Interviews were transcribed and analysed using the principles of thematic analysis. Results: Findings revealed that patient understanding of COPD was poor and approximately half of the patients were unable to provide a name for their condition. Most patients were unaware of the progressive nature of the condition, and few were aware they could die of COPD. Despite the poor understanding of COPD, patients often expressed concerns that their condition might deteriorate. Patients had particular concerns regarding the manner of their death; the overriding fear was dying of breathlessness or suffocation. Most patients expressed a preference to die peacefully. None of the patients had discussed their fears regarding the manner of their death with a health care professional. Conclusions: Although the majority of patients had a poor understanding of COPD and its prognosis, most had fears regarding deterioration of their condition and

particularly the way in which they might die. Improved patient education is needed in order to improve patients' understanding of their condition and their prognosis. Open communication regarding death, as advocated in a palliative care approach, is also needed to alleviate patients fears and to allow them to make decisions regarding the management of their care at the end of life.

#### **PB6 201 THE HEART RATE VARIABILITY ANALYSIS OF IRREVERSIBLE APNEIC COMA AND BRAIN DEATH VIA POINCARÉ PLOT**

J. SHIEH\* (Yuan Ze University, Chung-Li, Taiwan)  
B. HU(1), Y. HAN(2), S. HUANG(3) - (1) Yuan Ze University (Taiwan); (2) National Taiwan University Hospital (Taiwan); (3) National Taiwan University Hospital (Taiwan)

Introduction: The purpose of this research is to find the heart rate variability (HRV) of irreversible apneic coma (IAC) and brain death for the clinical correlation research. Sympathetic storm, a cardiovascular hyperdynamic state occurring in the process of brain stem failure, has been well studied in animal models. The phenomenon of sympathetic storm was also mentioned by researchers after introducing the HRV, suggesting its contributory potential to the diagnosis of IAC. Methods and materials: Based on the presence or absence of IAC as well as on GCS (Glasgow coma scale), subjects studied in this paper were divided into 3 groups. The first group consisted of 16 healthy subjects (normal) as control. The second group consisted of 26 ordinary patients (GCS between 4~15) without IAC in neurosurgical intensive care unit (NICU). The third group consisted of 16 patients with IAC and brain death in NICU. We calculate Poincaré plot index (SD1, SD2 and area), time domain index (SD, CV, SDSD, and RMSSD), and frequency index (HFP/LFP, HFP/TF) in order to obtain the relationship between HRV and Autonomic nervous system. Results: We find the shapes of IAC and brain death patients are fan and area are smaller, but shapes of normal people are comet and areas are bigger. Finally we use statistics by means of Kruskal-Wallis test and Dunns test to discuss the differences of these parameters with three groups. Conclusion: In this paper, it can be demonstrated that Poincaré plot index (SD1, SD2 and area) and time domain index (SD, CV, SDSD, and RMSSD) can discriminate the differences among normal healthy subjects, ordinary patients, and IAC and brain death patients. But, the frequency index (HFP/LFP, HFP/TF) can not discriminate the differences among normal healthy subjects and ordinary patients.

#### **PB6 202 AID IN DYING IN THE UNITED STATES: LAW AND POLITICS**

K. DAYTON\* (William Mitchell College of Law, St. Paul Minnesota, United States)

The presentation will address legal and political developments affecting the practice of aid-in-dying in the United States. Aid-in-dying, sometimes called "physician assisted suicide", allows terminally ill persons to choose their time of death through self-administered lethal doses of prescribed medication. Aid-in-dying has been legal in the state of Oregon for more than ten years, and the state of Washington recently enacted aid in dying legislation via a state-wide referendum. In the state of Montana, a state trial court held in December that the right to make this end-of-life medical choice is protected by the Montana state constitution. Polls show that public support for aid-in-dying has reached all time highs, and four major US medical organizations have endorsed regulated aid-in-dying as a legitimate end-of-life treatment choice. This presentation will address these legal and political developments from the perspective of the elder law professional. It will review the descriptive and empirical literature pertaining to aid in dying, in particular the empirical data that have been collected in Oregon during its decade of experience with legal aid in dying. The presentation will conclude with a discussion of the role of medical and legal professionals in educating the public about the pros and cons of legal aid-in-dying.

#### **PB6 203 SPIRITUAL CARE FOR CANCER PATIENTS AND THEIR FAMILIES**

S. RESNIZKY\* (Myers-JDC-Brookdale Institute, Jerusalem, Israel)  
N. BENTUR(1) - (1) Myers-JDC-Brookdale Institute (Jerusalem, Israel)

Introduction: The spiritual needs of patients with life-threatening illness and their families are becoming increasingly recognized. The WHO included spiritual care in its definition of palliative care, describing it as a means to provide relief and improve quality of life. While professionals are developing the concept of spiritual care, little is known about how it is perceived by the patients themselves and their families. The study addresses this issue. Methods and materials: Open-ended in-depth interviews with cancer patients and family members who have received care from a spiritual care provider in Israel. Results: Spiritual care uses a variety of strategies that on the one hand "extricate" patients from their illness and suffering and on the other give them space to address difficult themes. Spiritual care providers establish a relationship of intimacy and trust, and discuss with the patients topics that are important to them but are not related to the medical treatment such as their family or job. It allows the patients to maintain their identity as complete human beings. Rather than focusing on struggles, pain, and loss, they recognize strengths and hopes. Conversely, the spiritual care provider provides the patients with an opportunity to talk about difficult subjects that they cannot discuss with others, such as the fears of future or death. Conclusion: The encounter with a spiritual care provider is perceived by patients and their families as a very positive experience. It allows them to talk about things rather than their illness, gives the opportunity to touch on fears and anxieties, and makes it easier for them

to cope. It is appropriate and necessary to expand spiritual care services beyond their currently limited scope.

**PB6 204 FACTORS INFLUENCING HOME DEATH AND CAREGIVER BEREAVEMENT OUTCOME: RELATIONSHIP BETWEEN REGRET AND SATISFACTION WITH HOME MEDICAL CARE**

A. AKIYAMA\* (Osaka University Graduate School of Medicine, Suita city, Japan)  
K. NUMATA(1) - (1) Department of in-home medical care Tokyo Women's medical university (Tokyo, Japan)

**Introduction:** The purpose of this study was to examine the factors influencing home death and caregiver bereavement outcome  
**Methods:** This study was an anonymous mailed survey of bereaved family members (caregivers) of patients who died in a home medical care setting provided by an institution specializing home medical care in Japan (home death rate: about 80%). We analyzed the relationship between regret and satisfaction with home medical care and the place of death and caregiver's present feelings about loss.  
**Results:** The significant determinant factors associated with home death was preference of death at home by both the patient and the caregiver; caregiver's satisfaction with home medical care, cohabitation with children and lower caregiver apprehension about home medical care. In multiple linear regression analysis of factors influencing satisfaction with home medical care, significant influential factors were: peaceful death, psychological well-being of the caregiver and a good relationship with one's physician. Also, the caregiver's regret during bereavement significantly influenced their present feelings about loss regardless of the length of time after bereavement and the strength of the caregiver's regret during bereavement was an important predictor of their present feelings about loss. In multiple linear regression analysis of factors influencing regret during bereavement, significant influential factors were: psychological well-being of the caregiver, peaceful death of the patient, fulfilled home medical care service system. Conclusion: These findings suggest that in order to enable home death, it is important to improve caregiver's satisfaction with home medical care and it is also important to minimize caregiver's regret during bereavement for better subsequent adaptation to loss of the patient.

**PB6 205 PREDICTORS OF HEALTH CARE UTILIZATION DURING THE LAST YEAR OF LIFE OF ELDERLY PERSONS**

P. WERNER\* (University of Haifa, Haifa, Israel)  
J. BOOGAARD(1) - (1) University of Haifa (Haifa, Israel)

**Introduction:** The last year of life has frequently attracted the attention of health care planners, largely because it is assumed that elderly persons in the final phase of life impose a heavy burden on health care expenditures. However, the number of studies examining health care utilization in the last year of life is very scant. The aim of this study was to examine which factors contribute to health care utilization in the last year of life. **Method:** Participants were 139 next-of-kin of Jewish elderly individuals who had died during the course of the previous year in a major city in Israel. The data collected on the decedents included their use of health care services (i.e., doctor visits, nursing assistance); functional (ADL/IADL) and cognitive decline during the last year of life; social networks; socio-demographics; and cause of death. The data were analyzed using multiple regression techniques, with health care utilization defined as the outcome variable. **Results:** The majority of the decedents were female (79.5%), immigrants (90.5%), and married (98.9%). The mean age was 79.5, and the mean number of years lived in Israel was 49.1. Statistical analysis showed that, when controlling for cause of death and functional and cognitive decline, the number of children and grandchildren had a significant effect on the use of health care services (respectively  $B = .840$   $p=.006$  and  $B = .867$   $p=.009$ ). **Conclusions:** Functional and cognitive decline alone do not predict health care utilization in the last year of life. Indeed, the social network surrounding the older individual is instrumental in determining the use of health care services in the last year of life. Therefore, health care policy encouraging the involvement of persons in the social environment of older individuals during their last year of life might help.

**PB6 206 THE WAY PEOPLE WOULD LIKE THEIR LIVES TO END**

A. WESTTSTEIN\* (City Medical Service of Zurich, Zürich, Switzerland)  
U. SCHOLIAN(1), A. WETTSTEIN(1) - (1) City Medical Service of Zurich (Zürich, Switzerland)

**Introduction** The study explores the wishes people have for the final phase of their lives. **Methods and materials** By means of a questionnaire a survey was carried out in the canton of Zurich (Switzerland) with people working in nursing institutions and with participants of workshops preparing for retirement about the following questions: What age would they like to reach? In which way would they like their lives to end, choosing one of four dying trajectories? How much time of their lives would they forfeit in order to avoid dependence? **Results** 159 questionnaires were evaluated. The average lifetime women desired was 85.6 years, the one of men 83.8 years. 43% of the respondents preferred a sudden death, 50% a dying process of a few weeks or months. 3% would be ready to go through repeated serious health crises over several months and 4% to pass away after years of slowly increasing frailty. 34% of the respondents would forfeit at least six years, 61% at least two years of their lives in order to avoid dependence on others and the need for care.

14% would not trade off any time at all. Respondents working in nursing institutions would trade off significantly less time than respondents before retirement. Conclusion A vast majority of the respondents hoped for a dying process of a few months at most, a destiny which is only granted to a minority of (western) people. The desired lifetime, close to the actual life expectancy in Switzerland, is relatively modest. This may reflect the fear of losing autonomy, something the results of the time-trade-off question show clearly. Nurses may know the human capacity to deal with limited autonomy better than people without experience in care.

**PB6 207 OUTCOMES FOR OLDER ADULTS IN AN INPATIENT REHABILITATION FACILITY FOLLOWING HIP FRACTURE SURGERY**

K. MCGILTON\* (Toronto Rehabilitation Institute, Toronto, Canada)  
N. MAHOMED (1), A. DAVIS (1), J. FLANNERY (2), S. CALABRESE (2) - (1) Toronto Western Research Institute (Toronto, Canada); (2) Toronto Rehabilitation Institute (Toronto, Canada)

**Introduction:** The health care professionals on the rehabilitation unit in this retrospective study had never cared for frail patients with multiple co-morbidities including cognitive impairment (CI). After a Patient-Centred Rehabilitation Model targeting clients with CI (PCRM-CI) was developed, the staff were trained in the novel approach to care. There are five components to the PCRM-CI: rehabilitation management post surgery; dementia management; delirium management; staff education and support; family and patient education. Once the staff were trained the criteria for admission to the unit changed to include all clients living within the community who had fractured their hip, regardless of their cognitive impairment. This study evaluates patient outcomes regarding older community-residing adults who participated in rehabilitation program following hip fracture surgery. **Methods & Materials:** Motor subscale of the Functional Independence Measure (motor-FIM), length of stay (LOS), rehabilitation efficiency, discharge destination. **Results:** Eighteen out of 31 consecutively admitted patients were found to have CI postoperatively with a Mini-Mental State Examination score  $\leq 23$ . There were no differences in motor FIM gain scores, LOS, and discharge destination between the two groups of patients. Motor functional gain for subjects with CI was 57.2 versus 57.0 for those with intact cognition ( $p = .97$ ). The average LOS on the unit for patients with CI was 28 days, and 31 days for those without CI. Rehabilitation efficiency for patients with intact cognition was 2.1, vs. 2.6 for patients with CI. Discharge location for both groups was predominantly to the community, as 80% returned home. **Conclusions:** Staff can learn how to care for patients with CI in rehabilitation settings. Patients with CI can achieve outcomes comparable to those without CI in a setting dedicated to targeting interventions for patients who have dementia, delirium, and sustained a hip fracture.

**PB6 208 THE INFLUENCE OF SARCOPENIC OBESITY ON THE FUNCTIONAL FITNESS IN SEDENTARY OLDER ADULTS IN KOREA**

S. HONG\* (Kangnam University, Gyeonggi-Do, Republic of Korea)

1) **Introduction:** Despite the growing importance of physical function and Sarcopenic obesity in older persons, there is still a lack of information explaining whether they are related with each other. To examine the influence of sarcopenic obesity on functional fitness level in sedentary older adults, 673 community-dwelling sedentary Korean older women were recruited and examined. 2) **Methods and materials:** 673 sedentary older women were recruited from 16 different districts in Seoul. Rikli and Jones' five tests (chair stand, arm curl, one leg stand, 2-min steps, shoulder flexibility) were conducted to measure participants' functional fitness, and bioimpedance measured body composition. Participants were classified into 4 groups using the Cogswell and Dietz's classification of sarcopenic obesity; based on the level of their lean body mass and fat mass they were classified either one of followings: Normal muscle+normal fat(Group-A), normal muscle +high fat (Group-B), low muscle+normal fat(Group-C), and low muscle+high fat (Group-D:sarcopenic obese). GLM and LSD-test were conducted for the analyses with SPSS 13.0. 3) **Results:** For 673 older women, mean age of 75, chair stand ( $p<.05$ ), arm curl ( $p<.001$ ), one leg stand( $p<.01$ ), 2-min steps( $p<.001$ ) were associated with the level of muscle mass and fat mass. For chair stand, sarcopenic obese group has much lower score than that of Group-A and Group-B ( $p<.05$ ). For arm curl, sarcopenic obese group has lower score than that of Group- A ( $p<.05$ ). For One leg stand and 2-min steps show same results that sarcopenic obese group has lower score than that of Group A(normal muscle + normal fat) ( $p<.05$ ). 4) **Conclusion:** We conclude that conclude that sarcopenic obese were associated with functional fitness level of sedentary older adults.

**PB6 209 THERAPEUTIC GARDEN WITH REHABILITATION PATH: AN ORIGINAL EXPERIENCE IN A GERIATRIC HOSPITAL**

C. PENG\* (Groupe hospitalier Sainte Périne-Chardon Lagache-Rossini, Paris, France)  
F. POUDRET(1), F. HÉRITIER(1), R. MAHAMIA(1), M. ROGER(1) - (1) Groupe Hospitalier Sainte Périne-Chardon Lagache-Rossini (Paris, France)

For the elderly, hospitalization is often an important stress factor. The idea of creating a therapeutic garden including a rehabilitation path resulted from concept of strengthening an stimulating the residual abilities for mobility and to fight against autonomy loss in a surrounding close to nature. From 2004 to 2006 a therapeutic garden was designed and

realized in our hospital comprising over 600 beds in acute, rehabilitation and long stay wards. This garden was implemented with 5 physical rehabilitation modules (a slalom course, an obstacle-scattered path, a tactile board, a Japanese bridge and a hoop game) meant to stimulate walking, equilibrium, proprioception and stereognosis. Furthermore, this garden was adorned with 2 botanical spaces where fruit trees and aromatic plants were grown in order to offer a variety of sensorial stimulations. Thus patients with cognitive disorders were able to perform rehabilitation and fall prevention exercises in a natural entertaining environment whereas they had always refused to go to the physical therapy room. The botanical spaces allowed to strengthen sociability and conviviality, and hospitalized patients were able to make friendship ties and avoid self withdrawal and lonesomeness. This experience shows the importance of the environment and its impact upon the care of hospitalized elderly patients and the progress they may accomplish.

#### **PB6 210 POLYPHARMACY AND FRAIL PATIENTS**

J. MARTI\* (Hospital Zumarraga, Zumarraga, Guipuzcoa, Spain)

I. LARREA(1), J. RAMELLA(1) - (1) Hospital Zumarraga (Zumarraga, Spain)

**Background.** Older people consume an increasing amount of medication. Polypharmacy is associated with an elevated risk of adverse health outcomes resulting in hospitalizations and sometimes death. **Objectives:** To evaluate drug consumption in the elderly aged 85 years or more. Patients and Methods. We study a cohort of 100 patients aged 85 years or more, admitted in the Internal Medicine Department of Goiherri county. Data were collected by a structured questionnaire during the admittance exploring sociodemographic variables, drug use, disability and cognitive functions. Results. We present 100 patients, 64 women and 36 men ( $88.9 \pm 3.48$  years-old) a 13 % were nursing-home residents. Barthel Index with normal activities of daily living 62%, cognitive impairment 35%. Comorbidities: Hypertension 68%, heart failure 44%, diabetes mellitus 25%, ischemic heart disease 23%, renal failure 22%, COPD 21%, neoplasm 18%, stroke 12%, smoker 4%. A 53% present 3 or more comorbidities. The mean number of drugs was of 6.3 (5.77 for men and 6.62 for women with a statistically significant difference ( $p<0.01$ ). The main drugs used were of cardiovascular area. None of the patients had doses-adjusted to their MDRD. Inappropriate drugs prescribing(drugs,doses and contraindications )30 %. Possibility of pharmacologic associations 38%(90% ECAI/ARAB + diuretics). Discussion It is well known that multiple medication use entails health risks. According to several studies, inappropriate drug prescribing occurs in approximately 20% of older patients. Older people exposed to potential drug interactions rise from 25% in the age group of between 60 and 80 years to 36% in the 80+ age. Conclusion. At the moment the polypharmacy is inevitable due to increase in life expectancy and quality of life. We must adjust the drugs to comorbidities and MDRD. The use of pharmaceutical associations improve the adherence.

#### **PB6 211 A MULTIFACTORIAL AND INTERDISCIPLINARY TEAM APPROACH TO FALLS PREVENTION FOR OLDER HOME CARE CLIENTS**

M. MARKLE-REID\* (McMaster University, Hamilton, Ontario, Canada)

G. BROWNE(1), A. GAFNI(2), J. ROBERTS(1), R. WEIR(1), L. THABANE(3), M. MILES(4), V. VAITONIS(5) - (1) McMaster University (Hamilton, Ontario, Canada); (2) McMaster University (Hamilton, Ontario, Canada); (3) St. Joseph's Healthcare (Hamilton, Ontario, Canada); (4) Hamilton Niagara Haldimand Brant Community Care Access Centre (Brantford, Ontario, Canada); (5) Mississauga Halton Community Care Access Centre (Canada)

**Introduction:** Falls and fall-related injuries are common, potentially preventable causes of mortality, morbidity and increased health care use and cost among older people receiving home care services. The objective of this study was to determine the effects and costs of a multifactorial, interdisciplinary team approach to falls prevention compared to usual home care for older home care clients "at risk" of falling. **Methods:** The design was a randomized controlled trial of 109 older adults ( $> 75$  years) using home support services who are at risk for falls. Subjects were randomized to intervention ( $n=54$ ) or control ( $n=55$ ) groups. A total of 92 subjects completed the six month follow-up. The intervention was a 6-month multifactorial and evidence-based prevention strategy involving an interdisciplinary team. The primary outcome was number of falls during the 6-month follow-up. Secondary outcomes were changes in fall risk factors and costs of use of health services from baseline to 6 months. **Results:** At 6 months, there was no difference in the mean number of falls between groups. However, subgroup analyses showed that the intervention was effective in reducing falls in men, 75-84 years of age, with a fear of falling, or a negative history of falls. There was a greater reduction in number of slips and trips, and a greater improvement in role functioning related to emotional health in the intervention group. These improvements were achieved at no additional cost from a societal perspective. **Conclusion:** A multifactorial, interdisciplinary team approach was more effective and no more expensive than usual home care in improving quality of life, reducing the incidence of slips and trips, and reducing falls among males ( $>75$ -84 years), with a fear of falling or a negative history of falls.

#### **PB6 212 PREVALENCE, CORRELATES, AND COSTS OF FALLS IN OLDER HOME CARE CLIENTS "AT-RISK" FOR FALLING**

M. MARKLE-REID\* (McMaster University, Hamilton, Ontario, Canada)

G. BROWNE(1), A. GAFNI(2), J. ROBERTS(1), R. WEIR(1), L. THABANE(3), M. MILES(4), V. VAITONIS(5) - (1) McMaster University (Hamilton, Canada); (2)

McMaster University (Hamilton, Canada); (3) St. Joseph's Healthcare (Hamilton, Canada); (4) Hamilton Niagara Haldimand Brant Community Care Access Centre (Brantford, Canada); (5) Mississauga Halton Community Care Access Centre (Canada)

**Introduction:** Many older people receiving home support services are "at risk" for falling, but the rates of falls and fall risk factors have not been previously investigated in this population. Using baseline data from an efficacy trial on falls prevention, the objective of this study was to determine the 6-month prevalence, risk factors, and costs of falls in older people using home support services who are at risk of falls. **Methods:** The analysis includes 109 older adults ( $>75$  years) using home support services who are at risk for falls from two home care programs in Ontario, Canada. Data pertaining to known risk factors for falls and the cost of use of all types of health services in the previous 6 months were collected through a structured in-home interview. The frequency of falls in the previous 6 months was ascertained by telephone and by a monthly postcard follow-up. **Results:** Of the 109 participants, 70.6% reported  $>1$  fall in the previous 6 months, and 27.5% experienced multiple falls. Falls resulted in fractures (40%), emergency room visits (22%), and hospital admissions (54%). Seniors who fell had lower levels of physical, social, and psychological functioning and higher cost of use of health services compared with non-fallers. Cognitive impairment, Parkinson's disease, age  $>85$  years, environmental hazards, slip or trip, and visual impairment explained 22% of the variation in number of falls. **Conclusion:** Falls and fall-related injuries are highly prevalent among older people receiving home support services who are at risk of falling. Falls were associated with lower levels of health-related quality of life and function and higher cost of use of health services. Home care providers can help prevent falls by identifying individuals who are at greatest risk and could benefit most from targeted interventions.

#### **PB6 213 FRAILTY AND OXIDATIVE STRESS IN THE ELDERLY**

I. WU\* (College of Medicine, National Cheng Kung University, Tainan, Taiwan)

X. LIN(1), S. SHIESH(1), P. KUO(1) - (1) College of Medicine, National Cheng Kung University (Tainan, Taiwan)

**Background:** Frail elders have high morbidity and mortality, and are characterized by loss of skeletal muscle mass, increased and redistributed fat mass as well as systemic inflammation. Oxidative stress is closely related to muscle mass loss, obesity and systemic inflammation. We hypothesized that frail elders had higher oxidative stress as compared with non-frail elders. **Method:** A cross-sectional study of community-dwelling adults and geriatric clinic patients at the age of 65 or older without malignancy, stroke and Parkinson's disease was performed. Frailty status was classified as frail, prefrail and robust, and was determined by a validated tool. Blood was drawn to measure serum 8-OHdG level. Body mass index, waist-hip ratio, blood lipid, glucose, albumin and hs-CRP were also measured. Differences between groups were analyzed with the one-way ANOVA and chi-square test for trend. Multivariate associations were assessed with ordinal regression. **Results:** A total of 90 subjects with mean age of 77 years were recruited, among which 21 subjects (23.3%) were frail, while 56 subjects (62.2%) were prefrail and 13 subjects (14.4%) were robust. Frail vs. prefrail and robust subjects had higher serum 8-OHdG levels ( $3.0 \pm 1.5$  vs.  $2.8 \pm 1.9$  and  $1.4 \pm 1.1$  ng/mL), higher serum hs-CRP ( $6.5 \pm 8.7$  vs.  $4.9 \pm 9.1$  and  $1.7 \pm 1.0$  mg/L), lower serum albumin ( $4.1 \pm 0.4$  vs.  $4.4 \pm 0.4$  and  $4.6 \pm 0.2$  g/dL) and higher waist-hip ratio ( $0.96 \pm 0.11$  vs.  $0.91 \pm 0.07$  and  $0.89 \pm 0.05$ ) ( $p < 0.05$  for all). After adjusting for other factors, high serum 8-OHdG levels were significantly associated with frailty. **Conclusion:** Increased oxidative stress was independently associated with frailty.

#### **PB6 214 ANEMIA AND FUNCTIONAL CAPACITY IN THE ELDERLY.**

R. BOSCO\* (Santa Casa de Misericórdia de Belo Horizonte - Hospital Madre Teresa, Belo Horizonte MG, Brazil)

C. ANTUNES(1), L. PEREIRA(2), E. ASSIS(3), A. DIMAS(3), L. QUEIROZ(3), R. PINHEIRO(3), A. SCARABELLI(3), A. ROSA(3) - (1) Santa Casa de Misericórdia de Belo Horizonte (Belo Horizonte MG, Brazil); (2) Universidade Federal de Minas Gerais - UFMG (Belo Horizonte MG, Brazil); (3) Hospital Madre Teresa (Belo Horizonte MG, Brazil)

**Introduction:** Anemia is considered one of the factors responsible for the loss of functional capacity (FC) in the elderly. The objective of this study was to evaluate the association between FC and anemia in the elderly, both anemic and non-anemic. **Methods and Materials:** Cross-sectional study with 709 elderly individuals (male=343, aged  $71.8 \pm 7.9$ ; female=366, aged  $74.5 \pm 8.3$ ). Patients with severe disabilities, bleedings, poor cognitive status and visual and auditory limiting impairments were excluded. Anemia was diagnosed according to the WHO ( $Hb < 120.0$  g/L, for women;  $Hb < 130.0$  g/L, for men, sampled during the first 48 hours of hospitalization). FC was evaluated by self appraisal, related to the 30 days prior to hospitalization, by Katz's and Lawton's indexes. Correlation between variables was assessed by the Spearman test ( $\rho = 0.05$ ). **Results:** Prevalence of anemia was 30%, without differences between sexes. It was observed that the anemic individuals were the elderliest (anemic, aged  $75.9 \pm 8.5$ ; non-anemic, aged  $72.0 \pm 7.84$ ,  $p=0$ ). Average  $Hb$  values were: anemic =  $113.0 \pm 10.6$  g/L; non-anemic =  $138.5 \pm 10.5$  g/L,  $p=0$ . Decrease in FC was found in ADL (anemic =  $0.69 \pm 1.51$ ; non-anemic  $0.04 \pm 0.40$ ,  $p=0$ ) and in AIDL (anemic =  $23.1 \pm 3.48$ ; non-anemic  $26.4 \pm 1.94$ ,  $p=0$ ). Most compromised activities in ADL were bathing (22.5%) and dressing (18.4%); in AIDL, housework (56.8%), laundry/ironing (54.5%), shopping (55.4%) and transportation (49.1%). **Conclusion:** FC in the anemic

decreased if compared to the non-anemic. Activities most compromised demand significant muscular strength and flow of oxygen in the tissues, a scenario in which anemia has a very important negative impact.

**PB6 215 MOVEMENT SPECIFIC REINVESTMENT, FALLS AND WALKING IN COMMUNITY-DWELLING OLDER ADULTS**

W. WONG\* (The University of Hong Kong, Hong Kong, Hong Kong)  
R. MASTERS(1), J. MAXWELL(1), B. ABERNETHY(1) - (1) Institute of Human Performance, The University of Hong Kong, (Hong Kong, Hong Kong)

**Introduction:** Elder falls can result in detrimental consequences. Elder fallers(EF) may consciously monitor and control movements during walking to prevent repeated falls. Paradoxically, this may disrupt movements further. Conscious movement control with internal-focus on mechanics of moving is called 'reinvestment'. It is unclear whether reinvestment is related to falling history or whether EF have higher internal-focus on the mechanics of walking. This study aimed to (1)explore the relationship between elder falls and reinvestment, (2)examine whether the Movement Specific Reinvestment Scale(MSRS) can discriminate EF from elder non-fallers(ENF), and (3)investigate focus of attention of elder repeated-fallers(ERF) and ENF during walking. Methods and materials: Fifty-two elders(mean age=74.60±5.80) completed the MSRS, Mini-Mental State Examination, Timed 'Up & Go' and Four-Word Short-Term Memory tests. Demographics and falling history were collected. Thirty ERF and ENF(mean age=76.30±5.95) finished various walking trials(3-meters). Participants either carried no-cup(control), a cup(pressure) or a spillable-cup(high-pressure). Accuracy at answering questions relevant to internal-focus(mechanics of the limbs), external-focus(environmental) and control condition after walks was assessed. Results: Logistic regression revealed significant association between the MSRS(conscious motor-processing) and 'faller or non-faller' status. EF scored higher than ENF on movement self-consciousness( $p=0.001$ ) and conscious motor-processing( $p<0.001$ ) components of the MSRS. ERF showed higher internal-focus than ENF under pressure(main effect of Group,  $p=0.001$ ;Group x Pressure interaction,  $p=0.03$ ). Conclusion: EF have higher propensity for reinvestment during walking than ENF, especially under pressure. The MSRS is a potential clinical tool to predict elder falls. Strategies to prevent predisposition for movement-specific reinvestment may be useful during gait rehabilitation.

**PB6 216 THE PASSAGE OF TIME: SOCIAL RELATIONSHIP AND PHYSICAL ACTIVITY AMONG OLDER AFRICAN AMERICAN WOMEN**

I. HARVEY\* (University of Illinois Urbana-Champaign, Champaign, United States)  
M. MUYOT(1) - (1) University of Illinois Urbana Champaign (Champaign, United States of America)

**Introduction:** Optimizing health is critical to delay chronic illness in later life. Physical activity participation has been related to improve physical and psychological health, although many older Americans remain sedentary. It is reported that almost half of those 65 years and older do not engage in leisure time physical activity. Studies documented that social support provide a way to encourage older women to engage in physical activity. Although research has established a positive outcome of social support and physical activity, not enough research has been conducted to compare the relationship between social support and health-promoting behaviors among older diverse populations. Method: This study used three waves of data from the Americans' Changing Lives (ACL) survey, a stratified, multistage area probability sample of non-institutionalized individuals' aged 25 years and older living in the 48 coterminous states of the United States. Responses were based on a subset of 340 African American women aged 60 and older. Data from all three waves of the ACL were used to determine whether interpersonal relationships had an impact on health behavior by using repeated measures analysis of covariance. Results: The tests of significance of the fixed effects indicate that the main determinants of physical activity were wave ( $p < 0.0001$ ), ethnicity ( $p = 0.0002$ ), informal social integration ( $p < 0.0001$ ), and formal social integration ( $p < 0.0001$ ). In other words, increased formal and informal integration resulted in higher physical activity. Conclusion: The implication of these results is that social support from friends and organizations (i.e., religious) is an important motivational factor in engaging older African American women in physical activity. It may be more effective to combine neighborhood resources (e.g., churches and senior centers) to support health promotion programs.

**PB6 217 NONAGENARIAN ACUTE GENERAL SURGICAL ADMISSION: ARE WE ACHIEVING ANYTHING USEFUL?**

A. KESTERTON\* (Manchester Royal Infirmary, Manchester, United Kingdom)  
K. ANNABEL(1), S. NIGEL(1) - (1) Lancashire Teaching Hospitals NHS Trust (United Kingdom)

**AIMS:** To determine the duration, interventions and outcome of general surgical admission for patients aged more than 90 years admitted through the Emergency General Surgical Take. **METHODS:** Prospectively recorded database of Teaching Hospital emergency general surgical admissions for the nine month period – 1st January 2007 to 30th September 2007. Details of patient age, gender and pre-admission domicile recorded. On admission details of investigations, surgical interventions and discharge destination were

collected. **RESULTS:** During the 9 month period 49 patients aged 90 or older were admitted (median 92; range 90-99). Laboratory biochemical (90%) and haematological (92%) investigations were commonly used; cross sectional imaging (USS –18%; CT-14%) was rarely employed in patient assessment. Overall 43 nonagenarians (88%) had no invasive investigation or procedure, 4(8%) underwent endoscopy and 2 had a surgical procedure one of whom died. The median hospital stay for this cohort of nonagenarians was 4 days (range 0.1-72 days). A total of 8 (16%) patients died in hospital. All 17 survivors admitted from a nursing home were discharged back to that care; of the 24 survivors admitted from their own home – 22 went back to their own home and only 2 required nursing home care. **CONCLUSIONS:** Nonagenarian emergency admission is an increasing feature of the emergency surgical take. The large majority spend a relatively short time in hospital, have relatively little imaging and/or intervention before returning to their normal place of abode. This suggests that nonagenarian acute surgical admission has little to offer and alternative models of assessment with home support should be considered for this patient group.

**PB6 218 MUSCLE STRENGTH, MUSCLE BALANCE, QUALITY OF LIFE AND PLASMA IL-6 LEVELS IN OLDER INDIVIDUALS WITH KNEE OSTEOARTHRITIS**

M. AVELAR DI SABATINO SANTOS\* (Universidade Federal de Minas Gerais, Belo Horizonte, Brazil)

M. AVELAR DI SABATINO SANTOS, L. SOUZA MÁXIMO PEREIRA, J. DOMINGUES DIAS, E. FERRIOLI, D. MATTOS GARCIA OLIVEIRA, W. FABIANO GOMES, F. MATTOS COELHO, B. ZILLE DE QUEIROZ, N. MACIEL DE BRITO ROSA

**Objective:** Determine associations and correlations of muscle strength and balance to quality of life and plasma IL-6 levels in older women with knee osteoarthritis (OA). **Methods:** An exploratory cross-sectional study was performed on 80 older women ( $71.2 \pm 5.3$  years) with knee OA. Muscle strength (torque/body mass) and hamstrings/Quadriceps muscle balance (H/Q) were assessed using a isokinetic dynamometer at angle velocities of 60°/s and 180°/s. Quality of life was measured by the Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC). Body mass index (BMI) was expressed as  $\text{Kg}/\text{m}^2$ . Radiographic severity (Kellgren-Lawrence) was assessed. Plasma IL-6 levels were determined (ELISA). Spearman's correlation coefficient and the Mann-Whitney test (associations) were used, at a 0.05 level of significance. **Results:** A significant inverse correlation was found between BMI, muscle strength and muscle balance in all WOMAC subscale. Strongest correlations were between the hamstrings muscle at 60°/s ( $r=-0.437$ ;  $p=0.000$ ) and BMI ( $r=0.348$ ;  $p=0.002$ ) with the self-reported function subscale; and the Quadriceps at 60°/s with the pain subscale. IL-6 was significantly correlated to BMI ( $r=0.215$ ;  $p=0.056$ ); inversely correlated to muscle strength of the hamstring muscles ( $r=-0.232$ ;  $p=0.03$ ) and muscle balance on the right side at 180°/s ( $r=-0.254$ ;  $p=0.023$ ). Radiographic severity of OA was not significantly correlated with either the WOMAC or plasma IL-6 levels ( $p=0.351$ ). **Conclusion:** Reduced H/Q muscle strength and muscle balance, obesity and increased IL-6 were associated to a reduction in quality of life in the sample studied.

**PB6 219 SUBJECTIVE VISUAL PERCEPTUAL ABILITY RELATES TO FUNCTIONAL BALANCE PERFORMANCE IN PEOPLE WITH CHRONIC STROKE**

S. NG\* (The Hong Kong Polytechnic University, Hong Kong, Hong Kong)  
P. MARCO YC(1), K. MACY MT(1), C. BRYAN CH(1), C. ALEX SH(1), K. KENNETH CW(1), N. THOMAS KW(1) - (1) The Hong Kong Polytechnic University (Hong Kong, Hong Kong)

**Introduction:** Impaired subjective visual perceptual ability is common in people following stroke which may relate to balance deficits. While visual input and perception is important to balance control in healthy adults, the relationship between the visual perceptual ability and balance performance is not clearly identified in people with stroke. The purpose of this study is to identify the relationship between visual perceptual ability and balance performance in elderly with stroke. **Methods and Materials:** A convenient sample of 21 elderly subjects (14 males and 7 females), who suffered from a single stroke at least 6 months ago, participated in this study. The visual spatial perception was assessed by the Motor-Free Visual Perception Test-3 (MVPT-3). Laboratory balance performance was assessed by the sensory organization test of computerized dynamic posturography. Functional balance performance was assessed by the Berg Balance Scale and five-time-sit-to-stand test, functional mobility was measured by timed Up & Go test. **Results:** The MVPT-3 had a significant positive correlation with Berg Balance Scale ( $r = 0.509$ ,  $p = 0.019$ ), and a negative correlation with five-time-sit-to-stand test ( $r = -0.736$ ,  $p < 0.001$ ) and timed Up & Go test ( $r = -0.457$ ,  $p = 0.037$ ). However, there were no significant correlation found between MVPT-3 and visual ratio ( $r = -0.05$ ,  $p = 0.984$ ), somatosensory ratio ( $r = -0.209$ ,  $p = 0.363$ ) and vestibular ratio ( $r = -0.270$ ,  $p = 0.908$ ) of sensory organization test. **Conclusion:** Subjective visual perception was significantly related to functional balance performance in people with stroke. Future studies should be directed to quantify the effect of subjective visual perceptual ability on balance performance. Such

knowledge would be important in designing an effective rehabilitation program to optimize balance performance in people with stroke.

**PB6 220 BOTH PHYSICAL AND PSYCHOLOGICAL IMPAIRMENTS ARE RELATED TO COMMUNITY REINTEGRATION IN OLDER PEOPLE WITH STROKE**

S. NG\* (The Hong Kong Polytechnic University, Hong Kong, Hong Kong)  
N. SHAMAY SM(1), L. MANDY LM(1), L. MAGGIE SH(1), N. LINDA CC(1),  
W. ERIC FK(1) - (1) The Hong Kong Polytechnic University (Hong Kong, Hong Kong)

**Introduction:** Many older people who survive a stroke experience restrictions in reintegration into community activities after they are discharged from the hospital. Few studies have addressed the influence of different stroke impairments on community reintegration. The purpose of this study is to determine the factors related to the satisfaction with community reintegration for older people with stroke. **Methods and Materials:** A sample of 26 people with stroke (aged 41-66) participated in the study. The primary outcome was satisfaction with community reintegration, as measured by the Reintegration to Normal Living (RNL) Index. Each subject was evaluated for: (1) Functional mobility (Timed Up & Go Test), (2) balance ability (Berg Balance Scale), (3) lower extremity muscle strength (Five-sit-to-stand test), (4) motor recovery of lower and upper limbs (Fugl-Meyer Motor Assessment), (5) upper limb function (Wolf Motor Function Test), (6) balance confidence (Activities-specific Balance ), and (7) Depression (Geriatric Depression Scale). **Results:** RNL Index score had a significant, positive correlation with balance ability ( $r=0.537$ ,  $p=0.005$ ), lower limb motor recovery ( $r=0.496$ ,  $p=0.010$ ), and balance confidence ( $r=0.587$ ,  $p=0.002$ ). RNL Index score was also negatively correlated with the time taken to complete the Timed Up & Go Test ( $r=-0.704$ ,  $p<0.001$ ) and five-sit-to-stand test ( $r=-0.646$ ,  $p<0.001$ ). In contrast, depression, upper limb motor recovery and upper limb functional ability were not significantly correlated with RNL Index score. **Discussion and Conclusion:** Both physical impairments and psychological impairment were significantly related to the satisfaction with community reintegration in older adults with stroke. Rehabilitation strategies targeting these specific impairments may be effective in enhancing community reintegration among older people with stroke, but will require further study.

**PB6 221 POOR VISION ACCOMPANIED WITH OTHER SENSORY IMPAIRMENTS IS ASSOCIATED WITH FEAR OF FALLING IN OLDER WOMEN**

J. KULMALA\* (University of Jyväskylä, Jyväskylä, Finland)  
A. VILJANEN(1), S. SIPILÄ(1), M. KOSKENVUO(2), J. KAPRIO(2),  
T. RANTANEN(1) - (1) University of Jyväskylä, Finnish Centre for Interdisciplinary Gerontology (Finland); (2) University of Helsinki, Department of Public Health (Finland)

**INTRODUCTION:** Relatively little is known about the effects of visual loss and co-existing vision, hearing and balance impairments on fear of falling (FF) in older people. The purpose of this study was to investigate the cross-sectional association between decreased visual acuity and FF and the impact of co-existing sensory impairments on FF among community-dwelling older women. **METHODS AND MATERIALS:** 428 women aged 63-75 participated in visual acuity (VA), hearing ability and standing balance measurements in the research laboratory. FF was assessed by questionnaires. The Odds Ratios (OR) for FF was computed using the logistic regression. **RESULTS:** Altogether 75 (18%) participants had only vision impairment, 40 (9%) had coexisting vision and hearing impairment, 42 (10%) had coexisting vision and balance impairment and 34 (8%) participants had all three sensory impairments. Altogether 25 (6%) participants reported having FF at least sometimes. Vision impairment alone (VA of < 1.0), was not associated with FF compared to persons with normal vision (OR 1.1, 95% CI 0.3-4.2). Coexisting vision and balance impairment was strongly associated with FF (OR 4.4, 95% CI 1.5-12.5), compared to those with normal vision. Among persons with all three impairments the OR for FF was 3.8 (95% CI 1.0-13.8) compared to participants with good vision. Also coexisting vision impairment and impaired hearing increased the risk, although the OR was not statistically significant (OR 2.3, 95% CI 0.6-9.5). **CONCLUSIONS:** Poor vision increased the odds for FF when it was accompanied with loss of hearing or balance. Our study suggested that a multifactorial approach, including regular ophthalmic examination, audiometric screening and balance assessment followed by appropriate treatment and rehabilitation is likely an effective method in reducing FF in older people.

**PB6 222 HEALTH RELATED QUALITY OF LIFE (HRQOL) IN OSTEOPOROSIS: GENDER DIFFERENCES AND CORRELATES.**

O. EDELSTEIN\* (University of Haifa, Ness-Ziyonna, Israel)  
P. WERNER(2), I. VERED(3) - (2) Dean, Faculty of Social Welfare and Health Sciences, University of Haifa (Haifa, Israel); (3) Endocrinology, Sheba Medical Center, Tel Hashomer and Sackler School of Medicine, Tel Aviv University (Tel-Aviv, Israel)

**Introduction:** Osteoporosis and osteoporosis related fractures are usually considered conditions of postmenopausal women, but these also occur in men. Despite the large number of men affected, osteoporosis in men remains inadequately researched. The aim of the present study was to assess gender based differences in Health Related Quality of Life (HRQoL) and its correlates among osteoporotic men and women. **Methods & Materials:**

Participants were 102 women and 100 men recruited from four medical centers in Israel. Participants were interviewed face to face by using a structured questionnaire. Information was collected regarding participants perceived HRQoL, health beliefs, coping mechanisms, level of anxiety/depression, demographic and health characteristics. **Results:** Although no significant differences were found between men and women regarding most of their health characteristics, women reported worse scores at most of the HRQoL dimensions. Men perceived their disease as having fewer consequences, as being less chronic and more controllable. Compared to men, women reported higher levels of anxiety and depression and used more emotionally focused strategies and fewer problem focused strategies to cope with the disease. Regarding health behaviors, although men participated in more physical activities than women, no differences were found between the genders in daily calcium intake. Among the women, better HRQoL was associated with higher scores of the bone density scan of the femoral neck and with less engagement in emotion-focused strategies. In men, better HRQoL was associated with fewer number of fractures, greater sense of control, fewer perceived symptoms, higher participation in physical activities and fewer depression symptoms. **Conclusions:** The current study results suggest that osteoporotic men and women perceive their disease and HRQoL differently. These findings stress the importance of osteoporosis as a disease that affects both genders although differently. Consequently, interventions and educational programs should be geared to the specific needs of men and women.

**PB6 223 ASSOCIATION BETWEEN COGNITIVE DISABILITY AND FALLS AND ROLE OF LIFESTYLE IN THE ELDERLY**

S. BELBRAQUET\* (UNIVERSITÉ DE MONCTON, MONCTON, Canada)  
N. CHAU(1), L. GROUP(1) - (1) INSERM, U669 (Paris, France)

**Introduction:** Falls and cognitive disability represent important problems of public health, yet their relationships and the roles as mediators of lifestyle factors have not been well documented. This study assessed the association between falls and cognitive disability and lifestyle factors among elderly people. **Methods and materials:** In total 1,697 subjects (776 men and 921 women), 60 years, randomly selected from the Lorraine population ( $2.3 \geq$  aged million inhabitants) completed a postal questionnaire including socio-demographic characteristics, height, weight, socio-occupational category, diseases diagnosed by a physician, smoking habit, alcohol abuse (Deta questionnaire), cognitive disability (defined as difficulties for concentration, attention, orienteering, problem-solving or memory), and falls which resulted in physical injuries with difficulties for daily living activities observed at the time of the survey (at home, work, public places, during sports or leisure activities). Data were analyzed using the logistic model. **Results:** Falls were common (3.5%) and cognitive disability affected 46.6% of subjects. Falls related to cognitive disability (odds ratio 2.09, 95% CI 1.04-2.96). The OR decreased to 1.48 (95% CI 0.86-2.55) when controlling for gender, age, educational level, obesity, smoking, alcohol abuse, musculoskeletal disorders, other diseases, and perceived income. Among these factors those with significant adjusted OR (ORa), and thus mediated the association between falls and cognitive disability, were: aged 70-79 (ORa 1.73, 0.96-3.09) and aged 80+ (2.20, 1.01-4.83) vs. aged 60-69, obesity (1.88, 1.09-3.23), alcohol abuse (3.07, 1.30-7.24), and musculoskeletal disorders (4.43, 1.74-11.31). **Conclusion:** We found high prevalences of cognitive disability and falls with physical injuries and their strong associations in the general elderly population. This relationship was partly mediated by increasing age, obesity,

**PB6 224 CULTURE-BOUND INERTIA: IDENTIFYING BARRIERS TO EXERCISE FACED BY OLDER INDIGENOUS POPULATIONS.**

F. ALPASS\* (Massey University, Palmerston North, New Zealand)  
C. STEPHENS(1), J. NOONE(1) - (1) Massey University (Palmerston North, New Zealand)

**Introduction:** Older indigenous populations have poorer health and lower rates of beneficial exercise adoption than non-indigenous counterparts. In response the World Health Organisations Active Ageing policy framework advocates the development of culturally appropriate physical activity guidelines for older adults. Key to developing such guidelines is identifying whether indigenous populations encounter significantly different barriers to exercise adoption than non-indigenous populations. This study investigates barriers to exercise that differ between older Maori and non-Maori New Zealanders in the first data collection wave of the Health, Work and Retirement Longitudinal Study. **Methods and Introduction:** Postal survey data were collected from a representative sample of Maori (n=3117) and non-Maori (n=3545) New Zealanders aged 55-70 years. These data included stage of exercise adoption, self-reported physical activity levels, physical and mental health, healthcare utilisation, and key psychosocial factors such as social support, work/family commitments and economic living standards. **Results:** Analysis shows that while Maori have lower activity levels and are more sedentary than non-Maori, physical activity levels increased across exercise adoption stages for both groups. Key barriers to exercise adoption for both groups were poor physical and mental health and a lack of general social support. However, poor levels of social attachment, domestic overcrowding, and low income were significant barriers for Maori only. **Conclusions:** Findings indicate that there are specific barriers to exercise adoption faced by Maori which are not evident for non-Maori. While some of these differential barriers are linked to poorer socio-economic status other barriers are linked specifically to a lack of social integration and

social attachment for indigenous groups which are vital for supporting the adoption of new behaviours. These findings have direct implication for the development of culturally appropriate guidelines for physical activity adoption in older indigenous populations.

**PB6 225 THE DEVELOPMENT AND IMPLEMENTATION OF A STATE-WIDE FALLS PREVENTION POLICY IN AUSTRALIA - A CASE STUDY.**

R. POULOS\* (University of New South Wales, Sydney, Australia)

P. ALBANY(1), L. LOVITT(2) - (1) Motor Accident Authority of New South Wales (Australia); (2) Clinical Excellence Commission, NSW Department of Health (Australia)

Introduction New South Wales was the first Australian state to have a comprehensive management policy to reduce fall injury among older people. It was developed following extensive consultation, and takes a long-term public health approach. This research sought to determine the significant influences on falls policy development, identify strategies to assist researchers/practitioners increase their impact on policy, and explores barriers and enablers to policy implementation. Methods and Materials An analysis of the development and implementation of the policy was undertaken through interviews with key stakeholders (researchers, practitioners, policymakers and health service managers) and a review of policy documentation. Results The predicted increase in burden to the health system posed by population ageing and the associated anticipated costs of care were major factors in putting the issue of falls in older people on the government agenda. A growing body of research evidence identifying risk factors for falls and effective and promising interventions provided the background necessary for policy formulation. Motivated individuals were responsible for championing the issue, and leading policy development. Networks that brought researchers, practitioners and policy makers together promoted research dissemination, uptake and influence on policy formulation. Policy implementation has been enhanced through dedicated recurrent government funding, and partnerships with other sectors; but the dominance of the acute care sector, competing demands, limited workforce capacity and geographic distance have impeded implementation. Conclusions In line with the policy research literature, this study indicates the importance of ensuring the intersection of three issue streams (problem, policy and politics) for getting aged care needs onto the policy agenda. It highlights opportunities for, and methods by which stakeholders may influence the making of policy. Health agency leadership has been a key driver in falls prevention. The involvement of other sectors is vital for policy success and improved outcomes for older people.

**PB6 226 REHABILITATION OF PEOPLE WITH HIP FRACTURE AND DEMENTIA: RESULTS FROM THE FRANZ- STUDY**

A. MIHAIAL\* (Research-group on geriatrics, Charité-Universitätsmedizin Berlin, Berlin, Germany)

G. LÄMMLER(1), R. ECKARDT(1), Y. KAPPES(1), E. STEINHAGEN-THIESSEN(1) - (1) Research-group on geriatrics, Charité-Universitätsmedizin Berlin, Evangelisches Geriatrizezentrum Berlin (Berlin, Germany)

Background: Hip fractures are one of the most important risk factors causing permanent immobility and functional dependence in old age. Individuals with dementia are not only at high risk of falls, but in cases of a hip fracture they have difficulties to cope with conventional rehabilitation. Therefore, the research group on geriatrics, Charité Berlin, has developed a specific therapeutic method to address the demands of these patients. The project was granted by the Robert Bosch Stiftung. Method: The data for this evaluation study was ascertained using a control group design which included 114 individuals with dementia in an inpatient-setting. The study was started on 01.10.2005 and ended on 29.02.2008. The follow-up review ended on 31.05.2008. While the control group received conventional physiotherapy and occupational therapy, the treatment group received additional therapy which consisted essentially of two components: 1. Extra exercise provided by a trained geriatric nurse, and supervised by a physiotherapist. 2. The patients participated in a group program, which was based on reminiscence therapy. The intent was to enhance self-confidence and well-being. Results: Both groups improved their mobility considerably, but the improvement was significantly higher in the treatment group. Psychiatric disorders declined in the treatment group, but not in the control group. These results were statistically highly significant. The follow-up review, three months after discharge, showed no longer an advantage for the treatment group compared with the control group. However, the treatment with physiotherapy and anti-dementia drugs has not been sufficient for most patients during this follow-up period. Conclusion: This data shows the effectiveness of the new therapeutic method. Patients with dementia can be treated successfully, if their specific needs are addressed adequately. However, a stability of the treatment effect is not achievable without subsequent physiotherapy.

**PB6 227 FALLS AND FALL-RELATED INJURIES AND ASSOCIATED RISK FACTORS AMONG OLDER U.S. ADULTS**

K. FORREST\* (Slippery Rock University of Pennsylvania, Slippery Rock, United States)

W. STUHLDREHER

Introduction: Unintentional falls are the common cause of injuries and related medical and disability costs are significant. The current study evaluated the occurrence of falls and fall-related injuries and their associated risk factors among the population aged 65+ years in the

U.S. Methods and Materials: The data from the 2006 Behavioral Risk Factor Surveillance System (BRFSS) were analyzed. BRFSS is an ongoing data collection program that monitors risk factors for chronic diseases in the adult U.S. population. The 2006 BRFSS included two questions about falls and fall-related injuries occurred in the past three months. The data were analyzed using the statistical program SUDAAN that can account for the complex survey design and sample weight. Results: A total of 90,279 individuals, who were aged 65+ years and provided valid data on falls, were included in this study. Over 16% (n=14,909) of the study population reported at least one fall in the past three months. The rate of falls increased as age increasing, ranged from 14% for aged 65-69 years to 25% for aged 85+ years. Females were more likely to fall than males. The following factors increased the risk of falls: minority race other than black, living alone, low income and education level, rural dwelling, obesity, and poor health (all p-values<0.01). Of those who fell in the past three months, 32.9% sustained injuries and were characterized as females, aged 85+ years, minorities, low income, and poor health (all p-values<0.01). Conclusions: Falls and fall-related injuries are relatively common among older U.S. adults. To prevent falls and injuries from falls, certain risk factors could be modified, such as regular exercise to manage weight, to improve muscle strength, gait and balance, and to enhance overall health condition.

**PB6 228 VALIDATION OF THE CHINESE CANADIAN STUDY OF HEALTH AND AGING CLINICAL FRAILTY SCALE (CSHA-CFS) TELEPHONE VERSION**

D. CHAN\* (National Taiwan University Hospital, Taipei, Taiwan)

H. TSOU(2), C. CHEN(1), C. CHEN(4) - (1) Department of Geriatrics and Gerontology, National Taiwan University Hospital (Taipei, Taiwan); (2) Division of Biostatistics and Bioinformatics, National Health Research Institutes (Miaoli, Taiwan); (4) Division of Gerontology Research, National Health Research Institutes (Taipei, Taiwan)

OBJECTIVE: To validate the Chinese CSHA-CFS Telephone Version. DESIGN: Cross-sectional validation study SETTING: Outpatient clinics at a tertiary medical center in Taipei, Taiwan. SUBJECTS: Sixty-seven patients enrolled in the "Comprehensive Geriatric Assessment and the Frailty Study of Elderly Patients". METHODS: The CSHA-CFS Physician Version is a 7-point scale assigned after comprehensive geriatric assessments. Higher score indicates frailer status. The Chinese CSHA-CFS Telephone Version included 17 questions adapted from the Physician Version. Two trained research assistants conducted the telephone interviews. Administration time was " 3 minutes. Standard reliability and validity measures were applied. RESULTS: Three-fifths of the subjects were older than 75 years of age and half were female. Inter-rater reliability was achieved with weighted kappa of 0.684, (p=0.002) between first 20 ratings from 2 interviewers. Criterion validity was achieved with weighted kappa of 0.689 (p<0.0001) and Kendall's tau of 0.612 (p<0.0001) between the Telephone Version and the Physician Version scores. Divergent validity was demonstrated with significant correlations but only fair agreements comparing both Telephone Version and Physician Version scores with the Cardiovascular Health Survey phenotypic definition of frailty. CONCLUSION: The Chinese CSHA-CFS Telephone Version appears to be a quick, reliable, and valid frailty screening instrument for community-dwelling elderly.

**PB6 229 STUDY OF ELDERLY PATIENTS WITH FEMUR FRACTURE IN WALTER FERRARI MUNICIPAL HOSPITAL, JAGUARIUNA, SÃO PAULO, BRAZIL**

M. TOURINHO\* (Hospital de Jaguariuna, Jaguariuna, Brazil)

T. SABBAG(1), V. BELLINAZZI(1), M. BANDICOLLI(1) - (1) Hospital Jaguariuna (jaguariuna, Brazil)

The incidence of hip fracture increases with ageing, with 350000 fractures per year in the United States and is related to and increased number of falls. This is a disease related to females, with a mortality rate of 4.9 to 25%. This paper is about the characterization of the elderly people admitted in the Walter Ferrari Municipal Hospital, in Jaguariúna/SP, Brazil, with hip fractures and describes the risk factors and clinical and surgical management of these patients, relating these data to the ones reviewed in literature. It was observed an increased number of female patients, with up to 60 years old and even people over 90 years old. There were 14% of deaths and the first cause of fracture was falls. The risk factors associated were osteoporosis, neurological diseases, smoke and arthrosis of the knees. The major complications were infections and delirium. In conclusion the study population had the same behavioral of patients with hip fractures described in literature, with a need to prevention projects to decrease the incidence of this disease among the elderly.

**PB6 230 TO FALL OR NOT TO FALL THAT IS THE ISSUE.**

J. AGNEW\* (Counties Manukau District Health Board, Auckland, New Zealand)

Introduction to the Counties Manukau District Health Board: Their population(race, ethnicity, cultural context) the service provided in relation to Older Persons health requirements and the various services that are in place within this DHB at present. In-depth investigation into falls within the inpatient setting, what is in place and carried out to prevent falls and the strategies adopted to reduce falls, as investigated by the interdisciplinary team. In order to reduce falls the first step is to identify why they are occurring so looking at multiple factors; as to why and when they are happening, their frequency and severity. Hopefully through identification of "Risky times" and "places"-

the stigma which is associated with the fall is taken away from 1) the patient or 2) the carer and the emphasis is transferred onto the time and place factors to address those issues also. Thereby completely changing the focus of the fall from the patient to the factor-causing the fall; and hopefully changing the culture of falling within the environment. The presentation will look at the factors present around falls and the interpretation of those factors to hopefully bring about a reduction in falls.

**PB6 231 COMORBIDITY OF ELDERS: WHAT MEASURE IN PRACTICE ?**

M. HARBOUN\* (Clinique de la Porte Verte, Versailles, France)  
N. COHEN(2) - (2) Hopital Saint Joseph (Villejuif, France)

**Background:** The elderly often have concomitant chronic diseases, the number of which increases with age. They interact upon their health status, functional autonomy and life expectancy. The evaluation and quantification of comorbidity in the elderly is thus important in clinical research and for the clinician's diagnostic and therapeutic decisions. **Objective:** To quantify the weight of comorbidities in clinical practice and to give prognostic value of some important specific diseases. **Methods:** A systematic literature search was performed to bring out recent data concerning elderly's comorbidity such as prevalence and prognostic value of elders associated diseases. **Results:** All studies show that the prevalence of cardiovascular pathologies and their complications increases with age. Dementia makes the second most prevalent class of polypathologies but it often seems to be under diagnosed. The evaluation of polyopathy in the elderly is of interest as far as prognosis is concerned in terms of dependence and mortality and allows to anticipate complications leading to costly repeated hospitalizations. Several evaluation scales were validated, but only the Charlson index and the Cumulative Illness Rating Scale (CIRS) are used to quantify the weight of comorbidity. These indices are not convenient to use in every day clinical practice. It seems that moderate to severe dementia, severe cardiopathy or chronic renal insufficiency are the most prognostic factors. **Conclusion:** Comorbidity indices are of no interest in every day clinical practice. Clinician has to identify specific diseases such as dementia, severe cardiopathy or the association of diseases which have a synergistic effect on mortality and functional decline especially when an invasive therapeutic or diagnostic procedure is discussed. Further studies are needed to confirm these results.

**PB6 232 GAIT PERFORMANCE OF OLDER HOSPITALIZED ADULTS**

G. OSTIR\* (UTMB, Galveston, United States)  
I. BERGES(1) - (1) UTMB (Galveston, United States of America)

**Introduction.** Research on community dwelling older adults has shown important relations between gait speed and various health outcomes. These associations have not been evaluated in a hospital setting. The purpose of the study was to examine gait speed of older men and women during hospitalization for acute illness. **Methods and Materials.** A cross sectional design was used and included a convenience sample of 149 ambulatory adults aged 65 years or older admitted to an Acute Care for Elders (ACE) unit. Patient information was collected within 48 hours of hospitalization. **Results.** Mean age was 75.3 (SD 7.1) years, 55% were women, 35% were married, and 67% had at least a high school education. Most of the sample was non-Hispanic white (66%), followed by non-Hispanic black (22%) and Hispanic (11%). Mean gait speed was 0.40 m/s (SD 0.20); 0.46 m/s (SD 0.21) for men and 0.36 m/s (SD 19) for women. In multivariate regression analyses gait speed was significantly associated with increasing age ( $b = -0.006$ , SE 0.002,  $p=0.02$ ), female gender ( $b = 0.07$ , SE 0.03,  $p=0.03$ ), and longer length of hospital stay ( $b = -0.01$ , SE 0.01,  $p=0.04$ ). **Conclusion.** Hospitalized older adults have gait speeds about one third that of community dwelling older adults of comparable ages. Our results indicate that a measure of gait speed can be quickly and easily administered to an acutely ill older patient population. Results also suggest that this measure be included in a standard assessment of older patients.

**PB6 233 HIP FRACTURE IN ELDERLY : USE OF LINKAGE OF ADMINISTRATIVE DATABASES TO ANALYSE PATIENTS PATHWAY AND OUTCOME.**

J. HOLSTEIN\* (APHP, Paris, France)  
A. TEIXEIRA(1), L. TRINQUART(2), M. RAPHAEL(3), T. BASTANIC(3), G. CHATELLIER(2) - (1) HGMS plaisir grignon (Plaisir, France); (2) URC - HEGP (Plaisir, France); (3) DIM - APHP (Plaisir, France)

**Introduction :** Hip fracture of elderly patients constitutes an increasing critical problem with a high incidence of post-operative complications. The prognosis remains poor. In France, record linkage of hospital records has been introduced with the creation of an unique identifier for each hospitalized patient. We tested the use of linkage for the follow-up of elderly patients surgically treated for hip fracture. **Methods and materials :** We analyzed all discharge records collected from the 247 hospitals of Paris area in 2005. We extracted those corresponding to first admission of elderly patients with hip fracture surgically treated. We defined readmissions as the first admission (classified as likely related or unrelated to the index hospital stay) within 12 months of the discharge. We tabulated first readmission but also subsequent readmissions. We analyzed the association between a set of characteristics at index stay and first readmission. **Results :** 5709 patients

constitute our analysis population (mean age : 86 years, 77% women), both surgical techniques were equally used. 32% of patients (1842) had at least one readmission (with 53% classified as related). A total of 2870 readmissions were identified. The multivariate model included type of hospital, gender, comorbidities, type of surgery. Male were at increased risk of related readmission, especially in patients with cancer (OR : 3.38,  $p < 0.02$ ). The in-hospital mortality rate was 4.6 %, and the in-hospital one-year mortality rate in acute care was 8.6%. **Conclusion :** In-hospital mortality rate was ranging at the lower limit of those reported in the literature. A third of survivor patients were readmitted within one year, in which 50 % had related readmissions. Overall one-year mortality was 8.7%. Use of DRG-based administrative database may be relevant for monitoring outcome. However, the link with national mortality databases is required.

**PB6 234 DIZZY - WHY NOT TAKE A WALK? LOW LEVEL PHYSICAL ACTIVITY IMPROVES QUALITY OF LIFE AMONG ELDERLY WITH DIZZINESS.**

A. EKWALL\* (Acute Care Clinic, Malmö, Sweden)  
Å. LINDBERG(1), M. MAGNUSSON(1) - (1) Dept of Otorhinolaryngology (Lund, Sweden)

**Background:** Dizziness increases with age. It affects quality of life negatively for older persons in several ways. This study intended to investigate what variables (physical activity, loneliness, health complaints, need of help for daily living and falls) differed between those with and without dizziness and also to investigate what factors affected quality of life among older persons with dizziness. **Method:** An age stratified, randomised sample of senior citizens, aged +75 (n=4360) answered a questionnaire concerning demographic data, social network, health complaints and diseases, feelings of loneliness, quality of life (Short Form 12), frequency of falls and activities. **Results:** Dizziness was associated with an increased risk of falling. Falls in the last three months were reported in 31% of the subjects with dizziness compared to 15% among those without ( $p < 0.001$ ). Dizziness also correlated with depression, with 42.5% feeling depressed among the elderly reporting dizziness, to compare with 13.2%. Exercise, both light (i.e. go for a walk) or heavy (i.e. work in the garden) correlated with reduced risk of low quality of life among older, dizzy persons, both mental and physical. The proportion of dizzy persons doing light exercise was 75.6% versus 87.4% among the not dizzy ( $p < 0.001$ ). Exercise reduces the risk of falling, the risk of being depressed and increases quality of life. **Conclusion:** Even light exercise seems beneficial for improving quality of life and decrease the risk of falling, which in turn will lower mortality rate. Older persons reporting dizziness should be encouraged and helped to exercise. If one could increase physical activity among elderly and this would reduce the number of falls, it would diminish medical costs, suffering for the individual and be of paramount medico-social importance for the society

**PB6 235 FALLS AND HOUSE SAFETY IN OLD-AGE**

S. ERKAL\* (Hacettepe University, Ankara, Turkey)

**ABSTRACT** Introduction: Due to increased life expectancy, countries all over the world are experiencing ageing populations, with a growing number and proportion of elderly people within the overall population. Turkey currently has 3.5 million people over the age of 65. This number is predicted to reach 5 million by the year 2010 and 10 million by 2030. Reduced auditory and visual perception associated with ageing, together with balance disorders and loss of coordination, can present an increased risk of accidents for older people. Falls are the most common form of accident amongst older groups and subsequent trauma following a fall is one of the most serious problems of old age. The safety of individuals' homes is therefore of paramount importance in reducing the risk of falls. Particular importance should be attached to establishing and maintaining a safe home environment for elderly people. Conclusions: Housing safety checklists can be used when conducting risk assessments. Periodic safety checks may help to identify the risk factors and thus eliminate the causes of many home accidents.

**PB6 236 ANALYSIS OF FATIGUE AND CADENCE IN HEALTHY YOUNG AND OLDER INDIVIDUALS WITH BODY WEIGHT SUPPORT ASSOCIATED TO TREADMILL**

A. SILVEIRA GOMES\* (Universidade Federal do Paraná, Matinhos, Brazil)  
C. LOURENÇO CORREA(1), T. LISSA LUMI(1), R. ANA LUCIA(1) - (1) Universidade Federal do Rio de Janeiro (Rio de Janeiro, Brazil)

**Background:** Aging leads to increases in gait variability which may explain the large incidence of falls in the elderly. To increase walking performance of older people, it may be necessary to adopt specific training programs with special attention to the improvement of gait. The purpose of this study was to compare gait of healthy young and older subjects using BWS associated to treadmill. **Methods:** The study protocol was done in Universidade Federal do Rio de Janeiro - Brazil and all subjects completed a health history questionnaire before testing. Eighty four healthy participants were recruited from community of Rio de Janeiro city. Participants were divided into three groups according to age (group 1: <40 years; group 2: 40-60 years; group 3: >60 years). All subjects performed walking training on the treadmill with 20% BWS and 10% BWS starting at 1.0 km/h with 5 min of interval between each set. Speed was increased each 2 min and Borg Modified Scale applied to determine fatigue perceived from subjects until 10 minutes reaching maximal speed at 3.0

km/h. Besides that, the cadence was measured each 2 min using a video camera. Results and Conclusions: Statistical analysis showed that there were significant differences between older and young subjects when compared cadence or fatigue with 20% and 10% BWS at 1.0 and 3.0 km/h. This study suggest that gait variability due to aging can be observed using treadmill associated to BWS. Besides that, scores of Borg scale increase according to age and time in treadmill and BWS. This procedure could be used to promote gait training in healthy older individuals to prevent falls and impairments from aging process.

**PB6 237 EFFECT OF TURNING DIRECTION ON TIMED "UP & GO" TEST IN HEALTHY ELDERLY AND ELDERLY WITH STROKE**

S. NG\* (The Hong Kong Polytechnic University, Hong Kong, Hong Kong)  
T. HEUNG(2), M. KAM (1) - (1) The Hong Kong Polytechnic University (Hong Kong, Hong Kong); (2) Tuen Mun Hospital (Hong Kong, Hong Kong)

Introduction: The Timed "Up & Go" Test (TUG) is a simple and quick functional mobility test used in geriatric and stroke rehabilitation. It requires a subject to stand up, walk 3 meters, turn, walk back, and sit down and the time taken to complete the test is recorded as time scores. However, the effect of turning direction on TUG scores has not yet been examined. The purpose of our study was to examine effect of turning direction on TUG scores in healthy elderly and in elderly with stroke. Methods and Materials: Twenty-one healthy elderly and 25 elderly with hemiplegia underwent TUG tests under 2 situations: (1) turning to left and right sides in healthy elderly; (2) turning to affected and unaffected sides in subjects with stroke. The time scores in completing the TUG test were recorded. Results: In subjects with stroke, the TUG scores when turning to affected side ( $28.9 \pm 12.56$  s) was significantly lower ( $p < .001$ ) when compared with turning to unaffected side ( $30.6 \pm 12.70$  s). In healthy elderly, there are no differences in TUG scores when turning to left side and right side. After taking gender, age and height as covariates, the TUG scores when turning to affected and unaffected side in elderly with stroke were both significantly higher ( $p = .001$ ) when compared with that when turning to left and right side in healthy elderly. Conclusion: The TUG scores were capable of detecting differences in functional mobility between healthy elderly and elderly with stroke. Of special interest are the novel findings that the turning direction has significant influence on TUG scores in stroke patients. This finding suggests that the turning direction of TUG test would need to be standardized in order to monitor the patients' progress in stroke rehabilitation.

**PB6 238 EFFECTS OF AGING AND TAI CHI ON A FINGER-POINTING TASK IN A CHOICE PARADIGM**

W. TSANG\* (The Hong Kong Polytechnic University, Hong Kong, China)  
J. KWOK(1), C. HUI-CHAN(2) - (1) 1 (N/A, China); (2) 2 (United States of America)

Introduction: A finger-pointing task demands temporal and spatial control of the hand and eye movement relative to a visual target in space. The task will be more difficult when different visual targets signal different pointing movements. Using a finger-pointing task with a choice paradigm, our cross-sectional study examined 1) the effect of aging on performance, and 2) whether experienced elderly Tai Chi (TC) practitioners performed better than healthy elderly controls in such tasks. Methods: Thirty students and 30 healthy elderly controls were compared with 31 experienced TC practitioners. All subjects performed a rapid index finger-pointing task using their dominant hand, from a fixed starting position on a desk to a visual signal appearing on a display unit. The visual signal was a 1.2cm diameter ball appearing randomly: 1) A black ball required the subjects to touch it as quickly and as accurately as possible. 2) A white ball required the subjects not to touch it. 3) Both a black and a white ball required the subjects to touch only the white but not the black ball. Reaction time, movement time, accuracy and number of wrong movements were recorded. Results: Students displayed significantly faster reaction and movement times, with significantly greater accuracy and fewer wrong movements than the elderly controls. The TC practitioners had significantly faster movement times than elderly controls. They also attained significantly better accuracy when the target appeared contralateral to their pointing hand, and made fewer wrong movements. Their accuracy measures were similar to younger controls. Conclusion: Performance of a finger-pointing task in a choice paradigm declined with age. However, elderly TC practitioners were able to perform the task with significantly faster movement times, and with better accuracy and fewer wrong movements than elderly control subjects similar in physical activity level.

**PB6 239 EXPLORING OLDER ADULTS BELIEFS ABOUT STRENGTH TRAINING**

R. DEAN\* (University of Victoria, Duncan, Canada)  
R. RHODES(1), J. WHARF-HIGGINS(1), H. TUOKKO(1) - (1) University of Victoria (Victoria, Canada)

Progressive strength training in older adulthood is endorsed for improving muscular strength and preventing functional decline. However, rates of strength training participation among Canadian older adults are low. The factors affecting strength training participation in older adulthood are not well understood. The purpose of this study is to explore older adult's beliefs about strength training, using the Theory of Planned Behaviour as a framework. Separate focus groups were held with those who participated in

strength training and those who did not. Separate focus groups were also held with men and women. Participants were recruited through senior centres and fitness facilities using posters, newsletters, direct recruitment from program leaders and snowball sampling. All participants lived independently in the community and were physically able to participate in strength training. Results revealed differences in the behavioural beliefs, normative beliefs and control beliefs between the groups. The results of this study may be used in the design of strength training intervention programs that promote participation among older adults.

**PB6 240 ANEMIA IN ELDERLY: ASSOCIATION WITH WALKING IMPAIRMENT AND FUNCTIONAL CAPACITY**

R. BOSCO\* (HOSPITAL MADRE TERESA, BELO HORIZONTE, Brazil)  
C. ANTUNES(1), L. PEREIRA(2), E. ASSIS(3), A. DIMAS(3), L. QUEIROZ(3), C. SILVA(3), R. PINHEIRO(3), A. SCARABELLI(3), A. ROSA(3), C. MARTINS(3) - (1) Santa Casa De Misericordia De Belo Horizonte (Belo Horizonte, Brazil); (2) Universidade Federal De Belo Horizonte (Belo Horizonte, Brazil); (3) Hospital Madre Teresa (Belo Horizonte, Brazil)

Introduction: Anemia is a common problem in old age and has been associated with many negative consequences. Early identification of functional decline in the elderly is very important for prevention, treatment and rehabilitation. The objective of this study was to evaluate the association between walking impairment (WI), functional capacity (FC) and anemia in the elderly. Methods and Materials: Cross-sectional study with 709 hospitalized elderly participants (male n=343, aged  $71.8 \pm 7.9$ ; female n=366, aged  $74.5 \pm 8.3$ ). Anemia was defined according to WHO criteria. FC and WI were evaluated by self appraisal. FC was assessed by Katz's (ADL) and Lawton's (AIDL) indexes. WI was present if one or more of these symptoms occurred during walking (imbalance, fear of falling, tiredness, pain). Associations were assessed by the Spearman test ( $=0.05$ ). Results: Anemia was identified in 30% of participants. Higher age was significantly associated to anemia ( $75.9 \pm 8.5$  vs  $72.0 \pm 7.8$  years), no gender difference was found. Hb mean values were  $113.0 \pm 10.6$  and  $138.5 \pm 10.5$  g/L,  $p < .001$ . Concerning FC, anemic participants showed significant lower scores in both ADL ( $0.69 \pm 1.5$  vs  $0.04 \pm 0.4$ ) and AIDL ( $23.1 \pm 3.5$  vs  $26.4 \pm 1.9$ ). Concerning WI, anemia was significantly associated to imbalance (39.4 vs 26.0%), fear of falling (51.6 vs 29.6%) and tiredness (30.1 vs 21.6%); pain did not show statistically significant difference (43.2 vs 35.7%). Conclusion: WI symptoms are easily evaluated and were associated to FC and anemia. These results suggest that WI can be used as a sign of anemia. Therefore, early diagnosis of anemia is important to prevent worsening of FC and improve quality of life in elderly.

**PB6 241 EFFECTS OF A MULTIFACTORIAL FALL PREVENTION PROGRAM WITH CLIENT-CENTERED APPROACH ON RISKS OF FALLING IN THE ELDERLY**

N. NUALNETR\* (Khon Kaen University, Khon Kaen, Thailand)  
S. BOONYARAT(1), W. EUNGPINICHONG(2), A. EMASITHI(2) - (1) Department of Rehabilitation, Khon Kaen Hospital (Khon Kaen, Thailand); (2) Department of Physical Therapy, Faculty of Associated Medical Sciences, Khon Kaen University (Khon Kaen, Thailand)

Introduction: Falls are health hazard for the elderly and need multifactorial considerations for its prevention. In Thailand, no study on the effects of a multiple-risk factor intervention focusing on individual elderly is yet available. This study aimed to evaluate changes in risks of falling, that is functional balance (Berg Balance Scale; BBS), fear of falling, and home hazards, of the community-dwelling elderly after participating in a multifactorial fall prevention program with client-centered approach. Methods and materials: A 12-week study was conducted on 9 elderly with fall risks (2 men and 7 women, mean age  $77.4 \pm 5.8$  years) of a community in Thailand. During the first 4 weeks, specific fall risk factors of each subject were evaluated and discussed between the subjects and the investigator, after which a multifactorial fall prevention program was cooperatively designed and individually tailored to each elderly. The subjects were then instructed to perform their programs for 8 weeks. The subject's outcome measures were assessed at baseline and at every 4 weeks until the end of the study, and analysed by the paired t-test. Results: The multifactorial fall prevention program with client-centered approach significantly improved the BBS and home hazards of the subjects ( $P=0.0001$  and  $0.02$ , respectively). But such improvement in the BBS did not reflect a clinical significance in their functional balance. However, the elderly expressed high satisfaction of the program. Conclusion: The multifactorial fall prevention program designed with the participation of clients could reduce risks of falling in the elderly with high satisfaction. Future studies with a greater number of subjects should consider ways to obtain a greater benefit of such fall prevention scheme such as paying more attention on the issue of pain and participation of the elderly's family member.

**PB6 242 EFFECT OF RESISTANCE TRAINING AND ANTIOXIDANT VITAMIN SUPPLEMENTATION ON MUSCLE STRENGTH IN OLDER MEN AND WOMEN**

F. BOBEUF\* (Research Center on Aging, Sherbrooke, Canada)  
M. LABONTÉ(1), A. KHALIL(1), I. DIONNE(1) - (1) Research Center on Aging (Sherbrooke, Canada)

Aging is associated with sarcopenia, which is a decrease in muscle mass and strength. Resistance exercise is thought to increase fat-free mass and strength, although this remains controversial. Antioxidant vitamin supplementation may reduce exercise-induced oxidative stress and maximize the gains following exercise. The combined effect of resistance training and antioxidant vitamin supplementation on strength in the elderly remains unclear. Hence, the aim of this study was to evaluate this combination effect in elderly men and women. Thirty-five healthy elderly ( $65.6 \pm 3.7$  yrs) were divided into 2 groups: resistance training + placebo (3x8 repetitions at 80% of 1RM; 3 days/week), and resistance training + antioxidant vitamin supplementation (vitC: 1000mg/d; vitE: 600mg/d). The 1RM of 8 exercises and body composition (DXA) were performed at baseline and after 6 months of intervention. An independent sample t-test was performed to determine differences among groups at baseline. We also used a repeated measure-ANOVA using gender as covariate to evaluate the treatment effect after intervention and a pair t-test to examine difference between baseline and post-intervention measurements in each group. At baseline, no difference was observed between groups for any variables. No treatment effect was observed on muscle strength, even if fat-free mass was tendency more increased in the antioxidant group as compared to the placebo group ( $P=0.063$ ). Hence, muscle strength changes were similar in both groups. A 6 month resistance program combined with antioxidant vitamin supplementation in healthy elderly individuals did not seem to maximize muscle strength increases, although it appeared to be beneficial for fat-free mass gains. Nevertheless, high intensity resistance training was well-tolerated and should be recommended for others purposes. We suggest that a similar study to verify the impact of these interventions in frail subjects would be of great interest.

**PB6 243 PROLONGED FUNCTIONAL PERFORMANCE IN OLDER ADULTS FOLLOWING TRAINING CESSATION**  
T. HENWOOD\* (The University of Queensland, Brisbane, Australia)

Introduction: Training cessation among older adults has been shown to have negative consequences for muscle functional. Exercise programs undertaken prior to activity cessation may offer physiological protection. In this study the residual effects of varied resistance training were investigated following extended detraining and subsequent retraining. Methods: Thirty-eight healthy independent living older adults (65 - 84 years) entered a 24-week detraining period subsequent to 24 weeks of training. Following detraining, subjects' recommenced training (retraining) using either the high-velocity muscle power (HV) or muscle strength (ST) protocol undertaken during the initial training period, twice weekly for 12 weeks. Isometric and dynamic muscle strength, muscle power, movement velocity and a battery of functional performance tasks were assessed. As were body composition, balance confidence and quality of life. Results: Significant increase in muscle function and functional performance followed the initial training period. However, no differences between groups emerged. Detraining resulted in similar declines in muscle power and muscle strength for both groups ( $p < 0.05$ ) (power, HV  $17.8 \pm 1.8\%$ , ST  $15.5 \pm 2.2\%$ ; and strength, HV  $17.1 \pm 2.2\%$ , ST  $16.5 \pm 1.8\%$ ), which were accrued following the abbreviated retraining. No significant changes in functional ability were observed following detraining (average change; HV  $3.1 \pm 3.5\%$  and ST  $2.1 \pm 3.5\%$ ) or retraining. No group differences emerged following detraining or retraining in this study. Conclusion: Cessation of training resulted in only a modest loss of muscle power and strength that was recouped following 12 weeks retraining. Importantly, training-induced gains in functional performance were preserved during detraining. The residual effects of power or strength training appear comparable, and both may be suitable exercise modes prior to a period of activity cessation to promote physical independence.

**PB6 244 ARE ELDERLY PEOPLE RECEIVING CALCIUM AND VITAMIN D APPROPRIATELY FOR OSTEOPOROSIS IF RENAL FUNCTION IS CONSIDERED?**  
J. MCCREANOR\* (St James' University Hospital Leeds, Harrogate, United Kingdom)  
G. FOX(1), N. PENN(1) - (1) St James' University Hospital (Leeds, United Kingdom)

Introduction Many elderly patients are prescribed combination tablets for osteoporosis. Some prescriptions may be inappropriate as conversion of vitamin D to its active form is ineffective when Glomerular Filtration Rate(GFR) is  $< 30\text{ml/min}$ . We investigated the prescription of these drugs within inpatients & greater than or equal to 80 years; how many of these had a GFR  $< 30\text{ml/min}$  and whether they were assessed for renal bone disease. Method We reviewed 240 inpatients' drug charts, and notes for those taking calcium and vitamin D, and noted their weight and their best creatinine over the past year. We calculated estimated GFR(eGFR) using the Cockcroft-Gault equation. In those with an eGFR  $< 30\text{ml/min}$  we noted: Prescription of other calcium or vitamin D preparations and osteoporosis drugs; Calcium, Vitamin D, Phosphate and Parathyroid Hormone (PTH) levels and whether they had follow up in renal outpatients. We excluded those with oedema as dry weight would be difficult to assess. Results A total of 240 drug charts were reviewed, of these 52 patients were on calcium and vitamin D. 9 patients were excluded: 7 had no weight recorded, 1 had ascites, and one was taking plain calcium carbonate. 13/43 patients taking calcium and vitamin D supplements had an eGFR  $< 30\text{ml/min}$ . 1/13 patients were on calcitriol, 2/13 on a bisphosphonate, 10/13 had calcium and phosphate levels checked in the past year and 0/13 had vitamin D or parathyroid hormone levels checked. Only 2/13 had renal outpatient follow up. Conclusion Our audit raises several issues: There is inappropriate/ineffective prescribing of osteoporosis prevention medication in elderly patients with eGFR  $< 30\text{ml/min}$ ; and more elderly

patients could be followed up for the management of renal bone disease as per UK Chronic Kidney Disease guidelines.

**PB6 245 FRAILTY AND DEPENDENCY IN IADL AT 2 YEARS IN HIGH-FUNCTIONING OLDER ADULTS: THE ALBACETE STUDY**

C. LUENGO\* (Complejo Hospitalario Universitario Albacete, Albacete, Spain)  
G. PATERRA(1), E. MARTÍNEZ-SÁNCHEZ(1), E. LÓPEZ-JIMÉNEZ(1), M. GARCÍA-TOMÁS(1), J. NAVARRO(1), J. ESQUINAS(1), I. GARCÍA-NOGUERAS(1), L. CASADO(2), E. MARTÍNEZ(3), P. ABIZANDA(1) - (1) Geriatrics Department, Complejo Hospitalario Universitario Albacete (Spain); (2) Radiology Department, Complejo Hospitalario Universitario Albacete (Spain); (3) Residencia San Vicente Paúl (Spain)

INTRODUCTION: Frailty is a predictor of death, institutionalization and dependency. The association with dependency in IADLs and the role of cognitive status has not been analyzed in high-functioning older adults. METHODS AND MATERIALS: Longitudinal cohort study. 286 high-functioning community older adults. Frailty criteria: unintentional weight loss  $>4.5$  kg in the last year, exhaustion assessed with CES-D, kilocalories of total physical activity in the last week (men  $<1729$  kcal, women  $<1435$  kcal), slow gait measured with the Timed up and go (men  $>11.23$  secs, women  $>11.29$ ), low hand grip strength (men  $<24$  kg, women  $<15$  kg). Prefrailty status 2 criteria and frailty three or more. After, we added a MMSE<24 points as a sixth criteria. Loss of any IADL on the Lawton scale at 2 years was considered the main result variable, adjusted for age and sex. RESULTS: Mean age 74.3, 181 women (63.3%). Lawton 7.1, MMSE 25.3. Frailty criteria: slow gait 72 (25.2%), grip strength 52 (18.2%), physical activity 55 (19.2%), weight loss 27 (9.4%), exhaustion 39 (13.6%). 207 were non frail (77.2%), 44 prefrail (16.4%), and 17 frail (6.3%). In 16 cases data were not complete. 27.6% of subjects lost any IADL at 2 years (non frail 25.1%, prefrail 29.5% and frail 52.9%). Frail elderly people had an adjusted risk of losing IADLs at 2 years HR=3.35 (CI95% 1.18-9.51; p=0.023) compared with non frail. When MMSE criteria was added, the HR decreased but the CI was narrower: HR=2.97 (CI95% 1.34-6.59; p=0.008). CONCLUSION: Frailty status is associated with dependency in IADLs at 2 years in high-functioning older adults without clinical atherosclerotic disease.

**PB6 246 DOES THE CLINICAL CONTEXT AFFECT THE VALIDITY OF BATHROOM RECOMMENDATIONS MADE BY HOME HEALTH AIDS?**  
M. GUAY\* (Research Center on Aging and Université de Sherbrooke, Sherbrooke, Canada)

J. DESROSIERS(1), M. DUBOIS(1) - (1) Université de Sherbrooke and Research Center on Aging (Sherbrooke, Canada)

INTRODUCTION: When there is a shortage of occupational therapists, an organizational model that involves home health aides in the process of recommending bathroom equipment could have a positive impact on the physical and psychological health of these workers. Currently, the involvement of home health aides is often limited to clients already receiving their services. The PURPOSE of this study was to compare the criterion validity of recommendations made by home health aides using an algorithm regarding bathroom equipment for community-living adults presenting bathing difficulties under two clinical contexts: new referrals (group 1) and clients already receiving bathing assistance from home health aides (group 2). METHODS: Community-living adults with bathing difficulties (n=96) were visited by an occupational therapist (gold standard) and by one of four home health aides using an algorithm. Both evaluations took place within 10 days and evaluators were blind to the recommendations made by the other. Three parameters, sensitivity, specificity and kappa (agreement corrected for chance), allow to quantify the criterion validity for aspects such as most appropriate place for bathing or type of grab bars. RESULTS: Participants in the two groups differed on residential status, medical diagnosis and functional autonomy level. However, there was no significant difference between the groups in the criterion validity of the recommendations made by the home health aides ( $p>0.10$  on all three parameters for each aspect compared). CONCLUSION: Involvement of home health aides could be considered with a broader group of clients to increase the likelihood of bathrooms being properly adapted to the needs of both client and worker.

**PB6 247 CRITERIA OF THE TIMED TEST OF "STANDING UP FROM A LONG SITTING POSITION ON THE FLOOR" BASED ON PREDICTIVE VALIDITY FOR CARE NEED CERTIFICATION IN THE JAPANESE COMMUNITY-DWELLING ELDERLY.**

S. UEKI\* (Tohoku Bunka Gakuen University, Sendai, Japan)  
S. YASUMURA(1), N. YASUDA(2), H. HAGA(3), H. HONDA(4), J. TAKATO(4), G. INUZUKA(4), T. KASA(4), N. ARAYAMA(4), T. OKADA(5), S. EBATA(5) - (1) Fukushima Medical University (Fukushima, Japan); (2) Kochi medical school (Nankoku, Japan); (3) Graduate School of J.F.Oberlin University (Machida, Japan); (4) Tohoku Bunka Gakuen University (Sendai, Japan); (5) Graduate School of Tohoku Bunka Gakuen University (Japan)

We evaluated the criteria for determining care need certification of the elderly in terms of the timed test of "Standing Up from a Long Sitting Position on the Floor" (SULSPF),

previously proposed as a parameter for the simple measurement of decreased physical function. At the time of the baseline survey, there were 3,109 elderly residents (excluding those receiving some type of support or care) aged 70-84 years in Miyagi Prefecture. Of the 3,109 elderly residents, 2,772 (males, 41.3%; females, 58.7%) cooperated in the baseline, and data on SULSPF could be collected from 2,711 (effective percentage, 97.8%). Subsequently, in 1,233 elderly residents (males, 41.6%; females, 58.4%) in whom detailed observation of the situation for determining care need certification was possible, the predictive validity of SULSPF for the certification was analyzed by calculating the odds ratio adjusted for the influences of sex and age (continuous variables) by a multiple logistic regression model using the presence or absence of care need certification during the period of 2 years and 5 months (29 months) from the baseline survey as a dependent variable, and 5 grades (every 20 percentiles) of SULSPF as an independent variable. Compared with grade 1 (< 2.26 seconds), grades 3 (2.99-3.62 seconds), 4 (3.62-4.86 seconds) and 5 (> 4.86 seconds) showed significant odds ratios. This suggested that the risk for care need in the near future increases when SULSPF is more than about 3 seconds. As the evaluation criteria for screening as early as possible in the elderly at high risk for requiring care need, we propose the following classification of SULSPF: normal range, < 3 seconds; borderline range, 3-5 seconds; and impairment range, > 5 seconds, or standing up is impossible.

**PB6 248 THE -174G/C PROMOTER POLYMORPHISM OF THE INTERLEUKIN-6 GENE, PLASMATIC LEVELS OF IL-6 AND MUSCULAR STRENGTH IN OLDER WOMEN**

D. PEREIRA\* (UFMG, Belo Horizonte, Brazil)  
D. GARCIA(1), F. NARCISO(1), M. SANTOS(1), J. DIAS(1), F. COELHO(1), A. PARENTONI(2), E. SOUZA (3), O. NÓBREGA(3), L. PEREIRA(1) - (1) UFMG (Belo Horizonte, Brazil); (2) UNI-BH (Belo Horizonte, Brazil); (3) UCB (Taguatinga - DF, Brazil)

Introduction: Polymorphism in the interleukin-6 (IL-6) gene regulates the rate of IL-6 production and this has been implicated in age-related disturbances. The present study investigates the effect of -174G/C promoter polymorphism of the IL-6 gene on the plasmatic levels of IL-6 and muscular strength of elderly women. Methods and materials: The sample consisted of 199 institutionalized and community-living elderly patients ( $73 \pm 8$  years). Genotyping was done by direct sequencing of PCR products. The plasmatic concentrations of IL-6 were quantified by high-sensitivity assays. The muscular strength of the articulation of the knee was assessed using the Biodex System 3 Pro® isokinetic dynamometer. The ANCOVA was applied to investigate the effect of the polymorphism on the IL-6 levels and muscular strength. Results: The -174G/C promoter polymorphism affected the plasmatic levels of IL-6 in elderly women ( $p<0.01$ ). Interestingly, we found that the homozygotes for the G allele presented higher levels of IL-6 (GG 3.85pg/ml; GC+CC 2.13pg/ml). An interaction of polymorphism -174G/C and the place where they are living (institutionalized and community) was identified. Result show that the genotype has an effect over IL-6 levels and that IL-6 levels were higher in institutionalized ones. This polymorphism did not directly influence the muscular strength ( $p>0.05$ ). Conclusion: The results of this study support previous reports which defend that the -174G/C promoter polymorphism contributed to the individual variability of the IL-6 plasmatic levels in elderly women. An interaction between the place where they are living and polymorphism suggests that environment factors can to influence the genotype effects over IL-6 production. This polymorphism did not influence the muscular strength of the elderly patients.

**PB6 249 EFFECTS OF A MULTICOMPONENT EXERCISE PROGRAM ON LIFE SATISFACTION AMONG INSTITUTIONALIZED ELDERLY**

M. JUSTINE\* (Universiti Putra Malaysia, Serdang, Selangor, Malaysia)  
T. H(1), T. TK KAMALDEN(2), Z. AHMAD(3) - (1) Institute of Gerontology, Universiti Putra Malaysia (Malaysia); (2) Department of Sports Studies, Faculty of Education, Universiti Putra Malaysia (Malaysia); (3) Department of Community Health, Faculty of Medicine and Health Sciences, Universiti Putra Malaysia (Malaysia)

**BACKGROUND:** Information is lacking about the effects of exercise on life satisfaction among institutionalized elderly. **OBJECTIVE:** To determine the effects of a 12-week group-based, multicomponent exercise program on life satisfaction in a public funded institute for the elderly. **METHODS:** A quasi-experimental pretest-posttest design was used in the study. Participants involved in the study were residents of a shelter home located in Seremban, Negeri Sembilan, Malaysia. The intervention group consisted of 27 volunteers over the age of 60 who participated in a 60-min group-based exercise program conducted 3 times a week, for 12 weeks. The exercise consisted of 5-10 mins warming up and cooling down, 20-30 mins aerobic phase, 10-20 mins balance training and stretching exercises for major muscle groups. Strength training was incorporated two times a week emphasizing major muscle group. All exercise movements were designed based on functional-task elements. The control group consisted of 25 volunteers who continued with their current level of activity but received social visit once a week. **MAIN OUTCOME MEASURE:** Life satisfaction was measured using the Cantril's self-anchored scale. **RESULTS:** The intervention group and the control group were not significantly different at baseline. At the end of 12 weeks, the intervention group shows increase in life satisfaction by 10.7% ( $t=1.22$ ,  $p > .05$ ), while the control group decrease by 11.3% ( $t = -1.945$ ,

$p > .05$ ). **CONCLUSIONS:** This study suggests that a multicomponent exercise program may improve life satisfaction among institutionalized elderly, and it may be prescribed as a suitable exercise program for the elderly. Future study is warranted on similar study but need to be randomized, larger sample size and longer duration. **Key Terms:** Institutionalized older persons, life satisfaction, multicomponent exercise, Malaysia.

**PB6 250 ACTIVITY RESTRICTION INDUCED BY FEAR OF FALLING IN COMMUNITY-DWELLING ELDERLY**

R. DIAS\* (Federal University of Minas Gerais, Belo Horizonte, Brazil)  
M. FIGUEIREDO FREIRE (1), É. GONÇALVES SILVA SANTOS(1), M. RODRIGUES PERRACINI (2), J. DOMINGUES DIAS (1), L. SOUZA MÁXIMO PEREIRA(1), R. ALVARENGA VIEIRA (1) - (1) Universidade Federal de Minas Gerais (Belo Horizonte, Brazil); (2) Universidade Cidade de São Paulo (São Paulo, Brazil)

Introduction: Fear of falling is a common health condition among elderly and it can leads to an activity restriction which reduces social interaction and compromises physical and mental well-being. The aim of this study was to determine the social-demographic, clinical, functional and psychological factors associated to activity restriction induced by fear of falling in community-dwelling elderly and identify which variables best discriminate the individuals in relation to activity restriction induced by fear of falling. Methods and Material: One hundred and thirteen community-dwelling elderly ( $74.5 \pm 7$  years old) participated in the study. Activity restriction induced by fear of falling, previous falls, fall-related self-efficacy, frailty phenotype, functional capacity, depressive symptoms, health self-perception, socio-demographic and clinical factors were assessed. Descriptive statistics, ANOVA and Kruskal Wallis tests were used to analyze the correlations between activity restriction induced by fear of falling and all other variables. Path analysis (CHAID) method was used to verify which variable better discriminate individuals in relation to activity restriction ( $=0.05$ ). Results: The participants who reported fear of falling and activity restriction showed higher depression and lower fall related self-efficacy ( $p<0.05$ ). In comparison with participants with no fear of falling, those with fear of falling and activity restriction demonstrated lower gait velocity and independence level for instrumental daily living activities, higher number of diseases, worse health self-perception, more depressive symptoms and lower fall-related self-efficacy ( $p<0.05$ ). The variables which best discriminate groups were depression, exhaustion (frailty phenotype) and social participation activities. Conclusion: Activity restriction induced by fear of falling can have negative effects in functional capacity, psychological aspects and fall-related self-efficacy in community-dwelling elderly. Psychosocial factors seem to better discriminate the elderly who avoid activities due to fear of falling.

**PB6 251 IMPACT OF AN AQUATIC PHYSICAL THERAPY PROTOCOL IN ELDERLY WOMEN WITH OSTEOARTHRITIS OF THE KNEE**

J. DOMINGUES DIAS\* (Federal University of Minas Gerais State, Belo Horizonte, Brazil)  
W. GOMES(1), L. CISNEROS(1), R. DIAS(1), L. PEREIRA(1), M. DI SABATINO(1) - (1) Universidade Federal de Minas Gerais (Belo Horizonte - Minas Gerais, Brazil)

Introduction: Knee osteoarthritis (OA) is one of the most prevalent diseases among elderly individuals which leads to a number of adverse health events markedly impaired physical function and pain. Aquatic Physical Therapy is frequently prescribed for the treatment of rheumatic diseases, especially for OA. The aim of this study was to investigate the impact of an aquatic exercise protocol in a group of elderly women with knee OA. Methods and Material: Seventy-three 5.1) were randomly assigned to community-dwelling elderly women (70.8 an experimental group ( $n=37$ ) which received a treatment regimen in a warm pool (twice/weekly, 6 weeks, 50 minutes/session) or to the control group ( $n=36$ ). Muscular performance (strength, power and endurance) of the quadriceps and hamstrings muscles were assessed in an isokinetic dynamometer. The Western of Ontario and McMaster Universities Knee Osteoarthritis Index assessed pain, joint stiffness and physical function. Descriptive statistical analysis was conducted for all variables. For within-group comparison, the Wilcoxon test was used and for between-group comparisons, the Mann-Whitney U and the Qui-square tests were carried out. Treatment size effect was also calculated ( $=0.05$ ). Results: After six weeks, the experimental group presented a statistically significant improvement in pain ( $p=0.008$ ), physical function ( $p=0.004$ ), strength and power of the hamstrings ( $p=0.005$  and  $p=0.001$ ). The treatment size effect was moderate for pain ( $SE=0.50$ ) and physical function ( $SE=0.56$ ); and small for strength ( $SE=0.26$ ) and power ( $SE=0.27$ ) of the hamstrings. Conclusions: This study demonstrated that an aquatic Physical Therapy exercise protocol yielded improvement of pain and physical function, and in strength and power of the hamstrings of the elderly women with knee OA who participated of the experimental protocol.

**PB6 252 FRAILTY PROFILE OF BRAZILIAN COMMUNITY-DWELLING ELDERLY**

R. DIAS\* (Federal University of Minas Gerais, Belo Horizonte, Brazil)  
É. GONÇALVES SILVA SANTOS(1), M. FIGUEIREDO FREIRE(1), J. DOMINGUES DIAS (1), L. SOUZA MÁXIMO PEREIRA(1), R. ALVARENGA VIEIRA(1) - (1) Universidade Federal de Minas Gerais (Belo Horizonte, Brazil)

**Introduction:** Frailty is a common elderly condition which leads to adverse health outcomes. This study was conducted to identify the associated characteristics and the risk to be frail, according the frailty phenotype (Fried et al 2001) in community-dwelling elderly individuals in Brazil. **Material and Methods:** One hundred thirteen 7.0 years) were assessed with regard to the elderly individuals (74.5 five frailty criteria, socio-demographic and clinical variables, functional capacity, symptoms of depression and self-perception health were also collected. Descriptive statistics, the chi-square test, logistic regression and ANOVA were employed to assess correlations between the phenotype of frailty and the remaining variables. **Results:** Among the elderly individuals assessed, 13.27% were frail; 43.4% pre-frail. Frails were older (OR = 1.16; 95%CI 1.04-1.30); had lower income ( $r = -0.32$ ;  $p=0.048$ ) and schooling levels (OR = 0.31 95% CI 0.11-0.85); were widowed (OR = 4.89 95% CI 1.30-13.38); had greater number of diseases (OR = 1.61 95% CI 1.13 - 2.26); were dependent in basic (OR= 4.12 95% CI 1.68 - 10.10) and instrumental activities of daily living (OR = 0.56 95% CI 0.39 - 0.82); and had a worse health self-perception (Spearman's  $r = -0.23$ ;  $p=0.022$ ). Performing a sensitivity analysis of the five frailty characteristics, a high classification power was found when the number of frailty factors (exhaustion, physical inactivity and gait speed) was  $\geq 2$  (86.7% sensitivity and 97.0% specificity). Thus, at this cutoff point, these criteria are highly sensitive to classify an elderly as being frail. **Conclusion:** The phenotype of Fried et al. is a simple and reliable to detect frailty allowing a unified language for healthcare professionals regarding its definition.

#### PB6 253 SARCOPENIA AND FUNCTIONAL MOBILITY IN COMMUNITY-DWELLING ELDERLY

J. DOMINGUES DIAS\* (Federal University of Minas Gerais State, Belo Horizonte , Brazil)  
P. GARCIA(1), R. DIAS(1), L. PEREIRA(1), P. SANTOS(1) - (1) Federal University of Minas Gerais State (Belo Horizonte- Minas Gerais State, Brazil)

**Introduction:** sarcopenia is one of the most significant physiological changes related to aging and seems to be the main cause of functional mobility loss in the elderly. The objectives of this study were to compare muscle function of lower extremities, calf circumference, handgrip strength and functional mobility among age groups of older people and to explore the possible correlations between these measurements. **Methods and Material:** eighty-one community-dwelling 1.4); 70-79±elderly were stratified by age groups of 65-69 (67.4 3.2) years old. Walking speed (photoelectric $\pm 2.9$ ) and  $\geq 80$  (83.6 $\pm$ (73.9 cells), handgrip (Jamar dynamometer), muscle function of hip, knee and ankle (isokinetic dynamometer) and calf circumference were evaluated. Variance analysis, Pearson's correlation and Receiver Operating Characteristic (ROC) curves were used for statistical analysis ( $\alpha=0.005$ ). **Results:** The elderly group of  $\geq 80$  years showed lower values than the 65-69 age group for calf circumference, habitual and fast walking speed, hand grip, average peak torque and average power of hip, knee and ankle ( $p<0.05$ ). In all the correlation analysis of muscle function parameters with walking speed and handgrip, moderate significant correlations were found ( $p<0.05$ ). The ROC curve analysis suggested a cutoff point of 14.51 Kgf for screening muscle function loss in the sample, as an indication for possible sarcopenia. **Conclusion:** This study showed an association between muscle function, handgrip and fast walking speed as well as the decreasing of these parameters with aging and suggested a possible cutoff point to screening for muscle function of lower extremities through handgrip levels. The results indicated that muscle strength and power optimization are key elements on prevention protocols to maintain functional mobility and to establish rehabilitation programs for community-dwelling elderly individuals.

#### PB6 254 POLYPHARMACY AND FALLS: IS ORTHOSTATIC HYPOTENSION A MEDIATOR?

R. ROMERO-ORTUNO\* (TRIL Centre, Trinity College Dublin, Dublin, Ireland)  
L. COGAN(1), C. CUNNINGHAM(1), C. FAN(1), R. KENNY(2) - (1) TRIL Clinic, Trinity College Dublin (Ireland); (2) Department of Medical Gerontology, Trinity College Dublin (Ireland)

**Introduction** Polypharmacy is a known risk factor for falling. A recent systematic review identified psychotropics as the main culprits, whilst cardiovascular medications were weakly associated with falls (Hartikainen et al. 2007). To some, the clinical detection of orthostatic hypotension (OH) is unlikely to be useful in predicting falls (Liu et al. 1995). We tested whether OH interacts with use of psychotropics/cardiovascular medications in predicting current faller status in a sample of Irish community-dwelling older people. **Methods and materials** 338 participants aged $>60$  attending the TRIL Clinic between Aug 2007 and Sep 2008 (mean age 72.4, 66.6% females). Participants with MMSE $<23$  and Berg Balance Score $<36$  were excluded. OH was defined as symptoms of dizziness/light-headedness during active stand. Number of psychotropics (from ATC codes N06A, N05CD, N05CF) and cardiovascular medications (from codes C07A, C03, C09, C08, C02CA, C01DA) were recorded for each subject. Those who had two or more falls in the last year were classified as fallers. Results 15.4% of subjects were fallers, and 30.5% had OH. There was no association between number of cardiovascular medications and faller status, but there was an association between number of psychotropics and faller status (Chi-squared for trend,  $p=0.027$ ). A logistic regression model was computed with two

interaction terms as predictors of faller status: number of cardiovascular medications\*OH and number of psychotropics\*OH. Whilst the former interaction was not significant (95% CI for OR 0.79-1.58,  $p=0.516$ ), the latter had a trend towards significance (95% CI for OR 0.97-3.18,  $p=0.062$ ). **Conclusions** Despite the cross-sectional limitations, results support that cardiovascular medications may not have an association with OH and falls. OH may be relevant in mediating the relationship between psychotropics and falls.

#### PB6 255 OUR EXPERIENCES WITH ANEMIA IN THE OLD AGE – IS IT A SIGN OR ADDITIONAL DISEASE ?

H. MELUZÍNOVÁ\* (Faculty Hospital and Masaryk University, Brno, Czech Republic)  
P. WEBER(1), J. HRUBANOVA(1), H. KUBEŠOVÁ(1), V. POLCAROVÁ(1) - (1) Faculty Hospital and Masaryk University (Brno, Czech Republic)

**Background:** With increasing age occurrence of anemias grows. Anemia especially in the elderly is a sign, not a diagnosis, an evaluation is almost warranted to identify the underlying cause. **Purpose:** An analysis of occurrence and characteristics of anemia in the elderly 65+ y. admitted during the last two years. The authors demonstrate an importance of the problems through clinical observations of 246 cases with hemoglobin < 110 g/l. **Patients and Methods:** During the considered period of two years the authors treated 2614 elderly patients aged 65+ y. A subgroup of 246 old anemic patients (aged 81 $\pm$ 7.2 y.) during the whole of the two-year period was affected by pathologically decreased hemoglobin and clinical signs of anemia were the main cause of hospitalization and further diagnostic and therapeutic proceedings. All the presented patients underwent a complete intern examination (iron, ferritin, transferin, B12, folat, zinc inclusive) and complex geriatric assessment, too. **Results:** Hemoglobin by hospital admission in average was 93.4 g/l and below 80 g/l in 58 cases. MCV was normal in 66% of patients; below 80 fentoliter in 24% and above 95 fl in 10% of all anemic patients. The patients received transfusion 58-times and in all the cases anemia was managed according to its origin. During hospitalization the status was as follows: worsened 18-times; stationary 160-times and significantly improved 68-times. **Conclusions:** Anemia in the elderly is often caused by a benign disease and, in fact, may simply be a marker of a chronic illness. It may be, however, a presenting sign of a serious disease, including cancer. The authors point out some aspects, risks and pitfalls of anemia in the elderly following their own experiences. Anemia in old patients often means the one in chronic disease.

#### PB6 256 PROVIDING SINGLE LENS DISTANCE GLASSES PREVENTS FALLS IN ACTIVE OLDER MULTIFOCAL GLASSES WEARERS: AN RCT

S. LORD\* (Prince of Wales Medical Research Institute, Randwick, Australia)  
M. HAREN(2), I. CAMERON(3), R. IVERS(4), J. SIMPSON(3), B. LEE(4), M. PORWAL(1), M. KWAN(1) - (1) Prince of Wales Medical Research Institute (Randwick, Australia); (2) Royal North Shore Hospital (St Leonards, Australia); (3) University of Sydney (Australia); (4) Prince of Wales Hospital (Randwick, Australia)

**Introduction:** Recent research has shown that wearing multifocal (bi, tri- and progressive lens) glasses may significantly increase the risk of falls in older people. We aimed to determine whether the provision of single-lens distance glasses to older multifocal glasses wearers, with recommendations for wearing them for walking and outdoor activities, can reduce falls. **Methods:** 606 regular wearers of multifocal glasses (mean age=80 $\pm$ 7) were randomly allocated to either an intervention group (provision of single lens glasses, with advice about appropriate use) or a control group (usual care). Inclusion criteria included increased risk of falls (a fall in past year or a timed up and go time > 15s) and use of multifocal glasses 3+ times / week. Participants were followed-up for falls for 12 months. **Results:** At baseline, the two groups were well matched for a range of demographic, physical and health measures. Single lens glasses were provided to 90% of participants in the intervention group within 2 months; median = 28 days, IQR = 19-43 days. 54% of the intervention group complied with the recommendations for using single lens distance glasses for walking and outdoor activities for 7+ months of the follow-up year. Overall, the intervention resulted in an 8% reduction in all falls – IRR=0.92(0.73-1.16). A pre-planned sub-group analysis revealed the intervention was effective in preventing falls in people who regularly undertook outside activities as determined from the Adelaide Activities Profile. In this group (n=264) there was a 40% falls rate reduction - IRR=0.60(0.42-0.87). **Conclusions:** These findings suggest that with appropriate counselling, compliance with the intervention was acceptable and that the provision of single lens glasses for older people who take part in regular outdoor activities is a simple and effective falls prevention strategy.

#### PB6 257 EFFECTS OF RADIAL SHOCK WAVE THERAPY ON AGES WITH PERIARTICULAR SOFT TISSUE CALCIFICATION KNEE OSTEOARTHRITIS

M. HUANG\* (Kaohsiung Medical University Hospital, Kaohsiung, Taiwan)  
T. CHEN(1), C. LEE(2), C. HUANG(2), C. LIU(1), M. WENG(2), C. CHEN(1), C. WU(1) - (1) Department of PM&R, Kaohsiung Medical University Hospital (Taiwan); (2) Department of PM&R, Hsiao-Kang, municipal Hospital, (Taiwan)

**Introduction:** To investigate the effects of radial shockwave therapy (rESWT) on old age knee osteoarthritis with periarticular soft tissue calcification, and compare with ultrasound. **Methods and Materials:** 120 old patients (more than 65 years old) with bilateral moderate

knee osteoarthritis (Altman III) and calcification of periarticular tendon were selected and randomly assigned to four groups (GI-GIV). Patients in all groups received 20 minutes of hot packs and underwent passive range motion exercises on an electric stationary bike (20 cycles per minute) for 5 minutes to both knees before undergoing muscle strengthening exercises. Patients in Group I-III received isokinetic muscular strengthening exercises three times weekly for eight weeks. Besides, those Group II received pulse ultrasound treatment for calcified popliteal soft tissue three times weekly for eight weeks, in Group III received weekly radial shockwave for calcified popliteal soft tissue for first five weeks, and Group IV acted as controls. The therapeutic effects were evaluated by changes in the arthritic knees range of motion (ROM), visual analogue pain scale, Lequesne's index, and muscle peak torques of knee flexion and extension after treatment and at follow-up 6 months later. Compliance in each group was also recorded. Results: Each treated group exhibited increased muscle peak torques and significantly reduced pain and disability after treatment and at follow-up. However, only patients in Groups II and III showed significant improvements in ROM after treatment, and only participants in Group III showed immediate improvement in ROM after rESWT. Patients in Group III also showed the greatest increase in muscular strength, and the most decrease in disability after treatment and at follow-up. Conclusion: rESWT is better than pulse ultrasound as an adjuvant treatment in management of knee osteoarthritis with popliteal calcification and results in more functional improvements.

**PB6 258 A 24 WEEK HOME EXERCISE AND TELEPHONE FOLLOW-UP INTERVENTION DELAYS HOSPITAL READMISSION FOR OLDER ADULTS.**

M. COURTNEY\* (Queensland University of Technology, Kelvin Grove, Australia)  
H. EDWARDS(1), A. CHANG(1), A. PARKER(1) - (1) Queensland University of Technology (Kelvin Grove, Australia)

Introduction: Older adults with chronic disease have higher rates of hospital admissions, readmissions and longer hospital stays than the general population. Many older people experience functional decline during hospitalisation which impacts on their future independence and quality of life. This study aimed to determine the effect of an exercise-based home follow-up intervention on time to readmission and length of stay for older adults. Methods: 128 patients aged over 65 years admitted with a medical diagnosis and at least one risk factor for readmission were randomised to either usual care, or a 24 week home exercise and telephone follow-up intervention. Data were collected from medical records, clinical assessment and surveys at baseline (on admission), then 4, 12 and 24 weeks following discharge. Results: Kaplan-Meier survival curves indicated the intervention group had a longer time to first readmission than the control group (log-rank  $\chi^2=6.4$ ,  $p=0.011$ ). Median time to readmission was 56 days (95% CI 44–82) in the intervention group, and 34 days (95% CI 24–68) for the control group. After adjustment for potentially confounding factors in a Cox proportional hazards regression model, time to readmission remained significantly delayed for the intervention group (hazard ratio 0.31, 95% CI 0.15–0.65,  $p=0.002$ ); and the presence of vascular disease and functional impairment were significant risk factors for readmission (vascular disease: hazard ratio 2.59, 95% CI 1.33–5.05,  $p=0.005$ ; functional impairment: hazard ratio 2.65, 95% CI 1.25–5.63,  $p=0.011$ ). Shorter length of stay was significantly associated with increased numbers of emergency readmissions ( $p=0.001$ ) and visits to Emergency Departments ( $p=0.029$ ). Conclusion: An exercise and home follow-up intervention may delay time to readmission for older adults.

**PB6 259 RECOVERY IN ACTIVITIES OF DAILY LIVING AMONG DISABLED OLDER PEOPLE IN THE COMMUNITY**

D. SEIDEL\* (University of Cambridge, Cambridge, United Kingdom)  
C. JAGGER(1), C. BRAYNE(2), F. MATTHEWS(3) - (1) Department of Health Sciences, University of Leicester (United Kingdom); (2) Department of Public Health and Primary Care, University of Cambridge (United Kingdom); (3) MRC Biostatistics Unit, University of Cambridge (United Kingdom)

Introduction: A better understanding of the mechanisms underlying recovery in activities of daily living (ADLs) could facilitate the development of cost-effective prevention programmes. We conducted a systematic literature review and found that relatively little is known about factors predicting recovery among disabled older people in the community. The objective of our study was therefore to provide evidence for predictors of ADL recovery. Methods and Materials: The Medical Research Council Cognitive Function and Ageing Study recruited a sample of 13,004 individuals aged 65 years and over from five communities in the United Kingdom. Participants underwent a baseline interview during 1990–1994 and were re-assessed two years later. Those who reported they were unable to perform at least one ADL task without difficulty or help at baseline ('disabled') were included in the analysis. Logistic regression was used to calculate odds ratios (OR) and 95% confidence intervals (CI) for predictors of recovery from disabled to non-disabled state at follow-up. Results: At baseline, 50 per cent reported disability, eight per cent of whom recovered independent function at follow-up. Participants aged 75 years and over (OR = 0.4, 95% CI: 0.2–0.9) and with poor self-rated health (OR = 0.5, 95% CI: 0.4–0.6) were least likely to recover, followed by women (OR = 0.6, 95% CI: 0.5–0.8), those taking one or more medications (OR = 0.7, 95% CI: 0.5–0.8) as well as having two or more comorbidities (OR = 0.7, 95% CI: 0.5–0.9). Ten and more years of education was associated with an improved likelihood of recovery (OR = 1.3, 95% CI: 1.1–1.6). Conclusion: A

minority of participants reporting disability at baseline then reported independent function at two years. It may be important to focus on those who seem least likely to recover once they have become disabled. Factors that have been shown to be associated with greater risk of disability were inversely associated with recovery, suggesting that intervention programmes could target the same factors.

**PB6 260 INAPPROPRIATE MEDICATION USE AND RISK OF FALLS: A PROSPECTIVE STUDY IN LARGE COMMUNITY-DWELLING ELDERLY COHORT S. BERDOT\*** (INSERM UNIT 708, Paris, France)

M. BERTRAND(1), J. DARTIGUES(2), A. FOURRIER(3), B. TAVERNIER(4), K. RITCHIE(5), A. ALPEROVITCH(1) - (1) Inserm U708 & UPMC, Paris 6 (Paris, France); (2) INSERM U897, ISPED-Victor Segalen University (Bordeaux, France); (3) INSERM U657, Victor Segalen University (Bordeaux, France); (4) 5CHU de Dijon, Department of Geriatrics (Dijon, France); (5) INSERM U888 (France)

Introduction Explicit criteria for determining potentially inappropriate medication (IM) consumption in elderly have been elaborated. IM lists are used worldwide to evaluate medical prescriptions but there is little epidemiologic evidence demonstrating negative consequences of IM use. It has been reported that some drugs could increase the risk of falls, a frequent and serious problem in elderly population. We aimed to evaluate the association between IM use and fall risk. Methods and Materials The study population consisted of 6343 subjects included in a 4-year prospective cohort of community-dwelling elderly, the 3C study. Data collected at baseline, 2 and 4-year follow-up included sociodemographic characteristics, medical history, medication use (self-reports and from the national healthcare insurance) and falls' occurrence. We used logistic regressions to evaluate association between IM use and falls. Results 32% of subjects used IM at baseline and 22% had fallen 2 times or more during follow-up. Baseline IM users had a significantly increased risk of fall over 4-year follow-up which was mainly due to the use of long-acting benzodiazepine (OR=1.40,  $p<.01$ ), other inappropriate psychotropics (adjusted OR=1.74,  $p<.05$ , in regular users), or medication with anticholinergic properties (adjusted OR=1.57,  $p<.01$ , in regular users). Neither occasional, nor regular use of short- or intermediate-acting benzodiazepines was associated with an increased fall risk. Further analysis in long-acting benzodiazepine users did not show any dose-effect relation between the number of boxes bought over a 3-year period and fall risk. Conclusion Our study showed that use of IM, particularly of long-acting benzodiazepines, was associated with an increased risk of falling. Short- or intermediate- acting benzodiazepines, which did not increase falls' risk, should be preferred to long-acting benzodiazepines in elderly patients.

**PB6 261 INTERACTIVE GAIT AND THE RISK OF FUTURE FALLS AMONG INDEPENDENT OLDER PEOPLE**

E. NORDIN\* (Umeå University, Umeå, Sweden)  
R. MOE-NILSEN(2), A. RAMNEMARK(3), L. LUNDIN-OLSSON(1) - (1) Umeå University, Dept of Community Medicine and Rehabilitation, Physiotherapy (Umeå, Sweden); (2) University of Bergen, Dept of Public Health and Primary Care, Physiotherapy Science (Bergen, Norway); (3) Umeå University, Dept of Public Health and Clinical Medicine (Umeå, Sweden)

Background: Identifying individuals at risk of falling remains an important issue in fall prevention. Methods: 230 physically independent people, 75 years or older, underwent a 1-year follow-up of falls following baseline assessments of: Gait-pattern changes between single and dual-task walking, i.e. dual-task cost (DTC); Timed Up&Go; Short Physical Performance Battery; Activity Specific Balance Confidence Scale; Modified Survey of Activities and Fear of Falling in the Elderly; SF-36; self-perceived balance in walking; fall history; Mobility disability status. Results: Forty-eight percent of the participants fell during follow-up. A small prognostic guidance for ruling in a high fall risk was found for DTC in mean step width of " 3.7 mm with a manual task (Likelihood Ratio, LR+ 2.3), and a small guidance for ruling out a high fall risk with DTC in mean step width of " 3.6 mm with a cognitive task (LR- 0.5). In cross-sectional evaluations DTC related to an increased fall risk were associated with: sub-maximal physical performance stance scores (Odds Ratio, OR, 3.2 to 3.8), lower self-reported balance confidence (OR 2.6), higher activity avoidance (OR 2.1), mobility disability (OR 4.0), and cautious walking out-door (OR 3.0). However, none of these other measures provided any guidance to fall risk at an individual level. Conclusion: DTC of gait can, depending on the type of secondary task, indicate a functional limitation related to an increased fall risk or a flexible capacity related to a decreased fall risk. DTC in mean step width seems to be a valid measure of balance control in seemingly able older people and may be a valuable part of the physical examination of balance and gait when screening for fall risk in this population.

**PB6 262 INTEGRATIVE HEALTH FOR OLDER ADULTS: AN OBSERVATIONAL STUDY**

P. BLOOM\* (Mount Sinai Medical Center, New York, NY, United States)

Introduction: Integrative health, also known as complementary and alternative medicine, is increasingly popular, and has a growing body of scientific knowledge to support its use. The objective of this observational study was to establish the feasibility of offering integrative health options as integral components of a model academic geriatric medicine

practice. Methods: From 2004-2008, classes in tai chi, yoga, meditation, Pilates, and strength training were established under the guidance of a senior medical faculty person, with the support of the practice administration. From 10/07-11/08, number of participant episodes/weeks offered were: 1) tai chi 180/60; 2) yoga 420/60; 3) meditation 224/32; 4) Pilates 108/12; 5) strength training 68/17. Factors contributing to growth of programs included: 1) advertising in quarterly practice newsletter; 2) increasing knowledge of referring practitioners of the benefits of integrative health options by didactic and experiential seminars; 3) providing administrative support for organizational work via a small grant. Factors inhibiting the growth of programs included: 1) (initially) lack of knowledge in referring providers of benefits; 2) lack of space for physical movement-based programs; 3) lack of monetary support. Preliminary surveys demonstrate high satisfaction rates among patients and reports by providers of improvements in physical strength and mobility, and in mood and stress level. Research goals for all programs have been established, and implementation phases for research projects are underway. Conclusion: Older adults have demonstrated the same enthusiasm as younger adults for opportunities to engage in their own health plans via integrative health options. The feasibility of establishing integrative health programs within an academic medical center model program for geriatric care has been shown. Research concerning the benefits of integrative health interventions for older adults is needed.

**PB6 263 IMPROVING ORAL HEALTH OF THE GERIATRIC PATIENTS: EFFECTS OF AN EVIDENCE-BASED ORAL CARE INTERVENTION PROTOCOL**  
 D. YU\* (The Chinese University of Hong Kong, Hong Kong, Hong Kong)  
 D. LEE(1), E. LEUNG(2) - (1) The Nethersole School of Nursing, The Chinese University of Hong Kong (Hong Kong, Hong Kong); (2) The United Christian Hospital (Hong Kong, Hong Kong)

Introduction: Geriatric patients are susceptible to have poor oral health. Yet, health care professionals has placed least attention to improve oral care practice in geriatric setting. This study examined the effects of an evidence-based oral care intervention protocol on oral health and oral health-related quality of life of geriatric patients. Methods and Materials: This non-equivalent control group pre-test post-test study was conducted in a regional hospital in Hong Kong. Upon hospital admission, 120 geriatric patients (experimental group) received the evidence-based oral care interventions whereas the other 92 (control group) received the usual oral care. Baseline assessment of oral health and oral health-related quality of life was assessed by using the Oral Health Assessment Tool (OHAT) and the Geriatric Oral Health Assessment Index (GOHAI), respectively. Repeated assessment was done at 3-day and 6-day thereafter. Two-way repeated measure analysis of variance was used to detect the group difference in the oral health outcomes. Results: The geriatric patients had poor baseline oral health status, particularly cracked lip (73.2%), dental caries (63.5%), tongue problems (83.1) and poor oral hygiene (87.8%). By comparing the changes in the OHAT and GOHAI scores between the control and experimental groups, the evidence-based oral care intervention protocol significantly improved the lip condition ( $p<0.001$ ), gum tissue ( $p=0.035$ ), oral dryness ( $p=0.024$ ) and cleanliness ( $p=0.003$ ) of the geriatric patients. The protocol also significantly improved their oral health-related quality of life ( $p=0.022$ ), particularly in the pain and discomfort dimension. Conclusion: This study showed that geriatric patients had high demand for good oral care. The evidence-based oral care intervention protocol would be an effective practice to improve the oral health of geriatric patients.

**PB6 264 COMPARISON AND CORRELATES OF PARTICIPATION IN OLDER ADULTS WITHOUT DISABILITIES**  
 J. DESROSIERS\* (Université de Sherbrooke, Sherbrooke, Canada)  
 L. ROBICHAUD(1), L. DEMERS(2), I. GÉLINAS(3), L. NOREAU(1), D. DURAND(4) - (1) Université Laval (Canada); (2) Université de Montréal (Canada); (3) Université McGill (Canada); (4) Institut universitaire de gériatrie de Sherbrooke (Canada)

Introduction: Few are known about the impact of aging by itself on participation in daily activities and social roles. This study aimed to compare, by age group and gender, the level of participation of older adults who had no disabilities, and to determine which characteristics are most associated with participation. Methods and materials: This cross-sectional study involved 350 randomly-recruited community-dwelling older adults ( $\geq 65$  years) living in four regions of the province of Québec (metropolitan, urban or semi-urban and rural areas). Participation in daily activities and social roles were measured with the Assessment of Life Habits which comprises 12 life domains. Six of these domains relate to daily activities: nutrition, fitness, personal care, communication, housing and mobility, and the other six to social roles: responsibilities, interpersonal relationships, community life, employment, education and leisure. Demographic, health-related and environmental data were also collected. Results: A decline with age was observed in four of the six daily activities domains and two of the four social roles domains of participation. However, these lower scores are mainly explained by the 85+ group, which consistently scored lower than the 65-69 group. No differences were found between the 65-69, 70-74 and 75-79 groups. Some participation domains differed according to gender. Satisfaction with participation was high and did not differ between age groups. Characteristics most associated with participation vary according to the domains; generally, age and marital status are the best determinants of participation. Conclusion: This study found that most of older adults have an unrestricted level of participation which decreases only late in the

aging process. This reduction in participation in very older adults was not accompanied by a decrease in satisfaction, supporting the hypothesis that they can participate satisfactorily in valued activities.

**PB6 265 NEW COACHING MODEL FOR OLDER PEOPLE WITH HEALTH LIMITATIONS. RESULTS FROM A RANDOMIZED CONTROLLED TRIAL REGARDING FALL PREVENTION.**

T. WULFF\* (Bispebjerg University Hospital, København NV, Denmark)  
 C. HENDRIKSEN(1) - (1) Bispebjerg University Hospital (København NV, Denmark)

Introduction Better Balance Coaching is an integrative health coaching model, developed to engage older people in health promoting activities. The model is a 6 month programme combining face-to-face and telephone coaching. The key approach in the model is to collaborate with people from the assumption that they are naturally creative and resourceful, despite their health limitations. Calling forth people's values and strengths, when designing actions and inquiries are methods recognized for building people's positive self-identities and capabilities. This first study of the model has been taken place in the field of fall prevention among older people. Current research suggests that older people can be engaged with fall preventive health care by promoting the benefits fitting to a positive self-identity, tailoring interventions to individuals and encouraging self-management. The developed model is believed to support these recommendations. Methods and materials Community-dwelling people aged  $\geq 65$  years, involved in fall accidents without hospitalization, were randomly assigned to health coaching or to a control group. Both groups received conventional care. The tailored health coaching programme contained elements from coaching, positive psychology, cognitive coaching, health psychology, fall prevention research, and gerontology. Results Thirty-four people were included in the intervention group and 40 people were included in the control group. In total, 356 coaching sessions were carried out. Statistical analysis of fall rates (12 months follow-up's) and outcomes in relation to physical functionality, fear of falling, quality of life, use of home care, etc. will be presented. Further, qualitative analyses of potential mechanisms at play, when health coaching older people with health limitations, will be presented. Conclusion The results from the analyses are expected to contain explanations and relevant practice guidelines, which may complement current ways to engage older people in health-promoting activities.

**PB6 266 FALLS PREVENTION AND THE TAI CHI INTERVENTION PARADOX**  
 R. SAVAGE\* (Simon Fraser University, Vancouver, Canada)

Introduction: A brief look into statistical data pertaining to falls in the elderly provides ample evidence displaying the seriousness of this risk to health. Falls in Canada for example, result in 84% of injury-related hospitalizations in the sixty-five and over population. One rather novel approach to preventing falls at the individual level, involves promoting the use of Tai Chi in our senior population, and a modest literature has begun to accumulate to examine the efficacy of these interventions. Methods and materials: A conceptual framework was developed to assist in evaluating and understanding the many different fall prevention intervention options. Ageline and Medline searches were conducted using the key words "Tai Chi" and 10 articles were selected for review. Results: Falls intervention studies measure the actual number of falls during the study period and/or changes occurring in risk factors associated with falling. All 10 articles reviewed reported on risk factors, and 9 of 10 found a significant reduction in risk factors post intervention. Only 7 articles reported on the actual number of falls that occurred over the course of the intervention. Interestingly, only 1 of these 7 studies reported a significant difference in the number of falls between Tai Chi practitioners and controls. Conclusion: The review suggests that a Tai Chi intervention paradox exists. Simply, that Tai Chi is successful in reducing falls risk, but not in reducing the actual number of falls in elderly participants. This finding suggests that future research must be directed towards improving the psychometric properties of the instruments used to assess falls risk factors.

**PB6 267 STOPS WALKING WHEN TALKING: A PREDICTOR OF FALLS IN OLDER ADULTS?**

O. BEAUCHET\* (Angers University hospital, Angers, France)  
 C. ANNWEILER(1), G. ALLALI(2), R. KRESSIG(3), S. BRINDENBAUGH(3), F. ASSAL(2), F. HERRMANN(2) - (1) Angers University Hospital (Finland); (2) Geneva University Hospital (Switzerland); (3) Bales University Hospital (Switzerland)

Objective. The objective of this study was to systematically review all published articles examining the relationship between the occurrence of falls and changes in gait and attention-demanding task performance while dual tasking among older adults. Methods and material. An English and French Medline and Cochrane library search ranging from 1997 to 2008 indexed under "accidental falls", "aged OR aged, 80 and over", "dual-task", "dual-tasking", "gait", "walking", "fall" and "falling" was performed. Results. Of 121 selected studies, fifteen met the selection criteria and were included in the final analysis. The fall rate ranged from 11.1% to 50.0% in retrospective studies, and from 21.3% to 42.3% in prospective ones. Among the 3 retrospective and 8 prospective studies, 2 and respectively 6 studies showed a significant relationship between changes in gait performance under dual task and history of falls. The predictive value for falling was particularly efficient among

frail older adults compared to healthy subjects. Two prospective studies challenged the usefulness of the dual task paradigm as an efficient fall predictor compared to single task performance and 3 studies even reported that gait changes while dual tasking did not predict falls. The pooled odds ratio for falling was 5.3 (95% CI, 3.1-9.1) when subjects had changes in gait or attention-demanding task performance while dual tasking. Conclusions. Dual task-related changes in gait performance seem to be good predictors of falls among older adults and frail older adults in particular. Better identification of confounding factors, standardization of test methodology, increase of sample size and longer follow-up intervals will certainly improve the predictive value of dual task-based fall risk assessment tests.

**PB6 268 RISK FACTORS FOR RECURRENT FALLS IN THE ELDERLY POPULATION: RESULTS FROM THE PCR4 STUDY**

A. ROSSAT\* (Medical Health Center-CNAMTS-Lyon, CETAF, Lyon, St-Etienne , France)  
 B. FANTINO(1), C. NITENBERG(2), C. ANNWEILER(3), F. HERMANN(4),  
 O. BEAUCHET(5) - (1) Medical health center-CNAMTS-Lyon (lyon, France); (2) Medical health center-CNAMTS-Lyon (lyon, France); (3) Department of Geriatrics and University of Angers, Angers University Hospital (angers, France); (4) Department of Rehabilitation and Geriatrics & Faculty of Medicine, Geneva University Hospitals and University of Geneva (geneve, Switzerland); (5) Department of Geriatrics and University of Angers, Angers University Hospital (France)

Background. Few studies have examined the risk factors for recurrent falls. The aim of the study was to determine which risk factors of falls were associated with their recurrence among community-dwelling older adults. Method and material. 1066 subjects aged 65 and older were prospectively recruited. Use of psychoactive drugs, the number of drugs taken per day, basic mobility assessed with the Timed Up & Go test (TUG), maximal isometric voluntary contraction (MVC) force of hand, lower limb proprioception, distance binocular vision, fear of falling and history of falls during the past year were recorded. Subjects were separated into 4 groups based on the numbers of falls: 0, 1, 2 and > 3 falls. Results. Among the 395 (37.1%) fallers, 104 (9.8%) were recurrent fallers (i.e., > 2 falls). The numbers of falls increased with age (P-trend<0.001, ordered OR=1.05), female (P-trend<0.001, ordered OR=2.50), institutionalisation (P-trend=0.004, ordered OR= 2.40), the number of drugs taken per day (P-trend<0.001, ordered OR=1.08), taking sedative drugs (P-trend=0.017, ordered OR=1.59), score at Timed Up & Go Test (P-trend<0.001, ordered OR=1.04), use of walking aid (P-trend=0.004, ordered OR=2.05) and fear of falling (P-trend<0.001, ordered OR=5.06). After adjustment, only female (P<0.001), poor vision (P=0.006), lower limb proprioception (P=0.046) and fear of falling (P<0.001) were still significantly related to the number of incident falls. Conclusions. Several intrinsic factors are related to falls but few are specifically associated with their recurrence. The current study shows that sex female, poor vision, lower limb proprioception and fear of falling are related to the recurrence of falls.

**PB6 269 THE OCCURRENCE OF FALLS, FEAR OF FALLING AND FALL-RELATED EFFICACY AMONG INSTITUTIONALIZED ELDERLY.**

R. CORR A DIAS\* (Universidade Federal de Minas Gerais, Belo Horizonte, Brazil)  
 R. ALVARENGA VIEIRA (1), M. DE CASTRO FURTADO (2), R. CORR A DIAS (1),

Introduction: The fall event in elderly population is considered a public health problem because of its frequency and physical, psychological and social consequences. Objective: To verify the occurrence of falls, fear of falling and fall-related efficacy among older people living in long-stay institution. Methods and materials: This is a prospective exploratory study and we evaluated 33 institutionalized elderly aged 60 years or more, of both genders, residents in Juiz de Fora city, state of Minas Gerais, Brazil. Three instruments were used: the Mini-Mental State Examination (MMSE), used to identify cognitive impairment; Falls Efficacy Scale-International (FES-I) to assess fear of falling in older persons and a structured questionnaire containing data and identification of aspects related to falls. Results: The mean age of the sample was 79 years and 63.6% were women. Falls were reported by 33% of subjects, the mean length of institutionalization was 6.8 years. The majority of the elderly (59,38%) used more than 4 drugs. Fifty-four percent of the falls occurred during the afternoon, 63% of the falls occurred inside the housing and 45% of the elderly were recurrent fallers. Comparison between groups (fallers and non-fallers) showed that older subjects with recurrent falls have a significant fear of falling ( $p=0.00$ ) and a low fall-related efficacy ( $p=0.031$ ). The assessment of fear of falling, identified in 63% of the elderly a fear classified as very big and of the elderly that felt, 81% marked more than 30 points in the FES-I. Conclusion: The frequency of falls was smaller than expected for institutionalized elderly. The elderly that felt reported fear of falling and the falls occurrence affected negatively the fall-related efficacy.

**PB6 270 HEALTH PROFESSIONAL'S ROLES ACCORDING TO THE STROKE CAREGIVER'S TESTIMONY WHILE PROVIDING INFORMAL REHABILITATION AT HOME IN THAILAND**

P. JULLAMATE\* (Faculty of Nursing, Burapha University, Chonburi, Thailand)  
 Z. AZEREDO(1), E. ROSENBERG(2), R. SUBGRANON (3) - (1) ICBAS, University fo Porto (Porto, Portugal); (2) Appalachian State University (Boone, NC, United States of America); (3) Faculty of Nursing, Burapha University (Chonburi, Thailand)

Objective: Our aim was to identify the roles of health professional according to the perception of caregivers during providing informal rehabilitation activities at home to stroke relatives. Methods: The participants consisted of 20 primary informal caregivers of stroke survivors living in four districts of Chonburi province, Thailand. Data were collected from January – June , 2005, through the in-depth interview, non participant observation, field notes, memos and photographs until data saturation was reached. All interviews were tape-recorded and transcribed verbatim. All data accumulated from the interviews, observations, and notes were treated with content analysis. Results: Thai caregivers listed three groups of healthcare professionals - medical doctors, nurses, and physiotherapists - as providing useful health information to the stroke survivors and to themselves, both while caring for their stroke relatives in the hospital and, later while their relatives were recovering at home. "Advice" and "clarification" were the two categories that emerged from the content analysis. Three subcategories of "advice" were related to advice about (I) the disease (stroke), (II) rehabilitation, and (III) prevention from stroke-related complications. Two subcategories of "clarification" emerged from the content analysis related to (I) the disease (stroke) and (II) the future condition of the patients. Each group of health care professionals provided different information to the caregivers, depending on their main professional roles, points of view, training and experiences. Conclusion: The multidisciplinary stroke rehabilitation team is a specialized version of a health care team whose members collaborate with each other to establish a plan and goals for the achievement of the survivor's maximal potential. The multidisciplinary rehabilitation team is a powerful coalition capable of planning, managing, and evaluating strategies designed to enhance the maximal effectiveness of daily living and the highest quality of life of stroke survivors possible.

**PB6 271 EPIDEMIOLOGICAL DESCRIPTIVE STUDY OF INJURIES OF ELDERLY PEOPLE IN FRENCH SKIING RESORTS**

N. FENET\* (CENTRE HOSPITALIER D'ARRAS, ARRAS, France)  
 J. LAPORTE(1), D. CONSTANS(2), P. NEYRET(3), H. ARNAUD(4) - (1) Medecins De Montagne (Les Angles, France); (2) Medecins De Montagne (St Sorlin D'arves, France); (3) Centre Hospitalier Universitaire Hospices Civiles De Lyon (Lyon, France); (4) Centre Hospitalier D'arras (Arras, France)

INTRODUCTION Using the database of the Medecins de Montagne Association epidemiological network, we have carried out a retrospective descriptive study of 1360 elderly people (aged > 74 years) injured in French skiing resorts, between 1992 and 2005. METHODS AND MATERIALS Every injured person treated by a doctor from the association was registered on an anonymous standard file. The data were entered and analysed anonymously by a specific health programme EPI info and EPI 2000 for statistical analysis. Regarding the analysis of the distribution of data among the population, the program gives an analysis of the population variances. To check the normality of the distribution, an ANOVA test or non-parametric test equivalent of chi2 was used. The level of significance was set at  $p<0.01$ . RESULTS We observed that elderly people > 74 years old went to consult a doctor in the skiing resort more and more often and compared with the younger population presented the following characteristics : - A significant majority of severe lesions with an over representation of leg fractures, shoulder fractures and disjunctions, cranial and facial traumatisms. - A significantly higher rate of domestic accidents, public highway and street accidents, and collisions on the slopes. - A significantly higher rate of hospitalisation CONCLUSIONS - These results can be explained by the bone fragility of old people, and by physiological factors due to aging such as sarcopenia, the diminution of neuronal conduction, and existence of sensorial deficiencies. - Fall prevention, the treatment of osteoporosis and the prevention of sarcopenia among elderly people are the principal prevention methods. The wearing of helmets is also recommended. - With the current demographic trend, it is time to plan prevention measures aiming at elderly people. These preventive measures could fit in with an extensive national campaign of fall prevention.

**PB6 272 REHABILITATION FOR OLDER PEOPLE IN LONG-TERM CARE: A COCHRANE SYSTEMATIC REVIEW**

J. YOUNG\* (Academic Unit of Elderly Care and Rehabilitation, University of Leeds and Bradford Hospitals NHS Fou, Bradford, United Kingdom)  
 R. LAMBLEY(1), A. FORSTER(1), J. HARDY(2), J. SMITH(2), J. GREEN(2), E. BURNS(3) - (1) Academic Unit of Elderly Care and Rehabilitation, University of Leeds and Bradford Hospitals NHS Foundation Trust (Bradford, United Kingdom); (2) Bradford Teaching Hospitals NHS Foundation Trust (Bradford, United Kingdom); (3) Department of Elderly Care, The University of Leeds (United Kingdom)

Introduction: The benefits of physical rehabilitation for older people who are resident in long-term care (LTC) are unclear. A systematic review of published studies has therefore

been conducted with an emphasis on outcome measures indicating activity restriction. Methods: 17 electronic databases were systematically searched. Selection criteria: Any randomised controlled trial examining a physical rehabilitation intervention intended to maintain or improve physical function in LTC residents aged 60 years or older were included. Results: The search produced more than 20,000 titles, and 49 studies involving 3,611 participants were included in the review. The mean age of the study population was 82 years and most subjects were only mildly disabled. Interventions varied considerably but most involved an exercise programme that included one or more of walking practice; strength, flexibility, and balance training. Most trials lasted fewer than 20 weeks and comprised three 30-45 minute sessions per week. Trial quality was often unclear. 37 trials reported positive effects on mobility outcome measures. Positive effects on strength, flexibility, balance, physical condition, mood and cognitive status were also reported. Adverse events were unusual. There was little data available on longer term benefits or harms. Conclusions: There is a considerable existing evidence base in this area that indicates that interventions involving physical rehabilitation for older residents in LTC can be both safe and effective. However, the size and duration of the effects are unclear. Further research should be conducted to investigate the optimum content of the rehabilitation programme, identify the target group and estimate longer term outcomes.

**PB6 273 LONG-TERM EFFECT OF A MULTIFACTORIAL FALL PREVENTION PROGRAM ON THE INCIDENCE OF FALLS REQUIRING MEDICAL TREATMENT**  
**M. SALMINEN\*** (University of Turku, University of Turku, Finland)  
**T. VAHLBERG(1), S. KIVELÄ(2)** - (1) University of Turku, Biostatistics (Finland); (2) University of Turku, Family Medicine (Finland)

Introduction: Falls among the elderly represent a major public health problem with substantial medical and economic consequences. The purpose was to evaluate the long-term effects of a multifactorial fall prevention program on the incidence of falls requiring medical treatment. Methods and materials: Participants of the study were community-dwelling elderly living in the town of Pori in Finland. Altogether 591 subjects were randomly assigned into an intervention group (IG) (n=293) and a control group (CG) (n=298). The subjects of IG attended a 12-month multifactorial fall prevention program. The subjects in CG got one session of counseling and guidance on risk factors of falling. The occurrences of falls requiring medical treatment for 591 subjects were collected from the health center and hospital registers by a research assistant. Results: The intervention did not significantly reduce the incidence of falls requiring medical treatment during the 3-year follow-up (incidence rate ratio for IG compared to CG 0.87, 95% confidence intervals 0.63-1.21). However, the number of falls requiring medical treatment tended to be lower in IG (n=32) than in CG (n=50) (0.65, 0.40-1.07) during the first year after the intervention, while there were not such a difference between the groups during the intervention year (48 and 48, respectively) and second year (44 and 48, respectively) after the intervention. Conclusion: The multifactorial fall prevention program could not decrease the incidence of falls requiring medical treatment during the 3-year follow-up from the baseline in community-dwelling elderly with a previous fall. However, some positive effect was found the following year after the 12-month intervention. This effect was no longer evident during the second year after the intervention.

**PB6 274 THE EFFECT OF AGE ON RANKL EXPRESSION OF OSTEOBLASTS AND T CELLS IN A MURINE MODEL**  
**P. PIETSCHMANN \*** (Medical University of Vienna, Vienna, Austria)  
**W. SIPOS(3), D. KRENBEK(1), P. VARGA(4), P. ZYSSET(4), M. RAUNER(2)** - (1) Medical University of Vienna (Austria); (2) Technical University of Dresden (Germany); (3) University of Veterinary Medicine Vienna (Austria); (4) Vienna University of Technology (Austria)

Introduction: Age-related osteoporosis is hallmarked by excessive bone resorption, relative to bone formation. Since receptor activator of NF $\kappa$ B ligand (RANKL) and its antagonist, osteoprotegerin (OPG) are critical osteoblast-produced regulators of osteoclastogenesis, the aim of our study was to assess whether aging is associated with an increased expression of RANKL. Methods: Bone structure was analyzed by micro computed tomography of the 4th vertebral body in young (6 weeks), adult (6 months) and old (18 months) male C57BL/6 mice. Osteoclasts, defined as TRAP-positive multinucleated cells, were generated by treatment of bone marrow cells with 1,25-dihydroxy vitamin D3; osteoblasts were derived from bone marrow stromal cells in the presence of ascorbic acid and beta-glycerophosphate. RNA and protein levels of RANKL and OPG were determined by real time PCR and ELISA. Moreover, the expression of RANKL by spleen cells was analysed by flow cytometry. Results: Bone mass decreased significantly in the vertebral column of aged mice (young: 27%, adult: 20%, old: 16%, p<0.001). A significantly higher number of osteoclasts was generated in vitro from old compared to young mice. Immature osteoblasts from old animals displayed a lower RANKL/OPG ratio; in contrast, the ratio was higher in intermediate osteoblasts from old mice. Protein levels of RANKL and OPG in the supernatant of osteoblast cultures revealed no significant differences between the age groups. A higher percentage of CD4+ and CD8+ spleen cells in young mice expressed RANKL at the cell surface and also the production of intracellular RANKL was higher compared to adult and old animals. Conclusion: Our results suggest that the increased osteoclastogenic potential found in the bone marrow of old mice is not associated with an

enhanced production of RANKL. Thus, other molecules than RANKL appear to contribute to the augmentation of osteoclastogenesis.

**PB6 275 INTERVENTION IN PRE- FRAIL ELDERLY AT THE PRIMARY HEALTH CARE: PILOT STUDY**

**V. LINO\*** (Oswaldo Cruz Foundation, Rio de Janeiro, Brazil)  
**E. ENGSTROM M(1), L. FERREIRA N(1), M. CARREIRO L(1), M. PINTO O(1)** - (1) Oswaldo Cruz Foundation (Rio de Janeiro, Brazil)

Objective: development of a methodology aimed at intervention in pre-frailty. Methods: study with a convenience sample of 20 elderly presenting with one or two criteria: complaints of fatigue or weakness for one month or more; non-intentional loss of 5% of weight or more; two or more falls in the last six months; dismobility. Intervention: oriented physical activity (OPA) twice a week up to a total of 32 sessions, aimed at muscular strength and balance improvement. The elderly performances were assessed before and after the intervention in the following domains: cognition, humor, social integration (SI), gait speed (GS), balance, mobility, time to rise from the floor (TRFF), manual abilities (MA), activities of daily living (ADL). The statistical significance of the averages was measured by the T Student Test, with significance level of 5%. Results: effects of the OPA were not significant in: cognition, humor, SI, ADL. Significant differences were observed in GS (p=0,05), balance (p=0,0001), mobility (p=0,03) and TRFF (p=0,009), and a tendency to significance in the time to perform the MA (p=0,06). Conclusion: this pilot study proved the feasibility of the adaptation of pre- frail elderly to an OPA able to modify the physiologic response to physical exercise in order to postpone frailty, and can subside the elaboration of a randomized controlled trial. Training with a low level complexity and low cost technology can be implemented in a primary care unity, with few risks to the elderly health.

**PB6 276 RELATION BETWEEN THE GRAVITY CENTER AND THE RISK OF FALLS IN ELDERLY**

**L. FONSECA\*** (Universidade Estadual Paulista, Bauru, Brazil)  
**M. SCHEICHER(1)** - (1) Universidade Estadual Paulista (Marília, Brazil)

Introduction: During the aging process, it increases the postural asymmetries that could affect the mechanism of balance control, causing the falls. The objective of the study was to evaluate the static posture of each elderly, measure the risk of falls and correlate the projection of gravity center with the risk of falls. Methods and materials: The study involved 14 elderly people (7 males: 68.57 ± 4.12 years old; and 7 females: 72.57 ± 5.38 years old). They were informed about the experimental procedures and signed a Consent Form approved by the Ethics Committee. The volunteers were photographed, the images were transferred to a computer and it was calculated the projection of gravity center and the asymmetries of frontal and sagittal planes using the Software of Postural Evaluation. The risk of falls was assessed with the Berg Balance Scale (BBS). Statistical analysis was conducted using the Spearman correlation test ( $p < 0.05$ ). Results: The data are presented as mean ± SD. Score of BBS = 51.5 ± 3.3; sagittal plane (asymmetry anteriorly) = 42.0 ± 10.7%; frontal plane (right or left asymmetries) = 10.7 ± 8.9%. It was found a correlation between BBS and asymmetry of sagittal plane ( $r = -0.57$ ,  $p = 0.0312$ ) and between BBS and asymmetry of frontal plane ( $r = -0.72$ ,  $p = 0.0032$ ). Conclusion: The data founded suggest that as bigger the offset anteriorly (asymmetry of sagittal plane) and the offset laterally (asymmetry of frontal plane), lesser the scores of BBS, indicating an increase of risk of falls in elderly. Funded by FAPESP Proc. n° 2008/507128 and by FUNDUNESP Proc. n° 424/08.

**PB6 277 COPING STRATEGIES AND SOCIAL PARTICIPATION OF COMMUNITY-DWELLING OLDER ADULTS**

**L. DEMERS\*** (Research Center, Institut universitaire de gériatrie de Montréal, Montréal, Canada)  
**J. DESROSIERS(1), L. ROBICHAUD(2), I. GÉLINAS(3), L. NOREAU(4)** - (1) Université de Sherbrooke (Sherbrooke, Canada); (2) Université Laval (Québec, Canada); (3) McGill University (Montréal, Canada); (4) Institut de déficience en réadaptation physique du Québec (Québec, Canada)

Introduction: Literature on the social participation of community-dwelling older adults confirms that some daily activities and social roles are affected by age, albeit not strongly enough for them to require formal services. Dealing with those restrictions in participation thus seem to require some personal adaptation if the older adults are to remain in their community. This study sought to explore the relationships between cognitive and behavioral coping strategies and the social participation of community-dwelling older adults in conjunction with sociodemographic and health-related characteristics. Methods and materials: This cross-sectional study involved 350 randomly recruited older adults living at home independently. The Assessment of Life Habits (LIFE-H) and the Inventory of Coping Strategies Used by the Elderly (ICSUE) were used to document social participation and coping strategies. Socio-demographic and health-related characteristics were also assessed. Regression analyses were performed to evaluate the relationship between social participation, coping strategies and the other variables. Results: Behavioral coping strategies were the most important factor associated with daily activities, social

roles and total participation, followed by the type of living environment and age. These variables explained 33% ( $p = 0.04$ ), 13% ( $p = 0.02$ ), and 28% ( $p = 0.00$ ) of the variance of the models, respectively. The absence of any relationship between the cognitive coping strategies and social participation was a striking result. Conclusion: This study demonstrated the important association of behavioral coping strategies with social participation of among community-living older adults. Results suggest expanding current geriatric approaches to integrate knowledge on useful, safe and appropriate behavioral changes and to help older people acquire such strategies when they are lacking. Additional research is required to illuminate the influence of cognitive coping strategies.

**PB6 278 PERFORMANCE OF COMMUNITY DWELLING ELDERLY IN QUESTIONNAIRE OF QUALITY OF LIFE (SF-36) AND YOUR CORRELATION WITH DISEASES AND DISABILITY**

F. PEREIRA\* (Faculdade de Medicina de Petropolis, Belo Horizonte, Brazil)  
F. SOUZA MÁXIMO PEREIRA(1), R. CARDOSO GUIMARÃES(1), M. CLEMENTINO ALMEIDA(1), I. FERNANDA ALVES SANTOS(1), M. DE SÁ PITTONDO(1), D. ROSÂNGELA CORREA(2), L. SOUZA MÁXIMO PEREIRA(2) - (1) Faculdade de Medicina de Petropolis (Petropolis, Brazil); (2) Departamento de Fisioterapia Universidade Federal de Minas Gerais (Belo Horizonte, Brazil)

The aging is characterized by the accumulation of diseases, progressive dysfunctions and disability. These factors may influence in the independence and autonomy of elderly. OBJECTIVE:Correlation between performance of the community dwelling elderly in the Medical Outcomes Study Short-form (SF-36) and the number of diseases and dysfunctions. Methods:It was applied a multidimensional questionnaire of quality of life (SF-36),based on 8 domains: functional capacity, pain, general state of health, vitality, mental health, social, physical, and emotional aspects. The number of diseases and dysfunctions were evaluated through a clinical and structured questionnaire. It was made a descriptive analysis of the sample and the correlation was accomplished by the coefficients of Pearson and Spearman( $p \leq 0.05$ ) RESULTS Participated 72 elderly of the community ( $71.49 \pm 9.0$  years), which had  $2.39 \pm 2.0$  chronic diseases. The main disease were: arterial hypertension 28%, osteoarthritis 10.86%, diabetes 8.0%, osteoporosis 5.71%; all controlled by medication ( $2.42 \pm 1.7$ ). The most common dysfunctions were: decrease of the visual sharpness 32%, pain of articulation 22.40%, hypoacusia 16.80% and instability 12%. The correlation between the performance of the elderly in SF-36 and the number of dysfunctions did not present any relevant statistical result. However, in the domains of functional capacity, general state of health and pain of SF-36, was observed a decrease of the medium score in the questionnaire, when it was correlated with the increase of the number of diseases. Conclusion: Controlled diseases and dysfunctions which not influence the independence and the individual's autonomy should not interfere in the elderly quality of life. Nevertheless, the increase of the number of diseases was correlated negatively with three domains of SF-36. SF-36 is subjective,simultaneous application of other objective tests is suggested.

**PB6 279 COMPARISON OF HIP FRACTURE INCIDENCE AND TRENDS BETWEEN GERMANY AND AUSTRIA 1995-2004**

E. MANN\* (Institute of Health Services Research, Rankweil, Austria)  
G. MEYER(2), B. HAASTERT(3), A. ICKS(4) - (2) University Witten (Witten, Germany); (3) medistatistika (neuenrade, ); (4) North-Rhine Westfalian Chamber of Physicians (Düsseldorf)

Introduction Pronounced variations in hip fracture incidence rates and trends have been documented not only between countries regions but also within geographical areas. We aimed to compare incidence rates and trends between Austria and Germany from 1995 to 2004 by analysis of hospital discharge diagnosis register data. Methods Annual frequencies of hip fractures and corresponding incidences per 100,000 person years were estimated, along with 95% confidence intervals (CI), overall and stratified for sex and age, assuming Poisson distribution. Multiple Poisson regression models including country and calendar year, age and sex were used to analyse differences in incidence and trend between 1995 and 2004. The difference of annual changes between the two countries was tested using an interaction term (calendar year \* country) Results Overall, hip fracture risk was 1.31fold (95% CI 1.29-1.34) in Austria compared to Germany, adjusted for age, sex, and calendar year. The risk was equally higher for both sexes (men RR 1.35 (95% CI 1.32-1.37), women RR 1.31 (95% CI 1.29-1.33)). Hip fracture trends from 1995 to 2004 indicate an increase in both countries without a statistically significant difference between Austria and Germany (interaction term:  $p=0.67$ ). Sex-specific interactions were also not significant (men:  $p=0.07$ ; women:  $p=0.96$ ). Conclusion The hip fracture incidence in Austria is 30% higher compared to its neighbouring country Germany. For both countries a similar increasing trend of hip fracture incidence over the ten years study period was calculated. Further studies to explain the difference between the countries are needed.

**PB6 280 A SIMPLE CLINICAL SCALE TO STRATIFY RISK OF RECURRENT FALLS IN ELDERLY PEOPLE**

S. BUATOIS\* (University Hospital of Nancy, Vandoeuvre-les-Nancy, France)  
B. SEVERINE(1), P. CHRISTINE(1), G. RENE(2), M. PATRICK(2), V. GUY(3), P. PHILIPPE(4), B. ATHANASE(1) - (1) Department of Geriatrics, University Hospital of

Nancy (Vandoeuvre-les-Nancy, France); (2) Centre de Médecine Préventive (Vandoeuvre-les-Nancy, France); (3) Office d'Hygiène Sociale de Meurthe et Moselle, Centre Jacques Parisot (Vandoeuvre-les-Nancy, France); (4) National Institute for Health and Medical Research (INSERM), U 954, Faculty of Medicine (Vandoeuvre-les-Nancy, France)

Introduction: Identification and correct classification of subjects at risk of recurrent falls are essential in elaborating prevention strategies in older adults. Methods and Materials: We conducted a prospective study with a fall follow-up in 1618 community-living subjects ( $70 \pm 4$  years) consulting for a health check-up, to develop and validate a simple clinical scale to stratify risk of recurrent falls based on easily obtained social and clinical items. We had subsequently tested in three risk category groups the added value of the One-Leg Balance, Timed Up-&-Go and Five-Times-Sit-to-Stand, in predicting the risk of recurrent falls. Subjects were randomly divided into two groups: one was used to develop the scale (Group A, n=999), and the other (Group B, n=619) was used to prospectively validate the scale. Results: Logistical regression analysis identified four significant variables for the risk of recurrent falls in Group A: positive history of falls, living alone, taking  $\geq 4$  medications, and female gender. Thereafter, three risk categories of recurrent falls (low, moderate, high) were determined. Predicted probability of recurrent falls increased from 4.1% to 30.1% between the first and third category. This scale was subsequently validated with great accuracy in Group B. Only the Five-Times-Sit-to-Stand provided added value in the estimation of risk of recurrent falls, especially for the subjects at moderate risk, in whom failure to the test doubled the risk. Conclusion: In clinical practice, physicians could easily classify older patients in low, moderate or high risk groups of recurrent falls by using four easy-to-obtain items. The Five-Times-Sit-to-Stand provides added value to stratify risk of falls in subjects at moderate risk.

**PB6 281 COMPARISON OF STRENGTH AND AEROBIC TRAINING ON BASAL SERUM IGF-1 AND CORTISOL LEVEL IN ELDERLY WOMEN**

R. G. S. VALE\* (Federal University of Rio Grande do Norte (UFRN), Natal, RN, Brazil)  
Y. P. S. F. MENESSES(1), J. S. NOVAES(2), A. F. D. ANDRADE(3) - (1) State University of Piauí (UESPI) (Teresina, PI, Brazil); (2) Federal University of Rio de Janeiro (UFRJ) (Rio de Janeiro, RJ, Brazil); (3) Federal University of Pernambuco (UFPE) (Recife, PE, Brazil)

Introduction: IGF-1 shows a strong relationship with the conservation of the skeletal muscle system, but its secretion decreases with aging. On the other hand, cortisol, when persistently elevated, can be an inhibitor of protein synthesis and of increased muscle mass. Thus, the aim of this study was to compare the effects of strength and aerobic training on basal serum IGF-1 and cortisol levels in elderly women. Methods: The subjects were divided into three groups: Strength Group (SG) (n=12; age= $66.08 \pm 3.37$  years; BMI= $26.77 \pm 3.72 \text{ kg/m}^2$ ) submitted to strength training (75-85% 1-RM) using weights, and the Aquatic Group (AG) which performed water aerobic training (n=13; age= $68.69 \pm 4.70$  years; BMI= $29.19 \pm 2.96 \text{ kg/m}^2$ ) and a Control Group (CG) (n=10; age= $68.80 \pm 5.41$  years; BMI= $29.70 \pm 2.82 \text{ kg/m}^2$ ). Fasting blood samples were collected to measure basal IGF-1 and cortisol levels (chemiluminescence method), at the start and conclusion of the intervention (12 weeks). Results: Student's t-test showed only an increase in IGF-1 in SG (pretest= $116.85 \pm 36.87$  and posttest= $151.48 \pm 46.95 \text{ ng/ml}$ ;  $p<0.05$ ) in intragroup comparison. Repeated measures ANOVA showed increased levels of IGF-1 ( $p<0.05$ ) in SG ( $\delta\%SG=29.64$ ) compared to the other groups: AG ( $\delta\%AG=12.76$ ;  $p=0.005$ ) and CG ( $\delta\%CG=4.21$ ;  $p=0.003$ ). No differences were observed in cortisol levels. Conclusion: Strength training increased IGF-1 levels; therefore, it can be indicated for elderly individuals to promote the conservation of the skeletal muscle system. Keywords: aquatic exercises, muscle strength, IGF-1, cortisol, aging. Conflict of interest: none.

**PB6 282 SARCOPENIA AND CARDIOVASCULAR DISEASE IN OLDER MEN AND WOMEN**

D. BAYLIS\* (Southampton University, Southampton, United Kingdom)  
A. AIHIE SAYER(2), C. COOPER(2), H. SYDDALL(2), . (2), . (2) - (2) Medical Research Council Epidemiology Resource Centre, University of Southampton (Southampton, United Kingdom)

Introduction Sarcopenia is defined as the loss of muscle mass and strength with age. It has serious adverse health consequences in terms of mortality and morbidity and previous work has shown associations with both type 2 diabetes and metabolic syndrome. However its relationship with cardiovascular disease (CVD) has not been explored. We used data from the Hertfordshire Cohort Study to test the hypothesis that sarcopenia is associated with CVD in older men and women. Methods We studied 1,589 men and 1,418 women born between 1931 and 1939. Trained researchers used standardised questionnaires and an electrocardiogram grading protocol to identify participants with established CVD (typical angina, previous bypass surgery or presence of significant Q-waves on ECG). Information was also collected on co-morbidity and lifestyle (smoking and alcohol history, physical activity). Sarcopenia was characterised by measurement of grip strength and anthropometry included measurement of weight. Results 225 (15%) men and 127 (9%) women had CVD. CVD was associated with lower grip strength in women (average grip strength 24.9kg vs 26.7kg for those with and without CVD,  $p=0.001$ ) but not in men. The relationship among women remained significant after adjustment for age, weight, lifestyle and physical activity ( $p=0.04$ ). A significantly higher proportion of women reported angina, (54% vs 35% of

people with CVD) and higher proportion of men reported previous CABG, (44% vs 12% of people with CVD). Conclusions We have shown a significant association between sarcopenia and cardiovascular disease in older women. The association was not replicated in men, perhaps due to low numbers of self reported angina and higher previous CABG. Replication and more accurate characterisation of markers of CVD as well as investigation of potential underlying mechanisms are the next stage for this research.

**PB6 283 COURSE OF IMPROVEMENT IN INPATIENT GERIATRIC REHABILITATION - FEAR THE FEAR OF FALLING**

M. DENKINGER\* (Robert Bosch Foundation, Forschungskolleg Geriatrie, Ulm, Germany)  
T. NIKOLAUS(1), A. LUKAS(1), M. JAMOUR(2), S. BAILER(1), A. BADER(1) - (1) Bethesda Geriatric Clinic (Ulm, Germany); (2) Geriatrische Rehabilitation (Ehingen, Germany)

Objectives: To examine potentially new and known risk factors for their influence on the course of rehabilitation with regard to three differently measured functional outcomes. Setting: Geriatric inpatient rehabilitation unit. Participants: 161 geriatric rehabilitation inpatients (men, women) with a mean age of XX years who were capable of walking at baseline. Methods: Weekly assessments from admission until discharge, using the function component of the Short Form - Late Life Function and Disability Instrument, the Barthel Index and Gait Speed. A follow up was performed four months after discharge at home. Rarely reported factors such were examined in addition to common baseline parameters. Bivariate graphs of the course of rehabilitation were used to detect clinically relevant risk factors. Those factors were then used as independent variables in a multivariate linear regression model. Results: Relevant factors for any of the three outcome measures were age, gender, cognition, primary diagnosis, comorbidity, depression and fear of falling. Additionally minor adverse events were relevant for the in-hospital analysis and the amount of physiotherapy for follow up analysis. In the multivariate linear regression only falls related self efficacy, measured by the Falls Efficacy Scale - International significantly explained functional status in all three functional outcomes and across both, in-hospital and follow up analysis. Conclusion: Falls related self efficacy is the only parameter that significantly predicts rehabilitation outcome at discharge and at follow up at home in all outcome measures. It should therefore be considered in future studies on (geriatric) rehabilitation.

**PB6 284 A MULTICENTRE RCT OF A DAY HOSPITAL FALLS PREVENTION PROGRAMME FOR COMMUNITY DWELLING OLDER PEOPLE**

J. GLADMAN\* (University of Leicester, Leicester, United Kingdom)  
S. CONROY(1), T. MASUD(5), C. COUPLAND (2), A. DRUMMOND (2), R. HARWOOD(1), D. KENDRICK(2), T. SACH(3), R. TAYLOR(2), J. YOUNDE(4), J. EDMANS(2) - (1) Nottingham University Hospitals (Nottingham, United Kingdom); (2) University of Nottingham (Nottingham, United Kingdom); (3) University of East Anglia (Nottingham, United Kingdom); (4) Derby Hospitals NHS Trust (Nottingham, United Kingdom); (5) University of Leicester

Falls are a major public health issue. Most UK falls prevention programmes are reactive, rather than directed towards people at high risk on the basis of screening. The effectiveness of falls prevention programmes for people in primary care at risk of falling has not hitherto been evaluated. We carried out a multicentre RCT of falls prevention programmes based in three day hospitals in England, for people identified by screening using a validated postal screening questionnaire to be at high risk of falls. Participants were randomised to a falls prevention service, consisting of a medical assessment, strength and balance training and a home hazards review, or to a control group (falls advice only). The primary outcome was the rate of falls over 12 months ascertained using a monthly falls diary. 6133 people were screened, 1481 were at high risk of falls, 364 of which were recruited to the RCT and randomised: intervention (n=183), control (n=181). 37% of those allocated to the falls prevention programme attended six or more sessions. The rate of falls in the control group was 2.0 falls per person-year compared to 1.7 falls per person-year in the intervention group, adjusted IRR 0.73 (0.51-1.03), p=0.071. There were no significant differences between the groups in terms of the proportion of fallers, recurrent fallers, medically verified falls, injurious falls, time to first fall, function or quality of life. The magnitude of the reduction in falls risk observed is compatible with that seen in other fall prevention studies, and so this study may have been underpowered. At present, there is insufficient evidence for health care commissioners to recommend screening and intervention for falls in this manner. Further work to improve the take-up of falls prevention programmes, is warranted.

**PB6 285 RELATIONSHIP BETWEEN FALLS, FEAR OF FALLING AND HEALTH-RELATED QUALITY OF LIFE IN A COHORT OF COMMUNITY-DWELLING OLDER ADULTS**

W. WONG\* (Tan Tock Seng Hospital, Singapore, Singapore)  
Y. SITOAH(1), N. ISMAIL(1), Y. LEONG(1), S. CHAN(1), H. LIM(1), S. SEAH(1), N. MATTHEW(2), T. NG(2) - (1) Tan Tock Seng Hospital (Singapore, Singapore); (2) National University of Singapore (Singapore, Singapore)

Introduction: Falls and fear of falling are common in older adults. The aim of this study was to determine the relationship between falls, fear of falling and health-related quality of life (HRQoL) in a cohort of community-dwelling older adults. Methods and materials:

Prospective, longitudinal cohort study of 834 participants aged 55 years or older, recruited as part of a larger study examining the health status and aging process in community-dwelling older adults (Singapore Longitudinal Aging Study). Demographic information, medical history and functional status of all participants were obtained. The occurrence of falls, measures of fear of falling and HRQoL were recorded at baseline and then every 3 months for a total of 12 months. Fear of falling was determined using the revised Falls Efficacy Scale (rFES) and HRQoL was determined by the EQ-5D, with utility values derived using the York tariff. All participants underwent assessment of cognition, gait and balance. Results: The mean age of the study cohort was 65.0 years. 34.4% were male and 65.6% were female. 9.8% of the study participants lived alone and 38.2% had 2 or more chronic illnesses. 8.9% of the study participants reported at least one fall in the 6 months preceding recruitment into the study. The quarterly incidence of falls ranges from 2.8% to 4.4%. Longitudinal analysis using the generalised estimating equations method showed statistically significant association between HRQoL and falls (coefficient -0.029, 95% confidence interval (CI) -0.042, -0.016) and fear of falling (coefficient 0.046, 95% CI 0.039, 0.052). Conclusion: Falls and fear of falling are independently associated with health-related quality of life. In this cohort of community-dwelling older adults, both these factors have detrimental effects on health-related quality of life.

**PB6 286 QUALITY OF HOSPITAL RECORDING AND CODING FOR GERIATRIC SYNDROMES**

A. GUPTA\* (WEST WALES HOSPITAL, CARMARTHEN, United Kingdom)  
U. SINHA(1), G. SALONI(2) - (1) Royal Shrewsbury Hospital (Shrewsbury, United Kingdom); (2) Birmingham Uni (Birmingham, UK)

Introduction: Majority of hospitalised patients are elderly, frail with multiple diagnosis, comorbidity and functional impairment. Little information is available on the quality of hospital recording of common geriatric syndromes. Aim : of the study was to determine the completeness of recording of 4 geriatric syndromes in discharge summaries (DS) and in hospital Coding (HC). Methods: we reviewed case notes of 300 hospitalised elderly patients above age of 70 years in medical wards for the presence or absence of geriatric syndromes and compared information recorded on discharge summaries and by hospital coder. Results: 46 males. Age range 70-101 years. Median 82 years. Case notes identified 88% patients with one/more geriatric syndromes (fall, immobility,incontinence,intellectual impairment). Only 40% syndromes were mentioned on discharge summary and 35% captured on hospital coding. Of the geriatric syndromes, intellectual impairment was least likely to be identified and mentioned in DS and HC. Conclusion: The study demonstrates significantly incomplete recording of 4 geriatric syndromes on DS and HC. High quality coding and capture of information is essential for monitoring hospital activity accurately as data is used for measuring hospital performance, resource allocation and service planning in United Kingdom.

**PB6 287 PHYSICAL ACTIVITY AND EXECUTIVE FUNCTION IN AGING: THE MOBILIZE BOSTON STUDY**

L. EGGERMONT\* (VU University Amsterdam, Amsterdam, The Netherlands)  
W. MILBERG(1), L. LIPSITZ(2), E. SCHERDER(3), S. LEVEILLE(2) - (1) Geriatric Neuropsychology Laboratory; Geriatric, Research, Education and Clinical Center (GRECC); Brockton/West Roxbury Department of Veterans Affairs Medical Center (United States of America); (2) Department of Medicine, Harvard Medical School (United States of America); (3) Department of Clinical Neuropsychology, VU University (The Netherlands)

Introduction. Studies have found that physical activity and cognition, specifically executive function, in older adults are positively associated, but possible mediating factors such as cardiovascular disease (CVD) and CVD risk factors, chronic pain, and depressive symptoms have not been taken into account. Methods. and materials Older community-dwelling adults (n=544; mean age 78 years, 62 % female) participated in the population-based MOBILIZE Boston Study. Presence of CVD, pain, and depressive symptomatology were assessed in the home interview and blood pressure was measured in the clinic exam. Engagement in physical activity was determined by the self-administered Physical Activity Scale for the Elderly (PASE) and by self-reported number of blocks walked per week. Cognitive function was measured by a battery of neuropsychological tests. Results. Older adults that engaged in more physical activity (higher PASE score) showed significantly better performance on all cognitive tests after adjusting for age, sex, education, and total number of medications, except for Letter Fluency and the memory test of delayed recall. Similarly, older persons who reported more walking showed better performance on all cognitive tests. With further adjustment for CVD and CVD risk factors (i.e. heart disease, diabetes mellitus, stroke, and hypertension), pain, and depressive symptoms, both PASE score and number of blocks walked per week remained significantly associated with executive function tests. Conclusion. Even after multivariate adjustment, neuropsychological tests that were executive in nature were positively associated with physical activity in this cohort of older community-dwelling adults. In contrast, episodic memory subtests were not consistently associated with physical activity supporting the idea that the relationship with executive function represents a specific biologically determined relationship.

**PB6 288 COGNITIVE IMPAIRMENT IMPROVES THE PREDICTIVE VALIDITY OF THE PHENOTYPE OF FRAILTY FOR ADVERSE HEALTH OUTCOMES**

J. AVILA-FUNES\* (Centre de Recherche Inserm U 897, Bordeaux, France)  
H. AMIEVA(2), P. BARBERGER-GATEAU(2), L. GUTIERREZ-ROBLEDO(1),  
J. DARTIGUES(2) - (1) Instituto Nacional de Ciencias Médicas y Nutricion Salvador Zubiran (Mexico City, Mexico); (2) Centre de recherche Inserm U897 (Bordeaux, France)

**Objective:** To determine whether adding cognitive impairment to the phenotype of frailty improves its predictive validity for adverse health outcomes. **Design, Setting, and Participants:** Four-year longitudinal study of 6030 community-dwelling subjects aged 65-95 years, participating in the French Three-City Study. **Main Outcome Measures:** Frailty was defined as having at least three of the following criteria: weight loss, weakness, exhaustion, slowness, and low physical activity; subjects meeting one or two criteria were prefrail; and those meeting none as nonfrail. The lowest quartile in both the Mini-Mental State Examination (MMSE) and the Isaacs Set Test (IST) was used to identify subjects with cognitive impairment. The predictive validity of frailty for incident disability, hospitalization, dementia, and death was calculated adjusting for confounding factors. **Results:** 421 individuals (7%) met frailty criteria. Cognitive impairment was present in 10%, 12%, and 22% of the nonfrail, prefrail, and frail subjects, respectively. Those classified as frail at baseline reported more cognitive complaints and scored lower on the MMSE and IST in comparison to prefrail and nonfrail. After adjusting for potentially confounding variables, frail persons with cognitive impairment were significantly more likely to develop disability for activities of daily living (ADL) and instrumental ADL over the next 4 years. The risk for incident mobility disability and hospitalization was marginally increased. Incident dementia was increased in the groups with cognitive impairment irrespective of their frailty status. Conversely, frailty was not a significant predictor of mortality, although the risk tended to be higher among frail participants who were cognitively impaired. **Conclusions:** Cognitive impairment improves the predictive validity of the operational definition of frailty as it increases the risk for adverse health outcomes in this particular subgroup of elderly population.

**PB6 289 SCREENING FOR FALLS ON THE GERIATRIC WARD: ARE INSTRUMENTS PERFORMING BETTER THAN NURSES?**

N. VAN DEN NOORTGATE\* (Faculty of Medicine, university ghent, ICHTEGEM, Belgium)  
J. DEKONINCK(1), A. LIGNEEL(2), A. VELGHE(2), M. PETROVIC(2) - (1) Faculty of Medicine, university ghent (Gent, Belgium); (2) Dept of Geriatric Medicine, University Hospital Ghent (Gent, Belgium)

**Introduction** Fall prevention in hospital starts with a good riskstratification. Some instruments are developed to select highriskpatients as the St-Thomas Risk Assessment Tool for Fall in the elderly (STRATIFY) and the Morse Fall Scale (MFS). The study's objective is testing if these instruments are able to detect highriskpatients in a more appropriate way than the current used 'nurse competence' (NuCom). **Material & methods** Prospective study in the geriatric ward of the University Hospital of Ghent from January 2007 till march 2008. The STRATIFY and MFS were collected by two independent persons, namely the researcher (RS) using anamnesis and a referent nurse (RN), using nurselfiles and collecting the NuCom score defined as no, low or highriskpatient. Results 272 patients were included in the study by the RN, only a part of them, 95, were seen by the RS. The interrater correlation was weak and different results were obtained by the RS and RN. Looking at the whole population, only the morse fall scale ( $p=0.014$ ) and the NuCOM ( $p=0.001$ ) were significantly correlated with the fall incidents. For MFS and STRATIFY, a cut-off score of respectively 60 and 2 are withhold. Positive and Negative predictive values for the MFS, the STRATIFY and the NuCOM are comparable and respectively 25.6, 85.7; 25.6, 82.6 and 31.3, 87.2. Factor analysis shows fall history, gait difficulties, use of IV or heparines and mild transfer&mobilityscore to be significant risk factors for falls. **Conclusion** The usefulness of screeninginstruments are depending on the way of collecting the data. On a geriatric ward the best risk stratification is made by competent nurses capable of identifying risk factors as fall history, diminished locomotor capacity, evaluation of underlying illnesses and medication use. Screeningsinstruments don't seem to improve risk stratification.

**PB6 290 FALLS IN THE ELDERLY: WHO, WHEN, WHERE AND WHY FALLS IN NURSING HOME**

G. RICCI\* (RSA Villa San Clemente, Villasanta, Italy)  
S. BODINI(1), P. COSSO(1), L. FRANCHI(1), P. PAGLIARI(1), S. SALA(1), A. IANES(2) - (1) RSA Villa San Clemente (Villasanta, Italy); (2) Gruppo Segesta - Direzione Medica (Milano, Italy)

**Introduction:** Falls are a major problem in the elderly: up to 60% of nursing home residents fall each year and 50% of these "fallers" have multiple episodes. **Methods and Materials:** Over a period of 42 months (1/07/2005 – 31/12/2008) 544 falls occurred in 146 persons (101 females) over 65 yrs (mean age =  $84 \pm 7.5$ ) living in RSA Villa San Clemente. For every fall we collected age and sex of the faller, time, location, cause and dynamics. Patients were categorized into 5 groups: 1 fall (Gr.A= 51 pts), 2-3 falls (Gr. B=45pts), 4-5 falls (Gr. C=20pts), 6-10 falls (Gr D=18 pts) and > 10 falls (Gr. E=12pts). Fallers were categorized into three groups in relation to the walking ability: walking without assistance,

walking with assistance; not walking. **Results:** Mean age was related to the number of falls. Elderly with an higher autonomy in walking fell more frequently than impaired ones ( $p < 0.000001$ ). Falls occurred particularly in the afternoon (24.22%) and in the morning (19.87%) for all groups. Location of falls was more frequently the bedroom (38.41%) or other living spaces (41.17%). With regard to causes of falling, accidents were the leading cause of falling (63.6%); moreover, 271 (49.81%) falls were due to slipping, and 169 (31.06%) to an hazard of the patient. We want to remark that a number of falls could have been avoided, because they were caused by drugs use (6pts), inappropriate dresses or shoes (21pts), inappropriate aids (5pts), shoving (12pts), slipping (26pts). **Conclusion:** Falls are a frequent event in the elderly living in nursing home; the 13% of them could be avoided with a more careful health care.

**PB6 291 CONCURRENT UTILIZATION REVIEW TO FACILITATE THE EARLIER REHABILITATION OF OLDER PATIENTS**

C. POULOS\* (South Eastern Sydney Illawarra Health Service, Warrawong, Australia)

Utilization review is method used to determine whether a patient is appropriate for a particular care setting. Predominantly developed in the US, utilization review is used there as a tool of payers to justify payment for care. Outside the US utilization review is used as an aid to facilitate appropriate care, rather than approving or denying payment for care. We have trialed the InterQual utilization review tool in two studies in Australia in order to: 1. Test its utility in the Australian health care setting; 2. Compare the findings of utilization review to current practice, especially at the interface between acute and subacute care, and; 3. Compare current rehabilitation service provision against that suggested by utilization review. An initial pilot study was undertaken in 2004 and a further study in 2007/2008. Older patients in acute care with stroke, hip fracture, elective joint replacement, amputation and a range of other diagnoses were followed. The results show that, guided by utilization review, almost all older patients would be transferred to rehabilitation much earlier than currently occurs. Also, within the rehabilitation setting, older patients are shown to be receiving less therapy than suggested by utilization review. This paper will: 1. Describe the process of utilisation review and present and discuss the study findings; 2. Discuss the role of utilization review as an adjunct to routine clinical assessment in the early identification for rehabilitation of older patients in acute care; 3. Discuss the role of utilization review within the rehabilitation setting. 4. Examine the costs and barriers associated with the implementation of concurrent utilization review. We conclude that concurrent utilization review could improve outcomes for older people by reducing the opportunity for the functional decline associated with prolonged stays in acute care, and improve efficiency by promoting earlier and more effective rehabilitation.

**PB6 292 UNMET PHYSICAL ACTIVITY NEED IN OLD AGE**

M. RANTAKOKKO\* (University of Jyväskylä, Jyväskylä, Finland)  
S. IWARSSON(2), R. LEINONEN(3), E. HEIKKINEN(1), T. RANTANEN(1) - (1) Finnish Centre for Interdisciplinary Gerontology, Department of Health Sciences, University of Jyväskylä (Finland); (2) Department of Health Sciences, Faculty of Medicine, Lund University (Sweden); (3) GeroCenter Foundation for Research and Development, Jyväskylä (Finland)

**Introduction:** Unmet physical activity need refers to lack of perceived opportunities to increase physical activity level, even though being willing to do so. It may be common among older people and impact negatively to physical, social and mental well-being. Purpose of the study was to examine which individual characteristics and environmental factors correlate with unmet physical activity need in old age and predict development of unmet physical activity need over a two-year follow-up period. **Methods:** A total of 643 75- to 81-year-old people took part in face-to-face interviews at baseline, of which 314 persons took part in a two-year follow-up. **Results:** At baseline, 15 % of women and 12 % of men reported unmet physical activity need. Unmet physical activity need was more prevalent among those with musculoskeletal disease, depressive symptoms and difficulties in walking. Of the environmental factors, hills in the nearby environment, lack of resting places and dangerous crossroads were associated with unmet physical activity need at baseline. The effect of environmental features on unmet physical activity need was pronounced among those with difficulties in walking. Over the follow-up, 17 % of women and 10 % of men developed unmet physical activity need. Fear of moving outdoors, hills in the nearby environment and noisy traffic predicted development of unmet physical activity need over a two-year follow-up. **Conclusion:** Older people with health and mobility problems who report negative environmental features are more likely to experience unmet physical activity need. Solutions to overcome barriers to physical activity need to be developed to promote equal opportunities for physical activity participation.

**PB6 293 EFFECTS OF RESISTANCE STRENGTH OR STRETCHING TRAINING AND DETRAINING ON FUNCTIONAL STATUS IN ELDERLY**

A. GOMES\* (Universidade Federal do Paraná, Matinhos-PR, Brazil)  
R. LOCKS(1), T. COSTA(1), S. KOPPE(1), A. FORMIGA(1), M. CAMARGO(1) - (1) Universidade Federal do Paraná Setor Litoral (Matinhos-PR, Brazil)

**Introduction:** the purpose of the present study was to evaluate the effects of 12 weeks of stretching or resistance strength training, followed by 6 weeks of detraining on functional

status of elderly. Materials and Methods: The subjects were divided into 3 groups: control (CG; n=13; 66 years), stretching (SG; n=10; 69 years), and resistance strength (RSG; n=13; 69 years). The CG was not submitted to exercise, while SG and RSG performed twice a week 10 min of active exercise warm-up prior to exercises for lower body muscle groups. The SG performed 4 repetitions of stretching for 60s each. The RSG trained progressive resistive exercise with initial level set at 65% of 10 repetition maximum (RM) for the first five weeks, 70% for the next four weeks and 75% for the last three weeks. It was evaluated the cardiorespiratory performance by 6 minutes walk test (6MWT) and lower body muscle strength by stand up from a chair and sit down five times (SUCSD). The variables were measured before, 6 and 12 weeks during training and 6 weeks detraining. The homogeneity results were compared by ANOVA ( $p < 0.05$ ). Results: Twelve weeks of stretching decreased the SUCSD time compared before training. While, only 6 weeks of RSG diminished the time of SUCSD in comparison before training and increased the walking distance compared to CG. Conclusion: the resistive exercise, no more than 6 weeks, enhanced the strength of lower body muscle groups and the cardiorespiratory status. Thereafter it was efficient to maintain the gain even after detraining. Whereas the stretching training required 12 weeks to improve the strength of lower body muscle groups.

#### **PB6 294 DIFFERENCES IN MUSCLE ACTIVITY BETWEEN NONFRAIL AND PREFRAIL OLDER WOMEN DURING DAILY LIFE**

O. THEOU\* (University of Western Ontario, London, Ontario, Canada)  
G. JONES(2), J. JAKOBI(2), A. VANDEROORT(1) - (1) University of Western Ontario (London, Canada); (2) University of British Columbia-Okanagan (Kelowna, Canada)

Introduction: Identification of the early stages of frailty is imperative in prolonging functional independence. However, categorization between prefrail and nonfrail is not only complex but often ambiguous. Measuring muscle activity during daily life may provide an objective clinical method to assess early stage development of frailty. Purpose: Examine if electromyography (EMG) recordings for a typical day were different between nonfrail and prefrail older women. Methods: Twenty-six, community-dwelling, Caucasian, older women were classified as nonfrail (n=13, 73 ± 6 yrs) and prefrail (n=13, 75 ± 4 yrs) based on Fried's 5 criteria for physical frailty (weight loss, muscle weakness, physical inactivity, slow walking speed, and exhaustion). Surface EMG over a 9-hour typical day was recorded from the biceps brachii, triceps brachii, vastus lateralis, and biceps femoris. Muscle activity was quantified by burst analysis, where a burst is defined as a period of EMG activity greater than 2% of maximum voluntary contraction for a duration longer than 0.1 sec. The spatial (i.e. amplitude) and temporal (i.e. rate, duration) characteristics of the bursts were examined. In addition, leg extension strength, hand grip strength and physical activity were compared between groups. Results: The two groups were not significantly different in age, muscle strength and physical activity. Nonfrail women had a greater number of bursts and burst rate compared with prefrail women. In contrast, prefrail women had greater mean burst duration and mean burst area. Peak amplitude, burst activity, burst percent, total burst duration and total burst area were not significantly different between groups. Conclusions: These data indicate that prefrail women have fewer bursts which last for longer duration than nonfrail women of similar age, muscle strength and physical activity. Quantifying patterns of muscle activity with portable EMG may enable discrimination between early stages of frailty.

#### **PB6 295 DIZZINESS AMONG COMMUNITY-DWELLING ELDERLY ADULTS: RESULTS FROM ANDES MOUNTAINS**

F. GOMEZ\* (University of Caldas, Manizales, Colombia)  
C. CURCIO(2) - (2) Centre de Recherche sur le Vieillissement (Sherbrooke, Canada)

Background: dizziness is a common symptom in adults. The majority of those with dizziness complaints tend to have more than one risk factor, suggesting that dizziness is a multifactorial geriatric syndrome. Associated factors must be determined to permit risk-reduction approaches. Objective: to examine the associations between dizziness with socio-demographic and health factors among older persons living in the Colombian Andes Mountains. Design: population-based cross-sectional study. Settings/Participants: one thousand six hundred ninety-two community-living persons aged 60 years and over living in four sub-urban areas of villages in coffee-growers zone in Colombian Andes Mountains. Measurements: outcome measure was the report of dizziness very often and continuously presented in the last month. Independent variables were demographic, socioeconomic and social factors; disease and biomedical factors, functional status and performance based measures and psychological factors such as depressive symptoms and self-rated health. Results: Dizziness was reported by 15.2%. The prevalence of outcome was higher in women than men, but prevalence no rose with age. Variables independently associated with dizziness were: number of chronic conditions, decreased physical activity in the last year, visual and hearing impairments, the use of four or more medications, and fear of falling. Psychological variables independently associated were: poor perceived health and cognitive impairment. Health, functional and psychological factors classified 85% of dizziness. Conclusion: Older persons who referred dizziness are more physically frail, with more chronic conditions and sensory impairments, and have poor perceived health. Biomedical and functional factors showed a strong independent association with dizziness. A multifactorial intervention targeting the factors identified would reduce dizziness in

older people. However, this approach may need to address different sets of specific factors related with dizziness subtypes.

#### **PB6 296 DEMENTIA AND HIP FRACTURE: EPIDEMIOLOGY, PATHOPHYSIOLOGICAL AND CLINICAL CONSIDERATIONS**

A. FISHER\* (The Canberra Hospital and Australian National University Medical School, Canberra, Australia)  
W. SRIKUSALANUKUL(1), M. DAVIS(1), M. BUDGE(1) - (1) Department of Geriatric Medicine, The Canberra Hospital and Australian National University Medical School (Australia)

Aims: (1) estimate the prevalence of dementia in older adults with hip fracture (HF), (2) evaluate the clinicopathological profiles of HF patients with and without dementia and (3) determine if dementia predicts poor outcomes. Methods and materials: A prospective study of 842 consecutive patients ≥ 60 years with HF within 162,608 person-years of observation. The main end-points were HF, pre-fracture diagnosed dementia, residential status and HF outcomes. Results: Dementia was diagnosed prior to HF in 31.7% of patients. The relative risk of HF in individuals with dementia was 6.3 times higher (95% CI 5.1-7.1) than in people without dementia and this risk was 2.6-fold greater in people with dementia living in a residential care facility (RCF). All patients demonstrated a high prevalence of vitamin D deficiency [25(OH)D < 50 nmol/L, 77.7% with dementia and 80.4% without dementia] and secondary hyperparathyroidism (PTH > 6.8 pmol/L, 37.8% and 35.8%, respectively). Those with dementia were significantly older ( $85.0 \pm 6.7$  vs.  $81.1 \pm 8.1$  years;  $p=0.002$ ), more often living in an RCF (73.0% vs. 15.4%;  $p=0.001$ ), had a history of stroke (26.4% vs. 9.0%;  $p=0.001$ ), ASA score ≥ 3 (87.3% vs. 67.6%;  $p=0.005$ ), were malnourished (42.2% vs. 25.3%;  $p=0.010$ ), most had abnormally elevated bone resorption makers (92.5% vs. 80.3%;  $p=0.028$ ). Pre-fracture dementia was predictive of being discharged to a long-term RCF (RR = 2.6; 95% CI 2.1-3.0;  $p=0.001$ ), but did not influence survival or length of stay. Conclusion: Dementia is a significant risk factor for HF and both conditions share common characteristics which may indicate common pathogenetic mechanisms.

#### **PB6 297 RE-DEFINING THE "GERIATRIC GIANTS"**

P. O'MAHONY\* (Mayday University Hospital, Croydon, United Kingdom)  
S. YAU(1), R. LINDLEY(1) - (1) The University of Sydney (Westmead, Australia)

Introduction We wished to assess whether the "Giants of Geriatrics" (Immobility, Instability, Incontinence, Intellectual Impairment) defined by Isaacs remain relevant in today's acute healthcare system. Methods We audited a random selection of 1:10 admissions to our acute geriatric service over one year in a 750 bed teaching hospital. We identified triage presentation and, from electronic discharge summaries (or case notes), we collected data on demographics, length of stay, status and destination on discharge, final diagnosis and documented organ dysfunction or 'failure' (presence of underlying significant co-morbidities likely to be of relevance). We classified (by consensus) into the 'Giants', or alternative syndromes. Results The commonest triage presentations were 'fall' (20%), 'infection' (16%), 'pain' (13%), 'shortness of breath' (12%) and 'stroke' (6%). Mean age was 83 years; 60% female. Mean length of stay 8 days; 83% returned to pre-admission residence, 10% required higher care, 7% died. Only 45% could be classified according to the 'Giants' compared to 95% for our new suggested modern syndromes (the 8-Ss): Sepsis (44%), Stumble/fall (29%), Sore/pain (27%), Shortness-of-breath (21%), Stupor (16%), Stroke (8%), Side-effect (7%) and Stuck/immobility (7%). Underlying 'organ failures' were common, e.g. brain failure (included conditions such as dementia, stroke disease, Parkinson's Disease, epilepsy, neuropathy) in 62%, cardiovascular failure in 61% and bone failure in 54% of patients. Conclusions Awareness of the common syndromes of decompensation in frail elderly patients should assist with training staff, research and health service planning. Our study suggests that the "Giants of Geriatrics" may need to be revised to reflect the current pattern of acute presentation in the elderly. A heightened understanding of the importance of underlying organ dysfunctions also needs to be encouraged.

#### **PB6 298 EFFECT AT 1 MONTH OF A LARGE DOSE OF VITAMIN D3 IN FRAIL ELDERLY PATIENTS WITH LOW 25OHD SERUM CONCENTRATION**

G. DESCHASSE\* (CHRU de TOURS, TOURS, France)  
D. CHAVANNE(1), V. DARDAINE-GIRAUD(1), M. LAMANDÉ(1), H. RIPAUT-CESBRON(1), T. CONSTANS(2) - (1) CHU de Tours, Pôle Gérontologie (Tours, France); (2) Université François Rabelais (Tours, France)

Introduction: Vitamin D deficiency is highly prevalent in frail elderly persons living in nursing homes or in the community. A 25OHD serum level of at least 75 nmol/l (30 ng/ml) is required to avoid metabolic consequences of a secondary hyperparathyroidism. The currently recommended supplementations seem insufficient to reach this level. However, there is little data in the literature on the effectiveness of a large loading dose of vitamin D. Materials and methods: In a prospective observational study, the 25OHD serum concentration was measured 28 days (D28) after a loading dose of 200,000 IU of vitamin D3 followed by a daily supplement of 880 IU in frail patients aged 75 or over, who were admitted in a geriatric department of the University Hospital of Tours from May 15 to

October 20, 2008, with osteoporosis (bone mineral density Tscore <-2.5 SD or presumed osteoporotic fracture(s)), history of fall, depression and a serum 25OHD concentration below 50 nmol/l (20 ng/ml) (D0). Results: One hundred one patients (36 males, 65 females, aged 87.9 ± 5.9 yr) were included among 345 consecutive admitted patients. Serum 25OHD concentration were 20.3 ± 9.9 and 62.0 ± 32.3 nmol/l at D0 and D28 respectively. Twenty five patients (24.7%) reached a 25OHD serum level >or=75nmol/l. There is no significant seasonal relationship. Conclusion: Despite a controlled in-hospital vitD3 supplementation, 3/4 patients did not reach an optimal 25OHD serum level at 1-month. The inter-individual variability in the response to a 200,000 IU vitamin D3 loading dose argues for a monitoring of the 25OHD serum level and further trials with higher supplementations of vitamin D.

#### **PB6 299 OPERATIONALISING FRAILTY DEFINITIONS IN THE EMERGENCY DEPARTMENT – A MAPPING EXERCISE**

C. FERGUSON\* (University of Leicester School of Medicine, Leicester, United Kingdom)  
J. WOODARD(1), S. CONROY(1), J. BANERJEE(1) - (1) Leicester University School of Medicine (Leicester, United Kingdom)

**Introduction:** Emergency departments (EDs) assess a large number of older patients every day many of whom are subsequently admitted to acute medical units (AMUs). We assessed the frailty status of older patients attending an ED with a set of simple operational criteria. **Methods:** Medical student volunteers identified patients aged ≥70 years attending one ED over a five day period (8am-10pm). Frailty was defined as the presence of ≥1 of: fracture in a medically unstable patient, care home residency, confusion (Abbreviated Mental Test-4 score <4) or a Waterlow score >25 (measure of skin integrity and nutrition). The frailty status was recorded along with demographics, geriatric syndromes and the final destination. **Results:** There were 1723 admissions in all, 256 aged ≥70 years. 177/256 older patients were assessed, mean age 82.5 (range 69-99, 76 (43%) were men. 52 (29%, 95% CI 23-37%) were classified as frail, with confusion being the most commonly met criterion (38/52, 73%). Frail older people comprised 3% (52/1723) of all ED patients. The operational definition of frailty correlated well with the number of geriatric syndromes (Pearson's coefficient 0.56, p<0.0001). 75% (21/28) of frail patients required admission compared to 24/37 (66%) non-frail patients. Overall, 16/33 (48%) of those admitted to an AMU from ED were frail. **Conclusion:** The operational definition of frailty used in this mapping exercise was simple and easy to use, as demonstrated by its successful application by untrained volunteers. This pragmatic practice without dependence on complex criteria identifies a small but vulnerable population at risk of a prolonged hospital admission and other adverse outcomes. Interventions to improve care for this group early in their hospital stay have the potential to greatly influence patient flow in the axis of acute medical care.

#### **PB6 300 IMPLEMENTATION OF A PHYSICAL EXERCISE PROGRAM IN COMMUNITY FOR PEOPLE WITH STROKE: THE STANDPOINT OF PARTICIPANTS**

K. PERREAULT\* (Centre de recherche sur le vieillissement, Sherbrooke, Canada)  
J. DESROSIERS(2), J. LAMONTAGNE(1) - (1) Centre de recherche sur le vieillissement (Sherbrooke, Canada); (2) Université de Sherbrooke (Sherbrooke, Canada)

**Introduction:** The amount of time people with stroke spend in acute care is measured in days, whereas the time spent in the community after formal rehabilitation may be years. However, as described in recent focus groups and interviews, there are very few sustainable community programs suited to the needs of these people. This qualitative study aimed at 1) exploring the impact of a tailored community-based exercise program from the participants' point of view, and 2) observing the sustainability of this program. **Material and Methods:** The study enrolled seven community-dwelling persons with chronic stroke in an exercise program including health education sessions led by two kinesiologists. Participants met twice weekly for 10 weeks. A community partner organization working with stroke survivors provided all the facilities and logistical support. Qualitative methods were used to identify impacts, facilitators and barriers to the program. Individual structured interviews were conducted, audiotaped and transcribed. The transcribed interviews were analyzed using the analytical questioning method. **Results:** Participants reported increased mobility, reduced fear of falling and opportunity for socialization as positive elements. The most significant outcomes were self-confidence and feeling of achievement as catalysts for lifestyle modification. The group approach involving only people with stroke was considered a facilitator and transportation problems a barrier. Six months post-intervention, all participants continued to do physical activity. The sustainability of the program was demonstrated as the research kinesiologist was hired by the community organization and exercise was added to its regular program. **Conclusion:** The format under which the exercise program was delivered is innovative and interesting in terms of knowledge transfer and sustainability. Participants reported physical and psychological benefits. Moreover, results show that they decided to commit to a more active lifestyle. Funded by the Canadian Stroke Network

#### **PB6 301 PREDICTORS OF MORTALITY IN ELDERLY HIP FRACTURE PATIENTS ADMITTED TO AN ORTHOGERIATRIC UNIT IN OSLO**

K. HOLVIK\* (Diakonhjemmet hospital, Oslo, Norway)  
A. RANHOFF(2), M. MARTINSEN(1), L. SOLHEIM(1) - (1) Diakonhjemmet hospital (Oslo, Norway); (2) Hønslundsplass hospital (Bergen, Norway)

**Introduction:** Hip fractures are associated with high morbidity and excess mortality. An orthogeriatric unit providing multidisciplinary treatment to elderly patients was established

in Diakonhjemmet hospital in 2004. **Methods and materials:** One-year mortality of all causes was registered for 335 hip fracture patients aged 65+ who underwent surgery during January-October 2007. **Results:** Three-fourths (76%) of the patients were women. Women were older than men (mean age 85.9 vs. 83.2 years, p=0.002). One-fourth (27%) were admitted from nursing homes. One-year cumulative incidence (CI) of death was 25%; it was higher in men (CI 35% vs. 22%; cumulative incidence ratio (CIR) 1.6 (p=0.013)). The gender difference persisted when adjusting for age, body mass index (BMI), delay in operation, falling indoors, and cardiovascular disease. However, it was attenuated when adjusting for pneumonia during the hospital stay, as pneumonia was far more prevalent in men (22% vs. 6%, p<0.001). Unadjusted CI of death in patients with pneumonia was 52%, and 22% in those without (CIR 2.3, p<0.001). Unadjusted CI of dying in patients admitted from nursing homes was 47%, and 14% in those admitted from their homes (CIR 3.4, p<0.001). In a multivariable analysis (n=209) including age, gender, BMI, delay in operation, falling indoors, cardiovascular disease, pneumonia, and admittance from nursing home, the only significant predictors of mortality were pneumonia (CIR 2.3, p=0.045) and admittance from nursing home (CIR 3.6, p<0.001). **Conclusion:** One-fourth of the hip fracture patients died within a year after surgery. Mortality was higher in men than in women, despite their lower age, explained by a higher occurrence of pneumonia. Pneumonia during the stay and admittance from nursing home were significant predictors of mortality.

#### **PB6 302 COMPARISONS OF TOOLS PREDICTING FUNCTIONAL DECLINE AFTER HOSPITALISATION OF OLDER PATIENTS**

M. DE SAINT-HUBERT\* (Cliniques Universitaires de Mont-Godinne, Yvoir, Belgium)  
I. DE BAUWER(2), D. SCHOEVAERDT(1), P. CORNETTE(2), B. BOLAND(2), C. SWINE(1) - (1) Cliniques Universitaires de Mont-Godinne, UCLouvain (Yvoir, Belgium); (2) Cliniques Universitaires Saint-Luc, UCLouvain (Bruxelles, Belgium)

**Introduction:** Older patients frequently experience functional decline after hospitalization. Identifying at-risk patients is important to early plan appropriate care management. Several tools predicting functional decline upon admission have been designed: ISAR, HARP and more recently, SHERPA which has still to be prospectively validated. We aimed to compare the operational characteristics of this score to previous ones. **Methods:** Prospective cohort study including patients aged 75 years and over, hospitalized for hip fracture, infection or heart failure. ISAR (6-items questionnaire), HARP (age, iADL, MMSE), and SHERPA (age, fall, self-rated health, iADL, MMSE) were measured at admission. ADL score three months after discharge was compared to the preadmission ADL status and a decrease of one point determined functional decline. ROC analyses were performed. Results Ninety-eight patients were recruited (mean age 82±5 years, 56% of females, mean number of comorbidities 5.7±2.0). At 3 months, 46 (47%) presented functional decline. Area under ROC (95% CI) for ISAR, HARP and SHERPA were respectively 0.58 (0.48-0.68), 0.68 (0.57-0.77) and 0.73 (0.63-0.82). Difference between SHERPA and ISAR was statistically significant (p=0.001) and tended to statistical significance between SHERPA and HARP (p=0.078). To rule out the risk of functional decline, the optimal SHERPA cutoff was 3.5 (Se=98%; Sp=33%) and was reached by 82% of the patients. **Discussion:** SHERPA better predicted functional decline in older hospitalized patients in this study as compared with two other predictive tools. The predictive performances of the three tools are moderate, and the advantage for SHERPA is slight. Recruitment among three selected diagnoses may however limit the generalization of these results and further studies are needed to validate SHERPA.

#### **PB6 303 CARDIAC ARRHYTHMIAS IN GERIATRIC PATIENTS REFERRED TO FALL CLINIC AND EXAMINED WITH EVENT RECORDER**

Z. ABDULLAEVA\* (Bispebjerg Hospital, Copenhagen, Denmark)  
A. CHRISTIANSEN(1) - (1) Bispebjerg Hospital (Copenhagen, Denmark)

Bispebjerg Hospital has a catchment area of 220.000 persons. Geriatric department is part of the medical field; there are 36 beds and several outpatient treatment centers where the fall clinic has approximately 350 new-referred patients pr year. The patients in the fall clinic are examined with vestibular investigations, orthostatic BT mode, Biotelemetry, para-clinical studies and, in cases of suspected cardiac syncope, with Event Recorder (R-test). We have chosen to study the amount of cardiac arrhythmias needing treatment, in patients studied with Event Recorder. Analysis of 50 patient records: The patients had all been investigated with Event Recorder for at least 72 hours in order to investigate fall-tendency. The patients were all +65yr, 31 female, 19 males, range 65-95yr. Of the 50 patients we studied had 23 changes in the conventional ECG, 11 patients equivalent to 48% had no arrhythmias on Event Recorder, while the other 12 had arrhythmias that lead to intervention. 5 patients, equivalent to 22% were treated with Pacemaker, 6 patients representing 26% were treated medically and 1 patient, equivalent to 4% were treated both medically and with pacemaker. In review of 50 patient records of patients referred for investigation of causes of fall. We found with Event Recorder cardiac arrhythmias in 24% (12 patients) who needed treatment and 50% of these needed Pacemakers. These findings indicate that Event Recorder is a valuable test applied to geriatric fall-patients. It could be of interest to examine a larger number of patients in order to validate the findings. It also would be interesting to review the indications for Event Recorder because there was a large proportion that had normal conventional ECG nor had arrhythmias at Event Recorder. One

could compare changes in the conventional ECG with arrhythmias on Event Recorder and thus using

**PB6 304 KNOWLEDGE AND ATTITUDES ABOUT PARTICIPATION IN PHYSICAL ACTIVITY: AN INVESTIGATION OF OLDER POST-ACUTE HOSPITAL INPATIENTS**

A. BUTTERY \* (Kings College London , LONDON, United Kingdom)  
A. BUTTERY (1), F. MARTIN (2) - (1) King's College London, Institute of Gerontology (LONDON, United Kingdom); (2) Guy's and St Thomas' NHS Foundation Trust (London, United Kingdom)

**Introduction:** The habitual physical activity levels of most older people are sub-optimal. Post-acute rehabilitation provides an opportunity to promote physical activity. The illness experience may trigger a change in health behaviours. Readiness to participate is also affected by knowledge, attitudes, intentions and deterrents. **Methods:** We investigated these factors using a semi-structured questionnaire (developed from previously validated questions) in older patients pre-discharge from an urban hospital older persons' medicine unit in the UK. Frailty was defined according to published norms for grip strength. Responses to open questions were thematically analysed. Relationships between quantitative data were analysed using non-parametric tests. **Results:** From 256 patients screened, 66 patients were approached for inclusion and 44 (71% female) completed the interview. Age-median (range) was 83 years (67-91), Barthel Index 18/20 (9-20). Mean length of hospital stay was 13.7 days (SD 9.7). Frailty was present in 72% (31/43). Despite hospitalization for acute illness or injury, and a wide disability range, only 23% (10/44) reported "poor" general health. Knowledge of specific health benefits of physical activity was mixed with fewer participants responding correctly about the benefits of physical activity on hypertension (56% versus 78% p=0.0098) and osteoporosis (58% versus 84% p=0.0004) compared with community samples. Most wrongly believed their habitual activity levels were adequate. Intentions towards future physical activity were unrelated to frailty. Deterrents to increase activity were predominantly related to "breathing" and "leg" problems. **Conclusions:** These patients, potential benefactors from increased physical activity, have lower knowledge and poorer attitudes toward physical activity than in well community samples. These data provide insight about the challenges to delivering exercise related health messages and interventions.

**PB6 305 PARTICIPATION RESTRICTION IN FRAIL OLDER PEOPLE: EXTENT, NATURE AND UNDERLYING FACTORS.**

N. FAIRHALL\* (Musculoskeletal Division, The George Institute for International Health, The University of Sydney, Sydney, Australia)  
C. SHERRINGTON<sup>(1)</sup>, N. MONAGHAN<sup>(2)</sup>, K. LOCKWOOD<sup>(3)</sup>, S. KURRLE<sup>(3)</sup>, S. LORD<sup>(4)</sup>, I. CAMERON<sup>(2)</sup> - (1) The George Institute for International Health, The University of Sydney (Sydney, Australia); (2) Rehabilitation Studies Unit, Faculty of Medicine, The University of Sydney (Sydney, Australia); (3) Rehabilitation and Aged Care Services, Hornsby Ku-ring-gai Hospital (Sydney, Australia); (4) Prince of Wales Medical Research Institute, University of New South Wales (Sydney, Australia)

**Introduction:** Participation restriction, as defined by the World Health Organisation, is a key component of disability. Participation restriction has not been previously examined in frail older people. The objective of this study was to determine the extent and nature of participation restriction in community-dwelling frail older people, and to identify which health and demographic factors best explain participation restriction in this population. **Methods and materials:** Cross-sectional study of 132 community-dwelling adults aged 70-101 years (mean age 84.2, SD = 5.85), who met the criteria for frailty defined by Fried and colleagues. Participation restriction was evaluated using the Reintegration to Normal Living Index, which measures participation on a 5-point scale in 11 areas of life. Associations between participation restriction and ten health and demographic factors were examined using linear regression models. Results Eighty-eight percent of subjects reported participation restriction in at least one aspect of their life. Restricted participation was most prevalent in the areas of work in the home or community (55%) and community travel (60%), and least frequent with regard to indoor mobility (15%). Multivariate regression analysis showed impaired mood (assessed by the Geriatric Depression Scale), older age, greater number of health conditions, greater muscle weakness (as assessed by grip strength), and decreased performance at the activity level (assessed with the Barthel Index and Short Physical Performance Battery) were independently and significantly ( $p<0.05$ ) associated with participation restriction and explained 30% of the variance in participation restriction. Living with a carer and cognitive impairment were not significant predictors. **Conclusion:** In community-dwelling frail older people, participation restriction has a high prevalence. It is influenced by psychological, physiological and health-related factors. These findings indicate that a multidisciplinary approach may be helpful with improving participation in this population.

**PB6 306 NEUROLOGICAL ASSESSMENT OF IMPAIRED MOBILITY IN NURSING HOME RESIDENTS**

A. KOMIYAMA\* (St. Marianna University Yokohama City Seibu Hospital, Yokohama, Japan)

**INTRODUCTION:** Nursing home care is generally provided by care-workers without exact knowledge of underlying disorders or conditions in elderly residents. By contrast, in

acute care settings organ-targeted medicine is prevalent, paying little attention to the mental and/or functional status of the elderly patients. We therefore have undertaken a prospective study to evaluate residents upon admission into a nursing home by using a multidimensional assessment method to elucidate mental/physical disability and accumulation of underlying diseases. To characterize the motor function and mobility aspects of impaired ADL, we here describe the results drawn from neurological examination domain of assessment in consecutive 100 residents. **METHODS AND SUBJECTS:** Upon admission, every resident was examined by the use of a comprehensive assessment including mental (Folstein Mini-Mental State Examination, MMSE), functional (Functional Independence Measure, FIM), and physical /neurological evaluations. The subjects were 32 men and 68 women, mean age 81 years. **RESULTS:** All but four residents were cognitively impaired (mean MMSE score of 11.9/30); 49 Alzheimer disease, 14 vascular dementia, 13 Parkinson disease with dementia and Lewy body dementia, seven frontotemporal dementia and corticobasal degeneration. The motor segment of FIM was decreased to 41.4/91. The immobility was found to be mainly associated with muscle weakness relevant to sarcopenia (44%), parkinsonism (26%), cerebrovascular disorders (17%), and cervical myelopathy (6%), though these conditions were often overlapped. **CONCLUSION:** The thorough neurological examination showed that the major motor deficits in the nursing home residents was comprised of disuse muscle weakness, parkinsonism, cerebrovascular symptoms and cervical myelopathy in this order. Like cognitive deficits, many of these motor dysfunctions escaped recognition before the current nursing home placement.

**PB6 307 STRONTIUM RANELATE OVER 5 YEARS REDUCES NON VERTEBRAL FRACTURES IN WOMEN AGE > 80 AND IS COST SAVING**

B. VELLAS\* (Endocrinology centre of Excellence, HEIDELBERG, Australia)  
E. SEEMAN(9), S. BOONEN(1), F. BORGSTRÖM(2), J. AQUINO(4), J. SEMLER(5), C. BENHAMOU(6), J. KAUFMAN(7), J. REGINSTER(8) - (1) Leuven University Center for Metabolic Bone Diseases and Division of Geriatric Medicine (Leuven, Belgium); (2) i3 Innovus (Leuven, Sweden); (4) Clinique Médicale de la Porte Verte (Leuven, France); (5) Immanuel Krankenhaus Rheumaklinik (Germany); (6) Hôpital de la Madeleine (France); (7) U.Z. Gent Department of Internal Medicine (Belgium); (8) University of Liège (Belgium); (9) Endocrinology centre of Excellence (Australia)

**Introduction** - Longevity has resulted in a greater proportion of the population entering a time of life when increasing bone fragility and falls predispose to fractures, particularly nonvertebral fractures. Women over 80 years of age constitute 10% of the population but contribute 30% of all fractures and 60% of all nonvertebral fractures. Despite this, few studies have examined anti-fracture efficacy of treatments in this high risk group and none have provided evidence for benefits beyond 3 years. **Methods and materials** - To determine whether strontium ranelate reduces the risk of vertebral and nonvertebral fractures during 5 years, we analysed a subgroup of 1489 female patients over 80 years of age (mean 83.5 ± 3.0 years) with osteoporosis from the SOTI (Spinal Osteoporosis Therapeutic Intervention) and TROPOS (Treatment Of Peripheral Osteoporosis) studies randomized to strontium ranelate 2g/d or placebo. All received a supplement of calcium plus vitamin D. **Results** - By intention to treat, vertebral fracture risk was reduced by 31% (relative risk, RR = 0.69; 95% confidence interval, CI 0.52-0.92), nonvertebral fracture risk by 27% (RR = 0.73; 95%CI 0.57-0.95), major nonvertebral fracture risk by 33% (RR = 0.67; 95%CI 0.50-0.89) and hip fracture risk by 24% (RR = 0.76; 95% CI 0.50 - 1.15, not significant). Treatment was cost saving as it decreased cost and increased QALYs and life-years. **Conclusion** - Strontium ranelate safely produced a significant reduction in vertebral and nonvertebral fracture risk during 5 years in postmenopausal women over 80 years of age and was cost saving.

**PB6 308 THE EFFECT OF A HIGH ANIMAL PROTEIN DIET COMBINED WITH RESISTANCE TRAINING ON APPENDICULAR MUSCLE MASS IN OLDER ADULTS.**

M. MALTAIS\* (Université de Sherbrooke, Sherbrooke, Canada)  
F. BOBEUF(1), M. LABONTÉ(1), I. DIONNE(1) - (1) Université de Sherbrooke (Sherbrooke, Canada)

**Introduction:** The availability of essential amino acids is essential to promote muscle protein anabolism during a resistance training program in the elderly, as demonstrated in previous studies using a supplement (Parise & Yarasheski, 2000; Volpi, Kobayashi, Sheffield-Moore, Mittendorfer, & Wolfe, 2003). It remains uncertain if a high intake in animal proteins from food (especially rich in essential amino acids) can allow greater gains in muscle mass. **Purpose:** The objective of this study was to verify if a high consumption of essential amino acids coming from animal proteins in the diet could improve muscle mass gains after resistance training in older persons 59 to 73 years of age. **Methods:** 16 participants were submitted to resistance training 3 times a week. The resistance training intervention consisted in 3 sets of 8 repetitions at 80% of 1 RM. Nutrient intakes were measured by a 3-d food record. Subjects were divided into 2 groups of 8 participants based on animal protein intake and were paired for age and baseline lean mass (T1). The average intake of the high animal protein group (HPG) was  $1.27 \pm 0.4$  g/kg and  $0.55 \pm 0.1$  g/kg in the low animal protein group (LPG). Appendicular lean body mass was measured by DEXA at T1 and at the end of the intervention (T2). **Results:** While HPG showed a tendency to significantly increase appendicular lean mass ( $p=0.069$ ), no such effect could be observed in the LPG group. **Conclusion:** It seems that a high intake of animal proteins (including

essential amino acids) would tend to produce a gain of appendicular muscle mass compared to a low animal protein diet. Our results suggest that we need to study this question with a larger sample size.

**PB6 309 VIDEOFLUOROSCOPIC SWALLOW FINDINGS IN ADULT PATIENTS AND THE ELDERLY WITH COMPLAINTS OF COUGH.**

T. BILTON\* (Pontifícia Universidade Católica de São Paulo, São Paulo, Brazil)  
N. ZAMBOTTI(1), H. GUARINO(1) - (1) Pontifícia Universidade Católica (São Paulo, Brazil)

Aim: Describe swallow alterations that may provoke complaints of cough in adults and the elderly through videofluoroscopy. Casuistry and Method: is a retrospective study of swallow videofluoroscopies of the databank at the Fleury Diagnostic Medical Center. Subjects with neurological diseases, cancer and/or radiotherapeutic and/or chemotherapeutic treatment, mouth, stomach or esophagus surgery were excluded, thus reaching an overall of 119 patients. Events occurred while ingesting the following consistencies: fine, thick and pasty liquids and solids. The Statistical Method used was the chi-square test. Results: A significant difference was observed in the 40-to-59-year and 70-to-79-year old groups when swallowing phases were compared among different age groups, with a greater index of alteration occurrences in the esophageal phase. There was also a greater index of alteration occurrence in the esophageal (N=14), pharyngeal and esophageal (N=5) phases in the 60-to-69-year old group. There are alterations in the pharyngeal (N=12), pharyngeal and esophageal phase (N=13) and esophageal phases (N=11) when swallowing alterations were compared in 80-year and older patients. This result shows physiological changes in the pharyngeal phase that are provoked by aging. Conclusions: Alterations related to complaints of cough in all swallowing phases were found. It was also verified that the number of alterations in the pharyngeal phase among persons with 80 years or more (N=25) was greater than in all other age groups (N=19). The gastro-esophageal reflux appeared as most recurrent alteration. Hiatus hernia is quite associated to the RGE disease and is always present in its most serious forms. The third most prevalent occurrence was laryngeal-tracheal aspiration, which is directly related to the aging process. Treatment: phonoaudiological therapy (N=29), surgical treatment (N=18) and drug treatment (N=27).

**PB6 310 REHABILITATION NEEDS OF CARE HOME RESIDENTS: WHO DETERMINES IT?**

Y. CHANG\* (Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taipei, Taiwan)  
L. CHEN(1), S. HWANG(4), C. LAN(3) - (1) Center for Geriatrics and Gerontology, Taipei Veterans General Hospital (Taipei, Taiwan); (3) Institute of Health Welfare and Policy (112, Taiwan); (4) Department of Family Medicine, National Yang Ming University School of Medicine (Taipei, Taiwan)

Introduction The importance of rehabilitation in long-term care goes without saying, and the rehabilitation need for care home residents should be evaluated periodically. However, the precise description of "need" is a complex issue in health care system. The main purpose of this study is to evaluate the differences in the perceived rehabilitation need of care home residents and the assessed rehabilitation need of carers in the care home. Methods Senior residents of Banciao Veterans Care Home were invited for study and were enrolled when they were fully consented. Inter-RAI Minimum Data Set Nursing Home 2.0 Chinese version (MDS-NH 2.0) was implemented for all participants. Activities of daily living (ADL) of all participants were evaluated by the MDS ADL. The G8 section (evaluation of rehabilitation needs) was analyzed to explore the differences of rehabilitation need between participants' perception and onsite carers' assessment. Results In total, 581 residents were enrolled (mean age= 80.8 ±5.2 years, all males) for study. Overall, 91.3% of them were considered physically independent according to MDS ADL scale. Among all participants, 63.2% believed they would be physically improved by certain rehabilitation services. However, only 9.8% of study participants were considered having rehabilitation potential by their carers. Conclusions A significant gap of rehabilitation potential existed between senior care home residents and their carers. The judgment of carers was more compatible with the results of MDS ADL. However, perceived rehabilitation needs of care home residents deserve further attentions to promote better quality of care in care homes.

**PB6 311 PHYSICAL ACTIVITY AS A PREDICTOR OF ALL-CAUSE MORTALITY AMONG OLDER PEOPLE WITH CARDIAC DISEASE**

M. ÁIJÖ\* (Savonia University of Applied Sciences , Kuopio, Finland)  
T. PARKATTI(2) - (2) The Finnish Centre for Interdisciplinary Gerontology, University of Jyväskylä (Jyväskylä, Finland)

Aim: We investigated physical activity as a predictor of all-cause mortality among older people with and without cardiac disease. Methods: The study is part of the Evergreen-project. The study group consisted of 481 75 or 80 year-old residents of the city of Jyväskylä, central Finland. The baseline data were collected in the years 1989 and 1990. Participants gave self-reports of physical activity and chronic diseases. Diseases were later ascertained by a medical doctor in a clinical setting. Severity of cardiac disease was rated based on self-reports of symptoms and the use of heart medicines. Date of death was recorded for all subjects who died during the ten-year follow-up period. Cox regression analysis was used to investigate the

relationship between the dependent variable and the covariates. Results: 259 people died over the ten-year follow-up. The results showed that among physically active older people the full adjusted (age, gender, other chronic diseases, health behaviours, severity of cardiac disease) relative risk of death did not differ among those with or without cardiac disease. Results also show that the sedentary older people without cardiac disease had a higher mortality risk than the physically active older people with a cardiac disease. Conclusions: According to the results physically active life style predicted longer life among the older people with cardiac diseases. The severity of cardiac disease did not explain the result.

**PB6 312 RAPID IMPROVEMENT PROGRAMME FOR HIP FRACTURE CARE IN ENGLAND**

E. AITKEN\* (NHS Institute for Innovation and Improvement, Coventry, United Kingdom)

Introduction Patients who suffer a fractured neck of femur have high mortality (20% in first 4 months) and morbidity with up to 20% needing long term care post fracture. Care varies throughout the UK with length of stay varying between 17 to 40 days. Methods and materials The Institute for Innovation and Improvement (Delivering Quality and Value Team) has developed a tool kit. This toolkit reflects feedback from site visits to high and low performing Trusts and through evidence based literature, identifies key characteristics of high performing pathways for good fractured neck of femur care. At local level, the orthopaedic pathway team will be working with Trusts (Acute and PCT) to improve the quality and value of care provided to patients with fractured femur, by transforming care pathways and processes within short timescales. This will be achieved by offering improvement skills, project management support, metrics and measurement support and clinical expertise to NHS organisations (local and system wide) to make improvements. Results The 6 key characteristics of organisations providing high quality care and value for money in patients with fractured femur are: · Coordinated pathway, designed to reduce variation in length of stay, mortality and, re-admissions · Appropriate, medically fit patients receive surgery within 24 hours · Patients are mobilised within 12-18 hours post op including weekends · Patients are discharged back to their usual address using a criteria based discharge process · Health and social care multi agency teams are coordinated and integrated · The MDT works in partnership with an orthogeriatrician Conclusions A coordinated integrated pathway for fractured neck of femur care has been shown to decrease length of stay and improve quality of care and outcomes for patients. By reducing variation in these processes and sharing good practice it can be disseminated through Regional Networks throughout England.

**PB6 313 DOES THE ORAL NUTRITIONAL SUPPLEMENTATION IN UNDERNOURISHED OLDER PEOPLE AFTER HOSPITALISATION REDUCE DISABILITY?**

R. PRICE\* (University of Dundee, Dundee, United Kingdom)  
M. SHIELDS(2), J. POTTER(3), D. STOTT(2), M. MCMURDO(1) - (1) Ninewells Hospital and Medical School, University of Dundee (Dundee, United Kingdom); (2) Academic Section of Geriatric Medicine, University of Glasgow (Glasgow, United Kingdom); (3) Graduate School of Medicine, University of Wollongong, New South Wales (Wollongong , Australia)

Introduction To discover whether nutritional supplementation in recently discharged older patients reduces disability and improves muscle function. Methods This 2-centre, double blind, placebo controlled trial was conducted in the homes of community dwelling patients aged 70 years or over. Participants were randomised to receive either 2 cartons of a nutrient rich supplement (600kcal) or a matching placebo (200kcal) daily for 16 weeks. The primary outcome was Barthel which measures disability based on activities of daily living. Barthel, weight and handgrip strength were recorded at 0, 8 and 16 weeks. Participants wore an accelerometer for 7 days to record activity levels at the beginning and end of the study. Results Of the 2409 patients screened, 937 (39%) were eligible to participate, 684 declined, leaving 253 participants (61% female, mean age 82 years) who were allocated to the nutritional supplement (n=126) or matching placebo (n=127). 62/253 (25%) withdrew from the study, of whom 20 withdrew their consent and 18 died. We found no evidence for a reduction in disability with nutritional supplements, as measured by change in Barthel. Handgrip strength improved more in the supplemented group (mean difference 1.48kg, p=0.005, corrected for gender and baseline values). There was a modest increase in physical activity levels in the nutritional supplemented group (p=0.018) and a trend towards weight increase (p=0.037); both significant when adjusted for adherence (median 38% supplemented group, 50% placebo group). Approximately 25% patients reported gastrointestinal side-effects. Conclusions Oral nutritional supplementation in older people recently hospitalised did not reduce disability, despite improving muscle function and modestly increasing physical activity levels. The absence of benefit on function may be because of the modest increase in calories achieved or because more prolonged supplementation is necessary. Future trials should assess acceptability and tolerability.

**PB6 314 SURVIVAL AND LONG TERM FUNCTIONAL OUTCOME IN NONAGENARIAN PATIENTS AFTER HIP FRACTURE**

M. TOLFA\* (Hospital IRCCS Casa Sollievo della Sofferenza, San Giovanni Rotondo (FG, Italy)  
D. INTISO(1), F. DI RIENZO(1), G. GRIMALDI(2), T. LOMBARDI(2), P. FIORE(2), G. MARUZZI(1), A. IAROSSI(1), M. RUSSO(1), L. PAZIENZA(1) - (1) Casa Sollievo della Sofferenza (S. Giovanni Rotondo (FG), Italy); (2) University of Foggia (Foggia, Italy)

The number of individuals 90 years of age or older with hip fracture is expected to rise significantly in the next decades. This dramatic event is associated with morbidity, mortality, as well as poor quality of life. Nonagenarians may require a unique treatment and rehabilitation approach as well as an inpatient rehabilitation setting. In the present prospective study, the rate of survival and functional recovery after intensive rehabilitation was investigated in this very elderly population. Method: Consecutive nonagenarian patients suffering from hip fractures and admitted to an intensive rehabilitation setting were enrolled. Outcome measures included survival rate, Barthel scale assessment and gait evaluation at admission, discharge and follow-up (26.3±8.8 months). All patients were treated with a multidisciplinary therapeutic approach and rehabilitation treatment for almost two hours a day. Results: Sixty patients were screened and 42 subjects (38F, 4M, mean age 92.6±3.5 years, range 90-101) were successfully evaluated. Analyses demonstrated that patients achieved good functional recovery as the Barthel mean scale score was 51.6±7.8, 82.7±18.2 and 81.4±19.1, at admission, discharge and follow-up, respectively. At discharge, 8 (20%) patients achieved ambulation without aid and were independent, 28 (70%) walked with assistance and 4 (10%) subjects were bedridden. Globally, 18 (45%) subjects achieved their pre-injury functional level of gait. The in-hospital and two-year mortality rate was 4.7% and 19%, respectively. At the follow-up visit, 26 (76.4%) patients still lived at home and 8 (23.5%) at nursing facilities. Conclusion: Patients 90 years of age or older with hip fracture achieved a good functional outcome after intensive rehabilitation. The mortality rate was low and about one half returned to their pre-injury functional level of ambulation.

#### **PB6 315 HOME AND CLINICAL ASSESSMENTS OF INSTRUMENTAL ACTIVITIES OF DAILY LIVING IN FRAIL OLDER ADULTS**

V. PROVENCHER\* (Centre de recherche de l'Institut universitaire de gériatrie de Montréal, Montréal, Canada)  
L. DEMERS(1), I. GÉLINAS(2) - (1) Centre de recherche de l'Institut universitaire de gériatrie de Montréal (Montreal, Canada); (2) School of Physical and Occupational therapy, McGill University (Montreal, Canada)

Introduction: Hospitalized older patients are usually assessed in the clinical setting for their ability to accomplish instrumental activities of daily living (IADL) in an independent and safe manner before going home. However, for many frail older adults, this assessment in an unfamiliar environment might not be as representative of their functional abilities as an assessment performed at home. The aim of this literature review was to determine if differences exist between home and clinical assessments of IADL in frail older adults and identify factors that might explain those differences, if any. Methods: A review of studies comparing home and clinical IADL performance-based assessments in frail elderly was conducted. Medline, CINAHL, AMED, psycINFO, Embase, and Current content (1988-2008) databases were searched. As no relevant studies concerning frail people were found, the search was extended to mixed-age and older adults populations. Ten articles were retained and critically appraised. Results: The results suggest differences in IADL assessment between settings for older adults without significant cognitive impairments. More specifically, the studies reviewed tend to report a home advantage of IADL assessment with this population. Some factors, such as familiarity with the environment, might explain those differences. The results also suggest that fewer coping skills, reduced balance and grip strength, declining vision, higher anxiety level as well as less schooling may affect IADL assessment between settings. Based on this review, similar results might be expected with frail older people. Conclusion: The review suggests that home setting may be advocated for a more accurate assessment of IADL with older adults. However, further research is needed to compare home and clinical assessments and measure relevant factors in a frail population. Helping health professionals identify frail patients, who may show different abilities in unfamiliar settings, could mean more appropriate services after discharge from hospital.

#### **PB6 316 EPIDEMIOLOGY OF FALLS IN THE ELDERLY IN TUNISIAN POPULATION**

I. KSONTINI\* (Hospital of the Interior security forces, Marsa, Tunisia)  
S. LEBIB(2), C. DZIRI(2), S. HAJEM(3) - (2) National Institute of Kassab (Tunisia); (3) National Institute of health (Tunisia)

**INTRODUCTION** The ageing of the Tunisian population means a need to prevent falls which constitute a very important public health problem. **METHODS AND MATERIALS** The present study aims to identify the risk factors of falls in the Tunisian population aged 65 years old and more. The data used in this study are extracted from the national survey on the health of the old Tunisian population. It was about a transverse descriptive survey which allowed to study, by a survey at home, a representative sample of persons of 65 years old and more consisted of 2165 individuals. The objectives assigned to the present study are to estimate the frequency of falls, to identify the demographic, medical and socioeconomic predisposing factors and to elaborate propositions for the prevention. **RESULTS** Our study allowed to notice that 22.6 % of the investigated persons declared to have fallen at least once during the last 12 months preceding the survey, among which 12.7 % had put it because of an obstacle. Thus, this analysis allowed us, to notice that the fall results from the conjunction of several parameters which we can distribute in three groups: I) An indicator of the risk: the sex with a feminine ascendancy II) Risk factors which are on the base of the process leading to the fall: it is about the decline of the visual

capacity, the disorders of the walking and the balance, the invalidating articular diseases pulling a locomotiv embarrassment as well as decline of the muscular strength. III) Risk factors which increase the risk of falling: it is about dizziness, cognitive impairment and loneliness. Conclusion The falls thus result from the conjunction of several variables at the same time. This supposes that every old person detected at risk will have to benefit from an action of multifactorial prevention.

#### **PB6 317 IMPACT OF A NURSES' URINARY INCONTINENCE EDUCATIONAL PROGRAM ON THEIR HOME CARE OLDER INCONTINENT PATIENTS**

C. COLLETTE\* (Sherbrooke Geriatric University Institute , Sherbrooke, Canada)  
G. BRAVO(1), L. TU - (1) Sherbrooke Geriatric University Institute (Sherbrooke, Canada)

Introduction: Few studies have examined the impact of urinary incontinence educational programs designed for generalist nurses working with community-dwelling older adults. This research related to an evaluation of the effectiveness of a urinary incontinence educational program for nurses in reducing their home care patients' urinary incontinence and improving their quality of life. Methods: Pre-experimental design involving 11 community nurses and 24 of their urinary incontinent older patients. Participants' urinary incontinence and quality of life were assessed at baseline, and again two and six months after the end of the nurses' educational program. The aim of the program was to integrate the nurses' knowledge, skills and attitudes through three interactive workshops combining the case study method with lectures. Results: Two months post-intervention, urinary incontinence and quality of life improved in the older adults, although differences were not statistically significant ( $p=0.054$  and  $0.212$ , respectively). However, both outcomes had significantly improved by six months ( $p=0.002$  and  $0.001$ , respectively). Conclusion: This study suggests that the care provided by nurses who attended the program can significantly improve urinary incontinent older adults' clinical condition and quality of life.

#### **PB6 318 FUNCTIONAL STATUS IN FRAIL OLDER PEOPLE PREDICTS CARER BURDEN**

C. AGGAR\* (University of Sydney, Camperdown, Australia)  
S. RONALDSON(1), N. MONAGHAN(2), K. LOCKWOOD(3), I. CAMERON(2) - (1) Faculty of Nursing & Midwifery, The University of Sydney (Camperdown, Australia); (2) Rehabilitation Studies Unit, Faculty of Medicine, The University of Sydney (Ryde, Australia); (3) Rehabilitation and Aged Care Services, Hornsby Ku-ring-gai Hospital (Australia)

Introduction: Frailty affects a person's independence by diminishing their physical function and ability to carry out activities of daily living. These deficits erode the caregiving experience, potentially placing a burden on informal carers and reducing their ability to provide appropriate levels of care. This paper examines the relationship between carer experiences and the functional status of frail older persons. Method: This study involved the informal carers of community dwelling people (>70years) who were participants of a randomised controlled trial aimed at investigating frailty interventions. The informal carers were administered a questionnaire to identify carer experiences using the Caregiving Reaction Assessment (CRA). The correlation of carer experiences with frail older persons' functional status (Barthel Index) was investigated. Results: Sixty three (64%) of the carers have completed the questionnaire. Mean carer age is 65.5 (SD 13.5) years, of which 71% are female and 54% reside with the intervention participants. Mean participant age is 84.5 (SD 6.2) years, 71% are female. Overall, carers experienced higher levels of burden 2.6 (SD 0.6), mainly due to disrupted living schedules and impact on their health, whilst self esteem was derived from caregiving. Carer burden significantly correlated with frail older persons' functional status ( $r = -0.384$ ,  $p = 0.002$ ) particularly the dimensions of financial impact ( $r = -0.405$ ,  $p = 0.001$ ) and disrupted schedule ( $r = -0.433$ ,  $p = 0.000$ ). Regression analysis indicated that frail older persons' functional status is a predictor of carer burden ( $p = 0.005$ ). Conclusion: Detection of poor functional status in frail older persons enables the development of tailored strategies for their at-risk carers. Additionally, improving frail older persons' functional status may reduce carer burden. These results highlight the essential nature of the informal carers' role in community interventions to improve frailty in older people.

#### **PB6 319 WEIGHT CHANGES IN ELDERLY AND HOW IT ASSOCIATES WITH THE RISK OF DEVELOPING OSTEOPOROSIS**

S. BERKEMEYER\* (University of Bochum, Herne, Germany)  
J. SCHUMACHER(2), U. THIEM(1), L. PIENTKA(1) - (1) University of Bochum (Herne, Germany); (2) Alfried Krupp Klinikum Essen (Essen, Germany)

In elderly how body weight relates to bone health/osteoporosis is not without controversies. Weight loss due to loss of muscle mass (sarcopenia/frailty) has been reported to compromise bone health. Such a clarity though lacks for the relationship between body fat loss and bone health. More often obesity has been examined. Beneficial role of obesity is explained via weight loading and hormones, e.g. estrogens. A more deleterious role of obesity is explained via the controversial leptin, and co-existence of sarcopenia with obesity. Our sample (cross-sectional, n=576, men: women 313:263, age: 82.6y [82.3;82.8];  $P<=0.05$ ) was divided into six groups: osteoporosis and comorbidities, osteopenia and comorbidities, comorbidities, osteoporosis, osteopenia, and

healthy. Of this 59.4% had either osteoporosis or osteopenia, of which, 73.4% were overweight-obese. However, osteoporosis (with/without comorbidities) had the lowest weight and body mass index (BMI) among all six groups, and correlated inversely with weight (-0.11 to -0.28), and BMI (-0.15 to -0.23). Conversely, comorbidities-group (87.2% overweight-obese) correlated directly with weight (0.31) and BMI (0.21). Body weight is reported among the most powerful predictors of bone health. While overweight-obese elderly were found both in (a) osteoporosis and osteopenia (73.4%), and (b) comorbidities groups (87.2%), our study shows that osteoporosis (with/without comorbidities) as the crucial old-age disease that related to lower weight/BMI. Finally, our study had a study-specific healthy group with an average BMI of 28.5 (overweight), which was quite similar to osteopenic groups. We conclude that, old age with overweight might be a relatively healthy alternative for elderly. However, why some elderly remain healthy with overweight while others do not is yet an open question.

#### **PB6 320 TEN YEARS BONUS OF FITNESS AFTER A SHORT TRAINING PROGRAM AMONG OLDER SUBJECTS**

T. VOGEL\* (Hôpital de la Robertsau, Hôpitaux Universitaires de Strasbourg, Strasbourg, France)  
P. BRECHAT(1), P. LEPR TRE(2), G. KALTENBACH(3), M. BERTHEL(3), J. LONSDORFER(3) - (1) service de santé publique et économique de la santé, groupe hospitalier Lariboisière Fernand-Widal, assistance publique des hôpitaux de Paris (AP-HP), (Paris, France); (2) Laboratoire de recherche 'Adaptation physiologiques à l'exercice et réadaptation à l'effort, Faculté des Sciences du Sport, Université de Picardie Jules Verne (Amiens, France); (3) Pavillon Schutzenberger, Hôpital de la Robertsau, Hôpitaux Universitaires de Strasbourg (France)

Introduction: Prolonged training programs improve elderly's maximal aerobic and endurance capacities, but little is known about short programs. We tested a 9-week Intermittent Work Exercise Training (IWET) among healthy volunteers Methods and Materials: 130 participants were evaluated in 2 groups, according to their age: Group I (GI) including 62 subjects (mean age 60.8 years) and Group II (GII) with 68 subjects (mean age 68.9 years). All subjects performed before and after the IWET an incremental exercise test to obtain their first ventilatory threshold (VT1), Peak Oxygen Uptake (V02 peak) and Maximal Tolerated Power (MTP). IWET consisted to 18 sessions of our program: each session of 30 minutes of cycling consisted of alternating 4 minutes at the intensity of VT1 and 1 minute at a submaximal intensity. Results: in both groups before training, maximal values of V02 peak and MTP were near the mean theoretical values. After training all subjects increased significantly their maximal values: V02peak +9.9% (GI) and 13% (GII); MTP +14.3% (GI) and 16.4% (GII). The post-training maximal values (V02 peak, MTP) of GII regained the maximal pre-training values of GI. The VT1 intensity, increased highly after training: 20.5% in the GI (78.2 to 94.2 watts) and 25% in the GII (68.8 to 85.9 watts). During the training sessions, the intensity of the 4 minutes stage also increased regularly: from 75.8 to 107.4 watts in the GI and from 63.3 to 94.8 watts in the GII. Conclusion: this short "tailor-made" program seems to have the same effectiveness that prolonged program. After training, the 70-years old group (GII) regained the same level of fitness that had the 60-years old group (GI) before training. With a grant from CAMES

#### **PB6 321 EPIDEMIOLOGY OF THE DEPENDENCE WITHIN THE TUNISIAN POPULATION OF 65 AND MORE YEARS OLD**

I. KSONTINI\* (Hospital of the Interior security forces, Marsa, Tunisia)  
R. ZNAIDI(2), N. MEJRI(3), S. HAJEM(4) - (2) Unit of ambulatory geriatrics (Ariana, Tunisia); (3) National Box of health insurance (Tunis, Tunisia); (4) Research unit on ageing (Tunis, Tunisia)

Introduction Because of the demographic evolution, the number of old persons and especially the very old ones will increase in the next years in Tunisia. We can thus expect an important increase of the number of persons in situation of dependence. Material and methods Towards this situation, we decided to begin this study which has for objective to identify the risk factors of the loss of autonomy within this population and to make propositions for the prevention. It was begun by the national Institute of Public health with a representative sample of the Tunisian population of 65 and more years old living at home consisted of 2165 individuals distributed on more than 7000 households. To do it, we built an indication which measures the handicap of physical independence such as it was defined by the International Classification of the Handicaps: deficiencies, Incapacities and Disadvantages of the OMS. Results The analysis of this indication showed that the dependence concerns 10 % of our population of 65 and more years old living at home. Among the 216 dependent old persons, 104 are heavily disadvantaged, they are confined on the bed and/or on the armchair. 112 others are dependent for certain activities of the everyday life. This analysis also showed that the dependent population is dominated by the 80-year-old subjects (40 % of the total strength) and the women (about 56 % of the whole dependent population). The women of 75 and more years old represent to them only 36 % of the dependent persons and about 42 % of those who present a heavy dependence. This study allowed us to identify the risk factors of the dependence including medical and

sociological parameters Conclusion Our results suggest that any strategy of prevention must have a double medical and social approach.

#### **PB6 322 FEASIBILITY OF THE FRIED CRITERIA FOR FRAILTY SCREENING IN AN INTERVENTION TRIAL**

M. DREY\* (Hospital Nuremberg, Nuremberg, Germany)  
A. ZECH(1), B. FISCHER(2), K. PFEIFER(1), C. SIEBER(3), J. BAUER(3) - (1) Institute for Sportsscience and Sport (Erlangen, Germany); (2) Institute for Biomedicine of Aging (Nuremberg, Germany); (3) Hospital Nuremberg (Nuremberg, Germany)

Introduction Among the current operational definitions of frailty the criteria established by Fried and coworkers have aroused intensive interest in the recent scientific literature. Nevertheless these criteria have been applied mostly in epidemiological and rarely in interventional studies. In this presentation we provide data on the applicability of the Fried criteria in the context of a RCT (NCT00783159) of physical exercise in prefrail older persons. Methods and materials Recruitment was supported by newspaper articles, information by health insurance companies and advertising in senior residences. Potential candidates were invited to our research institute and screened for prefrailty (weight loss, hand grip, exhaustion, gait speed, physical activity). For the diagnosis of prefrailty one or two of these criteria had to be fulfilled. Results In total 270 persons were screened. Among those 183 were not frail, 87 were prefrail and none was diagnosed as frail. The most prevalent criterion was exhaustion (41%) whereas hand grip was the second most frequent criterion (37%). Weight loss (4%), gait speed (14%) and physical activity (4%) were much less frequently positive. 18% of the screened persons who scored positive for the criterion "exhaustion" were depressed according to Geriatric Depression Scale. With regard to the Minnesota Leisure Time Physical Activity Questionnaire (MLTPAQ), relevant for the criterion "physical activity", only three activities among the 18 of the MLTPAQ selected by Fried were applicable. Conclusion In our opinion the cutoffs (weight loss, gait speed), the applicability (physical activity) and the validity (exhaustion) of certain Fried criteria have to be reconsidered. In addition they should be adapted for application in an European population. Nevertheless the Fried criteria show high practicability, especially in the clinical setting.

#### **PB6 323 COMPARISON OF A BIOMEDICAL SPECTROSCOPIC ELECTRICAL IMPEDANCE ANALYSIS WITH FOUR CLINICAL MEASURES OF MUSCLE PERFORMANCE TO DETECT SARCOPENIA FOR THE OLD PATIENTS.**

E. RIVIER\* (Hôpital Riviera, Blonay, Switzerland)  
T. GAUTHIER(1), A. MAILLARD(1), I. PIESSEVAUX(1), C. GLAUSER(1), N. YERSIN(1), E. RENAUDIN(1), R. GOSNIER(1), P. LAMOTHE(1), M. BLANC(1), S. KRIEG(1) - (1) Centre de traitement et de réadaptation (Blonay, Switzerland)

Sarcopenia refers to the loss of skeletal muscle mass and to the decline in muscular performance in aging. The use of the bioelectrical impedance analysis is one of the ways to evaluate the skeletal muscle mass but to our knowledge, the correlation between muscle mass and muscle performance is not well established. Objective of the study : to look for a correlation between four different clinical performances (Grip Strength, Tip Pinch, Key Pinch, Ten Meters Walk Test) and bioelectrical impedance analysis. Patients and Method : 50 patients admitted in our rehabilitation hospital during february and june 2009. Exclusion criteria : terminal diseases, major motor difficulties (score of 5 or less for ambulation and transfer evaluated by the Barthel Index), severe to very severe dementia, cardiac, hepatic or kidney insufficiency with oedema, patients with coronary stents or pace maker. The preliminary results of this study will be given and the predictability value of these different measures commented.

#### **PB6 324 GENDER DIFFERENCES OF UPPER MUSCLE STRENGTH AND OXYGEN HEMOGLOBIN SATURATION IN ELDERLY RESIDENTIAL HOME**

K. CHIEN\* (Kainan University, Taoyuan, Taiwan)  
C. CHOU (1), Y. HUANG(2), C. LIN(3), T. LIU(3), C. CHEN(3) - (1) (Taoyuan County , Taiwan); (2) (Taipei, Taiwan); (3) (Taipei, Taiwan)

Introduction: It is well known the muscle strength in male better than in female adults. And physical fitness decreases with aging. However, the difference of functional fitness by gender was still unclear. The purpose of this study was to compare functional fitness between female and male elderly. Methods and Materials: Ninety-nine subjects were recruited (male=62, female=37) from residential home. The average age of the subjects was  $82.0 \pm 7.5$  years. Chair stand and arm curl in 30 seconds, 2-minute step, chair-sit reach, back scratch and 8-feet up and go were performed. Oxygen hemoglobin saturation (%) in arm was recorded by near infrared spectroscopy (NIRS). Spearman correlation and independent t-test were used for statistics. A level of  $<=0.05$  was set for significant on all tests. Results: The results showed that arm curl performance, oxygen hemoglobin saturation with resting, exercise and recovery phase in male were significantly higher than in female. Chair-sit reach and back scratch performance in female were better than in male. Arm curl performance was significantly related to oxygen hemoglobin saturation with resting, exercise and recovery phase. Conclusions: W suggested the upper muscle

strength was late of degeneracy with aging in male elderly and it was related to oxygen hemoglobin saturation.

**PB6 325 OCCUPATIONAL THERAPY AT AN ACUTE GERIATRIC UNIT: DESCRIPTION AND RESULTS**

J. GAJARDO\* (University of Chile, Santiago, Chile)

**INTRODUCTION.** Hospitalization has different consequences for aged people than younger. Staying at hospital has often a functional decline for the elder, as seen on the independence in Activities of Daily Life (ADL). It's suggested that 80% of people over 80 years old, will decline their functionality in Activities of Daily Life during hospitalization. At the Acute Geriatric Unit of the Clinical Hospital of University of Chile, an Occupational Therapist provides intervention to support the patients' process of functional and occupational recovery. This article contains a description of the Occupational Therapy treatment at the AGU and results in the functionality of a sample of 26 patients. **METHOD.** During august and december 2008, 26 patients with an average age of 83 years, received Occupational Therapy (OT) at the AGU. The intervention consisted on a daily 30 minutes session of individualized OT during the length of hospitalization. The Occupational Therapist also participated in medical meetings, and carried out educational and informative sessions wit most of the patients' family. **RESULTS.** From this sample, results can be resumed: When discharged, 18 patients increased the level of independence in Basic Activities of Daily Life (BADL) they had by the first day of hospitalization; 6 of them mantained the level of independence; and 2 of them decreased their independence in BADL. **CONCLUSIONS.** Hospitalization increases the possibility of functional loss in aged people and difficults reinsertion at home. From the analized sample, more than 50% of the patients could increase the level of independence they had. The intervention of an Occupational Therapist at the AGU, enables the aged patients to increase and mantain their level of independence in BADL at the moment of discharge.

**PB6 326 EFFECT OF PHYSICAL ACTIVITY COUNSELING ON DISABILITY AMONG OLDER PEOPLE: A 2-YEAR RCT**

M. VON BONSDORFF\* (University of Jyväskylä, Jyväskylä, Finland)  
R. LEINONEN(2), U. KUJALA(3), E. HEIKKINEN(1), T. TÖRMÄKANGAS(1), M. HIRVENSALO(4), M. RASINAHO(4), S. KARHULA(5), M. MÄNTY(1), T. RANTANEN(1) - (1) Finnish Centre for Interdisciplinary Gerontology, Department of Health Sciences, University of Jyväskylä (Jyväskylä, Finland); (2) GeroCenter Foundation for Research and Development (Kinkomaa, Finland); (3) Department of Health Sciences, University of Jyväskylä (Jyväskylä, Finland); (4) Department of Sport Sciences, University of Jyväskylä (Jyväskylä, Finland); (5) The Centre for Social and Health Services, City of Jyväskylä (Finland)

**Introduction** The aim of this study was to study the effect of a physical activity counseling intervention on Instrumental Activities of Daily Living (IADL) disability. Methods and materials The Screening and Counselling for Physical Activity and Mobility in Older People (SCAMOB) –project was a 2-year, single-blind, randomized controlled trial on the effects of individualized physical activity counseling on older sedentary people. The 632 participants (intervention group n=318 and control group n=314) were 75-81-year-old registered residents of the City of Jyväskylä, Finland. To be eligible, persons had to be able to walk 500 meters without assistance, be only moderately physically active or sedentary, have a Mini-Mental State Examination score >21, and have no severe medical contraindications for physical activity. The intervention group received a single face-to-face physical activity counseling session with supportive phone calls by a physiotherapist every four months for 2 years and annual lectures on physical activity. The control group received no intervention. The outcome was IADL disability defined as having difficulties in or inability to perform IADL tasks. Analyses were carried out according to baseline IADL disability, mobility limitation and cognitive status. Results At the end of the follow-up, IADL disability had increased in both groups ( $P<0.001$ ) and was lower in the intervention group, but the group by time interaction effect did not reach statistical significance. Subgroup analyses revealed that the intervention prevented incident disability among those without disability at baseline (risk ratio=0.68, 95% confidence interval 0.47-0.97), but had no effect on recovery from disability. Conclusions The physical activity counseling intervention had no effect on older sedentary community-dwelling persons with a wide range of IADL disability, however it prevented incident IADL disability.

**PB6 327 FRAILTY, FALLS, FEAR OF FALLING AND FUNCTIONALITY IN ELDERLY ASSISTED AT AN INTERDISCIPLINARY OUTPATIENT GERONTOLOGIC AND GERIATRIC CLINIC**

J. DOMINGUES DIAS\* (Universidade Federal de Minas Gerais, Belo Horizonte, Brazil)  
V. SANTOS BORGES(1), R. CORR A DIAS(1), R. ALVARENGA VIEIRA(1), P. MACHADO ARANTES(1), S. LANZIOTTI AZEVEDO DA SILVIA(1) - (1) Universidade Federal de Minas Gerais - Colegiado de Pós-Graduação em Ciências da Reabilitação (Belo Horizonte, Brazil)

The Frailty Syndrome is a condition associated with the vulnerability related to the aging process and with outcomes of health, such as falls, fear of falling and disability. The objectives of this study were to determine the frequency of frailty and to verify the

existence of correlation of that with falls, fear to falling and functionality in a group of elderly in a cross-sectional study in which elderly persons registered in a geriatric outpatient clinic were assessed according the frailty phenotype characteristics and for the outcomes: falls, fear to falling, functionality and socio-demographic data. Descriptive analysis of the sample identified 20% of frail, 46.7% of pre-frail and 33.3% of non-frail. There were significant differences between frail and pre-frail, and fragile and non-frail groups in relation to the functionality measured by the Lawton scale ( $p=0.000$ ;  $p=0.000$ ) and fear to falling evaluated by the Falls Efficacy Scale FES-I ( $p=0.011$ ;  $p=0.039$ ). There were a moderate and significant correlation between the FES-I scores and the number of falls and a moderate inverse significant correlation between the FES-I scores and the Lawton scores. The frailty frequency in the present study was greater than in previous ones and there were significant differences between groups according frailty classification, indicating that the most frail had greater incapacity for instrumental activities of daily living and more fear to falling.

**PB6 328 ADVANTAGES FOR SUBCUTANEOUS HYDRATION IN FRAGILE PSYCHO-GERIATRIC PATIENTS**

S. BERNADES\* (Germanes Hospitalàries S.S.M. Hospital Sagrat Cor, Martorell, , Martorell, Spain)  
M. MIRA(1) - (1) Germanes Hospitalàries S.S.M. Hospital Sagrat Cor, Martorell, (Martorell, Spain)

**Introduction:** Evaluate if hypodermoclysis (HDC) is a good alternative to treat fragile psycho-geriatric patients with dehydration due to acute processes. **Methodology:** It is a descriptive prospective study of 30 weeks duration, carried out in the psycho-geriatric and geriatric psychiatry units. All patients who needed subcutaneous hydration were included. **Results:** The total number of treatments was 41, carried out in 22 patients. The average age was 82 years old. Functional dependency measured by the Barthel index was of total or severe degree in 90% of the cases; mental dependency measured by MMSE was of total or severe degree in 68% of the cases. The reason for HDC indication in 80% of patients was the presence of dehydration associated to infection in 50% of cases. In a 15% of them it was caused by the denial of food with behavioural disorder. The clinical improvement of patients was related with the used analytical parameters (urea and creatinine in blood). For HDC physiological saline was used, with a volume oscillating between 1 to 2 litres/ day. The average duration of HDC was of 2,8 days with an interval of 1 to 5 days. The most used puncture area was abdomen (80,5%). Complications were only detected in 7,3% in an oedema, haematoma or pain form, always coinciding with subcutaneous hy on thighs. **Conclusions:** -HDC is highly indicated for psycho-geriatric patients with frequent behavioural disorders that need dehydration due to acute processes. -HDC is a very easily technique with few complications. Complications were only observed in 7% coinciding with subcutaneous hydratation on thighs. -The analytical renal function parameters confirms the duration and volumes necessary to

**PB6 329 REMOVAL OF URINARY CATHETERS IN OLDER'S WOMEN: A PROTOCOL USING PORTABLE ULTRASONOGRAPHIC DEVICE**

H. RIPAUT-CESBRON\* (CHU Hopital de l'Ermitage, Tours, France)  
V. DARDAINE-GIRAUD(1), M. LAMANDE(1), T. CONSTANS(2) - (1) Hopital de l'Ermitage (Tours, France); (2) Hopital Bretonneau (Tours, France)

**Introduction** The objective of this study was to evaluate a protocol using portable re-education device when removing urinary catheters from old women. **Methods and materials** All the women with urinary catheters admitted in the Geriatric Rehabilitation Unit of the University Hospital of Tours (France) from May 2005 to January 2008 were enrolled in the present study. The main outcome measures were: the age, the ground of admission, the impaired cognition – which was evaluated with the Mini Mental State of Folstein(MMS) -, the existence of an initial urinary retention higher than 700 ml, the length of re-education, the success or the failure of the re-education, and the number of urinary catheterizations avoided thanks to the ultrasonographic device. **Results** The average age of the sixty six patients included in the study was  $85 \pm 5$  years, and the average score to the MMS was  $20 \pm 6$ . The main admission grounds were osteoarticular (35%), cardiovascular (18%) and neurologic (12%) diseases. There was an initial urinary retention higher than 700ml for 28 (42,5%) patients. The average length of re-education was  $6 \pm 6$  days. The removal of the urinary catheter was a success for 57 (86%) old women and was independent of an impaired cognition (21 vs 17,  $p = 0.24$ ) as well as of the existence of an initial urinary retention higher than 700 ml. It was pointed out that the older the patients were the less successful the results were (85 vs 87,  $p = 0.043$ ). The number of urinary catheterizations avoided thanks to the ultrasonographic device was 844 that is to say a 1723 euro-material resource expenditure saving. **Conclusion** This protocol allows the nursing team to reach a consensual behaviour regarding urinary catheter removal.

**PB6 330 GERIATRIC-ORTHOPAEDIC UNIT: FUNCTIONAL AND RISK OF FALL ASSESSMENT OF PATIENTS INCLUDED IN A REHABILITATION PROGRAMME.**

L. VICH MARTORELL\* (Hospital General, Palma Mallorca, Spain)  
A. TRUYOLAS(1), F. ALBERTÍ(1), A. GALMÉS(2), J. CARBONERO(1), F. PALACIOS(1), L. FELIU(1) - (1) Hospital General (Palma Mallorca, Spain); (2) Servei Epidemiologia. Conselleria Salut. Govern Balear (Palma Mallorca, Spain)

**INTRODUCTION:** These units have considerable efficiency in functional gain of inpatients as well as in secondary prevention of fractures. A functional assessment of inpatients was developed in a geriatric-orthopaedic medium-stay unit and a risk of fall assessment at discharge after developing a specific rehabilitation programme. Inclusion criteria: early post-operative without complications, clinical stability. Exclusion criteria: severe previous functional damage, severe diseases. **METHODS AND MATERIALS:** Transversal study. Patients: those included in the programme between 2006 and 2008. Analysis: Age, gender, length of stay; previous Barthel index (Bip), at Admission (Bia) and at discharge (Bid), Functional gain (FG), Tinetti Assessment Tool at discharge (TATd), and Downton scale. **RESULTS:** 175 patients were included in the rehabilitation programme (72.6% of the initially admitted). Mean age: 79.2; 65.1 % women. Mean length of stay: 38.5 days. Diagnostics: hip fracture 70.8%, other diagnostics: 29.2 %. Functional indicators: Bip 81.2, Bia 30.1, Bid 67.6, FG 37.5, TATd 21.6/28 TATd <19: 39 patients (22.3 %), TATd 19-24: 85 (48.4%), TATd >24: 21 51 patients (29.3%) Downton 0-1-2: 22 patients (12.51%) Downton 3 or above: 153 patients (87.49%). Gait at discharge: walker 55.2%, cane 26.2 % without help 10.7 %. Not recovered 7.9%. **CONCLUSIONS:** The functional gain results show a slight dependence level (Bid 67.6) that allow most of patients to walk with or without help. The proportion of patients that do not recover gait is low compared to other series of the integral rehabilitation programme. The evidence provided by TATd shows a 70.7 % of patients with a high or medium risk of fall. This proportion is even higher when considering the Downton Scale. The gait assessment and the risk of fall are fundamental.

**PB6 331 EFFECT OF AGE ON PHYSICAL FUNCTION, EXERCISE PERFORMANCE AND DYSPNEA IN CHRONIC OBSTRUCTIVE PULMONARY DISEASE**

L. MACKIN\* (University of California San Francisco, San Francisco, United States of America)  
V. CARRIERI-KOHLMAN(1), N. STOTTS(1), W. GOLD(2) - (1) University of California San Francisco School of Nursing (San Francisco, United States of America); (2) University of California San Francisco Pulmonary Division (San Francisco, United States of America)

**Introduction:** Older adults with chronic obstructive pulmonary disease (COPD) experience both age-related and disease-related decline in pulmonary and physical function. Progressive dyspnea is a major symptom in COPD and is associated with decline in physical function. Self management programs for COPD that include exercise improve physical function and the intensity of dyspnea. It is not known if advancing age moderates the effect of programs on exercise and functional performance or dyspnea intensity. The purpose of this study was to determine if advancing age is a moderator of the outcomes of exercise and functional performance or dyspnea intensity following three different dyspnea self-management programs (DSMP) that varied only by the number of supervised exercise sessions. **Methods & Materials:** This is a secondary analysis of a 12-month, longitudinal, randomized-controlled trial. One hundred and three (103) participants with COPD (57 women; mean age 66 ± 8) were randomized to one of three groups: 1) DSMP with education and home walking; 2) DSMP plus four supervised treadmill exercise sessions or 3) DSMP plus 24 supervised treadmill exercise sessions. Outcomes were three measures of self-reported functional performance, incremental treadmill test performance and dyspnea intensity. **Results:** Age was a significant moderator of one self-reported physical function measure (role function), incremental treadmill duration and stage and dyspnea intensity during and after exercise. **Conclusion:** Advancing age was not a detriment to the effectiveness of the DSMP intervention. A more intense DSMP may positively influence or perhaps temporize age-related lung function decline in COPD patients. For role function and exercise performance outcomes, advanced age was associated with favorable and sustained improvements; this was not necessarily the case with a younger age prototype.

**PB6 332 DETERMINANT FACTORS FOR THE PHYSICAL-ACTIVITY LEVEL OF ELDERLY INDIVIDUALS IN A MEDIUM-SIZED CITY IN INNER SÃO PAULO STATE, BRAZIL**

C. JOSE EDUARDO\* (University of São Paulo State - UNESP, Botucatu, Brazil)  
J. CORRENTE(1), T. RUIZ(1) - (1) University of São Paulo State - UNESP (Botucatu, Brazil)

**Introduction:** Physical activity has been scientifically discussed and analyzed as fundamental for a healthy ageing process. This study aimed at evaluating the factors influencing elderly individuals to not perform physical and leisure activities in a medium-sized city in inner São Paulo state, Brazil. **Methods:** The complete IPAQ was applied to a population-based sample consisting of 364 elderly individuals in the city of Botucatu, São Paulo, Brazil. Such sample was obtained from a database of elderly individuals in the city by considering an unknown prevalence. Here, "walks" were considered to be mild physical activity, and the "days of activities developed during the leisure time" were considered to be moderate and intense ones. The number of days of physical activity was taken into account and logistic-type models for the data were fitted by including socio-demographic and life-satisfaction variables. **Results:** It was observed that 58.24% of the elderly individuals did not walk for at least 10 continuous minutes in their free time. 95.05% of the elderly persons did not perform physical activity requiring great effort and 93.13% did not perform moderate physical activity. For the fitted models, it was found that the unmarried

elderly individuals: OR=0.09, the oldest individuals: OR=0.91(CI) and those with the lowest education (OR= 0.36) were more likely to not perform physical activities considered to be intense. However, males (OR=0.24) and unmarried individuals (OR=0.25) were more prone to not perform physical activity considered to be moderate. Concerning walks as physical activity, no significance was found. **Conclusion:** A high level of sedentariness was observed among the elderly in relation to intense and moderate physical activity, and was associated with older age, not being married, being a male and having poor education.

**PB6 333 EXERCISE REHABILITATION TO HOME-DWELLING PATIENTS WITH DEMENTIA – A RANDOMIZED CONTROLLED INTERVENTION STUDY. PRESENTATION OF THE TRIAL DESIGN AND ITS FEASIBILITY.**

K. PITKALA\* (University of Helsinki, University of Helsinki, Finland)  
M. LAAKKONEN(1), M. RAIVIO(2), R. TILVIS(3), T. STRANDBERG(4) - (1) University of Helsinki (University of Helsinki, Finland); (2) The Social Insurance Institution of Finland (Lahti, Finland); (3) University of Helsinki (University of Helsinki, Finland); (4) University of Oulu (University of Oulu, Finland)

**Introduction:** Over 70 randomized controlled trials have investigated the effects of exercise rehabilitation among older people. However, the trials in dementia patients are still scarce. Intensive, long-lasting exercise may improve even physical functioning among older people. Exercise may also have favourable effects on behavioural and psychological symptoms of dementia (BPSD), and on cognition. The aim of this study is to investigate whether intensive, long-lasting exercise rehabilitation has effectiveness on mobility and physical functioning of home-dwelling patients with dementia. **Material and methods:** During years 2008-2010, patients with Alzheimer disease (n=210) living with their spousal caregiver in community will be recruited using central registers in Finland, and they will be offered exercise rehabilitation lasting one year. The patients will be randomized into three arms: 1)tailored home-based exercise (one hour) x2/wk 2)group-based exercise (four hours)x2/wk in rehabilitation center 3)control group with information of exercise and nutrition. Main outcome measures will be Guralnik tests and FIM-test to assess mobility and functioning, respectively. Secondary measures will be verbal fluency, NPI and Cornell, and RAND-36 to assess cognition, BPSDs, and QoL of caregivers, respectively. Data concerning admissions to institutional care and the use of health services will be collected during a two year follow-up. **Results:** By December 2008, 120 patients have been randomized. They will complete intervention by May 2009. Further 90 patients will be randomized by June 2009. Baseline data and preliminary results for the feasibility of intervention will be presented at congress. **Conclusions:** This is the first intervention study investigating the efficacy of intensive exercise on functioning of patients with dementia. If the intervention has efficacy on functioning and decreases the need for health services, it would have great significance for the care of these patients.

**PB6 334 CIRCUMSTANCES OF FALLS IN PATIENTS WITH PROXIMAL FEMUR FRACTURE**

A. MACHADO\* (University of São Paulo State - UNESP, Botucatu, Brazil)  
J. CORRENTE(1), G. PEREIRA(1), D. DINHANE(1) - (1) University of São Paulo State - UNESP (Botucatu, Brazil)

**Introduction:** Femur fracture is the worst consequence of osteoporosis due to its high morbidity and mortality. The majority of fractures occur after a fall. Several factors are involved in the fall, and being aware of the circumstance in which it happened is very important to improve prevention. The aim of this study was to evaluate the circumstances of falls in patients with proximal femur fracture at a medical school hospital in a medium-sized city in São Paulo state, Brazil. **Methods and Material:** Sixty-four patients (44 females and 20 males) with proximal femur fracture admitted to our hospital in 2008 were studied. Descriptive analysis was performed for the variables related to the circumstances of the falls. **Results:** The mean age was 80 years (SD, 8, range 60 to 98). Of the 64 patients, 8.1% had the fracture at dawn, 38.7% during the morning, 25.8% in the afternoon and 27.4% at night (before midnight). The most prevalent locations of the falls were the bedroom (37.5%), kitchen (20.3%), backyard (17.2%), bathroom (10.9%), sitting room (7.8%) and sidewalk (6.2%). The majority of the fractures were secondary to a fall (96.9%), and only two were spontaneous fractures (3.1%) followed by a fall. The causes of the fall were stumbling (28.3%), sliding (28.3%), leg weakness (23.3%), dizziness (13.3%) and other causes (6.7%). **Conclusions:** We conclude that it is important to focus on the morning and afternoon periods with preventive actions and on the use of safety devices in all locations, particularly in the bedroom and kitchen. We also conclude that situations leading to stumbling and sliding should be given careful attention.

**PB6 335 THE EFFECTS OF DELAYS IN COMMUNITY HOSPITAL TRANSFER ON INDEPENDENCE OUTCOMES FOR OLDER PEOPLE**

J. GREEN\* (University of Leeds, Bradford, United Kingdom)  
J. YOUNG(1) - (1) Academic Unit of Elderly Care and Rehabilitation, University of Leeds, Bradford Institute for Health Research, Temple Bank House, Bradford Royal Infirmary (Bradford, United Kingdom)

**Introduction** A multi-centre RCT of post-acute community hospital (CH) rehabilitation care for older people (JAGS 2007;55:1995-2002) provided an opportunity to investigate the effects on patient outcomes associated with delays in the time to CH transfer. We hypothesised that prompt transfer from the general hospital (GH) would be associated with better outcomes. Methods Medically stable patients needing post-acute rehabilitation care were randomised to CH transfer ( $n=280$ ) or to remain in GH elderly care wards ( $n=210$ ). The primary outcome was change in independence (Nottingham extended activities of daily living scale (NEADL)) baseline to six months. The effects of CH transfer times in patients treated as randomised were investigated: 1. Relationship: time to CH transfer and NEADL outcome. 2. Comparison: 'early' CH transfer (within two days), 'late' CH transfer (after two days), and control (remaining in the GH) groups adjusted for baseline variables. 3. Comparison: CH ('early' plus 'late') and GH groups, adjusted for baseline variables including time to transfer as a covariate. Results 1. A trend in the relationship between time to CH transfer and NEADL outcome: worse outcomes were associated with later transfers (Pearson's  $r = -0.140$ ;  $p=0.072$ ). 2. A significant difference between the three groups for NEADL outcome adjusted for baseline variables (ANCOVA  $p=0.016$ ). Post-hoc analysis of pairwise differences with Bonferroni adjustment showed a significant difference only between the 'early' transfer and control groups. 3. A significant difference between the CH and GH groups in NEADL change scores (adjusted mean difference 6.12; 95% CI 2.59 to 9.67; ANCOVA  $p=0.001$ ). Conclusion There was provisional evidence that time to CH transfer was associated with improved independence at six months: the sooner the patients were able to transfer, the better was their outcome.

**PB6 336 CHARACTERISTICS OF ELDERLY PATIENTS WITH HIP FRACTURE AND THEIR NEED FOR REHABILITATION**  
 A. RANHOFF\* (Diakonhjemmet Hospital, Oslo, Norway)  
 K. HOLVIK(1), M. MARTINSEN(1), K. DOMAAS(1), L. SOLHEIM(1) - (1) Diakonhjemmet Hospital (Oslo, Norway)

**Introduction:** Oslo, Norway has the highest incidence of hip fractures in the world. Hip fracture is a common cause of hospital admissions in the elderly. Orthogeriatric units combine geriatric and orthopaedic expertise. Early mobilisation, comprehensive geriatric assessment and planned discharge are important principles of care. In order to provide the best care, information about patients' characteristics is needed. Methods and material: An orthogeriatric unit for patients 65+ years with hip fractures was established in 2004. From 2007 data from routine assessment performed by the interdisciplinary team were collected to a patient database for quality improvement. Results: From January 2007 to November 2008, 735 patients, included 175 from long-term care institutions, were enrolled in the database. Mean age was 85.1 years, 77% were females and 85% had experienced in-door falls. Waiting time for surgery was 10 hours (25, 75 percentile 5, 19). Length of stay was 10 days (25, 75 percentile 4, 15 days). Chronic diseases were present in 89%, and 59% of those living at home had cognitive impairment. Postoperative complications were registered in 54%, the most common being need of blood transfusion, delirium and urinary tract infections. Prior to the fracture, 60% of home dwelling patients were independent in activities of daily living (Barthel Index 19-20), while only 16% at discharge. Conclusions: Patients in this orthogeriatric unit are old, with co-morbid disorders, cognitive impairment, and high risk of complications and decline in function. They are in need of comprehensive geriatric care. Many require further rehabilitation after discharge from hospital to regain their pre-fracture function.

**PB6 337 DIFFERENCES IN THE MOMENTUM DEVELOPMENT DURING SIT TO STAND TEST BETWEEN FALL AND NO FALL ELDERLY.**  
 S. CASTRO\* (Instituto Nacional de Geriatría, Santiago, Chile)  
 R. GUZMAN(1), A. ARANEDA(1), H. MELIAN(2), B. CORDIER(2) - (1) Universidad Santo Tomas (Santiago, Chile); (2) Instituto Nacional de Geriatría (Santiago, Chile)

**INTRODUCTION.** Rising from a chair (STS) is one of the most common tasks of daily life (Cahill 1999). The loss of the ability to execute STS, implies an important loss in functionality, being related with falls, crucial problem in elderly. The momentum developed on superior body (HAT), in the execution of STS could be related with a loss of balance under dynamic conditions determining higher risk of falls. The aim of this study is to quantify the differences in momentum development during STS in a sample of frequent fall (FFE) (two or more within a year period) and "non-fall" elders (NFE). **METHODS.** The sample consisted in elderly subjects ( $n=23$ ), divided into two groups of FFE and NFE. Criteria for exclusion used: severe dementia; Neurological illnesses; Musculoskeletal disabling pathologies; Vestibular alterations; Uncorrected visual pathologies; Obesity or malnutrition. The kinematics of the HAT during STS was registered through a motion analysis system (APAS). We calculate maximum values the vertical (↑), horizontal (↔) momenta, and the maximum (↑) and minimum (↓) angular momenta of HAT. Analysis variables were subjected to a non-parametric test to determine the possible differences among the groups. The level of significance used was of 95%. **RESULTS AND DISCUSSION** A significant difference was found for the variable of ( $p = 0.03$ ) between both groups. No difference was observed in ↑ and (↑ > 0.05). The main discovery was the poor capacity of elders with a frequent fall antecedent for the production of vertical momentum on the HAT during STS, in comparison with NFE. Our results showed that the low momentum production on HAT is a characteristic of the "fall" subjects.

**CONCLUSIONS** Therefore, the values of HAT momentum may be considered a better predictor of falls in elderly subjects.

**PB6 338 MEASURING FRAILTY: THE TILBURG FRAILTY INDICATOR (TFI) A TOOL TO IDENTIFY FRAIL COMMUNITY-DWELLING OLDER PEOPLE**  
 R. GOBBENS\* (Avans University of Applied Sciences, Breda, The Netherlands)  
 K. LUIJKX(1), M. VAN ASSEN(1), R. WIJNEN(2), J. SCHOLS(1) - (1) Tilburg University (Tilburg, The Netherlands); (2) Avans University of Applied Sciences (Breda, The Netherlands)

**Introduction** There is yet no uniform conceptual and operational definition of frailty, and the result is that frailty is measured in many ways. Most conceptual and operational definitions of frailty place heavy emphasis on physical losses in older people. However, more and more researchers are becoming convinced of the multidimensional and/or multifactorial nature of the concept of frailty. The aim of this study was to develop and test a user-friendly questionnaire for screening frail community-dwelling older people, including only self-reported information and which explores multiple domains of human functioning. **Methods and materials** On the basis of literature and after consulting representatives of professional disciplines the Tilburg Frailty Indicator (TFI) was developed. The first part of the TFI includes a list with ten determinants of frailty. The second part screens for losses in the physical (eight components), psychological (four components) and social (three components) domain of human functioning. The TFI was tested in a sample of 484 community-dwelling older people, 75 years and older. Results All results were obtained by regression analyses. The determinants explain about 35% of the variance of frailty. Controlled for other determinants, either a low or high income, an unhealthy lifestyle, and having at least two diseases predicted frailty. Interestingly, the effects of the determinants differed across domains of frailty; age predicted physical frailty, life events predicted psychological frailty, whereas being a woman predicted social frailty since elderly women have a higher probability to live alone. **Conclusion** Our finding that the effect of the determinants on frailty differs across domains suggests that it is worthwhile to distinguish the domains of frailty instead of just concentrating on frailty.

**PB6 339 THREE UNEXPECTED HAPPY END CASE REPORTS**  
 S. DA SILVA\* (Chu dijon, DIJON, France)  
 S. MARILIER(1), I. MARTIN-PFITZENMEYER(1), P. MANCKOUNDIA(1) - (1) Centre De Geriatrie Champmaillot Chu Dijon (Dijon, France)

**Introduction :** In clinical practice, geriatricians are often faced with life-threatening situations that at first glance seem to be hopeless. However, thanks to the use of meticulous procedures for diagnosis, such situations can sometimes have a favorable outcome, which leads practitioners to reconsider the fatalism often experienced in the treatment of elderly patients. **Methods:** This is a report of three clinical cases involving patients hospitalised in a Geriatric Internal Medicine (GIM) department. **Results:** The first case is that of an 88-year-old man transferred to the GIM department for the continued treatment of community acquired pneumopathy with hypoxemia that required intubation in a context of severe undernourishment (albuminemia 15 g/l). Faced with the persistence of bronchopulmonary symptoms despite several courses of antibiotic therapy, bronchoscopy was performed. It revealed the presence of a tablet in the inferior right lobe. Appropriate treatment was given and the patient recovered his initial level of autonomy and a satisfactory level of nourishment (Albuminemia 44.6 g/l). The second case concerns an 86-year-old woman hospitalised for cachexia with a major inflammatory syndrome. Radiography and thoracic tomodensitometry revealed nodular lesions suggesting metastases. Staphylococcus aureus was found in the bronchoalveolar lavage. After appropriate antibiotic therapy, the general health status of the patient progressively improved and pulmonary radiography returned to normal. The third case concerns an 84-year-old man hospitalised for a severe depressive syndrome with the loss of 80 kg in 4 years. After a number of investigations, ileo-caecal tuberculosis was diagnosed and anti-tuberculosis quadritherapy was implemented. Nine months later, the patient had put on 7 kg and the general physical state and mood were greatly improved. **Conclusion:** In Geriatrics, one must not be satisfied with appearances, but must persevere to obtain a diagnosis or try a test treatment.

**PB6 340 A LONGITUDINAL STUDY OF BONE STRENGTH AND PHYSICAL FUNCTION IN COMMUNITY-DWELLING AND INSTITUTIONALIZED ELDERLY**  
 T. KOMATSU\* (The University of Tokyo , Tokyo, Japan)  
 F. TOGO(1), H. PARK(2), T. MITANI(3), C. OKADA(4), Y. MUTOH(5) - (1) Japan National Institute of Occupational Safety and Health (Tama,Kawasaki, Japan); (2) Tokyo Metropolitan Institute of Gerontology (Itabashi,Tokyo, Japan); (3) Watanabe Hospital (Kamisu,Ibaragi, Japan); (4) Tokyo Koseinenkin Hospital (Shinjuku,Tokyo, Japan); (5) The University of Tokyo (Japan)

**Introduction:** Institutionalized elderly population has been increasing in Japan. The aim of our study was to evaluate bone strength and physical function in institutionalized elderly. **Methods and materials:** Our subjects were 65 community-dwelling elderly and 19 institutionalized elderly. The community-dwelling elderly participated in "Falls Prevention Program" in a hospital, but the institutionalized elderly did not. The program was twelve weeks class to maintain examines health condition, muscle strength, and physical ability of

participants through exercises. Bone strength and physical function were measured in all subjects before and after the program. Bone strength was assessed by a quantitative ultrasonic technique. Physical function was assessed by four tests: 10m-rapid gait time, maximum step length, 40-cm steps, and tandem gait. Differences in bone strength and physical function between groups were analyzed with unpaired t-test and analysis of covariance (ANCOVA). Partial correlations between bone density and changes in physical function were calculated after controlling for age, body mass index, and body weight in each group. The statistical package SPSS (Ver.15.0) was used for statistical analysis with 5% as the level of significance. Results: Body weight and bone strength decreased significantly ( $p < 0.05$ ) after the program relative to values before the program in the institutionalized elderly. A significant ( $p < 0.05$ ) negative correlation was observed between changes in body weight and changes in 10m-rapid gait time ( $r = -0.452$ ) or bone strength ( $r = -0.326$ ) in the institutionalized elderly. Conclusion: Decreased bone strength and physical deterioration were observed only in the institutionalized elderly. Our results suggest that the risk of fall and fracture might be higher in the institutionalized elderly compared to the community dwelling elderly. These might be prevented by improving nutrition and physical activity.

**PB6 341 THE INFLUENCE OF BODY MASS INDEX (BMI) OVER THE BONE MASS IN ELDERLY WOMEN.**

K. HELENA COELHO VILAÇA\* (University of São Paulo, Ribeirão Preto, Brazil)  
J. OLIVEIRA CARNEIRO(1), G. ARCARO DE LIMA(1), E. FERRIOLII(1), N. KILZA COSTA LIMA (1), F. JOSÉ ALBUQUERQUE DE PAULA(1), J. CESAR MORIZUTI(1) - (1) University of São Paulo (Ribeirão Preto, Brazil)

Introduction: Obesity and osteoporosis are chronic illness of high prevalence. Although not universal accepted, the obesity seems to be an osteoporosis protector agent. The aim of this study is to analyze the influence of the BMI over the bone mass in elderly women. Methods and Materials: 51 women over 65 years old were random selected to participate. The sample was divided according to the BMI classification by WHO: normal (N), overweight (OW) and obesity (OB) groups. The lumbar spine (L1-L4) and the total hip bone mineral density (BMD) were measured by the Dual-energy X-ray Absorptiometry (DXA). Statistic analysis: Fisher's exact test. Results: Volunteers mean BMI was  $28.4 \pm 5.7 \text{ kg/m}^2$ . In the N group (30%, n=15, age:  $69.7 \pm 4.6$ ) the normal BMD rates were 6.7% in the L1-L4 and 0% in the hip; osteopenia BMD rates were 60% and 80%, and the osteoporosis BMD rates were 33.3% and 20%, respectively ( $P < 0.01$ ). In the OW group (31%, n=16, age:  $69.2 \pm 4.9$ ) the normal rates were 25% in the L1-L4 and 50% in the hip; osteopenia rates were 37.5% and 37.5%, and osteoporosis was detected in 37.5% and 12.5%, respectively ( $P < 0.01$ ). In the OB group (39%, n=20, age:  $69.8 \pm 4.4$ ) the normal rates were 55% in the L1-L4 and 75% in the hip; osteopenia rates were 45% and 20%, and the osteoporosis was 0% and 5%, respectively ( $P < 0.01$ ). Conclusion: In this study, the elderly women with the higher BMI showed lower osteopenia and osteoporosis rates, both in the spine and the hip. These results suggest that, even in this group, the weight was a protector factor against the loss of mineral bone mass.

**PB6 342 DYNAMICS AND HETEROGENEITY IN THE PROCESS OF HUMAN FRAILTY AND AGING: EVIDENCE FROM THE U.S. OLDER ADULT POPULATION**

Y. YANG\* (University of Chicago, Chicago, IL, United States)  
L. LEE(1) - (1) University of Chicago (Chicago, IL, United States of America)

Introduction: This study investigated dynamics and heterogeneity of the frailty index (FI) conceived as a systemic indicator of biological aging in the community-dwelling older adult population in the U.S. Methods and materials: We used panel data on multiple birth cohorts from the Health and Retirement Survey 1993 – 2006 and growth curve models to estimate age trajectories of the FI and their differences by sex, race, and socioeconomic status within cohorts. Results and conclusions: The FI for cohorts born before 1942 exhibit quadratic increases with age and accelerated increases in the accumulation of health deficits. The average levels and rates of increment in the FI decrease in successive cohorts. Females, nonwhites, and individuals with low education and income exhibit greater degrees of physiological deregulation than their male, white, and high SES counterparts at any age. Patterns of sex, race, and SES differentials in rates of aging vary across cohorts. Adjusting for social behavioral factors, the analysis provides evidence for actual physiological differences in the aging process in recent cohorts of older adults, points to the need to seek biological explanations for female excess in general system damage, and reveals the inadequacy of any single mechanism for depicting the racial and SES differences in the process of physiological deterioration.

**PB6 343 WHICH IS MORE EFFECTIVE AT REDUCING FALLS AND IMPROVING QUALITY OF LIFE IN OLDER FALLERS? DOMICILIARY VERSUS CENTRE-BASED REHABILITATION.**

T. COMANS\* (The University Of Queensland, Brisbane, Australia)  
M. CURNIN(1), C. PETERS(1), S. BRAUER(1), T. HAINES(2) - (1) University of Queensland (Brisbane, Australia); (2) Monash University (Brisbane, Australia)

Aim: The Southside District Community Rehabilitation Service offers falls prevention programs to older community dwellers. This paper presents results from a RCT of the

effects of two falls prevention programs on falls rates, HRQOL, activity levels, physical status and depression. Method: Data has been analysed for differences in outcomes between participants undertaking a home based rehabilitation program and those undertaking a centre based rehabilitation program. Measures were taken at initial assessment and two follow up points – after an 8 week program and again at 6 months after initial assessment. Between group analyses was conducted using generalized estimating equations for normally distributed data and negative binomial regression for count data (e.g. falls). Results: Subjects presented with a wide range of issues in addition to falling including being outside normal weight range, incontinence and anxiety/depression. Physical skills were poorer than normal for age for walking, balance, strength, reaction times and hand function. The centre based service demonstrated significantly better results in preventing falls over the home based service. Clients in the centre based arm of the trial experienced less total falls and this group also had a greater reduction in the total number of fallers after the intervention. Quality of life, timed up and go and reaction times all improved in the group based intervention over the home based intervention however these did not reach significance. Activity levels were similar in both groups however depression scores as measured by the K-10 scale improved more in clients receiving the home based service. Conclusion: This research demonstrates that delivering a similar service in different settings – home based or centre based has implications for the effectiveness of the service as measured by changes in falls rates and health related quality of life. In addition this research shows that clients presenting with different types of co-morbidities such as depression may benefit from different service delivery models.

**PB6 344 THE ECCENTRIC STRENGTH TRAINING INCREASES CARDIAC SYMPATHETIC MODULATION IN RESTING CONDITION.**

A. TAKAHASHI\* (Universidade Federal de São Carlos, São Carlos, Brazil)  
R. MELO(1), R. QUITÉRIO(2), E. SILVA(3), E. TOBALDINI(4), A. PORTA(4), N. MONTANO(4), A. CATAI(1) - (1) Universidade Federal de São Carlos (São Carlos, Brazil); (2) UNESP (São Carlos, Brazil); (3) Universidade Metodista de Piracicaba (São Carlos, Brazil); (4) Università degli Studi di Milano (São Carlos, Italy)

Introduction: A decline in muscle force occurs with the aging process. The effect of eccentric strength training (ET) on the cardiac autonomic modulation is not clear. Methods and materials: The training group (TG) (9 men,  $62 \pm 2$  years) was submitted to ET (12 weeks, 2 days/week, 2-4 sets of 8-12 repetitions at 75-80% peak torque (PT) involving knee flexion and extension). The control group (CG) (8 men,  $64 \pm 4$  years) did not perform the ET. The cardiac autonomic modulation was evaluated by two symbolic indexes. The percentage of sequences characterized by three heart periods with no significant variations (OV%) and that with two significant unlike variations (2UV%) reflect changes in sympathetic and vagal modulations, respectively. Symbolic analysis was carried out over heart period variability series (around 200 cardiac beats) derived from ECG recordings during 15 minutes of rest in supine position. The unpaired and paired t-test was used in the statistical analysis. Results: ET increased the eccentric torque only for TG (TG:  $210 \pm 38$  to  $253 \pm 61$  and  $118 \pm 25$  to  $133 \pm 27$  N.m; CG:  $203 \pm 33$  to  $215 \pm 40$  N.m and  $126 \pm 20$  to  $135 \pm 26$  extensor and flexor PT respectively). There was a significant increase in OV% only for TG (TG:  $21 \pm 10$  to  $32 \pm 11$ ; CG:  $28 \pm 14$  to  $30 \pm 7$ ). The 2UV% declined in both groups (TG:  $21 \pm 11$  to  $15 \pm 10$ ; CG:  $17 \pm 10$  to  $12 \pm 5$ ). Conclusions: ET has improved the muscle force but had a negative effect on the cardiac autonomic modulation. The increase of symbolic index OV% reflects a shift of the sympathovagal balance toward a sympathetic activation. This fact has an important clinical impact on the elderly, because it can be associated with higher cardiovascular morbidity and mortality rates.

**PB6 345 INFECTIOUS DISEASES IN HOSPITALIZED ELDERLY PATIENTS IN BEHESHTI HOSPITAL OF KASHAN-IRAN 2007**

M. MOMEN HERAVI\* (Kashan university of medical sciences, Kashan, Islamic Republic of Iran)  
Z. SOLEYMANI(1), K. ESALATMANESH(2) - (1) 1 (kashan, Islamic Republic of Iran); (2) 2 (kashan, Islamic Republic of Iran)

Authors: Momen Heravi M, Soleymani Z, Esalatmanesh k Introduction: Elderly are the major and increasing portion of the world population. there are at increased risk for infection because of immunity and physiologic changes. Their mortality ,duration and cost of hospitalization are more than younger patients. This study was carried out to examine the common infectious diseases in elderly. Materials & Methods: This descriptive study was performed on 200 elderly patients( $\geq 65$ ) who hospitalized in infectious disease ward of Beheshti hospital in 2007. After history taking and physical examination laboratory test were requested. Clinical and Para clinical findings were entered in spss and analyzed. Results: 113 (56.5%) of patients were male and 87 (43.5%) were female. 65.5% were urban.the. The maen of age was  $75.7 \pm 5.97$ . 1.5% of them are above 90, 46% 75-90 and 52.5% 65-75 year.the rate of mortality was 2.5% and the most common cause of death was sepsis. The most common chief complaint and underlying disease was respiratory(24.5%) and hypertension 31.5% respectively. History of hospitalization was in 68.5% of patients.) The infections included: sepsis 29 (14.5%), COPD29 (14.5%), pneumonia 26 (13%), gastroenteritis 25 (12.5%), UTI 21 (10.5%), viral infection 12(6%), cellulitis12(6%), brucellosis 8 (4%), herpes zoster 6 (3%), prostatitis 4 (3%), TB 3 (1.5%) hepatitis 3 (1.5%), tracheobronchitis 3 (1.5%) Osteomyelitis 2 (1%), epididymoorchitis 2 (1%), cholecystitis 2 (1%), typhoid 1 (0.5%), non infectious 9 (4.5%) Conclusion: Sepsis was the

most common cause of admission and mortality in our patients. since the signs of sepsis in elderly is bland and pospond of treatment causes of dearh so the sepsis must be considred in differential diagnosis in any elderly patient with any change in functional state. Key word: Elderly,hospital,infectious diseasre

**PB6 346 GENDER DISPARITY IN HEALTH AMONG COMMUNITY-DWELLING CHINESE OLDER PEOPLE IN HONG KONG**

D. YU\* (The Chinese University of Hong Kong, Hong Kong, Hong Kong)  
D. LEE(1) - (1) The Nethersole School of Nursing, The Chinese University of Hong Kong (Hong Kong, Hong Kong)

**Background:** The gender differences in bio-psychosocial changes lead to the disparity in health between older men and women. Yet, Chinese older people have tended to be neglected in research on gender differences in health compared with the Caucasian population. This study compared the physical, psychological and social health between Chinese older men and women. **Methods and Materials:** This population-based survey was conducted in 1433 community-dwelling Chinese older people (mean age=75.6; 27% were male) in Hong Kong. The Short-Form 36 Health Survey, the Medical Outcomes Study Social Support Survey, the OARS Multi-dimensional Functional Assessment Questionnaire were used to assess HRQL, perceived social support, functional status, respectively. Data about stressful life event, life-style factors, chronic illnesses and somatic complaints was also collected. **Results:** The Chinese older men and women were similar in age but the later group was more likely to have no spouse ( $p<0.001$ ). The Chinese older men reported a higher perceived tangible support ( $p=0.003$ ) whereas women were more satisfied with their affectionate support ( $p=0.038$ ). Although there was no gender difference in the number of comorbidities and functional status, women reported more somatic symptoms including headache ( $p<0.001$ ), faintness ( $p<0.001$ ), stiff joint ( $p=0.002$ ), and chronic pain ( $p<0.001$ ) as compared with men. Chinese older women also reported poorer physical HRQL including physical function ( $p<0.001$ ), role physical ( $p=0.003$ ), bodily pain ( $p<0.001$ ) and general health ( $p=0.008$ ). No significant gender difference in mental HRQL was detected. **Conclusion:** The study reveal the poorer self-assessed health in Chinese older women even though there was only minimal gender difference in the objective health status. Promoting the health of Chinese older people may take into consideration such gender disparity.

**PB6 347 SELF-REPORTED HEALTH AS A PREDICTOR OF MORTALITY IN ELDERLY MEN LIVING IN A MEDIUM SIZE CITY IN BRAZIL**

L. SANTIAGO\* (National School of Public Health, Rio de Janeiro, Brazil)  
C. OLIVEIRA NOVAES(1), I. ECHEQUE MATTOS(1) - (1) National School of Public Health (Rio de Janeiro, Brazil)

**Objective:** To examine the role of self-reported health as a predictor of mortality in elderly men. **Material and methods:** The study population consisted of 2875 elderly men residing in a medium size city in Brazil, who were followed for two years or until the date of their death, whichever occurred first. Individuals alive at the end of follow-up were censored. The Kaplan-Meier method was used for an exploratory analysis of the data, comparing individuals with self-reported poor health conditions with those who referred good/excellent health, in different stratus of socio-demographic, life style and health-related variables, through the log-rank test, admitting significance level of 5%. Multivariate analysis was performed through Cox regression models. Variables presenting statistically significant associations with mortality in the bivariate analysis where entered into the models. **Results:** During the period, 120 deaths occurred in the study population, and cardiovascular diseases (40%), neoplasias (22%) and respiratory diseases (20%) were the major causes. Elders with self-reported poor health presented a greater risk of death, compared to those with self-reported good/excellent health in almost all stratus of the analyzed variables. In the final model, poor self-reported health ( $HR=1.88$  95% IC 1.29-2.72), age ( $HR=1.05$  95% IC 1.03-1.08), use of the public health services system ( $HR=1.69$  95% IC 1.10-2.60), current use of cigarette smoking ( $HR=1.94$  95% IC 1.24-3.04) and self-reported cardiovascular disease ( $HR=1.62$  95% IC 1.06-2.47) were independently associated to mortality. **Conclusion:** Self-reported health was a predictor of mortality in elderly men, in a follow-up period of two years. It is important that health care services incorporate this indicator in the health evaluation.

**PB6 348 GENETIC VARIATION OF CYP19 (AROMATASE) GENE INFLUENCES AGE AT ONSET OF ALZHEIMER'S DISEASE IN WOMEN**

R. CORBO\* (Sapienza University, Rome, Italy)  
G. GAMBINA(2), L. ULIZZI(1), E. BROGGIO(2), S. RENATO(3) - (1) Sapienza University (Rome, Italy); (2) Hospital of Verona, Division of Neurology (Rome, Italy); (3) CNR Institute of Molecular Biology and Pathology (Rome, Italy)

**Introduction.** There is evidence of a higher prevalence of Alzheimer's disease (AD) in women, but whether this is due to their longer life expectancy or to biological gender-specific risk factors is unclear. One likely contributing factor is the reduced neuroprotective action of estrogen following menopause. In this context a candidate gene for AD susceptibility is CYP19, encoding for aromatase, an enzyme that catalyzes the conversion of androgens to estrogens. **Methods and Materials.** With the present study we

analyzed the role of three CYP 19 SNPs (rs 12907866, rs17601241, rs4646) in AD development and their possible influence on quantitative traits reflecting disease severity such as age at onset (AAO) and cognitive decline. The analyses were carried out, besides the total sample (319 AD patients with and 110 controls), in men and women separately to reveal possible gender specific effects of CYP19 SNPs in women. **Results:** no significant association was observed between the three CYP19 SNPs and AD risk. Yet CYP19 genetic variation did seem to contribute to AD development in women as rs4646 genotypes were found to significantly affect age at onset of AD in female patients. More specifically the presence of rs 4646 T allele was associated with a reduction of AAO ( $p=0.01$ ), and its effect turned out to be independent from the similar effect determined by the presence of APOE e4 allele ( $p=0.005$ ). Also, being present only in parous women, the effect of rs4646 genotypes on AD onset age appeared to depend on past fertility ( $P=0.01$ ). **Conclusions:** Together with gender-specific factors such as parity, genes controlling estrogen metabolism may play a relevant role in AD susceptibility, suggesting a substantial biological basis for the higher prevalence of AD in women.

**PB6 349 EFFECTS AND COSTS OF TELEPHONE COUNSELING FOR OLDER ADULTS WITH BREAST LUNG OR PROSTATE CANCER**

B. DOWNE-WAMBOLDT\* (Dalhousie University, Halifax Nova Scotia, Canada)  
L. BUTLER(1), P. MELANSON(2), J. SINGLETON(2), J. KEEFE(3) - (1) University of Saskatchewan (Canada); (2) Dalhousie University (Canada); (3) Mount Saint Vincent University (Canada)

**Introduction** This longitudinal, randomized, controlled study determined the effectiveness and efficiency of usual medical cancer care versus usual care augmented by an individualized problem solving counseling intervention, provided over the telephone by registered nurses, for older persons with cancer of the breast, lung or prostate. **Methods and Materials** Of 175 older persons (mean age=62.3 years) who consented to baseline measures, 76 with breast, 49 with prostate and 24 with lung cancer completed the 8 month follow-up. The primary outcome measures were changes in the Jalowicz Coping Scale, the Center for Epidemiological Studies in Depression Scale and the Derogatis Psychosocial Adjustment to Illness Scale. In addition expenditures for use of all health and social services were computed at baseline and follow-up. Analyses of covariance were used to assess differences between groups in changes in coping, depression and adjustment scores. **Results** Poor psychosocial adjustment was related to depression and use of evasive coping. Greater annual health care expenditures were demonstrated by cancer clients with fair to poor adjustment to illness scores, compared to those with good adjustment. Among a group of older breast, lung and prostate cancer patients, telephone counseling promoted more favourable coping behaviours and prevented a decline toward more depressive symptoms compared to the control group at no further costs. **Conclusion** These findings are consistent with the most recent meta analysis of the effect of psychological interventions on anxiety and depression in cancer patients. This study has implications for the management of cancer between medical specialist visits, and in reaching older, rural persons with otherwise low access to counseling; especially those who live alone. Those who refused to participate were somewhat older than those who consented. Further research on telephone counseling should emphasize approaches to reaching clients in significant distress or risk circumstances following their cancer diagnosis.

**PB6 350 NOCTURNAL WANDERING AND COGNITIVE FUNCTION: CROSS-SECTIONAL AND LONGITUDINAL STUDY OF ELDERLY INPATIENTS IN FRANCE**

S. BANERJEE\* (Pôle pluridisciplinaire de Médecine, Grenoble, France)  
G. CORTE-FRANCO(1), F. STEENKESTE(1), P. COUTURIER(1) - (1) Clinique Universitaire de Médecine Gériatrique, Pôle pluridisciplinaire de Médecine (Grenoble, France)

**INTRODUCTION:** Abnormal nocturnal wandering is well known among the elderly having varying degrees of cognitive function, although its objective assessment using modern technology is seldom carried out. **METHODS:** Hospitalised elderly patients were monitored using eight passive infra-red sensors. Nocturnal patient activity (00:00-06:00) was captured by the sensors and stored as a data file. A validated algorithm analysed the stored data and estimated the duration of activity. Nocturnal activity was the outcome variable ( $N = 21$ ) measured in patients after  $\geq$  eight nights of hospital stay. The principal exposure variable was global cognitive function (Mini-Mental State Examination (MMSE)). Median nocturnal activity (seven consecutive nights) was modelled in a cross-sectional way to determine if cognitive function and other covariates were significant risk factors of high nocturnal activity. Nocturnal activity was also modelled in a longitudinal way to determine, in addition to the variables used for cross-sectional analysis, if nocturnal activity changed with time (over eight consecutive nights). **RESULTS:** Cross-sectional analysis revealed cognitively impaired group (MMSE < 25) had 6.1 (2.3-16.4, 95% CI) times the median nocturnal activity compared to the normal cognitive function group. Longitudinal analysis revealed that time (nights) was not significantly ( $P = 0.76$ ) associated with nocturnal activity in a model that included random-effects; no interaction was observed between time and cognitive function. Cognitively impaired group had significantly 3.4 (1.3-8.6, 95% CI) times nocturnal activity compared to the normal cognitive function group. Borderline significant inter-patient heterogeneity was noted ( $P = 0.05$ ). **CONCLUSION:** Poor cognitive function among the elderly is significantly

associated with abnormal nocturnal wandering in hospitalised patients, although short-term (eight days) treatment does not result in improvement of nocturnal wandering among such patients. Acknowledgement: GRECO, France Alzheimer, and AGRICA foundations financed this project.

**PB6 351** COLLEGE TECHNICAL DEGREE IN GERONTOLOGY APPLIED TO HOME HEALTH CARE, ACCESSIBLE TO ANYONE WITH AN INTERNET CONNECTION ANYWHERE IN THE WORLD.  
P. SIBOURG\* (CNED, Lyon, France)

Introduction The CNED ((National Centre for Distance Learning) offers health care professionals an exclusively online college technical degree. With this course students can acquire specific knowledge in gerontology applied to maintaining elderly people at home, without having to stop working. The diploma is issued by the Medical School of Claude Bernard University Lyon-1. Methods and materials Entry requirements: a Baccalaureat (A-level) or any equivalent. Duration: one year. Programme structure: 11 online units, each representing one credit. The course addresses the following topics: - gerontological context, - the dietary needs of the elderly, - incontinence, - accidental falls, - rheumatism, - hemiplegia, - Parkinson's disease, - Alzheimer's disease, - maintaining the elderly at home / admission to a nursing home, - high blood pressure, - the elderly person suffering from cancer. The programme employs a variety of teaching and learning methods, including illustrations, videos, and training exercises. The course has been conceived and supervised by a doctor and an epidemiologist, with the help of specialists in geriatric medicine. The assessment is composed of an MCQ on the Cned on-line platform. A result of 80% in each unit is required to obtain the degree after the examining board's final decision. Results Every year a hundred people study for this degree. The pass rate is 70%. The diploma benefits from Claude Bernard Medical School's name, which is a guarantee of quality.

**PB6 352** EFFECTS OF A ROBOTIC WALKING EXERCISE ON WALKING PERFORMANCE IN COMMUNITY-DWELLING ELDERLY ADULTS  
H. SHIMADA\* (Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan)  
T. HIRATA(2), Y. KIMURA(3), N. TAKAKO(2), K. KIKUCHI(2), K. ODA(4), K. ISHII(4), K. ISHIWATA(4), T. SUZUKI(1) - (1) Honda R&D Co., Ltd., Fundamental Technology Research Center (Wako, Japan); (2) Image Analysis Team, Biophysics Group, Molecular Imaging Center National Institute of Radiological Sciences (Wako, Japan); (3) Honda R&D Co., Ltd., Fundamental Technology Research Center (Wako, Japan); (4) Honda R&D Co., Ltd., Fundamental Technology Research Center (Wako, Japan)

Introduction: Reduced gait speed and stride length are characteristic of gait in elderly people and increase their dependency on assistance. We developed a robotic stride assistance system (SAS) to automatically control the walk ratio during walking. Our aim was to quantify the effects of a walking exercise with the SAS on walking performance and glucose metabolism during walking in community-dwelling elderly adults. Methods: Fifteen elderly women (72–85 years old) participated in this study. Subjects participated in a three-month walking program using the SAS, involving two 90 min supervised sessions per week. The SAS assists both flexion and extension of the subject's hip joints in a ballistic manner via electrical actuators equipped with angular sensors that monitor the cadence, angular velocity, and degree of extension and flexion of the hip joints. The SAS automatically manipulates the walking action to increase the walk ratio by increasing the degree of hip flexion and extension. We assessed walking for 5 m at a comfortable speed before and after the intervention. Positron emission tomography with [<sup>18</sup>F]fluorodeoxyglucose (FDG) was used to assess muscle activity during an unassisted 50 min walk. Results: Walking speed was improved by the intervention and FDG uptake by the gluteus minimus, gluteus medius, rectus femoris, and pelvic muscles (iliacus and gluteus muscles) was reduced. Conclusion: These results suggest that a walking intervention program using an applied robotic system is useful for improving the walking ability and the efficiency of muscle activities during walking in the elderly.

**PB6 353** DEVELOPMENT OF EQUIPMENT FOR TEMPORAL ORIENTATION  
M. GUIMARAES ASSIS TIRADO\* (Universidade FUMEC, Belo Horizonte, Brazil)  
M. TIRADO(1), A. OLIVEIRA(1), A. PERTENCE(1), L. PEREIRA(1), M. MANCINI(1) - (1) Universidade Federal de Minas Gerais (Belo Horizonte, Brazil)

Introduction: Impairment in temporal and spatial orientation is one of the most frequent symptoms of abnormality in brain function and can lead to a reduction in independence and autonomy in the performance of daily activities. Different approaches and methods are used in the rehabilitation of orientation deficit and often employ both electronic and non-electronic devices, such as alarms, calendars, day planners, etc. The aim of the present study was to develop appropriate technologies for the rehabilitation of individuals with temporal orientation deficit. Materials and Methods: Two pieces of equipment were developed separately: a calendar and a routine-structuring device. Two aspects were considered in the design of the calendar: 1) clear, easily visualized information; and 2) ease of handling. The routine-structuring device seeks to orient individuals with regard to activities they need to perform throughout the day. The equipment was evaluated by occupational therapists with regard to use, handling, suitability of the components and characteristics such as size and weight. The results of this evaluation directed the union of

the two devices and the development of a new version of the routine-structuring device. Results: The routine-structuring device functions as a calendar and helps in the organization of daily tasks, revealing the date and time, sounding an alarm at preprogrammed times and displaying (in writing) the activity to be performed. The equipment ended up being light, easy to use and of a low production cost. Conclusion: It is believed that the routine-structuring device could be a useful tool in the daily life of individuals with orientation deficit, enabling greater independence and autonomy in the performance of daily activities.

**PB6 354** HEALTH PROMOTION AND ELDERLY  
A. HAKIM\* (Jondishapur medical science university, Ahvaz , Islamic Republic of Iran)

Elderly biological phenomenon of natural and human development which is very slow and public all living things in it. According to predictions World Health Organization, in the year 2020 A. D. more than one billion people over 60 years. While the figure at the present 580 million. According to published Statistics from the registration organization the 4 million people equal to 6.6 percent of our population, over the seniors' constitute 60 years. With regard to the increasing elderly's percent of the population and important issue of senility phenomenon are involved in all societies also with insight that elderly is considered value. To prepare for the entire population of old age aspects should indivisibility of the policies of development of social-economic and with great efforts in all levels, local, today's suitableness family. As all aspects of life, including their participation in the development which determines the quality of life elderly's . Some aspects of this vital process include: economic security and the seniors' financial, health and continuing education, that these considerations, the general framework for action by governments in the seniors' issue. Conclusion: elderly kind of change and bring against the natural and tradition of God to be coordinated. The issue of the world that elderly for various reasons including the rate of birth, the progress of Medical Sciences, health, education and increase in the hope of living in the world has been mentioned. relatively new phenomenon. since this phenomenon in all aspects of human societies. Among the vast spectrum of the aging structures, values and the criteria and the creation of the Organization of the social changes have created a considerable brings. Therefore it can be with correct, policy making to elderly along with health and productive.

**PB6 355** A PILOT STUDY ON SELF-MEDICATION CARE OF COMMUNITY DWELLING ELTERS IN HONG KONG  
C. PANG\* (Hong Kong Polytechnic University, Kowloon, Hong Kong)  
W. CYNTHIA, L. CLAUDIA

Introduction : The majority of elderly people take drugs on a regular basis with the number of tablets increasing with age. Progressive cognitive impairment and physical function deterioration, contribute to medication non-adherence. Subsequent complications are having impacts on the cost of health care. Intervention to promote accessibility and drug knowledge may improve elders' drug adherence. Structural support, like organizing the drug and a reminder alarm, has shown a positive relationship. This study aims to identify factors contributing to medication non-adherence among the elderly and thereby contribute to the improvement of current medication devices. Methods : The data collection started in June 2007 and was completed in January 2008. The interviews were conducted in four residential areas, by face interviews using a semi-structured questionnaire. Focus group interviews were conducted to follow on the specificity of current medication devices. Convenience sampling was adopted to recruit fifty-six elders and thirty-one care-givers. Results : Forty-two respondents lived in public housing, while forty-five lived in private housing estates. Nineteen (33%) elderly participants self-reported having some visual impairment, and eight (14.2%) with some hearing loss. Eleven (19.6%) reported perceiving themselves to be in-need of assistance in activities of daily living (ADL). The number of tablets taken ranged from 1 to 10 tablets (mean = 3.59, SD = 2.39). There were twenty-three (31%) elders and twenty-four (27.6%) reported having forgotten to take the medication, citing reasons such as forgetfulness, being occupied or busy with others things, needing help, going out, and disease driven. Suggestions and opinions on the designs of the prototype of the medication device were collected and summarized. Conclusion : The results inform the production of the prototype of the new self-help medication device. Further accumulation of data will confirm the new features.

**PB6 356** SPORT TRAUMATISM AND QUALITY OF LIFE IN ELDERLY AND OLD PEOPLE

V. BENBERIN\* (Gerontology society , Almaty, Kazakhstan)  
S. TROFIMOVA(1) - (1) St. Petersburg Institute of Bioregulation and Gerontology (Russian Federation)

Traumatism in professional sportsmen has remote impact on quality of life in elderly and old age. The study was conducted to evaluate the adaptive capacities of the former sportsmen to everyday conditions. The studied group consisted of 56 people aged 56-84, who were professional sportsmen when young (masters of sports). Control group consisted of 61 people aged 62-87 who never went into sports. For evaluation of quality of life (QL) of the former sportsmen we made a questionnaire containing a set of questions showing the level of adaptation to everyday conditions. The questionnaire was based on the general

questionnaire "SF-36 Health Status Survey" and special questionnaire "VF-14 – Visual Function". The comparative analysis of the results showed lowered QL in all respondents, but self-appraisal of the former sportsmen was lower than in their peers of the control group. Thus, 82.1% of respondents of the main group considered their QL to be significantly reduced or strongly reduced, while in the control group only 44.3% of people considered their QL to be significantly reduced or strongly reduced. Low self-esteem of the former sportsmen depended on their incapacity for active physical activity. Multiple diseases of the musculoskeletal system, neurologic and visual disorders forced former sportsmen to spend most of their time at home. Hypodynamia was the main reason to changes in the life style, and thus to the further health worsening.

#### **PB6 357 THE YIELD OF ROUTINE EEG IN GERIATRIC PATIENTS**

Z. OURABAH\* (Hôpital Charles Foix, Ivry Sur Seine, France)  
V. NGUYEN MICHEL(1), Y. BOUDALI(2), A. GOURONNEC(1), S. ELWAN(1), G. MOTAMED(3), S. AL-RIFAI(3), C. SEBBANI(1) - (1) Hôpital Charles Foix (Ivry sur Seine, France); (2) La Collégiale (Paris, France); (3) Hôpital Emile Roux (France)

**Objective:** To study the yield of routine EEG in geriatric patients. **Patients and Methods:** We examined standard EEG recordings of 701 patients aged  $84.6 \pm 6.4$  years which were performed during a 15 month-period in a geriatric hospital. The majority of patients were hospitalised and 46.5% suffered from multiple medical problems. **Results:** We found EEG abnormalities in 392/701 (56%) patients which were subdivided into two groups: 1. Severe perturbations in 157/701(22.4%) patients consisted of permanent diffuse slowing alone (76.4%), or with intermixed epileptiform abnormalities (EA) (10.8%), triphasic waves (5.1%), status epilepticus (4.5%), periodic epileptiform discharges (2.5%), coma (0.6%) 2. Others EEG abnormalities in 235/701 (33.5%) patients consisted of seizure (1.2%), interictal EA (26%), focal slowing (46%) and intermittent diffuse slowing alone (26.8%). EA, observed in 92/701(13.1%) patients, were focal in the majority of patients (85.9%) and mostly of temporal localisation (42%) followed by centroparietal (20.2%), temporo-parieto-occipital carrefour region (17.2%), multifocal (10 %) but less frequent in frontal (6.3%) and occipital region (3.8%). Sleep activity without EEG abnormalities were observed in 96/701(13.7%) patients and non epileptic events in 5/701 (0.7%) patients. **Conclusions:** In this study, the yield of routine EEG in geriatric patients was highest for diffuse slowing suggesting encephalopathy and/or neurodegenerative disorders, followed by focal slowing and EA but very low for ictal epileptic events which mostly consisted in severe events of status epilepticus types. Routine EEG is not sufficient for the assessment of seizures and epilepsy in the elderly while video EEG monitoring is more adequate according to recent data of the literature.

#### **PB6 358 IN HOME TELEREHABILITATIONFOR POST-KNEE ARTHROPLASTY SURGERY: A PILOT STUDY**

M. TOUSIGNANT\* (Research Center on aging, Sherbrooke, Canada)  
B. PATRICK(1), M. HÉLÈNE(2), C. HÉLÈNE(1), C. FRANÇOIS(1) - (1) Université de Sherbrooke (Sherbrooke, Canada); (2) Université Laval (Québec, Canada)

**Purpose** - The purpose of this study is to investigate feasibility and efficacy of teletreatment as an alternative to conventional rehabilitation services following discharge from an acute hospital for a knee arthroplasty. **Method** - Four community-living elderly people were recruited for telerehabilitation services prior being discharged from an acute-care hospital. Telerehabilitation sessions with the participants were conducted by physiotherapists in a center of services to the home of the patient. The system used to support telerehabilitation services was built around network-attached remotely-controlled pan/tilt/zoom cameras with MJPEG compression, media displays. Once the patient returned home, an appointment was made for the independent research assistant to take the clinical measurements (T1). Five clinical variables were used (range of motion; lower-limb strength; balance; locomotor performance in walking and functional autonomy). In home telerehabilitation intervention was based on functional rehabilitation. A set of 10 exercises are adapted to the specific condition of the participant including increase of range of motion, strengthening lower limb muscles, balance and walking (inside and outside). 12 teletreatment was delivered at each of the patient. Before the patient was discharged from the in home telerehabilitation intervention, the same independent research assistant visited the subject again to take the T2 measurements. The satisfaction of the health-care professional was determined for each session with the homemade questionnaire. **Results** - Five subjects (3 men and 2 women) were recruited for this pilot study. Mean age was  $66.0 \pm 6.7$  years old. One participant was lost in the follow-up between T1 and T2. All five subjects improved on the five clinical variables. **Conclusion** - Telerehabilitation for post-knee arthroplasty is a practical alternative for dispensing rehabilitation services for patients discharged from an acute hospital.

#### **PB6 359 AGING DISABILITY AND OLD AGE DISEASES**

M. ADIB-HAJBAGHERY\* (Kashan university of medical sciences, Kashan, Islamic Republic of Iran)  
M. AGHAJANI(1) - (1) Medical univercity of Kashan (Kashan, Islamic Republic of Iran)

**Background:** The level of health has increased while the level of aging disabilities has decreased in western counties. Limited researches are available in this topic from the developing countries. This study was conducted to evaluate the disability and its relation to

chronic disorders of the old peoples. **Methods:** A descriptive study was conducted in Kashan, Iran. Data was gathered of a clustered sample of 350 elderly people over the age of 65 years. The WHODASII questionnaire (36 items in 5 likert scale format [with a sum score ranging from 0-144]) was used to assess the disability. A lower score was indicating of a higher disability. T-test and ANOVA were used for data analysis. **Results:** From a total of 350 elderly people, 61% were male. 19.14% of the sample had no diagnosed chronic disease. Of the other subjects, 50.53% had one disease and the others had two or more diseases (mostly including of cardiac, musculoskeletal, neural and respiratory disorders and hypertension). Elders with no chronic disorder had a mean score of 112.05 that indicated the low level of disability. The mean score of disability had decreased to 96.36 in elders with one disorder and to 81.40 in elders with two or more disorders. Elders with neural, musculoskeletal and cardiac disorders had more disability with the mean scores of 83.28, 86.50 and 95.61 respectively. A significant difference was observed between the elders with one and more than one chronic disease. **Conclusions:** More than 68% of the old peoples were suffering of one or more chronic disorder that can increase their level of aging disability. Developing a regular program for assessing the elders' health can help to early diagnosis of their diseases, improving their health and decreasing their level of disability.

#### **PB6 360 AN EXAMINATION OF THE MARKET POTENTIAL FOR AMBIENT ASSISTED LIVING TECHNOLOGY IN CANADA.**

S. ROBERT\* (Simon Fraser University, White Rock, BC, Canada)

**Introduction:** An Ambient Assisted Living (AAL) environment is an integration of stand-alone assistive technologies, with smart home innovation, and telecare services. The purpose of this integration is to provide individualized support services and health care to older people. Successful development of this emerging technology will promote the ability for older people, to live independently and age in place. **Methods and Materials:** Research was carried out as part of the European Commission's 6th Framework Programme SOPRANO Project. The strategy used to gather information concerned with the market potential for AAL technologies in Canada, was a case study design. A modified content analysis of government and corporate websites concerned with technology and/or aging in Canada was conducted. Additionally, telephone calls, using a snowball sampling technique were undertaken to contact key stakeholders. **Results:** AAL technology is not yet an active market in Canada. Therefore, extrapolation of historical data within similar Information and Communication Technology sectors, provides insight into the potential for AAL adoption in Canada. Key facilitators include the vast Canadian geography, and the number of older people living in remote and rural communities. The principle of universality in Canada's healthcare system bodes well for these technologies, as AAL has the potential to assist, in equalizing services to these communities. Barriers include fragmentation of the market, where in Canada, more than 100 different health authorities serve individuals across ten provinces and three territories. **Conclusion:** Under the domains of social care and housing, research suggests the market potential is low. The medical care, and informal care domains fared better, and market potential in these areas is considered to be medium.

#### **PB6 361 OBSTRUCTIVE SLEEP APNEA (OSA) IN ELDERLY PATIENTS**

X. LAM\* (Hôpital CHARLES FOIX, Ivry sur Seine, France)  
S. ROUHANI(1), L. LUCHON(1), D. DUSSER(1), S. MEAUME(2), A. DINH-XUAN(1), (1) - (1) Cochin Hopital (Paris CEDEX 14, France); (2) Charles Foix Hopital (Ivry-Sur-Seine, France)

**Introduction** The prevalence of OSA is high in adult patients, but its features in elderly patients have not been fully characterized. We have therefore studied 464 consecutive adult patients (age range: 19-86 yr-old) with suspected OAS. Results obtained from patients older than 65 yr were then compared with those obtained from younger patients (less than 65 yr-old). **Methods & Materials** We recorded polysomnography (PSG), body mass index (BMI), Epworth test (to detect diurnal somnolence), systemic blood pressure, and the occurrence ischemic heart disease and arrhythmias in all subjects. **Results** One hundred out of 464 patients were more than 65 yr-old. OSA was present in 76% and 89% in patients less than 65 yr-old and in elderly patients, respectively. Sleep-related disorders, including reduced sleep effectiveness and sleep total duration, and increased duration of stage 1 of sleep, were significantly associated with OSA in elderly patients. Arterial oxygen saturation was significantly reduced in elderly patients with OSA. By contrast, the risk of systemic hypertension was significantly greater in younger as compared with elderly patients with OSA, whereas this risk was the same with regards to BMI in both groups. The risk of ischemic heart disease and arrhythmias increased with age, but only in patients with OSA as compared with those without OSA. **Conclusion** Increased risk of systemic hypertension was only present in patients with OSA less than 65 yr-old, as a result of decreased arterial oxygen saturation related to apnea-hypopnea episodes. In elderly patients, increased prevalence of ischemic heart disease and arrhythmias associated with OSA was likely related to elderly rather than OSA itself. Finally, OSA significantly deteriorated the quality of sleep in elderly patients as compared with younger patients ( $\geq 65$  vs  $< 65$  yr-old).

**PB6 362 IS THERE PRIVACY IN HOME HEALTH CARE?**  
M. KINNUNEN\* (University of Turku, Kantvik, Finland)  
H. LEINO-KILPI(1) - (1) University of Turku (Turku, Finland)

**Introduction** The experience of privacy is important for patient's well-being. In home health care, research in privacy is rare. The purpose of the study is to find out 1) what is the realisation of the privacy in home health care, 2) what factors are connected with the realisation of the privacy and 3) what are the factors, which promote or impede privacy in home health care from the viewpoint of the patient in Finland. **Methods and materials** The study consists of three phases among the patients of home health care. In the first phase, the data ( $n = 28$  patients) was collected by thematic interviews in 2006 and was analyzed by means of an inductive content analysis. In the second phase, the questionnaire based on the results of the first phase was developed and content validity was estimated by nurses ( $n = 13$ ) in 2008. In the third phase, statistical data collection is under process, including first 60 home health care patients and after psychometric testing a larger national data of home health care patients ( $n = 450$ ). Results In the first phase results included factors promoting or impeding privacy in home health care were connected with the patient, nurse, patient-nurse, environment, organization, society and data-systems. Privacy was described as dimensions including physical privacy (own space, control and management), psychological privacy (integrity, own control and management), social privacy (domestic peace, social relationships, own control and management and informational privacy (personal information and confidentiality). Results are not yet available. Analysis of the data is in progress and results will be presented at the 19th IAGG World Congress of Gerontology and Geriatrics on July. **Conclusion** The findings offer a basis for planning and improving the ethical quality of home health care. Moreover, the results can be made use of nursing education.

**PB6 363 A RELATIONSHIP BETWEEN THE NIGHT-DAY LEVELS OF ACTIVITIES OF ELDER PATIENT IN A HEALTH SMART HOME**  
N. NOURY\* (Université Joseph Fourier, La Tronche, France)  
T. HADIDI(1) - (1) Lab TIMC-IMAG (La Tronche, France)

**I. INTRODUCTION:** The Health Smart Home has important application in Gerontechnology to address the problem of increasing rate in the elderly people. In this paper, a Health Smart Home called HIS [1] "In French: Habitat Intelligent pour la Santé" is used. It aims to evaluate the daily activities of an older patient, to find a relationship between day and night levels of his activities. **II. MATERIAL AND METHODS** The HIS was built, at the TIMC-IMAG Laboratory several years ago [2], equipped with presence infrared sensors and door contacts. The detected events are automatically collected and transmitted once a day by Email to a central data base [4]. The data is loaded in the Matlab™ environment to be converted into a preliminary matrix built with detection events. For further computation, data is formatted by time discretization, to the signal  $S(j,i)$ , which is transformed to  $S^*(j,i)$  by a "rectangularization" process [3]. Several parameters and indicators were elaborated, then normalized [value from 0 to 1] for the whole period, thus it is possible to proceed with data fusion techniques. **III. RESULTS** The experimental data belongs to an elderly person aged 86, suffering from congenital dysplasia with a reduced mobility, who spent 2 months in the hospital suite. We observed a strong disproportional correlation between day and night levels of activities, except in abnormal status. **IV. CONCLUSION** The evaluation of daily activity can be obtained with a simple set of PIR sensors. There exists multiple and complex relationships between the parameters of activity level, the health status and the self feelings of the person. This research aims at the automatic assessment of the daily activities of a person living independently in home.

**PB6 364 GERIATRICS RESEARCH IN TURKEY FROM A NATIONAL JOURNAL PERSPECTIVE 1998-2008**  
Y. GOKCE-KUTSAL\* (Hacettepe University, Faculty of Medicine, Sıhhiye, Ankara, Turkey)  
C. AKKOC(1) - (1) Technological Data Processing Department (Turkey)

**Introduction.** In this study, we aimed to assess Geriatrics research profile based on the evaluation of articles in Turkish Journal of Geriatrics (TJG) within the last 10 years. In the Turkish scientific literature, TJG is the only peer reviewed open access journal focused on elderly health in a multidisciplinary manner, cited in a number of national and international indexes. **Methods and materials.** TJG archive was searched between 1998-2008 based on type and number of articles, reference details, author profile. Differences from 1998 to 2008 were reported by these characteristics. **Results and conclusion.** 328 articles written by 1111 authors were published. Mean number of the authors per one article was 3.39. Total number of the references was found to be 6988. Mean number of references per one article was 21.3 whereas this number increases to 32 for review articles. References were less in number in 1998 (386) as compared to the 2007 data (814). Majority of the articles published in the journal was original researches (62.8%). Others were review articles (27.1%), case reports (4.6%), and editorials (5.5%). First three key words in the last 10 years were "ageing (88), "elderly (69), and geriatrics (45)". National literature findings were also assessed in order to improve the quality of research on ageing in Turkey. Mean percentage of citations to the Turkish authors (17.78) and to the TJG (3.22) were two important data which gave idea for the national strength and impact of the journal. In the

"National Impact Factor" list, TJG was in the first rank in 2004, 2005, and 2006. Improvement of researches in geriatrics should have been achieved in Turkey based on the rationale of the increase in aged population. TJG has provided the Turkish scientists a wide scientific discussion platform

**PB6 365 HUMANIZATION PROCESS IN ELDERLY PATIENTS ADMITTED IN THE INTENSIVE THERAPY UNIT**

T. BRUM\* (Hospital São José do Avaí, Itaperuna, Brazil)  
A. BRUM(1), L. COSTA(2), V. LOPES(3), M. BARROS(4), D. SUETH(5), M. VIEIRA(6), O. FAVORETO(7) - (1) Hospital São José do Avaí (Itaperuna, Brazil); (2) Hospital São José do Avaí (Itaperuna, Brazil); (3) Hospital São José do Avaí (Brazil); (4) Hospital São José do Avaí (Itaperuna, Brazil); (5) Hospital São José do Avaí (Brazil); (6) Hospital São José do Avaí (Brazil); (7) Hospital São José do Avaí (Brazil)

**INTRODUCTION:** Humanization, a philosophical theory which exalt human values, represents a challenge to hurdle the barriers of impersonality and glimmer the subject in a noble and more human way during one of its moments of more fragility and vulnerability. The Intensive Therapy Unit (ITU) is characterized by an interrupted rhythm, constant activity, lights, sounds and use of devices, provoking fear and anxiety, especially in elderly, as they are facing an unpleasant, stressing and traumatic atmosphere. It is from a great relevance the seeking of creating ways to promote love, comfort and harmony to patient, his family and interdisciplinary team, through technical able to humanize the Intensive Therapy Centers. **OBJECTIVES:** The present paper aims to report the process, used techniques and the results obtained from the humanization of the elderly patients admitted in the ITU of Hospital São José do Avaí, Itaperuna, Rio de Janeiro, Brazil. **MATERIALS AND METHODS:** Description of the humanization process of the Intensive Therapy Unit in Itaperuna, Rio de Janeiro, Brazil. **RESULTS:** During the period from July 2005 to December 2006, at the General Intensive Treatment Unit from Hospital São José do Avaí, Itaperuna/RJ, constituted of 11 beds, being 80% elderly patients, a multiprofessional team (medicine, physiotherapy, nursing and social service professionals) worked in the humanization process together with the patients in terminal phase and/or with an imminent risk of death. **CONCLUSION:** The ITU humanization process was important to improve the elderly patients' well-being, contributing to their recovery and reducing the necessity of chemical contention, with all advantages coming from this fact. Thus, the ITU environment humanization is a feasible process, which will benefit the patients and their families, increasing significantly the life quality promotion and the work conditions of the team involved.

**PB6 366 RAPID RESPONSE TEAM (RRT) IN INTRA-HOSPITALAR MEDICAL EMERGENCY CARE - AN OVERVIEW OF ELDERLY ASSISTANCE**  
V. MALULY FILHO\* (Hospital Quinta D'Or, Rio de Janeiro / RJ, Brazil)  
M. GUIMARAES(1) - (1) Hospital Quinta D'Or (Brazil)

**Introduction:** Studies have shown that a significant proportion of hospitalized patients present serious adverse events such as cardiac arrest(CA), admission to the intensive care unit and death not provided. These events are preceded by warning signals detected from 6.5 to 8 hours before the critical event. The benefits of implementing a RRT include the reduction of sentinel events, especially the CA and sequels, and hospital mortality, focusing on increase of survival after CA. **Methods/materials:** The reference hospital is a tertiary private service in Rio de Janeiro/Brazil, including 200 beds, with 59 intensive care, 35 intermediary care and the remaining units of admission. There is a group of trained doctors available to work per hole week and weekend, with a total of 21 professionals. The total care provided on average 1500 to 1800 calls per month. All staff was focusing on the concept of RRT that has a feature to work efficiently, effectively and multidisciplinary view of a sentinel event, triggered by the operating system of communication (radio/mobile branch), reaching criteria signs of severity, monitored by nurses. **Results:** The analysis made after the first three months showed a total of 59 patients with warning signals, mean age of 73yo, time for response of the BEEP(radio)-patient care was 2.47 min, 50% with oxygen desaturation ( $SpO_2 < 90\%$ ), followed by tachypnea ( $RF > 30$ ) and 56% needed transfer to a intensive care unit, including the 2 cases of CA. **Conclusions:** The introduction of new concepts is fundamental to the management of RRT as seems to be the key of security and monitoring for the elderly customers (progressive increase in our country and in our medical practice). More data must be obtained for show the increase long-term survival of this population.

**PB6 367 INCIDENCE AND ASSOCIATED CONDITIONS FOR NOSOCOMIAL INFECTIONS IN BRAZILIAN UNIVERSITY HOSPITAL**  
P. VILLAS BOAS\* (Botucatu Medical School, UNESP- São Paulo State University, Botucatu, Brazil)  
N. SERAFIM(1), M. SILVA (1), A. MONTELLI(2), A. MONDELLI(2), A. VALLE(2) - (1) Clinical Hospital of Botucatu Medical School, UNESP- São Paulo State University (Botucatu, Brazil); (2) Botucatu Medical School, UNESP- São Paulo State University (Botucatu, Brazil)

**Introduction:** Nosocomial infections are common in elderly inpatients. The objectives of this study were appraised incidence and associated conditions for nosocomial infections

(NI), and mortality attributable to such infections. Methods and material – A prospective study was performed with 28,189 elderly inpatients in Brazilian University Hospital according to NI and associated conditions, between 2002 and 2008. Standard definitions for infection and uniform reporting forms were used. Results – The incidence density and infection rates were 9.9 in 1000-patient days and 10.3% (3,028 episodes), respectively. The patient NI rate was 7.3% (2,054 patients). The prevalent topographies of NI were respiratory infection (33.7%), urinary tract infection (22.6%), surgical wound infection (12.8%) and skin and soft tissue infection (10.8%). The community infection (CI) rate was 20.9% (5,887 episodes) and its prevalent topographies were respiratory infection (30.9%), skin and soft tissue infection (24%) and urinary tract infection (21.7%). The mortality rate of the interned elderly patients was 10% and the lethality rate of the patients with NI was 38.2% ( $p = 0.00$ ; OR: 7.31; 95% CI: 6.61 – 8.09). The association conditions founds for NI were previous antibiotic use (in 48% patients), central catheters (35.9%) and respiratory ventilation (35.3%). The most used antibiotics for NI treatment were Cefepim (13.8%), Ciprofloxacin (10.8%) and Clindamycin (9.6%). Microbiological agents were isolated in 56% NI episodes and the most frequent were: Pseudomonas aeruginosa (14.8%) and Staphylococcus aureus (9.9%). IC microbiological agents were isolated in 1,397 episodes (26.1%) and the most frequent were: Escherichia coli (16.8%) and Pseudomonas aeruginosa (10.4%). Conclusion - NI presented elevated incidence and lethality of the elderly inpatients.

**PB6 368 PREVALENCE OF DERMATOPOROSIS IN GERIATRIC PATIENTS DURING SHORT- TO MEDIUM-LENGTH PERIODS OF HOSPITALIZATION**

A. SCHMITT\* (PFDc, TOULOUSE, France)  
V. MENGEAUD(1), C. VIEU(2), G. JOSSE(1), V. GARDETTE(3), B. VELLAS(2) - (1) Centre For Skin Research Pfdc (Toulouse, France); (2) Geriatrics Department Casselardit Hospital (Toulouse, France); (3) Unite Inserm 558 (Toulouse, France)

Dermatoporosis is a term recently proposed for the clinical signs and functional consequences of age-related extreme cutaneous fragility [1]. This term, proposed by analogy with osteoporosis, underscores the importance of employing preventive and therapeutic measures to avoid the complications of this pathology [2]. Study objective: To evaluate the prevalence of this pathology in geriatric patients during short- to medium-length periods of hospitalization. Material and methods: Cross-sectional, single-centre study to estimate the number of cases of dermatoporosis in patients hospitalized in 5 geriatric wards for short- to medium-length periods and to determine the factors associated with the presence of dermatoporosis. All patients in each of the wards taking part in the study (patients already hospitalized and new admissions) were monitored by the same dermatologist for a period of 1 month. Results: Each of the 5 wards was monitored for 1 month, yielding a total of 202 sets of patient data. Mean age: 83.4 years  $\pm$  7.25. Prevalence of dermatoporosis  $\pm$  95% CI: 32%  $\pm$  6.44. The lesions were localized on the forearms (77% of cases), legs (40%), and on the back of the hands (20%). In 82% of cases, the clinical severity of the dermatoporosis was rated stage 1 (atrophy, purpura, stellate pseudoscars). Factors significantly associated with dermatoporosis: age ( $p = 0.007$ ), chronic renal impairment (creatinine clearance < 30 ml/min) ( $p < 0.001$ ), confinement to bed (ADL < 2) ( $p=0.0293$ ). Conclusion: This is the first study measuring the prevalence of dermatoporosis in elderly patients and identifying the associated risk factors. The high prevalence of this pathology underlines the importance of conducting further studies to improve our understanding of its course and risk factors and to propose preventive therapies that would avoid the elevated comorbidity in an extremely frail elderly population. 1- Kaya G., Saurat J.

**PB6 369 THE USE OF POTENTIALLY INAPPROPRIATE DRUGS IN ELDERLY IN-PATIENTS**

J. JULIANA LOCATELLI\* (Hospital Israelita Albert Einstein, São Paulo, Brazil)

Introduction: As an adequate drug therapy can benefit and improve quality of life of elderly, the use of potentially inappropriate drugs (PIDs) may also be harmful by increasing risk of adverse reactions, increasing health expenditures, risk of hospitalization and mortality. This study objective was to evaluate the prevalence of potentially inappropriate drugs (PIDs) in elderly in-patients. Materials and methods. A transversal study at Albert Einstein Israeli Hospital wards in 100 elderly patients ( $\geq 60$  years old) with hospital length of stay from  $\geq 48$  hours to 30 days. For PIDs identification, modified Beers 2003 criterion was used. Results: 156 (62%) patients who have used at least one diagnosis- or condition-independent PIDs were found. Assuming exclusion of scopolamine, clonazepam, and flunitrazepam, which did not belong to the original Beers 2003 listing, 108 (43%) patients who have used at least one PIDs were found, with 28% being usually used. The most frequent diagnosis- or condition-independent PIDs was scopolamine (27.2%), followed by clonazepam (17.9%), and amiodarone (16.4%). The diagnosis-dependent PIDs was chronically used benzodiazepines associated to depression (47.4%). Conclusion: The present study has shown that the use of PIDs is usual in in-patients and the listing should be used as a guide of good practice rather than having a prohibitive character. This study will serve as a base for medical prescription intervention and

selection programs in order to warrant a safe and effective drug therapy for elderly inpatients.

**PB6 370 FUNCTIONAL DECLINE AND SELF-PERCEIVED HEALTH IN OLDER PATIENTS AFTER ICU STAY**

C. MAGNETTE\* (Université Catholique de Louvain, Jambes, Belgium)  
A. DIVE(1), C. SWINE(1), M. DE SAINT HUBERT(1) - (1) UCL Montgodinne (Yvoir, Belgium)

Introduction Intensive care population is growing old: this raises ethical questions and complex choices for the management of elderly patients admitted to the ICU. In this population, post-discharge functional status and quality of life are as important as conventional outcomes such as mortality. Methods and materials: Ongoing prospective cohort study including patients 80 years old and over, admitted to the ICU for at least 24 hours. Functional status was evaluated by both ADL and iADL before and three months after admission. At least one point decrease in the ADL or iADL scores defines functional decline. Self-perceived health was rated three months after ICU admission. Results Currently, 33 patients followed up to three months after ICU admission are included (mean age: 83 years), of which 51.5% females. Mean preadmission functional status is: 4.18/7 in iADL score and 5.54/6 in ADL score. Mortality is 21.2% (n=7). Among survivors, 20 (60%) experience functional decline. Among the decliners, 14 patients (70%) consider their health condition as worse than before their admission and 14 (70%) estimate themselves as in identical or better health condition than same aged peers. Eighteen patients (69%) would agree with a new ICU stay. Conclusion Initial triage process before ICU admission selects octogenarians with a good premorbid functional status. At the very beginning of our study, it seems that a substantial proportion of survivors present loss of function three months after admission. Accordingly, they have a poor self perceived quality of health but still consider themselves as in better health condition than same-aged peers. Further research will highlight progress of functional status and self perceived quality of health 6 and 12 months after ICU admission, and their interaction with other parameters measured during ICU stay.

**PB6 371 URINARY RELATED QUALITY OF LIFE AFTER MEDICAL AND SURGICAL TREATMENT IN WOMEN**

M. LAMYAN\* (Tarbiat Modares University, Tehran, Islamic Republic of Iran)  
M. SHAGERD HADDAD(2), R. MASSOMI(3), S. FAGHIIHZADEH(4), F. AHMADI(5) - (2) Marand Azad Islamic University (Tehran, Islamic Republic of Iran); (3) Tarbiat modares University (Tehran, Islamic Republic of Iran); (4) Tarbiat modares University (Tehran, Islamic Republic of Iran); (5) Tarbiat modares University (Islamic Republic of Iran)

Abstract Background and Aims: Urinary incontinence is the most common women's problem while increasing their age. This research will assess the urinary incontinence related quality of life after medical and surgical treatment in women . Methods: One hundred and seventy five women (mean age 46.27 years) affected by mixed urinary incontinence (50 in medical treatment, 50 in surgical treatment and 75 in control group), participated in 13.5 month prospected study in four educational hospital in Tehran. Quality of life was measured through interview and follow up using both generic (SF-36) and specific (I-QOL) questionnaires . Results:The specific quality of life measured showed significant improvement in 3rd and 6th month after medical and surgical treatment ( $p = 0.000$ ) From the SF-36 questionnaire after 3 month , all scores except 3 component scores, and after 6 month all scores except bodily pain score showed significant improvement ( $p<0.05$ ). There was no statistically significant difference between medical and surgical therapy before treatment and 3 month after treatment in the I-QOL and SF-36 scores. No significant difference was observed among therapy and control group scores before treatment, but after 3 and 6 month there was significant differences ( $p> 0.05$ ). Conclusion: Treatment significantly improves the quality of life of women suffering from mixed urinary incontinence , and this improvement raete is the same in medical and surgical therapy . Therefore it is better to consider medical treatment as a first priority. This will reduce problems resulting from hospitalization. Keywords :Quality of life, Urinary incontinence, Women

**PB6 372 HEALTH AND FUNCTIONAL STATUS AND UTILIZATION OF HEALTH SERVICES AMONG HOLOCAUST SURVIVORS AND GENERAL POPULATION**

E. IECHOVICH\* (Ben Gurion University, Beer Sheva, Israel)  
S. CARMEL(1) - (1) Ben Gurion University (Beer Sheva, Israel)

Introduction – many studies addressed the traumatic long-term effects of the holocaust. Only a paucity of studies examined the impact of the holocaust on the health and functional status of holocaust survivors and even less about patterns of utilization of health services. Results of a number of studies were found to be inconsistent. Methods and Materials – A national stratified random sample of 1225 respondents was selected from the Israel nation registrant. The sample included 3 age-groups: 65-74, 75-89, and 90+ of whom 452 were holocaust survivors. Referring to health status and use of health services was conducted by face-to-face interviews at the respondents homes, using a structured questionnaire. Results – Significant differences were found between survivors and general population in

perceived health status, morbidity, and functional status, with survivors reporting worse self-rated health, more morbidity and more difficulties in performing ADL and IADL compared to the general population. Multivariate analyses showed that after controlling for other variables, being a holocaust survivor was a significant predictor of health and functional status. Holocaust survivors visited their family physician and the nurses at the health clinics significantly more often and were more frequently hospitalized, but no significant differences were found between both groups in visits to specialists and emergency departments. Conclusion – The findings indicate that holocaust survivors are more vulnerable compared to the general elderly population, which might be connected to the trauma they had undergone. This suggests that professionals should be more aware and sensitive to their special health care needs. More research is necessary to identify the specific and special needs for health services in this high-risk group.

**PB6 373 MENTAL AND FUNCTIONAL COMPARISON FOR INSTITUTIONALIZED ELDERLY IN PUBLIC AND PRIVATE LONG-TERM CARE FACILITIES**  
**M. CONVERSO\*** (SÃO PAULO STATE UNIVERSITY - UNESP, PRESIDENTE PRUDENTE, Brazil)  
**N. COSTA ARROYO(1), F. AUGUSTO SCALET MEDINA(1) - (1)** São Paulo State University - Unesp (Brazil)

**INTRODUCTION:** The study aims to characterize and to compare public and private long-term care facilities for the elderly regarding their mental and functional capabilities. **METHODS AND MATERIALS:** The Mini-Mental State Examination (MMSE) and the Barthel Index were implemented in 151 elderly residents in three public and two private institutions in Presidente Prudente. Statistical analysis was performed using the descriptive method, the correction of Person and ANOVA test (Analysis of Variance between groups). **RESULTS:** It was observed that 59,13% of the elderly in public institutions are male and in private, 41,67%. Analyzing the level of schooling, 54,66% of the elderly in public institutions are illiterate and in private long stay institutions, 41,67%; in MMSE, 76,72% of the elderly in public institutions had cognitive deficit while in privates, 69,44%. According to Barthel Index, 75,65% of the elderly in public institutions were considered independent to conduct their daily life activities and in private institutions, only 27,78%. Thus, there is statistically significant difference between the two kinds of institution regarding the functional capacities ( $p < 0.0001$ ), but there is not in relation to mental status ( $p = 0.7669$ ). **CONCLUSIONS:** The data analysis allows us to conclude that the mental state is a crucial factor in the institutionalization of the elderly, both in public and private ILPs. However, we noticed that the families of higher socio-economic level usually intern their elderly when their functional status is also very compromised.

**PB6 374 HEALTHCARE COSTS FOR PEOPLE AGED 65+ TWO YEARS PRIOR TO THEM RECEIVING LONG-TERM MUNICIPAL CARE**  
**J. KRISTENSSON\*** (Lund university, Lund, Sweden)  
**I. RAHM HALLBERG(1), P. LUNDBORG(2) - (1)** The Vardal Institute, The swedish institute for health sciences (Lund, Sweden); (2) Department of Economics, Free University (Netherlands Antilles)

**Introduction:** More knowledge is needed about patterns of healthcare consumption in old age in particular with regard to the relationship between various agents in the health system. The aim was to investigate healthcare costs in the public medical healthcare system in men and women (65+) and with regard to age in the two years prior to the start of long term municipal care and services. The aim was also to investigate patterns and determinants of costs. **Methods and materials:** The study comprised 362 people (aged 65+) who received a first time decision about long-term municipal care or/and services during 2002-2003 and was drawn from the Swedish National Study of Aging and Care (SNAC). SNAC provided data about informal care, functional dependency and demographics at time for decision which was merged with data from the County Council patient administrative system regarding costs for inpatient and outpatient care the two years prior to decision. **Results:** A majority (58% for the women and 54% for the men) of the costs for acute inpatient care occurred within five months prior to municipal care. The men had significantly higher costs compared with women for inpatient care (EUR 4 700 vs. 700) and visits to outpatient physicians (EUR 700 vs. 400) the year prior to municipal care. A cluster analysis revealed 13% with overall higher healthcare costs. Those were more often married, men, younger and diagnosed with cancer, circulatory diseases or injuries. **Conclusions:** A share of 13% had higher healthcare costs throughout the two years. Those were more often younger, men, married and diagnosed with circulatory diseases, cancer and injuries. Those at risk of high healthcare costs should benefit from a systematic clinical assessment and a more proactive and integrated care to prevent escalating costs the period preceding long-term municipal care.

**PB6 375 DEVELOPMENT AND RELIABILITY OF A QUESTIONNAIRE FOR DESCRIBING RESIDENTIAL CARE FACILITIES FOR SENIORS**  
**C. LESTAGE\*** (Université de Sherbrooke, Sherbrooke, Canada)  
**N. DUBUC(1), G. BRAVO(1) - (1)** Centre de recherche sur le vieillissement CSSS-IUGS (Sherbrooke, Canada)

**INTRODUCTION:** In the province of Quebec, there is currently no official register of private residential care facilities (RCFs) that describe their physical and organizational

environments (e.g., rules, admission policies, staffing mix). Consequently, the choice of RCFs made by seniors, families and health care professionals is based on limited information. **METHODS:** We used a two-round postal Delphi survey based on the RAND/UCLA Appropriateness Method to identify characteristics of RCFs that need to be known to support the placement process of seniors. To assess the test-retest reliability of the questionnaire, 45 randomly selected RCF managers were invited to complete the questionnaire twice, one month apart. To calculate the inter-rater reliability, 40 randomly selected RCF managers were visited by a research assistant who fill out the questionnaire; the responses of the manager and the assistant were then compared. **RESULTS:** The Delphi process involved 48 experts who identified 131 characteristics as essential to describe RCFs. All retained characteristics were transformed into simple questions that can be answered by RCF managers. Those questions broadly describe staff, services and activities, organizational policies, neighbourhood, exterior, lobby, hallway and stairs, recreation area, dining room, apartment/room, bathroom, security aspects, and general information. The test-retest reliability for 81% of the characteristics and the inter-rater reliability of 69% of these were above 0.60; judged good to excellent. **CONCLUSION:** The reliability of the self-reported questionnaire proved to be satisfactory for most characteristics. Some questions were modified or withdrawn and a manual was developed to facilitate its completion. In fall 2008, a provincial census of 2139 RCFs was conducted with this questionnaire and manual. The main objective of the census is to develop a typology of private RCFs based on their physical and organizational characteristics.

**PB6 376 HOW TIME FLIES: EVERYDAY WORLDS OF NEW ZEALAND REST HOME DWELLERS**  
**L. KIATA\*** (University of Auckland, Auckland, New Zealand)  
**N. KERSE(1), S. KEELING(2) - (1)** University of Auckland (Glen Innes, Auckland, New Zealand); (2) University of Otago (Christchurch, New Zealand)

**Introduction** This presentation comes out of the doctoral study Everyday Worlds of Older People living in New Zealand Rest Homes. The study aimed to examine and understand the ways that older people living in 21 rest homes in two New Zealand cities go about their everyday lives. The study investigated the social construction of activity patterns and social links of residents within and outside the rest homes. Methods Quantitative and qualitative mixed-methods including semi-structured interviews and survey data were used as a research paradigm. Results Findings from the study challenge commonsense perceptions that rest home dwelling elders have 'all the time in the world' and are merely 'biding time' in what have been termed 'God's waiting rooms'. Given this, a study of older people's everyday rest home life must necessarily take the concept of time into account. In all its conceptual senses 'time' is said to be the most commonly used noun in the English language. Yet, it is extraordinarily difficult to discuss a commonsense concept like time because it is so clearly socially and situationally constructed. This presentation explains how participants offer a (mainly) positive representation of how 'life goes on' through active management despite limitations imposed by failing bodies and/or minds. **Conclusions** Participants are not apathetic elders sitting around with nothing to do. In contradistinction to this view this paper illustrates how participants actively 'take time' in day to day life to make sense and meaning of their everyday worlds through 'time spent' taking part in many social and physical activities.

**PB6 377 FACTORS RELATED TO NURSING STAFF'S FAILURE TO REPORT ELDER ABUSE IN LONG-TERM CARE (LTC)**  
**G. HAMEL\*** (CSSS Papineau: CHSLD Vallée de la Lièvre et Hôpital de Buckingham, Buckingham, Canada)

The aim of this grounded theory exploratory research was to describe the factors related to nursing staff's failure to report elder abuse. Using a snowball sampling technique and after reaching data saturation, the sample consisted of seven nurses employed in LTC facilities from the Montreal metropolitan region. Face-to-face audio taped interviews comprised of open-ended questions were conducted and verbatim data using constant comparative techniques were analyzed. Seven categories of factors emerged: past experiences, taking charge of the situation, organizational inertia, culture of silence, severity of abuse, desensitization and intimate interpersonal relationships. Findings strongly suggest that nursing staff's failure to report abuse is at the same time linked to several factors, is a shared responsibility within organizations, points to an apparent absence of ethics, and comprises an underlying emotional turmoil.

**PB6 378 INFLUENCE OF MODELS OF CARE AND STRUCTURAL EMPOWERMENT ON INDIVIDUALIZED CARE IN LONG-TERM CARE**  
**S. CASPAR\*** (University of British Columbia, Vancouver, Canada)  
**N. O'ROURKE(1) - (1)** Simon Fraser University (Canada)

**Objectives:** Implementing management initiatives that enable formal caregivers to provide quality, individualized care to older adults in long term care (LTC) facilities is increasingly important given that the number of LTC residents is projected to triple by 2031. The objective of this study was to explore the relationship between care provider access to structural empowerment and the provision of individualized care in LTC. **Methods:** Structural equation models (SEM) were computed separately for RNs/LPNs ( $n = 242$ ) and

care aides ( $n = 326$ ) to examine the relationship between access to empowerment structures (i.e., informal power, formal power, information, support, resources, opportunity) and the provision of individualized care. Invariance analyses were subsequently undertaken to determine if the association between empowerment structures and reported provision of individualized care differs between caregiver groups. Results: Access to structural empowerment had a statistically significant, positive association with provision of individualized care for both groups. For RNs/LPNs and care aides, empowerment explained 50% and 45% of observed variance in individualized care, respectively. These notable percentages did not significantly differ between caregiver groups. Discussion: Of the empowerment structures, support, especially in the form of access to educational opportunities and recognition for a job well done, seems to be particularly significant to care providers. Additionally, the variable informal power loaded across both latent variables (i.e., empowerment and individualized care) on the structural equation model computed for care aides, indicating that the quality of work relationships in LTC facilities may have a direct and meaningful influence on care aides' ability to provide individualized care. Findings from this study suggest that provision of individualized care in LTC may be significantly enhanced when formal caregivers have appreciable access to empowerment structures.

**PB6 379 THE ASSOCIATION BETWEEN A HIGH ELDERLY RISK ASSESSMENT INDEX SCORE AND THIRTY DAY HOSPITAL READMISSION.**

P. TAKAHASHI\* (Mayo Clinic, Rochester, United States)  
S. CRANE(1), C. STEPHEN(1), E. TUNG(1), G. HANSON(1) - (1) Mayo Clinic (Rochester, United States of America)

Objective: Identification of high risk nursing home residents for hospital readmission is an important task for healthcare providers in subacute long term care. The objective was to determine the relationship between a high score on the Elderly Risk Assessment (ERA) index and 30-day readmission to the hospital. Patients: All community dwelling patients over 60 years of age impanelled within primary care internal medicine on January 1, 2005 and admitted to a local nursing home from the hospital were included. This study occurred within a primary care internal medicine practice in Rochester, MN. Methods: This was a retrospective cohort study utilizing administrative data from a nursing home population. The primary outcome was 30-day hospital readmission rate from the initial admission to the nursing home. The predictor variable was the ERA score with the highest 10% considered the highest risk population. The ERA is based upon age, previous hospitalization and comorbid health status. Data analysis involved univariable comparison between ERA score and 30 day rehospitalization from the nursing home. Results: There were 12,650 subjects in the initial cohort of which 1914 (15.1%) were admitted to the nursing home. Of these 1914 nursing home residents, 347 subjects were readmitted within 30 days. Readmission was higher in the group with the highest ERA score (top 10%) with a relative risk of 4.54 (95% CI: 2.74-7.54) compared to the lowest scoring group. Discussion: Residents possessing high ERA scores have a four fold higher risk for 30 day readmission to the hospital. These findings suggest that the utilization of an electronic risk score can help identify patients at risk for 30 day readmission. Clinically, the identification of high risk individuals may be useful for future clinical interventions.

**PB6 380 PREDICTING MORTALITY OF OLDER RESIDENTS IN LONG-TERM CARE FACILITIES: COMORBIDITY OR CARE PROBLEMS?**

L. CHEN\* (Taipei Veterans General Hospital, Taipei, Taiwan)  
L. PENG(1), M. LIN(1), H. LAI(1), S. HWANG(1), C. LAN(2) - (1) Taipei Veterans General Hospital (Taipei, Taiwan); (2) National Yang Ming University (Taipei, Taiwan)

Introduction: Accurate prediction of life expectancy in long-term care facilities (LTCF) is important, but previous studies emphasized demographic characteristics, disease diagnosis or comorbidity. The purpose of this study is to evaluate the roles of geriatric care problems and comorbidity in predicting 12-month mortality in LTCF. Methods: Residents of Banciao Veterans Care Home were invited for study. Minimum data set (MDS) was implemented and resident assessment protocol (RAP) triggers were collected as the geriatric care problems. Comorbidity of the residents was evaluated by Charlson's comorbidity index (CCI). Results: 559 residents (mean age =  $80.9 \pm 5.3$  years, all males) were successfully followed and 50 residents (7.9%) died during the study period. Compared to survivors, dead subjects were higher in sum of RAP triggers ( $4.9 \pm 2.0$  vs.  $4.1 \pm 2.0$ ,  $P=0.004$ ), CCI ( $1.2 \pm 1.2$  vs.  $0.7 \pm 0.9$ ,  $P=0.014$ ), and were more likely to be hospitalized ( $1.6 \pm 1.9$  vs.  $0.4 \pm 0.9$ ,  $P<0.001$ ) and to visit emergency department ( $0.9 \pm 1.2$  vs.  $0.5 \pm 1.2$ ,  $P=0.012$ ). Moreover, dead subjects were more prone to suffer from cognitive loss, urinary incontinence, and behavioral symptoms than the surviving subjects ( $P$  all  $<0.05$ ). Cox proportional hazard model showed that both CCI ( $HR=1.44$ , 95% C.I.= $1.13-1.82$ ,  $P=0.003$ ) and sum of RAP triggers ( $HR=2.03$ , 95% C.I.:  $1.08-3.82$ ,  $P=0.028$ ) were significantly associated with 12-month mortality. Conclusion: Both geriatric care problems and comorbidity can significantly predict 12-month mortality in a veterans care home. Further intervention study is needed to evaluate whether elimination of these care problems can reduce the possibility of death in long-term care setting.

**PB6 381 TOWARDS CONTINUING NURSING CARE CONCEPTUALIZATION**  
J. TAVARES\* (Universidade de Aveiro, Coimbra, Portugal)  
A. SILVA

Introduction - The recent implementation of the National Integrated Continuing Care Network (NICCN) constitutes a new approach to nursing care for the elderly in Portugal. This network was established in 2006 and, therefore, research in this field is still scant. The main objective of this study is to contribute to a better conceptualization of Continuing Nursing Care (CNC) for the elderly within an Integrated Continuing Care Unit in Portugal's. Methodology - This is a descriptive-exploratory study of a qualitative nature. A total of thirteen nurses took part in the study, and the data were collected through semi-structured interviews which were audio-recorded with the participants' consent. Data were analysed using a hermeneutic-dialectic approach with the aid of the QSR Nvivo software application. Results - It was thus possible to conceptualize the CNC, demonstrating their: conceptual definition - as a continuous process, plural, complex and dynamic, targeted to people with limitations in the independence and/or autonomy, resulting from post-acute episodes of illness and that is expressed in the articulation and integration of the all dimension of care; general objective - promote independence and autonomy and specific objectives - CNC focus on the person and family/informal caregivers; reaffirm the potential of older people; building new(s) meaning(s) of living with the elderly; promote with the elderly, care of themselves; develop a multidisciplinary approach; and presuppositions. Conclusion - This conceptualization process and the philosophy of the Network itself are at a very early stage of development. Nevertheless the complex dynamics of CNC as well as its synergy with the whole NICCN are already clearly visible, and these factors are essential for their success. This study aims to improve the quality of CNC for the elderly in continuing care units and to encourage new research in and a further development of the concepts

**PB6 382 WHISTLING:AN UNUSUAL PRESENTATION OF ACUTE DYSTONIA**  
R. HAQUE\* (Michigan state university, East Lansing, United States)

82y/o caucasian female resident of a nursing home with a history of moderately advanced dementia, H.T.N and osteoarthritis hips. She was evaluated for "disruptive whistling" for three weeks. It was profound during dining hours. This behaviour caused "arguments and verbal agitation among other residents" around her. There were no other associated behaviours. She had good appetite. No recent falls or changes in cognitive status were reported. Bladder/bowel functions unchanged. Her medications included Acetaminophen/hydrocodone (500/5mg) twice daily. Aspirin 81 mg daily, Donepezil 10 mg daily, Colace 200 mg daily, Senna one tablet daily, Risperadone 0.5 mg po daily and Amlodipine 5 mg daily. She was stared on risperadone 2 months ago for agitation and disruptive behaviours at night, trying to get out of bed and yelling. Review of systems negative for acute cognitive changes. No pain was reported. She was pleasant and following simple commands. Osteoarthric changes with mild contractures of both knees noted. Functional status required moderate assist with transfers and activities of daily life.) No cough, wheezing or hoarseness. O/E; B.P 120/70, Heart rate 72/minute, afebrile, weight 150lbs, R/R 16/minute, pleasant and cooperative, Euthymic mood. following simple commands. Heart, lungs and abdominal exam normal. Neurological exam was negative for tremors. Musculoskeletal exam shows mild contractures both knees. Recent abnormal involuntary movement scale(A.I.M.S) was unremarkable. On observation whistling had expiratory character. Blood work and urine test negative Intervention; Risperidone was discontinued and the resident was observed closely. Results; Whistling disappeared in 2 weeks. Conclusion; Dystonic reactions of small muscles of face and orbit are not uncommon but difficult to assess. Even newer generation anti-psychotic and smaller duration and doses are capable of such reactions. New behaviours in dementia should be carefully evaluated.

**PB6 383 FAMILY FUNCTION AND CAREGIVER'S MENTAL HEALTH OF DEPENDENT RELATIVE**

P. ANIBAL\* (Universidad de Carabobo, Maracay Estado Aragua, Venezuela)  
A. PEREZ PEÑARANDA(1), L. GARCÍA ORTIZ (2), E. RODRIGUEZ SÁNCHEZ(2), A. LOSADA BALTAZ(3), N. PORRAS SÁNCHEZ(2), M. GÓMEZ MÁRCOS(2) - (1) Universidad de Carabobo (Maracay, Venezuela); (2) Unidad de Investigación la Alamedilla (Maracay, Spain); (3) Universidad Rey Juan Carlos (Spain)

Objective: To analyze the influence of family function on caregiver's perceived mental health. Design: Cross-sectional study Setting: two primary care urban health centres. Participants: 153 caregivers of dependent people. Measurement: sociodemographic variables from caregiver and dependent relative and psychoactive drugs prescribed to caregiver. Caregiver questionnaires: mental health evaluates with General Health Questionnaire (GHQ-12), family function with APGAR, and Duke-UNK functional social support questionnaire. Care-recipient questionnaires: cognitive disorders with Pfeiffer and functional dependence level with Barthel. Results: caregiver's mean age was 63.8 years old; 72.5% ( $n=111$ ) were female; 57.5% have primary studies; and 37.1% take psychoactive drugs. More than 40% of the care-recipients have cognitive disorders and 49.7% have total functional impairment. According to the GHQ-12, 27% of the caregivers had mental health disorders; 31.3% of the families were dysfunctional and 32.7% had poor social support. The variables that significantly contributed to the explanation of caregiver's

mental health have been: psychoactive drugs intake, family function, social support and educational level. Conclusion: Family function is an important predictor of caregiver's mental health. KEY WORDS: Caregiver. Dependency. Family function. Primary care

**PB6 384 WORK-INTEGRATED EDUCATION: PLACEMENT OF NURSING STUDENTS IN LONG TERM CARE FACILITIES**

R. LEE\* (The Hong Kong Polytechnic University, Hong Kong, Hong Kong)  
M. TSE(1), J. LIU(2), C. LAI(3) - (1) The Hong Kong Polytechnic University (Hong Kong, Hong Kong); (2) The Hong Kong Polytechnic University (Hong Kong, Hong Kong); (3) The Hong Kong Polytechnic University (Hong Kong, Hong Kong)

**Background:** In Hong Kong, as in Western countries, the number of elderly people is increasing. This situation is having significant impacts in health and social care. In particular the number of older people requiring residential long term care (LTC) is expected to grow. In light of the lack of clinical learning opportunities in LTC facilities for the pre-registration nursing students in our undergraduate programme, our research team proposed a work-integrated education (WIE) for students in a nursing home in 2008. **Objectives:** 1. To serve as a pilot for the School of Nursing (SN) in order to explore various issues involved in placing students in nursing homes, so that these issues can be addressed prior to the implementation of actual placements 2. To cooperate with nursing homes to provide learning opportunities for students, in order to prepare them for the care of LTC residents and their families, and possibly to foster their interest in a career in nursing homes and/or gerontological nursing 3. To explore various models of clinical supervision and identify the approach that is most facilitative to students learning Methods: It was a qualitative descriptive study. Focus group interviews were conducted with students and supervisors regarding teaching and learning. Results: Nursing students identified unique geriatric nursing roles within a multi-disciplinary working atmosphere. They also reported that they had gained awareness of current LTC practice and other social resources for older people. Students viewed the nursing home environment as a positive one conducive to facilitating learning about elderly care and gerontological nursing. Conclusions: Student placement in nursing homes has been found to have highly positive outcomes. Positive learning outcomes are vital to both widen and deepen students' nursing education. Thus, it will be beneficial to include LTC facilities as clinical placement venues in the undergraduate nursing programme.

**PB6 385 FOOT HEALTH PROBLEMS OF OLDER PEOPLE LIVING IN INSTITUTIONS - A LITERATURE REVIEW**

M. STOLT\* (University of Turku, Turku, Finland)  
P. VOUTILAINEN(1), H. LEINO-KILPI(2) - (1) Ministry of Social Affairs and Health (Helsinki, Finland); (2) University of Turku, Department of Nursing Science (Turku, Finland)

**Introduction** Over the next few decades, societies will be ageing fast posing a need to support the functional capability of older people. Functional capability can be affected by foot health problems, preventing older people from independent functioning. The aim of this study was to describe the foot health problems and their prevalence of institution-dwelling older people based on previous research. **Methods and materials** A literature search of the MEDLINE and CINAHL databases was made for 1980-January 2009, using the search terms: foot, problem, deformity, disorder, complaint, foot care and limits: age (65+) and English language. Included articles had to concern foot problems of older people living at institutions. Articles which dealt with foot problems of home-dwelling or references concerning diabetic foot care, foot surgery, wound care or an unscientific article were excluded. Different search term combinations resulted 1180 titles. Examining the titles, 114 references were selected. The abstracts of these were examined and 62 studies were selected. The final amount of selected studies for the review was 12, and it was based on full-text articles. **Results** Older people living in institutions have different foot health problems. Most (23-87%) have one foot health problem, but 14-53% of institution-dwellers are reported to have three foot health problems. Different foot structural problems are prevalent, most common are lesser digital deformities. Nail problems such as thickened toenails and onychomycosis affect 23-94% of institution-dwelling older people. Most prevalent skin problems are dry skin (14-98%). Conclusion: Institution-dwelling older people have multiple foot problems. Health care providers should pay careful attention to these problems. It is crucial to care for these problems and prevent the exacerbation of the problems. Untreated foot problems can lead to functional limitations and weaken older person's functional ability.

**PB6 386 MEASURING THE EFFECTIVENESS AND OUTCOMES OF AN ACTIVE REHABILITATION PROGRAM FOR STROKE CLIENTS IN A LONG TERM CARE SETTING**

M. LACROXI\* (Community Nursing Home, Pickering, Ontario, Canada)  
J. PRINGLE(1), P. NIPPAK (1), W. ISAAC(1) - (1) Ryerson University (Toronto, Ontario, Canada)

**PROBLEM:** There is currently no known study that looks at the benefits of having an Active Rehabilitation Program for stroke survivors in a Long Term Care Setting. This study measures the effectiveness and outcomes of an Active Rehabilitation Program for

**Stroke Clients in a long term care setting.** **METHODOLOGY:** A descriptive study was done using the Functional Independence Measure (FIM) tool as a quantitative measure to assess the level of functioning of stroke survivors who attended an Active Rehabilitation Program four to five times a week in group sessions. The study was conducted in a 218-bed long term care home located in downtown Toronto. The study involved 16 participants who had a history of stroke prior to admission to the program. The FIM scores were taken on admission to the program and again six months post-admission after the participant's involvement in the Active Rehabilitation Program. The overall FIM scores were evaluated along with the individual FIM scores on the sub-scales of eating and transferring abilities. **RESULTS:** Two ANOVA statistical analysis tests and a T-test were done using sex and the number of group sessions as variables. The Anova tests showed no statistical significance, a statistical significance was noted in the T-test results. A statistically significant value  $p < .05$  was noted in the areas of the overall FIM scores ( $p < .01$ ); the sub-scales of eating score ( $p < .05$ ) and the bed-chair score ( $p < .05$ ). **CONCLUSION:** The results of the study supported that an Active Rehabilitation Program in a long term care setting has a positive effect on the elderly client's activities of daily living functioning. The effects were seen within the first six months of starting treatment in the program with participants maximizing their overall FIM scores up to 152% post-treatment.

**PB6 387 MEDICATION IN ACCOMMODATION INSTITUTIONS FOR THE ELDERLY: HOW TO RECONCILE ECONOMICAL RESTRAINTS, GOOD PRACTICE AND GALENICAL CONSTRAINTS**

L. LENFANT\* (EHPAD Champmaillot, Dijon, France)  
F. MUGNIER(1), V. JOST(2), C. SGRO(3) - (1) EHPAD champmaillot (Dijon, France); (2) CHU bocage service pharmacie (dijon, France); (3) CHU bocage service de pharmacovigilance (dijon, France)

**introduction** Actual economical restraints and the latest regulation texts concerning EHPAD (établissement pour Personnes Âgées Dépendantes equivalent to long term care) in France entice professionals to reflexion on the good clinical use of medication. The objective of this study was to create a simplified list of medications with galenical presentations adapted to very aged multipathological patients. **Methodology:** This work was conducted in an EHPAD consisting of 7 units of 40 beds each with 3 prescribing hospital physicians. First, an inventory of all available medications was performed. Then this list was divided following the major pharmaceutical classes, in accordance with the recommendations concerning healthcare for the elderly above 80 years of age (Haute autorité de santé-Hight authority of healthcare-, scientific societies, specialised journals...). At this stage of our work, a minimal list by speciality was elaborated with the collaboration of the pharmaceutical department of the regional teaching hospital, taking into consideration cost and galenical forms that were requested. This list and the treatment guidelines issued from it are accessible to all physician via the computer network. **Conclusion:** This work will enable to standardize the contents of medication cabinets of the 7 units and also presumably the physicians' prescriptions and make information easily accessible. Moreover, the availability of adapted galenical forms enabled by crosswise implications of physicians and pharmacists should stop pill-crushing or capsule-opening practices which were responsible for the decrease of efficiency of these treatments.

**PB6 388 SOCIAL INTERACTIONS, BODY IMAGE AND ORAL HEALTH AMONG FRAIL INSTITUTIONALIZED ELTERS**

L. DONNELLY\* (University of British Columbia, Vancouver, Canada)  
L. HURD CLARKE(1), A. PHINNEY(2), M. MACENTEE(3) - (1) University of British Columbia (Vancouver, Canada); (2) University of British Columbia (Vancouver, Canada); (3) University of British Columbia (Vancouver, Canada)

**Introduction:** The extant research indicates that a positive body image is linked to increased social contacts, as well as improved health, well-being and quality of life irrespective of age. However, the extent to which oral health and diseases influence body image and social interactions amongst frail elders in care facilities is unknown. A preliminary study of these relationships suggested that oral health may have an important influence on the body image and social interactions of institutionalized elder women. The current study has expanded this investigation to explore these relationships within a more diverse group of frail elders. The research question underlying this study is "how are the social interactions and body image of institutionalized frail elders influenced by perceived oral health and disease?" **Methods:** Open-ended interviews were conducted with a purposefully selected group of cognitively intact, frail institutionalized elders who exhibited varying degrees of social engagement and oral health conditions. The narratives were analyzed using a constant comparative technique, and second interviews with the participants were conducted to check trustworthiness of the analysis. **Results:** Five major themes emerged: 1) culture of the environment; 2) influence of disability and social context; 3) embarrassment; 4) importance of a "nice smile"; 5) and life priorities. **Conclusions:** Poor oral health can embarrass frail elders and lead to altered body image, avoidance of social situations and reluctance to seek care. Consequently, the psychosocial impact of poor oral health needs more careful consideration to help sustain social interactions and quality of life for elders in care facilities.

**PB6 389 DIETARY AND FLUID INTAKES OF OLDER ADULTS IN CARE HOMES REQUIRING A TEXTURE MODIFIED DIET**

E. BANNERMAN\* (Queen Margaret University, Edinburgh, Musselburgh, United Kingdom)

K. MCDERMOTT(1) - (1) Queen Margaret University, Edinburgh (Musselburgh, United Kingdom)

Introduction Texture modified diets (TMD) are often prescribed for individuals with dysphagia as part of its clinical management. Often these individuals present with poor appetites. This along-with the need for the addition of fluid to foods to achieve the desired texture means intakes may be compromised. The present study aimed to evaluate and compare energy, protein, fibre and fluid intakes of a care home population consuming a TMD with those on a standard diet and evaluate the role of snacks in individuals' diets. Methods and materials Thirty individuals (n=15 Standard diet; n=15 TMD) from three care homes in Scotland were recruited. Dietary intakes were assessed using a three-day weighed plate-wastage method. All snacks and drinks consumed were observed and recorded and then weights of standard portions and volumes were used to determine actual amounts consumed of these items. Estimated intakes were converted to energy and nutrient intakes using WinDiets Dietary analysis software. Results Residents on a TMD had significantly lower intakes of energy (1312 (326) kcal versus 1569 (260) kcal, p<0.024), NSP (6.3 (1.7)g versus 8.3 (2.7)g, p<0.02) and fluid (1196 (288) ml versus 1611 (362) ml, p<0.002) when compared with residents on a standard texture diet. Snacks provided significantly less energy (13% or 173 kcal versus 22% or 343 kcal, P = 0.001) and NSP (p<0.001) in those requiring the TMD. Conclusion These results suggest that dietary and fluid intakes of older adults in care homes requiring a TMD are significantly less than individuals on a standard texture diet. These are unlikely to be meeting individuals' dietary and nutritional needs. Strategies that maximise provision of appetising energy and nutrient-dense foods (including snacks) & fluids of suitable textures require further investigation.

**PB6 390 A COMPARISON OF CANADIAN ALTERNATE LEVEL OF CARE (ALC) PATIENTS TO ELDERLY HOME CARE CLIENTS USING THE RAI-HC TOOL**

N. JUTAN\* (University of Waterloo, Waterloo, Canada)

A. COSTA(1), J. HIRDES(1), J. POSS(1) - (1) University of Waterloo (Canada)

Introduction: Elderly hospital patients who no longer require acute care, but cannot be discharged due to the lack of post-hospital resources are a significant concern for international health care systems. In Canada, these patients are labeled "alternate level of care" (ALC). ALC has been partly implicated in the overcrowding of emergency departments, increases in surgical cancellations, as well as health system financial risk. In Canada, approximately 60% of ALC patients are waiting for a nursing home bed. For these ALC patients, community care is thought to be a viable alternative placement. However, little is known about the ALC patient population in Canada. The aim of this research was to describe the ALC population in the province of Ontario using clinical items and scales embedded in the RAI-Home Care (RAI-HC) assessment instrument and compare them to that of elderly community clients. Methods and Materials: Analysis was conducted on a one year sample (2007-2008) of ALC patients and home care clients over 65 years of age collected in Ontario, Canada. The total sample included 153,048 individuals: 15,145 ALC patients waiting for nursing home placement; and 137,903 long-stay home care clients. Results: Numerous demographic and clinical factors distinguish the Ontario ALC and long stay home care population. Overall, ALC patients are more clinically complex and have higher caregiver burden relative to the home care population. However, summary results indicate that there is a substantial sub-group of ALC patients that share a similar clinical profile with elderly long stay home care clients. Conclusions: ALC patients have complex needs that require different approaches to care. Understanding such differences can inform new approaches and care options that meet the needs of ALC patients. Funded by the Change Foundation; Toronto, Canada.

**PB6 391 EMPLOYEE ENGAGEMENT, MONTHLY CELEBRATIONS, SMILES AND FUN, LIGHTS UP THE ROOM**

Y. HANEY, RN, MN, GNC(C)\* (Fraser Health Authority, Langley, Canada)

Inflexible routines, often time rigid, based on a medical and nursing model of care, has traditionally been the norm in long term care facilities. Residents viewed as bedridden or shut-in required hands on care with all aspects of daily activities. Long term care is rapidly changing, as is the resident population. Now preferred is a social atmosphere in a home-like environment that has staff engaged and involved in the residents quality of life. In late 2007 Fraser Health collaborated with The Gallup Organization conducting a Q12 Employee Engagement Survey which measures questions that Gallup's extensive research worldwide has identified as the best indicators of high performing workplaces. In early 2008 Terms of Engagement author Dick Axelrod facilitated a three-day workshop for "organizational barn raising". Teams were focused and the working environment encouraged spirited involvement with remarkable projects occurring. Our team of ten Rosewood/Marwood staff, through lively dialogue determined that an event for the residents was an action plan that would derive satisfaction from a job well done. But the event needed to be the staffs event and a well-designed monthly birthday celebration for the residents was the outcome. The results have been phenomenal! Our first party in May

was a bit shaky but our celebrations have evolved into a major monthly social event. The introduction of music, with maracas for every resident, visitor and staff member, now shakes the walls. Staff remain or come in to facilitate the party, the residents look forward to the third Friday of the month and the parties are getting livelier and longer. When asked what is the satisfaction of this staff engagement event many will respond that the smiles of everyone, especially the residents having such a good time lights up the room.

**PB6 392 I WANT TO STAY IN MY OWN HOME: WHO'S GONA TAKE CARE OF ME?**

S. DUARTE\* (ESCOLAS SUPERIOR DE ENFERMAGEM DE COIMBRA, COIMBRA, Portugal)

A. COSTA(1) - (1) ESEP (Oporto, Portugal)

Home care has always been an important subject in nursing care. The practices associated to home care have been changing dramatically in the last decade, driven, for example, by profound changes in patient clinical complexity, increase of early discharges from the hospital of patients still requiring a great amount of care and, specially, because of aging population. At present, different teams, often with different goals, provide home health care and it is therefore important to ensure the continuity of care. The nurse seems to be the professional best placed to assume the leadership of the process of continuity. As part of PhD achievement process we are conducting a study to identify the nurse's role in that environment of health care, with Symbolic Interactionism as theoretical framework and Grounded Theory as methodology. The research takes place in a Portuguese town with a newly program of Continuous Home Health Care performed by a multidisciplinary team under the management of the nursing staff. This program intends to support old people where they want to stay - their own home - after discharge from the hospital or in any situation of health needs such as chronic disease, dependency or elderly. By means of in deep interviews to informal caregivers, nurses and administrators, as well as participant observation of home delivery of care, we intend to identify the way they construct continuity of care and how ensure their maintenance. The main findings are a) the nurses and family build up its role as caregivers in partnership; b) the context of the home creates the particular conditions for the establishment and maintenance of a particular climate that makes possible the maintenance of continuity. We conclude that continuity is a movement for the independence of the person, built on close cooperation between the nurse and old person/family.

**PB6 393 STRATEGIES FOR IMPROVING ORAL HEALTH IN LONG-TERM CARE: A SCOPING REVIEW**

S. COBBAN\* (University of Alberta, Edmonton, Canada)

E. EDGINGTON(1) - (1) University of Alberta (Canada)

INTRODUCTION Dentate elderly in long-term care suffer from caries and gingival bleeding, and the edentulous suffer from denture stomatitis and loose dentures. These conditions are debilitating, and have a negative effect on food consumption. Residents are now older, more functionally dependent, and more cognitively impaired upon admission to long-term care, and have more natural teeth. Oral care policies have been slow to adapt to these changes. Links between oral and systemic diseases indicate need for change but the literature is not clear on what leads to effective outcomes. Under the direction of nurses, mouth care is provided by nursing aides, who face resistive behaviours, absence of necessary supplies, fear or discomfort providing oral care, low confidence in levels of knowledge, lack of time and lack of staff. Nurses need access to the best evidence of effectiveness to improve oral health. METHODS Comprehensive oral care addressing three components is necessary: a) valid and reliable assessment tools; b) regular access to dental treatment; and c) provision of daily mouth care. We are examining the extent of evidence for these three components using a scoping review. Our scoping review, in progress, is a structured review of literature that summarizes research findings and identifies gaps in research activity. RESULTS We conducted a scoping search for mouthcare interventions. Searching Medline, CINAHL, and CDSR identified 345 citations for reviews, but no systematic reviews, and 376 citations for trials, with six RCTs. The search is expanding to other databases and studies with other designs. Upcoming stages will identify evidence on assessment tools and treatment strategies. CONCLUSIONS Evidence-informed policies are needed to reduce the burden of oral disease on elderly residents. Our scoping review will provide information on the state of the science, directly useful for developing oral health policy for long-term care settings.

**PB6 394 PREVENTION OF UNINTENTIONAL WEIGHT LOSS IN NURSING HOME RESIDENTS: A CONTROLLED TRIAL OF FEEDING ASSISTANCE**

S. SIMMONS\* (Vanderbilt University, Nashville, United States)

E. KEELER(1), X. ZHUO(2), K. HICKEY(3), H. SATO(3), J. SCHNELLE(4) - (1) Rand Corporation (Santa Monica, United States of America); (2) Pardee Rand Graduate School (Santa Monica, United States of America); (3) University of California, Los Angeles (Los Angeles, United States of America); (4) Vanderbilt University (Nashville, United States of America)

Objective: To determine the effects of a feeding assistance intervention on food and fluid intake and body weight. Design: Crossover controlled trial. Setting: Four skilled nursing

homes. Participants: Seventy-six long-stay residents at risk for unintentional weight loss. Intervention: Research staff provided feeding assistance twice per day during or between meals, five days per week for 24 weeks. Measurements: Research staff independently weighed residents at baseline and monthly during a 24-week intervention and 24-week control period. Residents' food and fluid intake and the amount of staff time spent providing assistance to eat was assessed for two days at baseline, three and six months during each 24-week period. Results: The intervention group showed a significant increase in estimated total daily caloric intake and maintained or gained weight, while the control group showed no change in estimated total daily caloric intake and lost weight over 24 weeks. The average amount of staff time required to provide the interventions was 42 minutes per person/meal and 13 minutes per person/between meal snack compared to usual care during which residents received, on average, 5 minutes of assistance per person/meal and less than one minute per person/snack. Conclusions: Two feeding assistance interventions are efficacious in promoting food and fluid intake and weight gain among residents at risk for weight loss. Both interventions require more staff time than usual NH care. The delivery of snacks between meals requires less time than mealtime assistance and, thus, may be more practical to implement in daily NH care practice.

**PB6 395 COST EFFECTIVENESS OF TWO NUTRITIONAL INTERVENTIONS: A RANDOMIZED, CONTROLLED TRIAL**

S. SIMMONS\* (Vanderbilt University, Nashville, United States of America)  
E. KEELER(1), X. ZHUO(2), J. SCHNELLE(3) - (1) Rand Corporation (Santa Monica, United States of America); (2) Pardee Rand Graduate School (Santa Monica, United States of America); (3) Vanderbilt University (Nashville, United States of America)

Objective: To determine the cost effectiveness of oral liquid nutritional supplementation versus offering residents' snack foods and fluids between meals to increase estimated total daily caloric intake among nursing home (NH) residents at risk for weight loss due to low oral food and fluid intake. Design: A randomized, controlled trial. Setting: three skilled nursing homes. Participants: Sixty-three long-stay, NH residents with an order for oral liquid nutritional supplementation. Intervention: Participants were randomized into one of three groups: (1) usual care control; (2) supplementation, or (3) between-meal snacks. For both intervention groups, research staff provided either supplements or snacks twice daily between meals (10am and 2pm), five days per week, for six weeks with assistance and encouragement to promote consumption. Measurements: Research staff observed residents during and between meals for two consecutive days at baseline, weekly, and post six weeks to estimate total daily caloric intake. For both intervention groups, research staff documented residents' estimated caloric intake between meals from supplements or snack items, refusal rates and the amount of staff time required to provide the intervention daily during intervention. Results: Both interventions had a significant effect on estimated total daily caloric intake relative to the control group, and both interventions required more staff time than usual care. The amount of staff time and the refusal rates were higher for the supplement intervention group compared to the snack intervention group. Conclusions: The snack intervention was more cost effective than traditional sip-feed supplements in increasing total daily caloric intake among NH residents at risk for unintentional weight loss due to low oral intake during a six-week intervention trial.

**PB6 396 ACUTE PANCREATISIS DISEASE DUE TO MORPHINICS: AN ETIOLOGY TO BEAR IN MIND**

R. GONTHIER\* (Service de gérontologie, Saint etienne, France)  
E. CRAWFORD(1), D. FEDERIC(1) - (1) Hopital de la charité (Saint Etienne, France)

INTRODUCTION A lot of acute pancreatitis diseases are due to medicines used in treatment (Tetracycline, Oestrogen, Diuretics...). Acute iatrogenic pancreatitis is a rare condition, it represents 2-4% of acute pancreatitis. Morphine is a very rare cause of pancreatitis.. CLINICAL CASE A 78 year old woman was hospitalised for lumbar pain due to 2 spinal column compressions. It was impossible to relieve the pain using second level analgics. Morphinic treatment alongside standard physical treatment (surgical corset, rest) was introduced. After two weeks, the pain seemed to be under control but the patient presented new pain who was increasingly severe and new symptoms appeared in the upper digestive area. Abdominal exam was painful. The hypothesis that there might be an occlusive digestive cause due to morphinic treatment was dismissed following abdominal radiography. Blood tests gave the following results: amylosaemia: 1500UI (<90UI/l), lipasaemia: 700UI (N<200UI/l). Abdomen echography and scan were normal. The gall-bladder showed no trace of biliary calculus and there was no sign of pancreatitis disease. We therefore concluded upon the likelihood of an iatrogenic cause due to morphinic treatment inducing a spasm of Oddi's muscle. When we have stopped morphinic treatment The blood test became normal within 2 weeks DISCUSSION Acute pancreatitis due to medicine is rare. In this case, we dismissed other etiological hypotheses. Here, there was a direct chronological link between morphinic treatment and acute pancreatitis as the patient recovered once morphinic treatment was stopped. The physiopathological mechanism responsible for acute pancreatitis is a spasm of Oddi's muscle due to the administration of morphine rather than to any other immunity mechanism. CONCLUSION Morphine is a

very rare etiology of acute pancreatitis that we need to bear in mind in view of the frequent prescription of morphine in treatment.

**PB6 397 THYROID DYSFUNCTION IN AGED HOSPITALIZED PATIENTS: PREVALENCE, ETIOLOGY, AND CLINICAL OUTCOME**

M. GUERRERO\* (General's Hospital of Segovia, Segovia, Spain)  
P. IGLESIAS(1), A. MUÑOZ(1), F. PRAD(1), M. MACIAS(1), E. RIDRUEJO(1), P. TAJADA(1), J. DIEZ(1), V. HERNANDEZ(1), R. ALONSO(1) - (1) General's Hospital (Segovia, Spain)

BACKGROUND Thyroid dysfunction is common in aged people and has recently been associated to mortality. Our aims have been: (1) to assess the prevalence of thyroid dysfunction in hospitalised patients over age 60 years and (2) to study the relationship between thyroid functional status and mortality during hospitalisation. METHODS We studied a group of 447 patients (62% women), aged 61-101 yr, hospitalised during 2005. Thyroid dysfunction was assessed by measuring serum concentrations of thyrotropin (TSH), free thyroxine (FT4), and free triiodothyronine (FT3). Thyroid autoimmune status was evaluated through thyroid peroxidase (TPO) and thyroglobulin (TG) antibodies quantification. RESULTS 21 patients (4.7%, 19 women) showed previously known thyroid dysfunction. Total prevalence of thyroid dysfunction in the studied population was 74.3% (n=332). Euthyroid sick syndrome (ESS) was the type of thyroid dysfunction more frequently found (n=278, 62.2%). After excluding ESS patients, 60 (13.4%) showed thyroid dysfunction: overt hypothyroidism, 14 (3.1%); subclinical hypothyroidism, 25 (5.6%); overt hyperthyroidism, 11 (2.5%), and subclinical hyperthyroidism, 10 patients (2.2%). Thyroid autoimmunity was positive in only 4.0% and 2.3% of patients, for TPOAb and TgAb, respectively. Thyroid dysfunction was positively associated with mortality during hospital stay ( $p<0.001$ ). Serum levels of FT3 were negatively related to death during hospitalisation (OR 0.56 [CI 95%, 0.38-0.81],  $p<0.01$ ). CONCLUSIONS About three quarters of patients admitted in our geriatric unit exhibited thyroid dysfunction. Thyroid dysfunction was associated with elevated age and poor prognosis. The reduction of FT3 values was a powerful predictor for mortality during hospitalisation in elderly patients.

**PB6 398 THE EFFECTS OF CARBOHYDRATE AND FAT DIGESTION ON PLASMA GHRELIN CONCENTRATIONS IN HEALTHY YOUNG ADULTS**

K. TAI\* (Royal Adelaide Hospital, Adelaide, S.A., Australia)  
A. HAMMOND(1), J. WISHART(2), M. HOROWITZ(2), I. CHAPMAN(2) - (1) University of Adelaide Discipline of Medicine, Royal Adelaide Hospital (Adelaide, S.A., Australia); (2) University of Adelaide Discipline of Medicine, Royal Adelaide Hospital, and NHMRC Centre of Clinical Research Excellence in Nutritional Physiology, Interventions and Outcomes (Adelaide, S.A., Australia)

Introduction The mechanisms by which nutrient digestion suppresses ghrelin are poorly defined. It is not clear whether the presence of nutrients in the small intestine is sufficient to alter ghrelin concentrations or whether digestion and absorption is required. Methods and materials Twenty-four healthy young adults with a mean age of  $23 \pm 0.6$  (SEM) years and BMI of  $22.4 \pm 0.5$  kg/m<sup>2</sup> were examined on three separate days after an overnight fast. Twelve subjects participated in Part A of the study, and the other 12 subjects in Part B. In Part A, subjects received, in random order, one of three study drinks: 300 mL water; 300 mL high-fat drink, given with and without 120 mg orlistat (lipase inhibitor). In Part B, subjects received, in random order, one of three study drinks: 300 mL water; 300 mL sucrose, given with and without 100 mg acarbose. Results In Part A, plasma ghrelin concentrations decreased following ingestion of the high-fat drink ( $P = 0.01$ ), but did not change with the high-fat-orlistat drink or water ( $P > 0.1$ ). In Part B, there was a progressive suppression of plasma ghrelin following the sucrose drink ( $P < 0.005$ ), which was attenuated by acarbose ( $P < 0.01$ ). Sucrose, with and without acarbose, increased plasma insulin ( $P = 0.0001$ ) and glucose ( $P = 0.0001$ ) concentrations, which were both higher after the sucrose drink than sucrose-acarbose drink ( $P < 0.05$ ). Conclusion The suppression of ghrelin by fat and carbohydrate is dependent on digestion.

**PB6 399 DIABETES AND HEALTH OUTCOMES AMONG OLDER TAIWANESE WITH HIP FRACTURE**

Y. SHYU\* (Chang Gung University, Taoyuan , Taiwan)  
J. LIANG(1), M. CHEN(2), H. CHENG(3), C. WU(3) - (1) University of Michigan (Ann Arbor, United States of America); (2) Chang Gung University (Taoyuan , Taiwan); (3) Chang Gung Memorial Hospital (Taoyuan , Taiwan)

Introduction. This study examined how diabetes mellitus (DM) influenced mortality, service utilization, recovery in mobility and daily activities, and health-related quality of life (HRQoL) for hip-fractured elderly patients during first 12 months after hospitalized for a surgery. Methods. Secondary data analysis on 242 subjects was conducted. Among the overall sample, 61 (25.2%) of them had a diagnosis of DM. Outcomes were measured by the Chinese Barthel Index and Medical Outcomes Study Short Form-36 Taiwan version and analyzed by the generalized estimating equations approach. Results. The hip fractured elderly persons with DM had a significantly higher percentage of mortality (22.6% vs 10.3%,  $p=0.03$ ) during the first year following discharge, and significantly higher percentage of readmission rate (10.0% vs 2.5%,  $p=0.04$ ) during 1st to 3rd month following

discharge than those without DM. After controlling for covariates, hip fractured elderly patients without DM had an overall of 2.16 (CI=1.13-4.12) times greater odds of recovery in walking ability and better trajectories of general health ( $\beta=8.92$ ;  $p=0.02$ ) and physical functioning ( $\beta=7.35$ ;  $p=0.02$ ) than those with DM during the first year after discharge. Conclusion: These results may provide a reference for developing timely assessments and interventions for hip-fractured elders with DM.

**PB6 400 BODY MASS INDEX AND RISK OF NON-CARDIAC POST-OPERATIVE MEDICAL COMPLICATIONS IN ELDERLY HIP FRACTURE PATIENTS: A POPULATION-BASED STUDY**

J. BATSON\* (Dartmouth-Hitchcock Medical Center, Lebanon, United States of America)  
J. HUDDLESTON(1), L. MELTON(1), P. HUDDLESTON(1), D. LARSON(1),  
R. GULLERUD(1), M. MCMAHON(1) - (1) Mayo Clinic (Rochester, United States of America)

Background: Obese patients are thought to be at higher risk of post-operative medical complications. We determined whether body mass index (BMI) is associated with post-operative in-hospital non-cardiac complications following urgent hip fracture repair. Methods: We conducted a population-based study of Olmsted County, Minnesota residents operated for hip fracture in 1988-2002. BMI was categorized as underweight (<18.5kg/m<sup>2</sup>), normal (18.5-24.9kg/m<sup>2</sup>), overweight (25.0-29.9kg/m<sup>2</sup>) and obese ( $\geq$ 30kg/m<sup>2</sup>). Post-operative complication rates were estimated using logistic regression models. Results: There were 184 (15.6%) underweight, 640 (54.2%) normal, 251 (21.3%) overweight, and 105 (8.9%) obese hip fracture cases (mean age, 84 years; 80% female). After adjustment, the risk of developing an inpatient non-cardiac complication for each BMI category, compared to normal BMI, was: underweight (OR 1.33; 95%CI:0.95-1.88;  $p=0.10$ ), overweight (OR 1.01; 95%CI:0.74-1.38;  $p=0.95$ ), and obese (OR 1.28; 95%CI:0.82-1.98;  $p=0.27$ ). Multivariate analysis using stepwise selection demonstrated that an ASA status of III-V vs. I-II (OR 1.84, 95%CI:1.25-2.71;  $p=0.002$ ), a history of chronic obstructive pulmonary disease or asthma (OR 1.58; 95%CI:1.18-2.12;  $p=0.002$ ), male sex (OR 1.49, 95%CI:1.10-2.02;  $p=0.01$ ) and older age (OR 1.05; 95%CI:1.03-1.06;  $p<0.001$ ), significantly contributed to an increased risk of developing a post-operative complication. Conclusions: BMI has no influence on post-operative complications in hip fracture patients. These results attenuate concerns that obese or underweight patients may be at higher risk post-operatively for complications.

**PB6 401 QUALITY OF LIFE AND GLYCEMIC CONTROL OF PEOPLE WITH DIABETES AT MEDICAL OUT PATIENT UNIT, RAMATHIBODI HOSPITAL**

B. WONGSUNOPPARAT\* (Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand)  
C. NGARMUKOS(1), P. BUNNAG(2), N. PUKPOBSUK(3) - (1) Faculty of Medicine Ramathibodi Hospital, Mahidol University (Thailand); (2) Faculty of Medicine Ramathibodi Hospital, Mahidol University (Thailand); (3) Department of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University (Thailand)

BACKGROUND: Diabetes is a chronic disease threatening to quality of life. Glycemic control delays or prevents complications and improves quality of life, but many persons with diabetes do not achieve optimal glycemic control. AIM: The purpose of this descriptive study was to assess quality of life and glycemic control in people with diabetes. MATERIAL AND METHODS: Purposive sampling was used to recruit a sample of 497 adults aged 15 years or older. The instruments used in this study included a demographic data record form, physiologic parameters, and the Diabetes Quality of Life Measure (DQOL). RESULTS: Results revealed that the sample consisted of 71.4% of females and 28.6% of males. The mean duration of being diagnosed as diabetes was  $10.20 \pm 7.98$  years. Most of the sample (83%) perceived a high level of their overall quality of life. Approximately, almost half of the sample had higher levels of fasting plasma glucose (FPG) and glycosylated haemoglobin (HbA1C) than the targeted levels. However, 37% and 25% of the sample had the targeted level of FPG and HbA1C, while 27.8% had an acceptable level of HbA1C, and 7.3% had lower than the targeted level of FPG. In addition, the analysis showed that the patients with high quality of life were significantly associated with married status, low educational level, having affordable medical expense, having reimbursement scheme for medical expense, and having type 2 diabetes. Quality of life was associated with older age, lower level of FPG and lower level of HbA1C. CONCLUSIONS: This study demonstrates that about half of this sample could not control their glycemic level well, although most of them perceived good quality of life. Encouragement this population to improve their glycemic control for reducing complications by health care providers is necessary.

**PB6 402 USEFULNESS OF GERIATRIC NUTRITIONAL RISK INDEX IN ASSESSING THE NUTRITIONAL STATE OF LONG-TERM HOSPITALIZED JAPANESE FRAIL ELDERLY**

M. SAKAI\* (Heiseinomori Kawashima Hospital, Hikigun, Saitama, Japan)  
T. ENOMOTO(1) - (1) Heiseinomori Kawashima Hospital (Saitama, Japan)

Aim: The Geriatric Nutritional Risk Index (GNRI) is a new prognostic index of nutritional status combining serum albumin with ideal body weight. We evaluated GNRI as a

screening tool for malnutrition in the long-term hospitalized Japanese frail elderly. Methods: In total, 255 elderly patients (84 males, 171 females; mean age 82.9 years) were studied in anthropometric parameters, serum albumin concentration, activities of daily living (ADL) score and total score on GNRI. Survival analysis of mean 9.5-month mortality was conducted using Kaplan-Meier curves and multivariate Cox proportional hazards models. Results: According to the original cutoff point of GNRI, 27% of those patients were severe risk (GNRI<82), 46% were moderate risk (GNRI 82 to <92), 18% were low risk (GNRI 92-98) and 9% were no risk(GNRI>98). For 82 patients giving tube feeding, 82% of those were moderate to severe risk. GNRI correlated significantly with anthropometric parameters and ADL score. In anthropometric parameters, higher correlation coefficients were found in calf and mid-arm circumferences rather than the other parameters. All patients of no risk on GNRI survived for the follow-up period. Survival rate reduced in order of low, moderate and severe risk on GNRI. In multivariate analysis, GNRI was a most significant predictor of mortality ( $p<0.0001$ ). Conclusion: GNRI is a useful tool for predicting the risk of mortality and identifying patients suitable for nutritional support in frail elderly.

**PB6 403 THE HIGH RISK OF MALNUTRITION IN THE COMMUNITY DWELLING OLDER PEOPLE IN POLAND AND ITS DETERMINANTS\***

Z. WOJSZEL\* (Medical University of Białystok, Białystok, Poland)

Introduction The aim of the study was to evaluate prevalence of the high risk of malnutrition in the community-dwelling older people aged 75 years and over in Podlaski region of Poland and its determinants. Methods and materials The quota samples of older people based on gender and age structure (253 from the rural area and 256 from the urban one) took part in the cross-sectional questionnaire study. The survey tool included questions about the nutritional risk (the NSI DETERMINE checklist) and its potential predictors: the socio-demographic data, health status related items and the functional assessment of the respondent with geriatric functional ability scales. A multivariate logistic regression analysis was performed on high risk of malnutrition as outcome. Results 50.8% of the rural residents and 45.6% screened six or above on the checklist. The high nutritional risk was independently associated with functional disability, depression, cognitive impairment, difficulties in chewing, number of drugs taken, hospitalization within the past year and being not married. The final logistic regression model constructed with 7 above mentioned predictors, has got an overall prediction success rate of 75.8%. Conclusion The study has confirmed that nutritional risk is an increasing hazard for older people in Poland, especially for those with psycho- physical disability, chewing problems, polypharmacy, hospitalized within the past year and being not married. \*The paper was prepared within the framework of the Ministry of Science and Higher Education in Poland research project No N404 045 32/1014.

**PB6 404 ABDOMINAL CIRCUMFERENCE AND FUNCTIONAL PERFORMANCE IN ELDERLY WOMEN**

A. PARENTONI\* (Centro Universitário de Belo Horizonte, Belo Horizonte, Brazil)  
É. DA SILVEIRA(1), M. PIMENTA(1), S. ALVARENGA(1), R. DO AMARANTE(1), L. VERSIANI(1), G. SAMORA(1), I. CUNHA FILHO(1) - (1) Centro Universitário de Belo Horizonte (Belo Horizonte, Brazil)

Introduction: Aging and obesity may independently lead to functional loss, and when associated the level of impairment can be even higher. Abdominal circumference measurement (AC), an indirect predictor of abdominal adiposity, is related to physical inactivity, which is further associated to disability. Aim: To compare physical performance between two groups of elderly women by means of Six Minute Walking Test (6MWT) and Physical Performance Modified Test (PPMT). Methods and Materials : Forty-eight women were divided into groups according to AC (Group 1 AC>88 cm and Group 2 AC<88cm). They performed the 6MWT and PPMT and had their cardiovascular variables heart rate(HR) and blood pressure(BP) monitored. PPMT was composed of nine items, and a standard score was assigned according to the time elapsed to perform activities. Results: Mean age, weight and Body Mass Index (BMI) of groups 1 and 2 were, respectively,  $65.75 \pm 2.96$  and  $65.50 \pm 3.50$  years old;  $79.64 \pm 9.31$  and  $60.49 \pm 8.86$  kg;  $33.70 \pm 3.19$  and  $26.06 \pm 3.78$  kg/m<sup>2</sup>. Group 1 walked shorter distance as compared to Group 1 ( $515.28 \pm 33.07$  versus  $550.10 \pm 34.04$  meters,  $p<0.05$ ), and scored higher with the PPMT ( $27.64 \pm 2.84$  versus  $30.10 \pm 2.67$ ,  $p<0.05$ ). There was no difference between groups for both HR and BP and blood pressure across physical tests. Conclusion: Elderly women with AC above 88cm demonstrated worse performance in functional tests. These results grant further investigation on the association between abdominal fat deposit and functional impairment in aged and overweighted women.

**PB6 405 NUTRITIONAL INTERVENTION SIGNIFICANTLY DECREASED THE PROGRESSION OF DETERIORATION MENTAL FUNCTIONS OF THE PATIENTS WITH ALZHEIMER DISEASE(AD)-RESULTS OF MULTICENTRIC STUDY ON 156 PATIENTS**

M. NAVRATILOVA\* (Masaryk University Hospital, Brno, Czech Republic)  
J. JARKOVSKY, M. HAMROVA, B. LEONARD, A. VASKU, E. CESKOVA, L. SOBOTKA

**Introduction** Sufficient data on nutritional state and intervention regarding AD progression have not yet been available. The aims of our study were:a)to describe the relation between the state of mental functions and nutritional status in patients with AD and in patients with dementia of vascular etiology(VD) b)to prove the relation between nutritional support and the improvement or the maintenance of their state of health **Methods** and materials 165 patients from 7 institutions all over the Czech Republic were included in a 3year-study. The nutritional parameters were monitored every two months using the Mini Nutritional Assessment and physical and physiological parameters related to their nutritional state. The mental state of the patients was monitored by Mini Mental State Examination and Clock Drawing Test. The spontaneous food intake of the patients was monitored in the same time intervals. After the 1st year of the study the patients with AD were randomised into two groups- 1.with supplements 600 kcal/day(proteins 24g /day, carbohydrates 74g/day,lipids 23g day,fibres 9 g/day) to their ordinary food. 2.The control group continued consuming ordinary food without nutritional supplements. **Results** The nutritional status was significantly worse in patients with AD than in the patients with VD. The patients with AD who died had been suffering from severe malnutrition during the last three months of their lives. **b)**We discovered a significant decline of the mental functions in AD patients with simultaneous malnutrition. Nutritional support significantly slowed down the deterioration of the AD patients' mental functions. **Conclusions** We observed a slowing down of the deterioration of mental functions in ADpatients who received nutritional support. Therefore we suggest that the nutritional support can have a positive influence on the mental state and can slow down the progress of AD.

**PB6 406 DIETARY PATTERNS ASSOCIATED WITH BONE FRACTURE IN JAPANESE ELDERLY: A POPULATION BASED PROSPECTIVE STUDY**  
Y. MONMA\* (Tohoku University School of Medicine, -, Japan)  
K. IWASAKI(1) - (1) Tohoku University School of Medicine (Japan)

**Introduction:** Several studies have reported that dietary patterns may have a beneficial effect on bone mineral density (BMD). But no study has evaluated the relation between dietary patterns and risk of fracture. The aim of this study was to investigate the relations between dietary patterns and fracture in the elderly. **Methods and materials:** We designed a population based prospective survey of 1178 elderly (aged >70 years) people who are living in Japan. Dietary intake was assessed with a self-administered diet-history questionnaire, from which dietary patterns were created by factor analysis. The frequency of the fracture was investigated based on the insurance claim record since July 2002 until July 2006. **Results:** Three dietary patterns were identified. The daddy pattern, characterized by favor for strong tasted and high intakes of meats and alcohols had a tendency to reduce the risk of fracture ( $p= 0.05$ , hazard ratio (HR)=0.67) if other factors were not adjusted. The tendency could not be shown when sex and age were adjusted. Other two dietary patterns, Japanese style and ready-made cooking style, had no relation to the risk of fracture. After adjusting with gender and age, there was no significant relation between dietary patterns and fracture. **Conclusion:** Dietary patterns may weakly relate to the risk of fracture. But the impact of foods for fracture should not be exaggerated because it is far less than other fundamental factors as gender and age.

**PB6 407 IS THE ROLE OF AGE IMPORTANT FOR OCCURRENCE OF HLA DRB1\*03 AND DRB1\*04 ALLELES IN DIABETICS TYPE 1 AND LADA ?**  
P. WEBER\* (Faculty Hospital and Masaryk University, Brno, Czech Republic)  
H. MELUZÍNOVÁ(1), H. KUBEŠOVÁ(1), V. POLCAROVÁ(1), P. ČEJKOVÁ(2),  
M. ČERNÁ - (1) Department of Internal Medicine, Geriatrics and Practical Medicine, Faculty Hospital and Masaryk University (Brno, ); (2) Institute of Biochemistry, Cell and Molecular Biology, Third Faculty of Medicine, Charles University (Prague, Czech Republic)

**Background:** Type 1 Diabetes Mellitus (T1D) with an onset in adulthood and Late Autoimmune Diabetes of Adults (LADA) are connected with autoimmune insulitis and the specific high-risk HLA class II genotype. The aim: Main target of the study was to assess possible role of the old age onset and compare it with diabetics with the onset in the middle age (incl. analyzing HLA-DRB1 genotype). **Patients and Methods:** In the study, we included 103 diabetics with an onset of autoimmune diabetes 35+ y. of the average age  $65.7 \pm 13.8$  y. (range 35 – 93 y.). 41 were assessed as the T1D patients and 61 as the LADA ones. As a control group we used 99 healthy individuals. **Results:** Patients of the T1D subgroup developed diabetes in the age of  $50.8 \pm 15.1$  y. and of the LADA subgroup in the age of  $52.6 \pm 12.8$  y. Its duration in the time of this study was  $10.7 \pm 11.6$  y.; respectively  $5.3 \pm 7.1$  y. Fasting and postprandial C-peptide levels were statistically higher ( $p < 0.01$ ) in the LADA subgroup vs. T1D. Obesity 1st and 2nd grade were present together only in 12.6%. BMI was not statistically significantly different between both groups. We found in our diabetic patients the predisposition alleles HLA-DRB1\*03, HLA-DRB1\*04 and particularly their combination. The occurrence of these HLA alleles is significantly higher in T1D patients in comparison to controls ( $p=0.01$ , OR=4.0). **Conclusions:** In our study, the occurrence of the susceptible HLA-DRB1\*03 and HLA-DRB1\*04 alleles in T1D patients

is higher than in LADA. The presence of these alleles identifies patients of high risk and requirement of insulin therapy.

**PB6 408 FAT MASS PROTECTS HOSPITALIZED ELDERLY PEOPLE AGAINST MORBIDITY AND MORTALITY**

O. BOUILLANNE\* (Hôpital Emile-Roux, Assistance Publique - Hôpitaux de Paris, Limeil-Brevannes, France)  
B. OLIVIER(1), D. ANTOINE(1), H. PHASARO(1), H. BRIGITTE(1), C. LUC(3), A. CHRISTIAN(2), C. LUC(4), B. OLIVIER(4), A. CHRISTIAN(4) - (1) Service de Gérontologie 2, Hôpital Emile-Roux, Assistance Publique - Hôpitaux de Paris (Limeil-Brevannes, France); (2) Service de Biologie, Hôpital Emile-Roux, Assistance Publique - Hôpitaux de Paris (Limeil-Brevannes, France); (3) Service de Biochimie, Hôpital Hôtel-Dieu, Assistance Publique-Hôpitaux de Paris (94456, France); (4) Laboratoire de Biologie de la Nutrition, EA 2498, Université Paris Descartes, Faculté de Pharmacie (Paris, France)

**Introduction:** It is well established that protein energy malnutrition with low body mass index (BMI) increases the risk of death, but some recent studies indicate that the risk of mortality may decrease in elderly patients with higher body weight. Our hypothesis was that body fat, measured by a reference technique, predicted malnutrition-related risks of mortality and morbidity in hospitalized elderly patients. **Methods:** This prospective study enrolled 125 elderly patients. They were evaluated at hospital admission for their body composition [BMI, fat mass (FM), lean mass (LM), appendicular skeletal muscle mass (ASMM), body cell mass (BCM) indexes, measured by X ray absorptiometry, combined to bioelectrical impedance analysis]. Outcome was assessed 6 months later, using a score taking into account complications (bedsore or infections) and 6-month mortality. **Results:** Fat mass index correlated positively ( $r = 0.19$ ,  $p = 0.038$ ) with outcome score (1: death, 2: complications, 3: no complications), independently of C-reactive protein (CRP) ( $r = 0.18$ ,  $p = 0.042$ ). No significant correlation was observed between outcome score and BMI, LM, ASMM or BCM indexes. **Conclusions:** This study clearly indicates that an established rule (namely that overweight is associated with morbi-mortality) does not apply to hospitalized elderly patients, whose fat mass is associated with a decreased risk of adverse events. This invites new thinking on adequate maintenance of body fat in these patients. Strongly advocating weight reduction to increase the life span of very elderly overweight subjects may not be justified.

**PB6 409 OBJECTIVE AND SELF-REPORTED PHYSICAL CAPACITY MEASURES AFTER AN INTERVENTION IN OBESE OLDER WOMEN.**

M. SÉNÉCHAL\* (Université de Sherbrooke, Sherbrooke, Canada)  
D. BOUCHARD(1), L. SOUCY(1), I. DIONNE(1), M. BROCHU(1) - (1) 2500 (Sherbrooke, Canada)

**Background:** Objective and self-reported measures are two strategies to quantify improvement of physical capacity but nothing is known about whether both measurement are resulting of the same magnitude of change. **Objective:** To determine if objective and self-reported measures of physical capacity are two equivalent methods to detect changes following an intervention in obese older women. **Methods:** 36 obese women aged between 55 and 75 years participated to a 3-month study with the aim of improving physical capacity by caloric restriction and/or resistance training. Physical capacity was measured objectively with 10 different tests and self-reported with the SF-36 physical functioning score (SF-36 PF score). Then, the performance to objective tests was computed using quartiles to provide a baseline global physical capacity score. The mean percentage of change at the 10 tests as well as the SF-36 PF score were also calculated after the study. Body composition was measured by Dual energy X-ray absorptiometry. **Results:** The baseline global physical capacity score and the SF-36 PF score were significantly correlated at baseline ( $r = 0.43$ ;  $P < 0.01$ ). Eight out of the 10 objective tests of physical capacity improved after the intervention, while no improvement was observed for the SF-36 PF score. In average, percentage of change in physical capacity was  $4.1 \pm 5.9\%$  for the SF-36 PF score and  $11.1 \pm 2.9\%$  for the objective measures. However, no significant correlation was observed between percentage of changes between the two approaches after the intervention ( $r = 0.32$ ;  $P = 0.07$ ). **Conclusion:** Based on these results, the method used to quantify physical capacity after an intervention may have major implications on the outcomes. The methods used must be carefully analyzed in regard of the objective.

**PB6 410 DIABETES AND FUNCTIONAL LIMITATION IN OLDER TAIWANESE ADULTS.**

F. LU\* (National Taiwan University, Taipei, Taiwan)  
D. CHAN(1), S. WU(2) - (1) Department of Geriatrics and Gerontology, National Taiwan University Hospital (Taipei, Taiwan); (2) College of Public Health, National Taiwan University (Taipei, Taiwan)

**INTRODUCTION:** Little is known about the impact of diabetes on physical disability among older Taiwanese adults. Aims of this study were to describe the association between diabetes and physical disability in older adults, and to examine risk factors associated with disability among older adults with diabetes. **METHODS AND MATERIALS:** We analyzed data from a cross-sectional, nationally representative sample of 2,021 community-dwelling adults aged 65 or older who participated in the Taiwan Health Interview Survey in 2001.

Diabetes and comorbid conditions (heart disease, hypertension, stroke, hyperlipidemia, pain, depression, and visual impairment) were assessed by questionnaire. Physical disability was assessed by self-reported difficulty in activities of daily living (ADLs), household tasks, walking one kilometer, and climbing one flight of stairs. RESULTS: Of the study population, 48.6% were female. Mean age of the subjects was 73.4 years. Prevalence of diabetes among subjects was 16.8%. Basic demographics were not different between diabetic and non-diabetic elders. Prevalence of physical disability was higher in diabetics than non-diabetics (ADLs difficulty, 26% vs. 13%; housework difficulty, 35% vs. 19%; mobility difficulty, 66% vs. 48%). Diabetes was associated with a 2.5- fold increase in risk of physical disability. After adjustment for basic demographics and comorbidities, diabetes was associated with a 74-86% increased risk of physical disability for specific tasks. Among older adults with diabetes, multivariate analysis revealed that female gender, lower educational level, depression, chronic pain, visual impairment, and regular insulin use were independently associated with physical disability. CONCLUSION: Diabetes is associated with excessive burden of functional limitation among older adults in Taiwan. Targeted intervention to decrease risk of disability in older diabetic adults are warranted.

**PB6 411 OBSERVATIONAL STUDY OF THE EFFECT OF PROBIOTICS (LACTOBACILLUS CASEI SHIROTA) IN THE TREATMENT OF CONSTIPATION IN THE ELDERLY**

S. MEI MIN\* (St Mary's Hospital, Dublin, Ireland)  
D. POWER(1) - (1) St Mary's Hospital (Dublin, Ireland)

Introduction Approximately 75% of elderly hospitalized and nursing home residents require laxatives for bowel regulation, frequently requiring two or more laxatives. Multiple prescribing of laxatives is an added cost to the healthcare system. Lactobacillus casei Shirota(Yakult)LCS is a lactic acid probiotic bacteria, has been shown to improve frequency and consistency of stools in the general population. Our aim was to evaluate the severity of constipation, bowel movements, frequency and stool consistency(using Bristol stool from scale) after the ingestion of two bottles of Yakult Light per day. Methods This was an observation study of 50 patients in long stay wards in St Mary's hospital. The patients did not consume any probiotics for 2 weeks before and during, the course of the study. All patients were assigned to drink two bottles of Yakult Light a day. All laxatives that the patients were currently taking were taken into account before start of the trial. All patients continued to take their laxatives during the course of the trial. Bowel movements, frequency and consistency were taken into account 2 weeks before the commencement of the trial and throughout the trial. If bowel movements, frequency or stool consistency improved, patients had their laxatives stopped as appropriate. All patients were kept well hydrated to remove dehydration as a cause for constipation. Results There was a 61% reduction ( $p<0.05$ ) in the use of laxatives, with an increase in stool frequency however there was no difference in consistency found. Total cost of laxatives given before commencement of the probiotic was 1189.61 euros, and the total cost after commencement of probiotic was 239.83 euros. Total cost of probiotic consumed 1288.77 euros Conclusion Thus LCS has been shown to reduce the need for laxatives and improving bowel frequency in the elderly.

**PB6 412 PROTEIN-ENERGY MALNUTRITION AMONG THE ELDERLY: IMPLICATIONS FOR NURSING PRACTICE**

D. PRICE\* (Excelsior College, Albany, United States)

Introduction: Protein-energy malnutrition, a condition that affects many elderly individuals, consists of variety of alterations including decreased intake, increased metabolic rate, increased energy expenditure, and excess nutrient loss. Protein-energy malnutrition occurs when too few calories and protein are being supplied to the body because of malnutrition, and from acute conditions such as infection, trauma, or organ failure, which increase the protein and energy demands of the body. Methods and Materials: A comprehensive review of the literature was conducted including scholarly publications dating from 1993-2008. Results: Multiple instruments to identify protein-energy malnutrition were identified. These were categorized into several groups: dietary assessment methods, biochemical laboratory data assessment methods, anthropometric methods, and functional methods. It was concluded that prealbumin-level measurement provided a sensitive and cost-effective method of assessing for protein-energy malnutrition. However, some conditions including alcoholism and zinc-deficiency may falsely lower prealbumin levels. In addition, laboratory measurement of prealbumin may not be available in all settings. Conclusion: The nurse is uniquely qualified to identify elders at risk and to provide education to elders with the goal of decreasing or eliminating protein-energy malnutrition in this population. This presentation will explore the phenomenon of protein-energy malnutrition and how nurses working with the elderly can assess and intervene in this condition to prevent unnecessary mortality and morbidity.

**PB6 413 NUTRITIONAL STATUS AND NUTRITIONAL CARE FACTORS OF ELDERLY IN DIFFERENT CARE SETTINGS**

H. SOININ\* (City of Helsinki , City of Helsinki, Finland)  
M. SUOMINEN(1), S. MUURINEN(2), T. STRANDBERG(3), K. PITKALA(4) - (1) Department of Applied Chemistry and Microbiology, University of Helsinki (Helsinki, Finland); (2) National Research and Development Centre for Welfare and Health (Helsinki, Finland); (3) University of Oulu and University Hospital (Helsinki, Finland); (4)

Department of General Practice and Primary Health Care, University of Helsinki (Helsinki, Finland)

Introduction: Frailty and disability are known to be risk factors for malnutrition. Our aim was to compare the nutritional status of large samples of residents in all long-term care hospitals, nursing homes and service housing as well as independently living elderly individuals in the metropolitan region of Finland. Methods and materials The cross-sectional study assessed nutritional status (The Mini Nutritional Assessment, MNA) and associated health-related factors and nutritional care (a questionnaire to ward nurses) of all residents aged 65+ years. Of the institutional residents, 73 % (N=1444) in long-term care hospitals, 84% (N=2036) in nursing homes and 67% (N=1475) in service housing, and altogether 400 home-dwelling older people participated. Results The nutritional status deteriorated linearly according to dependence status. Largest proportion of elderly people with malnutrition was found in long-term care hospitals (57%); followed by nursing homes (29%), service housing (13%) and independently living individuals (8%). Mainly patient-related internal factors predicted malnutrition like impaired functioning, comorbidities (dementia, hip fracture, Parkinson's disease, stroke), and mouth and teeth problems. In the institutional settings several factors related to nutritional care like the regular weight monitoring, the small number of meals offered and eating very little during the meals were associated with nutritional status of the residents. Conclusion Although patient-related internal factors explain most of the poor nutritional status of aged individuals in different care settings, the quality of nutritional care has also an important impact.

**PB6 414 ASSOCIATION BETWEEN METABOLIC SYNDROME AND OBESITY IN OLDER ADULTS**

J. PARODI\* (Centro Geriatrico Naval, Lima, Peru)  
M. LISIGURSKI(1), J. FERNANDEZ(1) - (1) Centro Geriatrico Naval del Peru (Lima, Peru)

Introduction: Obesity is a risk factor for Metabolic Syndrome (MS) in young adults. Obesity seems to be also a risk for MS, morbidity, mortality and frailty in older people. Some studies suggest that changes in the distribution of body fat in older adults may condition an absence of association between obesity and morbidity evaluated on the basis of anthropometric parameters. Objective: To determine the frequency of MS and the presence of association between obesity and MS in older adults in the outpatient of the Naval Geriatric Center of Peru. Methodology: Cross-sectional and prospective study. We evaluated MS based on ATP III criteria and obesity based on body mass index (BMI), abdominal circumference index (AC) and waist hip ratio (WHR). Results: We studied 384 patients with a mean age of  $73.6\% \pm 8.3$  years; 46.1% were women. We found 58.3% patients with MS, it was more frequent in women (67.8% vs. 50%,  $p=0.01$ ). There were no differences according to age group. Based on BMI we found 46.7% and 20.4% of overweight and obesity, having association with MS (Normal weight: 42.1%, Overweight: 61.5%, Obese 76.9%,  $p<0.0001$ ). There was 46.5% of central obesity in base of AC and 41% in base of WHR. Both were associated with SM [AC (42.2% vs. 76.4%) and WHR (50.4% vs. 69.4%),  $p <0.0001$ ]. Conclusions: 58.3% of the older adults have MS. Overweight, obesity and central obesity assessed in base of anthropometric parameters are associated with the presence of MS in older adults. Recommendations: The nutritional assessment and management should be considered essential in the prevention and treatment of MS in older adults.

**PB6 415 TETRAPEPTIDE PANKRAGEN PRODUCES ADDITIONAL SUGAR-LOWERING EFFECT (SLE) IN ELDERLY PATIENTS WITH TYPE 2 DIABETES MELLITUS (DM2)**

V. SHATYLO\* (State Institute of Gerontology Academy of Medical Science of Ukraine, Kyiv, Ukraine)  
O. KORKUSHKO(1), V. KHAVINSON(2), I. ANTONJUK-SHCHEGOLOVA(1) - (1) Institute of Gerontology of the Ukrainian Academy of Medical Sciences (Kyiv, Ukraine); (2) Institute of Bioregulation and Gerontology of the Russian Academy of Medical Science (St-Petersburg, Russian Federation)

As shown by recent data tetrapeptide Pankragen leads to a significant SLE in rats with alloxan DM model. Lethality among animals decreased almost 2-fold compared with control. Purpose: Elucidation if Pankragen produces an additional SLE in elderly DM2 patients receiving glibenclamide (GL). Subjects: Thirty DM2 patients, aged 60 to 74 years, with HbA1c level between 7.5 and 9 % on stable doses of GL during 3 months before inclusion. After randomization, 16 patients during 3 weeks were injected intramuscularly 10 µg of Pankragen daily, as well as took orally 100µg of Pankragen and 10-20 mg of GL. Upon Pankragen cessation, the patients continued receiving the same GL dose during another 2 weeks; whereas the remaining 14 patients received stable GL doses (10-20 mg) daily during 5 weeks. Blood plasma insulin (BPI), glycolized hemoglobin (HbA1c), blood plasma glucose (BPG) at fasting and 2 hours after oral glucose tolerance test (OGTT) were used to assess treatment efficacy. Results: In elderly DM2 patients Pankragen against stable GL doses led to a significant decrease of fasting BPG by  $1.1 \pm 0.4$  mmol/l ( $p<0.05$ ) and 2h following the OGTT test by  $(1.2 \pm 0.3)$  mmol/l ( $p<0.01$ ). Additional SLE was kept 2 weeks after Pankragen cessation in 60% of patients who continued receiving GL in previous doses. In the DM2 patients receiving only GL, the BPG dropped insignificantly by  $0.3 \pm 0.2$  mmol/l at fasting and by  $0.2 \pm 0.2$  mmol/l after 2h following the OGTT test.

Pankragen produced an additional SLE in patients with high initial BPI level. No adverse events or undesirable changes in the laboratory data caused by Pankragen have been found. Conclusions: Pankragen is indicated to elderly DM2 patients with inappropriate efficacy of therapeutic GL doses.

**PB6 416 CLINICAL ASPECTS AND TREATMENT OF XEROSTOMIA**

I. GALERA PARDO \* (MORALES MESEGUE HOSPITAL, MURCIA, Spain)

F. GALERA-MOLERO(1), I. GALERA-PARDO(2), J. CASAS-TORRES(1) - (1) Fe Galera Dental Clinic (Hoya Del Campo-Abaran, Spain); (2) Santa Maria De Gracia Health Center (Hoya Del Campo-Abaran, Spain)

**Introduction:** Xerostomia is associated with increased incidence of dental caries and extensive dental and periodontal decay, infections of the tissues of the mouth like oral candidiasis, ulceration or soreness of the mouth, difficulty in speaking, eating and swallowing, an altered sense of taste, and difficulty wearing dentures. **Methods and Material:** Between 2005 and 2008, 106 patients (age range average 56.46 y) came to our department with dry mouth. We applied a protocol which key information to gather includes age, gender, number of drugs usually taken, number of teeth, state of oral mucosa and hygiene and recount of saliva and eye's tear. 42 patients were undergo minor salivary glands biopsy because their recounts were indicative of oral/ocular dryness. **Results and conclusions:** Decrease of salivary production or xerostomia is frequently in the elderly population (nearly of 30% of patients >65 years-old). The most frequently cause of xerostomia in elderly patients was side-effects of systemic medications. Other causes include high doses of radiation and certain diseases such as Sjögren's syndrome. Treatment may include ongoing dental care, possible elimination of drugs having anticholinergic effects, the use of salivary stimulant and salivary substitutes. Key words: Xerostomia. Sjögren's Syndrome.

**PB6 417 COMPARISON OF TWO MALNUTRITION SCREENING ASSESSMENTS IN RELATION TO BIOCHEMICAL PARAMETERS OF PROTEIN MALNUTRITION IN GERIATRIC HOSPITALIZED PATIENTS**

K. SCHMITT\* (Klinikum Nuernberg, Nuernberg, Germany)

T. DRESCHER(2), A. ULRICH(2), M. CHRIST-CRAIN(2), C. SIEBER(1), U. KELLER(2), R. KRESSIG(2) - (1) Nuremberg Hospital (Nuernberg, Germany); (2) Basel University Hospital (Basel, Switzerland)

**Introduction:** Malnutrition is a frequent condition in the elderly associated with higher morbidity, mortality, and lower quality of life. Unfortunately, the assessment of the degree of malnutrition is challenging since general accepted diagnostic criteria are not available. The Mini Nutritional Assessment (MNA) and the Nutritional Risk Score (NRS) are the most established screening tools in the geriatric literature. Evaluation of biochemical markers is an additional method to assess especially the degree of protein malnutrition. The aim of our study was to compare both assessment scores with respect to the serum markers albumin, prealbumin, and retinol-binding protein. **Methods:** 118 consecutive patients of a geriatric ward were investigated with assessments of the MNA and NRS, and measurement of anthropometric (BMI, arm and calf circumference) and biochemical (serum albumin, prealbumin, retinol-binding protein, C-reactive protein, and blood lymphocytes) parameters. **Results:** The median age was 84 years (IQR 79-89). The median BMI was 23.3 kg/m<sup>2</sup> (IQR 20-27.4). According to the MNA 24 patients were malnourished, 50 at risk for malnutrition, 31 had a normal nutritional status. The NRS showed 38 patients with moderate to severe risk for malnutrition, 47 patients with low risk and 29 patients without risk. Laboratory analysis revealed for albumin a median of 32 g/l (IQR 28-33), for prealbumin 143 mg/l (IQR 104-177), for retinol-binding protein 37.5 mg/l (IQR 32-47). Albumin, prealbumin, and retinol-binding protein gradually declined with increasing malnutrition as indicated by the NRS (0=0.03, 0.05, 0.02, resp.), the MNA in its 3 outcomes did not show any differences in the above mentioned biochemical parameters. **Conclusion:** The NRS better reflected the degree of protein malnutrition than the MNA. It seems therefore to be the preferred screening in hospitalized geriatric patients.

**PB6 418 BIOLOGICAL SCREENING OF VITAMIN D (25 OH-D3) IN THE ELDERLY PATIENT**

L. LORENTZ\* (CENTRE HOSPITALIER DEPRTEMENTAL DE BISCHWILLER, BISCHWILLER, France)

G. AIME(1), M. SCHATZ(1), O. FEUGEAS(2) - (1) Centre Hospitalier Départemental de Bischwiller (Bischwiller, France); (2) Laboratoire d'analyses médicales ASSIA (Strasbourg, France)

The aim of this prospective longitudinal study (during 6 months) is to show the interest of biological screening of serum Vitamin D (25 OH-D3) in elderly patient aged 70 years and over (average of age = 83.3 years), admitted in acute geriatric ward. In this population the deficiency in vitamin D is very frequent and well known especially by physicians and other Scientists who deals with osteoporosis. In our daily clinical experience the serum vitamin D in this population is rarely normal, even in patients without clinical manifestations of osteoporosis and with a normal level of calcium, phosphorus and alkaline phosphatase. The biological analysis is done immediately in all patients who are admitted whatever the pathology, the sexe and other biological data. Out of 149 samples of serum Vitamin D (25

OH-D3), 120 (80.5%) showed a vitamin D deficiency (less than 30 ng/l) and among them 79 (50.3%) showed a very important vitamin D deficiency (less than 10 ng/l). The analysis of demographic and pathologic data of this population will be done. According to these findings we think that it is wise to screen these frail patients for vitamin D deficiency. The medical literature will be reviewed to compare these values with vitamin D values of the healthy elderly people and we will try to suggest a supplementation with Vitamin D according to the importance of the deficiency.

**PB6 419 PULSE PRESSURE PREDICTS MORTALITY IN ELDERLY PATIENTS**

Y. BELOOSESKY\* (Beilinson Hospital - Rabin Medical Center, Petach-Tikva, Israel)

M. BOAZ(2), R. KORNOWSKI(3), E. GROSSMAN(4) - (2) Wolfson Medical Center (Petach-Tikva, Israel); (3) Beilinson Hospital, Rabin (Petach-Tikva, Israel); (4) The Chaim Sheba Medical Center, Tel-Hashomer (Petach-Tikva, Israel)

**Introduction:** Pulse pressure (PP) values increase with age. A high PP is a strong risk factor for cardiovascular morbidity and mortality; however, its impact on mortality in elderly patients has not been established. The aim of this retrospective clinical study has been to evaluate the effect of PP on mortality among very elderly patients. **Methods and materials:** The medical records of 420 inpatients (187 males, mean age of 81.4±7 years) hospitalized in an acute geriatric ward between 1999 and 2000 were reviewed. Blood pressure values were measured three times during a day and the average was calculated. Patients were followed-up until August 31, 2004 (mean follow up: 3.46 ± 1.87). Mortality data were extracted from death certificates. Using Relative Operating Characteristic (ROC) curves we identified PP of 62.5 mm Hg as a cut-off point. Subjects were categorized as having low PP ( $\leq$ 62.5 mm Hg; N =116), or high PP ( $>$  62.5 mmHg; N =304). **Main Results:** Mortality rate was greater in patients with high PP than in those with low PP. During the follow-up 201 patients died, 155 patients (51%) in the high PP group and 46 patients (39.7%) in the low PP group ( $p = 0.038$ ). Pulse pressure was associated with all-cause mortality even after controlling for gender, age, diabetes mellitus, atrial fibrillation and heart rate. **Conclusion:** High pulse pressure is an independent predictor of mortality among elderly hospitalized patients.

**PB6 420 METABOLIC DISORDERS IN PATIENTS OF GERIATRIC DEPARTMENT.**

P. MIKUS\* (Slovak Medical University, Bratislava, Slovakia)

Š. KRAJČÍK(1), I. BARTOŠOVÍČ - (1) Slovak Medical University (Bratislava, Slovakia)

We studied 201 inpatients of our geriatric department. The aim of our interest was the presentation of an metabolic disorder, the treatment of it and conditions with influence on the metabolic disorder, resp. by the metabolic disorder caused conditions. Diabetes mellitus was presented in 27.4% of patients. Only 20% of diabetics were without antidiabetic medication. The most frequent antidiabetic treatment were monotherapy by sulfonylurea derivates (27% of diabetics) and insulin (21.3%) 20.9% of patients had lipid disorders, and 14.4 % had thyropathy. Hyperuricaemia was presented at 12.9% of patients. 8.5 % of the patients were obese and 14.4% malnourished. 12.9% patients had dehydration and 5% had hypokalaemia. We can conclude that metabolic disorders are often present in our patients, they are relatively well treated. Conditions in relationship to metabolic disorders are often present in our elderly patients to, with an influence to the treatment and the prognosis.

**PB6 421 ASSOCIATION OF LOW SERUM ALBUMIN AND HIGH CRP WITH COGNITIVE IMPAIRMENT IN ELDERLY PATIENTS WITH DIABETES MELLITUS**

A. ARAKI\* (Tokyo Metropolitan Geriatric Hospital, Tokyo, Japan)

K. TOYOSHIMA(1), Y. KINBARA(1), Y. TAMURA(1), Y. CHIBA(1), S. MORI(1), H. ITO(1) - (1) Tokyo Metropolitan Geriatric Hospital (Tokyo, Japan)

**Introduction:** Diabetes mellitus is associated with high prevalence or incidence of cognitive impairment. Although aging, stroke, hyperglycemia, and advanced glycation end products(AGE) are thought to be responsible for the cognitive impairment, the exact mechanism remains unknown. The influences of nutrition and inflammation on cognitive function have been poorly understood. Thus, we examined whether malnutrition and inflammation are associated with cognitive impairment in elderly people with diabetes. **Methods:** A total of 522 patients (206 men, 316 women; mean age: 75 years) who admitted for the assessment of diabetic complications or glycemic control participated in this study. Cognitive impairment was defined as the MMSE score  $<24$ . As nutritional indices, we assessed serum albumin and Geriatric Nutritional Risk Index (GNRI)(Bouillon et al). We also evaluated serum CRP and IL-6 levels as inflammatory markers. **Results:** 1) About 20 % of diabetic patients had the cognitive impairment (MMSE<24). 2) Those with cognitive impairment had older age, higher prevalence of women or insulin treatment, higher HbA1c and lower HDL-C levels than those without. 3) The cognitive impairment was associated with the presence of retinopathy, stroke, PVD, and low eGFR. 4) Those with cognitive impairment had significantly lower levels of serum albumin, GNRI, and BMI than those without. 5) Cognitive impairment was associated with CRP but not IL-6 levels. 6) When we performed multiple logistic regression analysis using 8 variables (age, sex, HbA1c, serum albumin, CRP, systolic blood pressure, eGFR, history of stroke), low serum albumin ( $p<0.05$ ), high CRP ( $p<0.05$ ), age ( $p<0.05$ ), sex ( $p<0.05$ ), history of stroke ( $p<0.001$ ), and HbA1c ( $p<0.001$ ) were independently associated with cognitive impairment. **Conclusion:**

Low serum albumin and high CRP levels are independently associated with cognitive impairment with elderly patients with diabetes mellitus.

**PB6 423 THE EFFECT OF A NOVEL NUTRITIONAL INTERVENTION ON RESIDENTS WITH PROTEIN ENERGY MALNUTRITION IN CARE AND ATTENTION HOMES**

H. CHAN\* (The Hong Kong Geriatrics Society, Hong Kong, Hong Kong)

Introduction: Protein-energy malnutrition (PEM) is common in the elderly. There is little research on the impact of nutritional intervention on clinical parameters in residential care homes locally. Objectives: To examine the effectiveness of a novel nutritional intervention program for residents with PEM. Methodology: Residents with PEM living in three Care & Attention Homes were recruited. PEM was defined as having a body mass index (BMI) of below 18.5kg/m<sup>2</sup> and serum albumin level less than 35g/L. Subjects were randomized to receive either normal meals (control) or nutritional supplements on top of normal meals (intervention) for six months. The supplements comprised of 3-4 scoops of Beneprotein (an odourless protein powder sprinkled into normal meals) and 3-4 tablespoons of vegetable oil. Outcomes measures included anthropometric measures, hospitalization rate, prevalence of infections and pressure sores, activities of daily living (Barthel Index), mobility (elderly mobility score), and quality of life (WONCA). Results: Prevalence of PEM was 14.2%. There were 18 subjects in each group. After 6 months, BMI, mid arm circumference and tricep skin fold of intervention group significantly increased (38.5kg to 41.9kg, p<0.001; 16.9kg/m<sup>2</sup> to 18.4kg/m<sup>2</sup>, p<0.001; 19.7cm to 21.2cm, p<0.001; 0.65 to 0.83, p=0.004 respectively). Both groups had a higher WONCA scores after 6 months (18.3 to 21.5 in control group, p=0.001; 17.3 to 20.9 in intervention group, p<0.001), however, the increase was higher in the intervention group. There was no significant change in BI, EMS, hospitalization rate, mortality, prevalence of infection and pressure sores in both groups. Conclusions: This novel simple nutritional intervention program was effective in improving anthropometric measurements and quality of life of elderly residents with PEM.

**PB6 424 EFFECT OF VITAMIN C AND E CONSUMPTION ON INSULIN SENSITIVITY IN OLDER ADULTS ON A HIGH FAT DIET**

P. GIGOU\* (Université de Sherbrooke - Cendre de Recherche sur le Vieillissement de Sherbrooke, Sherbrooke, Canada)

M. MALTAIS(1), F. BOBEUF(1), M. LABONTÉ(1), I. DIONNE(1) - (1) Faculté d'Éducation Physique et Sportive, Université de Sherbrooke, Centre de Recherche sur le Vieillissement de Sherbrooke (Sherbrooke, Canada)

Introduction: A recent study shows that antioxidants (AO) improve insulin sensitivity in rats fed a high fat diet (HFD). Objectives: To verify if AO improve insulin sensitivity in older adults on a high fat diet. Methodology: Data come from of a previous clinical trial pertaining to exercise and AO on muscle mass and insulin sensitivity conducted in 80 elderly individuals. Insulin sensitivity was measured by an IVGTT (intravenous glucose tolerance test). Daily energy intake (DEI) was estimated with the use of a 3-d dietary record. For the purpose of this study, 20 subjects were pooled in 2 groups, in function of AO or placebo intake. Dietary lipid intake was >35% of DEI. Results: There is an improvement of insulin sensitivity in AO group (+77%) while no such improvement could be observed in the placebo group (+0.03). Unfortunately, due to the small sample size, this difference did not reach statistical significance (p=0.271). Conclusion: Our results suggest that a combination of vitamin C and E could have the potential to enhance insulin sensitivity in healthy older adults consuming a high diet. However, our results could not reach statistical significance and thus have to be confirmed with a largest sample size. Financial support : Canadian diabète association

**PB6 425 DEVELOPMENT OF PREDICTIVE EQUATIONS BASED ON ANTHROPOMETRIC DATA TO ESTIMATE WEIGHT IN ELDERLY LIVING IN RIO DE JANEIRO.**

S. DORES\* (UNIVERSIDADE FEDERAL FLUMINENSE, NITERÓI, Brazil)

G. VELARDE(1), L. CORREA(1), L. COHEN(1) - (1) Universidade Federal Fluminense (Brazil)

Introduction: Body weight (BW) is an important measure both to assess the nutritional status and prescription of nutrients and drugs. One of the solutions to estimate the weight of bedridden patients is the application of predictive equations. The aim of the study was to develop predictive equations based on anthropometric data to estimate BW in elderly people residing in Rio de Janeiro - Brazil. Methods and materials: We studied 89 subjects, both sexes, aged 74.0 ± 9.2 years. Measurements include weight, height, leg length, arm length, waist and hip circumferences, calf and arm circumferences. Body weight was measured in kilograms, by balance of precision. The measures were taken as the description of Lohman et al. (1988). The prediction equations were fitted by multiple regression analysis. Results: According to the nutrition classification by body mass index (BMI), 39% of normal status, 40% of overweight and 16% of obesity. The mean BMI was 25.7 kg/m<sup>2</sup> ± 4.6. After analysis of the effect of each variable on BW two equations were prepared. Equation proposal I consider the variables: sex, arm, waist, hip and calf circumferences. The equation proposed II eliminates the waist and hip circumferences because of the difficulty of making such measures in bedridden patients. Both models had

similar values to the real weight. The equation proposed I explain 93% of the weight variability and equation proposed II explained only 84%. Conclusion: Prediction equations are presented using six or four body measurements to allow the selection of an equation based upon those measurements that are possible to collect. The equation Proposal II was easier and faster to be applied to obtain estimated weight of bedridden elderly patients.

**PB6 426 MALNUTRITION AND NUTRITIONAL CARE OF PATIENTS WITH HIP FRACTURES**

H. THALER\* (Unfallkrankenhaus Meidling, Vienna, Austria)

I. GERSTORFER(1), H. STUNDNER(1), P. BISWAS(2), E. FABIAN(2), I. ELMADFA(2) - (1) Trauma Center Meidling (Vienna, Austria); (2) University of Vienna, Institute of Nutrition (Vienna, Austria)

Intoduction: Early recognition of the nutritional deficit and adequate and controlled nutritional therapy are important in the early application of medical nutritional intervention, especially in elderly patients. The aim of the study is to ascertain malnutrition and to demonstrate the effect of targeted nutritional therapeutic measures. Methods: From October 2007 to March 2008, 46 female patients over 65 years old (age 83±7 years) with hip fractures were recruited. The patients were randomly divided into a control group (21 patients) and an interventional group (25 patients). The nutritional status of both groups was determined preoperatively: Weight, height, Bioelectrical Impedance Analysis (BIA), Short Nutritional Assessment Questionnaire (SNAQ), serum albumin and total serum protein. The interventional group received a defined nutritional therapeutic regime: Compilation of the consumed nutrients by means of nutritional protocols, protein enriched food, oral and/or parenteral supplementation, weekly weight controls, BIA and blood chemistry. In the control group no defined nutritional therapeutic measures were performed. At discharge and 30 days thereafter both groups were weighed, BIA and blood chemistry were checked. Results: The SNAQ-Score showed malnutrition in both groups in 70%. From admission to discharge serum albumin dropped in the control group by 13.7% and total protein by 8.6%. In the interventional group serum albumin dropped by 7.8% and total protein by 3.6%. At discharge a significant drop in total protein was seen in the control group compared to the interventional group (p=0.028). The body's cellular component dropped in the control group from admission to discharge by 8.6% and in the interventional group by 0.5%. Conclusions: The compilation of nutritional parameters and specific nutritional intervention lead to an improvement in anthropometric data and protein synthesis parameters in elderly female patients with hip fractures.

**PB6 427 NUTRIENT DIMENSIONS IN 70-YEAR-OLD COHORTS BETWEEN 1971 AND 2000**

T. ALSTAD\* (Odontology, Sahlgrenska Academy, University of Gothenburg, Göteborg, Sweden)

The diet among elderly in Sweden change over time and some of that change may influence the intake of nutrients. As the intakes of many nutrients are inter-correlated nutrient dimensions may be used to facilitate analyses. The aim of the present study was to analyse the change of nutrient intake among 70-year-olds between 1971 and 2000 while adjusting for background variables. Results from four different dietary examinations of 70-year-olds performed 1971-72, 1981-82, 1992-93 and 2000-01 within the gerontological and geriatric studies of elderly in Göteborg were used. A total of 612 women and 532 men participated and were interviewed with the dietary history method. They also underwent a medical and dental examination. The intake of nutrients were analysed based on the food tables of the Swedish National Food Administration from year 2000. Energy, macronutrients and most micronutrients were included in the analyses. A factor analyses was used to analyse nutrient dimensions and the dimensions were later on analyses within a graphical interaction model (GIM) including background variables; gender, cohort, height, education, smoking, dental status, BMI and subjective health. Eight different nutrient dimensions were found and they included 87% of the variation in intake of the nutrients. The dimensions were firstly related to the intake of starch, monosaccharides, lactose, sucrose, cholesterol, retinol/ vitamin B12, PUFA and SFA. The GIM revealed dependences between the variables included. Differences over time were related to 7 nutrient dimensions, followed by gender and dental status which both were related to 4 dimensions. The nutrient intake was well described with the eight dimensions and included in the GIM they revealed important shifts over time and dependences on e.g. gender and dental status.

**PB6 428 ENERGY REQUIREMENT IN ACUTE HOSPITALIZED ELDERLY PEOPLE: RESULTS OF A DOUBLE LABELLED WATER STUDY**

M. BONNEFOY\* (Hospices civils de Lyon/UFR Lyon Sud, Pierre-Bénite, France)

B. DELAIGUE(1), S. NORMAND(3), J. DRAI(1), S. MAILLOT(1), M. JAUFFRET(1), M. LAVILLE(3) - (1) Hospices Civils de Lyon (Pierre Bénite, France); (3) CRNHL (France)

Introduction: Elderly patients hospitalized for acute diseases are prone to malnutrition resulting from low energy intake and catabolism. Determining energy requirement is of utmost importance in this population. However precise energy expenditure remain unknown in these patients. Our objective was to estimate precisely total energy expenditure (TEE) and

energy intake (EI) in elderly patients hospitalized for an acute illness. Methods and materials: 12 patients have been studied along a period of two weeks. Measurement of the 24 hours TEE has been realised by the gold standard double labelled water technique. Resting energy expenditure (REE) was measured by indirect calorimetry, and body composition by isotopic dilution. Energy intake was determined during a three days period at day 1 and day 12. Blood samples for inflammatory proteins, cytokines and cortisol were also performed to ensure cachexia. Results: The ratio TEE/REE was 1.27. Energy intake was slightly higher than REE by a factor of 1.065, but was clearly lower than TEE by a factor of 0.84. A mean loss of 0.85 kg of body weight was observed between day 1 and 14. Conclusion: This study provide for the first time evidence that energy intake is not sufficient to cover energy requirement in acute hospitalized elderly people. The second essential learning is that energy intake must be above 30 kcal/kg/day to cover energy expenditure in cachexia condition for all patients.

**PB6 429 LIVE MODIFY HABITS AND PHYSICAL ACTIVITY: PROMOTERS OF LONGEVITY IN THE ELDERLY**

ABECASSIS FABER\* (HOSPITAL UNIVERSITÁRIO GETULIO VARGAS, MANAUS, Brazil)  
M. ABECASSIS FABER(1), M. SOARES DA SILVA(2) - (1) University Of Amazon State (Manaus, Brazil); (2) University Of Amazon State (Manaus, Brazil)

Introduction: The multiple diseases and obesity increases the circulatory mortality and some cancers are among the diseases that most damage to self-esteem and quality of life of the elderly, causing no family impact, however, cause death or lead to hospitalization (Lotufo, 2000). Objective: To identify the causes of morbidity and mortality more frequent and avoidable, which can be reduced by means of primary and secondary prevention, relating them to changes in living habits and physical activities, such as delayed. Methods and materials: This bibliographic review study an increased physical activity of a population contributes significantly to public health, impacting on reducing the costs of treatments, including hospitals. The reduction in deaths from cerebral-vascular disease through the control of hypertension (primary prevention) and practice of physical activities associated with a healthy diet, has given greater extension of the age to die. Already the avoidable by secondary prevention (breast cancer, uterine cervix and uterus) had the lowest mortality rates (Camarano; Cols, 2004). Fries (2002) emphasizes that healthy living habits (especially the regular practice of vigorous exercise), they could postpone the onset of diseases and disabilities, postponing them for eight years, on average, when compared to similar groups, though consisting of sedentary, obese. The style of life is the main risk factor for death from cardiovascular causes or cancer, responsible for around 60% and 34% respectively of the deaths occurred in 1996 (WHO). Burini (2005) says that lifestyle, diet and physical activity are the main determinants of obesity and this, the main risk factor for chronic degenerative diseases. Conclusion: Individuals physically able and / or trained tend to have lower incidence of most chronic degenerative diseases and resistance exercises that result in significant psychosocial disorders. If the avoidable causes were actually eliminated, would significantly increase the quality and life expectancy.

**PB6 430 TEST OF NUTRITIONAL CARE METHOD ABOUT RENUTRITION OF ELDERLY HOSPITALISED PATIENTS.**

F. BON\* (CHU Dijon , Dijon, France)  
V. VANWYMELENBEKE, P. PFITZENMEYER

Introduction: Up to 60% of people in institutions, 50% at hospital and 3 to 10% at home suffered of malnutrition, consequently of lean body mass loss. Methods and materials: Objective is to determine if specific nutritional action improved nutritional status and has an impact compared to the usual care in acute care geriatric unit. Patients, aged of 75 years or more, were included during 4 months. A stimulated group with nutritional action ( $n=17$ ) and a control group ( $n=16$ ) have been compared. Nutritional action consisted to stimulate regular and at every meal the test group in order to initiate food intake or increase the calories ingested by emphasizing the importance of protein intakes. The control group received no specific stimulation other than usually implemented in the unit when malnutrition was detected. Measurements: Nutritional, cognitive, autonomy and depressive status; Albumin, transthyretin, CRP levels; Anthropometric measurements; Measures of food intake by weighing. Results: No significant difference on food intake between the groups was noted but the evolution in stimulated group was twice bigger than in the control group. There was a positive evolution for all blood criteria with significant difference for the stimulated group (albumin  $p<0.05$ , transthyretin  $p<0.001$ , CRP  $p<0.01$ ) while control just showed a difference on transthyretin ( $p<0.05$ ). Moreover, the evolution of transthyretin on stimulated group was 50 times larger than in control group. To sum up, usual care in geriatric unit had an effect on transthyretin only for 62.5%; of patients. Specific nutritional action shows an effect on 94%; of patients. Conclusion: Nutritional stimulation should be coupled with hospital conventional care to improve quickly the health status of patients when they arrive at hospital.

**PB6 431 NUTRITIONAL STATUS AND PSYCHOLOGICAL WELL-BEING AMONG ELDERLY SERVICE HOUSING RESIDENTS**

S. MUURINEN\* (National Research and Development Centre for Welfare and Health, Helsinki, Finland)

H. SOINI(1), M. SUOMINEN(2), K. PITKÄLÄ(3) - (1) Health Centre, Social Services, City of Helsinki (Finland); (2) The Department of Applied Chemistry and Microbiology, University of Helsinki (Finland); (3) Department of General Practice and Primary Health Care, University of Helsinki (Finland)

Studies investigating the relationship of older people's nutritional status and the quality of life (QOL) or psychological well-being (PWB) are scarce. The aim of this study was to examine the relationship between the nutritional status of 65+ service housing residents and their PWB. This cross-sectional study assessed nutrition, PWB and nutritional care of all service housing residents in the cities of Helsinki and Espoo in Finland. The MNA (Mini Nutritional Assessment) and a personal interview were used to assess the residents. Nutritional care was assessed by a questionnaire to the managers of the service houses. PWB was assessed with 6 questions. The score for PWB was formed by dividing the sum of questions (min 0, max 6) by the number of questions answered (score range 0-1). Of all the residents, 67% ( $n=1475$ ) participated (mean age 83 years, 78% females). Of them, 22% were well-nourished, 13% malnourished and 65% were at risk for malnutrition. PWB was good in 41% (score >0.80) and poor in 12% (score <0.40) of the residents. Good nutritional status, good subjective health and having meals in a common dining room, larger proportion eaten of the offered food and regular weight control were associated with good PWB. On the contrary, cognition, functional status or Charlson comorbidity index were not associated with PWB. In logistic regression analysis when age, gender, subjective health and nutritional care were used as covariates malnutrition according to the MNA was an independent predictor of low PWB (OR 0.73,  $p=0.003$ , 95% CI 0.59-0.90). Nutritional status is an important dimension of service housing residents' PWB and QOL. Professionals should pay attention to nutritional care in order to ensure PWB of aged resident.

**PB6 432 ASSOCIATION OF SERUM COPPER AND CLINICAL OUTCOMES AMONG SENIOR NURSING HOME RESIDENTS IN TAIWAN**

L. PENG\* (Taipei Veterans General Hospital, Taipei, Taiwan)  
L. CHEN(1), S. HWANG(1) - (1) Center for Geriatrics and Gerontology, Taipei Veterans General Hospital (Taipei, Taiwan)

Background Nutritional status plays an important role in predicting clinical outcomes among nursing home residents. Body weight trend and protein-energy malnutrition are two well documented parameters to fulfill this purpose. The main purpose is to evaluate the role of serum zinc and copper in predicting clinical outcomes among nursing home residents in Taiwan. Methods In 2002, residents of two private nursing homes were invited. Serial anthropometric and laboratory measurements were performed in 3-month interval. Clinical outcomes included mortality, hospitalizations, and emergency department visits. Results In total, 66 nursing home residents were enrolled (mean age= 77.2 ± 8.8 years, 68.2% males, 71.2% Barthel index<20). Paired t-test showed body mass index, total lymphocyte count and hemoglobin remained similar, but serum levels of albumin (3.8 ± 0.3 vs. 3.7 ± 0.4 mg/dl,  $P<0.001$ ) and total cholesterol (183.9 ± 37.4 vs. 176.7 ± 37.4 mg/dl,  $P=0.018$ ) were significantly decreased where zinc (84.5 ± 15.7 vs. 106.0 ± 26.7 μmol/l,  $P<0.001$ ) and copper (94.5 ± 19.2 vs. 111.2 ± 20.5 μg/dl,  $P<0.001$ ) were significantly increased. Logistic regression showed serum copper level (OR=1.07, 95% CI: 1.01-1.15,  $P=0.035$ ) and body weight loss (OR=1.20, 95% CI: 1.03-1.39,  $P=0.017$ ) were significant independent risk factors for hospitalization in 12-month follow-up. Conclusions With longer nursing home living, both serum zinc and copper were significantly increased along with mildly deteriorated protein-energy nutritional status. An incident testing of serum copper may predict a higher chance of hospitalizations in the following 12 months. Further study is needed to confirm the prognostic role of micronutrients in long-term care settings.

**PB6 433 HYPERBARIC OXYGEN THERAPY VS. SHARP DEBRIDEMENT ON PATIENT'S WITH DIABETIC FOOT ULCERS**

I. KASIOR-SZERSZEN\* (Howard University, Washington, United States)  
D. GORHAM(1), R. BEAN(1) - (1) Howard University (Washington DC, United States of America)

Introduction: Diabetes is a growing problem in the current modern society. Although both genetics and environmental factors such as advanced age, obesity and lack of exercise appear to play roles. Patients with diabetes develop impaired sensation which leads to trauma and foot ulcerations. Pt with diabetes exhibit prolonged wound healing which often may require lower extremity amputations. The goal in treatment patients with diabetic foot ulcers is to maximize the rate of wound healing and reduce the chance of infections. "Hyperbaric Oxygen therapy has been shown to increase transcutaneous oxygen in diabetic patient's with chronic ischemic ulcers" (Assal, 2007) and may be advantageous therapy during wound healing. Purpose: The purpose of this study is to review the effectiveness of hyperbaric oxygen therapy (HBO) on patients with diabetic foot ulcers and then compare these results with the effectiveness of sharp wound debridement. Method: Ten scholarly journal articles were collected that assessed hyperbaric oxygen therapy and ten that assessed sharp wound debridement. Five articles that assessed both hyperbaric oxygen therapy and sharp debridement together were also collected. All articles were then analyzed for the effectiveness of each treatment on patients with diabetic foot ulcers. Results: "The healing rates of wounds with hyperbaric oxygen therapy were found to be 2 to 4 times better in the treated groups when compared to the control group" (Assal, 2007). Some studies show that hyperbaric oxygen could be beneficial in Wagner grade 3 or 4

ischemic foot ulcers. Conclusion: Hyperbaric oxygen therapy is more beneficial in patients with diabetic foot ulcers and decreases the changes of lower extremity infections and possible amputation.

**PB6 434 EVALUATING THE VALIDITY OF A NUTRITIONAL SCREENING TOOL IN HOSPITALIZED OLDER ADULTS**

W. LIM\* (Tan Tock Seng Hospital, Singapore, Singapore)

Y. LIM(1), T. TAN(1), D. LYNN(2) - (1) Tan Tock Seng Hospital (Singapore, Singapore); (2) Queensland University of Technology (Singapore, Australia)

**Background:** Nutrition screening is a critical antecedent step of the nutrition care process. The Tan Tock Seng Hospital Nutrition Screening Tool (TTSH NST) is a 4-item graded response tool that was developed from a younger population of hospitalized adults. It is unclear if the previously derived cutoff of 4 would apply to the elderly. We aimed to determine the diagnostic utility and predictive validity of the TTSH NST in hospitalized older adults, a high risk group for malnutrition and its sequelae. **Methods:** We prospectively screened 281 newly admitted patients aged 61 to 102 years for nutritional risk using the TTSH NST. The Subjective Global Assessment (SGA) served as the gold standard for comparison of nutritional status. Length of hospital stay (LOS), Modified Barthel Index (MBI) at discharge and six months, and 6-month mortality were analyzed in relation to NST-ascertained nutritional risk before and after adjustment for age, gender, dementia, depression, severity of illness and admission MBI using regression analysis. **Results:** The prevalence of malnutrition was 35% based upon SGA. The optimal cutoff of the TTSH NST was 4, yielding sensitivity, specificity, positive and negative predictive values of 84%, 79%, 68% and 90% respectively (AUC=0.87). The optimal cut-off remained at 4 even for patients aged >85 years (AUC=0.85). Risk of malnutrition (as determined by TTSH NST) was predictive of 6-month mortality (adjusted OR: 2.2, p=0.05), LOS (p<0.05), and MBI at discharge (p<0.05) but not at 6 months. **Conclusion:** Our findings show that using a cutoff of 4, the TTSH NST is a valid screening tool with good diagnostic utility and predictive validity for detecting malnutrition in hospitalized older adults.

**PB6 435 A NUTRITIONAL FOLLOW-UP IN MALNOURISHED ELDERLY PEOPLE LIVING AT HOME.**

V. VAN WYMELENBEKE\* (Centre Gériatrique Champmaillot, Dijon, France)

I. MARTIN-PFITZENMEYER(2), S. POULAIN(1), P. PFITZENMEYER(1) - (1) Le Gérontopôle (Dijon, France); (2) CHU Champmaillot (Dijon, France)

**Background:** Malnutrition is a frequent problem in the elderly people that may be related to a low protein intake. **Objectives:** To evaluate the impact of a nutritional intervention program either beginning at hospital in geriatric care unit or at home and following at home during 12 months for malnourished elderly people on nutritional and functional status. **Methods:** The inclusions have been done between July 2007 and September 2008. After evaluation on nutritional status, old individuals undertook a 12-month follow-up and we investigated whether dietary advices targeting protein consumption and use of nutrient dense-foods to improve nutritional intake, body weight and mini nutritional assessment, ADL and IADL scores. The measurements were realised at the beginning of stay of hospital for hospitalized patients and then, at home, at 1, 30, 90 days, and all 3 months for both population by visits of nutritionist. **Results:** A total of 93 old people (51 at hospital and 42 at home, 74 women, 70 to 100 years old, short-MNA&smaller than 11) had accepted the study. Until the beginning of study 17 persons going to hospital and 5 persons living at home withdrew (dead, didn't want going on, institutionalized...). During the three first months, the results indicated that nutritional advices given during each visit were generally applied, translating a weight gain or stable weight in 60.9% of old people. **Conclusion:** At this period of the study, it seems that simple strategies, like dietary advices showing the importance of protein consumption and the use of nutrient dense-foods during aging, are necessary taking in place to treat malnutrition in this vulnerable population composed of the old-elderly people, wishing living at home the longer time. **Keywords:** elderly people, MNA, body weight, nutritional advices.

**PB6 436 MALNUTRITION IS AN IMPORTANT GERIATRIC SYNDROME CONTRIBUTING TO THE SHORT TERM MORTALITY**

T. YAMANAKA\* (Tokyo Women's Medical University Medical Center East, Tokyo, Japan)

N. YAMAMOTO(1), E. TAKASUGI(1), N. HOTTA(1), M. ISHIKAWA(1), G. YAMANAKA(1), K. OTSUKA(1) - (1) Tokyo Women's Medical University Medical Center East (Tokyo, Japan)

**Introduction:** Comprehensive geriatric assessment has been considered to be important for the elderly in sustaining or improving physical functions and quality of life. We examined factors that contribute to the short term mortality in the elderly at our comprehensive assessment clinic. **Methods:** Between March 2005 and December 2006, 74 elderly (48 females, 81.6±5.7 years) came to our comprehensive assessment clinic for the elderly. The numbers of elderly who had chronic disease were as follows: 30 psychiatric disorder including dementia, 25 heart diseases, 9 musculoskeletal disorder, 6 cancers, 6 diabetes, 3 stroke, 3 lung disease. Various aspects of daily living functions including physical and

mental function, social mode of life were assessed comprehensively. **Results:** During the observational period, 7 elderly (2 females, average 83.0 years) died. We examined the difference of daily living functions between alive group (n=67) and dead group (n=7). A Mann-Whitney's U test was used to compare two groups. The nutrition screening initiative score ( $3.2\pm2.1$ ,  $5.2\pm1.1$ ,  $p<0.032$ ), the skinfold thickness of scapula ( $12.9\pm4.8$ mm,  $7.0\pm3.6$ mm,  $p<0.027$ ) and Vitality index ( $9.5\pm1.2$ ,  $8.3\pm1.4$ ,  $p<0.012$ ) were significantly different between two groups. By Cox's proportional hazards model, the skinfold thickness of scapula was extracted as the factor contributing to the short term mortality (n=29,  $\beta=-0.380265$ ,  $SE(\beta)=0.176973$ ,  $z=2.1487$ ,  $p=0.031657$ ). The relative risk was 0.684 (0.483-0.967) at 1.0mm increase of the skinfold thickness of scapula. **Conclusions:** Malnutrition is considered to be an important geriatric syndrome contributing to the short term mortality in the elderly. We should evaluate the nutrition status with extreme caution in the frail elderly.

**PB6 437 HOSPITAL-BASED CASE MANAGEMENT IMPROVE NUTRITION STATUS IN ELDERLY LIVING IN NURSE HOME**

K. ,HUANG\* (China Medical University Hospital, Taichung, Taiwan)

W. LIN(1), C. LIU(1), H. HUANG(2), S. LEE(3), K. HUANG(4), C. LIN(1) - (1) China Medical University Hospital (Taichung, Taiwan); (2) China Medical University (Taichung, Taiwan); (3) National Taipei College of Nursing (404, Taiwan); (4) National Taiwan University Hospital (Taipei, Taiwan)

**Introduction:** People living in long-term care facilities are rapidly growing around the world, especially in elderly. Malnutrition is an important problem in caring elderly in long-term care facilities. The best caring model is still controversial. In this study, we assessed the improvement in nutrition using different care model in Taiwan. **Methods and materials:** There were 265 elderly residents living in 8 long-term care facilities were recruited (mean age= $78.8\pm7.1$  years). They were grouped into two groups (intervention and control group, each group included 4 long-term facilities) using randomized control design. Hospital-based multidisciplinary team care was used at intervention group. Usual care was used at control group. After randomization, intervention period was 6 months. We measured anthropometric index, biomedical markers, and structured questionnaire before and after intervention. **Results:** No statistical differences were observed in age, height, weight, body mass index (BMI), hemoglobin, albumin, and lipid profile between intervention group (n=83) and control group (n=182). After 6 months intervention, the increase of albumin in intervention group was greater than the control group ( $\Delta$  albumin=0.16 vs. 0.01 mg/dL,  $p<0.05$ ). After intervention, prevalence of malnutrition (Albumin < 3.5 mg/dL) decreased from 68.7% to 53.0% in intervention group and from 67.0% to 66.5% in control group. **Conclusion:** Hospital-based case management can effectively improve malnutrition in elderly living in long-term care facilities in Taiwan.

**PB6 438 A SHARED LEADERSHIP NETWORK MODEL: AN INNOVATIVE ORGANIZATIONAL STRUCTURE OF THE BC NETWORK FOR AGING RESEARCH (BCNAR)**

A. WISTER\* (Simon Fraser University, Vancouver, Canada)

L. BEATTIE(1), E. GALLAGHER(2), G. GUTMAN(3), D. HEMINGWAY(4), C. REID(5), D. SINDEN(6), B. SYMES(7) - (1) University of British Columbia (Vancouver, Canada); (2) University of Victoria (Victoria, Canada); (3) Simon Fraser University (Vancouver, Canada); (4) University of Northern BC (Prince George, Canada); (5) University of British Columbia Okanagan (Canada); (6) Simon Fraser University (Canada); (7) Simon Fraser University (Canada)

The BC Network for Aging Research (BCNAR) is one of eight population health networks funded by the Michael Smith Foundation for Health Research in British Columbia Canada. Initiated in 2005, the aging research network has undergone several interim evaluations, providing an opportunity for detailing features that are most successful. The mandate of BCNAR is to increase research capacity in the area of health and aging in the province through diverse networking activities; however, it is not mandated to conduct research itself. Several unique characteristics of BCNAR's organizational and management structure that have benefited researchers will be discussed in this paper. These include: its theoretical underpinnings; distributive/sub-network leadership model; research innovation model; regional networking structure; and use of networking technologies. These structural dimensions will be examined by highlighting the functioning of the network in terms of key activities and outcome measures: leveraging funds through institutional and organizational partnerships; developing innovative student training and mentorship programs (Student Training in Aging Research Program); awarding seed and team development grants, and assessment of future grant success; providing a comprehensive website with access to a database of aging research and publications; publishing a newsletter; use of other networking technologies; offering a range of high quality conferences and workshops; and fostering national and international research networks and collaborations. BCNAR also facilitates gerontological knowledge translation and transfer between those seeking research, conducting research and the decision-makers who utilize research; with the objective of positively impacting the lives of older adults. It will be shown that the network has worked in unique ways to facilitate the collaboration of researchers from a variety of disciplines, research streams, and organizations interested in pursuing aging-related research and knowledge translation. A major conclusion is that,

compared to hierarchical leadership/management models, BCNAR is highly flexible and opportunistic.

**PB6 439 BLOOMING GERIATRICS IN MOROCCO: FIRST NATIONAL MEETING OF GERONTOLOGY IN CASABLANCA.**

M. OUDRHIRI\* (AGE, Casablanca, Morocco)

M. MAAMAR(2), R. DEHBI(1), A. ALAMI(3), M. SOHANE(4), M. DEAL(5), M. VERNY(6), T. CUDENNEC(7), L. LECHOWSKI(8) - (1) Hôpital Mohamed Sekkat (Morocco); (2) CH Ibn Sina (Morocco); (3) Hôpital Elfarabi (Morocco); (4) Hôpital Elidrissi (Morocco); (5) AP-HP (France); (6) CHU Pitié-Salpêtrière (France); (7) CHU Ambroise Paré (France); (8) CHU Sainte-Périne (France)

Morocco is an Arabic and French-speaking developing country that's facing a brand-new challenge: the aging of its population. The amount of Moroccans covered by the actual health-system is insignificant (7%), however there's an ongoing radical change of this system. Among the thirty million Moroccans, 2.4 millions (8%) are 60 years-old or more, and 600 000 people are more than 75 years-old. There isn't any geriatrics department in the country, but thanks to a close cooperation with some French University-Hospitals, about fifteen internists have been trained to this new specialty. These new Geriatricians have gathered in a association called "AGE" (in French "Association de Gérontologie Espoir" which means "Hope Geriatrics Association"). They take care of elderly patients in the intern-Medicine Departments they belong to, and they have organized on May 31st and June 1st 2008, a National Meeting in Casablanca aiming to promote Geriatrics and it's teaching during general medical studies in Morocco. Besides the Geriatricians, teachers of other specialties (Nephrology, Neurology, Internal-Medicine, and Oncology) have participated to this first meeting. Some government-representatives (with MDs among them), have pleaded Geriatrics' cause in Morocco. The invited speakers where from different parts of the country, as well as France. The meeting has been organized at Casablanca's Medicine School, and around 200 people have attended it for free: "Generalist" doctors ("Family doctors"), Specialist doctors, nurses, social workers, nutritionists, and kinesitherapists. The meeting has been terminated the next day with a trekking of 5 and 11 Kilometers in the area of the city of Benslimane, to which about a hundred people aged 60 years or more have happily participated, under the beautiful shiny Moroccan sun!

**PB6 440 A NOVEL MOBILE ACUTE CARE FOR THE ELDERLY (MACE) INPATIENT MODEL OF CARE**

B. KORC\* (Mount Sinai School of Medicine, New York, United States)

J. FARBER(1), C. THOMPSON(1), A. MOSKOWITZ(1), S. COHEN(1), R. LEIPZIG(1) - (1) Mount Siani School of Medicine (New York, United States of America)

Introduction: As hospital occupancy rates become higher, the ability to assign patients to an ACE unit has become harder. The multidisciplinary MACE team was created to maximize the benefits of geriatric clinical care combined with enhanced communication and seamless transitions regardless of the geographic location within the hospital. Materials and Methods Setting: Urban Teaching Hospital. Design: Prospective cohort study Participants: Patients from Coffey Geriatrics Associates admitted to the Geriatrics Service, Mount Sinai Hospital (MSH), between 7/1/07 and 6/30/08. MACE team: 1. Geriatric-hospitalist; 2. Geriatric fellow; 3. Geriatric Nurse Practitioner (GNP) responsible for obtaining baseline data, communication and post-discharge phone calls to patients. 4. Social worker (SW) responsible for discharge planning and collaboration with the outpatient SW. Implementation: 1. Daily meeting to assess clinical/social/systems difficulties. 2. Family meetings early in the hospitalization 3. Transitional care adapted from The Care Transitions Program (1). 4. Patient/caregiver education on medication management. 5. Communication with primary care provider. Results: 597 discharges during this period. Mean age: 83 years old. 75% were female. The patients were frail, most of them dependent in IADLs and ADLs (57%). 46% had diagnosis of cognitive impairment or dementia and 56% walked with an assistive device prior to hospitalization. 443 patients (74.2%) were discharged home and the rest were discharged to nursing home, hospice care or expired. 38% of the phone calls to patients who were discharged home revealed difficulties with medications, services or worsening symptoms requiring intervention. Mean length of stay (6.0 days) was significantly lower than the prior year (8.3 days) with no difference in 7-day readmission rate (4.0% vs.4.9%). Conclusions: The MACE team is a novel model of multidisciplinary inpatient care with emphasis on communication and early coordination of care.

**PB6 441 LOSS OF AUTONOMY IN FRAIL ELDERLY AND CROSS NATIONAL COMPARISON IN TREATMENT APPROACH – A COMMON PROJECT OF THE EAMA**

H. HEPPNER\* (Klinikum Nuremberg, Nuremberg, Germany)

D. SOMME(1), K. SCHMITT(2), R. LINDNER(3), A. RAJSKA-NEUMANN(4), A. GARCIA(5), M. DENKINGER(6), C. SIEBER(2) - (1) Hopital Pompidou (Paris, France); (2) Klinikum Nuremberg (Nuremberg, Germany); (3) Klinikum Hamburg Eppendorf

(75015, Germany); (4) Lab. for Geriatric Medicine (Poznan, Poland); (5) Houston VA Medical Center (United States of America); (6) Bethesda Geriatrische Klinik (Germany)

Introduction: As a postgraduate course of geriatricians, we were interested how a geriatric patient is treated in different countries and which the main divergences are. Methods: In the vignette case, an 82 years old woman, hospitalized in a geriatric ward for an acute previously unknown heart failure was demonstrated. She was characterized as a typically geriatric patient with a present state of "complete exhaustion" and a probable cognitive decline (MMSE 22/30). She was described as frail and getting dependent. So discharging from hospital implied a new situation to the patient. Setting took place during the postgraduate course from February to June 2008. Therefore standardised questionnaires were sent to the participants enclosing different items of assessment, acceptance of geriatricians, medication, financial source, laboratory findings and social situation. Results: 45 students from 19 countries took part in this survey. 4 claimed participation because of not working with patients. In 23% no own geriatric ward is in the hospital, in 94% there are no geriatricians at the emergency department. In over 50% complementary assessment of nutritional and psychological status is used, 30% of the hospitals have no access to a psychogerontologist. Ranking of used assessment tools in declining frequency is (I)ADL, Barthel Index, MMSE, clockdrawing test, MNA, GDS and timed up and go test. 2 departments decide implication of RAI-emergency screener. Differences were found in prescription of appropriate medication, planning of ambulatory care or organizing residential homecare, as well as problems of funding source. Conclusion: The results show a huge heterogeneity in appreciating geriatric medicine in the different countries. There is a big necessity in harmonising acute and long-term care for our geriatric patients. This is only feasible with international networking and common scientific projects.

**PB6 442 STELLAR POTENTIAL IN GERIATRIC TRAINING AND RESEARCH**

S. LEDERMAN\* (American Federation for Aging Research, New York, United States)

O. VAN DER WILLIK(1), G. MARTIN(2) - (1) 1 (New York, United States of America); (2) 2 (Seattle, United States of America)

This session will provide a model to engage medical students in geriatrics and aging research. During the next two decades, the number of older adults is growing at an enormous world wide. There is a tremendous shortage of geriatricians to take care of this older population. The session will present a model program which has been successful in the U.S. over the past several years which offers a summer stipend to medical students. The track record of this program has been tremendously successful - sensitizing future physicians and providing a basis for research in aging. The program is a public private partnership and can be replicated for very low cost in numerous countries. The program provides, research experience, hands-on-work with patients and didactic instruction.

**PB6 443 INTEGRATED MODELS OF CARE IN ONE THIRD AGE CENTER IN MANAUS- AM**

M. FABER\* (UNIVERSITY OF AMAZON STATE, MANAUS, Brazil)

J. FABER(2), M. SILVA(1) - (1) Hospital Universitário Getúlio Vargas (Manaus, Brazil); (2) University of Amazon State (Manaus, Brazil)

INTRODUCTION: As much in physical aspects as social, is not easy to age in Brazil. The public system of health is precarious e, in the current context, the potential of the aged one as social agent lowermost when is not ignored. The Centers of Attendance Integrated to the Best Age have objectives to the attendance specialized to the aged; the health promotion providing the best way to promote an integral and integrated care of the health. METHODS AND MATERIALS: This is a retrospective observed by type of shelter of this population taken care of in one of them Centers (CAIMI) in Manaus, aiming at to know the reason of the search of the aged, the medical attendance, types of requested examinations, what the doctors of this Center understand the regular physical exercises for the customers CAIMI visits and the results of this attendance. Between November 2007 to February/2008, 843 aged was accompanied, amongst routine medical consultations; inclusion revisit. Excrement and blood biochemical analysis had been requested, and gauging of the arterial pressure. RESULTS: Of the 843, 87% hypertensive's, 48% had intestinal parasitism; 45% had high cholesterol, 47% anemic and 32% diabetics. The study it allowed to infer that beyond the attention, from the affection in the attendance, these persons had received orientations and emphasized practical the regular guided physical exercises by professionals in the Center to the aged possess high cholesterol and hypertension, associates to the nutritional orientation recommended by Nutritionist of the Center. CONCLUSION: Lastly, it can be concluded that the objectives of the Centers are reached by the relevance of the integration to multidiscipline in the attendance to the aged one.

**PB6 444 PREVALENCE OF INTESTINAL PARASITES AMONG GERIATRIC RESIDENCE IN GOLABCHI CENTER, KASHAN, IRAN 2006-2007**

S. RASTI\* (Kashan University of Medical Sciences, Kashan, Islamic Republic of Iran)

M. ARBABI(1), H. HOOSHVAR - (1) 1 (Kashan, Islamic Republic of Iran)

introduction: Intestinal Parasitic infections are the major health problems in many countries especially in developing countries. The prevalence of infection is variable in different social group. Since geriatric are high risk group, this study was carried out in order to

determine the prevalence of intestinal parasites in elderly people residence in Golabchi Center, Kashan, Iran 2006-2007. Methods & Material: In this Cross-Sectional study a total of 165 stool samples from elderly people and 54 office personals were randomly collected and examined by direct, logol stain and formalin ether concentration methods. Scotch type method was used for diagnosis Enterobiasis. The demographic data as sex and age were recorded. For statistical method X2 and confidence interval were used. Results: Of 155 elderly, 121 people (78 %) were positive for at least one intestinal parasites, (CI=78% ± 3.3). The prevalence of pathogenic protozoa were: Entamoeba histolytica/ E.dispar 16.7%, Giardia lamblia 2.6% .Dientamoeba fragilis 1.6% .The prevalence of nonpathogenic protozoa were: Entamoeba coli 46.5 %, Blastocystis hominis 31%, Chilomastix mesnili 28.4%, Entamoeba hartmanni 20.6% , Endolimax nana 16.2%, Iodamoeba butschlii 6.7% respectively. The prevalence of helminthes infection were: Taenia 2%, Hymenolepis nana 0.7% and Enterobius vermicularis 25.5% by Scotch type method. Infection rate in office personals were 49.3 %, and pathogenic protozoa were not seen. 67 of people infected with one or two parasites, 29 with 3 parasites, and 25 people with higher than 4 parasites. Conclusion: This study showed that infection with intestinal parasites especially pathogenic parasites were higher than expected in geriatric. Due to importance of intestinal parasites and some risk factors such as density of population and an immunosupress background in elderly, primary care by treatment of infection and control is emphasized. Keywords: Intestinal parasites, E.histolytica/E.dispar, Enterobius vermicularis,

**PB6 445 RECRUITING NURSING STUDENTS AND NEW GRADUATES INTO GERIATRIC MENTAL HEALTH NURSING PRACTICE IN NURSING HOMES AND RELATED RESIDENTIAL SETTINGS**

C. LE NAVENEC\* (University of Calgary, Calgary, Canada)  
S. HIRST(1) - (1) University of Calgary, Faculty of Nursing (Canada)

The purpose of the planned study that is the focus of this presentation pertains to identification of effective approaches to enhance recruitment of both undergraduate nursing students for part-time employment, and new graduates for full-time employment in nursing home settings that provide care to older people with dementia. To collect such data, our research team plans to conduct a major survey of the literature, and to send out an electronic call for short narratives about: (1) the key challenges facing Geriatric Nursing in Canada (e.g., see Hogan, 2007), and, (2) innovative and traditional initiatives that have developed in Canada to address those challenges (e.g., Gerontology Nursing Initiative for New Graduates by the Vancouver Health Authority; as well as the NICE program: <http://www.nicenet.ca>) Hogan, D.B. (2007). Proceedings and recommendations of the 2007 Banff Conference on the Future of Geriatrics in Canada. Canadian Journal of Geriatrics, 10(4), 133-147.

**PB6 446 AN ELECTRONIC TRANSFER FORM FOR ADVANCE DIRECTIVE COMMUNICATION BETWEEN A SKILLED NURSING FACILITY AND THE ED**

F. HUSTEY\* (Cleveland Clinic, Cleveland, United States)  
R. PALMER(1), D. PERDION(2), D. HRUBIK(2) - (1) University of Pittsburgh (Pittsburgh, United States of America); (2) Cleveland Clinic (Cleveland, United States of America)

Introduction: Quality problems regarding communication between nursing homes and emergency departments (ED)s have been well-described. Essential patient information such as advanced directives is often missing. The objective of this study was to determine whether the implementation of a standardized electronic transfer form improves communication of patient advanced directives (ex: do not resuscitate orders) between a skilled nursing facility (SNF) and the ED during patient transitions to the ED. Methods: This was a before and after study involving the largest SNF affiliated with the ED of an urban tertiary care center. Participants were a consecutive sample of patients transferred from the SNF to the ED over a 16 month period between June 2006 and January 2008. The intervention was the implementation of a standardized electronic transfer form via closed internet connection between the SNF and ED. Communication of advanced directives was considered to be satisfactory if patient wishes regarding resuscitation were communicated by the SNF to the ED as reflected by any of the following: 1. Notation in SNF transfer documents; 2. Notation in ED chart including that the information was obtained from the SNF; 3. Notation that the patient does not currently have advance directives. Results: 234/237 pre-intervention and 276/276 post-intervention transitions were reviewed. The transfer form was used in 130/276 (48%) of patient transitions (electronic version 76 (28%), paper copy 54 (20%). Advanced directives were found in 14/234 (6%; 95%CI, 4-10) pre intervention patient transitions and 112/276 (41%; 95%CI, 35-46) post-intervention patient transitions ( $p < .0001$ ). Conclusion: Communication of patient advanced directives between a SNF and ED during transitions of care was dramatically improved after implementation of a standardized electronic transfer form.

**PB6 447 NEWSPAPER-CONFECTION GROUP: AN INTERVENTION POSSIBILITY IN LONG-TERM CARE INSTITUTIONS FOR THE ELDERLY**

M. GUIMARÃES ASSIS TIRADO\* (Universidade FUMEC, Nova Lima - MG, Brazil)  
K. DE OLIVEIRA(1), L. DE OLIVEIRA ASSIS(1) - (1) Universidade FUMEC (Nova Lima, Brazil)

Introduction: Elderly individuals who reside in long-term care institutions and become inactive undergo a reduction in intellectual potential and their creativity and social

relationships are affected. Occupation therapy intervention has the objective of maintaining, restoring and improving functional capacity, thereby maintaining elderly individuals active and independent for the longest possible length of time. The aim of the present study was to evaluate a newspaper-confection group as a therapeutic resource for stimulating cognitive function and promoting interaction between residents in long-term care institutions. Materials and Methods: The group was made up of elderly residents of a long-term care institution in the city of Belo Horizonte (Brazil) Participants were from both genders and had a variety of conditions (depression, seeing impairment, musculoskeletal, cerebral-vascular and neurological diseases). The group was open and had an average of six participants at each weekly meeting. The 26 meetings were organized in the following manner: 1) opening, in which the interaction between participants was favored by employing the principles of reality orientation therapy; 2) reading of the day's newspaper; 3) selection of news from the paper and the institution; 4) suggestions for poetry and charades; 5) closing, organizing the material on placards and displaying the newspaper. All sessions were recorded by means of reports, which were used as the parameter for the analysis of the progress of the group and discussion of the results. Results: There was a significant increase in the interaction of the participants before, during and after the group activity as well as improvements in spatial-temporal orientation, attention and concentration in routine activities, thereby favoring autonomy as well as individual and group identity. Conclusion: The newspaper-confection group may contribute toward active ageing, with the preservation of intellectual potential as well as social and psychical skills.

**PB6 448 SHOULD DRUGS FOR PREVENTION BE PRESCRIBED IN THE CONTEXT OF ADVANCED DEMENTIA?**

M. ARCAND \* (Institut Universitaire de Gérontologie de Sherbrooke, Sherbrooke, Canada)  
R. JACYNTHE(1), A. JACQUES(1), V. GILLES(1), É. SERGE(2) - (1) Institut Universitaire de Gérontologie de Sherbrooke (Canada); (2) Clinique médicale de Richmond, Québec (Canada)

Introduction: Physicians often wonder about the appropriateness of prescribing medications for prevention in the context of advanced dementia. In this population, evidence for treatment effectiveness is lacking and existing guidelines are not helpful because they do not take into account relevant considerations such as comorbidity, immobility and life expectancy. Furthermore, in their advance directives, many patients ask for "comfort care only" if they become irreversibly incompetent and this may be interpreted as an indication to stop those medications. Objective and methods: In April 2004, 34 physicians, pharmacists and ethicists were assembled by the Sherbrooke Geriatric University Institute in order to discuss guidelines proposed by a group of clinicians and ethicists who reviewed the literature. Based on those discussions, a final series of recommendations was prepared and sent to them for final approval. Results: There was consensus about those four general recommendations: "In the context of moderate or severe dementia, the physician should · Prescribe drugs for prevention only to persons who have a long enough life expectancy to benefit from them · Avoid prescribing drugs other than for comfort when life expectancy is short or when quality of life is perceived by family members to be irreversibly poor · Avoid prescribing drugs for prevention if taking them puts too great a burden on the patient (e.g polymedication and swallowing difficulties) · In case of doubt, prescribe a potentially beneficial drug only for a limited period of time and then reassess the usefulness of continuing. A general guide for clinical reasoning was also proposed to help clinicians decide on the appropriate conduct in similar situations and specific recommendations were made for the use of statins, antiplatelet drugs and bisphosphonates. Conclusion It is the first time that clinical guidelines are presented on this topic.

**PB6 449 PROJECT HOPE: AN INTERDISCIPLINARY EDUCATION MODEL IN GERONTOLOGY**

M. PARDASANI\* (Fordham University , New York, United States)

Introduction: Project HOPE is an inter-disciplinary initiative that integrated the varied disciplines' (medicine, nursing and social work) teaching, practicum and service goals to enhance graduate student interest and expertise in gerontological practice. The population of persons age 65 and over is expected to double in size to 70 million by 2030 (US Census, 2000). As the elderly cohort grows exponentially, so does the need for competent and knowledgeable practitioners in healthcare. However, gerontological practice is not on the top of the list of professional or fieldwork choices for social work, medical or nursing students. Research in the three disciplines has noted some common themes such as lack of knowledge or interest on part of students and faculty, and limited opportunities for internship and clinical practice in aging. Methods: In 2007, the College of Health and Human Services was created at Indiana University Northwest by combining the social work, nursing and medical schools. Project HOPE, an inter-disciplinary, clinical practicum for students within a gerontological setting (nursing homes) was initiated. It has been posited that inter-disciplinary practicum initiatives create opportunities for increased understanding of varied professional roles and values, as well as increase students' knowledge of team-based interventions and patient-centered care, and prepare them for effective practice in inter-disciplinary, healthcare settings. Students from social work, nursing and medicine were required to work in teams and follow assigned elderly patients for the course of one year. In addition to joint structured supervision, they attended regular trainings and completed a course on Gerontological Healthcare. Results and Conclusion:

The project has been successful in increasing student competencies, knowledge and interest. This presentation will describe the design and implementation of the interdisciplinary project, and its impact on the students. Guidelines for replication, implications and lessons learned will be shared.

**PB6 450 MANAGEMENT OF DYSPNEA AMONG TERMINALLY-ILL NURSING HOME RESIDENTS IN THE UNITED STATES**

A. KRIS\* (Fairfield University, Westport, CT, United States)  
J. KAYSER-JONES(1), E. HALIFAX(1) - (1) University of California, San Francisco (San Francisco, United States of America)

**Introduction:** While dyspnea is one of the most commonly reported symptoms among terminally-ill nursing home residents, previous research has found that nearly 25% of residents receive no treatment for this distressing problem. This presentation discusses the problem of dyspnea among terminally-ill nursing home residents and describes the state of current management strategies, as well as barriers to the adequate control of this distressing problem. **Methods:** As part of a larger study that investigated end of life care, 117 residents were followed from the time they were identified as terminally ill until they died. Event analysis, participant observation, in-depth interviews with residents (n=21), their families, (n=46) nursing staff, (n=54) and physicians (n=36) were used to obtain data in two proprietary nursing homes. In addition, data were collected on the type and amount of analgesia prescribed and administered, and on the use of oxygen. **Results:** While 90% of residents had orders for oxygen, there were significant problems with oxygen delivery. Although 71% had orders for PRN sublingual morphine sulfate (MS), only 34.7% of residents with dyspnea received any MS on the day prior to death. Use of adjuvant medications was limited; only 20% of the residents had medical orders for lorazepam, and only 10% of patients received lorazepam on the day prior to death. **Conclusions:** Results suggest that the failure to utilize available pharmacologic and non-pharmacologic interventions contributed to dyspnea.

**PB6 451 USE OF PROTON PUMP INHIBITORS (PPI) AND THEIR ASSOCIATED RISKS AMONG FRAIL ELDERLY NURSING HOME RESIDENTS**

M. TERAMURA-GRONBLAD\* (Helsinki City Health Center, Espoo, Finland)  
H. SOINI(1), K. PITKALA(2) - (1) Helsinki City Health Center, Social Services (Helsinki, Finland); (2) University of Helsinki, Department of General Practice (University of Helsinki, Finland)

**Introduction:** Long-term use of PPIs to reduce the risk of GI-bleeding is common among frail elderly. We aim to test the associated risks of PPI use among frail elderly people in nursing home residents. **Methods:** A cross-sectional assessment of all nursing home residents (n=1987) was performed in Helsinki, Finland during February 2003. The association between PPI use and various characteristics, symptoms such as diarrhea, use of other drugs and presence of other diseases was studied. Logistic regression analysis was used to test the independent value of PPI use on diarrhea. **Results:** The nursing home residents (mean age 84y, 80% females) were administered following PPIs: omeprazole (423 patients), pantoprazole (1 patient), esomeprazole (2 patients) and lansoprazole (7 patients). The factors associated with regular PPI use in univariate analyses were inability to move independently, higher Charlson comorbidity index, higher mean number of medications and lactose intolerance. Users had had a prior ventricular or duodenal ulcer, cancer and coronary heart disease more often than the non-users, but less often a dementia diagnosis. In accordance with our hypothesis, the users of PPIs had more often diarrhea (19.7%) than the non-users (12.9%) ( $p<0.001$ ), and they had a prior hip fracture more often than the non-users ( $p<0.001$ ). In logistic regression analysis, where age, gender, Charlson comorbidity index, lactose intolerance, celiac, use of laxatives and calcium supplements were used as covariates, the use of PPIs had an independent association with diarrhea (OR 1.51, 95% CI 1.11 - 2.05). **Conclusion:** Long-term use of PPIs has adverse effects such as small bowel bacterial overgrowth and hip fracture known from prior small studies. Our study confirms the risk in a large epidemiological material. PPIs should only be prescribed for indications where there is proven.

**PB6 452 PRESSURE ULCER DEVELOPMENT IN BED- OR CHAIR-BOUND ELDERLY RESIDENTS IN NURSING HOMES: INCIDENCE AND RISK FACTORS**

E. KWONG \* (Hong Kong Polytechnic University , Hong Kong , China)  
S. PANG (1), G. ABOO(2) - (1) School of Nursing, the Hong Kong Polytechnic University (China); (2) Pamela Youde Nethersole Eastern Hospital (China)

**Introduction:** Elderly residents confined to beds or chairs in nursing homes have a comparatively higher risk of pressure ulcer development. Knowing the risk factors associated with their pressure ulcer development helps to design appropriate preventive nursing interventions. **Aim:** It aimed to identify the pressure ulcer incidence and risk factors affecting pressure ulcer development among bed- or chair-bound elderly residents in nursing homes. **Method:** The study used the secondary data from a prospective cohort study with 346 elderly residents aged 65 or above from four private nursing homes in Hong Kong. The subjects were initially collected clinical characteristics and assessed for eight pressure ulcer risk factors (sensory perception, moisture, mobility, friction and shear force, nutrition, skin type body build for height, nutrition) and skin in order to identify existing

pressure ulcers. Subsequently, they were assessed for skin every second day for 4 weeks to detect either new or first pressure ulcers. A total of 143 elderly residents who were either bed- or chair-bound were secondary analyzed for the incidence and the associated risk factors. **Results:** The pressure ulcer incidence rate was 48.3 %. In bi-variate analysis, all eight risk factors were significantly associated with pressure ulcer development ( $p=0.000-0.001$ ). The logistic regression model indicated that bed- or chair-bound residents with poorer mobility ( $\beta = -0.58$ ,  $p=0.009$ ), more severe problems of friction and shear force ( $\beta = -0.71$ ,  $p=0.014$ ) and having existing pressure ulcers ( $OR=1.681$ ,  $p=0.000$ ) tended to develop pressure ulcers. The data fit the model ( $x^2 = 7.761$ ,  $p=0.170$ ). **Conclusion:** Evidence-based interventions should be adopted to change and control body positions and minimize friction and shear force among bed- or chair-bound elderly residents in nursing homes, particularly those with existing pressure ulcers.

**PB6 453 BARRIERS TO HAND HYGIENE IN NURSING HOMES**

G. ALANO\* (North Shore-LIJ Health System, NY, USA, Mineola, NY, United States)  
M. SALMAN ASHRAF (1), S. HUSSAIN(2), M. RIVERA(4), N. AGARWAL(3),  
E. GEORGE-SAINTILUS(5), S. ASHRAF(6), G. EL-KASS(1), R. HUSSAIN(7),  
S. HEIDARIAN(1), G. WOLF-KLEIN(8) - (1) North-Shore LIJ Health System (United States of America); (2) Mayo Clinic (United States of America); (3) Loyola University (United States of America); (4) Akron General Medical Center (United States of America); (5) Destin Health Care and Rehabilitation Center (United States of America); (6) St. Barnabas Hospital (United States of America); (7) Krasnow Quality Management Institute (United States of America); (8) Lorber Center for Advancement of Medical Education (United States of America)

**Introduction:** Individual perceptions, professional education and practical limitations of healthcare settings are known to impact on hand hygiene in hospitals and ambulatory care centers. Yet, no similar data is available for long term care facilities. **Methods and Materials:** We developed a 52-question survey to determine nursing home employees' knowledge of current hand hygiene guidelines along with their self-perceived compliance and barriers to hand hygiene. Data analysis was primarily descriptive; for categorical variables either Chi-squared or Fisher Exact tests were used; for continuous variables, either t-tests or analysis of variance, were used. **Results:** Surveys were distributed in 14 nursing homes in 5 states. Overall 947 subjects responded and were grouped in certified nursing assistants (CNAs) (33.8%), nurses (30.3%) and others (35.8%). Only 291 (31%) subjects scored >90% on knowledge of current guidelines. Half (59.8%) reported not washing hands when they just went into patient's room to talk, 21.9% when they wore gloves, 27.9% when the patient needed immediate medical attention and 13.1% when patients didn't have serious medical problems. In addition, 19.5% recognized forgetting to wash hands when busy and many blamed absence of alcohol-based product (28.1%), soaps and towels (15.9%) or sinks nearby (15.1%). Overall, the three groups were different in identifying barriers ( $p<.001$ ). Nurses were more likely than CNAs to omit washing hands if they "just" spoke to patients (70.1% v. 48.9%,  $p<.001$ ), to report lack of alcohol based rub nearby (30.4% v. 16%,  $p<.001$ ) and to forget to wash hands when busy (33.7% v. 22%,  $p=.002$ ). **Conclusions:** Our data underlines the need to facilitate practice improvement programs in long term care facilities geared towards minimizing the barriers identified by nursing home employees.

**PB6 454 EVALUATION OF COMMUNITY NURSING CARE FOR THE ELDERLY IN CYPRUS**

C. KOUTA\* (Cyprus University Of Technology, Nicosia, Cyprus)  
C. KAITE(1) - (1) Cyprus University Of Technology (Nicosia, Cyprus)

**Introduction** Ageing demographic changes suggest an increased demand on health and social services and elderly prefer to be in their own homes and communities. The aim of the study is to evaluate the present situation in relation to the provision of community nursing care, particularly home nursing, the development of good practices, policies and interventions regarding the care of the elderly. **Methods and Materials:** This is a two year study, used both quantitative and qualitative methodologies: 1. In depth interviews with clients 2. Focus Groups with Community Nurses 3. In-depth interviews with key persons A semi-structured questionnaire was used to a) evaluate the clients needs b) evaluate the relationship between client and community nurse c) explore the most common interventions provided. A focus group guide as well as key person's interview guides were developed based on previous studies. The sample consisted of 100 clients that were randomly selected (aged 60+, female and male). Two focus groups with community nurses were carried out (n=11) in those. Six personal interviews were conducted with key persons such as the Head of Nursing Services and the president of the Parliamentary health committee. **Funding:** Cyprus University of Technology. **Results:** Preliminary findings showed that the majority of the participants were satisfied with care provided. However, several issues were raised, such as the need of a multidisciplinary team and the development of a legal framework for community. **Conclusions:** This study is considered as pioneer in Cyprus as it is the first time that community nursing care home services are evaluated. Policy makers, elderly organizations and the Ministry of Health should improve their collaboration and coordination aiming to provide a more holistic care, meeting the needs of the elderly and improving the quality of their care.

**PB6 455 PROFILE OF THE ELDERLY THAT REQUIRES NURSING HOME AT DISCHARGE**

M. BARCELÓ\* (Hospital de la Santa Creu i Sant Pau, Barcelona, Spain)  
R. PRATS(1), G. FUSTER(1), M. COMAS(1), O. TORRES(1), D. RUIZ(1), M. GELPI(1), E. FRANCIA(1), J. MASCARO(1) - (1) Hospital Santa Creu i Sant Pau (Barcelona, Spain)

**Introduction** The main objective is to define the characteristics of elderly patients requiring admission to a nursing home after entering a ward post-acute care, and as a secondary objective to see if there are differences in mortality and readmissions to hospital three months. **Patients and methods** We evaluated all patients older than 65 who were discharged for two years (from February 2005 to January 2007) ANOVA was used for quantitative variables and the chi-square for qualitative variables and statistically significant results were entered into a binary logistic regression. Results Of the 1063 patients who were discharged 59.6% were women, 38.9% had dementia, 77.2% lived at home (20.6% sons), 77.5% came from emergencies. Mortality to 3 months was 4.7% and 22.8% of readmissions. An 8.9% required a nursing home. The factors that were associated with the move to nursing home were prolonged hospital stay (42.62 vs. 16.34), lower albumin (31.63 vs. 32.90), lower hemoglobin (110.74 vs 115.27) previously being at home rather than in a retirement home (8.4% vs 0.6%) to be entered directly from emergencies (5.6% vs 3.3%), intrahospital complications (5.6% vs 3.4%) and not have a confusional syndrome during admission (2.7% vs 6.2%). There are fewer readmissions during the first three months (1% vs 7.9%) in patients referred to nursing home. In the logistic regression model remain the prolonged hospital stay, living previously in his home and confusional syndrome. Also re-entry in less than three months. **Conclusion** The profile of the elderly patient requires nursing home is the one that has a long hospital stay, coming from his home and that does not have a confusional syndrome.

**PB6 456 BALANCING THE SCALES TO IMPROVE OLDER PEOPLES SLEEP IN CARE HOMES**

I. EYERS\* (University of Surrey, Guildford, United Kingdom)  
E. COPE(1), T. ELLMERS(1), R. LUFT(1), S. ARBER(1) - (1) University of Surrey (Guildford, United Kingdom)

**Introduction:** This research identifies determinants of poor sleep in care homes as part of a four year New Dynamics of Ageing Collaborative Research Project (CRP), SomnIA (Sleep in Ageing), addressing practice and policy relevant issues arising from the nature, impact and management of the sleep-wake balance in later life. This is a complex cross-disciplinary research project, especially in light of the vulnerable group of older people living in care homes. The findings indicate a need to strike a balance between meeting individual care needs and institutional routines. **Methods and material:** In 10 care homes situated in South East England quantitative and qualitative data were collated from 140 male and female residents aged 65 - 100. For a period of two weeks participants wore Actiwatches and diaries denoting sleep and activity were maintained. To contextualise the environment in which this sleep research was taking place the quantitative data is supported by 275 hours of dawn, dusk and night observations, and interviews with residents (n=40) and staff (n= 78). **Results:** Data indicates disturbed sleep of residents at night and a lack of stimulus and motivation to stay alert during the day. Causes of the disturbances are strongly linked to nursing activities and institutional routine. **Conclusion:** Conflict between meeting care needs and the facilitation of sleep has been identified. These findings provide an evidence base from which policy makers and practitioners can undertake a much needed reconfiguration of how care is delivered in order to strike a balance between facilitating sleep and meeting care needs. This in turn could improve the daily quality of life experienced by older people requiring institutional long term care. This research is supported by the New Dynamics of Ageing initiative, a multidisciplinary research programme funded by AHRC, BBSRC, EPSRC, ESRC and MRC (RES-339-25-0009)

**PB6 457 ANY WEIGHT LOSS HAS A SIGNIFICANT INFLUENCE ON FUNCTION, HOSPITALISATION AND MORTALITY OF OLD DANISH NURSING HOME RESIDENTS**

A. BECK\* (Technical University of Denmark, National Food Institute, Søborg, Denmark)

**Introduction** A weight loss of 5 % or more per month increases the risk of death of nursing home residents by 10-fold and, at present, weight loss of this size is recommended to diagnose malnutrition. However, smaller weight loss may have a significant impact on the daily life of old residents. The purpose of this 1-year follow-up study was to assess the significance of any weight loss on function, hospitalisation, and mortality of old nursing home residents. **Methods and materials** Participants were 431 old (65+ y) residents, at 11 nursing homes in Denmark. They were assessed for (change in) weight, physical (ADL), cognitive (CPS), social (SE) function and hospitalisation by means of the Resident Assessment Instrument for nursing homes (RAI-NH) version 2.0, at baseline, and at follow-up after 6 and 12 months. Size of weight loss was defined as >1%/6 and 12 months, >5%/6 and 12 months and >10%/6 and 12 months. Statistics were analysis of variance and CHI-squared test. **Results** There was a significant association between weight loss after 6 months and loss of function (ADL ( $p=0.023$ ), SE ( $p=0.01$ )). There was a significant association between weight loss after 12 month and loss of function (ADL ( $p=0.003$ ), CPS ( $p=0.05$ ), SE ( $p=0.025$ ))). There was a significant association between hospitalisation and

loss of weight (>1%/6 months ( $p=0.004$ ), >5%/6 months ( $p=0.0000$ )). There was a significant association between death after 12 month and weight loss (>1%/6 months ( $p=0.0000$ ), >5%/6 months ( $p=0.014$ ))). **Conclusion** Weight loss - regardless of size - has a significant impact on function, hospitalisation, and mortality of nursing home residents. Preventive measures should be initiated at an earlier stage than recommended

**PB6 458 DESCRIPTIVE STUDY OF 4896 FRENCH NURSING HOMES RESIDENTS: RESULTS OF THE REHPA NETWORK ENQUIRY**

S. HERMABESSIERE\* (GERONTOPOLE TOULOUSE, TOULOUSE, France)  
S. GERARD(1), G. ABELLAN VAN KAN(1), S. GUYONNET-GILLETTE(1), Y. ROLLAND(1), B. VELLAS(1) - (1) Gerontopole Toulouse (Toulouse, France)

**Introduction:** Up to date very few research is performed in Nursing Homes (NH) and recommendation for quality of care, based on actual date, can hardly be made. The "réseau de Recherche en Etablissement d'Hébergement pour Personnes Âgées" (REHPA) is a functional network established, between the Geriatric Department of the Toulouse University Hospital and 240 NH, to overcome weak evidence-based recommendations and enhance research. **Methods and materials:** A cross-sectional observational study was set up between January and March 2008 to identify major health problems in NH in order to target future research. The number of residents included (randomly selected by birth date) depended on the total number of residents of the NH. Demography, medical and drug history, the presence of disabilities, and the usual care provided was assessed. **Results:** We report the results of 4896 residents of 240 nursing homes. Residents (73.9% women, 61.9kg  $\pm$ 14.8) were 85.7 years  $\pm$  8.8 old. ADL score was 2.8  $\pm$  2.1; 43.5% were demented (of which only 50.9% were treated); 19.6% had aggressive behaviors, 10.8% had verbal vocalisation, and 10.9% were wanderers; 27.4% were treated by antipsychotics; 54.4 % had hypertension; 8.7 % had diabetes; 14.8% osteoporosis; 4.1% had fallen during the previous week; 37.9% had pain; 19.8% lost weight; mean Charlson index score was 1.6  $\pm$  1.4; and finally 13.5% had an hospital admission in the last 3 months. **Conclusion:** The enquiry highlighted the specificity of NH residents and identified specific NH issues in order to target future NH field-research.

**PB6 459 PAIN IN COMMUNICATION IMPAIRED RESIDENTS WITH DEMENTIA: ANALYSIS OF RESIDENT ASSESSMENT INSTRUMENT (RAI) DATA**

C. BROWN\* (University of Alberta, Edmonton, Alberta, Canada)

**Introduction:** Pain is a significant and under-reported problem in the older adult and particularly in those persons with dementia faced with an impaired ability to communicate that they are in pain. Their pain, under-diagnosed and under-treated, has functional implications such as decreased ambulation, mood and sleep disturbances, impaired appetite and exacerbation of cognitive functioning. Functional and behavioral problems (like verbal and physical aggression) have also been linked to caregiver distress, inappropriate use of antipsychotic medication to manage behavior and premature institutionalization. Social myths about pain and aging, healthcare provider lack of knowledge and disproportionate fears related to pain medication and addiction compound the likelihood of unnecessary suffering in those least able to self-advocate. The Resident Assessment Instrument (RAI), widely used across North America for the collection of comparative data within healthcare settings, has been proposed as a source of longitudinal information from which profiles for chronic conditions (like pain) can be drawn. Clearer profiles will facilitate more effectively targeted interventions. This presentation will discuss the pain profile developed from such a review. **Methods and Materials** RAI data were statistically analyzed (SPSS version 14.0) in order to 1) identify a pain profile of all of the residents living in the facility across two sampling periods (Dec 2005 and Dec 2006) and 2) compare the pain profile of residents categorized into two subgroups (those with intact communication and with impaired communication). **Results:** Consistent with the literature, clear differences were demonstrated between pain reporting and management for communication impaired residents with dementia and residents with intact communication. Several incongruent findings were also demonstrated. **Conclusions:** The RAI is insufficient in itself for pain management purposes, particularly in the vulnerable group of residents with dementia and impaired communication. Pain assessment tools developed for this population must be employed.

**PB6 460 PREVALENCE OF PAIN, EFFICACY AND APPROPRIATENESS OF PAIN MANAGEMENT IN ELDERLY NURSING HOME RESIDENTS**

M. SOONG\* (St Mary's Hospital, Dublin, Ireland)  
D. POWER(1) - (1) St Mary's Hospital (Dublin, Ireland)

**Introduction** Pain is a frequent complaint in the elderly, and as the population ages, frailty and chronic diseases associated with pain will increase. This study investigates the prevalence and causes of pain in elderly nursing home residents and the efficacy and appropriateness of pain management in that setting. **Methods** We reviewed all case notes and drug records of inpatients in long stay wards in St Mary's Hospital and in Cuan Ros (community nursing home) in July 2008. As the majority of patients assessed were cognitively impaired (mean MMSE<20), questions asked during the pain interview were limited to simple yes or no answers. If the answer was yes, further questions as to the location of the pain and the severity using the numeric rating scale (NRS) were obtained. In patients who had severe or end stage dementia (MMSE<10), pain was assessed using the

Pain Assessment Checklist for Seniors with Limited Ability to Communicate (PACSLAC). Results A total of 270 patients were assessed, 40 from the community nursing home and 230 from the hospital setting long stay wards. Patients in the longterm care hospital setting were more likely to complain of pain (27% vs 17.5%, p<0.05) and were more likely to be on more than one analgesic agent (59% vs 45%, p<0.05) compared to those in the community nursing home setting. Approximately 25% of patients experience pain to some extent despite being on treatment. Pain was found to be more common among immobile patients(27% vs 22%) in female patients. (26% vs 24%) Conclusion Pain is a frequent complaint in nursing home patients. It is important to inquire about pain and treat any complaints. Our current knowledge of pain in the elderly is incomplete and there is a need for increased research and education.

**PB6 461 A FOLLOW-UP STUDY OF HEALTH STATUS IN PATIENTS WITH CHRONIC LOW BACK PAIN BEFORE AND AFTER SPINAL SURGERY**

I. ROOPSAWANG\* (Bann Mee Hospital, Ministry of Public Health, Lopburi, Thailand)  
S. AREE-UE (1), P. PUTWATANA (2) - (1) Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University (Bangkok, Thailand); (2) Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University (Bangkok, Thailand)

**Background:** Low back pain (LBP) is commonly known as musculoskeletal disorder in adults and older adults. Spinal surgery is widely performed to improve health status and quality of life; subjective evaluations by patients, therefore, are becoming increasingly imperative for monitoring outcomes before and after surgery. **Objective:** This prospective descriptive study was to compare health status in patients with chronic low back pain before and after spinal surgery, at a 6-week follow-up. **Methods:** Sixty-eight eligible patients (mean age = 68; SD = 15.42) were as follows: 20 years of age and over; diagnosed LBP with degenerative spinal diseases; and received spinal surgery as the first treatment. Data were obtained from patients admitted to orthopaedic wards at three government tertiary care hospitals in Bangkok, from February to August 2008. Statistical analysis was performed by using paired t-test. **Results:** Findings showed that health status of the participants was significantly improved postoperatively. Moreover, approximately 20 % of patients perceived moderate or severe disability at 6-week follow-up, while nearly 80 % of those perceived severe disability at the baseline assessment. **Conclusions and recommendations:** Subjective evaluation tools which provide the benefits of general and specific health status related to spinal problems can help identify patients who will benefit from surgical treatment. Additionally, although postoperative disability seems to be decreased, the continuing care of the adult and older adult patients with chronic low back pain is needed in order to restore the functional ability that could improve their health status affecting over all their quality of life.

**PB6 462 ASSESSMENT OF CHRONIC PAIN IN ELDERLY PATIENTS WITH VERBAL COMMUNICATION DISORDERS**

G. AIME\* (Centre Hospitalier Départemental de BISCHWILLER, BISCHWILLER, France)  
S. BAMBIS(1), M. SCHATZ(1), R. KAUFFMANN(1) - (1) Centre Hospitalier Départemental de BISCHWILLER (Bischwiller, France)

The objective of this presentation is to demonstrate the prevalence of chronic pain in elderly patients who are unable to express this symptom verbally. In this case the auto Assessment is almost impossible. In fact, in this population pain is frequent, not easy to assess (dementia, sensory impairment, cerebral accident...) A prospective transversal study is organised on 97 patients with verbal communication disorders, living in long-term units and in old people's home. The average of age is 80 years. The selection is done on medical basis; the sample is well determined and randomised. The study is done over a week. Pain is detected in 20 out of 97 patients (20.6%). The prevalence of pain in this population living in long-term units is 30% (17 out of 63 patients); on the other hand it is 8.7% (3 out of 34) in elderly living in old people's home. Visual analogue scales (VAS) are almost impossible to use it in this population. The Verbal scales (auto Assessment) is proved useful in 50% (50 patients) to define the intensity of pain meanwhile the behavioural assessment scales (Pain hetero assessment by the care givers) for elderly subjects with verbal communication disorders are a must in 47 patients (48.5%).

**PB6 463 THE PSYCHOMETRIC QUALITY OF FOUR OBSERVATIONAL PAIN TOOLS (OPTs) FOR ASSESSING PAIN IN ELDERLY PEOPLE WITH OSTEOARTHRITIC PAIN**

J. LIU\* (The Hong Kong Polytechnic University, Hong Kong, Hong Kong)  
J. CLOSS (2), M. BRIGGS(2) - (2) The University of Leeds (Leeds, United Kingdom)

**Introduction:** Pain in cognitively impaired elderly people (CIEP) is difficult to identify and often goes unrecognized. Observational Pain Tools (OPTs) have been designed but, the validating studies have limitations. **Methods:** The current study has taken steps to overcome these limitations to ascertain the psychometric qualities of the OPTs. The psychometric properties of four OPTs (i.e. Checklist of Nonverbal Pain Indicators [CNPI], Pain Assessment in Advanced Dementia Scale [PAINAD], Abbey Pain Scale and Discomfort Scale- Dementia of Alzheimer type [DS-DAT]), 2 self-reported scales and 2 proxy-reported scales were compared for the assessment of osteoarthritic pain (OA) among CIEP. Participants with OA pain were stratified into 2 groups (n=124) (Group 1 No/Mildly CIEP; Group 2 Moderately/Severely CIEP). They were observed by 3 raters simultaneously in 4 time periods (i.e. I: No movement of the affected joints; II: standardised exercises with movement of the affected joints). The procedures were repeated at 4 to 7 days later. The participants rated pain on the self-reported scales. Their nurses rated clients' pain on the proxy-reported scales. **Result:** Similar patterns of reliability / validity were obtained in all OPTs. Better levels of psychometric properties were consistently obtained during the exercises. In confirmatory factor analysis, a single factor (i.e. OA pain) appeared only in the PAINAD and the Abbey PS after the deletion of "Breathing" and "Physiological change" indicators, suggesting that these indicators are not sensitive for detecting OA pain. Conversely, "Facial expressions," "Body movements" and "Vocalisations and Verbalisations" were sensitive for detecting OA pain during the exercise. **Conclusion:** The results of this study provide strong evidence for the validity and reliability of the PAINAD and the Abbey PS for assessment OA pain during the standardised exercise programme among elderly people regardless of their

**PB6 464 AN ACTION-BASED APPROACH TO IMPROVING PAIN MANAGEMENT IN LONG-TERM CARE**

S. KAASALAINEN\* (McMaster University, Hamilton, ON, Canada)  
K. BRAZIL(1), J. PLOEG(1), F. DONALD(2), E. COKER(1), A. DICOSEN(1), R. MARTIN-MISENER(3), T. HADJISTAVROPOULOS(4), T. BURNS(5) - (1) McMaster University (Hamilton, ON, Canada); (2) Ryerson University (Hamilton, ON, Canada); (3) Dalhousie University (Hamilton, ON, Canada); (4) University of Regina (Hamilton, ON, Canada); (5) Ontario Ministry of Health (Canada)

**Introduction:** Pain management for older adults in long-term care (LTC) has been recognized as a national and international problem. Untreated pain can lead to depression, loneliness, impaired mobility, sleep disturbances, and decreased quality of life. The purpose of this study was to develop an interdisciplinary approach to improve pain management in long-term care (LTC) in light of the barriers and facilitators that exist within the current system. **Methods:** We used a case study approach based on a concurrent mixed model design that included both qualitative and quantitative components. Environmental scans were conducted at two LTC sites. Data was collected via focus groups and interviews with key stakeholders across all health care provider groups, and administration. In addition, a document review and a short survey were conducted to assess the perceptions of barriers related to pain management. **Results:** The environmental scan findings revealed many barriers to effective pain management in LTC, including those at the resident/family level (i.e., challenges in reporting pain, family concerns, need for individualized pain treatments); health care provider level (i.e., challenges in assessing pain, reluctance to use pain medications, lack of knowledge, lack of communication across care provider groups, lack of continuity of care); and system level (i.e., inadequate accreditation and compliance standards for governing bodies, lack of support and resources for staff in changing practice, lack of strong leadership to implement change). Based on these findings, a multi-tiered model was developed with proposed interventions to address these barriers. **Conclusions:** This model can be used to align and guide the development of innovative approaches to improving pain management in LTC settings, with the ultimate goal of improving pain management services across all levels of care.

**PB6 465 PERCEPTIONS OF THE NURSE PRACTITIONER ROLE AROUND PAIN MANAGEMENT IN LONG-TERM CARE**

S. KAASALAINEN\* (McMaster University, Hamilton, ON, Canada)  
F. DONALD(2), R. MARTIN-MISENER(3), N. CARTER(1), A. DICOSEN(1), P. BAXTER(1) - (1) McMaster University (Hamilton, Canada); (2) Ryerson University (Hamilton, Canada); (3) Dalhousie University (Hamilton, Canada)

**Introduction:** Considering the high rates of pain in long-term care (LTC) settings, research is needed to explore innovations in health services delivery, including the emerging nurse practitioner (NP) role. The purpose of this study was to explore the perceptions of LTC health care providers and administrators around the NP role in pain management with an emphasis on elucidating barriers and facilitators to optimizing the use of NPs in LTC around pain management. **Methods:** This study was grounded in a qualitative approach utilizing an exploratory descriptive design. Data was collected using 5 focus groups of nurses, and 16 individual interviews with other health care providers and administration. Data was analyzed using thematic content analysis. **Findings:** Participants described the current implementation of the NP role mostly in the areas of assessing pain, prescribing some pain medications, monitoring pain levels and side effects of pain medications, advocating for both staff and patients, and providing staff education related to pain management. Factors that influenced how the role has been implemented (i.e., limited scope, lack of clarity of NP role, workload demands) and perceived outcomes of the NP role (i.e., thorough assessments, consistent care, more time spent with residents, efficient ordering of pain medications and tests, timely follow-up with resident pain concerns) were also described. Areas that were suggested for future role development related to pain management included becoming more engaged with medication reviews and completing physical assessments. **Conclusions:** The findings from this study contribute to our understanding of how the NP role is perceived by other health care professionals, particularly around pain management. Stronger interdisciplinary collaborative relationships

need to be facilitated within a model of care that includes an NP, with the ultimate goal of improving pain management services in LTC.

**PB6 466 PAIN MANAGEMENT: HOW MUCH DO HEALTHCARE PROVIDERS KNOW?**

M. TSE\* (The Hong Kong Polytechnic University , The Hong Kong Polytechnic University , Hong Kong)  
S. HO(1) - (1) The Hong Kong Polytechnic University (Hong Kong, Hong Kong)

Introduction Pain is the fifth vital sign, and effective pain management requires accurate knowledge, attitudes and assessment skills. Methods and materials To determine the knowledge and attitudes of healthcare providers in pain management, healthcare providers working in two nursing homes were invited to join the study. There were 29 healthcare providers (2 registered nurses, 2 enrolled nurses, and 25 healthcare workers). They were asked to complete a questionnaire and attend a short interview regarding their opinions and experiences in caring for elderly people in pain. The questionnaire – The Nurses' Knowledge and Attitudes Survey Instrument questionnaire developed by McCaffery and Ferrell – was translated into Chinese and used with permission. The Chinese version of the NKASRP consists of 25 items about general pain management, pain assessment, and the use of analgesics. Higher scores indicate a better knowledge and understanding of pain management. Results The majority of the participants were healthcare workers who had more than 5 years of practical experience. Their clinical practices were primarily in medical, geriatric, and surgical units. In terms of educational level, 26% of the participants had a certificate. Only 5% of the respondents reported ever attending a pain management course. The mean score from the percentage of correct responses on the NKASRP was 8, which was considered quite low. There was statistical significance in educational preparation and clinical experience with correct scores. Participants stated that they would report to physicians regarding the pain situation of older persons, yet they would seldom use non-pharmacological strategies to relieve pain. Conclusion The findings of our study support the concern regarding inadequate knowledge and attitudes in relation to pain management. Further intensive continuing education and staff development are highly indicated for nurses and healthcare providers.

**PB6 467 STRONG OPIOIDS IN TREATMENT OF CHRONIC PAIN ON SENIORS IN PALLIATIVE CARE - CLINICAL RESEARCH**

L. KABELKA\* (St. Joseph's hospice and pain centre Rajhrad, Caritas Czech Republic, Rajhrad, Czech Republic)  
H. VERA(1) - (1) St. Joseph's hospice and pain centre (DLBsH) Rajhrad (Rajhrad, Czech Republic)

Introduction: St. Joseph's hospice and pain centre Rajhrad is 50-beds medical institution for specialized palliative care with pre and post-gradual educational programme. We concentrate on oncologic and non-oncologic (mostly geriatric) palliative care programme in association with chronic pain treatment. The continuous study "Strong opioids in treatment of chronic pain on seniors in palliative care" have been started (the end of 2008) with goals – treatment effectiveness, side effects, holistic treatment management. Methods and materials: Patients was divided to several groups depending on their age (75-83, 84-89, 90 and up), functional ability or handicap (ADL, MMSE, nutrition, hand grip) and clinical period of the disease (stable state, turning point period, terminal period). Parameters of evaluation – indication of opioid therapy, optimal dose and titration process, side effects, co-operation of patient and family, complications, rotation of opioids or fail therapy and their reasons. Results, conclusion Strong opioids at frail geriatric patients need clinical experience, dose titration and disponsible wide spectrum of pharmacological types for rotation possibility. Results of our study are not still disponibile, but the goal of presentation will be to release a current conclusion and evaluate how opioid drugs are using in Czech palliative care and geriatric environment.

**PB6 468 RHEUMATIC-LIKE SYNDROME REVEALING LATE-ONSET PRIMARY EMPTY SELLA IN AN ELDERLY WOMAN.**

E. ANTON\* (Hospital of Zumarraga, Zumarraga, Spain)

Introduction. Primary empty sella (PES) has been related to a congenital incomplete formation of the sellar diaphragm resulting in herniation of the subarachnoid space within the sella and increasing the intracranial pressure. Its clinical picture is often nonspecific. Case Report. A 75-year-old woman reported three weeks of severe pain and contracture in both thigh associated to progressive difficulty for walking. Response to analgesics and NSAID was limited. Her past medical history was unremarkable. Physical examination showed pronounced stiffness and pain in the aductor muscles of both thigh. Movement of lower extremities was painful. Laboratory test results: sodium 118 mEq/l, potassium 4.4 mEq/l, creatin-kinase 356 U/l (0-167), LDH 777 U/l (240-480), C-reactive protein 2.0 mg/dl (0-0.5). Thyroid function: serum level of T4 was < 0.4 ng/dl (0.93-1.70), TSH 1.31 mIU/ml (0.27-4.2). FSH 1.7 mIU/l (26.5-139.0), LH 0.4 mIU/l (20-65). At 10 AM, g/dl (5-20) and 29.4 μg/ml and plasma ACTH levels were 3.5 g (10-90). A short ACTH<sub>1-24</sub> pg/ml (0-52). 24-h urinary cortisol was 6.0 stimulation test showed low serum cortisol response. CT scan of the brain and sella revealed an empty sella. Replacement therapy was started. She has remained well since. Discussion. Most common symptoms

reported as presentation of PES were headache, visual disturbances, rhinorrhea, endocrine dysfunction and/or hypopituitarism. Endocrinological testing demonstrated in this patient secondary adrenal insufficiency and hypopituitarism related with PES. Patients with slow onset adrenal insufficiency usually complain of constitutional syndrome, abdominal pain, nausea and diarrhea. The clinical presentation of PES in this patient as pseudopolymyositis has not been reported previously.

**PB6 469 POLYMYALGIA RHEUMATICA (PMR):THE IMPACT OF NEW DATA FROM EULAR (EUROPEAN LEAGUE AGAINST RHEUMATISM)CONGRESS 2001-2008: DIAGNOSIS,RESPONSE CRITERIA, PMR ACTIVITY SCORE AND TREATMENT**

B. VERLHAC\* (Hôpital Sainte Périne APHP, Paris, France)

PMR is a disorder of unknown etiology which affects people over the age of 55, the average age at onset of the disease is 70. Giant cell arteritis (GCA), is associated in 10% to 20% of patients with PMR. Diagnostic criteria and the exclusion criteria PMR was determined by the Bird/Wood criteria (sensitivity of 92%, specificity of 80%). In addition to these criteria, a rapid response to oral steroids, provided a sensitivity of 99% in diagnostic performance(EULAR 2001). With ultrasound and MRI were seen bilateral subacromial/subdeltoid bursitis, joint synovitis, and cervical interspinous bursitis. These typical clinical and imaging features make the diagnosis of PMR relatively straightforward. Connective tissue diseases may mimic the clinical picture of PMR: seronegative elderly onset rheumatoid arthritis, RS3PE syndrome, late onset systemic lupus erythematosus, proximal symptoms of myositis, systemic vasculitis (PAN). Oral steroids are the main PMR treatment. Methotrexate treatment may be an alternative to prednisone alone for those patients who are at high risk of steroid-related toxicity. In contrast, TNF-alpha antagonists are probably ineffective (EULAR 2006) PMR response criteria. The European collaborative PMR group in 2003 develop PMR response criteria, for the purpose of monitoring therapy and for comparing alternative treatment with corticosteroids. A PMR activity score (AS), an easily applicable and valid tool for monitoring disease activity, and in combination with the PMR response criteria provides a better description of response(EULAR 2004). Improved knowledge of disease activity processes, monitoring activity and treatment responses, and increased treatment benefits can improve care of patients with PMR.

**PB6 470 DEVELOPING THE ABBEY PAIN SCALE JAPANESE VERSION**

Y. TAKAI\* (Tokyo Medical and Dental University, Bunkyo-ku Tokyo, Japan)  
Y. NISHIKAWA(1), Y. CHIBA(1), Y. SUGAI(2), K. HAYASHI(3), N. YAMAMOTO-MITANI(1) - (1) Tokyo Medical and Dental University (Bunkyo-ku Tokyo, Japan); (2) Yokohama City Hospital (Japan); (3) Gunma University (Japan)

Introduction: Pain among older persons with dementia is difficult to assess. The purpose of this study was to develop and validate the Japanese Version of the Abbey Pain Scale (APS-JV) to assess pain of older adults who are not able to verbalize their experience due to dementia. Methods and materials: The original Abbey Pain Scale (APS) was a 6-item, observational scale developed in English. In this study data were collected on demographics, the Barthel Index, the MMSE, the APS-JV, and the Verbal Descriptor Scale (VDS) of pain, from residents in two nursing homes in Japan. Two researchers independently assessed the residents' pain using the APS-JV while the residents walked or were transferred from bed to a wheel chair. Examined were intra-class correlation coefficients (ICC) for inter-rater and test-retest reliability, Chronbach's alpha of the APS-JV, and correlation between the APS-JV and other variables. The processes of research were examined and permitted by the ethical committee in the organization the nursing homes belonged, and consent from participants and/or their families was obtained before data collection. Results: Back-translated version of the APS-JV was given affirmation by the original author of the APS with minor changes. Altogether 171 residents were rated. The ICC for inter-rater and test-retest reliability were .824 and .657, respectively. Internal consistency was .645 and .719 for the total sample and for those who were 0 in the MMSE (n=58), respectively. Multiple regression analysis revealed that contractures (p<.001), previous injuries (p<.001), the MMSE (p=.003) and paralysis (p=.018) were independently associated with the APS-JV. The APS-JV and VDS were moderately correlated ( $r=.49$ ; p <.01). Conclusion: Findings show some evidence of reliability and validity of the APS-JV.

**PB6 471 RAPID EMERGENCY MEDICAL SCORE IN THE ELDERLY: PREDICTION OF MORTALITY, ADMISSION TO HOSPITAL AND RE-ATTENDANCE**

A. MILNE\* (Leicestershire Partnership NHS Trust, Leicester, United Kingdom)  
A. RATCHFORD(1) - (1) Mona Vale Hospital (Australia)

Introduction: The Rapid Emergency Medical Score (REMS) is a 26-point score, recently developed as a research and triage tool. It has been shown to be effective in predicting in-hospital and long-term mortality in non - surgical patients. No studies to date have examined the relative prognostic value of REMS in the over-75 age group. A pilot study was conducted to examine whether REMS was predictive of admission to hospital, 30-day mortality and 30-day re-attendance in non-surgical patients aged over 75 years attending ED. Methods: A list was compiled of every patient aged over 75 who had attended the

Emergency Department in the first 14 days of April 2006. After exclusion of surgical and relatively minor presentations, records were retrieved and data collected on the physical parameters to calculate REMS (mean arterial pressure, heart rate, respiratory rate, oxygen saturation, Glasgow coma scale and age), the Carlson Comorbidity Index (CCI) and data on admission to hospital, 30-day mortality and 30-day re-attendance. Results: Data were collected on 41 patients (mean age 83). There were two deaths within 30 days, both of whom had REMS above 7, and one death after 61 days who had REMS of 11. REMS was not found to be statistically predictive of admission to hospital ( $p=0.092$ , 95% CI: -2.961 to 0.233), or 30-day re-attendance to ED ( $p = 0.134$ , 95% CI: -0.431 to 2.9660). There was no significant correlation between REMS and CCI ( $p=0.394$ ). Conclusions: In patients aged over 75 years the REMS score may act differently as a predictive tool, owing to idiosyncrasies in physiology of older patients. An important difference may well remain undetected, as this was a small pilot study. A larger study is therefore suggested.

**PB6 472 PATIENT'S PROFILE ADMITTED AT A GERIATRIC PUBLIC HOSPITAL FROM SANTIAGO-CHILE.**

Y. ARAVENA\* (Geriatric National Institute- Santiago Chile, Santiago, Chile)  
J. SILVA(1), P. HERRERA(1) - (1) Geriatric National Institute (Chile)

**INTRODUCTION:** The Geriatric National Institute is a public hospital that gives health attention to older adults. The evidence increase of the old population in Chile has meant an important rise in recurrent pathologies, sometimes invalidating, with difficult treatments and high costs. **METHOD:** It checks clinical 226 histories. Some items were: pathologies, geriatrics syndromes, functionality, BMI, dental, plasmatic lipids, glucose and album. All patients are evaluated by a multiprofessional staff, applying valuation instruments, doing clinical tests, diagnosis of diseases, and a therapy it is developed. **RESULTS:** The sample it is constituted by 76 males and 150 women, with an average age of 78 years old. The pathologies of more prevalence were: Hypertension in 65.93%, Diabetes Mellitus 21.68% stroke 19.48 %, anemia 11.95 % and renal insufficiency the 11.5 %. The geriatrics syndromes were: walking disorders 64.1 %, inflexibility 45.7 %, cognitive damage 29.6 %, emotional disorders 26.9%, urinary incontinence 21.5 % and falls 18.3 %. Functionality conditions: Spanish Red Cross scale, in the level 5: physic 27.43% and psychic 28.32%. FIM, Motor, less than 80 points the 70%, cognitive less than 20 points the 30.97%. Dental conditions, the 40% doesn't use prosthesis.. The cholesterol levels, 19.47% present level over 200 mg/dl, TG, 20.8 % has more than 150 mg/dl. Plasmatic glucose over 100 mg/dl, 18.58%, BMI 23-28 kg/m<sup>2</sup> are 50.8 % and plasmatic album low 3.5 mg/dl are 61.95%. **CONCLUSIONS:** 1.- Doing a valuation at the entrance of each hospitalized patient allows us get different patients profiles, candidate, at the same time, to different levels attention once their acute illness is treated. 2.-Is evident the loss of functionality, prevalence of cardio and brain vascular pathology, hight frecuence of geriatric Syndrome.

**PB6 473 RISKS MANAGEMENT – AN EFFECTIVE TOOL FOR IMPROVING QUALITY OF CARE IN SHOHAM GERIATRIC HOSPITAL , PARDES- HANNA, ISRAEL**

T. SHMUELI\* (SHOHAM GERIATRIC HOSPITAL ISRAEL, ZICHRON YACOV, Israel)  
R. HAR NOY(2), J. DR.BEN ISRAEL(3) - (2) shoham griatic hospital (Pardes hana, Israel); (3) shoham griatic hospital (Israel)

Risks management is an effective tool that enables constant organizational evaluation. Staff members might be involved in the process and they should be directed toward efficient decision making, in order to improve quality of care in the facility. The workers and managers of the facility believe that risks management is an integral part of quality alignment and by using this tool there is a real opportunity to minimize damages caused by the medical system and eventually to improve processes. A special inter-professional team was gathered. The team members participated in additional training and further education sessions. The first task of the team members had been developing a sophisticated system of risks management that enables tracing errors or potential errors – everything based on reports transferred by the patients. Elderly patients are in high risk for accidents. As part of our duty, we collected information and data about dozens cases of injuries in the facility in order to develop higher standards of work and to prevent the next injury. Members of the “task force” proposed creative and innovative ideas in order to improve the situation and to prevent injuries. Examples: Higher bed panels, Anti Tipper , Safety belts, Chairs designed for bathing with safety mechanism, Changing the daily schedules/routines. In 2004, a special project was launched to prevent injuries of mentally frail patients. Hip protectors were used in order to prevent injuries of the hips. The results were outstanding: there was a decline of 85% in the injury rates. It became a standard of work in 2005, according to the Ministry of Health. I am going to present statistical data (data collected between 2000 – 2007) as well, in order to strengthen our initial hypotheses regarding injuries, reports and medical/nursing errors.

**PB6 474 GERIATRIC ORAL HEALTH INDEX (GOHAI) X CLINICAL EXAMINATION**

M. CARRÉRA\* (Brazilian Gerontology / Geriatric, Recife/PE, Brazil)  
A. MARQUES(1), S. AUSTREGÉSILO(2) - (1) UFPE (Recife/PE, Brazil); (2) UFPE (Recife/PE, Brazil)

Introduction: In the past the elderly population corresponded to a relatively small parcel and, as in general, most of them edentulous. Today we note, the emergence of a new

elderly class, with more education, political information and, most important having increasingly dental elements. To evaluate oral health it is evident the limitation of classical practices to measure the odontological problems and resulting treatment indication. Index as DMFT (Decayed, Missing and Filled Teeth) or the CPI (Community Periodontal Index) takes in account only the clinical dimensions. Atchison & Dolan (1990), developed the Geriatric Oral Health Index (GOHAI) as a way to measure self perceived geriatric oral health. Objectives: evaluate self perceived oral health by elderly, using the Geriatric Oral Health Index (GOHAI), identify the presence or absence of dental caries, periodontal disease, edentulous and prostheses. Methodology: This is a cross sectional epidemiological study, the sample composed by 157 individuals with 60 years or more, registered at the outpatients geriatric specialized at the Pernambuco Federal University/UFPE, where the interviews was carried out and also the oral examination. Results: most of participants were female 77.1%, dental caries absence in 72.6%, periodontal disease in 71.3%, edentulous in 65.0%, and prostheses presence in 88.5%. With respect of the Geriatric Oral Health Index (GOHAI), 53.5% classified it as very good, 40.8% as good and 5.7% as bad. Conclusion: the results lead us to conclude that clinical results, objectives, were compatible with subjective data obtained through GOHAI instrument and can be a good predictor for oral health assessment, when in combination with other indicators.

**PB6 475 SELECTED FACTORS PREDICTING OSTEOPOROSIS PREVENTIVE BEHAVIOR AMONG NURSING PERSONNEL**

P. YOUNGCHAROEN\* (Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand)  
S. AREE-UE(1), P. MALATHUM(1) - (1) Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital (Bangkok, Thailand)

**Background:** Osteoporosis is a silent disease affecting primarily women. Consequently, postmenopausal women will suffer an osteoporotic problem during lifetime. The current approach to the assessment of several risk factors based on the osteoporosis preventive behaviors (OPPB) is needed. **Purpose:** The aims of this descriptive correlational study were: to investigate the relationship between selected factors (age, education level, income, body mass index, hormone replacement therapy, knowledge about osteoporosis, and health belief about osteoporosis) and OPPB; and to examine the power of the selected factors to mutually predict OPPB among nursing personnel. **Methods:** A total of 170 nursing personnel aged between 20-60 years working at three government tertiary care hospitals in Bangkok were recruited in the study. Data were collected from April to June 2008 using instruments including: the Demographic Questionnaire; the Osteoporosis Knowledge Test; the Osteoporosis Health Belief Scale; the Osteoporosis Self-Efficacy Scale; and the Osteoporosis Preventive Behavior Questionnaire. Statistical analysis was performed by using descriptive statistics, Pearson's product moment correlation coefficient, Spearman rank order correlation coefficient, and multiple regressions. A p value < .05 was considered statistically significant. **Results:** Findings revealed that participants have had moderate knowledge about osteoporosis, and 89.2% of those had low level OPPB. Moreover, a significant inverse relationship was noted between perceived barriers of osteoporosis preventive behavior and OPPB, yet a positive relationship was noted between self – efficacy and OPPB; and health motivation in osteoporosis prevention and OPPB. All selected variables could together explain 28% of the variance in OPPB; self – efficacy in osteoporosis prevention emerged as the strongest predictor of OPPB among participants. **Conclusions and recommendations:** This result suggests that further study needs to emphasize what interventions increase osteoporosis knowledge and promote osteoporosis preventive behavior among nursing personnel for decreasing the risk of osteoporotic fractures in later life.

**PB6 476 ADHERENCE PROFILE TO HIGHLY ACTIVE ANTIRETROVIRAL THERAPY OF THE PACIENTS OVER THE 50 YEARS OUTPATIENTS ATTENDED IN THE INFECCIONS DISEASE DEPARTMENT OF UFTM.**

G. PARDI\* (Universidade Federal do Triângulo Mineiro, Uberaba, Brazil)  
D. CORREIA(1) - (1) UFTM (Uberaba, Brazil)

Since the introduction of highly active antiretroviral therapy (HAART), AIDS patients have been provided with the possibility of growing old with the disease. Elderly HIV (human immunodeficiency virus)-positive individuals form an emerging category in industrialized countries. We hypothesize that HIV-positive individuals over the age of 50 years would have combination of factors contributing towards worse adherence to antiretroviral treatment than among younger individuals. Patient adherence to HAART was defined as cases in which the individuals attended consultations and took their medication away with them every month for six months, or only missed one appointment and/or one dispensation of the medication (which would correspond to 80% adherence). A prospective cohort study was conducted concurrently with a cross-sectional study, for six months, with 101 individuals who were making regular use of HAART fulfilled the inclusion criteria. Adherence to the antiretrovirals was assessed according to the monthly dispensation of the medication, presence at consultations and self-reporting, in two groups: younger individuals (50 patients) and over 50 years old (51 patients). Epidemiological, neuropsychiatric and socioeconomic data were collected by means of the Mini-mental State questionnaire (to assess cognitive decline), the Geriatric Depression Scale (to assess depression) and investigations of patients' medical records, for descriptive statistical analysis, univariate and multivariate analyses and correlation tests. Among the variables

analyzed, no separate significance regarding adherence to HAART was found. However, Spearman correlation analysis showed greater adherence to HAART among the younger group, after adjusting for age. We could conclude that the older individuals presented lower adherence than did the younger ones. Furthermore, out of all the variables studied, no single factor was identified as a determinant for the level of adherence to HAART among the older group of patients. The adherence process must therefore be multifactorial.

**PB6 477** A PILOT STUDY OF BANXIA HOUPE TANG, A TRADITIONAL CHINESE MEDICINE, FOR REDUCING PNEUMONIA RISK IN OLDER ADULTS WITH DEMENTIA

K. IWASAKI\* (Tohoku University, Sendai, Japan)

S. KATO(1), Y. MOMMA(2), R. OKITSU(2), N. YAEGASHI(2), H. ARAI(3) - (1) Department of Cardiology and Pneumology School of Medicine, Dokkyo University (Utsunomiya, Japan); (2) Center for traditional Asian medicine, Tohoku University (Sendai, Japan); (3) Department of Geriatrics and Gerontology, School of Medicine, (Sendai, Japan)

Objective: To evaluate whether the traditional Chinese herbal medicine "Banxia Houpu Tang" (BHT, formula magnolia et pinelliae) prevents aspiration pneumonia and pneumonia related mortality in the elderly. Design: A prospective, observer blinded, randomized control trial. Setting: Two long-term care hospitals for handicapped elderly patients in Japan from March 2005 to February 2006. Participants: A hundred and four elderly patients (31 men and 73 women; age  $83.5 \pm 7.8$  [mean  $\pm$  SD] years) with cerebrovascular disease, Alzheimer's disease, and/or Parkinson's disease. Measurements: The occurrence of pneumonia, mortality due to pneumonia, and the daily amount of self-feeding. Interventions: 95 participants (mean age was  $84.0 \pm 6.5$ , M:F= 28:67) were randomly assigned to the BHT treatment group ( $n = 47$ ) or the control group ( $n = 48$ , control) and took BHT or placebo for 12 months. Results: Ninety-two cases were statistically analyzed. Four patients in the BHT group developed pneumonia and 1 died as a result of pneumonia. Fourteen patients in the control group developed pneumonia and 6 of them died as a result. There was a significant difference between the two groups in pneumonia onset ( $p=.008$ ), and a tendency toward significance in pneumonia related mortality ( $p=.05$ ). The relative risk of pneumonia in the BHT group compared with the control group was 0.51 (95% C.I. 0.27-0.84,  $p=.008$ ) and that of death from pneumonia was 0.41 (95% C.I. 0.10-1.03,  $p=.06$ ) according to the Cox proportional hazards mode. No adverse events were observed by the treatment with BHT. The daily amount of self-feeding was significantly maintained in the BHT group compared to the control group ( $p=.006$ ). Conclusion: BHT reduced the risk of pneumonia and pneumonia-related mortality in elderly patients.

**PB6 478** ASSOCIATION OF SOME SPECIFIC NUTRIENTS WITH PERIODONTAL DISEASE IN OLDER ADULTS: A SYSTEMATIC LITERATURE REVIEW

G. VAN DER PUTTEN\* (Zorgaccent Amersfoort, Amersfoort, The Netherlands)

L. DE VISSCHERE(1), J. VANOBBERGEN(2), J. SCHOL(2), C. DE BAAT(3) - (1) Department of Community Dentistry and Oral Public Health, Ghent University (Ghent, Belgium); (2) Department General Practice, Maastricht University (Maastricht, The Netherlands); (3) Department of Oral Function and Prosthetic Dentistry, Radboud University Nijmegen Medical Centre (Nijmegen, The Netherlands)

Objective: Over the past decades, the proportion of adults who have retained their teeth until late life has increased substantially, from 30% to 65%. Periodontal disease is a serious concern in older adults retaining their teeth. Deficiency of vitamin B-complex, vitamin C, vitamin D, calcium, and magnesium has been associated with periodontal disease. Study Aim: Systematically review of the current available literature on the association of vitamin B-complex, vitamin C, vitamin D, calcium, and magnesium with onset or progression of periodontal disease in adequately nourished adults aged 50 years and older. Method: Systematic review of relevant English and Dutch medical literature published between January 1990 and May 2007 with critical appraisal of those studies evaluating the association of vitamin B-complex, vitamin C, vitamin D, calcium, and magnesium with onset or progression of periodontal disease in older population groups. Results: No significant or consistent association was found of vitamin B-complex, vitamin C, vitamin D, calcium, and magnesium intake with periodontal disease onset or progression in populations of adequately nourished, non-institutionalised older adults. Although low vitamin C levels were found to be associated with periodontal disease, no conclusive evidence was found. Conclusion: There is no evidence of an association of vitamin B-complex, vitamin C, vitamin D, calcium, and magnesium with onset or progression of periodontal disease in adequately nourished older adults.

**PB6 479** INCIDENCE AND CAUSES OF ADMISSIONS DUE TO IATROGENIC REASONS IN THE ELDERLY AND THEIR PREVENTABILITY: ONE YEAR STUDY IN A GREEK UNIVERSITY HOSPITAL

I. STARAKIS\* (Patras University Hospital, Patras, Greece)

E. MAZOKOPAKIS(1) - (1) Naval Hospital of Crete (Chania, Greece)

Background: New medications and invasive interventions have radically changed the causes and incidence of iatrogenic diseases (IDs). Aim: To weigh up the occurrence, severity and unavoidability of IDs in the elderly patients admitted in our hospital, from

January 2007 to January 2008. Patients and Methods: During the study period, 18073 patients were admitted in the Internal Medicine department of Patras University hospital. 1324 (7.3%) patients, all older than 65 years old, were admitted because of an iatrogenic reason. Results: Of all these admissions, 72.3% could be preventable. 799 (60.3%) patients were admitted because of a drug-related adverse event. It was noted that these patients were administered more medications than those admitted for other causes. Most of these adverse events (58%) were originated from a single agent and 27% of these incidents were reactions to multiple drugs. Amongst the drugs most commonly implicated antiplatelets ranked first (24.7%) followed by diuretics (18.7%), oral anticoagulants (15.3%), cardiovascular medications (11.8%) and sedatives (8.7%). Poor patient compliance (31.7%) inappropriate prescriptions (29.8%) and inadequate monitoring (19.7%) were predominantly associated with preventable drug-linked admissions. Most of these patients had presented with bleeding diathesis (21.2%), electrolytic disturbances 18.4%, postural hypotension and fall (15.7%), and obtundation (9.7%). Poor patients' compliance and inadequate monitoring were connected with the severity of presenting signs and symptoms. 292 (22.1%) patients were admitted after a previous surgical intervention and 233 (17.6%) were admitted after a medical invasive procedure. Conclusions: Adverse drug reactions are the most common causes of admissions in the elderly but advanced medical and surgical interventions also have a considerable share. Most of these admissions are preventable and physicians should concentrate their efforts to reducing those

**PB6 480** GERIATRIC EDUCATION FOR ALL: THE UNIVERSITY OF PUERTO RICO GERIATRIC EDUCATION CENTER EXPERIENCE (UPR-GEC)

J. ROSADO-MATOS\* (University of Puerto Rico-Medical Sciences Campus, San Juan, Puerto Rico)

B. MARÍA(1), V. EMMA(1) - (1) University of Puerto Rico-Medical Sciences Campus (San Juan, Puerto Rico)

Introduction: The three level of training of the geriatric education program addressed to faculty leaders, health professionals/services providers and older adults is the response to the continuous changes in the Puerto Rican society: increasing of the elderly population, increasing of the health care needs for older adults, the complexity of health conditions requiring other health professional's interventions and the shortage of geriatricians. The older adults represent 15.4% of the total population according to the US Census 2000, and have lower level of health literacy. Is imminent a multi and interdisciplinary team based approach in order to allow the application of health promotion and disease prevention strategies to deal with the specific health care needs of the elderly population. Besides, there are 54,120 active health professionals who at some point provide services to older adults in diverse care settings (Puerto Rico Health Professional Register, 2006) From this total, 8,765 are physicians, and only 15 are geriatricians (Statistic Division, Department of Health, 2004-07). Methodology: The UPR-GEC, since its inception in 1986, had committed its efforts in the development of many geriatric education initiatives. For faculty leaders, 12 Credits on Basic Aspects in Geriatric, 20, 30, 40 hours seminars on geriatrics and 24 to 72 hours of clinical practice were implemented. Health professionals and services providers received 10 to 30 hours seminars on mental health, interdisciplinary teamwork, management and treatment of chronic conditions. Furthermore, older adults received education on health promotion and disease prevention. Results: Approximately, a total of 71 faculty leaders, 2,356 health professionals/services providers and 1,444 older adults have being trained 2000 to 2008. Conclusion: Through geriatric education, the trainees are exposed to increase their knowledge and skills on the special health care needs of the elderly population.

**PB6 481** LEISURE IN THE COURSE OF ACTIVE AGEING: THE EXPERIENCE OF THE OPEN UNIVERSITY FOR SENIOR CITIZENS

M. TIRADO\* (Universidade Federal de Minas Gerais, Belo Horizonte, Brazil)

R. DIAS(1) - (1) Universidade Federal de Minas Gerais (Belo Horizonte, Brazil)

INTRODUCTION: Leisure enables social interaction, creativity, personal growth and physical exercise. The choice of leisure activities among elderly individuals depends on motivation, life history and culture. An active life, including leisure and physical activity, contributes toward health and healthy ageing. The aim of the present study was to characterize leisure activities performed by participants in the Open University for Senior Citizens and identify the information demands of elderly individuals for improving the program. MATERIALS AND METHODS: A structured questionnaire was used to characterize the socio-demographic profile and activities of elderly individuals who participate in the Open University. RESULTS: Fifty-three elderly individuals participated in the University, 40 of whom answered the questionnaire. The interviewees were predominantly female, aged 61 to 85 years; 43% had a high school education; 28% had a complete university education; 43% were widowed; and 40% were married. Reading was the leisure activity indicated by 83%, followed by going out (70%) and traveling (65%). All the interviewees practiced regular physical exercise; 88% went on walks; 15% performed water aerobics; 13% performed aerobics; and 20% went on walks and performed another activity (aerobics, water aerobics, yoga or dance). Walking was the main physical activity among individuals aged 75 years or older (18% of the sample). The results revealed that the group of elderly individuals was active and performed the activities cited in the literature as those best indicated for this age group. The study also

found other activities of interest to be explored in upcoming offers of the project, such as dance, tai chi and global posture rehabilitation. CONCLUSION: The elderly individuals who attend the Open University performed regular leisure and physical activities and should be encouraged to continue doing so due to numerous benefits such activities offer to the process of active ageing.

**PB6 482 PHYSICAL ACTIVITY AND HEALTHY AGEING: THE EFFECTS OF RESIDENTIAL LOCATION.**

S. HETHERINGTON\* (University of Tasmania, Launceston, Australia)  
P. ORPIN(1) - (1) University of Tasmania (Launceston, Australia)

Introduction: For older adults, regular participation in physical activity has the potential to improve their health and wellbeing and enable them to live independently for longer. Nonetheless, research indicates that up to 50% of older adults are insufficiently active to realise health benefits. Emerging research suggests that residential location may be an important factor influencing the activity levels of older people. Methods: Older Tasmanian adults ( $M=76+6$  years), resident in a suburban retirement village ( $n=25$ ) and a rural township ( $n=17$ ), were surveyed for their activity levels, along with their perceptions of the enjoyment, value and cost of being physically active. Semi structured interviews were conducted to explore physical activity issues within each community. Results: Preliminary survey results indicated that in both locations perceptions of enjoyment and value of physical activity were high and costs associated with being active were relatively low. Respondents in the rural township were significantly more active than those in the retirement village, and a strong correlation was detected between younger age and increased levels of physical activity in the township but not in the retirement village. Interview data revealed that retirement village residents were not required to undertake garden or house maintenance, and although many sporting activities were offered at the village, attendance at these had been steadily declining. Conversely, comments from township residents indicated that the majority of their physical activity was derived from activities of daily living. Conclusions: Preliminary results from this study indicate that ageing location can have a significant impact on physical activity levels and that while freedom from having to maintain a residence was one of the attractions of moving to a retirement village this form of energy expenditure was not necessarily replaced by increased participation in available activities.

**PB6 483 THE ADVENT OF LONGEVITY AT WORKOCCUPATIONAL MEDICINE AND THE ELDERLY WORKERS: A NEW PROPOSAL FOR MEDICAL PERIODIC EVALUATION.**

M. BAEZ GARCIA\* (Amedbarra Associação De Médicos Da Barra, Rio De Janeiro, Brazil)

This paper aims to characterize the need to draw up a specific program for the elderly medical assessment work taking into consideration the growing aging population in general and the consequent increase in the number of elderly in action in the labor market, thereby as the needs and demands of this group of occupational health workers. Through the formulation and implementation of an evaluation program for elderly prescription for action in the labor market, which is the differential approach on diseases commonly present in this age group, a study was conducted based on retrospective review of 50 medical records of patients elderly inserted in various activities in the labor market and undergo periodic medical examinations. It appeared that in addition to the already expected presence of several degenerative pathological changes associated with other comorbidities, the occurrence also of great importance to cognitive disturbances combined with depression, disturbance of memory and low self-esteem, and sleep disorders, which are usually not, are valued at an occupational medical examination. Taking into account the results, discusses the need for deployment and implementation of an occupational medical examination differently, using standardized tools for the detection of cognitive changes to have better health promotion and better working conditions for this new age group in action.

**PB6 484 POLYPHARMACY IN ELDERLY "A MULTICENTER STUDY"**

Y. GOKCE KUTSAL\* (Hacettepe University, Faculty of Medicine, Ankara, Turkey)  
A. BARAK(1), A. ATALAY(2), T. BAYDAR(3) - (1) Hacettepe University, Faculty of Medicine (Ankara, Turkey); (2) Uskudar Kizilay Medical Center (Istanbul, Turkey); (3) Hacettepe University, Faculty of Pharmacy (Ankara, Turkey)

Introduction: Polypharmacy is highly prevalent in the elderly secondary to the increased number of co-morbid disease states. We aimed to evaluate the polypharmacy issue and its correlations with socioeconomic variables in Turkish elderly patients. Methods and Materials: A total of 1430 elderly from outpatient clinics of the medical schools, departments of Physical Medicine and Rehabilitation from 12 provinces in different geographical regions of Turkey during January 2007-January 2008 were included in this cross-sectional study. Patients were interviewed using a questionnaire which included demographic characteristics, current medical diagnosis and pharmaceuticals that are used by elderly. Demographical parameters were gender, age, marital status, number of children, level of education, province and status of retirement. Results: The mean number of drugs was found to be higher in the females compared to males and statistically different among age groups. There was a statistically significant difference between marital status

groups and the number of children categories regarding the number of drugs used per day. The distribution of the number of drugs among education levels did not differ significantly, where the distribution of the number of drugs among the status of retirement and the presence of chronic disease differed significantly. Conclusions: The present study shows that polypharmacy is correlated with various factors including age, sex, marital status, number of children, status of retirement and presence of chronic medical conditions but not educational status in our study group. Acknowledgements: We would like to thank Professor Selcuk Kucukoglu, Professor Tiraje Tuncer, Professor Sami Hizmetli, Professor Nigar Dursun, Instructor Suzan Sen, Associate Professor Sibel Eyigor, Professor Merih Saridogan, Associate Professor Hatice Bodur, Instructor Ahmet Tutoglu, Professor Ferhan Canturk, Associate Professor Ayse Turhanoglu, Associate Professor Sule Arslan, Assistant Professor Aynur Basaran, Professor Ergun Karaagaoglu, Professor Cigdem Tuzun for their help for data acquisition & analysis.

**PB6 485 HERPES ZOSTER BURDEN OF ILLNESS: PREVENTIVE STRATEGIES**

P. LANG\* (Geneva university hospitals, Geneva, Switzerland)  
J. MICHEL(1) - (1) Geneva university hospitals (Geneva, Switzerland)

The burden of illness and healthcare resource utilisation associated with herpes zoster (HZ) in individual aged 50 years or above is substantial causing severe loss of quality of life (QoL). Herpes zoster (HZ) incidence varies 1.5 to 5.0 per 1000 person-years in adults of all ages, and is near 11 cases per 1000 person-years in individuals aged over 60. The most frequent and debilitating complication is post-herpetic neuralgia (PHN). In the absence of antiviral therapy, up to 45% of over 60 year-olds experience pain which persists for 6 months to a year. The importance of preventive strategies for PHN is becoming widely recognised. Several systematic reviews support the short-term benefit gained from antiviral drugs, with limited evidence for a reduction in the incidence of PHN. Thus complementary analgesic drugs are often required. However, prescription of advised medications in old, frail, co-morbid and poly-medicated patients have to be carefully considered as their use may be contraindicated. In this context, the proven efficacy of the first HZ vaccine by randomized control trials is a great achievement. By reducing the emergence of both HZ by 51% and PHN by 66%, in individuals over 50 years of age, this vaccine promotes healthy ageing and improved quality of life. Many strategies to prevent PHN are available, but vaccination appears to be the best option.

**PB6 486 THE EFFECTIVENESS OF A CONSTIPATION PREVENTION PROGRAM FOR HOSPITALIZED ELDERLY WITH HIP SURGERY**

P. MONMAI\* (Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand, Bangkok, Thailand)  
S. AREE-UE(1), P. PUTWATANA(1), V. KAWINWONGGOWIT(1) - (1) Faculty of Medicine Ramathibodi Hospital, Mahidol University (Bangkok, Thailand)

Background: Constipation has been reported as a health problem among hospitalized elderly, especially the elderly undergoing hip surgery. The intervention that can be prevented or decreased the incidence and severity of constipation is needed. Objective: The purpose of this quasi-experimental study is to examine the effectiveness of a constipation prevention program for hospitalized elderly patients undergoing hip surgery. Methods: The sample consisted of 60 hospitalized elderly who were admitted to an orthopaedic ward at the University Hospital, Bangkok, Thailand, from March to October 2008. The participants were assigned into two groups: the control group consisted of 30 participants who received usual care; the other 30 participants of the experimental group received a constipation prevention program. The program was composed of: the education program providing information related to a natural pattern of normal bowel evacuation; the program of dietary intake; the program of water intake; the program of physical activity and exercise; and the program of habitual defecation practice for prevention of constipation. Data collected in this study were: the demographic record form, the daily defecation record form, the bowel pattern assessment form, and the constipation risk assessment form. The statistical analysis was performed by using descriptive statistics, Chi-square, and t-test. Results: Results revealed that the experimental group had statistically significant lower incidence and less severity of constipation postoperatively than those in the control group. Conclusions and recommendations: The constipation prevention program is effective in reducing the incidence and severity of constipation among the hospitalized elderly who have undergone hip surgery; therefore, it is a useful tool for health care teams to improve quality of care for the hospitalized elderly who are at risk of developing constipation.

**PB6 487 A STUDY OF FACTORS FOR LONG HOSPITAL STAYS AND FREQUENT ADMISSIONS: SEEKING TO HELP SENIOR CITIZENS AVOID HOSPITALIZATIONS**

D. WILSON\* (University of Alberta, Edmonton Alberta, Canada)

Introduction: The purpose of this study was to learn, from older hospital inpatients who were frequently admitted to hospital (2+ times/year) or who had long hospital stays (35 days or more) and from others who knew these patients, what contributed to their considerable need for or use of hospitals. This study was undertaken as only a small proportion (1-6%) of hospital patients are frequently admitted to hospital or have long hospital stays, yet their use of hospital resources is disproportionately large (25-40% of total utilization). Methods:

Ethnography was employed, with patients and their caregivers asked two main questions: 1. What is making you need to be admitted frequently to hospital or stay in hospital for a long time? 2. What could be done to help you - so you could avoid being admitted to hospital or so you would not need to stay for a long time in hospital? Family members and formal care providers who were identified by the patient and who volunteered to provide additional data were similarly interviewed. Results: Three themes emerged: 1) High users are high needs patients who have complex, chronic and severe health problems. 2) Various factors that are absent within the community increase their need for hospital-based care. 3) Numerous factors within the hospital and lack of post-discharge options leave patients "trapped" in hospital. Conclusions/Implications: This study identified the relevancy of General Systems Theory, with inputs, through puts and outputs identified as important to address if seniors are to avoid considerable hospitalization. This study indicated a need for increased community-based health promotion and support for high-needs persons, additional specific attention in hospital to high users, and improved access to alternative care options such as subacute care, hospice, and home care to enable discharge from hospital.

**PB6 488 THE PERSONAL FUNCTIONAL CONDITION OF ELDERLY ADULT PACKERS IN SUPERMARKETS**  
**Z. GÓMEZ LOMELÍ\*** (Universidad de Guadalajara, Guadalajara, Mexico)  
**J. DÁVALOS GUZMÁN(1), A. CELIS DE LA ROSA(1), M. OROZCO VALERIO(1)** - (1) Universidad de Guadalajara (Guadalajara, Mexico)

Introduction As in the rest of the world, Mexico is experiencing an aging process characterized by an increase in absolute and percentage numbers in the elderly population. Methods and materials The design of the study was transverse analytical. The objective was to identify social-demographical and social-economical characteristics and the analysis of the state of health. The information was obtained by means of personal standardized interviews, and the Yesavage scale was applied. Between May and July 2008, 416 voluntary packers from the SORIANA supermarkets in the Metropolitan Area of Guadalajara, were chosen from shops randomly selected from 4 regions. Results The average age was 69.4 years and the range studied from 60 to 87 years. The majority of men form part of family homes whilst the women live in extended homes and even alone. The schooling in both sexes is of primary level. With respect to occupation this differs, twice the number of males being formally employed in comparison with female employment which is often in the informal sector; hence, the men receive their respective pensions and the women do not claim a pension or retirement. The social-economic level indicates better conditions for men belonging to the medium-low class; in the case of the women, the situation shows that these are from the lower class. The self-perception of their state of health is generally satisfactory, with an existing cardiovascular risk for both sexes; however, the men do not show an important number of pathological symptoms. Illness is different in both groups being more frequent in the women. The scale of depression for the majority is normal. The reasons for their activity as packers were mainly due to economic necessity. Conclusion The results allow us to conclude that aging is different between men and women.

**PB6 489 THE IMPORTANCE OF THE ORAL HEALTH TO THE GENERAL HEALTH IN FRAIL GERIATRIC PATIENTS**  
**G. ARNETZL\*** (Medical University of Graz, Graz, Austria)  
**C. GLUHKAK(1)** - (1) Medical University of Graz (Graz, Austria)

Poor oral hygiene is closely connected to pneumonia, atherosclerosis, infection related diseases and malnutrition. The data of the present investigation suggest that regular dental prophylaxis on a professional basis leads to an increase in quality of life as well as in the general condition and minimizes the risk of morbidity. The WHO states that in 2030 COPD is going to be the fourth common cause of death. The oral cavity is among others a definite cause for COPD. Specific mouth associated germs are verifiable in atheromas of the coronary blood vessel and cerebral vessels. Over 80 percent of elderly living in long term care institutions in Austria, Germany and Switzerland, show acute inflammatory processes located in the mouth. Quality of life among elderly is associated with analgesia and appropriate mastication. A great deal of annoyance in this area can lead to malnutrition and declines the quality of life as well as the general condition. It is a proven fact that poor dental health is closely connected to illness generally, e.g. pneumonia, atherosclerosis and infection related illnesses. Furthermore, regular oral hygiene is an important preventative mean against infection in the dental and oral region and dietary problems; it also upholds the self confidence and quality of life for senior citizens who are in care. Poor oral health affects far more than just the oral region, indeed the whole quality of life can be greatly diminished through this. One only has to consider the recurring pain caused by the pressure of ill-fitting dentures. Prevention of dental pain as well as acute inflammatory processes in the mouth leads to an increase in quality of life as well as in the general condition and minimizes the risk of morbidity.

**PB6 490 THE RELATIONSHIP BETWEEN ORAL DISORDERS AND SENSORY PERCEPTION OF TASTE, SMELL, APPETITE AND HUNGRY IN ELDERLY WOMEN**  
**F. DÍAZ-GARCÍA\*** (University of Guadalajara, Mexico, Guadalajara, Mexico)  
**A. MORALES-SÁNCHEZ(1), N. MENDOZA-RUVALCABA(1), G. GÓMEZ-GONZÁLEZ(1), A. OLMEDO-SÁNCHEZ(1), S. LÓPEZ-CERECER(1), L. DÍAZ-**

**GARCÍA(1), E. FUENTES-MÉNDEZ(1)** - (1) University of Guadalajara, Mexico (Guadalajara, Mexico);

**INTRODUCTION:** Oral changes associated with aging, including depressed levels of taste and smell perception could diminish appetite, consequently endangering health conditions. Oral cavity participates in an important way in these perceptions, because it is richly endowed with sensorial systems. **AIM:** To assess the relationship between oral disorders like chronic periodontitis, tongue hygiene, wearing prosthetic dentures, absent teeth and sensory perception of taste, smell, appetite and hunger. **METHODS:** Cross-sectional clinical study. **SUBJECTS:** 228 elder females, 60 years and older living in a free style form. Cognitive deterioration, depression, alcoholism, tobacco and diabetes were exclusion criterions. Assessed: age, marital status, education level and oral disorders: wearing dentures, absent teeth, chronic periodontitis (Periodontal Index in Communities), tongue hygiene (Method of Miyazaki) and showing more than two oral disorders. The Appetite Hunger Sensory Perception questionnaire, (AHSP) was used to assess appetite, hunger, smell and taste perception. **RESULTS:** Women were primarily 60-74 years old; widows, and a low-level education (56.6%), (59.2%), (79.8%). Multivariate logistic modeling was used to make control for the potential confounding effects of age, education level, marital status and co-morbidity. Among women wearing denture on both maxillaries or wearing just one were significantly ( $p<0.02$ ) more likely to have lower taste perception than those without conditions; OR 2.1, 3.1. Women wearing denture on both maxillaries or wearing just one moreover showing a bad hygiene of tongue were significantly ( $p<0.05$ ) more likely to have lower appetite perception than those women without it; OR 4.5, 4.6, 2.1 respectively. **CONCLUSIONS:** Specific oral disorders were associated with taste and appetite perception in elderly women.

**PB6 491 BEST PRACTICE IN GERIATRIC HEAR CARE - A CONCEPT BADLY NEEDED –**  
**M. LERCH\*** (Ev. Krankenhaus Bethanien Iserlohn, Iserlohn, Germany)  
**M. DECKER-MARUSKA(1)** - (1) Krankenhaus St. Barbara (Attendorf, Germany)

**Background:** Due to the demographic change and the increasing life-expectancy there is an incline of hearing deficiencies among geriatric patients in Germany. In a current evaluation we were able to vindicate the need for a best-practice concept in evaluation and treatment of these patients. A multidisciplinary geriatric team, untrained in this concept, is often unable to detect and evaluate a hearing deficiency correctly. Causing false assumptions that may lead to a misinterpretation of the physical and cognitive skills of the patient and therefore to an insufficient or incorrect diagnosis and treatment of the patient. **Method:** The authors have developed and established a multimodal best-practice concept for the detection, evaluation and care for geriatric patients with hearing impairment. The „Geriatric HearCare Service“ (staff education, communicative skills, ENT and neuropsychological exam, documentation etc.) ensures a standardized procedure, for the diagnosis and care of these patients, their physical, emotional and cognitive situation and their need for assistance. More over it helps to differentiate between cognitive decline due to undetected hearing deficiency and other causes. **Result:** Within 6 month 530 geriatric patients were evaluated for hearing impairment under our concept, 170 of these were found positive for a hearing impairment and insufficient treatment, only 45 had a hearing aid, all of them had cerumen obturans and a pathological audiogram. In cognitive testing after the ENT exam and cerumen removal 65 patients had a MMST <24. **Conclusion:** The clinical pathway in the concept for Best Practice in Geriatric HearCare enables the geriatric team to ensure not only a better and resource-oriented care for geriatric patients, but also to a better differentiation of patients cognitive and emotional behaviour due a hearing deficiency and other causes like dementia and depression and provides a structure for follow up and provision of hearcare support.

**PB6 492 RELEVANCE OF PROTON PUMP INHIBITORS' PRESCRIPTION IN GERIATRICS**  
**F. SEITE\*** (CHU La Milétrie, Poitiers, France)  
**A. DELELIS-FANIEN(1), S. VALERO(1), C. PRADÈRE(1), J. POUPET(1), P. INGRAND(2), M. PACCALIN(1)** - (1) CHU La Milétrie (Poitiers, France); (2) Faculté de Médecine et de Pharmacie (Poitiers, France)

**Introduction** The proton pump inhibitors' consumption represents a huge cost for the Health insurance, estimated over a billion euros a year in France. A great proportion of prescriptions do not agree with the French defined recommendations. We conducted a study to estimate the validity of the indications of proton pump inhibitors (PPIs) therapy in hospitalized geriatric population and to identify the main reasons for un-necessary prescriptions. **Patients and method** This was a prospective study. All the patients hospitalized in the department of geriatric medicine over a period of 9 consecutive weeks were included. The patients treated with PPIs were separated in 2 groups: in accordance or not with a valid indication, published by the French agency for the safety of health products, AFSSAPS (Agence Française de Sécurité Sanitaire des Produits de Santé) in 1999. Epidemiological data, PPIs' duration of therapy, functional status and the CIRS-G co-morbidity score were collected. **Results** Among 257 hospitalized patients, 86 were treated with PPIs (33.5%), 51 prescriptions (59.3%) were inappropriate. In 60% of the cases, the duration of treatment was over 6 months. The main non-conform indications were respectively: co-prescription with low-dose aspirin (43.1%), lack of reevaluation of

the validity of the treatment (27.4%) and a microcytic not investigated anaemia (13.7%). The probability to observe a conform prescription was significantly associated with the conjunction of: a lower functional decline, prescription in ambulatory and performance of an endoscopic procedure ( $p=0.046$ ). Conclusion This study highlights the frequent prescriptions of PPIs therapy in geriatrics and the high prevalence of inappropriate treatments. A reevaluation of the long term treatments with PPIs would easily reduce a quarter of the prescriptions. Prevention of the hemorrhagic risk of anti-platelet agent remains an interesting debate.

**PB6 493 TIME-TRENDS IN PREVENTIVE DRUG TREATMENT AFTER MYOCARDIAL INFARCTION IN COMMUNITY-DWELLING ELDERLY PATIENTS**  
W. DE RUIJTER\* (Leiden University Medical Center, Leiden, The Netherlands)  
M. DE WAAL(1), J. GUSSEKLOO(1), W. ASSENDELFT(1), J. BLOM(1) - (1) Leiden University Medical Center (Leiden, The Netherlands)

Introduction With advancing age, myocardial infarctions become highly incident and their prognosis worsens. Secondary preventive drug treatment is believed to result in a cumulative risk reduction of about 75%. Our objective was to explore time-trends in the effect of increasing age on preventive drug treatment in community-dwelling elderly patients with a history of myocardial infarction. Methods and materials A retrospective patient record study in eighteen general practices in The Netherlands, including all patients >60 years with a history of myocardial infarction (post-MI patients). At one time point in the years 2000, 2004 and 2007, respectively, complete prescription records about the preceding year were obtained for all post-MI patients. In three strata by age, the availability of antithrombotics, statins, beta-blockers and ACE-inhibitors for >50% of days in the preceding year was assessed. Results The prevalence of prior myocardial infarction in patients >60 years in the consecutive years was 234/3717 (6.3%), 266/4489 (5.9%) and 342/5995 (5.7%), respectively. Combination therapy with at least 3 out of 4 drugs increased over time, from 31% (CI 95% 26-37) of all patients in 2000 to 59% (CI 95% 53-64) of patients in 2007. This increase, particularly in treatment with statins, occurred in all age strata: from 38% to 70% (relative increase 1.8) in post-MI patients 60-69 years, from 31% to 54% (relative increase 1.7) in those aged 70-79 years, and from 19% to 48% (relative increase 2.5) in post-MI patients >80 years. Conclusion Preventive drug treatment in community-dwelling post-MI patients >60 years showed a steep increase over a recent seven-year period. Although in the oldest old (>80 years) the greatest relative increase was observed, they still have most room for improvement.

**PB6 494 ARRREST – ACTION RESEARCH TO REDUCE REPETITION OF STROKE – PHD STUDY**  
C. STOCK\* (Swansea University, Swansea, United Kingdom)

This PhD study aims to: gather stroke survivors' and carers' knowledge and experiences of secondary stroke prevention; review best practice in a participatory action research group; and, understand the role of health workers who support stroke survivors and carers. The main approach for the study is action research which is a democratic process that can facilitate change. Action research allows the participants to bring their own meaning to the discussion. Mixed-methods were used to augment data collection resulting in triangulated output. A self-completion questionnaire was used to establish current knowledge about secondary prevention. Qualitative work followed using focus groups with stroke survivors and carers and one-to-one interviews with health workers. Sampling was purposive and ethical approval was given by the Local Research Ethics Committee. The study commenced in 2007 and is currently in the data collection phase and is planned to be completed in 2010. 85 questionnaires were distributed (71 completed – 84%). On knowledge of healthy living advice the top three rated answers were to: control blood pressure (97% said this would have a major impact); medication adherence (90%); low fat diet (83%). Only 78% of stroke survivors and carers stated that smoking cessation would have a major impact on stroke prevention. The lowest rated answer was taking a multivitamin every day (10%). The focus groups discussed these questions but were flexible to discuss topics prioritised by the participants. It is too early in the study to offer final conclusions, however, in line with the literature review, early findings have confirmed some gaps in stroke survivors' and carers' knowledge regarding secondary prevention. The focus group method has proved successful in building a supportive environment where stroke survivors and carers felt confident to share their knowledge and experiences in depth using an action research approach.

**PB6 495 LEG ELEVATION AND RISK OF RECURRENCE OF CHRONIC VENOUS LEG ULCERS – A PROSPECTIVE STUDY**  
K. FINLAYSON\* (Queensland University of Technology, Kelvin Grove, Australia)  
H. EDWARDS(1), M. COURTNEY(1) - (1) Queensland University of Technology (Kelvin Grove, Australia)

Introduction Chronic leg ulcers have a significant impact on resources and quality of life for older adults. Unfortunately after healing, up to 70% recur. This study aimed to determine relationships between physical and psychosocial factors, strategies to prevent recurrence and recurrence rates. Methods A prospective follow-up study was undertaken with participants who were diagnosed with a venous leg ulcer and recruited when their

ulcer healed. Data were collected via medical records and surveys at baseline, 3, 6, 9 and 12 months after healing on demographics, medical history, compression therapy, leg elevation, activity levels, psychosocial factors and ulcer recurrence. Median time to recurrence was calculated using the Kaplan-Meier method. Effects of physical and psychosocial factors on recurrence were evaluated using Cox proportional-hazards regression. Results There were 32 recurrences in a sample of 71 participants with a total of 360 months person-time follow-up. Median time to recurrence for participants who undertook at least 30 minutes/day leg elevation was 46 weeks, compared to 27 weeks for participants who undertook less than 30 minutes/day ( $p<0.001$ ). After adjustment for gender, ulcer duration and previous venous surgery, Cox regression analysis found a higher rate of recurrence remained significantly associated with less than 30 minutes/day leg elevation (RR 4.0, 95% CI 1.54–11.2,  $p=0.01$ ); and lower social support scale scores (RR 1.02, 95% CI 1.01–1.04,  $p=0.03$ ). Participants who wore Class 2 compression hosiery for at least 5 days/week were nearly 50% less likely to recur (RR 0.59, 95% CI 0.28–1.28,  $p=0.18$ ). Conclusions These results provide important information on the effectiveness of preventive strategies and the importance of social support when planning self-care activities for this population.

**PB6 496 ASSESSING THE INTEREST OF SYSTEMATIC SCREENING OF SENSORY DEAFFERENTATION IN GERIATRIC DAY CLINIC**  
A. MERGAM\* (University of Liège, Liège, Belgium)  
V. WOJTASIK (1), C. OLIVIER(1), S. GILLAIN(1), S. ALLEPAERTS (1), J. PETERMANS(1) - (1) Dept of Geriatrics, Liège University Hospital (Liège, Belgium)

Introduction: Sensory deafferentation, in particular visual and auditory impairment in the elderly may lead to social isolation, increase of cognitive dysfunction, disorientation, visual hallucination (Charles Bonnet syndrome), depression and anxiety, decreased quality of life, reduced autonomy and falls. Material and methods: Ninety five patients consulting at our geriatric day clinic were included (age range 68-90 y; 68% women). The main reasons for consultation were cognitive decline (67%) and falls (14%). The presence of visual or auditory deficit was prospectively assessed. Far and near visual acuity was tested for each eye using a Monoyer letter chart at a distance of 3 m and by validated text reading at 33 cm, both with the person's own glasses. Auditory testing was performed for each ear using Fournier's dissyllabic word lists. Results: Visual deficits were observed in 75% (far vision) and 46% (near vision) of patients. 56% of patients showing visual deficit did not have an ophthalmologic consultation during the previous year and 12% did not wear correction glasses. Patients with visual impairment, as compared to patients with normal vision, showed higher dependency in activities of daily living (mean Lawton IADL scales 4 vs 5; and Katz ADL scale 10 vs 7). No correlation was found between visual deficit and frequency of falls reported during the previous year (26% vs 28%). Presbyacusia screening showed 35% of consulting patients had an auditory deficit – only 23% of these had a hearing-aid. Conclusion: This study identified a high frequency of visual (3/4) and auditory (1/3) dysfunction in patients consulting a geriatric day clinic. Systematic screening of sensory deafferentation permits to correct or treat underlying pathologies, and to assure ophthalmological or ENT follow-up. Aggravation of geriatric fragility caused by sensory deafferentation can be countered by offering technological aids and professional counseling.

**PB6 497 SAFE HUG: SECURITY DEVICE TO PREVENT FALLS DURING THE USE OF THE TOILET**  
L. SAKANO\* (Hospital Israelita Albert Einstein, São Paulo, Brazil)  
S. LUCIANA(1), L. ANDREIA(2), R. NANCI(3), L. CLAUDIA(4), S. ADRIANA(5) - (1) 01 Hospital Israelita Albert Einstein (Brazil); (2) 02 Hospital Israelita Albert Einstein (Brazil); (3) 03 Hospital Israelita Albert Einstein (Brazil); (4) 04 Hospital Israelita Albert Einstein (Brazil); (5) 05 Hospital Israelita Albert Einstein (Brazil)

The population aging send us to think about strategies for security and comfort for aged population. OBJECTIVE: The geriatric nursing team in partnership with engineering team, developed a security device to prevent falls during the use of toilet. METHODS: This is a report of experience. A search in literature, Internet and in the market was done, and the engineering team searched for suppliers to produce the protective device for the lateral and anterior region when in use of toilet. RESULTS: The prototype was produced in the period of 06/06/2005 and 15/08/2005 and installed in an apartment of the unit of Geriatrics and it was evaluated positively. CONCLUSION: Considering the benefit gotten with the installation of this device and considering that the institution must provide conditions of better security to the patients, it is projected to install similar devices in the new apartments of the Hospital.

**PB6 498 A MODEL FOR FALL RISK REDUCTION IN COMMUNITY-DWELLING OLDER ADULTS USING SOCIAL COGNITIVE THEORY**  
R. HAKIM\* (University of Scranton, Scranton, United States)

Introduction: Facilitating behavior change to encourage fall risk reduction among older adults is a necessary step to promote proactive prevention of the devastation associated with falling. Application of Social Cognitive Theory (SCT) addresses the psychosocial dynamics influencing health behavior and provides methods for promoting behavioral

**change.** Methods & Materials: Several constructs of SCT are applicable for fall risk reduction and should be considered when developing a program for community-dwelling older adults. With respect to explanatory constructs, participants may be educated to improve their behavioral capability by learning strategies to reduce risk factors. Expectancies, or values placed on the outcome, are addressed with an emphasis on the importance of prevention and overall health status. Self -control is emphasized by training the participants to make changes and track progress. Constructs that initiate behavior change include observational learning via demonstration and group interaction in a social environment. Also, reinforcements should be provided in the form of positive feedback on improved self-monitoring and prize incentives (e.g., household gadgets) as risks are reduced. Self-efficacy is enhanced as the participants gain task specific confidence by successfully reducing fall risk factors. Results: Application of a theory such as SCT is appropriate with a multi-component intervention such as fall prevention in a community-based setting. Senior Centers and high-rise buildings can offer targeted programs to provide group education and exercise classes for minimal costs by forming partnerships with local health care or academic institutions. In this manner, health care workers or faculty can provide community service in order to meet the needs of older adults who have limited resources. Conclusions: Health care professionals should take a proactive approach with the implementation of theory-driven programs that teach fall risk reduction strategies to empower older adults to make positive changes for prevention behavior.

**PB6 499 SURVIVAL OF GROUPS OF ELDERLY INDIVIDUALS CLASSIFIED ACCORDING TO LIFESTYLE IN A MEDIUM-SIZED CITY IN SÃO PAULO STATE, BRAZIL.**

T. RUIZ\* (University of São Paulo State - UNESP, Botucatu, Brazil)  
J. CORRENTE(1) - (1) University of São Paulo State - UNESP (Botucatu, Brazil)

**Introduction:** Lifestyle is an unquestionable prognostic factor in survival. **Objective:** To evaluate survival in three groups of elderly individuals classified according to lifestyle. **Methodology:** By utilizing a population-based household survey applied to citizens aged 60 years and older in a city with 120,000 inhabitants in São Paulo state, Brazil, and which contained instruments for quality of life (QL) assessment (Flanagan), questions on 15-day reported morbidity and an open question on what the individuals defined as quality of life, the elderly persons were placed into 3 groups according to answer agreement (Ward's Method). Three-year follow-up survival analysis of this population is presented with results from the Cox model for the groups adjusted by age and sex. **Results:** The final Cox model adjusted for age and sex provided the following result: Group I (elderly individuals who valued keeping commitments as QL reported a larger number of diseases, the habit of smoking and drinking as well as being satisfied for balancing time between leisure and work) OR: 9.26 (1.17 – 73.24); Group II (elderly individuals who defined leisure as QL and who reported a capacity to learn new skills, to learn in courses, group activities, satisfaction with intimate relationships as well as being hypertensive) OR: 8.4 (1.01 – 69.66); Group III (elderly individuals who defined cultivating inner values and doing voluntary work as QL and reported to be satisfied about their families and the comfort of their homes) OR: 10.05 (1.21 – 83.46). **Discussion and Conclusions:** The way one leads one's life and defines QL is a prognostic factor of survival time, assuming that, for a longer period of observation, the results would be even more accurate. Acknowledgments: FAPESP and Group for Epidemiologic Research on the Elderly.

**PB6 500 PREVENTIVE HOME VISITS FOR OLDER ADULTS: A REPORT OF THE DESIGN AND FEASIBILITY OF A NEW PROTOCOL**

M. CUTCHIN\* (University of North Carolina at Chapel Hill, Chapel Hill, NC, United States of America)  
S. COPPOLA(1), V. TALLEY(2), J. SVIHULA(1) - (1) University of North Carolina at Chapel Hill (Chapel Hill, NC, United States of America); (2) Orange County Department on Aging (Hillsborough, NC, United States of America)

**Introduction:** The search for preventive methods to mitigate functional decline and unwanted relocation by older adults is important. To that end, the preventive home visits (PHV) model uses infrequent but regular visits to older adults, in their homes, by trained practitioners. Evidence about PHV efficacy is mixed but generally supportive. Yet interventions have rarely combined a comprehensive (biopsychosocial) occupational therapy intervention protocol with a home visit to older adults. There is a particular need in the USA to create and examine such a protocol that is also cost-effective. **Methods and materials:** We present the conceptual and practical bases of an occupational therapy-based PHV intervention. The study, funded by the U.S. National Institute on Aging, is being conducted in several North Carolina counties with an effort to establish evidence of feasibility and effectiveness. Investigators are using an experimental, repeated measures design with older (75+ years) community-dwelling adults who are identified as vulnerable. The experimental group receives the PHV intervention four times across 12 months. The therapist makes recommendations to help the older participants continue or implement strategies for well-being. Researchers are collecting various function, participation, health, healthcare utilization, and quality of life measures to test the intervention's effects. **Results:** As of January 2009, 110 participants were enrolled. Feasibility in data collection and intervention delivery was very good with little missing data or attrition to date. The most frequent recommendations by therapists to participants include affirmation of healthy habits, referrals to exercise regimens, and referrals to senior center activities. **Conclusion:**

This in-progress project offers an innovative approach to preventing loss of quality of life and involuntary moves. While the intervention's effects are yet to be determined, we have learned valuable lessons about how to design and implement such a program.

**PB6 501 PREVENTING INFECTION THROUGH THE PROMOTION OF ORAL CARE, IDENTIFYING THE BARRIERS TO GOOD NURSING PRACTICES**

C. DEBOUT\* (AP HP Charles Foix, ORIG INSERM UMR-S 707, IVRY SUR SEINE, France)  
M. ROTHAN TONDEUR(1) - (1) AP HP Charles Foix, ORIG INSERM UMR-S 707 (IVRY SUR SEINE, France)

Nursing interventions provided by Nursing Staff (NS) promoting oral care are essential to prevent infection in the elderly population. In a randomized study this relationships has been explored confirming that prioritizing oral care in nursing care plan reduces critically the occurrence of acquired infections (pneumonia and candidosis). This conclusion leads to engage a grounded theory study to better understand the factors influencing nurse in the performance of this nursing care intervention. The study was multicentric involving Swiss, Belgian and French healthcare settings. Data analysis of semi structured interviews According to the study design inspired by Glaser & Strauss, data were transcribed verbatim following each interview. Data analysis and data collection were conducted simultaneously. A combination of open, axial and selective coding was used and data were analysed to generate initial codes which were subsequently categorized into themes using a constant comparative, iterative approach both within and between informant. Aggressiveness, disgust and poor care planning was the three elements in the machinery leading to poor mouth care quality theory. Implication for nursing practice and nursing education •Mouth care must become a priority for NS. Nurses managers, team leaders and physicians must motivate NS regarding the importance to change their practice. NS must gain knowledge and training regarding oral hygiene and mouth care. Risks associated to poor oral hygiene should be emphasised. •The aggressiveness-disgust-poor care planning gearing theory must be explained to NS. •Quality mouth care does not mean a long intervention. Efficacy regarding mouth care is not synonymous of lengthy care. These messages must be addressed to NS. •Adequate equipment should be available to NS to perform state of the art mouth care.

**PB6 502 CAN ROUTINE PROTECT OLDER ADULTS FROM SLEEP DISTURBANCES?**

A. ZISBERG\* (University of Haifa, Haifa, Israel)  
N. GUR-YAISH(1), T. SHOCHAT(1) - (1) University of Haifa (Haifa, Israel)

**Introduction** Among the common problems related to age is sleep quality; over half of older adults suffer from symptoms of insomnia. One of its major factors is age related changes in circadian sleep/wake regulation. Constant and organized life style may protect from these changes in circadian rhythms. Preliminary findings have linked daily regularity to quality of sleep among healthy adults and in patients with Parkinson's disease. The current study investigated the relationships between daily routines, functional decline, and sleep quality among community dwelling elderly. **Methods and Materials** Ninety Israeli Russian speaking older adults living in a retirement community participated. Mean age was  $75 \pm 7.49$ , 72% were women, and 82% live alone. Sleep quality was assessed with the Pittsburgh Sleep Quality Index (PSQI). Daily Routines was assessed with Zisberg's Scale of Older Adults Routine. Functional status was assessed with the Lowten Instrumental Activities of Daily Living (IADL) and Bartlett's ADL. Comorbidity was measured with Charlson's comorbidity scale. Older adults' routines were evaluated by a trained interviewer at three time points two weeks apart. Sleep quality, functional status, and comorbidity were assessed during the last interview. **Results** Mean sleep efficiency was 78%, indicating poor sleep, functional status was fairly good (Mean ADL 89 out of 100 and mean IADL 44 out of 50 ), and 75% of respondents indicated fair or good subjective health. Regression analyses indicated that level of stability in daily routine was significantly related to sleep efficiency ( $B=-.627$ ,  $p=.0001$ ), sleep latency ( $B=1.87$ ,  $p=.0001$ ), and total sleep quality ( $B=.100$ ,  $p=.04$ ), beyond functional status, comorbidities and age. **Conclusion** Maintenance of daily routines may be a protective factor against insomnia for elderly. Further studies should examine these relations in broader populations with regard to health, functional status and cultural background.

**PB6 503 ASSESSMENT ON THE QUALITY OF LIFE OF AN ELDERLY POPULATION AT A TOURIST RESORT IN INNER SÃO PAULO STATE, BRAZIL: APPLICATION OF THE FLANAGAN'S SCALE**

J. CORRENTE\* (University of São Paulo State - UNESP, Botucatu, Brazil)  
C. KAGAWA(1), A. MACHADO(2) - (1) UBS - IARAS (Brazil); (2) University of São Paulo State (Botucatu, Brazil)

**Introduction:** The increase in life expectancy worldwide and particularly in developing countries such as Brazil leads to an intense demand for studies and analyses in order to better define public policies and improve the quality of life of elderly individuals. **Methods:** The Flanagan Quality of Life Scale was applied to a sample of 365 elderly persons assisted by the public health care network by means of household interviews at a tourist resort in inner São Paulo state, Brazil. The sample was obtained from an unknown

prevalence and stratified by age. Results: Among the 365 elderly persons interviewed, the mean age was 70.26 years with a SD 6.37 years; most of them were females (56.01%); 56.29% were married; 88.52% were retired; 48.53% had attended school for four years and 64.81% had an income of up to one minimum salary. As regards satisfaction about life in general, 93.69% reported to be satisfied. The application of Flanagan's quality of life scale showed Cronbach's alpha value of 0.7660, thus indicating good efficacy for the instrument. Factorial analysis of the answers applied of the scale showed that the elderly valued the following items as quality of life: physical and material well-being, personal development and fulfillment, relationships with other people, social and community activities, thus presenting some divergences with the domains proposed by Flanagan. Conclusion: Hence, in a general context, it is possible to state that the quality of life of the elderly can be considered to be good according to the Flanagan's Quality of Life Scale and its limitations. Additionally, the factors that mostly influenced general satisfaction about life were the lack of opportunities to perform leisure activities, comfort in relation to one's place of residence and financial conditions.

**PB6 504 PREVALENCE AND CAUSES OF VISION IMPAIRMENT AND BLINDNESS IN OLDER ADULT IN BRAZIL: THE SAO PAULO EYE STUDY**

R. BELFORT\* (UNIFESP, São Paulo, Brazil)  
S. SALOMÃO(1), R. CINOTO(1), A. BEREZOVSKY(1), A. ÁRAUJO-FILHO(1), M. MITSUHIRO(1), L. MANDIETA(1), P. MORALES(1), G. POKHAREL(2), L. ELLWEIN(3) - (1) Vision Institute, Department of Ophthalmology, Federal University of São Paulo (UNIFESP-Paulista School of Medicine), São Paulo, SP, Brazil (São Paulo, Brazil); (2) Nepal Netra Jyoti Sangh, Kathmandu, Nepal (Nepal); (3) National Eye Institute, National Institutes of Health, Bethesda, Maryland, EUA (United States of America)

**PURPOSE:** Investigate prevalence and causes of vision impairment/blindness in older adults in a low-middle income area of São Paulo, Brazil. **METHODS:** Cluster sampling, based on geographically defined census sectors, was used in randomly selecting cross-sectionally persons 50 years of age or older. Subjects were enumerated through a door-to-door survey and invited for measurement of presenting and best-corrected visual acuity and an ocular examination. The principal cause was identified for eyes with presenting visual acuity less than 20/32. **RESULTS:** A total of 4,224 eligible persons in 2,870 households were enumerated, and 3,678 (87.1%) examined. The prevalence of presenting visual acuity > or = 20/32 in both eyes was 61.6% (95% confidence interval [CI]: 59.4%-63.9%), and 80.4% (95% CI: 78.8%-82.1%) with best correction. The prevalence of visual impairment (< 20/63 to > or = 20/200) in the better eye was 4.74% (95% CI: 3.97%-5.53%), and 2.00% (95% CI: 1.52%-2.49%) with best correction. The prevalence of presenting bilateral blindness (< 20/200) was 1.51% (95% CI: 1.20%-1.82%), and 1.07% (95% CI: 0.79%-1.35%) with best correction. Presenting blindness was associated with older age and lack of schooling. Retinal disorders (35.3%) and cataract (28.3%) were the most common causes of blind eyes. Cataract (33.2%), refractive error (32.3%), and retinal disorders (20.3%) were the main causes of vision impairment < 20/63 to > or = 20/200, with refractive error (76.8%) and cataract (12.2%) as main causes for eyes with acuity < 20/32 to > or = 20/63. **CONCLUSIONS:** Vision impairment is a significant problem in older Brazilians reinforcing the need to implement prevention of blindness programs for elderly people.

**PB6 505 GRIP STRENGTH AS A PREDICTOR OF DISABILITY IN BASIC ACTIVITIES OF DAILY LIVING AMONG ELDERLY INDIVIDUALS**

T. SILVA ALEXANDRE\* (Universidade de São Paulo - USP - Faculdade de Saúde Pública - FSP, São Paulo, Brazil)  
Y. APARECIDA DE OLIVEIRA DUARTE(1), J. LÍCIO FERREIRA SANTOS(2), M. LEBRÃO(3) - (1) Universidade de São Paulo, Escola de Enfermagem, Departamento de Enfermagem Médico-Cirúrgica. (São Paulo, Brazil); (2) Universidade de São Paulo, Faculdade de Medicina de Ribeirão Preto, Departamento de Medicina Social. (Ribeirão Preto, Brazil); (3) Universidade de São Paulo, Faculdade de Saúde Pública, Departamento de Epidemiologia. (São Paulo, Brazil)

The measurement of grip strength has been used as a predictor of mortality and loss of functionality among elderly individuals. This fast, simple measure has gained prominence for representing overall muscle strength and has been used as a screening measure in geriatric practice. The aim of the present study was to test the measurement of grip strength as a predictor of disability in basic activities of daily living (BADL) among elderly individuals. A population-based longitudinal study was carried out on 1014 elderly individuals who took part in the SABE study, with no difficulties in BADL, no reports of wrist fracture, pain, stiffness or joint swelling and with complete information regarding BADL and anthropogenic assessment during the 2000 survey. The following variables were analyzed: gender, age, schooling, marital status, Mini Mental State Examination (MMSE), self-report of cancer, heart disease, stroke, arthritis, diabetes, depression, practice of physical activity, number of diseases, body mass index and grip strength (in quartiles). In the 2006 survey, 450 remained independent, 144 had become dependent on at least one BADL and 420 had either died or were considered losses. The logistic regression analysis demonstrated an independent relationship between grip strength at baseline and the risk of disability in BADL after six years of follow up. Among men, the odd ratio for the development of some disability was 5.07 (95%CI 4.74 to 5.42) in the lowest grip strength

quartile when compared to the highest quartile (controlled for the other variables). Among women, the odds ratio of the development of some disability was 3.11 (95%CI 2.98 to 3.24) in the lowest grip strength quartile when compared to the highest quartile. Grip strength is an independent predictor of disability in BADL among elderly individuals

**PB6 506 DETECTION AND MANAGEMENT OF ELDER ABUSE AMONG HEALTH CARE PROFESSIONALS IN IRAN**

A. ASADI NOUGHABI\* (Faculty of Nursing & midwifery Tehran university medical science, Tehran, Islamic Republic of Iran)

**Introduction** According to the latest census taken in 1996 in Iran, the elderly population aged 60 and older was 6.6% of the whole population and the Census Bureau predict that the elderly age dominance will be more significant from the year 2030 on. The elderly population aged over 60 will be 8.5 million in 2020 and five years later in 2025 this will reach up to 10.5 million. This means the population of aged below 5 years will be the same as older than 60. At that time we will have an explosion in the population of the elderly in the country. Elder abuse is one of the most under-diagnosed and under-reported problems in the United States; little are known about its characteristics, causes, or consequences or about effective means of management and prevention. **Aim** The purpose of this study is to assess the knowledge of health care professionals related to barriers to the detection and strategies for the management of the elder abuse. **Method** This study is a descriptive design. The participants for this study were randomly selected from the IRIMC organization. One hundred participants were selected, included Physicians 20%, nurse 60% and others 20%. The questionnaire utilized was designed. Fisher's exact test was used when appropriate along with the chi square. **Findings** The majority of healthcare professionals reported that most important the barrier of detection is denial of abuse. Other barriers included absence of professional protocol related to elder abuse, lack of clear guidelines about confidentiality in elder abuse situation, absence of knowledge about the prevalence of elder abuse. In the other hand strategies that helpful reported included: professional guidelines or protocol for

**PB6 507 INCIDENCE AND PREDICTIVE FACTORS OF URINARY TRACT INFECTIONS AMONG THE VERY ELDERLY IN THE GENERAL POPULATION.**

M. CALJOUW\* (Leiden University Medical Center, Leiden, The Netherlands)  
W. DEN ELZEN(1), J. GUSSEKLOO(1) - (1) Leiden University Medical Center (Leiden, The Netherlands)

**INTRODUCTION** To target preventive strategies in old age, we investigated which very elderly are predisposed to developing urinary tract infections. **METHODS AND MATERIALS** The current study is embedded in the Leiden 85-plus Study, a population-based prospective follow-up of 589 participants aged 85 years in Leiden, the Netherlands. During a five year follow-up period, information on the development of urinary tract infections was obtained from general practitioners or nursing home physicians. Possible predictive factors of urinary tract infections included socio-demographic factors (gender, living independently, income, education, body mass index, and smoking) and aspects of functioning (cognitive function [MMSE], presence of depressive symptoms [GDS-15], disability in basic activities of daily living [ADL disability/and diagnosis of incontinence], and were assessed at baseline. Relations between predictive factors and urinary tract infections were analysed with Cox regression analysis. **RESULTS** The incidence of urinary tract infections among persons aged 85 through 90 years was 110.96 (95% CI 95.34-126.57) per 1000 person-years. After multivariate analysis gender, MMSE <19, ADL disability and diagnosis of incontinence remained independently associated with the incidence of urinary tract infections. **CONCLUSION** In the very old, declined cognitive function, disability in basic activities of daily living and incontinence of urine are associated with the incidence of urinary tract infections and provide means to target patients at risk of urinary tract infections and severe health complications.

**PB6 508 REGULAR PHYSICAL ACTIVITY AND HEALTH CONDITIONS OF ELDERLY THAT LIVES IN MANAUS-AMAZONAS, BRAZIL.**

E. SANTOS\* (Universidade do Estado do Amazonas, Manaus, Brazil)  
A. RAIMUNDO(1), M. CAUDURO(1), A. SOUZA(1), S. FERREIRA(1), E. MAIA-RIBEIRO(1), M. ROCHA(1), A. SILVEIRA(2), E. RIBEIRO(1), I. CRUZ(2) - (1) Universidade do Estado do Amazonas (Manaus, Brazil); (2) Universidade Federal de Santa Maria (Santa Maria, Brazil)

**Introduction:** as the sedentary life style, mainly in elderly peoples, offer higher risk to chronic-degenerative diseases, depression, immunological decrease the objective of this study was to investigate the health conditions related to regular physical activity (self-reported) in elderly inserted in the Estratégia de Saúde da Família (ESF-SUS), Manaus-AM. **Methods and material:** a case-control study was performed from subjects previously included in the project named "Projeto Idoso da Floresta" (n=1509) that investigated the health conditions of elderly inserted in the Estratégia de Saúde da Família (ESF-SUS) de Manaus-A. Data were obtained from structured interview, anthropometric, blood pressure and biochemical (lipid and glicemia) evaluations. The elderly was classified in regular physical activity (AFR) and sedentary (S). **Results:** from 1509 elderly, 1506 answered the question about regular physical activity pattern (98%). 1199 (79.6%) reported no realization of any regular physical activity

whereas 307 (20.4%) report to realize regular physical activity. Distribution of AFR elderly was similar in the four Manaus health macrorregions. 97.1% (271) elderly reported to do regular walking, 04 (1.4%) to realize force exercises and 1.1 (0.3%) other types of exercises. Widow, highest income and education level were more prevalent in AFR group. Self-care was higher in AFR group (43.7%) than S group (23.8%) ( $p=0.0001$ ). Sarcopenia was more prevalent in sedentary male elderly. AFR elderly presented best quality of life parameters and lowest depression. Conclusion AFR elderly present higher autonomy, life quality similar to previous studies performed in other Brazilian regions and other developed populations. We suggest that the health services related to ESF-SUS need to stimulate the practice of regular physical activity as preventive strategy.

**PB6 509 AN NP/CNS INTEGRATED PRACTICE, EDUCATION AND RESEARCH MODEL**

K. HUNTER\* (University of Alberta, Edmonton, Canada)  
D. PARKE(1) - (1) University of Alberta (Canada)

**Title:** A New Nursing Model for Gerontological Advanced Practice, Education and Research  
**Introduction:** Nurse Practitioner (NP) and Clinical Nurse Specialist (CNS) roles have been broadly conceived in nursing literature. Separately, NPs and CNSs have made positive contributions to the health and well being of older people. These contributions are documented as specialized clinical practice, consultation, education and research. However, few models integrate the contributions of both.  
**Methods:** We describe the development of an innovative practice model where NP and CNS roles are integrated to combine individual and systems care expertise. This model incorporates a wellness, health promotion approach and autonomous nursing practice in a health care clinic located in a congregate living setting that has ties to an academic nursing faculty.  
**Results:** We create a matrix of influence that involves: 1. Mentoring and education of graduate and undergraduate nursing students; 2. A gerontological nursing care research network; 3. Research further into the NP and CNS roles in knowledge translation and exchange; 4. Advancing, promoting and participating in further development of nursing care of older adults within our faculty;  
**Conclusion:** Evaluation of the model using qualitative and quantitative approaches is currently underway. Outcome measures focus on the impact of the integrated model on individuals (clients and their families, health care team) and systems of care (cost effectiveness, use of health care services including ambulance, acute care utilization, ED visits).

**PB6 510 PROTOCOL 4S: STANDARDIZATION OF THE HEALTHY ELDERLY IN STUDIES ABOUT AGEING**

F. ARAÚJO\* (Hospital das Clínicas, São Paulo, Brazil)  
O. JALUUL(1), A. BUSSE(1), T. GUIMARÃES(1), B. TREZZA(1), W. JACOB FILHO(1) - (1) Hospital das Clínicas (São Paulo, Brazil)

**Introduction:** Medical literature shows several different definitions for the term “healthy elderly”. Each research uses its own classification what makes difficult a comparison of results. The aim of this protocol is to standardize this population and minimize endogenous or exogenous influences on the ageing process.  
**Methods and materials:** Based on the Senieur protocol and literature review, this protocol was developed in order to exclude situations that do not fit the natural ageing. **Results:** Exclusion criteria were hypertension, diabetes, cancer, heart failure, inflammatory conditions, depression, dementia and others that could influence or accelerate this process like smoking. The protocol also included a questionnaire concerning to social and economic aspects, dietary habits, parents' medical history and exercise practice. Since 2003, up to 120 subjects were included. This population is now being followed up on several other studies about natural ageing.  
**Conclusion:** Literature lacks of a standard definition of “healthy elderly” which leads to different concepts on the selection of samples and incomparable results. The Senieur protocol was pioneer in defining the status of healthy elderly for immunogerontological studies. However, it did not exclude situations that could influence the ageing of the other systems, such as hypertension, heart failure, endocrine diseases and smoking. In order to study the ageing process per se we believe that the use of the 4S protocol can lead to more credible results.

**PB6 511 PREDICTION OF ADVERSE OUTCOMES IN ACUTELY ILL ELDERLY PATIENTS AFTER HOSPITALIZATION**

R. WONG\* (University of British Columbia, Vancouver, Canada)  
W. MILLER(1) - (1) University of British Columbia (Vancouver, Canada)

**Introduction:** The longitudinal outcomes of patients admitted to acute care for elders units (ACE) are mixed. We studied the associations between socio-demographic and functional measures with hospital length of stay (LOS), and which variables predicted adverse events (non-independent living, readmission, death) 3 and 6 months later. **Methods:** Prospective cohort study of community-living, medical patients age 75 or over admitted to ACE at a teaching hospital. **Results:** The population included 147 subjects, median LOS of 9 days (interquartile range 5-15 days). All returned home/community after hospitalization. Just prior to discharge, baseline timed up and go test (TUG,  $P<0.001$ ), bipedal stance balance ( $P=0.001$ ), and clinical frailty scale scores ( $P=0.02$ ) predicted LOS, with TUG as the only independent predictor ( $P<0.001$ ) in multiple regression analysis. By 3 months, 59.9% of subjects remained free of an adverse event, and by 6 months, 49.0% were event free. The 3

and 6-month mortality was 10.2% and 12.9% respectively. Almost one-third of subjects had developed an adverse event by 6 months, with the highest risk within the first 3 months post discharge. An abnormal TUG score was associated with increased adjusted hazard ratio [HR] 1.28, 95% confidence interval [CI] 1.03 to 1.59,  $P=0.03$ . A higher FMMSE score (adjusted HR 0.89, 95% CI 0.82 to 0.96,  $P=0.003$ ) and independent living before hospitalization (adjusted HR 0.42, 95% CI 0.21 to 0.84,  $P=0.01$ ) were associated with reduced risk of adverse outcome. **Conclusion:** Some ACE patients demonstrate further functional decline following hospitalization, resulting in loss of independence, repeat hospitalization, or death. Abnormal TUG is associated with prolonged LOS and future adverse outcomes.

**PB6 512 QUALITY OF SLEEP AND ITS RELATED FACTORS IN HOSPITALIZED ELDERLY PATIENTS IN KASHAN'S HOSPITALS,2007**

F. IEZADI AVANGI\* (Nursing college, Kashan, Islamic Republic of Iran)  
F. IZADI AVANJI (1), M. ADIB HAJBAGHERY (2), M. AFAZEL (3) - (1) nursing college (kashan, Islamic Republic of Iran); (2) nursing college (kashan, Islamic Republic of Iran); (3) nursing college (kashan, Islamic Republic of Iran)

**Introduction:** Sleep an important variable affecting on the humans health. Need of sleep dose not change with increase of age but its quality is undergoing some change. There are little literature about the quality and pattern of sleep of hospitalized elderly people. This study was conducted to assess the quality of sleep and its related factors in hospitalized elderly patients in kashan's hospitals. **Methods and materials:** A cross sectional study was carried out on a sequential sample of 390 hospitalized elderly patients. A two part questionnaire was used for gathering data. The first part was about personal characteristics data and the second section was the Pittsburgh Sleep Quality Index. Student t-test and ANOVA and  $\chi^2$  were applied for statistical analysis. **Result:** The sample was consisted of 55/4% male and 44/6% female. Age rang of samples were  $71/8\pm5/9$ . Of the total samples 70/8% were illiterate. The total quality of sleep was poor in hospitalized elderly patients, but it was somehow better in men ( $6/22\pm4/9$ ) than women ( $8/32\pm4/33$ ). However, significant differences were identified in all aspects of sleep except that the sleep duration and sleep efficiency for the tow sex ( $p>0/05$ ). Dyspnea ( $9/3\pm4/56$ ), change in sleep habits ( $8/77\pm4/35$ ) and light stimulators ( $10/1\pm4/74$ ) were the most important factors affecting the quality of patients sleep. The quality of sleep had also significant relationship with sleep latency ( $p=0/0001$ ) and having respiratory and blood disorders. **Conclusion:** The quality of sleep was poor in elderly hospitalized patients. This could negatively affect on the process of their treatment. Some rearrangement in the ward facilities and routines can help the elderly patients to have a better quality of sleep.

**PB6 513 HOME HEALTH CARE SERVICES FOR ELDERLY IN THE VALENCIAN COMMUNITY (SPAIN).**

M. VIVANCOS\* (University of Valencia, Valencia, Spain)  
J. GALLUD(2), J. GARCÉS(1), D. CUEVAS(2), M. IZQUIERDO(1) - (1) University of Valencia (Valencia, Spain); (2) Generalitat Valenciana (Bienestar Social) (Valencia, Spain)

**Objectives:** to analyse patients and caregivers who receive home health care from primary health centres and hospital at home units in the Valencian Community (Spain) and referral of patients between the centres. **Methods:** For 1,622 home care patients the demographic, health and social characteristics were studied, within the home care pilot programme developed by multi-disciplinary teams in 2005. Six primary care centres (864 patients) and three hospital at home units (758 patients), in three of the 22 departments were used. **Results:** The patients attended by primary health centres compared to hospital at home patients were showed to be older, a higher proportion of women, more architectural barrier problems, a smaller dependence level and a different type of pathologies treated.. From the patients registered in hospital at home units and referrals from primary care, 86.8% were not detected by the latter. Patients' caregivers in primary health centres present less family links, bigger support of paid caregivers and bigger subjective overload. No specific interventions to support caregivers were detected in both resources. **Conclusions:** The patients cared for at home by primary health centres and hospital at home units presented different characteristics and comprise different groups. Continuity between these resources is insufficient. Consequently, both resources attend different groups and provide them with home care services in watertight compartments, with no shared care or mutual support between the organisations. We hereby confirm in our context the spontaneous trend that home care agents have of creating pools of “captive” patients and therefore, configuring parallel networks. We also detected the lack of consideration towards the caregivers as customers of the system. **KEYWORDS:** community health services; home care services; home care services hospital-based; hospital-at-home; continuity of care; caregivers; integrated care

**PB6 514 A RANDOMIZED CONTROLLED TRIAL TO IDENTIFY BIOMARKERS AND COMPRESSION SYSTEMS FOR OPTIMAL HEALING AND QUALITY OF LIFE**

H. EDWARDS\* (Queensland University of Technology, Kelvin Grove, Australia)  
U. ZEE(1), C. MARY(1), F. MELISSA(1), F. KATHLEEN(1), A. ROBIN(1) - (1) Queensland University of Technology (Kelvin Grove, Australia)

**Introduction:** Chronic leg ulcers have a significant impact on quality of life and functional ability of older adults, as up to 50% take over six months to heal and many remain

unhealed for years. This study aimed to identify biochemical changes and compression systems associated with optimal healing and quality of life in patients with chronic venous leg ulcers. Methods Eighty patients with venous leg ulcers were randomised to either a compression hosiery system (30-40mmHg) or 4-layer compression bandage system. Data on demographic, medical and ulcer characteristics were collected at baseline, wound fluid samples and data on progress in healing were collected fortnightly for 24 weeks, and quality of life data at baseline, 12 and 24 weeks. Concurrently, wound fluid samples from these patients were assessed using proteomic techniques to examine changes associated with healing. Results After 24 weeks of treatment, 81% of participants were healed. No significant differences in mean percentage reduction in ulcer area was found between groups (95% reduction for hosiery, 96% reduction for 4-layer), or in the proportion fully healed (80% of hosiery, 82% of 4-layer). However, participants in the 4-layer system were more likely to heal by 12 weeks (53% of hosiery, 74% of 4-layer, p=0.04). Proteomic analysis has identified prognostic and diagnostic indicators associated with healing. Other factors associated with poor healing were a BMI<22, ulcer duration >24 weeks, gender and higher depression scale scores. No differences in quality of life scores were found between groups. Conclusions From a clinical care perspective, findings indicate these two compression systems are equally effective in healing patients by 24 weeks, although a 4-layer system may produce a more rapid response. However, combining clinical indicators along with proteomic analysis could provide vital information resulting in customised treatments.

**PB6 515 PREDICTORS AND OUTCOMES OF OLDER PEOPLE'S HOSPITAL ADMISSIONS FOR ILL-DEFINED CONDITIONS**

B. WALSH\* (University of Southampton, -, United Kingdom)  
P. NICHOLLS(1), H. ROBERTS(1), K. HUNT(1), V. LATTIMER(1) - (1) University of Southampton (United Kingdom)

Introduction: Hospital admission rates are rising as the population ages in many countries. This is particularly the case for admissions for ill-defined conditions, which are known to be associated with frailty and geriatric syndromes. These admissions are thought to be avoidable, but averting admission is difficult because predictive factors, other than age, are not known. This study explored patient and organisational features of admissions in older people. Methods and materials: Data on all hospital admissions of people aged 65 and over in England were extracted from routine databases for the years 1995-2003 (n=2,793,653). Standardised rates were calculated for ill-defined admissions. Data were extracted from the records of one acute hospital for all medical and geriatric hospital admissions for people aged 65 and over in 2002 (n=6760). Patients with ill-defined and other diagnoses were compared on admission characteristics and outcomes. Results: Age is a driver of ill-defined admissions and the rate of such admissions increases with age, but the incidence rate within each age band has also increased over time. The increase exceeds what would be expected from population ageing alone. Patients with ill-defined conditions are more likely to be admitted to hospital out of GP working hours, via A&E and under the care of general rather than geriatric medicine and are more likely to have a high social deprivation score. Patients with ill-defined conditions are less likely to die, no less likely to be readmitted and more likely to be readmitted for ill-defined causes. Conclusion: An ageing population is likely to result in more hospital admissions for ill-defined conditions, but certain organisational factors also increase the likelihood of such admissions. There is potential to reduce these admissions in frail older patients through appropriate primary care provision.

**PB6 516 GERIATRICS, INTERPROFESSIONAL PRACTICE AND INTERORGANIZATIONAL COLLABORATION: THE GIIC INITIATIVE IN THE PROVINCE OF ONTARIO**

D. RYAN\* (Regional Geriatric Programs of Toronto , Toronto, Canada)  
W. DALZIEL(1), I. GUTMANIS(2), D. JEWELL(3), M. KELLEY (4), B. LIU (5), J. PUXTY (6), C. COTT(7) - (1) Regional Geriatric Program of Eastern Ontario (Ottawa , Canada); (2) Regional Geriatric Program of Southwestern Ontario (London, Canada); (3) Regional Geriatric Program of Central Ontario (Hamilton, , Canada); (4) Lakehead University (Thunder Bay , Canada); (5) Regional Geriatric Program of Toronto (Canada); (6) Regional Geriatric Program of Southeastern Ontario (Canada); (7) University of Toronto (Canada)

Introduction: Population aging and especially frailty present significant challenges to the health care system in the Province of Ontario in Canada. Health professionals are presently being insufficiently prepared in the competencies required to care for frail seniors - clinical geriatrics, inter-professional practice and inter-organizational collaboration. Methods: To help build these competencies an inter-professional team of consultants has drawn upon the knowledge base within the co-investigators organizations, prepared an evidence-based Giic toolkit and implemented a province wide knowledge-to-practice program to train and support a resource person within 200 family health teams and community health centers the province. Results: A descriptive design informed by a blend of qualitative and quantitative methods indicates high levels of satisfaction with the knowledge to practice processes, a 75% penetration rate in eligible organizations, an increase in trainee perceptions of self-confidence, an increase in Giic practices, and enhanced linkage between regional geriatric programs, family health teams and community health centers across the province. Conclusions: The Giic initiative seems a productive approach to enhancing the distribution of Giic competencies in two kinds of primary care practice

settings. In a poster presentation an overview of the project and its results will be shared, while in an oral presentation the Giic toolkit and the design of the knowledge to practice processes will be demonstrated.

**PB6 517 HEALTH PERCEPTION, PHYSICAL ACTIVITY AND COPING STRATEGIES TO HEALTH LIMITATIONS OF OLDER ADULTS VOLUNTEERING FOR HABITAT FOR HUMANITY**

P. SRIKAN\* (The University of Tennessee at Knoxville, Knoxville, United States of America)  
B. CALLEN(1), J. WITUCKI BROWN(1), A. BROWN(1), L. MEFFORD(1), S. CHEN(1) - (1) College of Nursing, the University of Tennessee at Knoxville (Knoxville, United States of America)

Introduction: With the growth of seniors in the U.S comes an increase of volunteering among older adults. Volunteering improves quality of life, enhances physical and psychological well-being, and has beneficial socioeconomic effects. The purpose of this study was to examine the health perceptions, capability of physical activity, and coping strategies of older volunteers participating in a Habitat for Humanity Blitz Build. These volunteers come together each summer from eleven southern U.S. states to build a house in one week. Methods and materials: Qualitative descriptive methods were used to analyze transcripts and demographic information from 40 older adults, age 57 to 88. Results: The majority of the volunteers were males (60%), Caucasian (92.5%), and married (87.5%). Twenty percent were employed full-time. Many older volunteers had physical problems, but 95% perceived their health as being excellent or good. They remained physically active despite limitations. Physical activities reported among the older volunteers ranged from purposeful exercise such as doing aerobics, walking, or using stationary bicycles to simple stretching activity. Other activities included routine indoor household work, outdoor activities, and recreational activities such as dancing, traveling, shopping, and doing aerobics. Three main coping strategies were used during the volunteering. These strategies included learning when to stop, cutting back, and taking a break to rest. Conclusion: Volunteerism had positive effects for these older adults. It increased their health perception, enhanced physical activity, and promoted optimistic coping strategies. Limitations of the study were the cross sectional design and self-rating of physical health. Longitudinal research is needed on the coping strategies among the older volunteers to examine changes over time. The wide variety of ages participating in Habitat for Humanity activities benefits older volunteers by allowing them to safely engage in physical activity despite increasing limitations.

**PB6 518 "YOUR BODY'S NOT PERFECT AS YOU GET OLDER": A QUALITATIVE STUDY OF LAY PERCEPTIONS OF OSTEOARTHRITIS AND WELLNESS**

J. GRIME\* (Keele University, Staffs, United Kingdom)  
J. RICHARDSON(1), B. ONG(1) - (1) Keele university (United Kingdom)

Introduction Professionals have mixed views about the usefulness of the concept of 'wear and tear' to explain OA to patients. Some see an advantage of this explanation is to demedicalise mild cases of OA. Others claim that a consequence of regarding joint problems as a natural part of ageing leads to patients adopting a general attitude that nothing can be done to improve joint pain and stiffness. A qualitative study to investigate why many older people consider themselves to be well while also reporting problems with one or more joints has thrown light on the significance and consequences of the 'wear and tear' explanation. Method Twenty-seven people aged between 56 and 87, who reported having joint pain and stiffness, were sampled from a cohort study of joint pain in Staffordshire, UK. Respondents were interviewed at baseline, and are being followed up for one year - further contact with the researchers during this time is decided by the respondents themselves. Results Seeing their joint problem as a natural part of growing older helped respondents to carry on life as normal. Holding such a view did not cause respondents to avoid physical activity in order to protect their joints from further wear and tear. Indeed, some increased activity to keep mobile. Fulfilling everyday roles and tasks was important for staying well, and respondents were prepared to cope with a degree of pain to achieve this. The relationship between ageing and having 'wear and tear' arthritis was complex, with some respondents considering themselves to be young for their years despite having OA. Conclusions Perceiving joint pain and stiffness to be a result of their bodies ageing helped respondents to feel well and did not cause them to reduce physical activity. Professionals should take account of patients' explanatory model of their joint problem.

**PB6 519 COMMUNITY HEALTH NEEDS AND RESOURCES ASSESSMENT IN NEWFOUNDLAND AND LABRADOR CANADA: SENIORS ISSUES IN PRIMARY CARE**

S. MACDONALD\* (Memorial University of Newfoundland, St. John's, Canada)

Community health needs and resources assessment studies are critical when planning healthy public policy and population health initiatives, especially when considering initiatives for healthy seniors in the community. This study is based on the Population Health Framework and supports the belief that partnerships between community representatives and health care professionals provide valuable information upon which to

base decisions regarding policy and program formation. The purpose of this study was to assess the community health needs and resources of five regions within the province of NL. The study used a descriptive, exploratory design to gather qualitative and quantitative data regarding health needs and resources. The research objectives included assessing health beliefs and practices, determining satisfaction with existing community health and related services and determining utilization of selected health and community services. A triangulation of methods (general public household survey, key informant telephone interviews and focus groups sessions) was built into the study in an attempt to provide both a convergent validity and a broad understanding of the data collected. A random sample of households were surveyed using the international tool "Community Health needs and Resources Assessment Guide" (CHNRG) developed by the Association of Registered Nurses of Newfoundland and the Danish Nurses Organization and modified for use in this study. The findings indicate that seniors wanted a primary health approach to community care. Issues arising included the need for improved home care, elder abuse and social isolation. This presentation will focus on recommendations for addressing senior's issues and concerns and will discuss implications for healthy public policy and population health initiatives for healthy seniors in the community.

**PB6 520 AGE DISCRIMINATION DEFIES PATIENT CENTRED CARE IN PROVISION OF ACUTE CARE OF THE OLDER PERSON: EXTENDING KNOWLEDGE THROUGH DISCOURSE ANALYSIS.**

L. SLATER\* (University of Newcastle, Stockton, Australia)  
D. HIGGINS(1), D. VAN DER RIET(2) - (1) University of Newcastle (Callaghan, Australia); (2) University of Newcastle (Callaghan, Australia)

Person-centred care is recognised internationally as central to the care of older people. From an acute care perspective, this study revealed tensions between the needs central to older person care and discriminatory systems that govern that care. Implicit and explicit negative attitudes cognitively, affectively and behaviourally impacted the capacity of healthcare staff to contribute to positive health outcomes from acute care situations. Healthcare staff developed coping mechanisms to tolerate bureaucratic systems that perceive the older patient as burdensome and difficult. There are recognised shortages of health care staff worldwide and these shortages were shown to both affect and be affected by negative staff attitudes. Method Qualitative research extended the knowledge of healthcare staff attitudes. Previous research has predominately used questionnaires. Innovatively, this study interviewed a range of health care staff plus patients and carers at the same time. A conceptual framework was based on Foucauldian concepts of power, knowledge and governmentality. Ethics approval for research with human subjects was obtained from both the University and the Area Health Service Ethics committees. Focus groups and single interviews were employed. Results Age discrimination was evidenced through negative attitudes towards care of the older person. Health care staff did not blame, but instead rationalised, the governing systems for poor attitudes. Current systems are evidenced globally through the cost-conscious management of health care. The desire to provide higher standards of care were frustrated by perceptions of powerlessness and inequitable systems with inadequate coping mechanisms. Conclusion Healthcare staff were challenged in their roles of care providers by situations constrained by systems (power). Nationally and internationally, improvements in the care of the vulnerable older person need to be supported by developing manageable workloads, improving knowledge of the health care needs of the older person and by governing systems valuing the older person.

**PB6 521 THE ROLE AND IMPACT OF COMMUNITY MATRONS ON THE CARE OF COMMUNITY DWELLING OLDER PEOPLE LIVING WITH LONG TERM CONDITIONS IN HERTSMERE, UNITED KINGDOM (UK)**

C. LISK\* (Barnet hospital, London, United Kingdom)  
E. REED(1), C. JONES(1), F. SPPEAR(1) - (1) potters bar hospital (potters bar, United Kingdom)

**INTRODUCTION** Case management is the process of planning, coordinating, managing and reviewing the care of an individual. The demography of patients we provide healthcare to is changing with an increasingly ageing population. This has implications for service delivery to older adults living in the community. In the UK, 3% of over 65 year olds account for 35% of admissions to hospital. Hertsmere has a population of 95000 people and we sought to look at the role and impact of community matrons on very high intensity users of unplanned secondary care using a case management approach to anticipate, coordinate and join up health and social care. **MATERIALS AND METHODOLOGY** All patients were identified from the Hertsmere case management database and their notes were reviewed by one reviewer. **RESULTS** 101 patients were identified. The majority were female (59%). The median age was 77 years with 10% of patients aged 90 years and above. The majority of patients had 5 or more long term conditions with the majority being cardiorespiratory in nature. Patients were identified from a variety of sources; the commonest through their General Practitioner (55%), Consultant Geriatrician (17%) and the Patient at risk scoring tool (PARR)(13%). The main tasks carried out were disease management with clinical management plans put in place for long term conditions, care coordination, medicines management and patient education. The service impacted positively on patient care through the provision of acute episodes of care in a patients home thus preventing the need for the use of secondary care services, facilitating discharge from secondary care, virtual ward rounds and direct access to a Geriatrician and therapy teams.

**CONCLUSION** Community matrons have had a positive impact on the healthcare of older people living in Hertsmere through maximising their functional independence through prevention, education, equity of access and quality care.

**PB6 522 THE ROLE OF A CLINICAL PHARMACIST IN REDUCTION OF DRUG INTERACTIONS AND POLYPHARMACY IN THE ELDERLY IN LATVIA.**

J. ROTBERGS\* (Riga Stradins University, Riga, Latvia)  
E. STRUPA(1), D. KANDERE(1), R. MEDNE(1), S. BERZINA(1), A. STOKMANE(1) - (1) Riga Stradins University (Riga, Latvia)

**Introduction.** Elderly patients are often treated for several medical conditions concurrently with many drugs and thus they are potentially prone to numerous risks of drug interactions. Especially significant interactions may occur between psychoactive medications (tranquillizers, sedatives, hypnotics, antidepressants, anticonvulsants etc.) and other drugs used to treat pain, in cardiovascular, gastrointestinal, pulmonary and infectious diseases. The main objective of this investigation was to survey and evaluate the current situation of geriatric prescribing in Latvia. Methods and materials. We conducted interviews with geriatric patients in several community pharmacies in the capital city Riga, several smaller towns and rural areas. Altogether we received answers from approximately 500 patients over 65 years of age. Respondents were asked to name not only the current prescription drugs but also concurrently taken over the counter (OTC) medications. Results. Polypharmacy (more than 5 drugs at the same time) was observed in a significant number of cases (over 20%). Typical examples include concurrent use of several benzodiazepines. The most undesirable therapeutic combinations found were those of benzodiazepines with antidepressants and cardiovascular drugs (propranolol, metoprolol, verapamil etc.) acting as inhibitors of benzodiazepine metabolism. Conclusion. To secure safe and effective medication use, we see an important role for a clinical pharmacist in consulting prescribers on possible unwanted drug interactions and overprescribing as well as consulting patients on appropriate drug use.

**PB6 523 PRIMARY CARE RECRUITMENT OF GPS AND THEIR OLDER PATIENTS FOR RESEARCH WITH OLDER PEOPLE.**

C. MCLEAN\* (University of Auckland, Auckland, New Zealand)  
N. KERSE(1), S. MOYES(1), E. ROBINSON(1) - (1) University of Auckland (Auckland, New Zealand)

**Introduction** Recruiting older participants can be difficult. An increased understanding of processes that facilitate or constrain recruitment is needed. Complexity and variations in the recruitment process to recruit 148 general practitioners and 3800 of their older patients aged 75 plus (or 65 plus if Maori) in three areas of New Zealand are described. **Methods and Materials** The BRIGHT (Brief Risk Identification Geriatric Health Tool) Trial recruited 3800 older people to participate in a cluster randomised controlled trial (randomised by GP practice). Approaches to key stakeholders and organisations representing GPs were followed by a personal faxed invitation to each GP. Various media was used to communicate with and recruit GPs. Meetings with practices explained the research processes and consenting GPs were enrolled. Practice's patient lists were used to identify eligible patients, 75+ years, community living and the GP sent personal letters to each patient. Consent information was included in the invitation letter initially and signed consent forms returned to the research centre. Local research nurses undertook all clerical work associated with recruitment. Results 148 of 470 GPs approached were recruited (31.5%). GP response was affected by other major quality improvement projects underway, lack of support from GP organisations, heavy GP workloads, locums and seasonal workload changes. Recruitment rate of older people (46%) was lower than expected. Neither strategy adapted to increase the recruitment rate resulted in a change, including a two stage recruitment process and documentation re-written in plain English. Personal follow up of each potential participant was important to successful recruitment. Time, financial and resource costs were greater than originally expected. Conclusion A greater range of strategies, flexibility and adaptability may be needed to overcome barriers to recruitment of older patients through primary care. Individual follow up and planning are essential to ensure older adults were contacted

**PB6 524 THE INFLUENCE OF MICRONUTRIENTS DEFICITS ON COMPLEX GERIATRIC ASSESSMENT RESULTS.**

J. MATEJOVSKY\* (Masaryk University Brno, Medical Faculty, Czech Republic, Brno, Czech Republic)  
H. MATEJOVSKA KUBESOVA(1), I. BYCHLER(2), Z. CEJGLOVA(2), F. DVORSKY(2), I. LEIXNER(2), P. TOMECEK(2), M. NAVRATILOVA(2) - (1) Masaryk University Brno, Medical Faculty (Brno, Czech Republic); (2) GP South Moravia (Czech Republic)

**Introduction:** Our previous experience showed high frequency of serum micronutrients deficits in seniors. The aim of our work was to realize how these deficits influence the overall health status of seniors, their independency. **Patients and methods:** We examined in cooperation with general practitioners 161 seniors, 60 men and 101 women of average age 73,2±5,9 years living in their own environment in a rural area. These seniors underwent functional geriatric testing (MMSE, ADL, IADL, Geriatric Depression Scale). The history

of patients and their medications were considered, physical, hematological, and biochemistry including calcium, magnesium, iron, vitamin B12 and folinic acid serum levels examinations were performed. Data were analyzed by statistical methods. Results: we found deficits of any studied micronutrients in 72 of 161 patients (44.7%). Serum level of calcium below normal range was in 10 of 161 patients (6.2%), magnesium in 36 of 161 (22.4%), iron in 20 of 161 patients (12.4%), vitamin B12 in 21 of 161 patients (13.1%) and folinic acid in 23 of 161 patients (14.3%). If we divided all patients according to any micronutrient deficit appearance, we found significantly worse results in patients with deficits in comparison with patients without micronutrient deficits – ADL 94.1+13.2 vs 98.0+6.57, p=0.03, IADL 71.39+16.4 vs 77.58+7.27, p=0.004. The same trends but without statistical significance showed MMSE 27.18+2.87 vs 28.0+2.72, p=0.07 – ns, depression scale 2.88+3.26 vs 2.27+2.86, p = 0.23 – ns. Conclusions: Serum level deficits of studied micronutrients are frequent among elderly patients. Important changes were found in result of complex geriatric assessment in patients with micronutrient deficits. We will continue our follow-up.

#### **PB6 525 CARDIOVASCULAR MULTIMORBIDITY IN PATIENTS OF GERIATRIC DEPARTMENT**

S. KRAJCIK\* (Slovak Medical University, Bratislava, Slovakia)  
P. MIKUS(2), I. BARTOSOVIC(3) - (2) St Elisabeth University College of Health and Social Work (Bratislava, Slovakia); (3) Slovak Medical University (Bratislava, Slovakia)

Introduction : The aim of the study was to find prevalence of cardiovascular condition and diseases in patients treated in geriatric department Methods and materials: The data were obtained from medical records of 201 inpatients treated at University Geriatric Department. The ICD10 was used for coding the diagnoses Results: Only 1% of the patients did not have cardiovascular diagnosis and cardiovascular diagnoses represented 27,55 % of all diagnoses.The average number of cardiovascular diseases present at one patient was 2,59. The most frequent dg. was hypertension (74,1% of patients) Chronic ischaemic heart disease was present at 69,7% of the patients. 13,4% of the patients had positive history of MI. 16,4% of the patients suffered from angina pectoris. 1% of the patients were after coronary bypass. 19,9% of patients were presented with heart failure. 4% of patients had aortal and 2 % mitral valvular disease. Atrial fibrillation was present in 13,9% of patients. 2% of patients had 1st. degree AV block, 2,5% 2nd. degree AV block. 7,5% of patients had pacemaker. 25,9% of the patients had symptoms of cerebrovascular diseases. 9,5% of patients had peripherals peripheral vascular disease. Varices were present at 23,8% of patients Conclusion : The cardiovascular system multimorbidity is very frequent needing comprehensive approach to diagnostics and therapy

#### **PB6 526 PREDICTING DESTINATION AFTER A VISIT AT THE EMERGENCY DEPARTMENT FROM A FUNCTIONAL STATUS ASSESSMENT**

N. VEILLETTE\* (Université du Québec à Trois-Rivières (UQTR), Trois-Rivières, Canada)  
L. DEMERS(2), F. GIROUX(3) - (2) Université de Montréal (Canada); (3) Research centre, Institut universitaire de gériatrie de Montréal (Canada)

Introduction: When a patient presents at the emergency department (ED), the treating team must make decision about discharge within a short time. Although the assessment of functional status is viewed as helping foresee future needs of older adults, little information is available on the accuracy of its predicting value. This study sought to assess the association between the effective disposition of patients after ED visit and the recommendation reached by clinicians using the Functional Status Assessment of Seniors at the Emergency Department (FSAS-ED). Method: A sample of 150 community-living elderly individuals was recruited in three large acute-care hospitals. The recruitment and assessments were made in the ED. The FSAS-ED is a 40-item, interview-based tool addressing the person's functional status prior to and following the decision to consult in ED. Items are related to activities of daily living, domestic activities, body functions and environmental factors. A recommendation relating to discharge is reached by the evaluator. Effective disposition post ED visit was obtained via medical record. Results: Participants were categorized as ready for home discharge (positive recommendation) (n = 68, 46 %) or as to be admitted on care unit (negative recommendation) (n = 80, 54 %). The effective discharge destination yielded a sensitivity of 95% and a specificity of 95%. Items most strongly contributing to the decision reached by clinicians ( $\chi^2$  coefficients with  $p < 0.01$ ) were related to basic activities of daily living (n = 9 items/10) and to domestic activities (n = 4 items/4). The clinician's overall decision was also associated with sleep, cardio-respiratory and movement related body functions, as well as with the availability of mobility products and transportation services (environmental factors). Conclusion: The FSAS-ED provides clinically-relevant information which could facilitate the planification following the ED visit.

#### **PB6 527 FRAIL OLDER PEOPLE AT THE INTERFACE**

W. JAMES\* (University of Leicester, Leicester, United Kingdom)  
J. GLADMAN(1), J. WOODARD(2) - (1) University of Nottingham (Nottingham, United Kingdom); (2) Nottingham University Hospitals (Nottingham, United Kingdom)

There is an international move to minimise emergency hospital admissions and length of stay, by maximising care closer to home. Many acute hospitals include an acute medical admissions unit (AMU) which facilitates rapid assessments on emergency patients.

Individuals not requiring hospital admission can be identified and discharged. We followed up patients being sent home from one AMU in whom there were concerns about functional status. This population had been assessed and managed by the medical team, and then referred to a nurse/therapist led Integrated Discharge Team. The team reviewed current and prior function, social circumstances and rehabilitation needs, arranging support and interventions as required. Standardised forms were used to collect demographics, geriatric syndromes and mortality and readmission data were obtained from hospital systems. 184 patients were studied. Their mean age was 82.1 years (SD 8.0), 62 (34%) were male. The mean length of stay on the AMU was 2 days (SD 8). 67 (36%) had a fall, 43 (23%) had cognitive impairment, 42 (23%) immobility, 109 (59%) polypharmacy and 7 (4%) a pressure sore. The median (IQR) number of geriatrics syndrome per patients was 1 (1-2). 102/184 (55.4%) were readmitted and 48 (26.1%) died in the following 12 months. The readmission rate was 2.5 (95% CI 2.1-3.1) and the mortality rate 0.9 (95% CI 0.7-1.2) per 1000 person-days. These data show that patients with functional decline or other geriatric syndromes represent an especially vulnerable sub-population of those attending AMUs. Their mortality is substantial and the high readmission rates suggest on-going complexities. Our findings suggest that additional services are required, for example specialist geriatric expertise to manage these complex patients, with a greater focus on end of life care and advance care planning.

#### **PB6 528 LIMITATIONS OF THE CONCEPT OF HEALTH-RELATED QUALITY OF LIFE IN OLDER POPULATION**

K. SAKS \* (University of Tartu, Tartu, Estonia)  
T. STRANDBERG(2), E. TIIT(1) - (1) University of Tartu (Tartu, Estonia); (2) University of Oulu (Oulu, Finland)

Introduction: Quality of life (QoL) has become a central interest for researchers and practitioners working in the area of health and social care. Whether or not health related QOL (HRQoL) measures can be used validly for frail older populations remains unclear, because the scales may not measure important dimensions relevant to QoL of older people. The aim of our survey was to study the relationship between psychological well-being, subjective health, and HRQoL in two culturally different samples of older population. Methods and materials: We made population-based postal surveys in a random sample of community-living older people in Helsinki (Finland; N=1380) and Tallinn (Estonia; N=900). HRQoL was assessed using the internationally validated 15D instrument consisting of 15 dimensions which can be expressed with one score. In addition, data about living conditions, loneliness, health, functioning, psychological well-being and depression were collected. The linear regression analysis was used as modelling methodology (SPSS statistical package), where step-wise selection (combination of forward and backward selection rules) of arguments and significance level 0.05 was used. Results: The mean 15D score was similar in both samples (0.792 in Tallinn and 0.793 in Helsinki; P=0.86). At the same time Estonian seniors' self-assessed subjective health, psychological well-being and depression were significantly worse than in Finnish seniors. The structure of HRQoL models was rather similar in both samples, which contained besides physical and mental health items also loneliness as an independent factor. Conclusions: Our results indicate that HRQoL measured with 15D describes identical dimensions in older population with different cultural background. At the same time HRQoL may not reflect older people's global well-being. For cross-cultural comparisons HRQoL scores should be handled with caution and against other health and well-being variables.

#### **PB6 529 INEQUALITY IN UTILIZING COMMUNITY BASED HEALTH SERVICES FOR AGING HYPERTENSION OUTPATIENTS**

N. QIAO\* (Fudan University, Shanghai, China)

Introduction With the biggest aging population and the fastest aging speed in the world, China has moved to the issue of the elderly's health. In 1997, the central government started an initiative to establish a community health system in urban areas through which the demand of the elderly for primary health care, especially chronic and common diseases outpatient care was expected to better meet. Hypertension is the most commonly seen chronic diseases with the prevalence of above 12 percent in the population aged 65 or above, top 1 in all chronic diseases. The study aims to analyze the difference in healthcare utilization for hypertension elderly with different income. Methods Cluster random sampling method was used to survey one day's 922 hypertension outpatients aged 60 or above in 22 community health centers in the cities of Shanghai, Chengdu and Yinchuan locating in East China, Northwest China and Southwest China respectively. Range analysis was conducted to evaluate the community health care equity among the elderly with different incomes. Results The main arterial pressure of highest income group is 101.77mmHg, while in the lowest is 105.44mmHg. The richest visited community health centers by 3.24 times per month in average and their average daily expenditure was 12.6 Yuan RMB, while the poorest had 2.30 visits with an average daily expenditure of 5.0 Yuan RMB. 72.4% of the not-insured were in the lowest income group while only 4.8% in the highest one. Conclusion Inequality in healthcare utilization exists in hypertension aging patients. The poorest group has worse health status, less utilization of health resources,

while low insurance coverage. The government should formulate policies to subsidy the poor chronic disease aging patients to improve their health service utilization.

**PB6 530 PREDICTORS OF QUALITY OF LIFE IN OLDER PEOPLE FROM THE ENGLISH LONGITUDINAL STUDY OF AGING**

A. YOHANNES\* (Manchester Metropolitan University , Manchester, United Kingdom)  
G. TAMPUBOLON(2) - (2) University of Manchester (Manchester, United Kingdom)

**Introduction** The number of older people and life expectancy are rising in England. Cross-sectional population studies often suffer from unobserved individual heterogeneity (e.g. genetics or unobserved predisposition to adopt healthy lifestyle) contaminating the estimate of social inequalities on well-being. Therefore, longitudinal population studies that investigated quality of life in older people are sparse or lacking. We explored factors that predict quality of life in older people in England in six years follow-up. **Methods** Secondary data analysis of the three waves (2002 = 9,953; 2004= 8,411; 2006 = 8,411) of the English Longitudinal Study of Ageing. Subjects were nationally representative sample of non-institutionalized older people living in England. The study collected information on personal, economic, and social circumstances were collected. Quality of life was measured using CASP-19, a 19 item likert scale index. It has four domains: control, autonomy, self-realisation and pleasure. We used random effect Poisson model to analyse data that accounts of individual heterogeneity and non-linear scale of quality of life. It is robust to attrition if the data is missing at random. Significance was set at  $p < 0.05$ . Results Predictors of impaired quality of life using CASP-19 were: female gender (beta 1.199,  $p < 0.001$ ), older age (beta 0.596,  $p < 0.0001$ ), self reported health (beta 4.339,  $p < 0.0001$ ), active smoking (beta -0.988,  $p < 0.0001$ ), alcohol consumption (beta 0.345,  $p < 0.0001$ ), socioeconomic status (beta 0.115,  $p < 0.001$ ) and low monthly income (beta 0.913,  $p < 0.0001$ ). Conclusion Factors that impair quality of life in older people are multi-factorial. Health care providers and policy makers should be aware of the impact of financial hardships, socio-economic status, social habits (smoking and alcohol) on quality of life.

**PB6 531 DOCUMENTATION AND RESEARCH OF UNWANTED EFFECTS OF ANTI-FLU VACCINATION IN SENIOR PATIENTS (MULTI-CENTER STUDY)**

S. TSOUKIS\* (General Hospital of Kastoria, Thessaloniki, Greece)  
S. PATIAKAS(1), S. TSUKIS(2), I. GIOVANOPoulos(2) - (1) General hospital of Kastoria (Greece); (2) General Hospital of Rethymno (Greece)

**INTRODUCTION :** Documentation of the frequency and the types of unwanted effects occurring mostly in elderly people after anti-flu vaccination. **MATERIAL – METHOD :** A total of 367 people were studied, out of a general total of 452 senior patients > 65 years of age, who were vaccinated against the flu. All of the commercially available vaccines were used, while the unwanted effects were documented in full detail either by filling in special questionnaires in the following visit of the patient, either via telephone communication after the manifestation of symptoms, or as a result of the clinical examination. **RESULTS :** A total of 45 people (12.3% of the vaccinated) presented unwanted effects. In particular : Redness and edema at the point of inoculation was reported in 28 cases (62%), which in the general total is very low and subsided without treatment within three days. Fever ranging from 37.5 °C to 38.2 °C was reported in 7 people (16%). Paracetamol 500 mg X 3 was administered and remission of the symptoms followed in the total of the cases. Knematos at the point of inoculation was reported in 6 people (13%), while generalized knematos was reported in 2 cases where administration of oral antihistamine drugs was deemed necessary. Finally in 2 people were documented arthralgias, mainly of the upper and lower limbs, that subsided with paracetamol in one case, while in the other case non-steroidal anti-inflammatory drugs were needed. **CONCLUSIONS :** In elderly people who frequently suffer from a variety of diseases, the unwanted effects of anti-flu vaccination are relatively rare and moderate regarding their severity. And in any case easily and fully treated. Consequently, the generalized application of anti-flu vaccination in elderly people and especially in high risk groups (coronary disease patients, pulmonary disease patients, etc.) is essential.

**PB6 532 STUDY OF CLINICAL AND MICROBIOLOGICAL FINDINGS IN SENIOR PATIENTS WITH ACUTE PYELONEPHRITIS**

S. TSOUKIS\* (General Hospital of Rethymnon, Rethymno, Greece)  
S. PATIAKAS(1), I. GIOVANOPoulos(2) - (1) General Hospital of Kastoria (Greece); (2) General Hospital of Rethymnon (Greece)

**INTRODUCTION :** Scrutiny of underlying situations, clinical manifestations and lab test results in cases of elderly patients with acute pyelonephritis (AP), a common disease in elderly patients. **MATERIAL – METHOD :** 52 cases of patients with age average 74.2 +/- 7.1 years of age with AP were studied, which were documented last year in the areas of Goumenissa and Lemnos. 47 of the cases were community infections and 5 were hospital infections. In all of the cases demographic, clinical and lab: microbiological and X-ray, data were collected. **RESULTS :** The most common underlying situations were proved to be: prior urinary tract infection 34.6% (18 cases), diabetes mellitus 25% (13 cases), nephrolithiasis 17.3% (9 cases), and catheterization of the urinary bladder 13.5% (7 cases). Clinical manifestations included mainly: urethral syndrome 71.2% (37 cases),

fever 67.3% (35 cases), and low blood pressure 15.4% (8 cases). Lab tests demonstrated leukocytosis (average value 15.710+/- 1312) and an increase in creatinine levels (average value 1,9+/- 1,7 mg/dl). Furthermore, the cultures were positive for e.coli at 67.3% (35 cases), proteus and enterococcus at 7.7% (4 cases each), pseudomonas at 5.8% (3 cases) and klebsiella at 3.8% (2 cases). Correspondingly, e.coli sensitivity to gentamycine was 88.6% (31 cases in a total of 35), to amoxicillin-clavulanic acid 71.4% (25/35), trimethoprim-sulfamethoxazol 62.9% (22/35), while resistance to ampicillin was 65.7% (23/35). Finally, bacteraemia occurred in 48% (25 cases in a total of 52), while 3 deaths occurred (5.8%). **CONCLUSIONS :** 1) AP cases are common in senior patients of the community and in 1/3 of the cases there is a prior urinary tract infection. 2) Primary cause is e.coli. 3) However, special attention is required in

**PB6 533 INAPPROPRIATE DRUG PRESCRIPTION IN OLDER SUBJECTS IN DIFFERENT HEALTH CARE SETTINGS**

A. CRUZ-JENTOFF\* (Hospital Universitario Ramón y Cajal, Madrid, Spain)  
B. MONTERO-ERRASQUIN(1), S. GONZÁLEZ-BLAZQUEZ(2), B. BRUSINT-OLIVARES(3), M. MARTÍN-ÁLVAREZ(3), M. CONEJOS-MIQUEL(3), M. SÁNCHEZ-CUERO(1), E. DELGADO-SILVEIRA(1) - (1) Hospital Universitario Ramón y Cajal (Madrid, Spain); (2) Residencia Adavir (Madrid, Spain); (3) Centro de Salud Alpes (Madrid, Spain)

**Objective:** Inappropriate prescription of drugs is frequent in older subjects, but may vary in different health care settings and with the use of different detection criteria. We wanted to compare the performance of two different tools (Beers criteria and STOPP-START) in the detection of potentially inappropriate drugs and potentially appropriate, indicated drugs in older patients cared as hospital outpatients, in primary care and in a nursing home. **Method:** STOPP-START and Beers criteria were used in 50 consecutive outpatients at a hospital geriatric clinic (HC), 50 random patients of a public primary care clinic (PC) and 50 random patients of an assisted nursing home (NH). **Results:** Age increased with the complexity of the setting (78.8 years in PC to 84.5 years in NH patients), as did the number of females (46% in PC to 76% in NH). Beers criteria detected potentially inappropriate drugs in 24% (PC), 26% (HC) and 20% (NH) of the subjects. STOPP criteria detected potentially inappropriate drugs in 36% (PC), 54% (HC) and 50% (NH) of the subjects. The number of subjects with two or more inappropriate prescriptions was higher with STOPP (12-20%) than with Beers criteria (2-10%). START criteria found that 28% (PC), 54% (HC) and 46% (NH) of the subjects were not receiving drugs indicated for some diseases. **Conclusions:** STOPP criteria detected a higher number of subjects with potentially inappropriate drug prescription than Beers criteria in all health care settings, although there are significant differences across settings. START criteria also detected many subjects who were not receiving appropriate drug treatments for their diseases.

**PB6 534 SELF-REPORTED SLEEP DURATION AND PERCEIVED HEALTH AMONG YOUNG OLD, MIDDLE OLD, AND OLD OLD POPULATIONS IN TAIWAN**

W. LIAO\* (Chun Shan Medical University, Taichung, Taiwan)  
J. CHEN(2), C. KUO(1), C. WANG(1), C. YEN(1), M. LEE(1) - (1) Chun Shan Medical University (Taichung, Taiwan); (2) Taijen University (Pingtong, Taiwan)

**Introduction:** Sleep is a vital function and is associated with mortality. However, perceived health is more important than mortality on explaining quality of life. This study examined the association of self-reported sleep duration and perceived health in Taiwanese older adults. **Method and materials:** Data were from a Taiwanese national survey of the Knowledge Attitude and Performance in Health 2002. Older adults aged 65 years or more ( $n=4207$ ) were sampled from all areas of Taiwan island. Older adults were classified as young old (aged 65-74 years, mean =  $69.3 \pm 2.8$ ,  $n=2641$ ), middle old (aged 75-84 years, mean =  $78.4 \pm 2.7$ ,  $n=1303$ ), and old old (aged 85 years and over, mean =  $88.2 \pm 3.0$ ,  $n=263$ ). **Results:** Sleep duration was increased as people aged with a mean of 6.6 hours ( $SD=1.6$ ). In young old and middle old, short sleep ( $\leq 6$  hrs) was associated with increased depression ( $F=28.7$ , 17.7, respectively,  $p<.000$ ); long sleep ( $>9$  hrs) was associated with more disability days ( $F=17.7$ , 11.4, respectively,  $p<.000$ ); and short and long sleep was associated with poorer perceived health ( $F=23.4$ ,  $p<.000$ ,  $F=4.8$ ,  $p=.009$ , respectively). However, only short sleep was associated with depression in the old old ( $F=3.9$ ,  $p=.02$ ). **Conclusion:** There exists a U shape between sleep duration and perceived health in the young and middle old groups but not in the old old group. The old old group is a small portion of healthy and long-lived people in the society. Further study to examine the contributors to their healthy and longevity is needed.

**PB6 535 COMPARING CARING BURDEN AND DETERMINANTS OF CARING BURDEN IN COHABITANTS LIVING WITH PARTNERS SUFFERING FROM DEMENTIA OR CHRONIC OBSTRUCTIVE PULMONARY DISEASE**

B. NORDTUG\* (NTNU, Trondheim, Norway)  
A. HOLEN(1), O. SLETVOLD(1), R. WALSTAD(1) - (1) NTNU (Trondheim, Norway)

**Introduction:** Dementia and chronic pulmonary disease (COPD) will increase in coming years. To meet the challenges of helping these patients stay longer in their homes, more insight into the determinants of the caring burden of their cohabitants is warranted. **Methods and materials:** This cross-sectional survey examined caring burden and

characteristics of cohabitants living at home with partners having dementia or COPD. The sample included 101 cohabitants of partners with dementia, and 105 cohabitants of COPD partners. Medical experts established the diagnoses. The severity of their diseases was assessed by the Clinical Dementia Rating (CDR) and by the Global Initiative for Chronic Obstructive Lung Disease (GOLD). Relative Stress Scale (RRS) quantified the caring burden. Medical Outcomes Study Social Support Survey Form (SSS) captured perceived social support. Response rate was 80 %. Results Caring Burden increased with severity in dementia group. In the COPD group, the caring burden was higher and more stable. 60 % of the caregivers were women. Caregivers in the dementia group were about seven years older, had longer cohabitation spans, yet the duration of their partners' illness was shorter. Perceived social support was lower, utilization of professional aid and social withdrawal was higher in the dementia group. The patients in the dementia group were less self-reliant, showed more aggressive behaviour, and could adequately be left alone shorter. In the dementia group, the patients' degree of self-care made the most difference, while in the COPD group, social withdrawal played that role. Conclusions To estimate the caring burden in future planning, consider gender, education of caregiver, degree of perceived care, social withdrawal from family and friends, and patients capacity of self-reliance, aggressive behavior, and ability to be adequately alone. These determinants explained 54 % of the variance in the dementia group and 58 % in the COPD group.

#### **PB6 536 THE NEXUS BETWEEN ALLIED HEALTH PROFESSIONALS AND NURSING CARE FOR AGED PEOPLE**

S. MEEHAN\* (Southbank Institute of Technology, Brisbane, Australia)

**POSTER PRESENTATION** Demographically in Australia, there is a shortage of Allied Health professionals whilst the numbers of older people requiring these services continues to grow. One response to this is the introduction of the "Allied Health Care Assistant". This course which provides assistance for Physiotherapists, Podiatrists, Occupational Therapists, Speech Therapists and Dieticians has been introduced at the Southbank Institute of Technology in Brisbane, Queensland, Australia. In groups of 25, students of this course learn the basic techniques required for care of the aged according to an action plan provided by the professionals. When a client does not or cannot respond to the plan provided by the professional the AHC assistant will notify the professional for necessary adjustments. The assistant is aware of his/her limitations and is always under the direct or indirect supervision of the Allied Health Professional. The students of this course all have a background in nursing care of the elderly and may work in residential care or community settings. The course is short and of a practical nature. It also is not expensive, thus encouraging many applications. Students have come from all over Queensland to complete this course as it becomes recognised that it can support the allied health needs of older people, particularly in areas where an allied health worker may visit irregularly. Presently, there are 60 graduates as Podiatry assistants and 26 graduates as Physiotherapy/Occupational Therapy assistants. The Speech Therapy/Dietetics course will be introduced later this year. In caring for our aged both in residential and community care it is essential that we remember the importance of preventive medicine. Good Allied Health care is an essential part of this and will ensure that aged people are given quality care in the winter of their lives.

#### **PB6 537 THE BELGIAN GERIATRIC DAY HOSPITALS ONE YEAR AFTER IMPLEMENTATION AT THE NATIONAL LEVEL.**

A. VELGHE\* (University hospital ghent, Ghent, Belgium)

J. PETERMANS(2), D. GILLAIN(2), N. VAN DEN NOORTGATE(1) - (1) UZ Gent (Belgium); (2) CHU Liège (Belgium)

Introduction: In 2006 an evaluation project started on the Belgian geriatric day hospitals (GDH). Forty eight GDH and 2519 patients were included. In 2007 a follow up study was carried out. Methods: All included patients were contacted. Using a standardized questionnaire patients were asked about health status and degree of satisfaction about the GDH. Results: Data, often incomplete, were available for 1269 patients (46.9%). After 1 year 425 (33.5%) patients are still in follow up. The presence of a geriatric syndrome is the main motive ( $p<0.0001$ ) to provide follow up. Hundred eighteen patients (19%) died and 714 patients (66.7%) were hospitalized. In 60% of patients there was no correlation between the reason for which they visited the GDH and their hospital admission. Moreover, 31% of all patients included in 2006 had been hospitalized prior to their first visit at the GDH. Seven hundred sixteen patients (69%) were advised to start or change medication. Only 31 patients (4.4%) did not follow this advise, half of them in consultation with their general practitioner. Physiotherapy was advised for 205 patients (20.7%). Fifteen percent did not start physiotherapy, 80% on their own initiative. At the end of rehabilitation 86 patients (72%) considered themselves to be improved. Five hundred fifty one interviewees (75%) consider the GDH to provide an added value. Conclusion: The main reason for follow up in the Belgian GDH is the presence of a geriatric syndrome. The number of patients who died or were hospitalized is disproportionately high and probably due to selection bias (accessibility of information, low response rate), comorbidity and a higher risk of readmission. Most advises concern medication and compliance to this advises is high. It seems more difficult to motivate patients for rehabilitation therapy. Overall satisfaction about the GDH is high.

#### **PB6 538 FOOT PROBLEMS OF OLDER VETERANS IN A VETERANS CARE HOME**

S. CHU\* (Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taipei, Taiwan)

L. CHEN(1), M. LIN(1), S. HWANG(3), C. LAN(2) - (1) Center for Geriatrics and Gerontology, Taipei Veterans General Hospital (Taipei, Taiwan); (2) Institute of Health Welfare and Policy (Taipei, Taiwan); (3) Department of Family Medicine, National Yang Ming University School of Medicine (Taipei, Taiwan)

Background Foot problems are common in older people. Older veterans may be more susceptible to various foot problems because of their experiences of military services. However, foot problems of older people do not gain sufficient attentions in clinical practice. The main purpose of this study is to assess older veterans in a veterans care home in Taiwan to evaluate the characteristics of foot problems and the relationship between physical function. Method Senior residents of Banciao Veterans Care Home were invited for study and were enrolled when they were fully consented. Inter-RAI Minimum Data Set Nursing Home 2.0 Chinese version (MDS-NH 2.0) was implemented for all participants. Activities of daily living (ADL) of all participants were evaluated by the MDS ADL. The C1,C2 (hearing ability or aids use ), D1, D2 (visual acuity or glasses use ), JJ1g (any edema), JJ4 (any fall accident within 180 days), and MM6 section (evaluation of foot problem and care) were selected for evaluations. In addition, dermatologic conditions, orthopedic conditions, tenderness, edema and sensory loss of both feet were examined by directly by a geriatrician. Results In total, 120 senior residents (mean age: 83.3 years, all male) were examined and over 96% of all participants had certain foot problems. However, the presence of orthopedic condition, edema, tenderness and sensory loss were not significant between subjects with and without functional dependence. Moreover, independent subjects were more likely to have corns or calluses of both feet (54.9% vs. 24.1%,  $P<0.05$ ) than dependent subjects. Conclusions Foot problems are common among older veterans in Taiwan. Further study is needed to clarify the clinical impact of foot problems to older veterans.

#### **PB6 539 IMPACT OF A MULTIDISCIPLINARY GERIATRIC INTERVENTION IN THE EMERGENCY DEPARTMENT**

M. VIDEAU\* (CHU bordeaux, Pessac, France)

F. MARIE(1), C. ODILE(1), V. ANGELIQUE(1), G. CLAUDE(2), S. NATHALIE(1) - (1) CHU (pessac, France); (2) CHU (bordeaux, France)

Introduction: Older adults use emergency service at higher rates and frequently generate inappropriate hospitalizations, and make their care in the Emergency Department (ED) problematic. Objective: To determine the impact of multidisciplinary geriatric ED intervention on patient's outcome. Methods: During 4 years (2004 to 2008), all the patients admitted in the ED and evaluated by the multidisciplinary geriatric team, were included in the study. Data from the standardized geriatric evaluation were collected, outcome after ED was described (i.e. hospitalization, home discharge or nursing home discharge), and follow-up was carried out by the team, one month after patient's discharge for all the included patients. Statistical analyses: descriptive, unvaried and multivariate analyses were carried out. 5.9+Results: During 4 years, 2666 patients were included (mean age 86.2 years). Most of the evaluated patients were defined as frail, i.e. syndrome of falls (21.4%), delirium (18.2%), loss of one or more ADL items (72.8%), and problematic social conditions of living (40.5%). Hospitalization was decided in 1277 (52.5%) ED patients, and was statistically associated with diagnosis of delirium (OR 1.3; CI 95% 1.1-1.6;  $p=0.03$ ), fall (OR 1.6; CI 95% 1.3-1.9;  $p<0.0001$ ), ADL loss (OR 1.3; CI 95% 1.1-1.5;  $p<0.0001$ ), and social problems (OR 1.4; CI 95% 1.1-1.5;  $p<0.0001$ ). A total of 138 (5.2%) patients were re admitted one month after their discharge, and only complex social condition of living was a significant risk factor of re admission (OR 2.7; CI 95% 1.5-4.8;  $p=0.001$ ). Conclusion: The presence of specific multidisciplinary teams in ED would help to decrease the rate of inappropriate hospitalizations.

#### **PB6 540 IMPACT OF A POST EMERGENCY GERIATRIC ACUTE UNIT ON THE HOSPITAL READMISSION RATE**

T. TRAISAC\* (CHU, Pessac, France)

V. MARIE-NEIGE(1), B. MARIE-JOSE(2), B. ISABELLE(1), R. MURIEL(1), S. NATHALIE(1) - (1) CHU-pôle de gériatrie clinique (pessac, France); (2) CHU-pôle médecine urgences (bordeaux, France)

Introduction: Post emergency geriatric acute care unit provide specific geriatric multidisciplinary management, and this may decrease length of hospital stay, functional decline, and early re admission rates. Objective: The aim of this study was to evaluate risk factors of early re hospitalization in an acute geriatric unit. Patient-methods: During one year (2007), all the patients aged over 75 years, admitted in the geriatric acute unit, and discharged home were included. Socio demographic data, geriatric assessment (co morbidity, list of treatment), and gerontological assessment (ADL, IADL, cognitive and mood evaluation, (MMSE, GDS), nutrition assessment (BMI, MNA), and Timed Up and Go test) were collected for all the included patients. One month after home discharge, patients were followed-up by phone, and hospital re admission rate was carried out. Statistical analyses: descriptive, unvaried and multivariate analyses were carried out. 6±Results: A total of 476 patients were included (mean age 86.5 years, 154 men,

322 women). During one year of inclusion, the mean 2.7 days, and a length of stay in the geriatric acute unit was 6.3 total of 68 (14.3%) patients were re admitted within one month after their discharge. Univaried and multivariate analyses showed that the re admission rate was statistically associated with diagnosis of delirium (OR 1.9; CI 95% 1.1-3.3; p=0.02), a mean length of stay in the unit higher than 6 days (OR 1.9, CI 95% 1.1-3.5; p=0.02), and the decision of home discharge (OR 2.4; CI 95% 1.4-4.1; p=0.002). Conclusion: Post emergency acute geriatric unit model with very short lengths of stay seems to improve functional and clinical outcomes of frail elderly, and prevent early re admission.

**PB6 541 GENERAL PRACTITIONERS' PERCEPTIONS AND NEEDS FOR GERIATRIC DAY HOSPITALS IN BELGIUM**

J. PETERMANS\* (UNIVERSITY OF LIEGE, LIEGE, Belgium)  
C. DUCHESNES(1), V. MASSART(1), F. DESMYTER(2), P. DENOEL(1),  
P. VANDENBUSSCHE(2), S. WILLEMS(2), D. GIET(1), N. VANDENNOORTGATE(2)  
- (1) UNIVERSTY OF LIEGE (LIEGE, Belgium); (2) UNIVERSITY OF GHENT  
(GENT, Belgium)

Context: The first forty-five geriatric day hospitals (GDH) were created in 2006 in Belgium and their number increases every year. They propose a multidisciplinary support to diagnosis and possibly to treatment of elderly, without hospitalisation. A first evaluation showed that few general practitioners use this new institution. The reported research is a part of a wider evaluation of the GDH. This work was financed by the Belgian Ministry of Public Health. Objective: The goal of the qualitative research was to gather general practitioners' perceptions, attitudes and expectations about the care of their old patients in this new structure. Method: Focus groups of general practitioners (GP) were organised in Flanders (Flemish-speaking part of Belgium) and in Wallonia (French-speaking part of Belgium). A common guide of questions was prepared and translated in both languages. The discussions were recorded and integrally transcribed. Coding was performed in parallel by French and Flemish-speaking researchers; the coding tree was continuously discussed and adapted. Results: The results first highlight the general context of the Belgian health system: GPs' mistrust and suspicions about the second line. In this context, GPs often see geriatric specialists as rivals for the care of the elderly. Moreover most GPs scarcely know the new institution, its functions and organisation. Those who already used the service clearly appreciate the advantages such a structure brings to their practice and to their patients. However, they also quote organisational difficulties concerning the principle of team-working. Finally, they mention ethical concerns about responsibility-sharing and decision-making. Conclusion: This research showed obstacles to the use of the GDH by the general practitioner. One of the actions of the Belgian health system will be to propose better information to the GPs about functions, organisation and goals of the local geriatric day hospital.

**PB6 542 REGIONAL GROUP OF MOBILE GERIATRIC TEAM IN THE SOUTH WEST OF FRANCE**

S. NATHALIE \* (CHU, PESSAC, France)  
M. FLOCCIA(1), V. MARIE-NEIGE(1), Z. EDOUARD(2), B. DANIEL(3),  
S. MARION(4), V. LUC(5), B. CHRISTOPHE(6), P. JEAN-LUC(7), L. FRÉDÉRIQUE(8)  
- (1) CHU pôle de gérontologie clinique (peccac, France); (2) CH côte basque, pôle de  
géatrie (bayonne, France); (3) CH Périgueux, Géatrie (33604, France); (4) CH Pau,  
Géatrie (Pau, France); (5) CH Agen, Géatrie (France); (6) CH Mont de Marsan, Géatrie  
(France); (7) CH Dax, Géatrie (France); (8) CH Rober Boulin, Géatrie (France)

Introduction: Since 2007, French Ministry decrees defined specific geriatric intervention in all sectors of the health facility, including Emergency Department (ED). Objective: To describe activities and missions of all the geriatric intervention teams in the south west of France. Methods: Since 2006, we organized a meeting, every 6 months, of all the mobile geriatric teams of the region (Aquitaine, France) in order to homogenize the functioning of the teams, and to centralize results of different indicators of efficiency and effectiveness. Different indicators were analysed: rate of interventions for each team, description of all the evaluated elderly patients (standardized gerontologic and geriatric assessments), rate of home discharge, and rate of hospital re admission. Results: A total of 8 mobile teams of geriatrics were included, 7 teams had an intra hospital functioning (ED or medico chirurgical units), and 1 had an extra hospital functioning (nursing home, home care). All the teams were composed by a geriatrician, a nurse, a social worker, and a secretary and some had an occupational therapist or a psychologist. All the mobile teams had same missions: providing medico-psycho-social assessment, planning health care and life project for geriatric patients, and participating in the organization of patient's outcomes with home support devices. Preliminary centralized results showed that the mean average interventions per month for all the teams were 42 (30 to 114 interventions per month), and that the rate of hospital re admission one month after hospital discharge was 7.8% (6.1 to 9.7%). In conclusion, the creation of this regional group of mobile geriatric teams permitted to decrease variance in care for elderly patients and to avoid unnecessary re admissions.

**PB6 543 ELDERS COMPREHENSIVE ASSESSMENT: PORTUGUESE VERSION OF THE OARS**

R. RODRIGUES\* (Escola Superior de Enfermagem de Coimbra, Coimbra, Portugal)

INTRODUCTION The aim of this study was the creation of the Portuguese version of the OARS (Older Americans Resources and Services Program), showing its reliability and validity. The OARS methodology was developed to evaluate the functional capability in five fundamental areas of the older life quality: social resources, mental health, physical health and activities of daily living. It measures also the usage and need felt of 23 services. This instrument has been used in different studies tending to define interventions based in the gathering of information about central features of this population. METHODS AND MATERIALS For the development of the Portuguese version of OARS, we followed two directives: (1) the linguistic and cultural adaptation to Portuguese language and (2) the psychometric study of this version, comparing it with the original. The following study began with the back-translation procedures and cultural adaptation, for the Portuguese language. The Portuguese version of the OARS, was applied to the assessment of 302 older persons (randomised and stratified sample by age, gender and type of institutional support), allowing with this sample the global psychometric study of the instrument. RESULTS The results of the psychometric study done with the Portuguese version (QAFMI) tend to show that is an equivalent version to the original version and others Latin languages. CONCLUSION All the work developed with the creation of the Portuguese version (QAFMI) lead us to consider this instrument very useful to define the functional situation of the elders in the specific evaluation areas and the needs, becoming right to the planning of older care services. Study most relevant outcome, shows that we have an equivalent version of the original instrument. Therefore, we make available a measurement instrument of quality for older people providing significant information to interventions and improve adequate care strategy on this population group.

**PB6 544 STATUS EPILEPTICUS IN THE ELDERLY: A CASE-CONTROL STUDY.**

P. CAILLET\* (Henri Mondor's hospital, Creteil, France)  
S. BASTUJI-GARIN (1), G. LABREVOIS-DARCEL(2), S. KRYPCIAK(1),  
S. THOMAS(2), E. TAILLANDIER-HÉRICHE(1), F. TAHMASEBI (2),  
E. PAILLAUD(2) - (1) Henri Mondor's Hospital (Créteil, France); (2) Albert Chenevier's  
Hospital (Créteil, France)

Introduction. The aim of this case-control study was to assess mortality, morbidity and risk factors of Status Epilepticus (SE) among elderly patients hospitalized in geriatric units. Methods. 63 consecutive elderly patients ( $\geq 70$ y) with a SE were prospectively included and matched for age ( $\pm 3$ ), gender, hospital and co-morbidity score (CIRSG $\pm 3$ ). Univariate and multivariate exact logistic regression models were used to compare cases and controls, and survivors and non-survivors. Results. In univariate analysis, a history of diabetes (p=.04), stroke (.000), seizure (.000), hypocalcaemia (.003), hyper- and hyponatraemia (.000) were associated with SE. In multivariate analysis, history of stroke (OR=3.44 95%CI 1.33-8.92), seizure (OR=5.33, 1.36-20.85), hypocalcemia (OR=2.53, 1.01-6.37) and hypo- (OR=8.90, 2.75-28.79) or hyponatraemia (OR=2.99, 1.15-7.78) were independently associated with SE. Among the 63 SE cases, 17 (30.0% 95%CI 16.6-39.7%) died during the following 3 months. Non-survivors were more frequently male, younger (80.0±6.4 / 84.5±7.0, p=0.03), with a higher comorbidity index (14.2±5.7 / 10.3±3.9) and a history of coronary heart disease (p=.06), cardiac insufficiency (p=.06) or diabetes (.09). They also had more frequently hyper- or hyponatraemia (.04). In multivariate analysis, younger age (OR=0.90, 0.81-0.99), male gender (OR=6.67, 1.39-33.3) and higher comorbidity index (OR=1.20, 1.05-1.41) were independently associated with death. Conclusion. Our results showed a worse outcome in younger male SE patients with higher number of comorbidities, suggesting that SE represents a severity marker of superimposed conditions and does not directly affect prognosis.

**PB6 545 MAB: NUMERICAL UNIFORM PROFILE REPRESENTATION OF BIOPSICOSSOCIAL DATA. ELDERLY FOLLOW-UP IN A LISBON HEALTH CENTRE**

A. HENRIQUES\* (Nursing School of Lisbon, Lisboa, Portugal)  
M. BOTELHO(1), M. COSTA(2), J. CABRITA(3) - (1) Universidade Nova de Lisboa/  
Faculty of Medical Sciences (Lisboa, Portugal); (2) Instituto de Ciências Biomédicas Abel  
Salazar (Porto, Portugal); (3) Faculdade de Farmácia da UL (Lisboa, Portugal)

Introduction Due to the demographic explosion in elderly age, there is the need of adequate an uniform screening, and follow-up biopsicosocial tools, manageable at multiprofessional level. We suggest the "MAB" – Método de Avaliação Biopsicosocial (Biopsicosocial Evaluation Method) which variables, categorization and numerical profile output are based on validated instruments and population studies. Methods and materials A cross-sectional survey was conducted in community dwelling older people aged 65 years, recruited by phone and interviewed at the health centre. Participants were evaluated by MAB methodology, that describes biopsicosocial item arranged in ten domains (Health State, Nutritional State, Falls, Walking Ability, Basic ADL, Instrumental ADL, Emotional State, Cognitive State, Social State and Habits), each composed by one or two variables. The domains classification, structured in four levels with the dichotomic approach unfavourable/favourable, fulfills a biopsicosocial profile. Results Of the 258 elderly, 25% were male and 8% had 80 years. The expression of favourable results was as follows: Health State 14.3%, Nutritional State 19%, Falls 67%, Walking Ability 98%, BADL 96%, IADL 85%, Emotional State 25%, Cognitive State 99%, Social State 21% (no isolation

44%, social economic status 17 %), Habits 89% (physical activity 81%, meals 97%). Conclusion Summarizing biopsicosocial information by MAB methodology gives a short and confidential report and an ease comparison of data, in the same and in groups of individuals. MAB has also useful operational properties, as a known length of application and applicability by any professional category, in different care settings, to people with diverse health states, by interview with the patient and/or a carer, part of it even by observation. We conclude that MAB is a welcome innovative method suited to biopsicosocial evaluation. For these reasons, computerized MAB is the evaluation method employed at the National Portuguese Network for Integrated Continuous Care.

**PB6 546 OLDER ADULTS LIVING WITH OSTEOARTHRITIS: THE EFFECT OF AGE AND GENDER ON MEDICATION TYPE**

J. FISHER\* (Dalhousie University, Halifax, Canada)  
P. BALLANTYNE(2), G. HAWKER(3) - (2) Trent University (Peterborough, ON, Canada); (3) University of Toronto (Toronto, ON, Canada)

Introduction: To examine the impact of age and gender on medication use in symptomatic osteoarthritis (OA). Methods: Data were derived from the fifth year (2003) of a prospective cohort study of community-dwelling persons aged 55+ with moderate to severe hip or knee arthritis (N=1097). We constructed logistic models to examine the impact of age, gender and their interaction on use of: acetaminophen, non-steroidal anti-inflammatory drugs (NSAIDs) and opioids, adjusting for arthritis severity (WOMAC pain and physical function scores), concurrent diseases; number of physician visits; and education. Results: The study population was primarily female (N=818, 75%), mean age 75.2 (s.d. 7.8); mean WOMAC scores pain 7.7/20 (s.d. 3.2) and physical function 29.6/68 (s.d. 12.0). Adjusting for all covariates: NSAID use was negatively associated with advancing age ( $\beta = -.029$ ,  $p<.001$ ). Acetaminophen use was significantly associated with the interaction between age and gender ( $\beta = -.047$ ,  $p<.05$ ); at younger ages (< 80 years) women were more likely than men to take acetaminophen; however, the likelihood of taking acetaminophen was similar for women and men aged 80 and older. Adjusting for all covariates, opioid use was not associated with age or gender, but was positively associated with number of physician visits ( $\beta = .076$ ,  $p<.001$ ). Conclusions: Findings demonstrate that factors other than symptom severity influence choices regarding medicine use in this population, in particular, age and age in the context of gender. The relationship between age and NSAID use highlights the independent effect of advancing age on NSAID use. The relationship between acetaminophen use and age in the context of gender suggests that normative expectations regarding 'old age' and gender may impact decision-making. More study is needed to explore the interplay among age, gender and medicine use in this population.

## Track C – Behavioural and Psychological Sciences

**PC6 547 FACTORS THAT CONTRIBUTE TO HEALTHY AGING FACTORS THAT CONTRIBUTE TO HEALTHY AGING.**

S. FUENTES\* (PUC Pontifícia Universidade Católica de São Paulo, São Paulo, Brazil)  
I. FERRAZ(2), J. TEIXEIRA(3), J. HIGA(4), M. PAGENOTTO(5) - (2) PUC (Brazil); (3) PUC (Brazil); (4) PUC (Brazil); (5) PUC (Brazil)

Factors that contribute to healthy aging Fuentes SAMPS<sup>1</sup>,Higa J<sup>2</sup>, Pagenotto ML<sup>3</sup>, Teixeira J<sup>4</sup>, Ferraz T<sup>5</sup> Section Theme: Behavioural and Social Sciences Introduction: Whilst the population in the world is aging; a higher proportion of the population is in the elderly phase of their life and experiencing a longer life span. Considering the detailed gaps that exist in regards to this "elderly population", it is compulsory to conduct a more accurate research in this field in order to disseminate more information that would aid the "healthy aging process". Therefore, with this effort we aim to contribute to acknowledge these gaps and provide a new direction and vision for future studies. Aim: To investigate what factors elders believe that might contribute for their healthily ageing. Method: We conducted and recorded some open-ended interviews with 22 elders (aged above 70 years old), which they answered the following open question: "In your opinion, what do you believe are the main factors that contribute for your healthy aging?" After that interview, all the answers were qualitatively analyzed. In conclusion, we also compared these answers with a similar study made by health researchers in Colorado, Denver in USA. Results: The factors that contributed for their healthy aging are: adequate eating habits, family closeness, religion, work, optimism, maintenance of interests, physical activity, capacity to adapt to any change, friendship, desire to live, and adequate medical control. Conclusion: This study, point out that the main factor that elders described as the most important for health aging are associated with an optimistic attitude and interest for something such as have a particular hobby, work, or a study. The previous studies have shown that elders who carry out activities, which they believe to be worth-while tend to be happier than those that don't do anything.

**PC6 548 COMMUNICATION ABOUT INCONTINENCE – THE VIEW OF AFFECTED INDIVIDUALS AND HEALTH CARE PROVIDERS**

K. KUMMER\* (Charité - Universitätsmedizin Berlin, Berlin, Germany)

Introduction: Incontinence is a highly prevalent phenomenon that is surrounded by a medical and social "taboo". The aim of this study was to analyse the communication

behaviours of doctors and nurses with incontinent patients focussing on perceptions, expectations and wishes of patients addressing the professionals. It was of interest, what meaning patients and professionals attribute to incontinence. Methods: In a qualitative design (method triangulation) 22 structured interviews were conducted with 16 female and 6 male patients (age > 60 years, mean: 81 years), supplemented by 12 interviews with doctors and nurses within the setting of a geriatric rehabilitation hospital. Furthermore it was observed how doctors took the medical history and performed assessments for 20 patients. Content analysis was applied to the empirical material. Results: Patients have distinct expectations regarding the communication with doctors and nurses. In this context physicians are perceived as professionals while nurses are seen more as partners in a caring relationship. The analysed medical history took 46 minutes in median (min = 30', max = 70'). If incontinence is addressed, it is mostly by doctors, not by patients. Nevertheless the symptoms of incontinence seem to be of little importance for physicians and hardly lead to specific interventions. However, there are three phenomena that trigger further medical investigation, e.g. neurological disorders. For nurses, dealing with the excrements (e.g. changing diapers) is a more prominent task than more therapeutic nursing functions (e.g. continence training). But most of the interviewed nurses were able to take the view of the patients with incontinence. Conclusion: The preliminary results show that (1) there is room for improvement for a better communication regarding incontinence and (2) more attention for incontinence on the part of medical and nursing professionals is essential. Findings result in recommendations for health care professionals.

**PC6 549 OLDER PEOPLES' EXPERIENCES OF A FLOOD DISASTER: MAKING SENSE OF AN EXTRAORDINARY EVENT.**

R. TUOHY\* (Massey University, Palmerston North, New Zealand)

Introduction This research focuses on the experiences of older people in a flood disaster. In July 2007, a number of older people in Kaitaia, New Zealand were evacuated from their homes because of flooding. This qualitative study explores older peoples' experiences of the disaster to gain a broader understanding of how they responded to and recovered from the flood. Methods This narrative research is based on semi-structured interviews with nine older people who were evacuated from the flood. These interviews were conducted with four residents living in a rest home and five pensioners living independently. Thematic analysis was used to describe how older people accounted for their experiences of the flood. Results The narratives were influenced by the participants' identity as either rest home residents or pensioners living independently. The analysis showed that their accounts of the disaster were incorporated and integrated into the personal and social context of each person's life story. The two groups differed in the levels of evacuation and post disaster assistance received. The rest home residents experienced little disruption and did not require relocation, whereas the pensioners experienced major disruption and relocation. Narrative themes that emerged from the analysis for the pensioner group were coping alone, the importance of treasured possessions, social support and community, while themes for the rest home residents were protection and care. Conclusion The narrative findings suggest that older people integrated the disaster into their lives by linking the event to their life story. The themes reflected the dependent world of the rest home residents and the security of being cared for. The themes for the pensioners revealed their vulnerability to a disaster and the challenges they faced during the post disaster recovery phase. These findings are important for planning emergency support for this age group.

**PC6 550 DISASTER OUTCOMES: SOCIAL CONSTRUCTIONS BY HURRICANE KATRINA SURVIVORS**

C. THOMAS\* (University of North Texas, Denton, United States of America)

Introduction: In 2005, Hurricane Katrina hit landfall in the United States causing catastrophic damages that resulted in enormous costs, the mass displacement of over a half million people, and lost lives. Many of these displaced survivors were high-risk: African American, poor, and elderly. Our understanding of disaster outcomes on older African Americans is vastly limited. This study explores those conditions and contributing factors influencing outcomes as perceived by Katrina survivors following disaster. Methods: A qualitative paradigm was used to highlight the uniqueness of the survivor's perspective and to promote attention to culture, social class, and race. In-depth, semi-structured interviews were conducted with African Americans, aged 55 years and older, who relocated as a result of Hurricane Katrina (n=30). Grounded theory, using constant comparison methods was employed to analyze data. Interviews with participants were transcribed verbatim using inductive processes to code and identify salient themes. Results: The major themes highlight three primary processes that influenced perceived outcomes. 1) Prominent internal processes attributed to outcomes by way of individual level characteristics (age, gender, physical /mental health) and cognitive meanings were adopted by Katrina survivors about their experiences. 2) Key alliances were employed to shape interactional support and social participation. 3) Finally, structural components reflected the significance of access, quality of social or economic status, and stability. Conclusion: The complex nature of processes influencing outcomes as perceived by Katrina survivors was explored. The experiences and factors contributing to these perceptions have important implications for research and geriatric practice. This study informs our understanding of the risk factors and vulnerability facing diverse older populations; underscoring central dynamics in the context of a cultural perspective. It is important that this knowledge base is

applied to more effectively guide practice approaches that are flexible and targeted to these identified contributing factors.

**PC6 551 STARTING PROBLEM SOLVING WITH SORTING CARDS - A DIAGNOSTIC APPROACH FOR FAMILY CAREGIVERS IN CHRONIC STROKE CARE**  
D. BEISCHE\* (Robert Bosch Hospital, Stuttgart, Germany)  
K. PFEIFFER(1), C. BECKER(1), B. LINDEMANN(2), R. HOFFRICHTER(1), M. HAUTZINGER(3) - (1) Robert Bosch Hospital (Stuttgart, Germany); (2) Red Cross Hospital (70372 , Germany); (3) University of Tuebingen (72072, Germany)

Defining and analysing the specific problem areas are fundamental steps for an effective problem-solving in caregiver counselling. To facilitate this crucial process a specific set of cards has been developed in several steps using different sources. The final version consists of 40 cards, with each card displaying one specific problem identified as important for family caregivers in chronic stroke care. Additional blank cards can be labelled as individually needed. After selection of the relevant cards by the caregiver two methods of sorting are used. In a first step the caregiver has to rank the individual cards according to the perceived burden. Second the caregiver is asked to build groups and to label and characterize them. This card sorting task helps caregivers to consider issues that may be outside their immediate awareness and allows them to talk about problems that they may have been previously unwilling or unprepared to discuss. In practice it has proven to be an effective and well accepted way to focus on relevant problem constellations and to convey to the caregiver a first understanding of problem interaction. The development of the cards and data of 40 participants of an ongoing intervention study are presented. The assessment of problem areas at two different points and the topics that have been actually focussed during the first 3 months of the intervention are presented and future perspectives for different target groups are discussed.

**PC6 552 MAPPING EMOTION PROCESSING DISTURBANCE IN FRONTOTEMPORAL DEMENTIA SUBTYPES**  
O. PIGUET\* (POWMRI, Randwick, Australia)  
S. HSIEH(1), S. SAVAGE(1), L. MILLER(2), J. HODGES(1) - (1) POWMRI (Randwick, Australia); (2) Royal Prince Alfred Hospital (Camperdown, Australia)

Introduction: Emotion processing is significantly disrupted in frontotemporal dementia (FTD), particularly in patients with behavioural presentation (bvFTD) or with semantic dementia (SD), but less so in patients presenting with progressive nonfluent aphasia (PNA). Existing literature reports greater emotion recognition impairment for negative (e.g., anger, disgust) than for positive emotions. It remains unclear, however, which of the processes required for optimal emotion processing and recognition are disrupted (e.g., face detection, affect recognition, emotion labelling). Methods: Fifty-one FTD patients (bvFTD = 28, SD = 13, PNA = 10) and aged-matched healthy controls participated in four tasks of emotion processing involving static visual stimuli: face perception, identification discrimination, affect discrimination and affect selection. Results: Overall, FTD patients were significantly impaired on all tasks compared to healthy controls. Analyses on the FTD subgroups, however, revealed that the reduced performance was almost exclusively mediated by the bvFTD group. Within this group, ≥ 50% of patients scored at least 2 standard deviations below the mean score of healthy controls on each task. In contrast, most SD and PNA patients performed within normal limits. Conclusions: These results indicate that within FTD, bvFTD patients appear most sensitive to emotion processing disturbance. In addition, the deficits in emotion processing may be caused by a breakdown in processing visuospatial information, as much as by a deficit in high-level emotion integration. Future research will examine the relations among these components involved in the recognition of facial emotions and their biological correlates.

**PC6 553 NEUROPSYCHOLOGY OF THE YOUNG-OLD AND OLD-OLD IN COLOMBIAN AD PATIENTS AND CONTROLS**  
P. MONTANES\* (Universidad Nacional de Colombia, Bogota, Colombia)  
D. MATALLANA(1), A. MORENO(2), P. REYES(3) - (1) Universidad Javeriana (Colombia); (2) Clinica de la Policia (Colombia); (3) Universidad Nacional de Colombia (Colombia)

A range of neuropsychological measures were compared across two groups of patients diagnosed with Alzheimer's Disease (AD). Patients classified as Young-Old (YO,  $\leq 70$  years) and as Old-Old (OO,  $\geq 80$  years) according to the NINCDS-ADRDA criteria for Probable Alzheimer's Disease. Patients were matched for age with a group of normal controls, also without evidence of depression (Yesavage Geriatric Depression Scale  $\leq 5$ ) and MMSE  $\geq 24$ . In one study, raw scores were compared between YO and OO normal controls, between patients and normal controls, and between YO and OO patients. Then, raw scores were standardized with the mean and standard deviation of matched normal controls and the z-scores were compared. Although the four groups were matched for gender and education, and patients were at the same stage of illness, and comparable in years of disorder evolution and on level of functionality, comparison of the raw scores underestimated the performance of OO patients, while the use of standardized scores showed that the cognitive profile of the OO group was superior to the YO profile on

measures of attention, language, memory, and executive functioning. The clinical and research implications of these findings for the neuropsychology of the old-old in normal and AD populations are discussed.

**PC6 554 THE TNM STUDY: IMPORTANCE OF THE STAFF / RESIDENT RATIO FOR MANAGEMENT OF BEHAVIOURAL SYMPTOMS**  
P. ROBERT\* (Centre Mémoire de Ressources et de Recherche, Nice, France)  
A. DEUDON(1), N. MAUBOURGUET(2), X. GERVAIS(2), E. LEONE(1), J. PIANO(1), A. COUDERC(1), L. CARCAILLON(3) - (1) CMRR - CHU Nice (France); (2) FFAMCO (France); (3) INSERM U 697 (France)

The TNM study (Traitement Non Médicamenteux) demonstrated the effectiveness of a staff education intervention to manage Behavioural and psychological symptoms of dementia (BPSD) in people with a diagnosis of dementia. Objective: To evaluate the impact of the staff/resident ratio for management of behavioural symptoms in nursing home. Methods: The TNM study was conducted in 16 nursing homes into two French regions. Nursing homes were randomly allocated to an intervention group or a control group. An eight-week staff education programme was conducted in intervention group. The main outcome measure was the Cohen-Mansfield Agitation Inventory (CMAI). Assessments were done at baseline (W0) and at the end of the 'intervention' period (W8). For each nursing home 3 staff / resident ratio were calculated: a) including nurses and Health care auxiliaries; b) including psychologists, speech therapists and activity coordinators; c) corresponding to the sum of a) and b) staff. For the entire ratios "residents" correspond to the total number of residents living in the nursing homes. Results: 306 (22%) patients with BPSD were selected for the study among the 1369 residents. The staff/resident ratio (c) ranged from 0.12 to 0.46. The ratios were a) 0.23; b) 0.02; c) 0.25 in the control group and a) 0.28; b) 0.02; c) 0.30 in the intervention group. Ratios were not statistically different between the two groups. There was a significant decrease in the global CMAI score between baseline and W8 (-7.8; p > 0.01) in the intervention group but not in the control group. Using Spearman rho we found that there was no significant correlation between the CMAI total score change (base line - W8) and the staff resident ratio a), b) or c) in the two groups. Conclusion: The total number of staff members was not associated with behavioural changes in an eight-week follow up period of BPSD.

**PC6 555 SAVING ELDERLY OR PROTECTION OF SCIENCE AND EXPERIENCE**  
A. SAHATIMEHR\* (Bonab Islamic Azad University, Bonab, Islamic Republic of Iran)  
R. HASANZADEH(1), T. SAHATIMEHR(2) - (1) sari Islamic Azad University (Islamic Republic of Iran); (2) UCNA (Islamic Republic of Iran)

Human resource management has determinant effect in development. Education and experience are gathered by time and it has to be considered as a valuable asset in organizations. It is pity to say that in most of the developing countries this factor is not properly recognized and for development especial attention on other factors are focused. Normally in the developed countries the work force enjoys from good life and enough payment and when they retire they have satisfactory income and there are good plans to spent time in active life and to enjoy from holidays. In the mean while they have the chance of to be as a consultant or work in part time as an advisor. This situation in the developing countries normally is not the same. Occasionally some of the organizations for creating jobs for unemployed, they force the man power to retire in early stages and this means that when the work force still is fully active has to leave the work and from other side when they are not mentally prepared they have to stay at home. By taking this action the fully Knowledge and experienced manpower feel being useless and normally in short time they get sick and their behavior dramatically change. Developing countries normally are suffering from the lack of enough knowledge and experienced of work force. By early retirement they lose the experts and in the mean while they create mental disorders to their healthy population. Due to the cultural differences our study showed that, the rate of depression in elderly house for both men and women are higher than dwelling house.

**PC6 556 FACTORS UNDERLYING CAREGIVER STRESS IN FRONTOTEMPORAL DEMENTIA AND ALZHEIMER'S DISEASE**  
E. MIOSHI\* (Prince of Wales Medical Research Institute, Sydney, Australia)  
M. BRISTOW(2), R. COOK(2), J. HODGES(1) - (1) Prince of Wales Medical Research Institute (Australia); (2) Stress and Health Research Group, Anglia Ruskin University (United Kingdom)

Introduction: Frontotemporal dementia (FTD) has devastating effects on patients and caregivers, yet the factors underlying caregiver stress are poorly understood. Methods and materials: 108 caregivers (79 = FTD, 29 = Alzheimer's disease) participated in a postal survey. Self-report measures of perceived stress, depression, social networks, as well as patient-based measures of behaviour change and activities of daily living were completed. Results: Depression was a cardinal feature in FTD caregivers, and it accounted for more than 58% of stress scores. Both depression and stress were significantly higher than in AD. Neither the severity of behaviour changes nor functional disability explained caregiver stress. Conclusion: Caregiver stress is a multidimensional construct, and FTD caregivers

should receive more support than it is currently available. Depression plays a key role in coping ability.

**PC6 557 THE DARK SIDE OF THE FRONTOTEMPORAL LOBAR DEMENTIA IN AN OLD MAN**

B. BEAUMATIN\* (CHU Limoges, Limoges, France)

S. ISABELLE(1), F. AURÉLIE(1), B. LAURENCE(1), D. THIERRY(1) - (1) CMRR Pôle Gerontologie CHU Limoges (Limoges, France)

**Introduction:** In the frontotemporal lobar degeneration, the atrophy is localized in frontal or temporal lobes, especially anterior area. 3 syndromes occur in FTLD: frontotemporal dementia [FTD], semantic dementia [SD] and progressive primary aphasia. Methods: We studied a 72 years old man underwent Geriatric Consultation for behavioral (fixed and mystical ideas, logorrhea, impulsiveness and self-centered) and cognitive impairment. To identify the diagnosis, a standard cognitive assessment was been realized (anamnesis, previous history, neuropsychological tests, clinical and psychiatric examination, standard serum parameters, cerebral MRI and Functional Brain Imaging [SPECT]). Results: Even if the neurological assessment and serum parameters were normal, either a hypomania or a frontal disease was suspected. Neuropsychological testing showed abnormalities such as "puzzle" and "igloo" non recognition while the patient had a high socio-cultural level. In a second exploration, there were a prosopagnosia and associative agnosia were noted. Cerebral MRI showed a right temporal atrophy and the SPECT, a low tracer uptake in both frontal and posterior space. Conclusions: The first hypothesis was FTD because of the behavioral symptoms were obvious on a first view. But, the cerebral MRI and the cognitive assessment were more in favor of SD. Even if in the majority of the SD, the right temporal atrophy is uncommon.

**PC6 558 MALNUTRITION AND BEHAVIOURAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA.**

L. RULLIER\* (Université Victor Segalen Bordeaux 2 EA 4139 Santé et Qualité de vie , Bordeaux cedex, France)

A. LAGARDE(1), P. BARBERGER-GATEAU(2), J. BOUSSON(1) - (1) EA4139 Santé et Qualité de vie, Université Victor Segalen Bordeaux 2 (Bordeaux cedex, France); (2) INSERM U897 (Bordeaux cedex, France)

**Introduction** Malnutrition is often observed in people with dementia and is primarily studied by its physiological aspects. However, some studies indicate the important role of Behavioural and Psychological Symptoms of Dementia (BPSD) (Brocker et al., 2003). Indeed, they show that there is a link between the deterioration in the nutritional status of the demented elderly and the severity of BPSD, without specifying which (Guerin et al., 2005). Therefore, our work focuses on the identification of BPSD specifically associated with malnutrition. Method and materials 19 seniors suffering from dementia and living at home were included. The survey was conducted in a Local Information and Coordination Center in rural areas. Nutritional status was assessed through the MNA score (Mini Nutritional Assessment, Guigoz et al., 1994), and different types of BPSD were evaluated by the scores for each of the 12 sections of the NPI (Neuropsychiatric Inventory, Cummings et al., 1994). Results The results confirmed the involvement of BPSD in the deterioration of nutritional status, and highlighted two BPSD that are particularly associated: hallucinations and aberrant motor behaviour. Conclusion The question remains as to what extent these two BPSD are not interrelated. Indeed, hallucinations, which could cause a false perception of food, could cause other BPSD, including aberrant motor behaviour. Furthermore, aberrant motor behavior, repetitive and ceremonial activities, could cause an increase in energy expenditure that is not compensated by food intake (Roland et al., 2003). Thus, it would be interesting to study the issue of the consecutive comorbidity of these BPSD in altering the nutritional status, and their fluctuating association during the course of the disease.

**PC6 559 CAN PROGRESSIVE AND NON-PROGRESSIVE BEHAVIORAL VARIANT FRONTOTEMPORAL DEMENTIA BE DISTINGUISHED AT PRESENTATION?**

M. HORNBERGER\* (Prince of Wales Medical Research Institute, Sydney, Australia)

B. SHELLEY(3), C. KIPPS(4), O. PIGUET(1), J. HODGES(2) - (1) Prince of Wales Medical Research Institute, University of New South Wales (Sydney, Australia); (2) Department of Clinical Neurosciences, University of Cambridge (Cambridge, United Kingdom); (3) Department of Neurology, Father Muller Medical College (Mangalore, India); (4) Neurology Department, Southampton General Hospital (Southampton, United Kingdom)

**Introduction:** Recent findings suggest that behavioral variant frontotemporal dementia (bv-FTD) patients differ in their disease progression (progressive vs. non-progressive patients). The current study investigates whether the two groups can be discriminated by their clinical features at first presentation. Methods and materials: Archival clinical data of the Early Onset Dementia Clinic, Cambridge, UK were analyzed of ninety bv-FTD patients: 53 progressive and 30 non-progressive cases with more than 3 years follow-up. Results: The subgroups were largely indistinguishable on the basis of the presenting clinical features but could be distinguished on general cognitive (ACE-R) and selected supportive

diagnostic features (distractibility, stereotypic speech, impaired activities of daily living (ADLs) and current depression). Conclusion: Progressive and non-progressive bv-FTD patients are difficult to differentiate on the basis of current clinical diagnostic criteria for FTD but a combination of general cognitive, executive dysfunction and impaired ADL measures appear to be the most promising discriminators.

**PC6 560 RESOURCES NEEDED TO PROVIDE EFFECTIVE RESPONSES TO BEHAVIORAL CHALLENGES IN LONG TERM CARE FACILITIES**

D. FORBES\* (University of Western Ontario, London, Canada)

K. CLARK(2), R. COATS WORTH-PUSPOKY (1), A. JARVIE(3), C. MCDONALD(3), A. LISCHKA(1) - (1) University of Western Ontario (London, Canada); (2) Conestoga College (Waterloo, Canada); (3) St. Joseph's Health Care (London, Canada)

**Introduction**In Ontario, Canada, the most common concern reported by long-term care (LTC) healthcare providers in dealing with residents' challenging behaviours was the accessibility and availability of resources, especially during crisis situations (MOHLTC, 2007). Moreover, lack of knowledge of appropriate responses, existing resources, and poor linkages between health care sectors were also noted as barriers to optimal care for LTC residents. The purpose of this study was to gain a deeper understanding of healthcare providers' needs for appropriately responding to residents' challenging behaviours in LTC facilities in South West Ontario, Canada. MethodsThe research design used a Qualitative Interpretive Descriptive approach (Thorne et al., 2004). Data were collected during 18 focus groups with LTC front-line health care providers (e.g., nursing aides, personal support workers, nurses, physiotherapists, recreational therapists). Data analysis encompassed a transcript-based analysis using a thematic approach. ResultsThe overarching Context included themes identified as 'place', 'organizational structure', and 'resources'. These themes described the context within which the front-line practitioners conducted their daily dementia care. 'Place' included rural/urban and the structural lay-out of the ward. 'Organizational structure' included concepts such as hierarchy, consistency of care, boundaries and rules, and knowing how to work the system. 'Resources' included time, team members, experiential knowledge, and support system. At the centre of Context, two overlapping themes were identified: 'relationships' (e.g., power, roles, boundaries, recognition) and 'information communication technology' (e.g., standardized assessment tools, access to the internet, who communicates what). Lastly, 'Consequences' (e.g., helplessness, fear, desensitization, the need to be heard, empathy, and thirst for knowledge) were revealed by the participants. ConclusionThe knowledge gained from this study is being shared with the participants and senior LTC administrators. The aim is to change the 'Context' within which care is provided to facilitate evidence-

**PC6 561 VIRTUAL REALITY AND LIFE REVIEW THERAPY: TOWARD A NEW FORM OF PSYCHOAFFECTIVE CARE IN ALZHEIMER'S DISEASE?**

S. PROTAT\* (Sherbrooke Research Center on Aging, Sherbrooke, Canada)

D. LORRAIN(1), D. BÉLISLE(2) - (1) University of Sherbrooke - Psychology Department (Sherbrooke, Canada); (2) University of Sherbrooke - Letters and Communication Department (Sherbrooke, )

This research's aim was to assess the effects of a virtual version of life review therapy on cognitive functioning, autobiographical memory, mood states and self-identity, for subjects at the early to intermediate stage of Alzheimer's dementia. Exposure was achieved through an Evocative Virtual Environment (EVE), consisting in a virtual museum viewed through a head mounted display, where one can roam at leisure using a physical driving wheel interface, and in which are displayed enlarged photographs related to the subject's life. A multi-case (n=5) ABA design was used in order to establish proof of concept for the EVE. Baseline for various measures was established during a 2-week pre-test, followed by a 4-week test period where subjects, comfortably seated in an armchair, were driven in the EVE three times a week for an hour. Post-test consisted in a 2-week period where control measurements were taken. Results reflected the heterogeneous nature of the Alzheimer's patient population, as no clear regular pattern of effect did stand out. Process chart analysis did not yield statistically significant differences between the three phases of the experiment when considering all subjects. However, a clear pattern of improvement (t-tests only) does emerge when considering as a subgroup the three subjects where data indicates efficacy of treatment, corroborating non-systematic observations to the effect that exposure in the EVE did lead to clinically significant and positive results. Of the two subjects that didn't benefit from the treatment, one was moved to a long-term care facility and medication was changed during the time of the experiment. The other presented an overall decline in most aspects measured, pointing toward the possibility that either EVE exposure has its limits and cannot counterbalance the effect of a degeneration bout, or that the EVE may in some cases have a deleterious effect.

**PC6 562 THE CASE-SPECIFIC NATURE OF INTERVENTIONS FOR MANAGING CHALLENGING BEHAVIOURS IN NURSING HOMES**

J. TURNER\* (Concord Centre For Mental Health, Sydney, Australia)

**Introduction.** The behavioural and psychological symptoms of dementia (BPSD) pose a significant clinical problem in long term care. Research evidence supports the efficacy of non-pharmacological interventions in the management of BPSD. Bird et al (2002) showed

that case-specific, primarily psycho-social interventions in nursing homes resulted in the reduction of challenging behaviours and improvements in staff attitudes. Additionally, increased staff education and clinical supervision has been found to reduce challenging behaviours and to positively alter staff perceptions of the problem. This paper aims to canvas the broad range of interventions available for individuals presenting with challenging behaviours in nursing homes, with an emphasis on the necessity of addressing the specific causative factors in each case. Some of the complexities of providing psychological services in the nursing home environment are discussed. Method. A review of 24 cases from a recently established Behaviour Assessment and Intervention Service was conducted, using a content analysis of behavioural care plans to categorise the interventions. Results. There were a total of 20 categories of interventions, incorporating a wide variety of specific applications within each category. The categories are discussed and a small sample of case studies is presented to demonstrate the case-specific nature within intervention category. Conclusion. The key message derived from the analysis is that although some broad categories of interventions are used consistently across cases, the complexity of each case requires that the interventions be individualised in their application to suit the needs of the person, and to address the specific causative factors of the challenging behaviour.

#### **PC6 563 ARE THERE SPECIFIC PSYCHOLOGICAL AND BEHAVIOURAL SYMPTOMS OF DEPRESSION IN DEMENTIA PATIENTS ?**

A. PRADO-JEAN\* (Centre mémoire de ressources et de recherche du Limousin, Limoges, France)  
P. THOMAS(2), P. NUBUKPO(1), L. BERNARD-BOURZEIX(1), N. DECHAMPS(1), T. DANTOINE(1), P. COURATIER(1), J. CLEMENT(1) - (1) Centre memoire de ressources et de recherche du Limousin (Limoges, France); (2) Centre de Psychiatrie du Sujet Agé (Limoges, France)

Background. Psychological and behavioural symptoms in dementia (BPSD) are very frequent, so that 95% of patients have at least one. Third of persons with dementia have depressive symptoms, and concomitant BPSD are very frequent. Objective. The study aimed to characterize these psychological and behavioural manifestations of depression in patients with dementia. Methods. We recruited 331 patients with dementia from several nursing homes of Limousin-France. The depression was diagnosed by the Cornell Scale for depression in dementia (CSDD) with a cut-off of 7, and the BPSD were assessed using Neuropsychiatric inventory (NPI). Results. Of 331 individuals with dementia, 42.9% (n=142) had depression and 75.8% (n= 251) had BPSD. All BPSD were significantly ( $p<0.0001$ ) more present in depressed patients. But we did not have significantly difference for sex and age. The most common NPI symptoms in depressed patients other than depression were agitation (43.7%), anxiety (42.9%), apathy (41.5%) and irritability (40.8%). Four NPI-based factors were indentified (60.8% of the common variance): environmental factor (irritability, disinhibition, agitation), positive factors (elation, hallucination, delirium), emotional factor (anxiety, apathy, appetite disturbance) and circadian factor (aberrant motor behavior, sleep disturbance). The depression in dementia patients was significantly associated with environmental, positive and emotional factors. Conclusion. BPSD are a common and major problem. Before to consider them as isolated symptoms, this is important to assess co-morbidity with depression in order to have better therapeutic attitudes.

#### **PC6 564 \$RESULTS FROM THE LONGITUDINAL DEMENTIA CAREGIVER STRESS STUDY (LEANDER)**

S. ZANK\* (Universitaet Siegen, Siegen, Germany)  
C. SCHACKE(1) - (1) Universitaet Siegen (Siegen, Germany)

Introduction. The study assessed objective and subjective burden of Dementia caregivers over three years within a stress theoretical framework. Methods Initially, 888 caregivers participated in the study. These subjects completed the Berlin Inventory of Caregivers' Burden at five measurement points. The inventory consists of 20 subscales with 88 items. Complete longitudinal data were gathered from 226 participants. Results Results show that the intensity of burden varies considerably in different dimensions and changes over time. The loss of a beloved person seems to be the greatest burden for all caregivers. The study proves positive intervention effects of day care facilities and social services.

#### **PC6 565 HIGH PREVALENCE OF NEUROLEPTIC DRUG USE IN ELDERLY PEOPLE WITH DEMENTIA.**

I. FORT\* (Badalona Serveis Assistencials, Badalona (Barcelona) , Spain)  
F. FORMIGA(1), M. ROBLES (2), P. REGALADO(3), E. BARRANCO(4) - (1) Hospital Universitari Bellvitge (Hospitalet del Llobregat, Spain); (2) Hospital de la Esperanza (Barcelona, Spain); (3) Hospital Benito Menni (Sant Boi de Llobregat, Spain); (4) Hospital General de Granollers (Granollers, Spain)

INTRODUCTION: The management of the psychological and behavioural symptoms associated with dementia frequently requires the use of neuroleptic drugs. The objective of this study was to determine the prevalence, characteristics and possible differential factors of people aged  $\geq 65$  years diagnosed with dementia taking or not taking neuroleptic drugs. MATERIAL AND METHODS: Five-hundred and fifteen patients aged  $\geq 65$  years with

dementia were retrospectively evaluated. Data were collected on sociodemographic variables, type of dementia, the Barthel Index (BI), the Lawton Index (LI), the Mini Mental State Exam (MMSE), the Charlson Index, treatment with psychoactive drugs (neuroleptic drugs, antidepressants, benzodiazepines and non-benzodiazepine hypnotic-sedatives), specific dementia treatments, vascular risk factors and comorbidities. The stage and severity of dementia were evaluated by the Global Deterioration Scale (GDS), stratifying patients into two groups: Mild-moderate (GDS 3, 4 and 5) and severe (GDS 6 and 7) disease. RESULTS: There were 364 women (70%) and 151 men, with a mean age of  $81 \pm 6$  years, of whom 10.1% were institutionalized. A total of 270 patients (52.5%) had GDS 3-5 and 245 had GDS 6-7 (47.5%). Neuroleptic drugs were being taken by 233 (45.2%) patients. In the multivariate analysis, neuroleptic drug use was associated with male gender, institutionalization, worse LI scores, more severe dementia and not having heart failure. CONCLUSION: A high percentage of elderly patients with dementia are treated with neuroleptic drugs. There are significant differences in the prescription of neuroleptic drugs according to patient sociodemographic characteristics, the severity of dementia and comorbidities.

#### **PC6 566 MANAGING CHALLENGING BEHAVIOUR OF PEOPLE WITH DEMENTIA THROUGH INTERDISCIPLINARY IMPLEMENTATION OF QUALITY INSTRUMENTS IN LONG-TERM CARE**

D. HARDENACKE\* (University of Witten/ Herdecke, Witten, Germany)  
C. KRÜGER(1), M. HALEK(1), G. BUREICK(2), S. WILM(2), S. BARTHOLOMEYCZIK(1) - (1) University Witten/ Herdecke, Institute of Nursing Science (Germany); (2) University Witten/ Herdecke, Institute of General Practice and Family Medicine (Germany)

Introduction: Challenging behaviour of residents with dementia has been identified as one of the primary concerns caregivers and nurses face in long term care. A German guideline was developed containing seven recommendations for managing the care of people with dementia showing challenging behaviour. The first recommendation refers to "understanding diagnostics". Nurses first have to understand the reasons why a person with dementia behaves in a specific way before they decide to initiate or to omit interventions. Case conferences are an important method for implementing "understanding diagnostics". Moreover, a standardized assessment tool (IdA) was developed which can help nurses to structure and guide these case conferences. Nurses, family members and the resident's general practitioner should attend these meetings. Besides implementing the guideline for nurses, a dementia guideline for GPs will be implemented in the project as general practitioners medicating residents in nursing homes often lack special evidence-based knowledge of dementia care. Aim of the study: The current study aims at improving the quality of life (QoL) of residents with dementia and challenging behaviour through implementation of the "understanding diagnostic" in the field of nursing, a dementia guideline for general practitioners and an improved cooperation between both professional groups. Furthermore case conferences are realized. Methods: The study uses a pre-post-test design. The resident's QoL (Qualidem), challenging behaviour (NPI-NH), physical maintenance (PSMS) and psychotropic medication is assessed before and 9 months after the interventions (trainings and case conferences). There is a total of 158 residents with dementia (MMSE< 24) who complete the pre-intervention measures in 15 nursing homes in two regions of North Rhine Westphalia (Germany). Results: Preliminary results of the study will be presented. Furthermore, supporting and impeding factors of the trainings and case conferences will be discussed.

#### **PC6 567 PRIMARY CAREGIVERS IN CRISIS: CARING A FAMILY MEMBER WITH DEMENTIA AT HOME**

C. SEKI\* (Tsukuba International University, Tsuchiura-shi, Ibaraki-ken, Japan)  
A. KATADA

INTRODUCTION: There is much quantitative research focus on caregiver burden caring for demented people. However, the current reports show that there are still criminal cases related to care for people with dementia at home in Japan. The purpose of this qualitative study explores experiences of primary caregiver in crises that cared for people with dementia at home. METHODS and MATERIALS: Ten primary caregivers initially interviewed in their homes for 90 to 180 minutes. They were asked about their perceptions and experiences, from the onset of symptoms of dementia to the death. Interviews were IC recorded and transcribed verbatim. Two cases were analyzed to identify characteristics of the primary caregiver in crises in the qualitative descriptive method. Analysis of data was assisted by NUDIST NVivo, a software package for qualitative research. RESULTS: Major themes emerged from elements of crises were evident among primary caregivers in the process. In crisis mediator was in conjunction with physical and psychological "exhaustion" due to deterioration of BPSD and lack of family supports, "isolation". As a result, primary caregivers were attempted murder to demented people with aggressive behavior, caused by "resisting care" them. Furthermore, along with the primary caregivers failed attempts to keep their relative at home caused the crisis process, "conflict". At last, primary caregivers got themselves out of the crisis situation, because they felt themselves "family in crisis". Therefore, the family sent a person with dementia to a nursing home. CONCLUSION: This study indicates that isolated primary caregivers living with demented people are the high risk group in the crises. Therefore, promote welfare and health care

services in community levels to find out people with isolation, and participation in neighborhood.

**PC6 568 RELATIONSHIP BETWEEN THE BEHAVIORAL AND PSYCHOLOGICAL SYMPTOMS AND THE BURDEN OF CAREGIVER OF PATIENT WITH DEMENTIA**

A. LAGARDE CHAINTRIER\* (Université Victor Ségalen Bordeaux 2, BORDEAUX, France)  
S. AURIACOMBE(2), V. BERGUA(1), L. LETENNEUR(3), J. BOUSSON(1) - (1) Laboratoire de Psychologie : EA 4139 « Santé et Qualité de vie » Université Victor Ségalen Bordeaux 2 (BORDEAUX, France); (2) Centre Mémoire de Ressources et de Recherches, CHU Pellegrin (BORDEAUX, France); (3) INSERM U593 – Université Victor Segalen Bordeaux 2 (BORDEAUX, France)

**Objective:** The purpose of this study is to identify the principal factors associated with the burden of caregivers of patients with dementia. To date, the results of the literature do not clearly underline the specificity of the link between the Behavioral and psychological symptoms (BPS) and the burden of caregiver. This study aims them to study association between the BPS and the burden of caregiver, within the particularly framework of a Local Center of Information and Coordination (CLIC), touching a population socially not very favoured, alive mainly in residence in rural environment and far away from the expert centers. **Methods:** The evaluations were carried out in the residence of the patients. The BPS were evaluated by using the NPI among 100 patients with dementia. The burden of caregiver was evaluated by using the scale of burden of Zarit. **Results:** The results of the linear regression analyses show a significant association between the total score obtained with the NPI and the score of burden. This association continues, even after the adjustment of this score with other known explanatory variables. In addition, the univariated analyses enabled us to highlight an association between almost all the BPS and the burden of caregiver (only the euphoria did not present significant association). Lastly, into multivariate, the principal variables associated with the burden are the disinhibition and the sleep disorders. **Conclusions:** This study reinforces the idea of the need for a specific accompaniment of caregiver of patients with dementia. Within the framework of the CLIC, a pilot study thus could be initiated with an intervention structured near caregiver since April 2007. It is precisely centered on the taking into account of the strategies of adjustment facing BPS.

**PC6 569 INSIGHT AND ALZHEIMER'S TYPE DEMENTIA.**

G. NOBILI\* (AOU San Giovanni Battista- Turin, Turin, Italy)  
M. MASSAIA, S. MONDINO, G. CAPPA, M. JAGODNIK, B. MARIO, G. ISAIA

**Introduction:** The study of insight (awareness of the disease) in patients affected by Alzheimer disease (AD) has been relatively neglected in literature due to both definition problems and lack of evaluation instruments. The aim of this study is to evaluate the insight in a group of demented patients characterized by degree of cognitive impairment from mild to mild-moderate. **Methods and materials:** Since January 2008, 100 consecutive patients, were enrolled in the study according to NINCDS-ADRDA Work Group criteria. Degree of cognitive and functional impairment was analyzed using MMSE, ADL and IADL. Severity of dementia was assessed using the Clinical Dementia Rating Scale (CDR). Insight was evaluated using the Guidelines for the rating of awareness deficits (GRAD) and the Clinical Insight Rating Scale (CIR). **Results:** The mean age of the patients was  $76.9 \pm 6.9$ . The age didn't appear significantly related to GRAD ( $R=0.17$ ;  $p= NS$ ) and CIR ( $R= -0.18$ ;  $p= NS$ ). Scores. There was a statistically significant relationship between GRAD and CIR scores and severity of dementia evaluated by CDR ( $R= -0.78$ ,  $p<0.01$ ;  $R= 0.74$ ,  $p< 0.01$  respectively) and between GRAD and CIR scores and severity of cognitive impairment evaluated by MMSE ( $R= 0.73$ ,  $p<0.01$ ;  $R= -0.81$ ,  $p<0.01$  respectively). The linear regression coefficient between insight(GRAD-CIR ), and severity of dementia and cognitive impairment shows that the degree of awareness of cognitive deficits calculated with both scales is significantly related to severity of dementia evaluated using CDR (GRAD  $-1.01 \pm 0.92 \beta \pm es$ ;  $r= 0.78$ ,  $p< 0.001$ ; CIR  $2.08 \pm 0.22 \beta \pm es$ ,  $r= 0.74$ ,  $p< 0.001$ ) and MMSE (GRAD  $0.13 \pm 0.01 \beta \pm es$ ,  $r= 0.74$ ,  $p< 0.001$ ; CIR  $-0.25 \pm 0.31 \beta \pm es$ ,  $r= 0.69$ ,  $p< 0.001$  ) scores. **Conclusion:** Insight decreases with worsening of cognitive impairment and degree of dementia.

**PC6 570 INCOME, EDUCATION, AND HEALTH-RELATED BIOMARKERS: EVIDENCE FROM A U.S. NATIONAL SAMPLE OF MIDLIFE AND OLDER ADULTS**

N. MARKS\* (University of Wisconsin-Madison, Madison, United States)  
J. SONG (1) - (1) University of Wisconsin-Madison (Madison, United States of America)

**INTRODUCTION:** Lower socioeconomic status (SES) has been consistently linked to higher rates of morbidity and mortality. Yet less research from population samples has explored how lower income and lower education are linked to an accumulation of biological risk factors that may help explain this linkage. **METHOD:** This study used survey and biomarker data from 887 participants in the National Survey of Midlife in the U.S. (MIDUS) 1995-2005 (1) to examine how variation in education and household income among adults aged 32-84 in 2005 were linked to 15 biological risk factors and

composite scales assessing overall allostatic load (a cumulative assessment of biological risks: 15-item total scale), cardiovascular dysregulation (6-item subscale), inflammatory dysregulation (5-item subscale), and hypothalamic-pituitary-adrenal axis (HPA)/hormone dysregulation (4-item subscale); and (2) to examine gender differences in biological risks and linkages to SES. **RESULTS:** Multivariate regression models (adjusting for age) revealed that lower education and lower income both independently predicted higher levels of allostatic load. Lower income was a stronger predictor of allostatic load among women; lower education was a stronger predictor of allostatic load among men. Relatively similar patterns of gender differences were also observed across the subscales. Women and men did not differ in levels of overall allostatic load, but women reported higher levels of hormone dysregulation than men and men reported higher levels of cardiovascular dysregulation than women. **CONCLUSIONS:** Results from a U.S. population sample confirm that both lower education and lower income are independently linked to health-related biological risk factors—including cumulative allostatic load—in a problematic way. Biological risks and links between education, income, and biological risks vary somewhat for men in contrast to women, suggesting that future work needs to take gender differences into account, and also explore multiple biological subsystems (e.g., inflammatory factors and cardiovascular factors as well as HPA/hormone factors).

**PC6 571 SOCIOECONOMIC FACTORS, FUNCTIONAL DISABILITY AND NUMBER OF DISEASES AMONG ELDERLY**

D. TAVARES\* (University Federal of Triângulo Mineiro, Uberaba Minas Gerais, Brazil)  
S. SANTOS(1), M. BARBOSA(2) - (1) 1 (Barretos, Brazil); (2) 2 (Uberaba, Brazil)

**Introduction:** Thinking in the quality life of elderly people, several factors must be considered, as age, sex, family arrangement, marital status, education, income, chronic diseases and functional capacity. So, relationship among diseases and income, education, use of health services and disability is focus of interest of numerous research. **Objective:** Compare diseases with aged, sex, education, income, use of health services and number of functional impairments. **Methodology:** The study integrated 2912 elderly people of Uberaba city, Minas Gerais, Brazil, who were interviewed in their home. The sampling technique was the systematic stratified proportional, considering the districts as strata. Data were entered into double entry in the electronic program EpilInfo3.2. and were submitted to descriptive analysis and the chi-square test ( $p <0.05$ ). The project was approved by the Research Ethics Committee. **Results:** The majority of respondents are women, is at the age of 60 I-70 anos; has 3 I-8 years of study; receives from 1 I-3 minimum wages; sought the health service over the past twelve months; were not hospitalized; examination done in the past twelve months, took care of the problem in the health service, especially for the long wait, displays 1 I-3 functional disability and has, on average, four morbidities. The analysis showed that the largest number of diseases is, proportionately, more women, among older people without education, with lower individual income, with the increased demand by the health service, with the greatest frequency of hospitalization and higher occurrence in the number of disabilities functional. **Conclusion:** The results, obtained in this study, can help the planning of health care for elderly people.

**PC6 572 THE EFFECTS OF MUSIC THERAPY ON ANXIETY IN PATIENTS WITH ALZHEIMERS DISEASE; A CONTROLLED, RANDOMISED STUDY**

S. GUÉTIN\* (AMARC, Paris, France)  
P. FLORENCE(1), P. CHRISTELLE(2), P. MARIE-CHRISTINE(3), M. MOULLOUD(1), D. LEILA(1), L. EDITH(4), T. JAQUES(1) - (1) CHRU Montpellier, Service de Neurologie, Centre Mémoire de Ressource et de Recherche; Inserm U888 (Montpellier, France); (2) Association de Musicothérapie Applications et Recherches Cliniques (AMARC); www.amarc.fr (Montpellier, France); (3) CHRU Montpellier, Département d'Information Médicale (DIM) (Montpellier, France); (4) Université Paris 5; René Descartes, Laboratoire de Psychologie Clinique et de Psychopathologie (LPCP); EA4056 (Montpellier, France)

**Introduction:** Numerous studies have indicated the value of music therapy in the management of patients with Alzheimers disease [1]. A recent pilot study demonstrated the feasibility and usefulness of a new music therapy technique [2]. The aim of this controlled, randomised study was to assess the effects of this new music therapy technique on anxiety and depression in patients with mild to moderate Alzheimer-type dementia. **Methods and Materials:** This was a single-centre, comparative, controlled, randomised study, with blinded assessment of its results. The duration of follow-up was 24 weeks. The treated group (n=15) participated in weekly sessions of individual, receptive music therapy. The musical style of the session was chosen by the patient. The validated "U" technique was employed. [2]. The control group (n=15), participated under the same conditions in reading sessions. The principal end-point, measured at W1, W4, W8, W16 and W24, was the level of anxiety (Hamilton scale). Changes to the depression score (GDS) were also analyzed as a secondary end-point. **Results:** Significant improvements in anxiety ( $p<0.01$ ) and depression ( $p<0.01$ ) were observed in the music therapy group as from W4 and until W16. The effect of music therapy was sustained for up to 8 weeks after the discontinuation of sessions between W16 and W24 ( $p<0.01$ ). **Conclusion:** These results confirm the valuable effect of music therapy on anxiety and depression in patients with mild to moderate Alzheimers disease. This new music therapy technique is simple to implement and can easily be integrated in a multidisciplinary programme for the management of Alzheimers

disease. [1] Sherratt K et al. Aging Ment Health 2004; 8: 3-12. [2] Guetin s et al. L'Encephale 2008; In press.

**PC6 573 THE EFFECTS OF VISUAL ACUITY (I.E., BLURRING) ON AUDIOVISUAL SPEECH-PERCEPTION: A COMPARISON OF YOUNGER AND OLDER ADULTS.**

I. LEGAULT\* (Université de Montréal, Montréal, Canada)  
J. GAGNE(1), W. RHOUALEM(1), T. JODOIN-FONTAINE(1) - (1) École d'orthophonie et audiologie, Université de Montréal (Montréal, Canada)

Introduction: Everyday listening situations contain varying degrees of background noise. Many studies have shown that speech-perception is improved when the interlocutor can both see as well as hear the talker. In other words, visual speech cues (lipreading) contribute to improve communication particularly when the auditory signal is distorted. The purpose of this study was to assess the effects of visual acuity (i.e., visual blurring) on audio-visual (AV) speech-perception performances among younger and older adults. Methods & Materials: Two groups of participants performed a closed-set sentence recognition task in a background of noise. The task was completed in one auditory-alone (A-alone) condition as well as under three AV conditions. In the first AV condition, all participants had normal or (corrected normal) visual acuity (20/20). In the other two AV conditions, visual acuity was blurred to simulate a moderate visual impairment (acuity 20/100) or a severe visual impairment (20/200). Results: The results obtained in younger and older adults showed that (1) the addition of visual-speech cues significantly improved speech-perception relative to the A-alone condition, (2) under the AV conditions, performance declined as the level of blurring increased,(3) even in the AV condition in which visual acuity was severely distorted the speech recognition scores were significantly higher than those obtained in the A-alone condition, and (4) generally, older adults obtained lower scores than younger adults in all conditions; however, the pattern of results observed was similar for both groups of participants. Conclusions: Our results illustrate the importance of lipreading even when visual acuity is not optimal. To optimize communication with older adults (even those with poor visual acuity) the interlocutor should face his communication partner in order to allow that person to make use of visual speech cues.

**PC6 574 PRELIMINARY RESULTS OF A STUDY MEASURING THE EFFICIENCY OF ECOSYSTEMIC THERAPY FOR THE COMMUNICATION DISORDERS OF ALZHEIMER**

T. ROUSSEAU\* (Université d'Angers, Sablé Sur Sarthe cedex, France)

In 2006 and 2007 in 22 regions of France, 1016 speech therapists were trained to use ecosystemic therapy for treating communication disorders associated with Alzheimer's disease. The outcome of this therapy was studied; these professionals agreed to implement therapy with their patients, and to send the results of communication and cognitive assessments carried out, using a protocol they were given, to UNADREO (French association promoting Evaluation and Information in Speech and Language Therapy). A questionnaire was also to be filled in by each family. Assessments were to be carried out every 6 months for a total duration of 18 months. Some intermediate results have already been analysed. They show, in particular 6 months after the beginning of therapy, the efficiency of this type of therapy when comparing these patients with a control group. These results will be presented, thus proving the value of speech and language therapy based on an ecosystemic approach, which maintains communication between the patients and their family, reduces behavioural disorders of patients and eases some of the suffering for people close to them.

**PC6 575 TO BE A CENTENARIAN 160 YEARS AGO: BETWEEN HISTORY AND STORY**

A. PORRO\* (Università degli Studi di Brescia, Brescia, Italy)  
G. CESA-BIANCHI, C. CRISTINI, A. FRANCHINI, L. LORUSSO, B. FALCONI

In the XXth century, some historians of medicine approached the old age. We can mention Luigi Belloni (1914-1989) and Mirko Dražen Grmek (1924-2000). Grmek gave (Grmek, 1965) a basic contribution to the history of ageing and old age. Simone de Beauvoir (1908-1986) (de Beauvoir, 1970) or George Minois (Minois, 1987) can be mentioned too. We can also point out some publications due to psychologists and medical historians from Brescia and Milan Universities (Porro 2008). In this presentation, we point out a publication, that appeared in 1887 (Corradi, 1887). The author, Alfonso Corradi (1833-1892), was full professor of materia medica (pharmacology) in Pavia University, and an esteemed medical historian too. In his speech, delivered in Vienna during the 6th International Congress of Hygiene, he discussed the problem of longevity. He made an exhaustive study of this subject (from a positivist point of view), and gives us some records, regarding a Sardinian centenary. He was a priest, and died at 104, in 1857. He led an active life, psychologically too. Studying the centenaries is a topical subject, and the history of old age can be used as a didactic unit. REFERENCES de Beauvoir S. (1970), La vieillesse, Gallimard Paris. Corradi A. (1887), Della longevità in relazione alla storia, all'antropologia ed all'igiene, Annali Universali di Medicina e Chirurgia. Gallimard, Paris, 777-829 Minois G. (1987), Histoire de la vieillesse en Occident: de l'Antiquité à la renaissance, Fayard, Paris. Porro A. (2008), La vecchiaia: un'interpretazione storico medica, Ricerche di psicologia, I-II Numero dedicato a Marcello Cesa-Bianchi, 15-22.

**PC6 576 EVALUATION OF AN INTERPROFESSIONAL EDUCATION (IPE) MODULE IN CARE OF THE ELDERLY AND ELDER ABUSE.**

A. SCLATER\* (Memorial University Newfoundland, St. John's, Newfoundland, Canada)  
V. CURRAN(1), B. KIRBY(1), D. SHARPE(1), S. ANSTEY(1), L. BENNETT(1), D. DAWE(1), D. EDWARDS(1), S. EDWARDS(1), A. KEARNEY(1), M. WHITE(1) - (1) Memorial University Newfoundland (A1A 1E5, Canada)

Introduction An educational module of 2 hours E-learning followed by 2 hours face-to-face learning introduced medical, nursing, and pharmacy students to principles and concepts of interprofessional teamwork in geriatric care and elder abuse. Methods Students participated in a web-based tutorial involving review of online instructional materials and small-group discussion activity. They completed an evaluation questionnaire regarding the role of their own as well as other professions in collaborative management of geriatric patients. Student activity was tracked by the WebCT learning management system. Facilitators of small group sessions completed an evaluation based on their observations of small group dynamics and functioning. Results N=113 students participated in this module: 55 medical, 8 pharmacy, 50 nursing. Majority of respondents (64.2%) reported the learning experience enhanced understanding of interprofessional teamwork. Significant differences in ratings between professions were found for items related to confidence in the role of one's profession on the team, dependence on the skills of others, ability to serve the patient/client, and level of contribution from interprofessional team members. Overall, medical students reported significantly lower scores than students from other professions. Medical students were less inclined to feel that interprofessional teams are effective in developing solutions to problems than their counterparts from nursing and pharmacy. Students reported a greater preference for face-to-face small group learning activities for interprofessional learning in comparison to e-learning and panel discussion activities. Students and facilitators felt that students from social work should have been involved in this module. Conclusions These findings suggest exposure to IPE is important for undergraduate medical education. Timing of learning about roles of different professionals in the undergraduate curriculum is yet to be resolved and requires further investigation. Other areas of curriculum in geriatric medicine may benefit from an IPE model.

**PC6 577 WORK TO RETIREMENT: DOES CULTURE MATTER?**

C. HOWE\* (University of Sydney, Lidcombe, Australia)  
L. MATTHEWS

Introduction: Research indicates that moving into retirement may increase levels of psychological symptoms for older people who retire out of their country of origin. Little is known about the transition from work to retirement process in Australia from a broad cultural perspective. The aim of the study was to explore psychological health from work to retirement for an overseas born population living in Australia in comparison to an Australian born population living in Australia to inform evidence-based practice for health professionals Method: The study utilised Internet Research Methodology. A purposive (non-probability) sample of people 50 years or older was recruited through web search engine links and online community interest groups. The dependent variables assessed were, depression, stress, anxiety, post-traumatic stress, life satisfaction, social support and social interaction. Two-way analysis of variance was conducted for each of the above stated dependent variables against: (1) being born in Australia Yes/No (country of origin), and (2) Retired Yes/No (work/retired). Results: Online data was collected from 286 participants. The findings indicate that there were no significant differences in psychological symptoms between groups for depression, stress, anxiety, post-traumatic disorder or social support. Only life satisfaction and social interaction showed significant differences, with retired people indicating that they were more satisfied than pre-retired people. This was more pronounced for those born in Australia than those born overseas. The only effect seen in social interaction was that retired people scored significantly higher than people not retired. Conclusion: Our sample reported no significant negative effects in retirement on a multicultural population when looking at increased symptoms of depression, anxiety, stress or post-traumatic stress disorder. Findings suggest that health professionals may need to continue to work with older working populations to help improve their overall life satisfaction.

**PC6 578 TAKING ACTION ON AGEING AND PHYSICAL ACTIVITY FOR OLDER PERSONS: THE EUNAAPA NETWORK**

E. TAK\* (TNO Quality of Life, Leiden, The Netherlands)  
M. HOPMAN-ROCK(1), E. FREIBERGER(2), C. DELECLUSE(3), N. WAALER-LOLAND(4), F. SCHENA(5), A. RUETTEN(2) - (1) TNO (Leiden, The Netherlands); (2) Friedrich-Alexander-Universitaet-Institut für Sportwissenschaft und Sport (Erlangen, Germany); (3) Faber-KU Leuven (Leuven, Belgium); (4) Oslo University (Oslo, Norway); (5) University of Verona (Italy)

Introduction European nations face increasing numbers of older people. Promotion of physical activity (PA) in this group will contribute to maintaining and improving the

quality of life and to reducing the (economic) burden of disease and disability. Currently, there is no integration of health policies related to PA and ageing across Europe. From 2005, 20 European countries worked together to improve health, wellbeing and independence of older people throughout Europe by the promotion of evidence based PA. This was achieved by the foundation of a EUropean Network for Action on Ageing and Physical Activity (EUNAAPA). Methods The EUNAAPA network is a thematic, collaborative action network which incorporates scientists, providers, policy makers and elderly representatives. The objectives are: 1) to establish a self sustaining network, 2) to foster an intersectoral approach to the promotion of PA among older people by engaging in a dialogue with different policy sectors, 3) to identify evidence-based, cost-effective and acceptable ways to promote PA and 4) to facilitate the contribution of European scientists to the development and implementation of evidence based PA promotion policies. During its first project (funded by EU DG Sanco) inventories were carried out in all participating countries on PA promotion. Results Inventories and best practice reports have been published on assessment instruments on PA and physical functioning, successful PA programmes and promotion strategies and implementation and dissemination strategies. People can approach all the reports and join the network on: [www.eunaapa.org](http://www.eunaapa.org). A second project called PASEO (Building policy capacities for health promotion through Physical Activity among Sedentary Older people) has been awarded by EU DG Sanco. Conclusion EUNAAPA aims to bring science, practice and policy making together by fostering a sustained dialogue between all EU member states on the implementation of evidence based recommendations on ageing and PA.

#### **PC6 579 EFFECTIVENESS OF A HOME PROGRAM INTERVENTION FOR CAREGIVERS AND DEPENDENT OLDER PEOPLE**

T. LORENZO\* (University of A Coruña, A Coruña, Spain)  
A. MASEDA(1), I. GONZÁLEZ-ABRALDES(1), J. TUBÍO(1), M. FERNÁNDEZ(1), J. MILLÁN-CALENTI(1) - (1) University of A Coruña (A Coruña, Spain)

Introduction: Current policies emphasise the importance of taking care of dependent older people in their own homes as long as possible. To provide care for a dependent relative has been identified as a demanding and stressful situation associated with physical, mental health and socio-economic problems in the caregiver. Therefore, it is necessary the development of specialist home care services in order to provide Quality of Life for both caregivers and care recipients. The purpose of this study was to observe the effectiveness of a home program intervention for dependent older people. Methods and materials: 43 pairs of caregivers and old people were involved. Besides the social status of both, the cognitive and functional status of older people, and the overload of the main caregivers were also evaluated. This intervention lasted one month during which mental, functional and social functions were worked in older people. Also psychological attention and formation were given to caregivers. At the end, participants were re-evaluated to observe the possible effects of the program. Results: Main data showed that 12.2% of all caregivers had higher level of burden which was reduced after home program intervention. Moreover, those without burden increased from 61.0% to 74.4%. According to care recipients, Barthel Index mean score improved in 10.7 points, whereas the cognitive functions evaluated by MMSE did it in 5.8 points. Conclusion: This program was effective to reduce the level of burden in main caregivers, moreover, improvements in cognitive and functional status of dependent older people were observed. Reduction of burden could result from these improvements or from program intervention. More research is needed to consider this possibility, besides it is necessary to extend the time of intervention to observe if its effectiveness is maintained in samples with different characteristics.

#### **PC6 580 MANAGING FEAR OF FALLING: THE DEVELOPMENT OF AN IN-HOME INTERVENTION FOR FRAIL OLDER PEOPLE**

T. DORRESTEIJN\* (University Maastricht, School for Public Health and Primary Care (CAPHRI), Maastricht, The Netherlands)  
G. ZIJLSTRA(1), J. VLAHEYEN(2), G. KEMPEN(1) - (1) School for Public Health and Primary Care (CAPHRI), Department of Health Care and Nursing Science, Maastricht University (Maastricht, The Netherlands); (2) Department of Clinical Psychological Science, Maastricht University (Maastricht, The Netherlands)

Introduction Fear of falling in old age is considered a concern that may lead to decreased physical, mental and social functioning. A cognitive-behavioral group intervention has shown to reduce fear of falling and avoidance of activities in community-living older people. However, up to 42% of the older persons did not start or complete this group intervention, mainly due to health problems. The current study aims to develop a tailored in-home intervention guided by public health nurses for older people in poor health. Methods and materials For the development of the in-home intervention, the suitability of the 8 sessions of 2 hours of the group intervention was examined. For this purpose all components and techniques of the group intervention were assessed on their appropriateness for the targeted population and the in-home setting, and experts (n=7) in the domain of intervention development and behavioral change were consulted. Additionally, a pilot study was conducted to test the feasibility of the newly developed intervention. Results Compared to the group intervention, overcoming specific (fear-related) problems in daily life ('exposure-in-vivo') and formulating behavioral contracts were added to the newly developed in-home intervention, the physical exercises were skipped for practical reasons. To encourage participants to change their behavior,

motivational interviewing was added as discussion technique in the in-home intervention. The experiences of 6 nurses and 6 participants in the pilot show that this in-home intervention consisting of 3 home-visits of 1 hour each and 4 telephone contacts of 35 minutes each seems to be feasible. Conclusion An in-home intervention to reduce fear of falling and avoidance of activity in frail elderly has been developed and is promising. Currently a randomized controlled trial is conducted to test the effectiveness and feasibility of the intervention.

#### **PC6 581 PERCEPTION OF PATIENTS WITH DIABETES REGARDING TYPE 2 WITHIN THE RANGE OF A BASIC HEALTHCARE UNIT (SPONSORED BY FAPESP 06/54424-2)**

I. MORITA\* (Botucatu Medical School, UNESP - Sao Paulo State University, Botucatu - Sao Paulo, Brazil)  
F. YAMAMOTO(1), C. ARIKI(1) - (1) Botucatu Medical School, UNESP - Sao Paulo State University (Botucatu - Sao Paulo, Brazil)

Introduction: Chronic diseases such as Diabetes Mellitus cause great concern in the field of health due to the economical and social burden they represent to individuals and society, their frequency and increase in life expectancy requiring constant and appropriate care. Objective: To identify the perception of patients with insulin-dependent and non-insulin-dependent diabetes within the range of BHU-CECAP in Botucatu, São Paulo. Methods: Two-stage exploratory survey: quantitative, using a data collection instrument in 79 insulin-dependent and 61 non-insulin dependent individuals; and qualitative, using a semi-structured form in 19 insulin-dependent and 18 non-insulin dependent patients. A saturation sampling technique was used to determine sample size and discourse analysis to assess representations of the disease. Results: In both groups, there was a greater concentrations of older patients, especially between 70 and 74 years; the presence of females was relatively more frequent; low schooling level; knowledge of the different treatment modalities; the majority received guidance from physicians with just a few mentioning other professionals; 68% of the insulin-dependent and 44% of the non-insulin dependent patients sought for further information; 31% of the insulin-dependent and 23% of the non-insulin dependent individuals reported difficulty in complying to treatment and 61% of the non-insulin dependent vs 26% of the insulin-dependent performed physical exercises. In both groups, perceptions presented three meaning structures: "disordered life", "life threat" and "biological meaning". The remarkable aspects within these structures were: food restriction, the idea of control, prohibition, strangeness, danger and malignancy. In the approach to biological, there was influence of profession or relatives in the health field. Conclusion: Acknowledging the existence and influence of cultural and social as well as subjective and symbolic elements that give meaning to individual experience challenges the health sector to develop interventions sensitive to the specificities of different social groups.

#### **PC6 582 FACTORS RELATED TO THE CAREGIVING SATISFACTION OF FAMILY CAREGIVERS OF EDLDERS WITH STROKE IN KOREA**

S. YU\* (Sangji University, Wonjusi, Gangwondo, Republic of Korea)  
H. KIM(1), Y. PARK(2) - (1) Chungju National University (Jeungpyong-eup, Jeungpyong-gu, Chungbuk, Republic of Korea); (2) Seoul National University (Seoul, Republic of Korea)

Introduction: The purpose of this study was to identify the factors affecting caregiving satisfaction of family caregivers of community-dwelling elders with stroke in South Korea. Methods and materials: The study design was a cross-sectional descriptive survey. A total of 104 primary family caregivers and their care recipients who were noninstitutionalized and community-dwelling elders with stroke agreed to participate. The data were collected from June, 2008 to January, 2009 using a survey including Korean-Revised Caregiving Satisfaction Scale (Son, Zaiszniewski, Wykle & Fultton Picot, 2000). Results: The mean score for caregiving satisfaction was 40.02. There were significant differences in the degree of caregiving satisfaction by living arrangement, type of relationship with the elder, and family income. Caregiving satisfaction showed significantly negative correlation with level of paralysis, and a significant positive correlation with previous relationship between the primary family caregivers and their care recipient. The most powerful predictor of caregiving satisfaction was the relationship between caregiver and elder. Conclusion: Findings indicate that primary family caregivers of elders with stroke need family-focused nursing intervention as supported care to improve relationship between elder and family caregiver and to increase the caregiving satisfaction of caregivers by culturally tailoring to Korean. And replication of the study with a larger sample needs to be considered the further enrich specific knowledge regarding caregiving satisfaction experienced by korean family caregivers of elders with stroke.

#### **PC6 583 DISTANCE EDUCATION IN GERONTOLOGY FOR DENTAL HYGIENISTS**

E. EDGINGTON\* (University of Alberta, Edmonton, Canada)  
S. COBBAN(1) - (1) University of Alberta (Edmonton Alberta, Canada)

BODY Oral health is the biggest unmet health care need of elderly in long-term care. Despite this, many oral health professionals are unwilling to work with the elderly. Health

providers' lack of geriatric knowledge and skills, and ageism, are significant barriers to quality elder care. INTRODUCTION Education socializes health professionals to their future roles in health care. Research shows that geriatric education is a stronger predictor of positive attitudes toward older adults than is daily contact. The University of Alberta developed an online course for dental hygiene management of elderly in long-term care. This presentation describes the course components designed to enhance knowledge, skills and positive attitudes. METHODS AND MATERIALS A 14-week distance education course was piloted to 29 post diploma dental hygiene professionals in 2008. Students were orientated to the technology and received a manual with the relevant readings. Each unit applied distance education teaching and learning pedagogy. Interactive meta-cognitive exercises enabled students to monitor and reflect on their attitudes and advance their knowledge of elder care. Guided activities emphasized the complexities of the multidisciplinary care environment. Case studies were provided and students analyzed scenarios relevant to weekly topics. Frequent formative feedback was provided. Interaction, collaboration and sharing were encouraged. RESULTS Students increased their knowledge of the continuing care system, the funding of institutions and health policies. The course aided students in identifying their misperceptions of the elderly and in developing positive attitudes toward them. Students expressed a higher level of confidence and willingness to work with the elderly. CONCLUSIONS Gerontology education advanced dental hygiene students' knowledge and skills, and increased their willingness and confidence to work with the elderly. Use of distance education increased accessibility for practicing professionals.

#### **PC6 584 THE EFFECTS OF HEALTH EDUCATION INTEGRATED EXERCISE PROGRAM FOR COMMUNITY DWELLING OLDER ADULTS WITH HYPERTENSION IN SOUTH KOREA**

Y. PARK\* (Seoul National University, Seoul, Republic of Korea)  
M. SONG(1), W. SONG(2), B. CHO(1) - (1) Seoul National University (Seoul, Republic of Korea); (2) Seoul National University (Seoul, Republic of Korea)

Introduction. The aim of this study was to indentify the effects of a randomized controlled trial involving health education integrated exercise program for older adults with hypertension. Methods and materials. Older adults with hypertension from a senior center in South Korea completed a baseline assessment and were randomly allocated to either experimental (n=18) or control group (n=22). Older adults in experimental group received the health education and tailored exercise program bi-weekly for 12 weeks from December 2007 to March 2008. The intervention program developed by multidisciplinary collaboration of nursing, medicine, and exercise physiology based on the program evaluation method. Results. The mean age of subject were 71years (experimental group) and 69 years (control group). There were no significant differences in socio-demographic characteristics between two groups. All baseline data were homogeneity. After intervention, systolic blood pressure of experimental group was statistically decreased than that of control group ( $F=9.6$ ,  $p=.004$ ). Exercise self efficacy ( $F=8.3$ ,  $p=.006$ ) and general health ( $F=13.6$ ,  $p=.001$ ), vitality ( $F=6.4$ ,  $p=.016$ ), social functioning ( $F=4.8$ ,  $p=.034$ ), mental health ( $F=5.0$ ,  $p=.031$ ) among SF-36 were statistically increased than those of control group. Conclusion. Health education integrated exercise based on the needs of older adults with hypertension is effective to achieve blood pressure control, and ultimately a reduction in adverse outcomes. Further research is needed to develop and testify the long term effects of intervention to enhance patient adherence, health status, and quality of life for this prevalent chronic condition. Key words: health education, exercise, older adults, hypertension, randomized controlled trial

#### **PC6 585 THE ASSOCIATION BETWEEN SOCIAL SUPPORT AND EMOTIONS AMONG ALZHEIMER'S CAREGIVERS**

Á. GARCÍA\* (INGEMA Instituto Gerontológico Matia, Donostia-San Sebastian, Spain)  
I. ETXEVERRIA(1), A. IGLESIAS(1), I. LASKIBAR(1), E. URDANETA(1), N. GALDONA(1), J. YANGUAS(1), I. LOREA(2) - (1) Instituto Gerontológico Matia (INGEMA) (San Sebastian, Spain); (2) Asociación de familiares de enfermos de Alzheimer de Navarra (AFAN) (Pamplona, Spain)

Introduction: Research shows that Alzheimer's disease caregiving can generate emotional and psychological distress, impact on the physical health and isolation. A big amount of research has set up that social support positively influence resilience and reduces the psychological and emotional distress. But few studies have attempted to study the relationship between social support and emotions. As a result, the aim of this study was to analyze the relationship between the frequency of negative and positive emotions and its association with the perceived social support among Alzheimer's caregivers. Methods and Materials: A cross-sectional analysis of self-reported data was conducted. Measures of demographics, perceived social support and positive and negative affect were administered to 51 Spanish community dwelling Alzheimer's patients informal caregivers. Social Support was evaluated through the Psychosocial Support Questionnaire (PSQ, Ribera & Miquel, 1991) and the Positive and Negative Affect was measured by the Positive and Negative Affect Schedule (PANAS, Watson, Clark, & Tellegen, 1988). Results: Results show significant statistical association between perceived social support and negative emotions. The results addressed a negative association between perceived social support and distressed [ $r(49) = -.392$ ;  $p<.01$ ], upset [ $r(49) = -.396$ ;  $p<.01$ ], hostile [ $r(49) = -.386$ ;  $p<.01$ ], and irritable [ $r(49) = -.344$ ;  $p<.05$ ]. These results outline that those caregivers that

perceived a low social support presented more distress, upset, hostile and irritable feelings. On the other hand, to have positive emotions like enthusiastic feelings [ $r(49) = -.368$ ;  $p<.01$ ] showed a positive association with perceived social support, which means that the more enthusiastic a caregiver is the more perceived social support has. Conclusions: This data show that caregiver's emotions are directly related to the perceived social support. This should be considered when developing therapeutic intervention programmes for Alzheimer's caregivers and also in clinical practice.

#### **PC6 586 SMOKING CESSATION AND LIFESTYLE CHANGES IN LATER LIFE**

M. VEENSTRA\* (NOVA, Oslo, Norway)  
S. DAATLAND(1), I. LIMA(1) - (1) NOVA (Oslo, Norway)

Background: It is a well established fact that smoking greatly increases the risk for different types of cancer, heart diseases and respiratory diseases. In Norway, smoking policies have mainly targeted younger smokers, but smoking cessation can be of substantial benefit also for elderly people who have smoked for many years. Health related behaviour, such as smoking, physical activity and diet, follows distinct social patterns in the population. Yet few studies focus on how change in smoking behaviour is related to change in other types of health-related behaviour in later life. Objective: To explore the extent to which self-reported changes in smoking behaviour are related to changes in overall lifestyle. Methods and materials: Cross-sectional survey data from the Norwegian Lifecourse Generation and Gender study (LOGG). The analyses in the present paper are based on 9 592 respondents in age range 18 to 79 years, with valid answers to the postal part of the survey. Results: Ten percent reported that they had stopped smoking during the past 5 years. Selfreported smoking cessation is strongly related to other health-related behaviours such as eating healthier and increased exercise. It is also related to more structural life changes such as change of work status/ retirement, family life and onset of health problems. Associations are stronger for those aged 67+ compared to younger age groups. Conclusions: In addition to targeting smoking behaviour separately, the findings underline the importance of taking overall lifestyle into account in health promoting interventions in later life.

#### **PC6 587 A EUROPE-USA EXCHANGE PROGRAM FOR GERONTOLOGY STUDENTS AND CURRICULA: BEST PRACTICES IN THE INTERGERO PROGRAM**

B. BUENO\* (University of Salamanca, Salamanca, Spain)  
R. APPLEBAUM(4), J. BUZ(1), A. KRUSE(2), S. KUNKEL(4), R. LEVENSON(5), P. MAYORAL(1), A. PELHAM(6), E. SCHMITT(2), D. STEPP(7), R. VANRIJSSELT(3) - (1) University of Salamanca (Salamanca, Spain); (2) Institut für Gerontologie Universität Heidelberg (Heidelberg, Germany); (3) Vrije Universiteit - University Amsterdam (37005, The Netherlands); (4) Miami University (Oxford, OH, United States of America); (5) Oregon State University (United States of America); (6) San Francisco State University (United States of America); (7) AGHE (United States of America)

Introduction With support from the European Commission, Directorate General for Education and Culture (EU), and the US Department of Education (FIPSE), this project was designed to exchange both ideas and students between six universities in Europe and the United States. A consortium of six universities specializing in Gerontology has been formed to help train the next generation of leading professionals in this field. Methods and materials The Intergero project includes several components: the development and dissemination of an innovative international curriculum on Gerontology; the integration of the curriculum within existing programs of study; the development of language and cultural preparation and assessment; the development of an organizational framework for student mobility; the promotion of internships in gerontological institutions included in the curriculum; the pursuit of structured exchanges and teaching assignments; the joint development and dissemination of web-based information; the reporting of products, outcomes and results; and the development of a thorough project evaluation plan. Students participating in the exchange are assessed through a pre and post survey. Surveys are conducted focusing on preparation and logistical areas, comparative social policy, and personal growth and experiences. Results The presentation will emphasize the outcomes of the exchange for both students and faculty. Identification will be made of the "best practices" of the Intergero program providing appropriate social support for the visiting students, arranging interesting programs of study and, at the same time, building in flexibility. Conclusion Providing an opportunity to truly understand comparative social programs and policies developed across Europe and the United States constitutes a critical opportunity for both students and faculty in the field of Gerontology.

#### **PC6 588 TRAINING DIVIDED ATTENTION IN HEALTHY AGING: EFFECT OF PRACTICE AND MODULATION**

C. DE BOYSSON\* (CRIUGM, Montréal, Canada)  
S. BELLEVILLE(1), J. DEMONET(2), M. LAFORTUNE(3), J. RICARD-SAINT-AUBIN(3) - (1) CRIUGM (Montréal, Canada); (2) INSERM U825 (Toulouse Cedex 3, France); (3) Université de Montréal (Montréal, Canada)

Divided attention is a cognitive function known to decline with age. The goal of this study was to assess the task conditions that improve divided attention and the ability to modulate

attention in older adults. Twenty-four participants (60-85 y.o.) were recruited. Participants were randomly assigned to three conditions of training: 1) practice on each task in the condition of focused attention; 2) practice in divided attention with fixed task priorities; 3) practice in divided attention with variable task priorities. Training was provided in six one-hour sessions over a two-week period. To assess the effects of the training format, divided attention was compared prior to and after the intervention in a dual-task paradigm that combined a visual detection task and an alphanumerical equation judgment task. In addition, attention modulation was assessed by asking participants to complete the task with varying task priorities (20-80%; 50-50% and 80-20%). Results indicated that the global cost for divided attention was not improved after training in the condition of focused practice. There was, however, a global improvement in divided attention capacities in the conditions of both fixed and variable task priorities. When looking at the participants' ability to modulate their attention as a function of task instructions, it was found that only the group trained in variable priorities modulated its attention as a function of the task instruction. Overall, this study showed that older adults can improve their dual tasking capacity, but that the condition of training has differential effects on the observed improvement. In particular, simple practice of individual tasks has no effect on the participants' ability to combine them. Practicing divided attention does affect the ability to divide, but not to modulate, attention; the latter being improved only by specific training on modulation.

**PC6 589 AGEING AND NEUROPSYCHOLOGICAL TREATMENT: A PILOT STUDY IN PATIENTS WITH NEGLECT.**

P. MARIA PANAGIOTA\* (Casa di Cura Privata del Policlinico, Milano, Italy)  
M. SOZZI(1), L. VERONELLI(2), L. PISANI(1) - (1) Casa di Cura Privata del Policlinico (Milano, Italy); (2) University of Milano Bicocca (Milano, Italy)

Introduction: Unilateral spatial neglect (USN) is a neuropsychological disorder whereby patients fail to detect objects, or execute movements in the portion of space contralateral to the side of brain lesion. Our aim is to describe the response, in relation to age, of a selected USN affected sample to a Neuropsychological Treatment. Methods and materials: In this pilot study we collected data regarding the performances of a group of 20 USN patients (13 females, 7 males, age 53-91 y.o.), admitted to our Rehabilitation Unit about 15 days after stroke, collected during one year (January-December 2008). Four neuropsychological tests were administrated, both at admission and at discharge, in order to classify patients in non-severe USN (failed in 1 or 2 tests) and severe USN (failed in 3 or all tests). The sample underwent to visuo-spatial cognitive training (VSCT) consisted of a two months one-hour daily sessions. Results: The performances of patients were analyzed in relation to the age of subjects: the sample was divided in three groups (<65, 65-80, >80 y.o.). Younger patients (<65 y.o.) had the worst performance at admission; all of them showed a severe USN; whereas in the group 65-80 y.o. the 42% had non severe and 58% severe USN, while in the >80 y.o. category 50% had non severe and 50% severe USN. Concerning rehabilitation response, we observed that still the younger group had a worst response to treatment: only 25% of them showed an improvement. In the second group the 43% of severe USN, and the 100% of the non severe ameliorate. In the oldest, all the severe patient improved as well as half of the non-severe ones. Conclusion: Data of this pilot study demonstrate that old subjects with USN seem to cope better and to have a better response to VSCT.

**PC6 590 PROFESSIONAL COMPETENCE FOR OLDER PEOPLE CARE IN PRIMARY HEALTH CARE**

E. PINHEIRO DE MORAIS\* (Federal University of Rio Grande do Sul, Porto Alegre, Brazil)  
M. DE OLIVEIRA ROOS(1), N. MAESTRI CARVALHO(1), A. MACHADO DA SILVA(2), S. RIGATTI SILVA(2), C. SILVA RODRIGUES - (1) IAPI Health Center - Porto Alegre Health Secretary (Porto Alegre, Brazil); (2) School of Nursing/Federal University of Rio Grande do Sul (Porto Alegre, Brazil);

This project takes part of a wider initiative named 'Healthy aging in the south of Brazil: addressing challenges and developing opportunities for health professionals and older people' which have been developed with a partnership of the Nursing School of the Federal University of Rio Grande do Sul/Brazil and the IAPI Health Care Centre of the Health Secretary of Porto Alegre/Rio Grande do Sul. Related to the World Health Organization's Age Friendly proposal of preparing health care professionals for practice on Primary Health Care (WHO, 2004), the proponents of this project adopted the competence concept of the Pan American Health Organization (PAHO, 1998). The investigation has the objective of developing a professional competence referential for primary health care practice with older people. General competences will be studied, since the objective of this project is to develop a framework for the multidisciplinary team. The research project has been approved by the Ethics Committee of the Porto Alegre Health Secretary. The Delphi Technique has been used for data collection. Thirty health care professionals participated of the first round which resulted on 57 competences. These competences will be compared with those which resulted from a Nurses Primary Health Care Competences Project (Witt, 2005). After that, the development of the competence structure will follow the International Council of Nurses proposal (ICN, 2003) with the creation of a local multiprofessional committee which will validate these competences. The structure resulted from these phases will be submitted to health care professionals of the Northeast Health

District of Porto Alegre. These competencies will constitute a reference for health professional practice and education allowing the improvement of health care providers attitudes, education and training so that they can assess and treat conditions that afflict older persons and empower them to remain healthy.

**PC6 591 IMPACT OF A PROGRAM OF ATTENTION: BURDEN AND THE QUALITY OF LIFE FOR FORMAL CAREGIVERS OF ELDERLY**

V. SILVA\* (Centro Universitário São Camilo, São Paulo, Brazil)  
J. BIANCO(1), M. PEREZ(1), A. ODA(1) - (1) Centro Universitário São Camilo (São Paulo, Brazil)

Introduction: Epidemiological studies show an increasing elderly population in Brazil. This scenario has increased the demand for caregivers, especially due to functional impairment and the elderly's dependence. The objective is to evaluate the effectiveness of a support program to the caregiver, related to work burden and quality of life on a long-stay institution. Material and methods: We evaluated 10 female formal caregivers (100%), with an average age of 35.9 years, average schooling of 8.7 years and average of 27.7 months of professional activity with the elderly. Instruments used: Quality of Life Questionnaire of WHOQOL-brief, Burden Scale (Zarit Burden Interview) and Functional Independence Measure. After such assessments, a "support Program for the caregiver" was done with ten weekly meetings. In the group, there were dynamic exercises and reflections on the activity of care taking and to determine strategies for overcoming any possible difficulties. Next, they were re-evaluated with the same tools used at the beginning of the search. Results: There was an increase on the independence of the elderly, reported by the caretaker, in the Functional Independence Measure evaluation, in every aspect. The total average rose from 32.45 to 35.82. The overload average score fell from 25.36 to 24.27. There was no association between the caregiver's quality of life and the degree of functional independence, but the higher the burden, the lower quality of life rates. Conclusion: Deployment of the Program for Attention to the Caregiver was effective in reducing the level of overload and the promotion of conduct which increased the autonomy of the elderly thus reducing the degree of dependence. Such programs, that offer support to these professionals, are essential to reduce the burden on caregivers, improve their quality of life and also to the elderly assisted by them.

**PC6 592 "ADD LIFE TO YOUR YEARS": EDUCATING FOR LIFE IN THE DOMINICAN REPUBLIC**

Z. PARRA\* (CEITE, Centro de Evaluación Integral para la Tercera Edad., Santo Domingo, Dominican Republic)  
S. MONTES JORGE, Z. PARRA MELO

Introduction: With the objective of educating the elderly population of the Dominican Republic, was developed the educational campaign for the health, from march to december 2008. This consisted in the launching of the web page [www.ceite.com](http://www.ceite.com) and the publication of ten educational brochures. Methods and Materials: The most frequent reasons for consultation and diagnoses at CEITE during the last years, were determined statistically: 1. Home Care 2. Burnout Syndrome 3. Dementia 4. Insomnia 5. Malnutrition 6. Osteoporosis 7. CVA's 8. Constipation 9. Infections 10. Arthritis and Joint Pain The material was distributed, free of charge, through the web page, ten illustrated brochures and the mass media. Results: 250,000 persons read the brochures. For the first time, the elderly in the Dom. Rep. had a web site. Thousands of people got information about aging from mass media. Conclusion: Educating the population provoked consciousness of aging, more people taking care of their own relatives and more elderly accepted their aging process. The long term objective of this campaign provides behavioral changes that contribute to a more dignified quality of life and psychological welfare in elderly Dominicans.

**PC6 593 EVALUATIVE RESEARCH ON REMINISCENCE PARTNERSHIP PROGRAM FOR ELDERLY PERSONS IN COMMUNITY**

T. NOMURA\* (Toyo University, Asaka-shi, Saitama-ken, Japan)  
Y. NOMURA(1) - (1) Tokyo University (Japan)

I.Introduction The history of Reminiscence approach in Japan started in 1980s with the introduction of R. Butler's work. Butler's concept of life review soon found its place with the cultural tradition to value life stories of the elderly as socio-culturally shared knowledge. The purpose of the study is to examine the effect of group reminiscence for elderly persons living in community and to develop a community-based educational program. II.Methods The study is built on Reminiscence Partnership Program, which frames the reminiscence group and the training of the staff members. The participants are 16 elderly persons living in community, university students and professionals of health and social division. The elderly are divided into two groups. They attend an hour-long group session once every two weeks over three months. The themes of the group are chronological and non-chronological, using prompts of local community. The examination into the effect on the elderly includes pre and post comparison by MMSE, LSIK, and Baum Test. It also involves descriptive analysis of records and videos taken every session. The evaluation of educational effect on the students includes analysis of the pre and post questionnaire along with the result of the focus group interview. III.Results The study shows group reminiscence is effective for the elderly participants to bring out a sense of

confidence towards the continuity of self. It also suggests the framework of valuing social interaction across generations encouraged their active participation. As for the students, it enhances their understanding for possibility in aging and their reflection on themselves as future career. IV. Conclusion There is growing need for evaluative research with active involvement of members of a community. Collaboration and communication among the elderly people and younger generation as in this study can bridge the past, present and future of the community.

#### **PC6 594 STIGMA AND DEMENTIA**

C. SWANE\* (EGV Foundation, Copenhagen K, Denmark)

Starting in the 1990s, a conceptual change towards a more humanistic approach to dementia care has occurred in Europe: from the person with dementia to the person with dementia, popularly speaking. Cultural images of dementia have been constructed throughout history, often creating quite negative expectations of the mental and emotional capacities of older people. Both medical and public focus on the 'severely demented' has resulted in a discourse equating all dementia with severe dementia. This has changed somewhat during the last two decades where earlier 'stages' of dementia, and younger people with dementia, have come to the attention of medicine as well as the public, e.g. ministerial development projects and in the media. This attention creates a more nuanced image of dementia. But still we categorize – and stigmatize – people with dementia as 'the demented', with a 'changed personality'. People with dementia are often unable to conform to the standards of social behaviour that we call normal. Their thoughts and communications can be difficult or at times impossible to understand. Their needs and demands can be hard to meet. They become disqualified from full social acceptance because they make 'the non-demented' insecure, our sense of Normality is challenged. There is no way out of the basic paradox of labelling. We use language to describe dementia. In doing so, we categorize persons with dementia as a distinct group. Language is a two-sided sword. While talking about people with dementia in order to break taboos and make their needs visible, we also categorize each person with dementia by the categories of the 'demented' or the 'Alzheimer patient'. Hence we risk missing the opportunity to emphasise the social and human similarities between people with and without dementia: We all live in a social world.

#### **PC6 595 COMPARISON OF PERCEIVED AUTONOMY AMONG COMMUNITY-DWELLING OLDER ADULTS IN THE US AND JAPAN**

M. MATSUI\* (Nagasaki University, Nagasaki-shi, Japan)

E. CAPEZUTI(1) - (1) New York University (New York, United States of America)

Introduction: Perceived enactment of autonomy is sensing the ability to choose courses of action for ones self in accordance with ones goals to meet needs for both dependence and independence. This study examines perceived autonomy among older adults between the United States and Japan. Methods: Cross-sectional study was conducted using a questionnaire. Three hundred and forty older adults consisting of 220 Japanese and 120 Americans recruited from Senior Center participated in this study. Perceived autonomy was quantified with the Hertz Perceived Enactment of Autonomy Scale (HPEAS). The HPEAS contains 31 positively and negatively worded statements and total scores can range from 31 to 124, with higher scores indicating a higher level of PEAS. There are 3 subscales: Voluntariness, Individuality and Self-Direction. Results: The mean age of Japanese was 74.2 (SD 6.2) and 149 (67.7%) were male, whereas 76.4 (SD 8.7) and 48 (40.3%) for Americans. Japanese showed perceived autonomy with low score on the HPEAS scale (mean 86.9, SD 9.4) compared to Americans (mean 109.5, SD 10.2). Additionally, Japanese demonstrated lower score on 3 subscales and 29 of 31 items than Americans. Although significant differences were observed regarding HPEAS scale, age and gender were not related to perceived autonomy in each group. Conclusion: Sociocultural background for differences between these two groups of Japanese and Americans are suggested.

#### **PC6 596 ELDER ABUSE IN HIP FRACTURE PATIENTS**

C. SÁNCHEZ-CASTELLANO\* (Hospital Universitario Ramón y Cajal, Madrid, Spain)

B. GUTIÉRREZ(1), B. MONTERO-ERRASQUIN(1), L. REXACH-CANO(1), A. CRUZ-JENTOFF(1) - (1) Hospital Universitario Ramón y Cajal (Madrid, Spain)

OBJECTIVE: To study the prevalence and risk factors of elder abuse in older adults admitted to an Orthopedic Department for the surgical treatment of a hip fracture. METHODS: All subjects aged 70 years or older who were admitted for a hip fracture in a one year period were included. Patients and caregivers were carefully assessed by a multidisciplinary team looking for signs of elder abuse, based on agreed standard criteria. Age, gender, functional status (basic ADL, gait), cognitive impairment and social variables were recorded, to assess risk factors of abuse. RESULTS: 392 patients were included, mean age 84.7±5.8 years (range 70-101), 72.3% women. The prevalence of abuse was 12%. The major type of abuse was abandonment (67% of cases), followed by financial exploitation (17%) and other types of neglect (10%); physical abuse was infrequent (4% of cases). Abuse was unrelated with age, gender, and functional status. Abused subjects had more children. Living at home was also a risk factor for abuse: none of the nursing home patients in our group were abused. Abuse was significantly more frequent in those

admitted in summertime (August, September) and in December. All the 7 caregivers who suffered schizophrenia or alcohol dependency were abusers. CONCLUSIONS: The prevalence of abuse in this cohort of frail older people was slightly higher than in other settings (12%). Some risk factors (more children, living at home, time of admission and mental problems of caregiver) may help detection of abuse in this population.

#### **PC6 597 ARE MEDICAL STUDENTS WELL PREPARED FOR CARE FOR ELDERLY ?**

K. ZÍKMUNDOVÁ\* (Charles University Prague, Faculty of Medicine Plzen, Plzen, Czech Republic)

H. ZAVÁZALOVÁ(1), J. KOTRBA(1), V. ZAREMBA(1), I. HOLMEROVA(2) - (1) Charles University Prague Faculty of Medicine Plzen (Plzen , Czech Republic); (2) Charles University Prague, Faculty of Medicine Plzen (Plzen , Czech Republic)

Introduction: Main task of effective medical and social care is to promote quality of life with respect of dignity, identity and needs of everybody, the insurance of not only their basic biological needs. What is legal is not always ethical. Methods and materials : Anonymous questionnaire was filled in 1996/7 and 2006/7 by 2 ndcourse and 5th and 6thcourses medical students. It was concerning main ethical problems in medical care. 1996/7 were in 2 ndcourse 116 students , in final courses 162 students, in 2006/7 were in 2 ndcourse 186 students and in final 169 students. Results : Current students (2006/7) are more open to legalization of euthanasia than the students before ten years, especially in final courses. They feel more often lost of human dignity in dying, more missing communication now. Concerning students' preparation: the best are their ethical skills (despite no subject medical ethics). Only 16 % feel well prepared for care in final courses. Half of them can communicate well, 40% are satisfied with their psychological skills. Only 36% students are prepared well for care for elderly (no geriatrics in education). Half of students finds some discrimination of elderly in medical care, mainly in communication, attitudes and availability of care for seniors. Elder abuse (EAN) syndrome saw 14% students. Majority of them can react. Conclusion: Students in 2nd courses are more optimistic, they have not enough information about professional demands in science, ethics, psychology, practical skills and communication. Current students are more sceptic and more critical than ten years ago despite many positive changes in educational and medical institutions. To educate ethics, communication, professional and psychological skills is task of faculty of medicine. Good models of moral, educated and humanistic professionals, tutors is the most important for students.

#### **PC6 598 AGE PREDILECTIONS FOR PERSONALITY FACETS: INCONSISTENCIES AND POSSIBLE THREATS TO HEALTH RESEARCH**

K. PETWAY\* (University of Southern California, Los Angeles, United States)

E. ZELINSKI(1) - (1) University of Southern California (Los Angeles, United States of America)

Introduction The debate over whether longitudinal changes in personality exist continues with no true consensus. It is likely that personality changes with age may depend largely on what aspects of a personality variable are measured. Methods & Materials We administered Costa's & McCrae's (1992) NEO-PI-R to a sample of 56 men and 61 women from the Long Beach Longitudinal Study who completed the measure two times (in 1994 and 2000; mean age at T1 = 64 years). The NEO-PI-R is an application of the five-factor model of personality where each personality factor (Extraversion, Openness to Experience, Neuroticism, Conscientiousness, and Agreeableness) has six lower-order facets. Three conditions were tested: condition 1, using the three facets (per factor) with the lowest age correlation; condition 2, using the three facets with the highest age correlation; and condition 3, using big-five factor sum scores. Results In condition 1, Conscientiousness, Extraversion, and Neuroticism at time 2 were not related to performance at time 1, but Agreeableness and Openness to Experience at time 2 could be predicted by time 1 ( $\beta_A = .685, \beta_O = .391$ , significant). In condition 2, performance on the first three factors at time 2 could be predicted almost perfectly by time 1. The relationship between time 1 and time 2 for Agreeableness and Openness to Experience did not change notably in condition 2. Finally, in condition 3, Extraversion was the only factor notably predictable at time 2 using time 1 scores. Conclusion These analyses suggest that identifying age changes for Neuroticism, Conscientiousness, and Extraversion is more dependent on how those factors are defined within the measure as compared to Agreeableness and Openness to Experience which have age (time) relationships that agree across the conditions. The ramifications for health research and identification of longitudinal personality changes are discussed.

#### **PC6 599 THE FORGOTTEN AGE : OLD' UP**

M. FUCHS\* (Old'up association, Paris, France)

M. TUBIANA, C. VIMONT

The OLD'UP Association was born of an observation and a study spread over two years regarding "the second stage of retirement". It stands for actions with and for, the standing elders, an ever growing population, that covers the span between newly retired and highly handicapped. It concerns around 50% of retired French population. The originality of this association lies in the fact that it is made up by people who belong to this generation. Every one of them is concerned with optimizing the years added by increased longevity.

This has produced a social situation hitherto unknown; for the proper integration of this age group, its familial and social utility must be explored, valorized and made more dynamic. OLD'UP is a grassroots association working to bring to the attention of public and private decision-makers the daily realities endured by our elder contemporaries. It is pursuing two objectives: - On the individual level, create and stimulate, social bonds through an active network dealing with civic life overcome the risks of isolation and uselessness... (By stimulating them, by fighting against loneliness, organizing meetings to favor new contacts.) - - On the collective level- address public and private administrations informing them of the specific needs of this generation so that their minor handicaps don't exclude their - active participation in community life. And collect information on similar actions. (Ex. sub-titles accessible on television to compensate slight losses of auditory acuity, access to public buildings facilitated by inclined handrails, elevators available without need of a handicap card, enlarge letters on road signs or markings etc.) OLD'UP is weaving inter associative connections in France and Europe and wishes to make itself known to the

**PC6 600 A "LETTER SENT TO ...": FROM SELF EXPRESSION TO FREEDOM OF EXPRESSION**

M. DORANGE\* (Fondation Nationale de Gérontologie, Paris , France)  
J. GAUSSENS(1), I. BESSON(1), G. ARFEUX-VAUCHER(1) - (1) Fondation Nationale de Gérontologie (Paris , France)

**Introduction** When elderly people living in residential institutions are given the opportunity to write about the past, the present, the future, how do they express themselves and what do they say? Are their words constrained because of the influence of the institutional setting ? Methods and materials To answer these questions, the National Foundation of Gerontology has created a "Letter sent to..." project that enables elderly people attending senior centres and home care services or living in institutions to write a letter on a subject they choose. The FNG analysed the themes, form, syntax and word formation in a sample of 303 letters. A qualitative analysis was undertaken on interviews conducted with professionals and authors who took part in this research, as well as a lexical analysis using specific software. Results When they talk about themselves, elderly people are influenced by the contextual and environmental settings around them. In this respect, they do not differ from younger people. Some construct very lucid narrative accounts while remaining in touch with their emotions. The content shows a high level of literary expression including control, anticipation, choice and responsibility for challenging words. Although the past has a central place, the present also dominates the content of the letters. The themes that emerge include transmission, expression of affection for a parent, reflexion about things unsaid, and atonement. Conclusion The 'Letter sent to...' project restores an individual sense of identity. Older people can re-say "I" instead of being considered as one of the many as so often happens in communal institutions. Thus the primacy of individuals is reasserted.

**PC6 601 SARTORIAL IDENTITY AND FASHION NEEDS FOR OLDER WOMEN LIVING AND WORKING LONGER: AN INSIGHT FOR GERONTOLOGISTS AND GERIATRICIANS.**

C. LACOSTE KAPSTEIN\* (University of Rhode Island, Kingston, United States)

The 21st century is faced with a unique aging paradigm that entails millions of older women to stay healthier and independent longer, often demanding them to remain in the workforce longer. The role of "clothing" is inherently associated with protection, identity formation, appearance, and status definition. As such the study of clothing and textiles needs to be integrated in the fields of gerontology and geriatrics. Similar to caring for the older population through improved nutrition, exercise, and cognitive activities, there is a necessity to focus on sartorial needs that is still ignored for this age-group. A sixty-five year old woman today working and competing against a forty-year old must feel as equally attractive and effective for both herself and the market demand. This reality, based in present and future political economies of our global world has direct consequences for studying aging through social sciences and geriatric practices. Using an hermeneutic phenomenological method, this qualitative research explores through in-depth interviews the sartorial experiences of ten urban professional women over age 60 in Manhattan sharing their wardrobe stories, opinions, and struggles (University of Minnesota IRB: 0206E26362). The voices of these participants contradict assumptions about physical and mental aging, gender roles, and apparel needs in later years. To them, chronological age becomes a non-entity and post-menopausal physical and biological changes combined with typical aging ailments are internalized as just being 'normal age-related changes.' As such, these women continue to live their lives adapting the same sartorial needs they always had to express their positive attitudes toward work, appearance, and aging. This presentation illustrates the pertinence of integrating sartorial entities in the multidisciplinary study of aging and in the goal of caring for older persons.

**PC6 602 THE INTERACTION BETWEEN EMOTION AND COGNITION IN AGEING:ALEXITHYMA AND ITS INFLUENCES ON INHIBITION PROCESSES**

D. GUIBAUD-DRESSAIRE\* (Centre de Gérontologie Raymond Ruffi, NIMES, France)  
E. GUERDOUX(1), D. STRUBEL(2), D. BROUILLET(3) - (1) Clinique Le Millénaire (Montpellier, France); (2) Centre Raymond RUFFI (Nimes, France); (3) Université Paul Valéry, Montpellier 3 (Montpellier, France)

According to Mandler, emotion processed consciously (=cognition) and unconsciously (=physiological reactions). However, in alexithymia (=difficulties in experiencing and expressing emotion), only the unconscious processing of feelings is efficient, which involves disorder at the cognitive level of feelings. We explore alexithymia' effects on elderly individuals' cognitive processing, especially in regard to inhibition which permits to selectively attend to or ignore information, by using the directed forgetting paradigm (DF). DF studies ability to voluntarily forget activated information which is no longer relevant. Forgetting appears necessary to effective performance. We assume that alexithymic elders would ignore emotional information, and so prevent their conscious treatment. Two experiments using DF with list method were conducted to explore the impact of Alexithymia on DF: for neutral words (experiment 1), for emotional information (experiment 2). We studied 135 persons (45 young adults, 45 non alexithymic elders and 45 alexithymic elders). In DF procedure, people must learn a list of words, at the middle of it, an error screen appears. Participants have to forget previous words ("TBF") and to remember new items ("TBR"). At the end of the list, participants must only recall the TBR items. We observed a DF effect when more TBR than TBF items were recalled. This effect was inferred by voluntary inhibition. DF effect was obtained with neutral words and with young adults [ $F(1,42)=48.22;p<.001$ ] and non alexithymic elders [ $F(1,42)=13.17;p<.001$ ], but disappeared with alexithymic elders [ $F(1,42)=1.22;NS$ ] (experiment1). In experiment2, DF effect was obtained with emotional words and with the different subject groups [ $F(2,84)=7.65;p<.001$ ]. Findings pointed that inhibitory deficit is caused by alexithymia, more than ageing, especially with non emotional information. Emotional information in alexithymia would operate as attentional attractor facilitating voluntary inhibition.

**PC6 603 HEALTH TYPE SCENARIOS: UNDERSTANDING THE DYNAMICS OF CHANGING USER NEEDS IN AGING-IN-PLACE**

J. KNIJES\* (Technical University of Eindhoven, Eindhoven, The Netherlands)  
M. VAN GAASBEEK(2), A. VAN BRONSWIJK(1) - (1) Technical University of Eindhoven (Eindhoven, The Netherlands); (2) Azora, Nursing Home (Terborg, The Netherlands)

Aging is characterised by diversity. Housing needs vary among people and across the life span. To achieve satisfactory aging-in-place facilities an understanding of the dynamic needs of older adults is required. A scenario approach may give more insight into relevant aspects. Methods and materials Persons over 65 in the Netherlands may be classified in 6 different health types, with symptoms of (i) COPD & cancer, (ii) other chronic disease, (iii) impaired cognition, (iv) arthritis, (v) cardio vascular diseases, or (vi) healthy older adults without these symptoms. 'Worst-Case' scenarios are written for each health type. Health type V incorporates two scenarios to illustrate the effects of multimorbidity (cardiovascular diseases and diabetes). Medical literature and statistical data are used to describe the changes over time in health status and physical, social and mental functioning. The 3rd and 4th age of three Dutch couples (male-female) and one single Indonesian female are subsequently viewed within (i) technology use, (ii) Becker's Generations, (iii) life cohorts from 1921-30 up until 1961-70, (iv) social groups and (v) life clusters. For each scenario, between 3 and 6 moments in time are chosen to depict typical housing needs of the user, especially in relationship to mobility, socialising, and privacy. Results The seven scenarios demonstrate the housing consequences of various physical, mental and social changes in the Dutch population over 65. The varying housing needs for mobility, socialising and privacy concern the balcony, living room, dining room, bedroom, kitchen, bathroom, restroom, workroom, guestroom, storage space and outdoor space. Conclusion The scenario approach combines characteristics of the Dutch elderly population with the home environment. With disease progression taken as the starting point, an estimate is made of the actual housing needs. For satisfactory aging-in-place, the dynamically changing needs of the users are paramount.

**PC6 604 THE IMPACT OF ALCOHOLISM ON THE QUALITY OF LIFE OF THE ELDERLY**

K. RAMOVS\* (ANTON TRSTENJAK INSTITUTE OF GERONTOLOGY AND INTERGENERATIONAL RELATIONS, LJUBLJANA, Slovenia)

In Slovenia, one of the European countries most at risk for alcohol consumption, alcohol abuse is on the rise among the young and those aged 60 and over. At the same time, the demographic imbalance between the young and the oldest generation is increasing rapidly. The present study compares the life-style characteristics of alcohol addicts aged 60+ with those of equally aged moderate alcohol consumers. The interviewers, aged 21 to 25 and from all Slovenian regions, were themselves partially research subjects. The data were collected by means of an open, semi-structured questionnaire. Each interviewer first completed the questionnaire about his/her own attitude towards alcohol consumption and then interviewed, in his local environment and using predetermined criteria, one alcohol addict and one moderate alcohol consumer, both aged 60+. There were 100 addicts and 100 moderate consumers included in the study. Typical cases were extracted and then qualitatively analysed. The main findings are: 1. Alcohol addicts are less active, less creative, and express fewer needs and lower standards about a quality life than lower-risk drinkers. Mostly they are satisfied with their lives, despite their disorderly living conditions. 2. They both experienced tragic life turning points, but the moderate drinkers coped successfully, whereas the addicts increased their alcohol consumption. Healthy life habits play an important role in keeping the alcohol addicts nevertheless energetic.

3. Alcohol addicts have fond memories of their first alcohol experiences during their youth. In their opinion young people used to drink for a reason, while today youngsters drink because of the drinking itself. With the help of this study we shall better understand the impact of alcoholism on the quality of life of the elderly, which is important for the planning of care programmes for the elderly and youth drinking prevention programmes.

**PC6 605** QUALITATIVE ON-THE-SPOT FIDELITY CHECKING OF AGED PEOPLE ANSWERS TO A QUESTIONNAIRE ON INDEPENDENCE IN DAILY LIVING

J. SANTOS\* (UNIFESP, Sao Paulo, Brazil)  
M. REBOUÇAS(1), L. RAMOS(1) - (1) UNIFESP (Sao Paulo, Brazil)

Introduction: Quantitative approaches to auto-checking questionnaires for independence in old age are scarce and categorically limited. One alternative is the use of qualitative techniques that may reveal incoherence and untruthfulness in opinions given by respondents. Methods and Materials: Qualitative semi-structured interviews conducted by an experienced health anthropologist with 12 selected elderly persons in different levels of independence in daily life. Sessions took more than one hour, in-depth probing their abstract thinking as being or not coherent with given opinions about themselves in a closed questionnaire on independence in activities of daily living. Results: a) when home provided medical care becomes routine, patients do a "clean-up" of former subjective experience-based concepts of disease, thus being able to talk about their situation in objective, scientific grounds, at least to socialize properly with interviewers, in an opinion giving situation; b) information given is channeled into a few stances, suggesting the existence of an independence related typology of responses, ranging from straightforward ones, to entirely manipulating ones; c) all patients who remain faithful to old habits of living, and socializing, are more prone to lie about their present condition and hide symptoms. Conclusion: Constant medical information and care at home improves self-appraisal and establishes marks of objectivity, very useful to caregivers. Knowledge of the level of independence in daily life becomes a very important health indicator. Trying to turn the moment of interview into an exaggerated and embarrassing social situation (arrogance, doling up), as well as talking of the past as an everlasting model for behavior, point to probable untruthfulness in opinions about the self. Studies are needed to detail this line of investigation.

**PC6 606** EFFECTS AND UNDERLYING MECHANISMS OF ERRORLESS LEARNING IN COMPARISON TO OTHER LEARNING METHODS TO IMPROVE ACTIVITIES OF DAILY LIVING IN ALZHEIMER DEMENTIA

A. DECHAMPS\* (UMC St Radboud, Nijmegen, The Netherlands)  
R. KESSELS(1), J. JUNGHEIM(1), M. OLDE RIKKERT(1) - (1) Radboud University Medical Centre (Nijmegen, The Netherlands)

INTRODUCTION The purpose of this project is to highlight theoretically-driven learning techniques that may facilitate the acquisition of new information in Alzheimer's disease (AD) patients. Gradual deterioration of functional autonomy in the instrumental activities of daily living (IADL) is a key feature of AD. A better understanding of the parameters that predict successful outcome of such intervention techniques in AD, as implicit memory function, will help to improve independent living across dementia stages. This work presents the comparison of three learning techniques [Errorless Learning (EL), Spaced Retrieval (SR), Trial and Error learning (TEL)]. The aim is to highlight the most beneficial learning method to (re)learning instrumental skills in moderately-severe AD. METHODand MATERIALS Design Pilot in which 3 AD patients follow cross-over training of either EL consisting of a reduction of errors during learning using forward information or SR/TEL. Interventions: We developed a new EL strategy consisting of a 4-week cognitive-training and follow-up of 3 IADL. Each activity (making coffee, sending a mail, setting the table) was divided in small steps on cue cards (A4-sheet with a picture of the step and written instruction). SR refers to the increasing time intervals between the completion of the task and the rehearsal of the targeted information, and also is compared to TEL as the regular unstructured learning. Measures In great detail feasibility, process and performance are studied also in terms of application of implicit/explicit memory functions. RESULTS This study is a work in progress but the final results of the intervention will be presented. CONCLUSION There has been only limited exploration of the feasibility and effectiveness of EL in AD. The mechanism and significance of this learning method will be discussed based on the results of our in depth pilot study.

**PC6 607** CROSS-CULTURAL CONFIRMATORY ANALYSIS OF THE CES-D IN SPANISH AND MEXICAN DEMENTIA CAREGIVERS

L. ANDRES\* (Universidad Rey Juan Carlos, Madrid, Spain)  
A. LOSADA(1), M. VILLAREAL(2), R. NUEVO(3), B. SALAZAR(4), R. ROMERO(1), A. CARRILLO(2), M. MÁRQUEZ-GONZÁLEZ(5) - (1) Universidad Rey Juan Carlos (Madrid, Spain); (2) Universidad Autónoma de Coahuila (Coahuila, Mexico); (3) Hospital de la Princesa, Departamento de Psiquiatría (28922, Spain); (4) Universidad Autónoma de Nuevo León (Monterrey, Mexico); (5) Universidad Rey Juan Carlos (Spain)

Introduction The Center for Epidemiological Studies Depression (CES-D) is probably the most used scale for assessing depressive symptomatology in caregiving research. Although different factor structures have been found, the four factor structure (depressed affect,

somatic symptoms, positive affect, and interpersonal problems) has received recent support in caregiving population. However, the factor structure of the Hispanic version of the CES-D has not been analyzed in caregivers. Methods and materials Face to face interviews were conducted with 539 female dementia caregivers (370 from Madrid, Spain, and 169 from Coahuila, Mexico). The Center for Epidemiological Studies-Depression scale (CES-D) was used. Single and multigroup confirmatory factor analyses for categorical outcomes were performed using MPlus software, employing the WLSMV estimation method for polychoric correlations. Results Different structures of the CES-D previously reported in the literature were tested and compared. Considering the entire sample, the four factor model presented the best fit ( $CFI = .96$ ;  $TLI = .98$ ). The four factor model was tested separately for each sample, obtaining acceptable fit for both samples (Spain:  $CFI = .97$ ;  $TLI = .97$ ; Mexico:  $CFI = .90$ ;  $TLI = .95$ ). Then a multi-group confirmatory factor analysis was performed in order to test factor loadings invariance across countries. Constraining factor loadings and thresholds to be equal across samples produced a significant fit worsening, and complete invariance could not be assumed. A model of partial invariance is consequently proposed. Conclusion The CES-D appears appropriate for cross-cultural use in Hispanic samples. Results generally support the invariance of the factor structure across groups, although there was some evidence of differences for model parameters. We discuss these findings and their implications.

**PC6 608** A TAILORED MADE INTERVENTION. THE EFFECTIVENESS OF LIFE REVIEW THERAPY USING AUTOBIOGRAPHICAL MEMORY RETRIEVAL IN A DEPRESSED NURSING HOME POPULATION: A RANDOMIZED CONTROLLED TRIAL.

B. STEUNENBERG\* (VU University Amsterdam, Amsterdam, The Netherlands)  
E. BOHLMEIJER(2), A. STRATEN(1), A. BEEKMAN(3), P. CUIJPERS(1) - (1) Department of Clinical Psychology (Amsterdam, The Netherlands); (2) Psychology and Communication of Health and Risk (Enschede, The Netherlands); (3) GGZ Buitenamstel (Amsterdam, The Netherlands)

Introduction Life review can be conducted for therapeutic purposes; it can help people cope with loss, guilt, conflict, defeat, or help someone find meaning in ones accomplishments. Recent meta-analyses have proven the effectiveness on both depression and psychological well-being in community dwelling older adults. Bearing in mind the high prevalence rate of mood disorders in residential- and nursing home elderly and the need for effective interventions, life review might be an effective and attractive intervention. In this study we performed a RCT with depressed residential- and nursing home inhabitants who received autobiographical memory retrieval practice, which focuses on retrieving positive memories. Autobiographical memory has been found to be related to depressive feelings. By training the elderly we hope to reduce their feelings of depressed mood and to find an association with change in specificity of autobiographical memory. Methods In 2007 100 older adults were included to this RCT. Participants were randomly assigned to a direct intervention group or waiting list control. After pre-test they received the autobiographical retrieval practice that entailed focusing on a particular life period each weak- childhood, adolescence, adulthood and summary. For each period, 14 questions were prepared, for example: "What is the most pleasant situation that you remember from your childhood". Results Preliminary results show the protocol is effective in reducing depressive mood. 73 participants completed the intervention. For depressive symptoms a medium to large effect size was found (Cohen's d of .70). Of those with a major depression 44 % were recovered at post measurement. Change in depressive symptoms was found to be related to change on specific memories. In conclusion, these results suggest the protocol is effective in training the oldest old in recollecting positive specific memories and as such can be useful in treating the symptoms of depression.

**PC6 609** THE INTEREST OF MEASURING RECOGNISING FACIAL EXPRESSIONS IN DEPRESSED PATIENTS WITH MAJOR DEPRESSION DISORDER(MDD)

A. BRIDOUX\* (CENTRE HOSPITALIER VALENCIENNES, VALENCIENNES, France)  
P. GRANATO (1), O. GODEFROY(2), M. BOUCART (3), R. BRUYER(4) - (1) Centre Hospitalier de Valenciennes. Géronto-psychiatry (VALENCIENNES, France); (2) Centre Hospitalier d'Amiens, Neurology (AMIENS, France); (3) Neurosciences Fonctionnelles et Pathologies, CNRS (UMR 8160), CHRU Lille. (59000, France); (4) University de Louvain, University of psychology, Unity of Neurosciences cognitives, B-1348 Louvain-la-Neuve (Belgium). (B-1348 , Belgium)

Background : Abnormal recognition of Facial Expressions (ARFE) is associated with interrelational difficulties and among depressive patients, lead to errors in emotionally charged information. Objectives: To evaluate ARFE following the Analysis method and the search for emotional integration (MARIE). This tool uses a continuation of fictive portraits created from two real portraits and in varying proportions (Ekman's portraits). This is an emotional series which can be either unipolar or bipolar (neutral/emotion, emotion/emotion). The subject has to choose between two possibilities for each portrait. The programme comprises nine series of 19 pictures of different faces (a fair-haired woman, a dark-haired woman and a man). Statistical Analysis An average between the 2 evaluations ( $\chi^2$  test) can be compared according to the patient's answers. Comparison of results between patient's answers before and after the treatment and results before and after

of a standard reference which is, by definition, 100%. Comparing the averages of time answering between the 2 evaluations (Student test) by logarithms. Results At the acute depression phase, the ARFE is linked with the congruent mood. In remission, a dissociation between an improvement of recognition of happiness emotions and sadness approaching results of a population reference and a degradation of recognition of other emotions appears; resulting in an overall deficiency of facial emotion recognition. The persistence of recognition errors of Unipolar Emotional Continuum (UEC) (neutral-anger, neutral-fear, neutral-surprise, neutral-disgust) with an appropriate treatment, can prove the severity of the case. Discussion The ARFE is an integral part of the depression criteria. However, the disorder varies according to the face presented. Improved performance of recognition of UEC Neutral/happy and BEC happiness/sadness and a degradation of recognition of the others UEC apparent in the patient and others depressives can reiterate the depression aspect.

**PC6 610 DEPRESSION,QUALITY OF LIFE AND LIVING WILL OF COMMUNITY-DWELLING POSTMENOPAUSAL AND ELDERLY WOMEN IN THREE ASIAN COUNTRIES: JAPAN,KOREA AND CHINA**  
 K. INA\* (Department of Geriatrics, Nagoya University Graduate School of Medicine, Nagoya, Japan)  
 T. HAYASHI(1) - (1) Department of Geriatrics, Nagoya University Graduate School of Medicine (Nagoya, Japan)

**INTRODUCTION:** The purpose of this study was to examine the prevalence of screening-based depression and the association of depression with quality of life (QOL) of community-dwelling postmenopausal and elderly women living in three Asian countries: Japan, Korea and China. **METHODS AND MATERIALS:** A total of 911 community-dwelling postmenopausal and elderly women living in three Asian countries (Japan:169, Korea: 300,China: 442) participated in this study. Depressive symptoms were assessed using a 15-item geriatric depression scale (GDS-15). For the assessment of QOL, we used EQ-5D. And we also examined the prevalence of subjects wish to be informed that they have cancer and wish to be treated for prolonging life. These were assessed by self-report questionnaires. **RESULTS:** Using the cut-point 5/6 for the GDS-15, proportions of subjects with depression comprised 33.9% of those in Japanese postmenopausal, 39.0% of those in Korean postmenopausal, 29.2% of those in Chinese postmenopausal, 17.0% of those in Chinese elderly, 36.4% of those in Japanese elderly and 32.7% of those in Japanese extremely elderly. For the assessment of QOL, following five dimensions were assessed: mobility, self-care, usual activities, pain/discomfort, and anxiety/depression. Proportions of reported problems for each dimension were examined. Subjects with depression had significantly lower level of QOL than those without depression in all three countries, all six populations. **CONCLUSIONS:** In all three countries, 17.0-39.0% of community-dwelling postmenopausal and elderly women had screening-based depression, which was significantly associated with lower level of QOL. These results suggest that clinicians should pay more attention to depression of community-dwelling postmenopausal and elderly women.

**PC6 611 A RCT OF LIFESTYLE AND MENTAL HEALTH LITERACY INTERVENTIONS FOR THE INDICATED PREVENTION OF DEPRESSION**  
 J. WALKER\* (Australian National University, Canberra, Australia)  
 A. MACKINNON(2), P. BATTERHAM(1), A. JORM(2), I. HICKIE(3), A. MCCARTHY(1), M. FENECH(4), H. CHRISTENSEN(1) - (1) Australian National University (Canberra, Australia); (2) ORYGEN Research Centre (Melbourne, Australia); (3) Brain and Mind Research Institute (Sydney, Australia); (4) CSIRO (Adelaide, Australia)

Introduction. To test whether mental health literacy (MHL), physical activity, or folic acid + B<sub>12</sub> reduce depressive symptoms in at risk community-dwelling older adults. Method and Materials. A randomized controlled trial, the Beyond Ageing Project (BAP), recruited 909 adults aged 60-74 years with K-10 scores > 15 directly from the community. The BAP was a two-year intervention with a completely crossed 2 x 2 x 2 factorial design that comprised eight intervention arms: (400 mcg/d folic acid + 100 mcg/d B<sub>12</sub> vs placebo) by (physical activity promotion vs nutrition control) by (MHL vs pain information control). The intervention was delivered via mail in 10 modules with concurrent brief telephone tracking calls. Changes in depressive symptoms were measured using the PHQ - 9 at 6 weeks, 6, 12 and 24 months. Examined here is the data currently available from baseline to 12 months. Results. In the intention-to-treat analysis, depression was lower in the MHL intervention compared to the control condition at six weeks ( $p = .042$ ). Neither folic acid + B<sub>12</sub> ( $p = .476$ ) nor physical activity promotion ( $p = .177$ ) reduced symptoms. Conclusions. MHL reduces depressive symptoms and, consequently, may be a viable indicated prevention strategy in older adults. Neither folic acid + B<sub>12</sub> at the chosen doses, nor promoting physical activity were effective for preventing depressive symptoms compared to attention control interventions.

**PC6 612 AFFECTIVE DISORDERS AS RISK FACTORS FOR DELIRIUM AFTER CARDIAC SURGERY**  
 P. TULLY\* (University of Adelaide, Adelaide, Australia)  
 R. BAKER(2), D. TURNBULL(1), H. WINEFIELD(1), J. KNIGHT(2) - (1) School of Psychology, University of Adelaide (Adelaide, Australia); (2) Dept. Cardiac and Thoracic Surgery, Flinders Medical Centre (Bedford Park, Australia)

**Introduction:** Delirium is a known adverse outcome of cardiac surgery and research supports an association with depressive symptoms. The objective of this study was to determine the association between incident delirium after cardiac surgery and preoperative affective disorders, and also Type-D personality. **Methods and materials:** Ninety nine cardiac surgery patients free from delirium were assessed preoperatively for mood and anxiety disorders using structured diagnostic interview, and patients completed a Type-D scale. Patients were re-examined for new onset delirium in the postoperative period, and results were analysed using Fisher's exact tests. **Results:** Postoperative assessment showed that 22 (22.2%) patients met criteria for delirium. The prevalence of affective disorders at baseline was 12.1% for current major depression, 8.1% for panic disorder and 4% for generalized anxiety disorder (GAD). Delirium was associated with major depression (5.2% vs. 36.4%),  $p < .001$ , panic disorder (2.6% vs. 27.3%),  $p < .001$  and GAD (1.3% vs. 18.2%),  $p < .01$ . Social phobia was not associated with incident delirium (1.3% vs. 9.1%),  $p = .12$ . Delirium was associated with high negative affect without social inhibition (23.4% vs. 45.5%),  $p = .06$ , but not in combination with social inhibition (i.e. Type-D personality) where a trend was observed (11.7% vs. 27.3%),  $p = .10$ . **Conclusion:** This study highlights an association between affective disorders and delirium following cardiac surgery, while support was also shown for negative affect in isolation without social inhibition. This suggests that current distress rather than distressed personality style is associated with incident delirium. Future research should consider the utility of differential diagnosis for postoperative delirium among cardiac surgery candidates who have a high prevalence of affective disorders and explore the rehabilitation options and longer term neuropsychological function of this precarious population.

**PC6 613 LONG TERM NEUROPSYCHOLOGICAL DEFICIT AFTER CARDIAC SURGERY: THE EFFECT OF PSYCHOLOGICAL DISTRESS**  
 P. TULLY\* (The University of Adelaide, Adelaide, Australia)  
 R. BAKER(2), D. TURNBULL(1), H. WINEFIELD(1), J. KNIGHT(2) - (1) School of Psychology, University of Adelaide (Adelaide, Australia); (2) Dept. Cardiac and Thoracic Surgery (Bedford Park, Australia)

**Introduction:** The independent influence of depression and anxiety on neuropsychological performance following coronary artery bypass graft (CABG) surgery has not been examined in the longer term where it has been suggested that CABG patients show marked cognitive dysfunction. **Methods and materials:** Seventy five CABG patients and 36 non-surgical community control subjects completed a neuropsychological test battery and measures of psychological distress at baseline, six months and five year follow up. Neuropsychological change in CABG patients was derived from standardized regression based methodology estimated from the control group. Linear regressions were performed to predict neuropsychological change from psychological distress, adjusted for hypertension, diabetes, peripheral vascular disease and intraoperative parameters. **Results:** The results showed that cognitive and affective depressive symptoms five years after surgery were significantly associated with lower neuropsychological function at this time in the CABG patients. Depression symptoms were associated with the Trail Making Test part A and B and Digit Symbol Coding, and explained 6.8%, 7.6% and 12.3% of variance respectively. Anxiety was significantly associated with verbal memory, and explained 5.3% of variance among CABG patients. No significant effects for psychological predictors were evident at six month follow up. With regards to cardiac and surgical covariates, poorer neuropsychological function at six months and five years was commonly associated with hypertension and diabetes, and the minimum temperature on cardiopulmonary bypass. **Conclusion:** These results suggest that depressive symptoms may influence long term neuropsychological performance after CABG on tests tapping into attention and visuomotor speed and executive functioning. Depressive symptoms may exacerbate cerebrovascular ischemia over time and this might partly explain long term neuropsychological dysfunction in CABG patients.

**PC6 614 SLEEP HABITS AND SLEEP THOUGHTS IN AGED INDIVIDUALS SHOWING PSYCHOLOGICAL DISTRESS**  
 D. LORRAIN\* (University of Sherbrooke, Sherbrooke, Canada)  
 M. PRÉVILLE(1), S. DÉSJARDINS(3), D. BÉLISLE(1) - (1) University of Sherbrooke (Sherbrooke, Canada); (3) UQTR (Sherbrooke, Canada)

**Introduction:** Sleep disorders, anxiety or depression co-occur frequently in the elderly population (Morgan, 2000; Giron, 2002). While the physical and affective symptoms tends to be thoroughly looked at by the physician or therapist, other aspects of the problems, such as the attitudes, beliefs and habits, surrounding the sleep problems of the elders are often neglected. **Methods:** Participants were 1850 adults (M age=74, SD=6 years) selected from a probabilistic sample composed of individuals leaving at home in the province of Québec, Canada. The inclusion criterias were: being over 65 years old and having no diagnostic of cognitive disorders. The DIS was used to evaluate the presence of depression or anxiety in the past 12 months, whereas the PSQI was used to measure sleep quality (Buysse, 1989). Sleep habits, thoughts and beliefs were investigated with chosen items from different questionnaires (Morin, 2004). **Results:** A subgroup of particular interest was identified from the 12% of the participants that had at least 1 diagnostic of mental health problem and a PSQI score greater than 5. Concerning sleep habits, this subgroups of subjects reported practicing relaxation, watching TV or reading in bed, doing lots of thinking during the night and awakening in a bad mood more often than the subjects

without a diagnostic ( $p<.01$ ). They also believed that they should stay in bed, trying harder to fall asleep, and that it is normal that their sleep is worst because of the aging process itself ( $p<.01$ ). Conclusions: Psychological distress is related to several bad habits and dysfunctional beliefs that could contribute to exacerbate and perpetuate the sleep problems. Together with pharmacological and/or psychological treatments, these aspects should be looked at more closely while treating anxiety or depression symptoms in aged individuals.

#### **PC6 615 A TRAINING PROGRAM FOR PEOPLE WITH DEMENTIA AND THEIR FAMILY CAREGIVERS: A RANDOMIZED CONTROLLED TRIAL**

A. PRICK\* (Vrije Universiteit Amsterdam, Amsterdam, The Netherlands)  
A. POT(1), E. SCHERDER(2), J. DE LANGE(1) - (1) Netherlands Institute of Mental Health and Addiction (Utrecht, The Netherlands); (2) Vrije Universiteit (Amsterdam, The Netherlands)

Introduction People with dementia and their caregivers can suffer a lot from dementia. A recent review shows that combined interventions both for dementia patients as for their caregivers are effective to diminish depressive symptoms. One combined intervention is developed by Linda Teri and her colleagues (2003). People with Alzheimer disease together with their caregivers received an exercise program. The caregivers were also trained in behaviour management techniques to deal with behaviour disturbances. People with Alzheimer disease who participated in the intervention program performed significantly better on measures of physical function and measures of affective status compared to the care as usual group. For our study we translated and adapted the intervention program of Teri to the Dutch situation and at the moment we investigate whether it is feasible and effective for both people with dementia as their caregivers. Methods and materials The patients-caregivers dyads (160) are randomly assigned to the training program or care-as-usual with attention. The duration of the exercise training is three months. Assessments are conducted at screening, baseline, after 3 months and at 6 and 12-month follow-up. The intervention effect will be assessed by trained interviewers who are blind to the treatment assignment. Next to measures as used in the study of Teri, we add measures for physical, cognitive and executive functioning. In addition, we study the effects of the integrated treatment program on the mood of the caregivers. Outcome analyses compare the intervention group with the routine care group using generalized estimating equations for linear, logistic, and Poisson regression. Results The data collection started in January 2009. The first results will be presented at the congress.

#### **PC6 616 INVARIANCE IN THE PREDICTORS OF SEVERITY OF SUICIDE ATTEMPTS BETWEEN OLDER AND YOUNGER ADULTS.**

R. NUEVO\* (CIBER-SAM, HOSPITAL DE LA PRINCESA, MADRID, Spain)  
M. MIRET(1), C. MORANT(2), M. JIMÉNEZ(3), M. RENESES(4), M. LÓPEZ(4), J. AYUSO-MATEOS(1) - (1) CIBER-SAM, LA PRINCESA UNIVERSITY HOSPITAL, PSYCHIATRY DEPARTMENT (MADRID, Spain); (2) MADRID REGIONAL COUNCIL, MENTAL HEALTH DEPARTMENT (MADRID, Spain); (3) RAMÓN Y CAJAL UNIVERSITY HOSPITAL, POSCHIATRY DEPARTMENT (28006, Spain); (4) AUTONOMA UNIVERSITY OF MADRID, PSYCHIATRY DEPARTMENT (MADRID, Spain)

Introduction: In the elderly suicide is an important problem, and literature has reported that attempts are in general more severe and have higher impact on health in this age. Differences between younger and older adults have still not been, however, well analyzed. Methods: Reports of all patients attempting suicide were collected during 4 months in 4 general public hospitals (covering 44.7% of the whole population) in the Community of Madrid. 1009 suicide attempts were collected, with an incidence of 34.3 people per 100.000 in 4 months. Sample was split according to age in those 55 years old or over (11.99% of the sample), and persons below 55 years. Results: A multigroup confirmatory factor analysis with covariates with categorical factor indicators was performed. Demographics, different disorders, other clinical characteristics, social support, etc. were included as predictors of a latent factor of intent, which explained scores in characteristics of the attempt related with the severity and the extent of willingness to die (e.g. suicidal ideation). The first model including all variables had not a good fit, and the worst predictors and indicators were iteratively removed one by one. A final baseline model for both groups reached a good fit ( $CFI = .932$ ;  $RMSEA = .056$ ). Predictors in the final model were depressive disorder, social support, and substance abuse disorder. When constraining factor loadings and thresholds to be equal across groups there was not a significant worsening in the fit of the model ( $\chi^2$  squared change = 3.7;  $p = .296$ ). Latent factor means did not significantly differ between groups. Conclusion: A structurally invariant model with adequate fit was found in predicting suicide attempt severity across age groups. This suggests that factors involved in attempt severity are similar among the older adults compared with general population. Funded: Madrid Public Health Institute

#### **PC6 617 DEPRESSIVE SYMPTOMS IN OLDER MALE ITALIAN IMMIGRANTS TO AUSTRALIA: THE CONCORD HEALTH AND AGEING IN MEN PROJECT.**

F. STANAWAY\* (University of Sydney, Sydney, Australia)  
R. CUMMING(1), V. NAGANATHAN(2), F. BLYTH(2), D. HANDELSMAN(3), D. LE COUTEUR(2), P. SAMBROOK(4), M. SEIBEL(3), H. CREASEY(2), L. WAITE(2) - (1) School of Public Health, University of Sydney (Sydney NSW, Australia); (2) Centre for

Education and Research on Ageing, University of Sydney (Concord NSW, Australia); (3) ANZAC Research Institute, University of Sydney (Concord NSW, Australia); (4) Institute of Bone and Joint Research, University of Sydney (St Leonards NSW, Australia)

Introduction: Italian-born Australians represent the largest group of older Australians from a non-English speaking background. However, there has been little research conducted on the mental health of this important group of older Australians. The aim of our study was to describe the prevalence of depressive symptoms in older male Italian-born immigrants compared to Australian-born men. Methods and Materials: This study analysed data from 335 Italian-born men and 849 Australian-born men aged 70 years and over participating in the baseline phase of the Concord Health and Ageing in Men Project (CHAMP). Depressive symptoms were assessed using the short version (15 item) of the Geriatric Depression Scale. Crude and adjusted odds ratios for country of birth were calculated using logistic regression. Results: The prevalence of depressive symptoms in Italian-born men was 18%, which was almost twice the prevalence of 10% in Australian-born men ( $OR=1.9$ , 95%CI 1.2-3.0). After adjusting for socioeconomic and health factors, the relationship between country of birth and depressive symptoms was attenuated and became statistically non-significant ( $OR=1.7$ , 95%CI 0.9 – 3.0). The strongest confounders of the relationship between country of birth and depressive symptoms were source of income and satisfaction with social support. Conclusion: Male Italian-born immigrants aged over 70 years report more depressive symptoms than their Australian-born counterparts. This association appears to be partly explained by increased reliance on a government pension as the sole source of income and lower satisfaction with social support in Italian-born men.

#### **PC6 618 STANDARDIZATION AND FACTOR STRUCTURE OF THE CES-D IN IRANIAN ELDERLY**

A. MIRABZADEH ARDAKANI\* (University of Social Welfare and Rehabilitation Sciences, Tehran, Islamic Republic of Iran)  
S. MALAKOUTI(1), T. ZANDI(2) - (1) (tehran, Islamic Republic of Iran); (2) 2 (plattsburgh, United States of America)

Objectives. Depressive disorders are a public health problem even in developing countries. Access to valid and reliable screening instruments is needed for conducting community surveys. The main objective of this study is to provide the Iranian version of the Center for Epidemiologic Studies Depression Scale (CES-D). Methods. The CES-D, (10 items) Farsi version was developed by translation and back translation. Two hundred and four subjects aged 59 years or older, who were chosen randomly from residents of the Ekbaten district of Tehran, the capital city of Iran, completed the CES-D. The Composite International Diagnostic Interview (CIDI) was used to establish a gold standard diagnosis of major depressive disorders. Results. The CES-D was found to be an internally consistent measure. Alpha, split-half coefficients and test-retest reliability were 0.86, 0.81 and 0.49 respectively. Two factors were extracted by using factor analysis and the principle component analysis (varimax rotation): 'depression' and 'interpersonal relationship'. The Depression factor (omitting items 6,9), which could be considered as a short form of the scale ( $\alpha=0.87$ ), has significant correlation with the main scale ( $r=0.99$ ). Using receiver operating curve (ROC) analysis, the optimum cutoff score for both short and long form of is 5, yielding a sensitivity of 0.81 and a specificity of 0.74. Conclusion. The long and short forms of the CES-D have acceptable properties as screening instruments for major depression in older dwellers in Iran, particularly in urban areas, as presented in our findings.

#### **PC6 619 REMINISCENCE FUNCTIONS AND MENTAL HEALTH IN OLDER ADULTS WITH MODERATE DEPRESSION**

J. KORTE\* (University of Twente, Enschede, The Netherlands)  
E. BOHLMIJER(1), G. WESTERHOF(1), A. POT(2) - (1) University of Twente (Enschede, The Netherlands); (2) Netherlands Institute of Mental Health and Addiction (Utrecht , The Netherlands)

Introduction There is growing knowledge on the relation between reminiscence functions and mental health, such as depression and anxiety. However, most studies have been conducted in the general population, without clinical symptoms. Since the presence of depressive and anxiety symptomatology which do not meet the diagnostic criteria are by far the most important risk factors of late-life clinical disorder, it is relevant to study the functions of reminiscence in a group at risk. Methods and materials A total of 171 Dutch older people, with mean age of 64 years ( $SD= 7.4$ ), and with moderate depressive symptomatology, participated in this study. Participants' depressive symptoms were measured with the CES-D, and anxiety symptoms were assessed using the HADS-A. We also measured whether participants had recently experienced important life-events or serious illness. The reminiscence functions that we included were boredom reduction, identity, problem solving, and bitterness revival, measured with the Reminiscence Functions Scale (RFS). Results Depression is positively correlated with boredom reduction and bitterness revival, the so-called 'negative' reminiscence functions. Regression analysis shows that only bitterness revival remains significant after controlling for the other reminiscence functions. Anxiety has a positive relation with bitterness revival and boredom reduction, and a negative relation with problem solving. If we control for all reminiscence functions, only problem solving has a unique contribution. Also, we observed a positive relation between important recent life events and anxiety. Moreover, problem solving mediates the relation of negative life events with anxiety. Conclusion In order to reduce

clinical symptomatology and prevent mental disorder, we advise mental health care professionals to focus on techniques which reduce bitterness revival in people with depressive symptoms, and to focus on problem solving reminiscence in people with anxiety symptoms.

**PC6 620 DIOGENES SYNDROME (DS): RESULTS FROM AN OBSERVATORY STUDY IN A PARIS DISTRICT.**

L. HUGONOT-DIENER\* (Hôpital BROCA CMRR Paris sud, PARIS, France)  
C. WONG(2), J. MONFORT(3) - (2) Cabinet de Psychiatrie (Paris, France); (3) Hopital Ste Anne (75014, France)

Introduction Diogenes syndrome is a behavioral disorder affecting more often older adults. It is a controversial syndrome with at least 4 almost permanent described symptoms: No request from the subject, when he had nothing; an unusual relationship with things (hoarding of rubbish, or nothing in the house); an unusual relationship with people (misanthropy) and an extreme self neglect. Difficulties in taking care of such subjects, has conducted our socio-medical team to carry out a descriptive study to find out if these subjects had a pathological state or not. Methods and material It is an observatory retrospective study aiming to improve our knowledge of DS in a community dwelling older persons from the XVth Paris District. 600 questionnaires had been sent to medical and social workers, to describe potential cases of DS. Results 136 questionnaires have been completed by 53 professional workers, and 15 of them, concerned the same patients. Our sample was 121 subjects. The mean age was  $77.8 \pm 9.9$ , from 52 to 95 years old. 71% of the subjects were women. All the socio professional categories were represented. 60% of the subjects were living alone, with in 65% of the cases a proxy's help. 26% of the subjects had a diagnosis of dementia. 93% had no alcohol addiction. Only 12% were reported having psychiatric troubles as anxiety or depression. Conclusion Prevalence of the reported DS is comparable to the previously published data: 2/10 000 habitants. However we need a prospective study with a good methodology to conclude. Thus these results may help to build the future questionnaire. Some younger subjects seemed to have schizophrenia; older subjects had a probable FTD, although 10% of the subjects had no pathology but personality disorder linked with a traumatism during the first years of their life. .

**PC6 621 DEVELOPING A SELF RATING SCALE FOR DEPRESSION IN OLD AGE: THE DIA-SCALE A VALIDATION OF TEST PERFORMANCE CRITERIA IN COMPARISON TO THE GERIATRIC DEPRESSION SCALE (GDS-15)**

S. HEIDENBLUT\* (Universitaet Siegen, Siegen, Germany)  
C. SCHACKE (1), Z. SUSANNE(1) - (1) Universitat Siegen (Siegen, Germany)

Introduction: Despite the relevance of depressive disorders in geriatric medicine there is a lack of appropriate screening instruments. The 15-Item-Shortform of the Geriatric Depression Scale (GDS15) is one of the few scales developed for elderly subjects and a widely used assessment instrument. But, as it is not designed for physical impaired subjects, the GDS-15 does not seem suitable for a clinical geriatric setting. The Purpose of the study was to create a depression rating scale that exceeds diagnostic accuracy for physically impaired geriatric patients whereas in terms of practicability it is comparable to the GDS-15. Methods: In a pilot study a self-rating scale for depression in old Age (DIA-Scale) was constructed considering formal, content and empirical criteria. The Scale consists of 10 short Items and has a simple yes/no-answering scheme. In the main study the new Scale and the GDS-15 were validated using the Montgomery and Asberg Depression Rating Scale (MADRS) as gold standard criterion. Based on a stratified sample of N = 300 geriatric inpatients (N = 150 depressed Subjects; N = 150 not depressed subjects) performance criteria of the two tests were compared. Results: The DIA-Scale shows a considerably higher internal consistency than the GDS-15. The better screening qualities of the DIA-Scale also show in a comparison of sensitivity and specificity for the best cut-off-score of each test. Furthermore, in a comparison of classification performance via Receiver-Operating-Characteristic-Curves the new test achieves a significantly better result. Conclusion: The better test performance of the DIA-S is a very promising result considering that the new instrument is also 5 items shorter than the GDS-15. Hence the new scale would also be an improvement in terms of efficiency. On this account further investigation such as an implementation of the new instrument into the practice of geriatric medicine or the validation in other European countries seems worthwhile.

**PC6 622 GENDER DIFFERENCES IN SYMPTOMS OF DEPRESSION AMONG PEOPLE 65 YEARS AND OVER LIVING IN QUEBEC**

M. DUBÉ\* (Université du Québec à Trois-Rivières, Trois-Rivières, Canada)  
D. MECHAKRA-TAHIRI(1), P. MICHEL(2), B. JOËLLE(2) - (1) Université de Montréal (Montreal, Canada); (2) Université de Sherbrooke (Sherbrooke, Canada)

Introduction: Despite abundant literature on the subject, the gender imbalance in depression is one of the major unresolved problems in psychiatric epidemiology. Epidemiological studies suggest that women present between 1.5 and 2 times more depressive disorders than men. A wide range of hypotheses have been put forward to explain this gender difference, including those that focus on differences in clinical manifestations of depression in men and women. In the depressed elderly population, however, the relationship between age and gender seems more complex. The present study

examines (1) the differences in the prevalence and nature of the symptoms of depression, reported by depressed older men and women in Quebec and (2) how the severity of depression influences the prevalence of the symptoms reported. Method: Data was used from the ESA study conducted in 2005-2006 with a representative sample of community-dwelling adults aged 65 years and over in Quebec (N=2784). Depression (including major, minor and subclinical depression) was measured among depressed older adults (n=205) according to DSM-IV criteria using the ESA questionnaire developed by the research team. Results: Concerning gender rates for individual symptoms of depression, the greatest differences statistically significant were found for the following items (women's rates provided first): appetite disturbance (36.8% vs. 22.6%), psychomotor change (59.9% vs. 52.8%), thoughts of death (34.9% vs. 18.9%) and difficulties in social activities (71.7% vs. 54.7%). No significant gender differences were found for the other remaining symptoms. Most of the participants reported minor depression (78%). Only 7.3% met the subclinical depression criterion, and of these all were women. Conclusion: Depressed mood and loss of interest or pleasure, which are the essential features of depressive episodes, do not differentiate between depressed older men and older women. The other features, in accordance with the DSM-IV, may be more typically feminine features of old age.

**PC6 623 PSYCHOMETRIC CHARACTERISTICS OF THE DEPRESSIVE SYMPTOMS QUESTIONNAIRE IN A SAMPLE OF ELDERLY PEOPLE FROM CUBA.**

A. RIQUELME MARÍN\* (University of Murcia, Murcia, Spain)  
J. ORTIGOSA QUILES(1), M. MARTÍN CARBONELL(2), R. PÉREZ (2), J. ENRÍQUEZ SANTOS(2) - (1) Universidad de Murcia (Spain); (2) Universidad de La Habana (Cuba)

Introduction: In this work, the factorial structure and psychometric characteristics of the depressive symptoms questionnaire (Riquelme et al, 2006) are studied in a sample of elderly people from Cuba. Material and method: The questionnaire of depressive Symptoms was applied to a sample of 100 65-year-old grownups living in Havana (Cuba). Out of these people, 50 had clinically diagnosed with depression according to DSMIV TR approaches, in the Clinical Psychology Service at the Iberian-Latin American Elderly Center. Results: The results show a structure of four factors again just as it happened in the Spanish population. (perfomance problems, self-conceptuation, sleep disorders and suicidal ideation). As far as reliability is concerned, an alpha coefficient of Crombach .91 has been obtained. Finally, the capacity of this instrument as a screening test for clinical depression showed a specificity of 95.7 and a sensitivity of 88.3, with a total percentage of correct classifications peaking 91.7% for a top cutout point of 39. Conclusions: The data contributed in this work indicate excellent values of the questionnaire in this preliminar study of the Cuban population, both regarding their psychometric characteristic –as their capacity- and as a screening tool. These results are encouraging in the face of the adaptation of this questionnaire to different cultural contexts.

**PC6 624 DIFFERENCES IN EITHER PRESENCE OR ABSENCE OF DEPRESSIVE SYMPTOMS IN ELDERLY PEOPLE FROM SPAIN AND CUBA.**

J. ORTIGOSA QUILES\* (University of Murcia, Murcia, Spain)  
M. MARTÍN CARBONELL(2), A. RIQUELME MARÍN(1), A. CERQUERA(3), R. PÉREZ(2), J. ENRÍQUEZ(2) - (1) University of Murcia (Spain); (2) University of La Habana (Cuba); (3) University of Bucaramanga (Colombia)

Introduction: The purpose of this work is to value the existence of depressive symptoms differences between elderly people from Spain and Cuba, both at overall magnitude level and with regard to the relevance of different depression symptoms. Material and Method For conducting this study, as many as 223 people of 65 years of age or older were screened. The Spanish sample is composed of 56 elderly people that make up the clinical level, with an average age of 70.73 years, plus 57 elderly people without depressive background with an average age of 69.7 years old. Regarding the Cuban group, this one is composed of 110 elderly people, 35 men and 75 women. Out of this group, 67 people conform the clinical subgroup and the remaining 41 individuals make up the normal group. Their respective age averages are 70.27 and 71.51. A model of clinical questionnaire, laid out under DSM-IV TR approaches, was coupled with the Ces-d questionnaire, plus a 58-item self-designed inventory that focuses on the assessment in terms of existance and repetition of different depressive symptoms that was also applied. Results: The outcomes show a much bigger presence of depressive symptomatology in the Cuban sample. Regarding the depressive symptoms, significant differences in over 20 different depressive symptoms, both in the case of the clinical sample and in that of the normal population. Special attention must be paid to the case of suicide tentatives, reported in 12.2% of the normal population from the Cuban sample of elderly people. Conclusions: The data contributed by this work shed light on the need of making deeper analysis of the differences found in elderly people from both countries, as well as the reasons whereby these differences can be explained away.

**PC6 625 CAREGIVING: A HARD JOB DONE WITH LOVE**

L. AREVALO-FLECHAS\* (University of Texas Health Science Center at San Antonio, San Antonio, United States of America)

C. BRADEN(1) - (1) The University of TexaHealth Science Center at San Antonio (San Antonio, United States of America)

Burden may not be the most appropriate concept used to describe the full impact of caregiving in Hispanic/Latino Alzheimer's caregivers. Caregiving models based on classic stress and coping theories have not considered the role that culture and language has on the perception of the caregiving experience. The Spanish language lacks a word that translates to the exact meaning of the English word burden. The Spanish word carga translates more to a physical load than to an emotional load. Neither burden nor carga are culturally congruent words to describe the Hispanic/Latino caregiving experience. This culturally informed conceptual orientation of caregiving proposes burden as one of the consequences of caregiving realities (situations faced day-to-day by caregivers), which are the antecedent to caregiving coping and perceptions. Caregiver expenditure, an antecedent to the coping response, is the degree to which one offers time, as well as physical, social, financial, environmental, and personal resources on behalf of another. Culture and language moderate the relationship between the caregiver expenditures and the coping response, and the relationship between this response and the perception of the experience. The 3 constructs are: Caregiving Realities, Caregiving Coping, and Caregiving Perceptions. Caregiver expenditure is a "kind of" Caregiving Reality. Hours of care, travel time, money, and time for self, are expenditure referents. Caregiver coping response is a "kind of" Caregiving Coping. An example of a referent is The Lazarus Coping Scale. Caregiver Burden, Caregiver Duty Fulfillment, and Caregiver Satisfaction are "kinds of" Caregiving Perceptions. Referents of these Perceptions that consider the moderating role of language and culture remain to be developed. The inclusion of culture and language as moderators of the Caregiving Perception offer a culturally informed conceptual orientation that further refines theory that frames studies aimed at decreasing the negative impact of caregiving.

**PC6 626 GENDER DIFFERENCES IN THE ASSOCIATION BETWEEN SOCIOECONOMIC STATUS AND DEPRESSION IN THE ELDERLY**

J. BACK\* (Ajou University School of Medicine, Suwon, Republic of Korea)  
Y. LEE(1), J. KIM(1) - (1) Ajou University School of Medicine (Suwon, Republic of Korea)

Introduction: With rapid population aging in Korea, increasing attention is given to the mental health of older people. This study examines the association between socioeconomic status and depression in older adults. Methods and materials: The study population consisted of 4123 persons aged 65 and older from Wave 1 of the Korean Longitudinal Study of Aging that used a multistage stratified cluster sampling of community residents. The Center for Epidemiologic Studies Depression scale was used to measure the extent of depressive symptoms. Socioeconomic indicators included education, employment, income source (wage, family support and assets, public transfer, others), and household assets. Analyses were conducted by age groups (65-74, 75+) and gender, using multiple logistic regression, taking into account demographics and health-related variables. Results: Among the survey participants, 16% of men and 27% of women experienced symptoms of depression. In the young-old, education, wage income, and assets were associated with depression, whereas in the oldest-old, public transfer income was significant. In the young-old, for men, those currently employed and having higher assets were less likely to have depression. Receiving wage income was associated with a higher risk. For women, higher education lowered the risk, but those who had worked in the past were more likely to have depression. In the oldest-old men, those who received income support from family or had public transfer of income showed a higher probability of experiencing depression. For women, higher education tended to lower the risk of depression, while having public transfer of income showed a higher risk. Conclusion: Depressive symptoms of the young-old and the oldest-old by gender showed a clear difference depending on the socioeconomic factors. Even with the demographic and health-related variables controlled, the correlation turned out significant, indicating that socioeconomic factors have a major influence on depression.

**PC6 627 CLINICAL BENEFITS OF MEMORY TRAINING PROGRAMS FOR OLDER CHINESE PEOPLE WITH EARLY DEMENTIA**

J. CHUNG\* (The Hong Kong Polytechnic University, Kowloon , Hong Kong)  
A. ERIC (1) - (1) The Hong Kong Polytechnic University (Kowloon, Hong Kong)

Introduction Little is known about the clinical efficacy of memory training programs for older Chinese people with limited education. This study investigated the clinical benefits of two forms of memory training – (1) spaced retrieval and errorless learning (SR-ER) and (2) mnemonics (MNEM) among older Chinese people with early dementia. Method 39 community-dwelling subjects with early dementia were enrolled to the study (data collection is still in progress), and were randomly assigned to SR-ER group, MNEM group and a wait-list control group. Subjects assigning to the two intervention groups attended 8 sessions over 4 weeks. Subjects were evaluated with Fuld Object Memory Evaluation (FOME) and digit span (DS) tests at baseline and post-intervention. Percentages of training items recalled and recognized were obtained from the intervention groups. Results Full sets of results will be presented. Mean age, years of education, and MMSE score of the study sample were 82 years, 2.2 years, and 18.0 respectively. About two-thirds of the study subjects were females. Preliminary results suggest that the three groups did not significantly differ from each other in delayed recall score of FOME ( $F = 0.43$ ,  $p = 0.66$ ) and backward

span score ( $F = 1.85$ ,  $p = 0.17$ ). The percentages of training items recalled were 70 for SR-ER group and 75 for the MNEM group. Conclusions The preliminary data suggest that memory training programs are not clinically beneficial for older Chinese people with early dementia. Three reasons may explain for these observations – (1) insufficient sample size as shown by power analysis, (2) subjects too old and mostly illiterate, and (3) low dosage of training sessions. Yet, approximately two-thirds of training items could be recalled and recognized by the subjects, suggesting that the memory interventions might be effective for the items being trained but have limited generalization effect.

**PC6 628 BURDEN OF CHRONIC DISEASE IN THE QUALITY OF LIFE OF THE ELDERLY IN SÃO PAULO, BRAZIL**

A. CAMPOLINA\* (HSPM, São Paulo, Brazil)  
P. DINI(1), R. CICONELLI(2) - (1) HSPM (São Paulo, Brazil); (2) Unifesp (São Paulo, Brazil)

Objectives: To evaluate the impact of chronic disease in the quality of life of elderly people living in São Paulo, Brazil. Methods: Cross-sectional study of individuals over 60 years. Application of a standardized questionnaire and the Short-Form 36 items questionnaire. Statistical analysis describes the clinical and demographic data, ANOVA were used for the correlation of the SF-36 domains with age and the number of morbidities. Results: 353 individuals were evaluated. The mean age was 71.6 years, with 48.7% of men and 51.3% women. The women presented the worst levels of quality of life in all domains evaluated. ANOVA revealed significant variation in the quality of life in several areas as increasing the number of morbidities. The most compromised domain was Role Physical ( $p < 0.05$ ). The same analysis, applied to the average of the domains by age group, showed an inverse relation of Functional Capacity ( $p < 0.05$ ) with age. Conclusions: The increase in the number of morbidities and the increasing age would significantly affect several areas of quality of life in the old people.

**PC6 629 LEARNING HOW TO BE AN 'OLDER WOMEN': NEGOTIATING CULTURAL SCRIPTS OF AGEING FOLLOWING THE MENOPAUSE**

M. GOTTF\* (University of Sheffield, Sheffield, United Kingdom)  
S. HINCHLIFF(1), C. INGLETON(1) - (1) University of Sheffield (United Kingdom)

Background Whilst traditional cultural scripts of ageing invoke decline and decrepitude, new 'ways' of ageing are beginning to dominate popular understandings of mid and later life. In particular, emergent technologies of ageing are now considered critical in shaping the ageing experience. However, empirical research is needed to further this debate. Methods In-depth interviews were conducted with 12 women aged 48-60 years who self-defined as post-menopausal on 2 occasions, 6-8 months apart. Findings For many participants, menopause was perceived as a time of transition into a 'different' phase of life. Whilst for most it invoked feelings of 'getting older', these were framed both negatively (in relation to concerns about mortality) and positively (as a time of increased opportunities). Evident in some participants' accounts was an uncertainty and anxiety about how an 'older woman' should behave. Concerns related to self-presentation (dress, make-up, weight), as well as behaviour (appropriateness of having sex, need for exercise and dieting). Participants reported negotiating these concerns with reference to the advice and behaviour of peers, female family members and the media. Physical appearance was identified as important to most participants, although views about the use of age-resisting technologies to modify appearance were mixed. Some saw these as inherently unnatural, but to others they were 'just a bit of help'. Discussion These findings indicate that women in mid life experience difficulties in negotiating competing cultural scripts of ageing and identify the menopause as a time when these concerns are brought into focus. The importance of the body in shaping women's understandings and experiences of ageing is also highlighted.

**PC6 630 RELATIONSHIP BETWEEN QUALITY OF LIFE AND CLINICAL AND PSYCHOLOGICAL PARAMETERS AMONG THE OLDEST OLD IN TOKYO.**

M. TAKAYAMA\* (Keio University School of Medicine, Tokyo, Japan)  
Y. ARAI(1), K. SHIMIZU(1), Y. ABE(1), R. FUKUDA(3), M. FUKUMOTO(4), T. IINUMA(4), J. ANDO(5), N. HIROSE(1) - (1) Keio University School of Medicine (Tokyo, Japan); (3) Faculty of Environment and Information Studies, Keio University (Tokyo, Japan); (4) Nihon University School of Dentistry (Tokyo, Japan); (5) Faculty of Letters, Keio University (Japan)

Introduction Quality of life (QOL) of the elderly is one of the most important issues concerning well-being in their late-life. Various factors, such as physical and cognitive function, personality, psychological status, and medical condition may contribute to QOL of the elderly. Despite the number of the oldest old has been increasing dramatically, little is known about QOL of the oldest old. This study aims to evaluate which clinical and psychological parameters correlate to QOL among the oldest old. Methods We recruited 179 individuals aged 85 years or older living in Tokyo metropolitan-area (men 74, women 105, mean age 88.4 years) and examined QOL (WHOQOL-OLD), basic and instrumental activities of daily living (BADL and IADL), cognitive function (mini-mental state examination; MMSE), personality (NEO-FFI; Neuroticism, Extraversion, Openness, Agreeableness and Conscientiousness), mental status (WHOS), and morale (PGC morale;

PGC). We simultaneously examined morbidity of age-related diseases, such as hypertension, diabetes mellitus, heart disease, stroke, fracture, and malignancy. Relationships between WHOQOL-OLD and other variables were investigated by Spearman correlation coefficients and multiple regression analysis. Results. BADL, IADL, Extraversion, Openness, Agreeableness, Conscientiousness, and PGC showed significant positive correlation with WHOQOL-OLD ( $p<0.05$ ). Besides, gender (men 0, women 1) Neuroticism and WHO5 showed significant negative correlation ( $p<0.05$ ). Neither MMSE nor morbidity of diseases was correlated with WHOQOL-OLD. A subsequent multiple regression model ( $R^2=0.624$ ,  $p<0.01$ ) extracted significant independent variables correlated with WHOQOL-OLD; IADL and Extraversion showed significant positive association, gender and WHO5 showed significant negative association ( $p<0.05$ ). Conclusion. These results suggest that the oldest old living independently and sociably, taking optimistic views and who are less prone to depression, have better QOL. Prevention of disability and depression might contribute to high QOL in late-life.

**PC6 631 PSYCHOLOGICAL ADJUSTMENT STRATEGIES OF FRAIL OLDER PERSONS TO MAINTAIN QUALITY OF LIFE**  
Y. LIN\* (Central Taiwan University of Science and Technology, Taichung, Taiwan)

Introduction: The population of aged people is increasing worldwide. At any age, quality of life (QOL), with its subjective and multidimensional elements, is a major concern for a person. Little is known about QOL for frail older persons. Methods and materials: This study developed a substantive grounded theory regarding the major concern regarding quality of life for a group of frail older persons in Taiwan. Guided by theoretical sampling until saturation, data were collected via interviews about theoretically sampled incidents and situations pertaining to the QOL of 28 frail older persons aged 65 years and over. Results: The core basic social psychological process identified was 'The process of frail older persons seeking to maintain QOL in Taichung, Taiwan'. The substantive theory about that process encapsulates four major categories. Presented here is 'Psychological Adjustment', one of these categories, with linkage to another category, 'Level of QOL', regarding the quantitative level of QOL consequent from use of psychological adjustment strategies. The category of 'Psychological Adjustment' is comprised of several subcategories, which are presented in detail. Frail older persons applied four types of psychological strategies to maintain their QOL, these being the sub-categories of: cognitive strategies, self-reliance strategies, evasive strategies and coping with emotion strategies. Each of these sub-categories has relevant properties. Conclusion: Understanding how frail older persons seek to maintain QOL and how this influences their level of QOL can guide facilitation of optimal QOL for them. Keywords: Frail elderly • Older people • Psychological adjustment • Qualitative study Quality of life

**PC6 632 SATISFACTION ANALYSIS ON INP MEETING HOUSE'S ELDERLY PEOPLE FROM VALPARAISO, CHILE.**  
D. SEQUEIRA DAZA\* (Sociedad Chilena de Geriatría y Gerontología, Santiago, Chile)

Introduction Students from educational programs usually show high levels of satisfaction. Main goal of this research is analyze vital satisfaction on elderly people that joins a Memory Stimulation Workshop. Methodology A descriptive research was made on 2008 over on elderly people that joined a Memory Stimulation Workshop on INP Meeting House's. Dependent variable was satisfaction and its factors, independent variable was age, married status and to live alone. Sample was made for 17 women and 3 men, from 57 to 84 years old. Statistical Methods used: Philadelphia Satisfaction Scale adapted for I. Montorio and an inquiry that take social and demography information. Both methods were running at the same time to all the people, after an explication about it. Software Excel 2007 was used to process the data. Results Elderly profile: 60% lives alone, 30% has between 70 and 74 years old, 55% are widows or widowers, 15% are married and 10% are singles. Global satisfaction punctuation fluctuates between 15 and 2, average of 9.0; without difference between alone people or accompanied ones. Groups between 60 to 64 years old and 75 to 79 years old show lower satisfaction. Discussion Punctuation of 9.0 could be consider lower over Satisfaction Scale in comparison of other researches, low satisfaction on group 60 to 64 years old could be caused by a recent retirement and physical body changes produce by growing old and way of life

**PC6 633 INTIMACY RELATIONSHIP , PSYCHIC MODALITIES OF INTEGRATION DURING BODY CARE**  
C. CALECA\* (Université de Caen , Caen , France)  
P. NADINE(1) - (1) UFR DE PSYCHOLOGIE LAB CERREV (Caen , France)

Both intellectual disabilities and physical impairment in people with A.D make necessary to help them, particularly during washing . Nurses frequently complain about the difficulty of this task which often generates refusals and can even pull risks of violence. We are leading a research to understand better the complex relational processes that are working during this particular moment. The first step of this research is to understand what happens during this care with old patients. We have first chosen to study how patient without AD but with physical impairment can tell their experience about this particular moment of nursing. We train the hypothesis that they set themselves in a particular psychic disposal which allows them to benefit from this care, in spite of the dependence from which they

suffer. We first decided to have non-directive interviews with old patients having period of short hospitalization, for which the care or toilet was an unusual event. We handled these data following two methods: - a manual qualitative method of analysis based on traditional methods of analysis of contents - an analysis automated by the speech using the software "Tropes" ®. This method allows us to find how the patients are telling their experience. It shows the ordinary or unusual expressions that appear in the interviews. We noticed that they consider themselves in a impersonal way and that they use the same process towards the nursing which carry out the care. We have now to pursue other interviews with old patients for whom nursing is necessary in a chronic way. We form the hypothesis that they have to use other way of managing this situation than patient in short caring situation.

**PC6 634 AGEING IN PLACE – RISK OR RESOURCE FOR LIFE SATISFACTION**  
F. OSWALD\* (University of Heidelberg, Heidelberg, Germany)  
D. JOPP(2), C. ROTT(3), H. WAHL(4) - (2) Fordham University, Department of Psychology (Bronx, NY, United States of America); (3) University of Heidelberg, Institute of Gerontology (Heidelberg, Germany); (4) University of Heidelberg, Institute of Psychology, Dept. of Psychological Ageing Research (Heidelberg, Germany)

Given age-related reduction in internal resources such as health, the importance of the immediate socio-physical environment for life satisfaction is likely to increase in later life. As old and very old individuals may differ in their person-environment relationships, the aim of this presentation is to investigate whether objective and perceived physical and social environmental conditions at home and in the neighbourhood represent risks or resources in relation to life satisfaction of young-old (65-79 years) versus old-old (80-94 years) individuals. A sample of 381 community dwelling individuals (65-94 years) was presented with measures on their immediate objective and perceived socio-physical environment as well as on life satisfaction as outcome. On the mean level young-old differ from old-old participants in physical environmental indoor indicators (e.g., living space, accessibility), but not in neighbourhood characteristics (e.g., neighbourhood quality, outdoor place attachment) or social aspects of housing (e.g., perceived social quality, social partners in area). Regression analyses revealed that living space, perceived neighbourhood quality and outdoor place attachment made independent contributions to life satisfaction, while social aspects of housing did not. Separate analysis for young-old and old-old participants revealed age-differential prediction patterns. Living space was positively related to life satisfaction in the young-old and negatively in the old-old while controlling for functional capacity (i.e., ADL, IADL). Thus, living space emerged as a resource for life satisfaction in young-old and as a risk factor in old-old age. Moreover, for the old-old, neighbourhood quality and outdoor place attachment were more important in explaining differences in life satisfaction compared to the young-old. In conclusion, findings suggest that physical environmental resources have an age-differential function for life satisfaction in later life.

**PC6 635 PSYCHOLOGICAL IMPACT OF PROSTATE CANCER ON ELDERLY COUPLES**  
P. PETIT\* (Université Victor segalen, Bordeaux, France)  
L. ANAÏS(1), C. FLORENCE(1), B. JEAN(1) - (1) Université Victor Segalen, Laboratoire de psychologie, EA 4139 (Bordeaux, France)

Recent research consistently indicates that age is a major risk factor for cancer (Tubiana, 2002). Such is the case of prostate cancer, which is typically detected between the ages of 60 and 90 (average age of detection: 73 years). Coping with the physical effects of cancer is not the only challenge for elderly patients; cancer may also affect patient's emotional and social lives as well. The current study presents preliminary results of an experience sampling study on the psychological impact of prostate cancer on the daily lives of elderly patients and their wives. We present data on 20 patients with prostate cancer and their spouse who were recruited from the Regional Center for the Fight Against Cancer in Bordeaux, France. Participants completed 3 daily assessments for 4 days (at the beginning of treatment, in the middle of treatment and at the end of treatment). The methodology has a number of advantages, including that it allows us to establish the relationship between variables (couple adjustment, anxiety and depression), between subjects, and within the couple. (Swendsen, 1997, Czikszentmihalyi, 1984). This study will help us to refine our knowledge and understanding of emotional adjustment and quality of life of patients with prostate cancer and their spouses. We will thus be able to realize the importance of taking into account the couple and not just patients in psychological interventions. Research must continue to move forward for patients, with patients and their families, in a desire to make it quicker and more incisive to support the patient suffering from cancer. More research should allow us to test the feasibility of this methodology on cancer patients and then to evaluate patients' daily lives experiences. This research is being funded by the National League for the Fight against Cancer, France

**PC6 636 NEUROPSYCHOLOGICAL ANALYSIS OF GAIT DISTURBANCES DURING DUAL TASK IN MCI PATIENTS**  
F. LEKEU\* (CHU, Liège, Belgium)  
S. GILLAIN(1), E. WARZÉE(1), V. WOJTASIK(1), D. MAQUET(2), J. CROISIER(2), L. SEIDEL(3), E. SALMON(4), J. PETERMANS(1) - (1) CHU - Geriatry (Belgium); (2)

Ulg - Kinesitherapy and Readaptation (Belgium); (3) Ulg - Computer Science and Biostatistic (Belgium); (4) CHU - Neurology (Belgium)

Introduction : dual task difficulties are frequently reported in MCI patients, but are not easily objectivated in classical neuropsychological tests. Methods and Materials : 14 elderly normal controls and 14 MCI patients participated in the preliminary study. Patients were first diagnosed MCI according to Petersen criteria (1999). All participants realized both neuropsychological and gait testing. Neuropsychological testing consisted of global cognitive assessment (MMSE and Mattis scales), verbal episodic memory test (Grober & Buschke test), visuoceptive test (Copy of Complex Rey Figure), alerte and divided attention tests and IADL assessment. Different gait parameters were recorded using a new sensitive instrument ("Locometrix"), during simple and dual task (counting down). Gait parameters which differentiated both groups in dual task were entered into correlational analysis with the neuropsychological performances in MCI patients. Results : the following gait parameters differentiated both groups in dual task : speed of walk, stride frequency and symmetry. Interestingly, correlational analyses showed that speed of walk was positively correlated to the MMSE score and that the alteration of symmetry due to dual task was correlated to the higher reaction time in the divided attention test. Conclusion : this study demonstrates that "walking and talking" situation is already impaired in MCI patients. By affecting specific gait parameters, it could reflect reduced attentional resources in MCI population. From a more theoretical point of view, this observation could be discussed in terms global cognitive functioning and of automatic versus effortful processes required to walk "normally".

**PC6 637 LEISURE ACTIVITIES OF DISABLED ELDERLY: PATTERNS, CHANGES, AND CORRELATION WITH QUALITY OF LIFE**  
J. BRODSKY\* (Myers-JDC-Brookdale Institute, Jerusalem, Israel)

Introduction: Studies indicate that leisure activities contribute to the psychological well-being, life-satisfaction and functioning of the elderly. However, they seldom focus specifically on the disabled elderly. Methods and materials: Analysis of data from face-to-face interviews with a sample of 160 elderly with disabilities living in the community. Results: 41% of disabled elderly engage solely in passive activities (e.g., TV, radio, reading); 25% in one active leisure activity and 34% in two or more. The more popular are physical exercise (24%), going to cafes (24%), and board games (18%). 40% reported their current activities to be greatly (rather than moderately or somewhat) meaningful to them and three-quarters wanted more activity. Most (83%) had reduced activity since retirement. A multivariate analysis of the correlation between health-related quality-of-life (SF-12) and the elders' characteristics and leisure activity patterns revealed that older age (80+), participation in at least one active leisure activity, and a great meaning of the activity, had a positive impact on the mental component summary (MCS-12) of quality of life. Interestingly, functional status, gender, frequency of contact with family, and the reduction of leisure activity had no effect. Analysis of the physical component summary (PCS-12), revealed that gender, and great meaning of the activity attributed positively to the health-related quality-of-life. No connection was found with active leisure activity in the present, reduced activity compared to the past, age, and functional status. Conclusion: The study found that significant active leisure activities contribute to quality-of-life among the disabled elderly. Unexpectedly, engaging in fewer activities than in the past has no significant impact on current quality of life, implying the great importance of encouraging disabled elderly to engage in significant leisure activities and creating suitable opportunities for them.

**PC6 638 A QUALITATIVE INVESTIGATION OF THE NEEDS OF COMMUNITY DWELLING OLDER ADULTS WITH SELF-REPORTED MEMORY PROBLEMS**  
K. PARSONS-SUHL\* (Memorial University, St. John's, Newfoundland, Canada)  
A. SURPRENANT(1), A. TRACEY(2), M. GODWIN(1) - (1) Memorial University (St. John's, Newfoundland, Canada); (2) Centre for Nursing Studies (St. John's, Newfoundland, Canada)

Introduction Given the nature and significance of human memory, an understanding of the needs of older adults experiencing memory loss and their families is vital. This is a qualitative investigation of the needs of community dwelling older adults with self-reported memory problems. The primary objectives of the study are: (1) to identify the priority health-related needs of community dwelling older adults with mild memory loss; (2) to identify the services and potential intervention strategies that could assist this group of individuals to meet these needs. Methods and materials The needs assessment consisted of a comprehensive literature review, qualitative interviews of twenty-two community dwelling individuals with early memory impairment (MMSE above 22) and their significant others, and focus groups. Data analysis followed the method of textual analysis described by Diekelmann, Allen, and Tanner (1989). Results Many themes emerged from the data describing the participants' experiences of memory loss which could be very useful for planning intervention strategies. The main health-related need expressed by the participants was the need for information. Most participants felt that they had many unanswered questions and did not know where to seek assistance. Most stated that they did not feel comfortable discussing the problem with their primary health care provider such as their family physician and those who did, felt that their health care provider did not truly understand the problem. They also felt that there were very few resources available within

the community to address this knowledge deficit. Participants also discussed what they felt might be important for developing appropriate intervention strategies to meet their needs. Conclusion A greater understanding of the needs of community dwelling older adults with mild memory problems has the potential for the development of intervention strategies that support an increased quality of life.

**PC6 639 PERCEIVED AGE DISCRIMINATION PREDICTS HEALTH AND ILLNESS THROUGHOUT LATER LIFE**  
B. MEISNER\* (York University, Toronto, Canada)  
J. BAKER(1) - (1) York University (Toronto, Canada)

Introduction: Many older adults experience age-based discrimination. Such events include discriminatory attitudes, prejudicial comments, and unfair treatment. Developing research has shown that perceived ageism can have significant effects on health and illness outcomes in later life. Consequently, it is imperative to substantiate the influence of ageism on health and disease outcomes over time. Using a longitudinal analysis and design, this study examines the influence that perceived age discrimination has on emotional well-being and disease status in later life over an 18 year period. Methods and Materials: Using data from the Aging in Manitoba (AIM) Longitudinal Study (1983-2001), ordinal and multiple linear regression models were developed. Respondents were drawn from a computerized registry containing all provincial residents covered under the universal health insurance program. Participants were randomly selected using an age- and sex-stratified area-probability sampling of both community and institutional dwelling individuals aged 65 and greater. Results: First, a negative linear association between perceived ageism and emotional reactivity was found over time. Subjects who believed older adults were treated with respect in 1983 were over seven times less likely to display negative affect in 2001 compared to those who perceived disrespect (estimate = -2.10, OR = 7.13, p < .01, n = 666). Second, after controlling for baseline level of disease, a negative relationship was discovered between perceived age discrimination and disease status such that as ageism increased, the average number of reported chronic conditions decreased over two decades (beta = -.21, p < .05, n = 919). Conclusion: Results confirmed that perceptions of age discrimination influenced psycho-emotional as well as physical measures of well-being in later life; however, perceiving unjust treatment has both deleterious and affirmative consequences on health over time. These effects are dependent on whether an older person is aware of discrimination or not.

**PC6 640 FACTORS RELATED TO LONGITUDINAL CHANGE IN OLDER ADULT'S SUBJECTIVE HEALTH PERCEPTIONS**  
K. SARGENT-COX\* (Australian National University, Canberra, Australia)  
K. ANSTEY(1), M. LUSCZ(2) - (1) Australian National University (Canberra, Australia); (2) Flinders University (Adelaide, Australia)

Introduction: An important domain affecting older adults' quality of life is the perception of health. A poor self-rated health (SRH) appraisal is increasingly recognized as an important risk factor for negative major health outcomes. The current study investigates the effects of a comparative reference point and change in health status on older adults' susceptibility to decline in self-rated health perceptions. Methods and Materials: A large representative sample (N=2034) of older adults (65+ years) from the Australian Longitudinal Study of Ageing was used to investigate the longitudinal (7 waves over 12 years) patterns of change in physical and functional health on change in two SRH measures with different reference points: global (overall health) and age-comparative (health compared to same aged peers). Results: Ordinal latent growth models revealed decline in physical and functional health negatively affected both global (OR=1.26, CI=1.22-1.30) and age-comparative (OR=1.20, CI=1.15-1.23) ratings over time. Males were 1.14 ( $p<.05$ ) times more susceptible to decline in age-comparative ratings than females. The significant age effect for the age-comparative slope showed that for each year over 78 years (mean age wave 1) the odds of decline in age-comparative ratings decreased by 1.19 ( $p<.05$ ). Model invariant testing showed health decline had a significantly greater negative impact on global SRH compared to age-comparative ratings (Scaled  $\chi^2$  (2) = 63.12,  $p<.001$ ). Conclusion: Results indicate that the SRH reference point strongly influences how older adults interpret health decline. Furthermore, this influence on health appraisals depends on gender and age. Findings have important implications regarding the use of SRH items with older adult populations and the psychological effect of comparative reference points on subjective well-being and quality of life.

**PC6 641 PSYCHOLOGICAL DISTRESS IN ELDERLY HOSPITALIZED PATIENTS WITH CHRONIC RESPIRATORY DISEASE**  
M. MAGDALENA\* (Joan March Hospital, Mallorca, Spain)  
M. CARMEN(2), A. CATALINA(2), M. BELEN(2), R. FELIU(1) - (1) Joan March Hospital (Spain); (2) University of Balearic Islands (Spain)

Introduction: the studies of stress during the hospitalization has been mainly concentrated in patients entered in hospitals for acute problems but the same phenomenon and its relationship with Health Related Quality of Life (HRQOL) hasn't been described in chronic and elderly patients. Objective: to study the presence of stress and coping strategies in patients with Chronic Obstructive Pulmonary Disease (COPD) in the public

health hospital and its relation with previous patients HRQOL. Materials and Methods: n=51 patient with diagnostic of COPD has been evaluated in Joan March Hospital by means of: the Hospital Stress Rating Scale (HSRS), the Dyspnoea Scale (MRC), the Nottingham Health Profile (HRQOL) and a list of coping strategies. Results: the levels of stress in hospitalized elderly and chronic patients are minor than the obtained in samples evaluated in the acute hospitals and this is independent of the level of COPD severity stage ( $p>0.05$ ). The patients with slight dyspnoea presented more stress than the most severe ( $p<0.05$ ). Patients with a bad HRQOL before the entrance showed a greater level of stress during hospitalization ( $p<0.05$ ). The evitative coping strategies are most prevalent in these hospitalized patients. Conclusions: the stress generated during hospitalization in COPD/elderly patients will depend on psycho-social factors like HRQOL at the same time as structural factors related with the hospital quality.

#### **PC6 642 MAINTENANCE OF VERBAL MEMORY PERFORMANCE IN INDIVIDUALS WITH A HIGH INTELLECTUAL ACTIVITY**

M. CARMEN\* (University of Balearic Islands, Palma de Mallorca, Spain)  
M. MAGDALENA(1) - (1) Joan March Hospital (Spain)

Introduction: memory during normal ageing has been broadly studied, as it is the most frequent complaint in elderly populations. Although it seems unavoidable that decay is experienced in some aspects, it can be slowed down or even inverted through cognitive interventions. Cognitive exercise can extend well being and life quality. Methods: the objective of this study was to compare, based on ex post facto transversal evolutionary study, verbal memory performance in individuals with a high intellectual activity in four age groups. Results: there were no performance differences between group 3 (51-64 year olds) and group 4 (65-83 year olds), thus we can state that advanced-age elderly people maintain their performance across time. Conclusion: this effect can be explained by the features of samples that we used: individuals with a high educational level and "mentally active" (as they were enrolled in the university programme for the elderly). Adding up, the results support the hypothesis that cognitive exercise helps to maintain cognitive capabilities.

#### **PC6 643 PERSONAL MEANING AND DEPRESSION: AN RCT ON THE EFFECTS OF LIFE REVIEW THERAPY**

G. WESTERHOF\* (University Twente, Enschede, The Netherlands)  
E. BOHLMEIJER(1), A. POT(2) - (1) University Twente (Enschede, The Netherlands); (2) Trimbos Instituut (Utrecht, The Netherlands)

Introduction: Personal meaning is an important resource in maintaining mental health in contemporary society. Since older adults might find it difficult to achieve meaning in life, an intervention based on life review therapy was developed. The intervention intends to increase personal meaning by the integration of positive and negative recollections of one's life. This study assesses the impact of this intervention on personal meaning as well as the effects of personal meaning on depressive symptoms as outcome of the program. Methods and materials: A multi-center RCT was conducted with one group obtaining the intervention (N=73) and the other group (N=67) watching a video about the art of growing older and with access to mental health care as usual (mean age 64 years). Measures included the CES-D for depression and a sentence completion questionnaire for personal meaning. Measurements took place before and after the intervention as well as three months later at follow-up. Results: Those who followed the program increased significantly more in meaning in life than the control group and this increase in personal meaning remained stable at follow-up. Baseline personal meaning and improvements in meaning during the intervention predicted a significant decline in depressive symptoms later in time. Conclusion: Personal meaning is a positive asset in the lives of older people that can be supported by means of life review therapy. The focus of the intervention on the promotion of meaning in life contributes to the mental health of the older participants.

#### **PC6 644 PSYCHOSOCIAL FACTORS CONTRIBUTE TO REDUCING FEAR OF FALLING IN A COGNITIVE BEHAVIOURAL INTERVENTION**

G. ZIJLSTRA\* (Maastricht University, Maastricht, The Netherlands)  
J. VAN HAASTREGT(1), J. VAN EIJK(1), G. KEMPEN(1) - (1) Maastricht University (Maastricht, The Netherlands)

Introduction: Fear of falling is a disabling concern in older persons. Several cognitive behavioural interventions for fear of falling showed to be effective in community-living older people, yet the effect sizes were limited. Knowledge about the mechanisms that contribute to the intervention effects may help enhance intervention effects. In the current study we explored the mediating effects of psychosocial factors on trajectories of fear of falling in a cognitive behavioural intervention aimed at reducing fall-related fear and associated activity restriction. Methods and materials: Our study sample comprised 540 community-living older people who participated in an RCT evaluating a cognitive behavioural group intervention. This intervention aimed to instil realistic and adaptive views on falls risk and fear of falling, and to achieve behavioural change, for instance regarding physical activity. It comprised 8 weekly sessions of 2 hours and one booster session at 6 months after the intervention. Self-reported data on control beliefs, self-efficacy beliefs, outcome expectations, and social interactions - as potential mediating factors both separately and combined - and fear of falling - as outcome - were assessed

before, directly after, and at 6- and 12-months after the intervention. Results: Mixed-effects linear regression analyses showed small to moderate intervention effects on the psychosocial factors at nearly all follow-up assessments (effect sizes range from .04 to .41). Modest mediating effects of the separate psychosocial factors on fear of falling were shown. Taking all psychosocial factors into account, a substantial amount of the association between the intervention and fear of falling was explained, i.e. 44% to 76% for the various follow-up assessments. Conclusion: The intervention showed to improve several psychosocial factors that mediated the association between the cognitive behavioural group intervention and fear of falling in community-living older people.

#### **PC6 645 SOCIOECONOMIC POSITION AND SUBJECTIVE WELL-BEING AMONG ELDERLY PEOPLE IN SWEDEN**

I. KÅREHOLT\* (NVS, Stockholm, Sweden)  
M. GLANBORG(1) - (1) Aging Research Center (Stockholm, Sweden)

Introduction: The relation between socioeconomic position (SEP) and health have been studied extensively, the relation between SEP and subjective well-being less, especially among elderly. We study the relation between four measures of SEP and four measure of well-being. Methods and materials: The results are based on a nationally representative random sample of Swedes aged 77-99 years. In 1992 537 persons were interviewed. The dropout rate was 4.6 %. Measures of well-being: Sense of coherence is based on three questions, one from each of the three domains comprehensibility, manageability and meaningfulness, life satisfaction on three questions regarding fulfilled life expectations, social circumstances on three questions about positive relations to important persons and housing autonomy, and quality of life on questions regarding family relations, leisure and subjective evaluations of life. Measures of socioeconomic position (SEP) are income, cash margin (the ability to raise 1,100 euro in a week), social class based on main lifetime occupation, and highest finished education. Results: The results show significant correlations between SEP and well-being measured as sense of coherence, social circumstances, and quality of life, but not to life satisfaction. Not all separate correlations were significant. Many more of the correlations were significant among men than among women. For men significant effects were found of all four measures of SEP while among women only significant correlations were found for cash margin and well-being. Among men income and cash margin were the most important measures of SEP, followed by social class and with education as the least important. Conclusion: Results show the importance of SEP on subjective well-being among elderly. Results also show that the more economically oriented measures of SEP are more strongly correlated to well-being and that SEP are more important for men than for women.

#### **PC6 646 DOES LEARNER AUTONOMY DIFFER BY GENDER ACROSS AGE GROUPS?**

E. PARK\* (Johns Hopkins University School of Medicine, Baltimore, United States)  
G. CONFESSORE(1) - (1) The George Washington University (Rockville, United States of America)

INTRODUCTION: Conscious and continuous learning across the lifespan enhances the quality of human life. Learner autonomy is a key ability for individuals to engage in lifelong learning including learning self-care strategies to manage chronic illnesses. What is the pattern of the perceived learner autonomy of gender across age groups? METHOD: Using an international database (n=28,224) responded from 10 countries to the Learner Autonomy Profile (LAP) 3.0v validated for the four constructs of Desire, Resourcefulness, Initiate, and Persistence with Cronbach's Alphas of .94 to .98, gender and age-group effects were analyzed in a 2x6 unbalanced factorial design. Tamhane post-hoc analyses were selected for unequal variances. RESULTS: Central characteristics of the sample were 62% women, 61% single, average age 31 years old (range 18-89), and 51% bachelor's equivalent education. On the LAP total and all four constructs, main effects for gender [ $F<47.91$ ,  $p<.031$ , Partial Eta Squared (PES)  $<.002$ ], main effect for age groups ( $F<106.15$ ,  $p<.001$ , PES  $<.018$ ), and interaction effects ( $F<100.58$ ,  $p<.001$ , PES  $<.018$ ) were found. Post-hoc comparisons of LAP total highlight the over 65 years-old reported lower scores than two younger age groups (45-54; 55-64). While men hold higher total than women within the 18-24 age group ( $p=.000$ ), men had lower scores than women within three older groups ( $p<.001$ ). Older women group reported higher scores than younger groups, while lower for the men group over 64 than the 35-64 age groups. CONCLUSION: Although gender and age may account for small variances in learner autonomy scores, the cross-sectional data show different levels of learner autonomy by gender across age groups. Older women may hold positive identities as lifelong learners compared to older men.

#### **PC6 647 SUBJECTIVE WELL-BEING IN OLDER ADULTHOOD: DO SPOUSAL BELIEFS MATTER?**

T. WINDSOR\* (Australian National University, Canberra, Australia)  
L. RYAN(1), J. SMITH(1) - (1) University of Michigan (Ann Arbor, United States of America)

Introduction: Physical health contributes positively to subjective well-being, particularly in later life when functional capacity becomes a salient component of personal identity. Psychosocial resources believed to facilitate adaptation in response to the detrimental

effects of declines in health on well-being include control beliefs and relationship closeness. This study extends previous research concerned with psychosocial predictors of well-being by examining dyadic interdependencies in the associations among self-rated health, control (mastery and perceived constraints), relationship closeness and subjective well-being (life satisfaction, positive and negative affect) in a large sample of older married couples. Methods and materials: Participants consisted of 2235 spousal dyads (4470 individuals) who took part in the Health and Retirement Study (HRS) in 2006. Actor-partner interdependence (APIM) models were used to explore associations of individual and spouse characteristics with well-being indices. Results: A significant proportion of variance in health (25%), mastery (17%), perceived constraints (28%), relationship closeness (47%) and well-being measures (28 – 38%) occurred between dyads. Individuals' health, control and closeness were positively associated with life satisfaction and positive affect, and negatively associated with negative affect, controlling for age, gender, race and education. Spouses' health and control beliefs were also associated with greater well-being. Significant interactions indicated that individuals' control beliefs buffered against the effects of poor health on life satisfaction and negative affect. Conclusions: The findings indicate substantial concordance in the psychosocial characteristics of older married adults, and indicate that an individual's well-being could in part be dependent on both their spouse's health, and their spouse's perceptions of external constraints on personal agency. The absence of buffering effects of spouse characteristics on the association between health and well-being suggests a particular importance of individual mastery beliefs for positive adaptation to aging-related declines in health.

**PC6 648 FACTORS HELPING TO ENHANCE COMBAT VETERANS POST-WAR ADAPTATION AND WELL-BEING: A QUALITATIVE SYSTEMATIC REVIEW**  
 H. GOUGH\* (University of Alberta, Edmonton, Canada)  
 D. HOLLIS(1) - (1) University of Alberta (Edmonton, Alberta, Canada)

Introduction: As veterans' age, worldwide research confirms the unique long-term physical and mental consequences of combat and reveals "silent effects" as loneliness, confusion, concentration, memory, and daily functioning difficulties. Symptoms can be confused with dementia or lead to late-life Post Traumatic Stress Disorder. Quantitative studies indicate the potential of social supports in alleviating some effects of war memories for aging veterans. Some researchers advocate qualitative methods arguing for in-depth insights to supplement quantitative. This qualitative systematic review and meta-synthesis reports the impact of social supports on reconciling traumatic war memories from the emic perspective of veterans. Methods/materials: Included studies were peer-reviewed, published in English 1990–2009, had a qualitative component, and described nonmedical supports for veterans over 45 years of age experiencing traumatic war memories. Studies focusing on dementia and acutely ill were excluded. Expert qualitative search filters with veteran\*, military, coping, social support\* terms were used in OvidMedline, CINAHL, PsychINFO, AMED, Ageline. The McMaster Critical Review Tool was used to evaluate methodological quality. Study findings were categorised as themes and subthemes. Results: 432 studies were found. Seven met criteria. One study used grounded theory, another attachment theory and five thematic analysis. The studies revealed four supports: comradeship; family; veteran associations; community appreciation. Credibility/confirmability was compromised as studies lacked triangulation methods and strategies to decrease bias. Conclusion: There is an urgent need for focused, high quality qualitative research on non-medical, particularly social, supports for veterans. This review is an important initial step in showing that healthy aging of veterans goes beyond healthcare. Community-Based Rehabilitation, involving the whole community, is worthy of consideration. Healthcare professionals can help improve/maintain veterans' health, particularly those living in rural or nursing care settings, by partnering with communities in providing therapeutic engagement in meaningful social supports.

**PC6 649 PERCEPTION OF ELDER MALTREATMENT THROUGH THE EYES OF OLDER MALAYSIANS**  
 T. HAMID\* (Institute of Gerontology, Universiti Putra Malaysia, Selangor, Malaysia)  
 S. ABDULLAH(1), N. YAHYA(1), M. MANSUR(2), A. ABU SAMAH(2),  
 Z. AHMAD(3) - (1) Institute of Gerontology, Universiti Putra Malaysia (Selangor, Malaysia); (2) Faculty of Human Ecology, Universiti Putra Malaysia (Selangor, Malaysia); (3) Faculty of Medicine and Health Sciences, Universiti Putra Malaysia (43400, Malaysia)

Introduction: Elder maltreatment has never been a problem to Malaysia where the culture is courteous and respectful of elders. However, it is expected to increase as the country is enduring the ageing process. The purpose of this paper is to examine the perceptions of elder maltreatment among older Malaysians. Methods: This paper utilizes a sub-sample of 480 older persons from a cross-sectional study entitled "Perception, Awareness and Risk Factors of Elder Abuse." The perception of elder maltreatment was measured by 45-statement (Cronbach Alpha = 0.92) with response categories of (1) Yes, (2) No and (3) Not sure. The statements were developed by the research team, based on literature of abuse and neglect. Results: The respondents' age ranged from 60 to 95 years (Mean = 68.99, SD = 7.602). It was found that 104 of the respondents have a full score on the statements of maltreatment. Chi-square test showed that sex ( $\chi^2 = 4.097$ ,  $p = 0.043$ ) and education level ( $\chi^2 = 5.299$ ,  $p = 0.021$ ) are significantly difference with perception on maltreatment. On explaining the respondents' perception by various type of maltreatment, statement on

sexual abuse received the highest agreement (97.1%) followed by emotional abuse (82.5%), physical abuse (79.2%) and financial abuse (66.3%). It was acknowledged that statement on neglect received a low score, with only 30% of full score was noted for self-neglect and none of the respondent holds a full score for neglect. Conclusion: Definition on elder maltreatment will differ by socio-demographic features and cultural values. The respondents associated maltreatment more towards an abusive behaviour. With non-existence of violence, neglect remains acceptable among the older persons. This study highlight the level of tolerance of neglect and this has serious implications for service development and utilizations.

**PC6 650 AGE DIFFERENCES IN POSITIVE MENTAL HEALTH AND ITS RELATION WITH MENTAL AND PHYSICAL ILLNESS IN THE DUTCH POPULATION**

S. LAMERS\* (University of Twente, Enschede, The Netherlands)  
 G. WESTERHOF(1), E. BOHLMEIJER(1) - (1) University Twente (Enschede, The Netherlands)

Introduction: Recently mental health is defined as not merely the absence of psychopathology but as a syndrome consisting of positive feelings (hedonic well-being) together with positive functioning in life (psychological and social well-being). Nevertheless, few studies have addressed positive mental health in older as compared to younger adults. The present study investigates age differences in positive mental health and its relation with mental and physical illness. Methods and materials: In this study use is made of data of the LISS panel of CentERdata, an internet panel for Longitudinal Internet Studies in the Social Sciences. A representative sample of 1.662 Dutch respondents between the ages of 18 and 87 participated in the present study. Positive mental health was measured with the Mental Health Continuum – Short Form (MHC-SF). Psychopathology was measured with the Brief Symptom Inventory (BSI), and questions were asked about chronic diseases, functional limitations, and subjective health. Results: Older individuals experience more physical health problems and less psychopathological symptoms than younger adults. Mental and physical problems are related to lower levels of positive mental health. No moderating effect of age was found, showing these relations are similar in all age groups. Yet, there are no age differences in positive mental health. When controlling for physical and mental illness, the oldest age groups (65-74 and 75+ years) even show a lower degree of positive mental health than younger age groups. Conclusion: Positive mental health shows different relations to age than physical and mental illness. Although related to mental and physical illness, positive mental health is therefore a distinct indicator of health. When controlling for physical and mental illness, older persons have the lowest degree of positive mental health. Older adults would thus profit from interventions directed at the promotion of their mental health.

**PC6 651 NEW INTIMATE RELATIONSHIPS AMONG OLDER PEOPLE LIVING IN INSTITUTIONS: EXPLORATORY STUDY**

C. PIRES\* (Unifai\_ICBAS -Universidade Porto, Porto, Portugal)  
 S. RIBAS, P. TERROSO, O. RIBEIRO(1) - (1) Universidade Aveiro (Aveiro, Portugal)

New intimate relationships among older people living in institutions are frequently associated with a wide range of difficulties from the understanding they have of their own sexuality, to the way they express themselves in an institutional environment and to various embarrassments and repressions that exist in our society. This study focuses on the difficulties and incentives felt by a group of elderly couples that had established new intimate relationships in an institutional setting. Based on a qualitative methodology, we formed a focus group and interviewed three couples aged 65 years or over, functionally independent and that had initiated an intimate relationship after they had entered a nursing home. Through analytic methods based upon open coding and grounded theory techniques, our findings suggest the presence of difficulties and encouragements for establishing a new intimate relationship. These are related both to family and professionals working in the institution. Findings also reveal an overall acceptance of the relationship, but often embedded in a perceived social pressure from the institution staff in order to make the relationship "official" (through marriage), even though that was not the couple's wish. Main motivations for beginning a new relationship rely on loneliness, feelings of compassion and overall affective needs.

**PC6 652 HOW FEELING YOUNGER CAN PUT OLD PEOPLE IN DANGER? A STUDY ON THE OVERESTIMATING OF POSTURAL CAPABILITIES IN THE ELDERLY**

M. NOEL\* (Centre Hospitalier de ROUBAIX, ROUBAIX, France)  
 D. DOMINO(2), M. LUYAT(2) - (2) Laboratoire de neurosciences fonctionnelles (UMR 8160) LOOS, France)

Introduction Falls in the elderly are very frequent, sometimes leading to medical complications and even causing death in extreme severe cases. During the elderly, the postural capabilities slowly but inexorably decrease and there would be a discrepancy between what the old peoples believe to be still able to do and what they really can do. In this study, we tested the hypothesis that old people overestimate their postural capabilities. This cognitive bias could put the old person in danger and could explain certain falls.

Method Twenty young adults (17 at 33 years) and twenty healthy older adults (64 at 84 years; MMSE>25) had to judge, without doing the real action, if they were able to stand upright without falling on an inclined board. The real maximal inclination permitted an upright stance was also measured after the perceptual judgments. This task was performed both in vision and without vision. The response times and the level of confidence were also recorded. Results As expected, the results showed that old people overestimated three times more than young controls their postural capabilities. No difference between vision and no-vision conditions were observed. They had lower postural capabilities but they behave not differently as young people on the perceptual judgments as if they felt, in fact, younger "in their mind". The results concerning response times and levels of confidence confirmed these data. Conclusion These results confirm our hypothesis: old people overestimate their postural capabilities both with visual and non-visual judgments. Old people behave as if they were "younger in their mind" and this could put them in danger and causing falls. This cognitive overestimation could be due to a difficulty to actualize the internal model of action with the new motor capabilities imposed by age.

#### **PC6 653 FACTORS PREDICTING LONELINESS AMONG OLDER PEOPLE IN DEPRIVED NEIGHBOURHOODS**

J. SIM\* (Keele University, Staffordshire, United Kingdom)

T. SCHARF(1), C. PHILLIPSON(1), A. SMITH(1) - (1) Keele University (Staffordshire, United Kingdom)

Introduction Loneliness represents a difference between the actual and the desired quantity and quality of social relationships, and is associated with reduced health and well-being. This study investigated predictors of loneliness among older people living in deprived neighbourhoods in three UK cities: Liverpool, London and Manchester. Methods and materials Data were collected from 501 respondents by a questionnaire. Loneliness was measured using the 11-item De Jong Gierveld scale; this was used as both a continuous scale and as a dichotomy ('not lonely' versus 'moderately/ severely/ very severely lonely'). Potential predictors were identified a priori in three categories: sociodemographic factors, objective life conditions, subjective life conditions. Analysis was through multivariable linear and logistic models. Results Analysis was based on 447 respondents (median [interquartile range] age 70 [65, 77] years) for whom there was complete data. Of these, 198 (44%) were 'not lonely', 187 (42%) 'moderately lonely', 40 (9%) 'severely lonely', and 22 (5%) 'very severely lonely'. In both the linear and the logistic models, marital status, morale, satisfaction with life, feeling isolated from society, and perceived poverty were significant predictors of loneliness; feeling isolated from society was the strongest predictor in both models. Additional significant predictors were satisfaction with accommodation and quality of neighborhood in the linear model, and fear of crime in the logistic model. Conclusion The prevalence of loneliness among older people in deprived areas is relatively high. With the exception of marital status, subjective life conditions dominate among predictors of loneliness. Aspects of quality of life (morale and life satisfaction) and social isolation (both objective and subjective) were strong predictors, as might be anticipated from their conceptual closeness to the construct of loneliness. These predictors reflect those in other studies of older people. There is a need for comparative studies between deprived and non-deprived populations.

#### **PC6 654 IS IT TIME FOR AN IN-DEPTH REVISION OF THE CONCEPT OF MILD COGNITIVE IMPAIRMENT AS A PRODROME OF ALZHEIMER DISEASE?**

D. M<sup>a</sup> CARMEN\* (UNED, Madrid, Spain)

G. SARA(2), P. HERMINIA(3) - (2) UNED (Madrid, Spain); (3) UNED (28040, Spain)

Within the framework of early detection of Mild Cognitive Impairment (MCI) as a possible prodrome of Alzheimer disease, one of the main objectives is to characterize its subprofile and study its markers and outcome. Our longitudinal study analyzes the neuropsychological data of individuals whose diagnostic category changed during the early years (2) of follow-up. Methods and Material We evaluated 140 participants using a set of 12 psychometric and neuropsychological tests. Participants were classified using psychometric criteria as healthy, amnestic MCI (aMCI), nonamnestic MCI (naMCI), and mixed MCI (mMCI). The same tests were applied after 1 year and the patients were reclassified into the above-mentioned subprofiles according to the results obtained. Results Forty-four healthy participants (73.33%) and 48 MCI (72.72%) did not change category. However, 16 (27.11%) healthy participants became MCI and 19 (27.27%) MCI participants became healthy. If we take each of the MCI subprofiles, we observe that 4 (44.44%) of the aMCI, 2 (14.28%) of the naMCI, and 8 (80.00%) of the mMCI changed to another MCI profile. The chi-square test revealed a statistically significant association between both evaluations ( $\chi^2 = 57.443$ ,  $p < 0.000$ ). The performance of the executive function and praxis tests led to the change in diagnostic category of the healthy participants, who became MCI. In the MCI patients who became healthy, the tests affected by such a change were episodic memory and recall. Both these tests and the tests on immediate recall and verbal fluency led to the changes in MCI subprofile. Conclusions The relevant statistical tests showed that the results for praxis, executive function, immediate recall, and verbal fluency led to changes in diagnostic category. As demonstrated by Dubois et al (2007), these tests could represent a core diagnostic criterion for prodromic Alzheimer disease.

#### **PC6 655 UNDERSTANDING THE EXPERIENCE OF BEING AGED: WHAT WE CAN LEARN FROM COMMUNITY-DWELLING ELDERS**

N. KERSE\* (Auckland University of Technology, Auckland, New Zealand)

V. WRIGHT-ST CLAIR(1), S. LIZ(1) - (1) Auckland University of Technology (Auckland, New Zealand)

Introduction An ontological exploration of the 'being' of being aged has the potential to throw a new light on that which is already known about aging and the aged. The aim of this hermeneutic phenomenological study was to understand the meaning of 'being aged' through the everyday experiences of New Zealand elders. Methods and Materials Individual research interviews were conducted with fifteen participants; four Maori elders aged 71 to 93 and eleven non-Maori elders aged 80 to 97 years. Seven men participated and eight women. All were living in private residences on Auckland's North Shore and purposively recruited by way of the general electoral roll. Each persons account of everyday events as well as their reflections on aging were gathered. The interpretive analysis of the narrative data aimed to understand the meaning of being aged in the everyday. Results Four overarching notions were illuminated; elders ordinary ways of 'being in the everyday,' the experiences of 'being with others in advanced age, how being aged was revealed through 'experiencing the unaccustomed' in the context of a day, and how 'aging just is' in an everyday way. Conclusion The meaning of being aged is in its ordinariness. In this way, being in the ordinary everyday in advanced age both conceals and reveals the phenomenon of being aged. Being aged is something that most of us will come to experience. This study offers understandings which may guide how we move towards being aged, as well as inform the provision of health and social services for community-dwelling elders. Within the context of an aging population, both nationally and globally, the meaning of being aged is an important phenomenon to apprehend.

#### **PC6 656 NEIGHBORHOOD CHARACTERISTICS AND MENTAL HEALTH AMONG THE ELDERLY IN AN URBAN AREA OF JAPAN**

T. SAITO\* (University of Tokyo, Tokyo, Japan)

H. SUGISAWA(2), K. HARADA(3), T. YAMAGUCHI(1), I. KAI(1) - (1) University of Tokyo (Tokyo, Japan); (2) Obirin University (Tokyo, Japan); (3) Jissen Women's University (Tokyo, Japan)

Introduction: The number of elderly citizens in Japan has been rapidly increasing, particularly in urban areas. Although recent reports have revealed that neighborhood characteristics such as poverty affect the health of the elderly, few studies have examined the impact of these factors on elderly Asians. We examined the relationship between neighborhood factors and mental health in elderly people aged &gt;= 75 years living in an inner city in Japan. Methods: We conducted a face-to-face structured interview survey in July 2001 on 1,000 randomly selected people aged &gt;= 75 years living in a single ward of Tokyo, Japan. Abbreviated versions of the Life Satisfaction Index A (LSIA) and Geriatric Depression Scale (GDS) were used to assess mental health. Neighborhood variables of socioeconomic status, residential mobility, proportion of elderly people in the neighborhood, and crime rate were computed for each of 24 districts within the ward based on census data, police statistics, and data from another population survey. Multilevel analyses examined the correlation between neighborhood variables and the two dependent variables, controlling for district as a random effect and for age, sex, and other individual level variables as fixed effects. Results: The mean age of the 570 respondents was 79.6 years, and 63.0% were female. Multilevel analysis showed that no neighborhood variable was significantly associated with either the LSIA or GDS. However, neighborhood socioeconomic status was found to be significantly associated with both dependent variables among elderly people whose physical mobility was limited to their neighborhood ( $p=.034$  for LSIA,  $.017$  for GDS). Conclusion: In the present study, neighborhood characteristics did not appear to significantly affect the overall mental health of elderly people, although these factors may have some influence on the frail elderly. The relatively small sample size limits the generalizability of these findings.

#### **PC6 657 UNDERSTANDING PSYCHOLOGICAL DISTRESS AMONG ELDERLY MIGRANTS AND USE OF HEALTH CARE SERVICES: DOES ETHNICITY MATTER?**

K. O'LOUGHLIN\* (University of Sydney, Sydney, NSW, Australia)

Z. HOSSAIN(1), M. MATHEWS(1), M. ALIZADEH-KHOEI(2) - (1) University of Sydney (Sydney, NSW, Australia); (2) Ministry of Health and Medical Education (Sydney, NSW, Islamic Republic of Iran)

Introduction This paper assesses factors that influence psychological distress and their impact on the utilisation of health and community aged care services by elderly migrants living in the Sydney Metropolitan area (SMA). Methods and Materials Data on Arabic, Chinese, Greek, and Italian elders were drawn from the NSW Older People's Health Survey 1999 and data on Iranian elders were drawn from a targeted 2007 survey. All participants were aged 65 years or older, who had lived in the SMA for at least six months prior to the survey. Results Results showed that a majority of the elderly migrants (70%) were between 65-74 years age and most (64%) were married at the time of survey. Most of the Italian and Greek elders had arrived in Australia in the 1940s and 50s, and most of them (87%) owned their home outright. Most of the Chinese, Arab, and Iranian elders arrived in the 1970s and 80s and about 40% owned their home. Arab and Iranian elders

reported more limitations in physical function (using the SF-36 and ADL), lower wellbeing scores, and more psychological distress (using the K-6), than Chinese, Greek or Italian elders. However, the Chinese elders reported the fewest functional limitations and least psychological distress. There were no significant differences in use of Home and Community Care services between these groups, however, Arab and Iranian elderly reported greater use of health services than the other ethnic groups. A multivariate regression analysis that controlled for ethnicity showed that psychological distress was best predicted by well-being, ADL, physical functioning, and home ownership ( $r^2=0.623$ ,  $p<0.001$ ). Conclusion This suggests that home ownership, physical functioning, ADL, and well-being are better predictors of psychological distress than use of health services, age or duration of migration to Australia.

#### **PC6 658 IMPROVING MOTORWAY REST AREA BASED ON VISUAL SEARCH CHARACTERISTICS OF ELDERLY PERSONS**

T. AKAGI\* (Kogakuin Univ, Tokyo, Japan)

S. AJISAKA(1), Y. KAWAGUCHI(2), M. SATO(3) - (1) Kogakuin Univ (Tokyo, Japan); (2) Expressway Technology Center (Tokyo, Japan); (3) Expressway Technology Center (Tokyo, Japan)

Purpose The purpose of this study is to seek concrete solutions for improving motorway rest areas "MRA" through wayfinding legibility from the viewpoint of universal design concept with an emphasis on visual search characteristics of elderly persons. Method The study focused on four major routes in a large-scale MRA. Subjects were eight elderly persons in good shape and their average age was 73.8 years-old. The experiment was carried out by video-recording their eye-fixation behaviors while wayfinding to the target while walking along the four routes previously selected, which represent typical behaviors of the elderly persons in MRA; a) From their vehicles to rest room, b) from rest room to ticket vendors for restaurants, c) from vendors to restaurants/shopping area, and d) from restaurants/shopping area back to their vehicles. Results and Conclusions 1) The experiment was shown that elderly persons found it the most difficult to find a way back to their vehicles among four routes. When returning to their vehicles, rather than identifying their vehicle's location by small public signboards, they relied on a particular visual search to locate their vehicles in relation to other surrounding environmental elements including parking lot arrangement, light poles and steel towers. It is concluded here that MRA legibility can be improved by planning signboard system that closely relate to obvious environmental elements. 2) Elderly persons tend to look down below for visual search, namely road surfaces and building floors. To make the use of the tendency, it makes sense to place signs to low-height area. 3) Elderly persons found it difficult to make a quick identification of proper signs that help them find the direction. The signs for wayfinding should therefore differ from other information by using specific size, dimensions, shapes and colors.

#### **PC6 659 LEGIBILITY CHALLENGES WITH WAYFINDING BEHAVIOR OF ELDERLY PERSONS IN MOTORWAY REST AREA**

S. AJISAKA\* (Kogakuin Univ, Tokyo, Japan)

T. AKAGI(1), Y. KAWAGUCHI(2), M. SATO(3) - (1) Kogakuin Univ (Tokyo, Japan); (2) Expressway Technology Center (Tokyo, Japan); (3) Expressway Technology Center (Tokyo, Japan)

Purpose The purpose of this study is to clarify the environment-related legibility challenges in the motorway rest area "MRA" by examining how the elderly persons use MRA based on the analysis of their strategy while wayfinding behaviors. Method Eight elderly persons were subjected to the wayfinding experiments conducted in a large-scale MRA. After completing the experiments, a hearing session was held to identify how to locate their target destinations, upon which the important strategy factors were extracted. Furthermore, the subjects were categorized in accordance with a cluster analysis based on Pearson's product correlation "furthest neighbor method" while using the strategy factors. Results and Conclusions 1) Three major strategy factors of elderly persons extracted; a) Prior knowledge of target destination, b) Target destination location, and c) Judgment basis for target destination location. 2) Under an environment where the information is easily recognizable thanks to clearly identified target and/or signs, the most significant factor was "Judgment basis for target location". Elderly persons were categorized based on whether or not they had used the signs when locating their destination. All elderly persons, however, found it difficult to reach the destination especially when the actual spatial image of MRA differed from their visionary image or there were many similar signs. 3) Under an environment where the information is not recognizable with ease, due to temporary installation of the signs and/or unclear identification of the target destination, "Prior knowledge of target destination" was of the most importance. Elderly persons were categorized according to whether or not they had knowledge or memory as of where the destination is from their previous experiences. When the environment surrounding the destination was changeable "due to movement of the cars parked", all elderly persons encountered some difficulties to reach the destination.

#### **PC6 660 AGE-RELATED CHANGES OF ATTITUDES TOWARD DEATH AMONG JAPANESE MIDDLE-AGED AND ELDERLY**

C. TANGE\* (National Institute for Longevity Sciences, National Center for Geriatrics and Gerontology, Obu City, Japan)

Y. NISHITA(1), M. MORIYAMA(2), M. TOMIDA(2), S. TSUBOI(1), Y. FUKUKAWA(3), F. ANDO(4), H. SHIMOKATA(1) - (1) National Institute for Longevity Sciences, National Center for Geriatrics and Gerontology (Obu City, Japan); (2) Nagoya University (Nagoya City, Japan); (3) Seitoku University (2718555, Japan); (4) Aichi Shukutoku University (Nagoya City, Japan)

Introduction For the middle-aged and elderly, the theme of death and dying is thought to be one of the developmental tasks. This study investigated the age-related changes of attitudes toward death among Japanese middle-aged and elderly using longitudinal data. Methods The data were taken from the National Institute for Longevity Sciences-Longitudinal Study of Aging (NILS-LSA), conducted in 1997-2000 (Wave1) and 2002-2004 (Wave3). The subjects were community dwelling 803 males and 743 females (aged 40 to 79 years at Wave1). The mean interval between both waves was 4.1 years. A multidimensional scale of Attitude toward Death was assessed at both waves. It contained five subscales: 'Fear of death', 'Intention to live out own life', 'Belief in existence of afterlife', 'Meaning of death for life', 'Approval of death with dignity'. Repeated measures analysis with GLM procedure (in SAS ver.9.1.3) was used for the analysis. The independent variables were age group by decade, sex, wave, and those first- and second-order interactions. Results There were significant main effects of wave and age on the subscales of 'Fear of death' (both  $p<0.001$ ) and 'Belief in existence of afterlife' (wave effect:  $p<0.001$ ; age effect:  $p<0.01$ ): These scores decreased in Wave3, and were lower among the older groups. On the subscales of 'Intention to live out own life', 'Meaning of death for life', and 'Approval of death with dignity', the main effects of age were significant (in each,  $p<0.001$ ;  $p<0.01$ ;  $p<0.05$ ), namely, the elderly had high scores on the former two subscales, and showed more approval of death with dignity on the last subscale. Conclusion These results suggest that some aspects of attitude toward death changes for four years among Japanese middle-aged and elderly.

#### **PC6 661 BEHAVIOUR COGNITIVE PROFILE CORRESPONDING A SAMPLE OF USERS FROM A GERONTOLOGICAL CENTER**

I. GONZÁLEZ ABRALDES\* (University of A Coruña, A Coruña, Spain)

A. MASEDA(1), T. LORENZO(1), J. TUBÍO(1), A. BALO(1), J. MILLÁN-CALENTI(1) - (1) University of A Coruña (A Coruña, Spain)

Introduction: Progressive aging of population implies a prevalence and incident increase of cognitive disorders including dementia. Although cognitive and functional symptoms have traditionally identified these subjects, behaviour and psychological symptoms (BPS) are becoming more and more relevant. The study's aim was to know the behaviour cognitive profile of the residential users in a Gerontological Center. Methods and materials: The study was carried out with residential users in a Gerontological Center in A Coruña (Spain). The sample was constituted by 32 people over 65, 6 men and 26 women with different levels of cognitive impairment. The MMSE Spanish version was used to assess the user's cognitive state and Global Deterioration Scale (GDS) to establish the different impairment levels. The 12-item Spanish version of the Neuropsychiatric Inventory (NPI) was used in order to evaluate behavioural and psychological symptoms. Results: From the total sample, 28 users (87.5%) were below the MMSE Spanish version cutoff point, which means they showed cognitive impairment. They were grouped in the following GDS Scale stages: GDS1 and GDS2: (12.5%), GDS3: (0%), GDS4: (25%), GDS5: (28.1%), GDS6: (15.6%) and GDS7: (18.8%). Twenty four users (75%) showed BPS. Those corresponding GDS6 showed an average of 4.4 symptoms and those in GDS7 showed 3.2 (0-12 symptom range). The study showed that users with severe cognitive impairment (GDS6) and very severe cognitive impairment (GDS7) presented the highest NPI levels with scores between 47.2 and 90.0. Conclusion: Most of the patients with cognitive impairment showed BPS, being more predominant in the most severe stages. Therefore, early diagnosis is of utmost importance in order to take action and improve both caregiver and patients quality of life.

#### **PC6 662 SUCCESSFUL AGING: LAY PERSPECTIVES OF YOUNG, MIDDLE-AGED, AND OLDER GERMANS**

D. WOZNIAK\* (Heidelberg University, Heidelberg, Germany)

D. JOPP(2), S. EHRET(1), S. STANEK(1), C. BERENDONK(1), M. STROBEL(1), A. GLAUB(1) - (1) Heidelberg University, Institute of Gerontology (Heidelberg, Germany); (2) Fordham University, Department of Psychology (Heidelberg, United States of America)

Introduction: Demographic changes and the growing number of old people fuel the increasing interest in the nature of successful aging. However, despite decades of research there is no consensus about what aging well entails. Since ideas about aging influence thinking and behaviour, clarifying subjective theories of aging represents an important goal and may inform intervention efforts. Methods and materials: The present study examined laypersons' definitions of successful aging and the factors determining it. Open interviews with young, middle-aged, and older Germans ( $N=155$ ) were conducted and evaluated with a newly developed coding system ( $\kappa=0.90$ ). Since findings showed comparable numbers of codes for definitions and determinants, data was combined for further analysis. Results: Findings indicate that health and social network were the key components of successful aging, whereas meaning in life, micro-environment and respect/status were reported least often. Age groups differed in four categories: Instances of activities/interests were

mentioned more often with advancing age, whereas knowledge/education was mentioned less frequently. Middle-aged reported more goals/tasks compared to younger and older participants. Finance matters showed an inverse trend. In addition, an interaction effect between age and gender was observed: Young women mentioned quality of life more often than young men, whereas middle-aged and older women mentioned it less frequently than men at the same ages. Conclusion: Results suggest that the understanding of successful aging is multi-faceted and can be mapped onto multiple dimensions discussed in several aging theories. The ideas about successful aging change only moderately over the life span. Nevertheless, these age differences highlight which areas of life could be targeted in prevention and intervention. Future research should include longitudinal data and more individual characteristics in order to explain age-related changes.

**PC6 663 A QUALITATIVE STUDY FOR THE BARRIERS FOR PARTICIPATIONG IN CHILD-SUPPORT ACTIVITIES BY GRANDPARENTAL GENERATIONS**

M. TABUCHI\* (Osaka University, Suita, OSAKA, Japan)  
J. NAKAHARA(1), A. FUJITA(1) - (1) Osaka University (Suita, OSAKA, Japan)

The purpose of this study was to reveal the barriers for participating in child-support activities by grandparental generations, in order to promote "child support program by grandparental generations in communities". Grandparental generations (n=9) and parents caring preschool children (n=9) were investigated by means of a group-interview. The data obtained by grandparental generations were classified into 9 categories, "anxiety of being rejected by parents," "considering parents' attitude as too much dependence," "generation gap about how to caring children," "generation gap about attitude toward children," "having no time to joining," "liability issues," "anxiety about health and strength," "not knowing how to handle children," and "consideration for parents". The data obtained by parents were classified into 8 categories, "anxiety of being imposed by grandparental generations," "anxiety of being considered as too much dependence," "overindulging children," "generation gap about how to caring children," "generation gap about attitude toward children," "being confused receiving too much importations," "consideration for grandparental generations," and "being uneasy about leaving children". The results of this research demonstrate that the main barriers were the programmatic attitudes of each others'. To promote child support program by grandparental generations and exchanges among different generations, it's necessary to provide the importation about these barriers to each other, and dispel the misconception about generation gap.

**PC6 664 PSYCHOLOGICAL ADAPTATION TO VISION LOSS IN OLD AGE: THE ROLE OF FUNCTIONAL ABILITIES**

O. SCHILLING\* (University of Heidelberg, Heidelberg, Germany)  
H. WAHL(1), A. HOROWITZ(2), J. REINHARDT(2), K. BOERNER(2) - (1) University of Heidelberg (Heidelberg, Germany); (2) Jewish Home Lifecare Research Institute on Aging (New York, United States of America)

Introduction: To investigate psychological consequences of vision loss in old age, we considered the concept of Adaptation to Age-related Vision Loss (AVL; Horowitz and Reinhard, 1998). We hypothesized that the consequences of objective visual acuity losses on the AVL outcome are largely mediated by perceived functional vision loss (FVL) and functional abilities to conduct activities of daily living (ADL). Following a process-oriented view of adaptation, we further expected some reduction of psychological responsiveness to vision losses with ongoing advancement of AMD, weakening the impact of vision loss when higher levels of vision loss have been "reached". Methods and Materials: Longitudinal data comprising baseline and one-year follow-up measures from two samples of elders suffering from age-related macular degeneration from New York City (N=361 at baseline) and Heidelberg (Germany, N=90) were analyzed. Structural equation modelling techniques were applied for data analysis Results: We analyzed the hypothesized structure of mediation cross-sectionally, relating the variables baseline measures, as well as longitudinally, relating their latent one-year change scores. Results confirmed the hypothesized relational structure, showing that the impacts of vision loss on psychological AVL are largely mediated by losses in functional abilities. We further compared the relations between one-year change scores of FVL, ADL, and AVL among those with low, medium, and high levels of objective vision loss at baseline and found evidence of a "unique psychological" adaptation, in that among those with high levels of objective vision loss, further changes in FVL and ADL showed only minor impact on AVL. Conclusion: Functional abilities appear to be a fundamental driver of positive attitudes kept under irreversible vision losses in old age. It seems, however, that on the long run there is some "immunization" of the elders' psychological reactions against further losses in vision.

**PC6 665 INFLUENCE THAT CHANGE IN LIFE ENVIRONMENT GIVES TO "TIME SPENT ALONE" OF ELDERLY PERSON WHO NEED CARING AND THE FAMILY**

S. SASAHARA\* (Kogakuin University, Tokyo, Japan)  
T. AKAGI(1) - (1) Tetsuya Akagi (Tokyo, Japan)

The purpose of this study is to clarify how the change in life environment influences "Time spent alone" of elderly person who need caring and his family living at home. Subjects are

husband who need caring (80 years old) and his wife (74 years old). The method is an interview to husband and his wife respectively. The investigation content five items "disability and health condition, cost for living, interpersonal relationship, physical environment, regional service" that relate living environment and "Time spent alone" in home. The interview results are evaluated by five stages "satisfaction - dissatisfaction" And, this investigation was done two times "November 2008 and December 2009". 1) Husband has dissatisfaction about "health condition" "physical environment" as well as one year ago. Though "Time spent alone" of husband was enhanced by his family doctor, husband's hobby activity will hardly be seen within one year. In this case, it is necessary to improve the environment that the husband can do alone, or husband's hobby is newly converted, after the reasons for dissatisfaction are considered enough. As a result, it is thought that the activity of husband's daily life is maintained, and it leads to the bedridden prevention. 2) His wife has dissatisfactions about "health condition" "physical environment" as well as one year ago. Nevertheless, an integrated satisfaction ratio of both life in home and region is improved compared with one year ago. The improvement reason for the satisfaction ratio is related to an increase of free time for his wife while husband living at nursing home. His wife is liberated from the mental and the physical stress of home care by the existence of "Time spent alone". As a result, this is useful for softening the loneliness and strengthening the connection with the society for his wife.

**PC6 666 AGE DIFFERENCES IN OROFACIAL SENSORY THRESHOLDS**

M. HEFT\* (University of Florida, Gainesville, FL, United States)  
M. ROBINSON(1) - (1) University of Florida (Gainesville, FL, United States of America)

Introduction: This study sought to assess differences in sensory thresholds for painful and non-painful multimodal orofacial stimuli. Methods and materials: Medically healthy subjects (Ss, N=178; female=100) judged thresholds for: (1) warming, (2) cooling and (3) painful thermal stimuli and (4) tactile stimuli delivered to the glabrous (upper lip) and hairy (chin) skin sites of the face and (5) salt (NaCl) and (6) sour (citric acid) taste in separate sessions. Thresholds were determined by the ascending and descending Method of Limits. The thermal stimuli were delivered via a 3-layer Peltier thermode; pressure stimuli were delivered with Semmes-Weinstein filaments, calibrated nylon monofilaments; and the taste stimuli samples were prepared with 0.25 logarithmic steps between successive stimulus concentrations. Results: Age was categorized based on a bimodal distribution split at 50 yrs, to yield 92 younger and 86 older adults. Separate ANOVAs were conducted for each of the sensory domains. For the thermal and tactile sensory domains lip thresholds were less than chin ( $p < .05$ ). The age effects were moderate to large in magnitude. Older adults had lower thresholds for all sensory domains ( $p < .01$ ). There was a small, but significant sex difference suggesting that women had higher cooling threshold for chin stimulation ( $p = .027$ ), accounting for approximately 3% of the variance in ratings and lower sour threshold ( $p = .01$ ) and an age x sex interaction accounting for 4% of the variance. Conclusion: Older Ss were less sensitive to threshold stimuli than younger. However, age accounts for <20% of the variance. When participant ratings of sensory words was controlled, age differences in sensory ratings decreased, indicating that a large portion of the age effect was a function of a more stoic response set in older participants. Supported by P.H.S. DE08845

**PC6 667 PATIENTS' PERSPECTIVES ON THE IMPORTANCE OF NURSE-PATIENT RELATIONSHIPS IN CHRONIC CARE**

V. BOSCARTE\* (University of Toronto, Toronto, ON, Canada)  
D. PRINGLE(1), K. MCGILTON(1), E. PETER(1), F. WYNN(1) - (1) University of Toronto, L. Bloomberg Faculty of Nursing (Toronto, ON, Canada)

Introduction: Chronic care facilities (CC) provide complex care to patients for extended periods of time. When patients spend significant periods of time with nursing staff there are opportunities to develop warm and family-like relationships with them. The purpose of this study was to determine what aspects of patients' relationships with nursing staff matter most to them and how frequently patient's experience relationships that matter. Methods: Two scales were developed: a Humanistic Relational Importance Scale and a Humanistic Relational Experience Scale. The items were based on concepts embedded in Paterson's and Zderad's Humanistic Nursing Theory. A descriptive survey was used to collect data from 240 chronic care patients living in 6 facilities in Ontario, Canada. Results: This paper will present the qualities of the nurse-patient relationships that are most important to patients and how frequently these qualities are experienced. Conclusion: Findings of this study will lead to greater understanding of the nurse-patient relationship in CC settings and will support clinical practice, research and education of nursing staff in these settings.

**PC6 668 THERAPEUTIC ORIENTATION TO ADAPT ELDERLY AND THEIR FAMILY IN AN ASSISTED LIVING FACILITY**

E. ARAUJO\* (Liga das Senhoras Católicas-Lar Sant' Ana, São Paulo, Brazil)  
R. LOPES, R. MIRANDA

Introduction: In a Brazilian Assisted Living Facility, new residents and their families presented difficulties during the adaptation process. The complaints were of personal dissatisfaction and issues in their intergenerational relationships. Psychogerontologic assistance was created, aiming the resolution of past and current conflicts, promoting an adequate adaptation and stay, accompanied by intergenerational relationships. Material and

**Method:** A study, descriptive and analytical, with a qualitative data approach. Therapeutic Assistance is carried out since 2004, with systematic group approach. The interventions are held by a psychologist, monthly throughout the adaptation period, which lasts around 4 to 6 months. After this period, there is a therapeutic maintenance in individual or group assistance, according to their needs. Elderly are stimulated to live and experience their anxieties and doubts in their new everyday life. Family orientation reinforces affective bonds and the relevancy of their participation during the stay of the elderly at the institution.

**Results:** The continuity of therapeutic intervention contributed to the decrease of complaints and conflicts during the adaptation process. It was demonstrated a drop in resident departure, as well as an increase in their staying with lifted feeling of satisfaction and sense of self-efficacy. The exchange of experiences amongst family members helped to decrease angst and guilt feeling, developing a net of solidarity and protection between elderly and their family.

**Conclusion:** This psychogerontologic orientation demonstrated to be an excellent resource to the strengthening of affective bonds and improving intergenerational relationships. It contributed to the elevation of feelings of self-esteem, independence and autonomy in the elderly, accompanied by a sensation of dignity and pleasure, promoting a successful aging.

**PC6 669 MARITAL ADJUSTMENT AND ITS ASSOCIATION WITH MARITAL DISTRESS IN OLD AGE**

M. GOLDFARB\* (Université du Québec à Montréal, Montréal, Canada)  
 G. TRUDEL(1), R. BOYER(2), M. PRÉVILLE(3) - (1) Université du Québec à Montréal (Montréal, Canada); (2) Université de Montréal (Canada); (3) Université de Sherbrooke (Canada)

Little is known about marital satisfaction in the elderly. Some studies suggest that it is generally higher than that of their younger counterparts while other studies suggest the opposite. Also, while the association between marital satisfaction and psychological distress has been well established in younger couples, knowledge about this association in older couples is scarce. The aim of the present study was two-fold: first, to compare the level of marital adjustment of the elderly with that of younger couples reported in previous literature; then, to document the cross-sectional association between marital adjustment and psychological distress in a representative sample of the married population of Quebec aged 65 years and older. Data was drawn from 1175 married participants of the Survey of the elderly's health (ESA study) in Quebec, Canada. Participants responded a face-to face interview at their own home. The Dyadic Adjustment Scale was used to measure marital adjustment while psychological distress was measured with the ESA Diagnostic Questionnaire (ESA-Q). Results suggest that the elderly are generally more satisfied of their marital relationship than their younger counterparts ( $t(1333) = 2.54$ ,  $p < .02$ ). In addition, after controlling for the effect of age and duration of the relationship on marital satisfaction, results suggest that sex ( $F(1, 1188) = 21.49$ ,  $p < .001$ ) and psychological distress ( $F(1, 1188) = 18.36$ ,  $p < .001$ ) are associated with marital satisfaction, being women and those suffering from psychological distress significantly less maritally satisfied. These results support what has been generally found in previous studies with younger couples.

**PC6 670 GIVING AND RECEIVING IN THE POST-MODERN ERA IN MANAGING SENIOR CITIZEN CLUBS WITH THE HOLISTIC APPROACH**  
 A. EIZENHAMER\* (NA, Ramat Gan, Israel)

**Introduction:** This paper focuses on the study and the significance of reciprocal relations between the director of senior citizen clubs, on the background of social post-modern approaches and in line with the holistic approach. Mutual relations between the director of senior citizen clubs and the senior citizens constitute an essential foundation for the efficient operation of these networks. **Methods and Tools:** a semi structured interview was conducted to examine the viewpoint of the senior citizens and the perspective of the director regarding these mutual relations. The contents of the interviews were determined during the research design stage, by means of questions directed at understanding the ways of managing "receiving" and "giving" among the senior citizens and the director. The research population included 15 senior citizens from three senior citizen clubs and six directors. The mean age of the club members was 70. **Findings:** The main theme revealed in the senior citizens group was a feeling of security, expressed through five types of support: social security, emotional security, security of self reliance and independence, security of a place, reliance on the director of the club who serves as a secure anchor. The findings show that the senior citizens and the directors report these indicators and expressions in the three reciprocal relations; from the director to the senior citizen, from the senior citizen to the director and among the senior citizens themselves. The content analysis of the interviews with the directors revealed mirror relations which connect them to the senior citizens. **Conclusions:** Receiving and giving are processes that occur between the directors of the senior citizen clubs and the senior citizens in a reciprocal manner. The manifestation and the understanding of these reciprocal processes and the fact of their existence for a long duration lead to a significant and central conclusion.

**PC6 671 METAPHORIC MEANING OF WORDS PROCESSING AND AGING: A CASE OF BRAIN FUNCTIONAL REORGANIZATION**

B. MEJIA-CONSTAIN\* (IUGM, Université de Montréal, Montréal, Canada)  
 O. MONCHI(1), N. WALTER(1), M. ARSENAULT(1), N. SENHADJI(1), Y. JOANETTE(1) - (1) Centre de recherche, Institut universitaire de gériatrie e Montréal (Canada)

**Introduction.** The hypothesis of a brain functional reorganization for language during aging is still a matter of debate. The processing of metaphors offers an interesting field of research in order to observe possible age-related brain reorganization. That is because it is considered as a preserved ability in older adults. In order to explain the age-related functional brain changes of a number of cognitive processes, Cabeza has proposed the HAROLD phenomenon. Such a reduction of differences in neural inter-hemispheric activations has been shown to be present in the preservation of task performance during aging. However, still little is known about the determinants of the age-related reduction in hemispheric asymmetries for language processing in successful aging. The goal of this study was to describe the patterns of inter-hemispheric activations during processing of metaphoric meanings of words, looking for possible age-associated changes allowing for preserved performance. **Methods and materials:** Ten young adults and ten older adults were scanned using 3T fMRI during the performance of a semantic judgment task using pairs of words: targets with literal (LT) or metaphoric (MT) relationships and distractors paired with concrete (CD) or abstract (AD) words. Lateralization indices were calculated. **Results:** The [MT-LT] contrast showed significantly increased activity in the superior frontal gyrus bilaterally for both groups and in the inferior frontal gyrus and the left temporal cortex in the older group only. There was a left lateralized index for both groups. **Conclusion:** Different patterns of neural activity were associated with processing of metaphors depending on age: a change in anterior/posterior activation profile instead of a reduction of differences in inter-hemispheric activations. These results are compatible with the possibility that the greater frontal activations present in older adults may reflect a requirement of additional attentional resources on a demanding task.

**PC6 672 THE EFFECTS OF FAMILY-RELATED FACTORS ON THE QUALITY OF LIFE FOR THE ELDERLY PEOPLE IN KOREA**

C. PARK\* (Daegu University, Korea, Kyongsan City, Kyongsangbuk-do, Republic of Korea)

The main purpose of the study is to investigate the relationship between the family-related factors and the quality of life for the elderly people in Korea. Since family plays an important role in caring the aged in Korean society, the family-related factors are also very important in determining the quality of elderly people's life. The subjects of the study were a total of 443 people, both male and female, residing in Daegu and Gyongsan areas. Data were collected through a self-reporting method and each items in the questionnaire had a possible score of 5. The family-related factors are the degree of intimacy with the spouse, with the children, and the filial piety perceived by elderly people. The results are as follows: the intimacy with the spouse is positively related to the quality of life of the elderly. The average score for the intimacy with the spouse was found to be 2.56, which was relatively low in comparison with the score for the intimacy with the children (3.34). The score for the perceived filial piety by the elderly was found to be 3.21, which indicated that most elderly people perceived their children to be very close and faithful. The positive attitude toward the children of the elderly was very significant in making the old people satisfied with their life in general. As a conclusion, the quality of the life of the elderly was very much determined by the family-related factors such as the intimacy with the spouse, with the children, and the perceived filial piety. Therefore, it is suggested that the welfare policy for the elderly people should be family-oriented or family-centered in Korea. Much effort should be made in order to improve the relationship between the elderly people and their family members. It would be further proposed that many programs and services should be provided to give the family various incentives for taking care of their elderly people.

**PC6 673 A STUDY OF THE ECOLOGICAL FACTORS AFFECTING THE QUALITY OF LIFE AMONG THE ELDERLY PEOPLE IN KOREA**

N. BAE\* (Hoseo University, Asan city, Chungchungnam-do, Republic of Korea)  
 C. PARK(1) - (1) Daegu University (Kyongsan city, Kyongsangbukdo, Republic of Korea)

The purpose of this study is to analyze the factors affecting the quality of life for the elderly people from the ecological perspectives. Specifically, this study attempts to compare the relative contributions of the variables from the individual system, microsystem, mesosystem, and macrosystem on the quality of life for the elderly. The subjects for this study consisted of 443 elderly over 60 years old in urban areas using interview method based on a structured questionnaire. The data were analyzed by frequency, t-test, ANOVA, and hierarchical regression method. The major findings of this study were as follows: 1) Out of the individual factors influencing the quality of life of the elderly, the economic status of the respondents was found to be the most important. Out of the microsystemic factors, the most important factors were found to be the intimacy with the spouse and with the children. Out of the mesosystemic factors, the degree of the social participation of the elderly was found to be the most significant. However, none of the macrosystemic factors were found to be important in influencing the quality of life of the elderly. 2) The relative significances of the variables contributing to the quality of life of the elderly were analyzed using a hierarchical regression technique. It was found that there was no significant factor in social background and mesosystemic variables. On the other hand, the degree of the self-efficacy and the level of the economic status from the individual factors, and the intimacy with the spouse and the children from microsystemic factors were found to be very significant in the contributing the quality of life for the elderly. As a conclusion, based upon these results, it is suggested that the ecological factors are very important in determining the quality of life for the elderly people, and thus, strong

supports from the family, the local community, and the government are crucial in order to improve the quality of life for the elderly people in Korea

**PC6 674 THE IMPORTANCE OF COGNITIVE RESOURCES FOR EVERYDAY COMPETENCE AMONG VISUALLY IMPAIRED AND UNIMPAIRED OLDER ADULTS**

H. WAHL\* (University of Heidelberg, 69115 Heidelberg, Germany)  
V. HEYL(1) - (1) University of Education (Heidelberg, Germany)

**Introduction** This paper investigates the role of cognitive resources for everyday competence, contrasting visually impaired and unimpaired older adults. We hypothesize that relationships are different depending on impairment status, i.e., we assume that lower cognitive resources have a stronger negative impact on everyday competence among the visually impaired as compared to those unimpaired. Methods and materials Findings are based on samples of 121 visually impaired and 150 unimpaired adults between 72 and 95 years (mean age: 82 years) from the SENSO-AGE Project. Visual impairment was defined as distance and/or near visual acuity of less than 20/70 in the better eye. All participants were community-dwelling and had no major cognitive impairment. Cognitive measures mainly came from the Hamburg-Wechsler test battery. Everyday competence was assessed by everyday activities, leisure activities and the environmental mastery subscale from the Ryff Scales of Psychological Well-Being. Results Differential relationships in the predicted direction emerged for fluid as well as crystallized measures of cognitive functioning. More precisely, speed of processing was a significant predictor of out-of-home activities of daily living, but only in the visually impaired group. The positive relationship between capacity for abstraction and leisure activity level was stronger for the visually impaired as compared to the visually unimpaired older adults. Conclusion There is first evidence that the relationships between cognitive resources and everyday competence are different depending on impairment status. In terms of intervention, a possible implication would be that classic everyday competence trainings should be enhanced by systematic cognitive training.

**PC6 675 EXPLORING DETERMINANTS OF ORAL HEALTH-RELATED QOL AMONG THE OLDEST OLD IN TOKYO**

M. FUKUMOTO\* (Nihon University, Tokyo, Japan)  
K. SAITO(1), T. IINUMA(1), Y. ARAI(2), M. TAKAYAMA(2), Y. ABE(2),  
M. TAKAYAMA(3), N. HIROSE(2), K. KOMIYAMA(1), N. GIONHAKU(1) - (1) Nihon University (Tokyo, Japan); (2) Keio University (Tokyo, Japan); (3) Keio University (Tokyo, Japan)

**Introduction** Low satisfaction with oral health is serious problems among older adults, because it can cause not only undernourishment, but also poor mental conditions. However, few studies have focused on the relationships among oral function, state of the mouth, and a medical health condition among the oldest old. The aim of this research was to examine factors that potentially improve QOL among the oldest old in terms of oral health. **Material and methods** We recruited 152 community-dwelling individuals aged 85 or older (65 men, 88 women, mean age 88.4 year+3.1). Oral health-related QOL was assessed by using GOHAI (Geriatric Oral Health Assessment Index). Oral health measures included the number of remaining teeth, the condition of dental prosthesis and the bite force. Body mass index (BMI), serum levels of albumin (Alb), and total cholesterol (TC) were measured as nutritional indices. Philadelphia Geriatric center morale scale (PGC) was examined as an index of the psychological condition. **Results** The mean value of GOHAI score of the participants was 52.2 + 9.2, which was comparable with reference data from general population in Japan; 52.2+7.8 for 50 - 59 years old, 50.8+8.8 for 70 - 79 years old. A significant correlation was admitted in GOHAI score with the bite force and the condition of dental prosthesis ( $r=0.305$   $p<0.01$ ;  $r=-0.182$ ,  $p<0.05$ , respectively). However, no significant correlation was admitted in GOHAI score with BMI, ADL, PGC scale, and serum levels of TC and Alb. **Conclusion** The oral health-related QOL was found not to decrease by chronological age, but to be associated with poor bite force and the condition of dental prosthesis. Our results suggested that improvement of oral function and optimization of dental prosthesis could maintain oral health-related QOL even in the oldest old.

**PC6 676 CULTURAL-SPECIFIC SIGNS OF GEROTRANSCENDENCE IN THE VERY OLD IN JAPAN**

T. NAKAGAWA\* (Osaka University, Suita, Japan)  
Y. MASUI(1), Y. KURETA(2), M. TAKAYAMA(3), C. KAWAI(1), Y. GONDO(4),  
R. TAKAHASHI(1) - (1) Tokyo Metropolitan Institute of Gerontology (Japan); (2) Showa University (Fujiyoshida, Japan); (3) Keio University (Japan); (4) Osaka University (Suita, Japan)

**Introduction:** An increasing number of the very old in Japan show a decline in physical and cognitive function, but still achieve a psychologically adaptive development (cited article). This developmental change is conceived as a process of "gerotranscendence" proposed by Tornstam (1989). According to his theory, gerotranscendence process is hypothesized to be intrinsic and universal, but to be modified by specific cultural patterns. However, it remains unexplored whether gerotranscendence is culturally specific. The purpose of the present study was to explore cultural-specific signs of gerotranscendence in the case of

Japanese. **Methods and materials:** Informants: Participants were 16 volunteers aged 81-106 (M = 92.75). The ratio of male to female was equal. All the participants showed a substantial decline in physical function [e.g., Barthel Index  $\leq 90$ , etc], while maintaining cognitive function [MMSE  $\geq 21$ ]. Subjective well-being scores [PGC moral scale & self-reported health] varied between participants. **Procedure:** Semi-structured interviews were conducted following the interview guide by Tornstam(1997). **Analysis:** We made qualitative analyses into the interviews, based on phenomenological approach and grounded theory. **Results:** We successfully found three signs of gerotranscendence, which Torenstam failed to find in his studies (1997a, 2005). First, some had recognized spiritual existences even if they were not religious (spiritual existences). Secondly, some had accepted changes of situations by detaching from self (self-detachment): It means a shift away from defense mechanisms. Third, some had redefined independence and recognized interdependency (interdependency): Sometimes they accepted dependence on others. **Conclusion:** There seems to be some signs of gerotranscendence that are modified by not only cultural-specific patterns but also further age-changes. Amae may accelerate the development of "interdependency." And, older age may accelerate the development of "self-detachment." Recently, Tornstam described "selflessness" as a revised sign. So, it may correspond to "self-detachment."

**PC6 677 IMPROVED SPATIAL WORKING MEMORY IN MICE LACKING ADENOSINE A<sub>2A</sub> RECEPTORS**

J. HE\* (Wenzhou medical college, Wenzhou, Zhejiang province, China)  
S. ZHOU(1), D. SHU(1), M. ZHU(1), X. WANG(1), R. ZHENG(1), J. CHEN(2) - (1) Department of Neurology, the First Affiliated Hospital and Research Institute of Experimental Neurobiology (WenZhou, China); (2) Department of Neurology, Boston University School of Medicine, (Boston, )

Extracellular adenosine acting at adenosine A<sub>2A</sub> receptors (A<sub>2A</sub>R) is increasingly recognized to modulate the striatal plasticity and cognitive function in brain. In this study, we employed adenosine A<sub>2A</sub>R knockout (KO) models to investigate the effects genetic inactivation of A<sub>2A</sub>R on spatial working memory in eight-arm radial maze and in a repeated trial testing of Morris water maze (MWM). Compared to the wild-type (WT) littermates, A<sub>2A</sub>R KO mice displayed an improved working memory as evident by reduced working memory errors in the radial maze performance in both 6 days or 15 days training protocol. This enhanced working memory in A<sub>2A</sub>R KO mice (after 15 days training but not after 6 days training) was retained even after 7 days of washout period. Moreover, the enhanced working memory was also confirmed/observed in two separate experiments with two different working memory testing protocols (i.e. four repeated trials with varying, but <3 min interval, and two repeated trials with mixed interval at 15 second, 10 min and 60 min.) However in both radial maze and MWM paradigms, there was no/minor significant difference in the performance of spatial reference memory between the A<sub>2A</sub>R KO and WT littermates. The results demonstrate that genetic inactivation of A<sub>2A</sub>R preferentially improves spatial working memory, suggesting a modulatory role of the A<sub>2A</sub>R in spatial working memory in mice.

**PC6 678 AGEING AND EMOTIONAL REACTIVITY: DO OLDER ADULTS SHOW DIFFERENTIAL SUBJECTIVE AND PHYSIOLOGICAL RESPONDING DURING PICTURE VIEWING COMPARED TO YOUNGER ADULTS?**

B. MASSAVELLI\* (The University of Queensland, Brisbane, Australia)  
O. LIPP(1), N. PACHANA(1) - (1) The University of QLD, School of Psychology (Brisbane, QLD, Australia)

Viewing affective pictures elicits reliable patterns of physiological change in the somatic, visceral, and central systems of children and adults that covary with reports of affective valence and arousal. Research that has directly investigated the relationship between emotion and overall physiological change in the context of healthy ageing is currently equivocal. Australian older and younger adults' subjective and physiological reactivity to affective pictures from the International Affective Picture System were compared. Across three experiments, younger (18-25 years), middle aged (31-48 years) and older (52-93 years) participants viewed and provided ratings of valence, arousal, dominance and fear for subsets of affective pictures using the Self-Assessment Manikin. Eyeblink reflex, skin conductance, heart rate, corrugator and zygomaticus activity were recorded during picture viewing in Experiment 3. Affective responding is assumed to be activated by basic appetitive and defensive motivational systems. Across the three experiments, there were no age related differences in subjectively rated pleasantness; older adults provided reduced arousal ratings for pleasant pictures and showed little differentiation among the pleasant high, medium and low arousal categories. Differences in emotion driven physiological responding were evident in both age groups. Blink magnitude of younger adults did not differ during pleasant and unpleasant pictures, however, older adults showed an enhanced blink magnitude during unpleasant pictures. Both age groups showed largest SCR activity during high arousal pictures. In older adults, corrugator activity was larger when viewing unpleasant compared to neutral pictures. Zygomaticus activity was enhanced for younger adults during pleasant pictures. Older adults did not show emotional modulation of

zygomaticus activity. Taken together, these findings suggest that older people differ in subjective and physiological emotional reactivity compared to younger people.

**PC6 679 AN EXPLORATION OF LONELINESS AMONGST OLDER WOMEN: LOSS OF IDENTITY**  
L. DE JAGER\* (North-West University, Potchefstroom, South Africa)  
V. ROOS(1) - (1) NWU (Potchefstroom, South Africa)

**Introduction:** Loneliness has increasingly become a pertinent issue for many persons older than 60 years. The experience of loneliness in South Africa could be contextualised against the history of various negative circumstances, which contribute to the experience of loneliness by older people, such as poverty, urbanisation, HIV/AIDS and migration. Research demonstrates relationships between loneliness and chronic conditions, anxiety and depression. Furthermore, it impairs the quality of life and implies a poor prognosis for ageing. **Method and materials:** The focus of this qualitative, phenomenological study was to explore the experiences of loneliness. Fifteen Afrikaans-speaking women older than 60 years participated in the research. Various qualitative data gathering methods were used, such as, a visual projective technique that is referred to as the Mmogo-metodTM, individual interviews and journal writing. The data were enriched with a focus group discussion and member checking were used to ensure trustworthiness of the results. **Results:** The results indicated that their socio-cultural contexts, socialised women to adopt designated roles as carers for their homes, children and husbands. They were submissive to their husbands and supported their husbands in their career developments to the extent that they neglected their own development as independent people with their own identities, who were capable of adjusting to different situations and relations. The losses that accompanied old age accentuated the lack of identity roles that could be applied to different contexts. Specific recommendations were made regarding psycho-social interventions such as exploring the self, different identities, dealing with different losses and bereavement counselling. **Conclusion:** Many older women experience loneliness, hopelessness and a feeling that life has no meaning. Loneliness was experienced by this particular group of women as a loss of their identity.

**PC6 680 LIVING ALONE, SOCIAL ISOLATION AND LONELINESS IN SPAIN AND THE NETHERLANDS**  
M. SANCHEZ\* (Universidad de Salamanca, Salamanca, Spain)  
J. DE JONG GIERVELD(2), J. BUZ DELGADO(1) - (1) Universidad de Salamanca (Salamanca, Spain); (2) Netherlands Interdisciplinary Demographic Institute (NL-2502 AR , The Netherlands)

**Introduction:** Loneliness is a subjective and negative experience resulting from a cognitive evaluation of the discrepancy between the quantity and quality of actual social relationships and relationships standards (de Jong Gierveld, 1987). This experience has been acknowledged as an important indicator of subjective well-being in older age (Dykstra, 1990). Important cultural differences have been found in the prevalence and determinants of loneliness (Jylha and Jokela, 1990, Perlman, 2004). The aim of this study is to analyze the prevalence and determinants of loneliness in Spanish and Dutch elderly people. **Method and materials:** We use comparable data from two samples of community-dwelling older adults ( $n=646$  and  $n=656$ , respectively). In both countries, the de Jong Gierveld scale is applied to measure loneliness, and information about age, gender, health, living arrangements and social network characteristics, is collected. **Results:** Total loneliness is higher among Spanish than among Dutch older adults. However, more people live alone in the Netherlands than in Spain. The multivariate analysis showed that total effect size of living alone is higher in the Dutch than in the Spanish sample. However, interaction terms between living alone and age, gender and receiving support are significant for the Spanish, but not for the Dutch participants. In Spain, the effect of living alone is stronger for the very old (75+) than for the youngest old (60-75). Also, when living alone, men were lonelier than women. Finally, elderly people living alone, but with high levels of emotional support received, showed lower loneliness scores than those with low levels of support. The effect of receiving emotional support was not significant for those living with other people. **Conclusions:** Loneliness is a culture bounded experience. The results are discussed in the context of cultural differences in living arrangements and norms of support in both countries.

## Track D - Social Research, Policy and Practice

**PD6 681 UNEMPLOYMENT IMPACTS ON OLDER WORKERS MENTAL HEALTH**  
R. NEVES\* (University of Minho, Braga, Portugal)  
A. MATOS(1) - (1) University of Minho (Braga, Portugal)

This research assesses unemployment impacts on mental health in 55 year and older workers and their implications on self-perceptions and re-integration strategies in the labour force, given the particular economic, social and cultural pressures that this age group suffers. Unemployment in older ages will eventually speed up the deterioration of

health status. Several studies demonstrate that a stressful event like unemployment may cause depressive feelings, anxiety, physical and mental exhaustion and low self-esteem (Fryer, 1988; Eisenberg e Lazarsfeld, 1938; Jahoda et al. 1972, etc.). As economic stagnation diminishes the labour market demands, younger and most qualified workers are preferred. Age discrimination and poor practice in age management make maintenance and re-integration in the labour market an endeavour. As empowerment and active ageing political speeches are passed on to the community, pressure rises and these individuals are more exposed to stigmatization and mental health destabilization. Life story research was conducted on ten unemployed men with 55 years and older chosen by convenience sampling. Perceptions over 1) unemployment and ageing; 2) empowerment and individual responsibility; 3) labour force and age management 4) self wellbeing (physical, psychological and social); 5) Health related or health oriented behaviours and life styles 6) plans for the future; 7) community participation extent 8) quality of life, were addressed on a life course personal perspective. Results will be available on May this year.

**PD6 682 AGEING AND SOCIAL ENVIRONMENT: LATENT DISCRIMINATIONS. THE CASE OF CHILE**  
P. OSORIO\* (Universidad de Chile, Santiago, Chile)  
M. TORREJÓN(1), N. VOGEL(1), A. MARÍA SOL(1) - (1) Universidad de Chile (Santiago, Chile)

**Introduction:** During the year 2008 the qualitative phase of the research "Calidad de vida y Adulto Mayor" was realized in Santiago, Chile. The target was to characterize the factors that have an influence over the quality of life of the older people, considering their own perceptions. The findings show the implications of the social environment on the given definitions of quality of life, including the role of the older people and the possibilities of inclusion that are socially given in Chile. **Methods:** A qualitative methodology was used, including 16 focus groups with free living older people, and 10 in-depth interviews with semi-disabled older people. The data was analyzed with the qualitative software Atlas ti 5.1. **Results:** According with the participants, there are 3 areas where the social environment is linked to the quality of life, which ones are also linked with other dimensions already empirically and theoretically defined as relevant, like health and economy. a) Intergenerational relationships. The attitude of the new generations to the older ones in public spaces, there would be an irrespectfull behaviour. b) Stereotypes and prejudices. The older people is discriminated by the images of ageism, reducing competition in front the other age groups, specially in the labor force. c) Influence and social participation. Not being considered as relevant for the decision making, diminishing validity to participate social and politically in their wider social environments. **Conclusions:** In Chile, traditionally there have been studies about the role of the older people inside the family, and their participation in groups and clubs. The results of these research add the implications of the chances of inclusion and social integration in their self perceived quality of life, which ones act like ways of latent discriminations, even in the daily treatment as in the institutional treatment to older people.

**PD6 683 AGE, AGEISM AND AGE DISCRIMINATION - NEW DYNAMISM IN MODERN SOCIETIES**  
L. VIDOVICOVA\* (Research Institute for Labour and Social Affairs, Brno, Czech Republic)

**Introduction:** In modern societies chronological age has been substantially structuralized, formalized, individualized and in reaction to new demographic developments was constituted in terms of age inequalities and age legitimization of discriminative behaviour. On the case of Czech Republic we are showing the dynamism of reports of age discriminative behaviour and discussing the role of chronological age in different social settings. **Methods and materials** We use two representative surveys "Ageism" conducted in adult population of Czech Republic in years 2003 ( $N = 1584$ ) and 2007 ( $N = 1810$ ). Results Due to the used datasets we can follow the dynamic development in perception of age discrimination in different fields of social life - interpersonal communication, labour market, and health care system to name a few. While some of the fields do show decrease in report of the discriminatory situations, others show increase and/or change in the main age group affected. The results from year 2007 also confirm some of the previous findings from 2003, such as higher share of persons reporting that they have "heard" about age discriminatory behaviour, then being actual victims or witnesses of it. Therefore further discussion about methodological issues and interconnection between ageism and age discrimination should be carried out as well. **Conclusion** We believe there are three possible modes of how older people can face the oppression of ageism and how may society answer their endeavour: assimilation, hyphenation, and age multiculturalism, and we will discuss them in more detail as well.

**PD6 684 THE SELF-DETERMINATION IN THE ILL ELDERLY PATIENT IN THE HOSPITAL**  
M. DARIO\* (UNIVERSITÀ DEGLI STUDI DI SIENA, SIENA, Italy)  
G. DE PADUANIS(1), A. GIANNI(1), D. MARIELLI(1), R. CAPPELLI(1), S. BOSCHI(1), M. BICCHI(1), G. PERUZZI(1), A. BARBI(1), M. BARTALINI(1), M. SANTORO(1) -

(1) Dipartimento di Medicina Interna Cardiovascolare Geriatrica; Università degli Studi di Siena (Siena, Italy)

In Geriatrics it is difficult to furnish an information suitable to the patient and to get an valid consent. THE AIM: to appraise the reliability and the validity of the signature of the informed consent in a population of elderly in-patients in a hospital for acute. MATERIALS AND METHODS: a observational study of cohort has been effected on 150 elderly patients within 48 hours from the admission. Exclusion: refusal to the study; MMSE<=10. The others patients were submitted GDS. He wondered to the patient if he had understood Informed Consent read and then to explain the content. RESULTS: the 25,33% had MMSE <=10 (one had the legal guardian), 64% completed the study. Of these the 46,88% had normal MMSE, 15,63% light cognitive deficit, 37,50% moderate deficit; 67,39% had GDS normal, 28,26% light depression, 4,35% severe depression. The 79,38% of patients declared to have understood the read document and of 5,15% acknowledged not to have it inclusive. Only the 13,40% gave a correct explanation, 36,08% gave a partly correct explanation, 23,71% it explained, 10,31% said not to know. None of patients with GDS>5, none with MMSE 11-20 included the consent. With to increase the score of MMSE and the school-years, the percentage of patients that understood the consent increased, with the aging percentage reduced. CONCLUSION: more than halves the champion has not included the consent; there is a notable difference among the number of patients that declared to have understood the document and the number of subjects that understood really. A greater school-years, a lower age, a taller MMSE and the absence of depression can be considered "positive factors" for a suitable understanding of the Consent. Confirmation of the literature: MMSE not to appraise ability to intend and to want but as screening, in partnership to GDS, age and school-years.

**PD6 685 SURVEILLANCE OF THE HUMAN RIGHTS OF ELDERLY PEOPLE IN COSTA RICA**  
J. FERNANDEZ\* (Asociacion Gerontologica Costarricense, San Jose, Costa Rica)

At the present time, the Human Rights of Elderly People are among the most violated ones and, despite that, there are public policies that seek to solve and give protection; those are not enough because the violent situations and the abuse continue. The project promotes the respect and execution of the Human Rights for Elderly People by means of a surveillance process that includes coordination, diffusion, follow up, and evaluation of the activities designed for the promotion of the Human Rights of this population in different scenarios. Likewise, the project makes use of an action research method. This way, the leading role and the active participation of Elderly People is promoted as leading activists in the surveillance of their rights and civic responsibilities in institutions and in the daily life. The people who join the program as observers play a part in all its stages, for example: the training and awareness of the subject of Human Rights, Old Age, and Aging, the process of training, incorporation and initiation of the duty, and evaluation of the project, etc. The techniques and instruments of data compilation are the following: the main technique is observation and the instrument used is a comparison list; and the secondary technique is the interview and the instrument used is an interview semi-structured guide. The creation of this project seeks to contribute, among many other things, to actively integrate Elderly People as observers of those daily-life situations where their rights are violated and, at the same time, that they become promoters of the knowledge of the Human Rights in their families and in the community; and to generate better policies that allow the adequate access to goods and services, eradicating any way of discrimination and violation of the Human Rights of Elderly People.

**PD6 686 AGEISM: RESULTS OF AN INTERNATIONAL STUDY**  
F. MEIER\* (FAU Erlangen-Nürnberg, Nuremberg, Germany)  
A. DR. ESSLINGER(1), H. DR. HEPPNER(2), R. DR. ROLLER-WIRNSBERGER(3) -  
(1) FAU Erlangen-Nürnberg (Nuremberg, Germany); (2) FAU Erlangen-Nürnberg (Nuremberg, Germany); (3) Medizinische Universität Graz (8036, Austria)

Ageism in the health care sector is a matter of fact. It influences any actor concerned with the provision of health care services. Based on this fact the authors were motivated to investigate the attitudes towards ageism of geriatric experts in Germany and Austria. In the years 2006-2008 an empirical survey was undertaken. 376 experts in the field of geriatrics answered a questionnaire. They were asked about their attitudes towards ageism in general and their practical experiences concerning allocation decisions. Using the statistical method of SPSS, and especially a factor analysis, the scientists detected three different types of experts (clusters) concerning their attitudes and behaviors: In group 1 experts state that ageism is a matter of fact. They are strictly against it ("opposer"). They argue that medical treatment is independent of age and always useful. There are no possible savings based on the patients' age. Therefore, in their work they do not accept age limits. In contrary, they demand more time for the medical, psychological and social treatment, especially in palliative care settings. In group 2, the "realists" realize that age dependent provision of care is a rational need because of limited budgets in the health care sector. Therefore, they do accept an age limit. To their opinion it is reasonable. Realists demand for broad diagnostics in order to make better decisions. In group 3, experts purely deny the fact of ageism ("denier"). They argue that, independent of age, any possible treatment is provided. Everybody obtains the best possible care. Ageism is becoming more and more important in any society. The three groups mirror social reality. Transparency, discussions

and solutions about allocation decisions have to take place in any group of society (e. g. politicians, patients, medical experts, economists, managers) as everybody is personally affected with this important matter.

**PD6 687 "OLDER PEOPLE HAVE A LOT TO SAY ABOUT SEX AND SEXUALITY": ISSUES IN RESEARCHING SEXUALITY AND AGEING**  
R. JONES\* (Manchester Metropolitan University, Manchester, United Kingdom)

Introduction Engaging in research with older people around the issues of sexuality raises general concerns ranging from the belief that the sensitivity of the topic makes the research methodologically too difficult, through to a perception that sexuality and ageing are incompatible. It could be argued that these views are linked to a particular perception and construction of older people's sexuality that is influenced by ageism. Qualitative researchers in this field of study also experience discrimination through a lack of support and funding for their work. There is therefore a dearth of literature focusing on the issues and challenges raised by researching sexuality and ageing with only a few researchers exploring the issues in any depth. This qualitative study goes some way to addressing the gaps and discrimination in this area by focusing on the issues in researching sexuality with older people. Methods and materials A purposive sample of six older women and eight researchers, with an interest and experience respectively in the research area, were recruited to take part in individual interviews. The interview schedule was structured around seven key aspects of the research process which in turn made up the coding framework under which themes were developed using a thematic analysis (Braun and Clarke 2006). Results A range of themes were identified within the following aspects of the research process in relation to researching older people's sexuality, that of, level of importance, gaps in knowledge, influence of society's views of sexuality and ageing, language of sexuality, recruitment of participants, data collection methods, and the researcher's influence on the research process. Conclusion Undertaking research in this area is necessary and critical with the researcher having a pivotal role in countering any negative impact on the research process that may result from stereotypical views of sexuality and ageing.

**PD6 688 SOCIAL RISK AND FRAILTY IN LATER LIFE**  
J. URBINA\* (PRIMARY CARE HEALTH, GUADALAJARA, Spain)  
M. GARCIA(1), J. FLORES(1), L. TORRES(1), R. TORRUBIAS(1) - (1) PRIMARY CARE HEALTH (GUADALAJARA, Spain)

Introduction. Elderly people are de most expensive community for the National Health System. Prevention in Primary Care Health produces highest benefits. In this context Frailty appeared like one of de best index to evaluate community dwelling elders. Social Risk factors are less studied than others Frailty markers. Objectives: 1. to examine the prevalence of Social Risk factors. 2. To analyse relationship between Social Risk and others markers and demographic aspects. Methods and Materials. Cross sectional study through a survey carry out over a sample of elders at Guadalajara province(Spain) along de year 2002. The questionnaire contents social and clinical items and four evaluating scales: Folstein, Barthel, Yesavage and a specific Spanish social scale (five dimensions: social network to care, social support, participation, home facilities and incomes). Data base was analysed with logistic regression models (statistical significance p-value=0.05). Results. After elders loses (26.6%) a representative sample of 434 were studied (dwelling in rural communities, 56.7%, women, 51.4%, older age 85 years old, 12.7 %). The prevalence of Social Risk was 20.05%(95% CI,16.3-23.8). The distribution of this factors between eachother show significant difference in case of rural areas 65.5% (95% CI,56.5-74.6) age older 85, 34.3%(95% CI,26.3-42.4) and Dementia illness 71.4%(95%CI,48-95). When we analyse with Logistic Regression models only de age older 85, OR:3.1(95% CI,1.2-7.4) and Dementia, OR:11.3(95% CI,2-62.5) are explaining social risk in our communities. However it is not associated to depression, cognitive impairment, disability, polypharmacy, comorbidity and sex. Conclusions. Social risk appeared with a very large prevalence, like a independent factor only associated with age and Dementia. We need to take account this factor.

**PD6 689 PERSONHOOD FOR OLDER ADULTS RECEIVING NURSING CARE IN HOSPITAL: A CRITICAL REVIEW OF THE LITERATURE**  
E. MOODY\* (The University of British Columbia, Vancouver, BC, Canada)  
A. PHINNEY(1) - (1) The University of British Columbia (Vancouver, BC, Canada)

Introduction: As the Canadian population ages there will be increasing numbers of older people in the hospital who will require general and specialized nursing care. It is important to explore how nurses can best provide ethically sound care to older people while supporting physical and functional health in hospital settings. Ageism is a common occurrence in hospitals and affects the health of older adults. Personhood is an ethical concept reflecting the experience of being treated as a person in a social context that is not generally applied to older adults in hospital settings. In this paper I discuss the importance of studying the experience of personhood for older adults who are receiving nursing care in the hospital. Methodology: A critical systematic review of the current literature on personhood was conducted. Nursing and allied health literature was critically reviewed for how it can be applied to an older adult population by nurses working in hospitals. Findings:

Much of the research on personhood has been focused on the care of individuals with dementia or other forms of cognitive impairment and may not be directly generalizable to the older adult population. There are, however, important lessons to be learned from the literature on personhood in dementia care. Specifically, a conceptual framework which suggests research on personhood in dementia can be explored through three interconnected research domains can be a valuable way to explore personhood for hospitalized older adults. The three domains are: the subjective experience of the individual, the immediate interactional environment and the wider socio-cultural context. Conclusion: A framework developed to organize research on personhood in dementia care provides a foundation for a program of empirical research focused on the exploration of personhood in a general older adult population.

**PD6 690 COMPARATIVE STUDY OF THE HEALTH STATUS AND HEALTH CARE NETWORK OF OLDER PERSONS IN SOUTHERN TUNISIA (DOUZ) AND IN SWITZERLAND (GENEVA)**  
 A. CHETOUI \* (Direction Régionale de la Santé de Kébili, KEBILI , Tunisia)  
 A. CHETOUI(1), A. STÜCKELBERGER(2), R. DARWICH(2), P. CHASTONAY(2) - (1) Direction Régionale de la Santé de Kébili (Kélibi, Tunisia); (2) Programme de Santé Publique, Faculté de médecine, Université de Genève (Genève, Switzerland)

The gradual settlement of the nomadic population is a feature of socio-cultural change experienced in most parts of Northern Africa Regions during the past 50 years. Nevertheless, the organization of family life and social interaction in daily life maintains many traditions of the nomads in the Sahara. In the traditional context, the older person has a key role, thus benefiting from a traditional health structure and social integration, which is often very remote from modern health care. Hence, the traditional health system used by the older person and national aging policies could be counter-efficient and not adapted to the culture of the specific generation of older persons in these areas recently settled. This study was initially developed to analyze the health status of the population as well as the formal and informal care networks of older persons settled in the past decades in Douz (Southern Tunisia). The objective of the study is to 1) give a clear picture of the health status and the health care networks (formal and informal) in the region, 2) to analyze not only this network, but also the access and interactions in it, 3) to identify the high risk health behavior and psycho-social ways of coping with the health (coping, sense of control, health belief system). The second objective was to conduct a comparative study among elderly in Geneva (Switzerland) and in Douz (Tunisia) to highlight the contrasts and similarities between the two contexts. This may attest or not the relevance of applying a public health population study model to another context. Our study was conducted from February to March 2003 with a sample of 104 persons aged 65 and over and their families in the district of Douz. A semi-structured questionnaire was used for all participants and a translator Arabic-French accompanied the interviewers; for comparability purpose, the questionnaire used stemmed from the population survey conducted in Geneva and in Valais funded by the Swiss National Research on Aging (1991-1999). Specific socio cultural and health aspects in Southern Tunisia were added to the original questionnaire. The statistical analysis was conducted with Epi Info. The main result shows significant differences between the older persons in Douz and in Geneva: a) the informal health care network is more dense and active in Douz than in Geneva, b) their health is significantly lower, but could reflect the fact that older people can and want to stay in their home longer, thanks to an intensive family care support which responds to the cultural norm rather than to the official policy formal care system. Many recommendations can be made, but the most important one is that implementing a formal standard care system with occidental hospitals and care systems can be challenged by traditional care. Preserving traditional family care benefits many stakeholders, not only does it maintain family and social cohesion but it can avoid the increasing costs caused by the development of formal care observed in Europe. A reflection on the importance to develop a culture-sensitive research approach in different settings is underlined, and calls for a carefully look at attempts to standardize care without an ethical framework respecting traditions and cultures.

**PD6 691 EVALUATION OF THE POPULATION PROJECTIONS FOR JAPANESE - THE LIFE EXPECTANCY MODEL BY USING THE MIXED WEIBULL MODEL**  
 Y. OOE\* (Yao Municipal Hospital, Yao, Osaka, Japan)  
 T. FURUKAWA(2), T. NAGAKURA(3), Y. OHNO(4), S. YONEDA(1) - (1) Yao Municipal Hospital (Yao, Japan); (2) Osaka National Hospital (Osaka, Japan); (3) Osaka Electro-Communication University (Shijonawate, Japan); (4) Osaka University (Senri, Japan)

Introduction In Japan, the National Institute of Population and Social Security Research (IPSS) announces population projections every five years based on the Population Census. We announced population projections in Japan using the mixed Weibull lifetime model in 2003. In 2006, the IPSS announced the 13th Population Projections for Japan. Based on this estimation by IPSS, we examined the accuracy of our estimation of future population. Methods and Materials The 13th Projections is based on the 2005 Population Census. Our population estimation is based on the 2000 Population Census and by making the life table based on the transition of death rates of elderly people (which are compared to wear out failure) from 1965 to 2000. In this research, the anticipated number of people aged 65 and older and those aged 75 and older in 2025 according to the 13th Projections and our estimation were compared. The comparison was made simply in terms of the number of

elderly people. The aging index was not considered in this research because it significantly fluctuates depending on the expected number of births. Results Estimated number of people aged 65 and older based on the Weibull model was 38.9 million, which was 7.09% more than the 13th Projections. We had also estimated the number of people aged 75 and above 9.22% more than the estimation by the IPSS. The number of men aged 65 and above was estimated 2.70% higher, and those aged 75 and above 4.93% higher. The number of women aged 65 and above was estimated 11.6% higher, and those aged 75 and above 15.6% higher. Conclusion According to our analysis based on the Weibull model, the lifetime extension of Japanese people has not slowed down. We would like to further make comparison with the 14th Projections by the IPSS (2012).

**PD6 692 ADVERSE DRUG REACTIONS IN HOSPITALISED ELDERLY PATIENTS: A PROSPECTIVE STUDY**

B. TANGIISURAN\* (Brighton and Sussex Medical School, Brighton, United Kingdom)  
 J. WRIGHT(1), N. GAINSBOROUGH(1), K. ALI(1), G. DAVIES(2), C. RAJKUMAR(1) - (1) Brighton and Sussex Medical School (United Kingdom); (2) Brighton and Sussex Medical School (United Kingdom)

Introduction Adverse Drug Reactions (ADRs) are an important problem resulting in admission or an increase in length of hospital stay and are clearly costly. The aim of this study was to assess the incidence of ADRs in elderly inpatients in a UK university teaching hospital. Method A prospective review was conducted between January to March 2007 in Brighton and Sussex University Hospital (BSUH), and repeated at the same period in 2008. The study population included elderly patients ( $\geq 65$  years) admitted to four wards. The patients were monitored daily for ADRs by a single observer through review of their notes until discharge or death. Suspected ADRs were validated by an independent reviewer. Results Six hundred and ninety patients were reviewed during the study period. The median age was 85 (interquartile range 81-89) years; 61% female. Eighty six patients [12.5% (95% CI 10-14.9)] had at least one ADR during admission. A total of 95 identified overall. The ADR occurred at a median of 5 days (IQR 3-10). Characteristics Patients without an ADRs Patients with an ADRs N 604 86 7 (5-10) 10 (7.8-13)\* $p$ Number of medications 11 (7-19) 16 (10-26)\* $p$ Length of Stay p< = Median (IQR) $p$ 0.000; Conclusion In the group studied almost one in eight inpatients experienced an ADR. Patients with ADR were on significantly more medications and had longer lengths of stay.

**PD6 693 AGEING IN RUSSIA AND UKRAINE: A COMPARATIVE ANALYSIS OF CURRENT STATE AND FUTURE TRENDS**

G. SAFAROVA\* (Saint-Petersburg Institute for Economics and Mathematics, Russian Academy of Sciences, Saint-Petersburg, Russian Federation)  
 S. PIROZHKOVA

In Russia and Ukraine where since the collapse of the USSR in 1991, old people have experienced numerous shocks that have worsened their living conditions and health status ageing issues are highly important. In a globalizing world comparative studies present interest from both theoretical and practical point of view. The study aims at analyzing current state and future trends of ageing in Russia and Ukraine within European context. The study is based on censuses and vital statistics; materials of Council of Europe, Eurostat, UN DESA, Human Mortality Database (Max Plank Institute for Demographic Research) are used. Analysis of age structure changes has been made. To characterize the situation with ageing a number of conventional ageing indicators have been computed for the period 1989 – 2007. Future trends of ageing up to the year 2050 are studied based on probabilistic projections. Great increase in the proportion of the elderly and decrease in that of children in the post-war period take place in both countries. Ageing trajectories in Russia and Ukraine have been similar, values of considered ageing indicators for Ukraine being higher. Both countries are projected to follow monotonically decreasing trajectories. Ageing is expected to continue but increase in the proportions of the elderly will not be monotonous. Proportions of the elderly for Russia/Ukraine and developed European countries are converging, while life expectancies at older ages behave differently - for Russia/Ukraine they are much lower. Substantial rural/urban and male/female differences have been found, for Russia/Ukraine gender disbalance being more marked than that for developed European countries. Results obtained may contribute to better understanding of ageing regularities not only in Russia/Ukraine but in the whole Europe. Showing similarities and diversities in ageing dynamics in Russia and Ukraine, the study results may be useful in sharing positive experience in population policy forming.

**PD6 694 RURAL-URBAN DIFFERENCES IN REPORTED HEALTH STATUS BY OLDER PERSONS IN KOREA**

M. LEE\* (Hansei University, Gunpo-city, Korea, Democratic People's Republic of)

The objectives of this research are to explore residential disparities between rural and urban areas in self-rated health status of older persons that aged 65 years and over in Korea. Despite the rapid increase of older population, a national profile on the health status of old individuals remains far deficient in Korea. Data for the analysis are from the public-use data files developed as part of the 2008 Elderly Living Condition Survey data base, conducted by the Korean Institute of Health and Social Affairs. The data sets contain information for 9,355 households and 2,535 older persons aged 65 and over using random

stratified cluster. To answer whether it is true that the elderly people living in rural areas are disadvantaged in self-rated health status, simple frequency counts, proportions, and chi-square tests have been used. Socio-demographic characteristics and self-rated health status including chronic illnesses, ADLs, IADLs, and MMSE scores have been analyzed by area of residence. The results show that there is a significant variability in the characteristics of older persons that aged 65 years and over by area of residence. Compared to their urban counterparts, 1) in terms of socio-demographic factors, those elders residing in rural areas are older, and have a higher proportion of spouse households, lower education levels, and lower monthly household income; and 2) in terms of self-rated health status, they are better situated in terms of chronic illnesses but worse situated in terms of ADLs, IADLs, and MMSE scores. Study findings that there are significant rural-urban differences in self-rate health status of older persons suggest that it is vital for planner and providers to take residential disparities into account when designing and formulating community-based long-term care service programs.

**PD6 695 PROMOTING MULTI- AND INTERDISCIPLINARY AGEING RESEARCH IN THE UNITED KINGDOM**  
C. HENNESSY\* (University of Plymouth, Plymouth, United Kingdom)  
P. WALKER(1) - (1) University of Sheffield (Sheffield, United Kingdom)

**Introduction:** Despite the growing awareness of the value of discipline spanning research on ageing, many common but significant barriers to interdisciplinary collaboration persist. In view of these barriers, government and other scientific funding bodies worldwide are actively involved in establishing the methods and means to promote cross-disciplinary cooperation in the field. In the United Kingdom, since the late 1990s, national Research Councils with key interests in ageing and older people have been actively pursuing the development of programmes of research which feature multi- and interdisciplinarity. **Methods and materials:** This presentation reviews key developments in the promotion of multidisciplinary science on ageing in the United Kingdom including Research Council programmes and other strategic initiatives. It details the approach to multi- and interdisciplinary research developed by the authors in the National Collaboration on Ageing Research, a partnership among four of the Research Councils to stimulate cross-disciplinary collaboration through working with scientists, funding bodies, and research end users. The presentation highlights how this approach is being pursued in the New Dynamics of Ageing (NDA) Programme (2005-2012), the largest programme of multidisciplinary ageing research to date (£20 million) in the United Kingdom which spans the social, medical, biological, and engineering sciences, and the arts and humanities. Examples of how cross-disciplinary working is being stimulated in the NDA are provided including the incubation of interdisciplinary research teams under the programme's Preparatory Networks scheme. **Results and conclusions:** This overview of some of the major programmatic developments in the promotion of multi- and interdisciplinary research in the United Kingdom identifies and discusses the rationale behind and key features of these efforts. As a successful innovation in providing infrastructural and intellectual support to scientists working across a broad range of disciplinary affiliations, the NDA Programme is offered as a potential model for other research funders.

**PD6 696 ESTIMATING POPULATION SIZE FOR MICRO MINORITY POPULATION GROUPS: ESTIMATING ELDERLY INTERCENSAL DENOMINATORS**  
J. MCNALLY\* (University of Michigan, Ann Arbor, United States)  
S. PANAPASA(1) - (1) University of Michigan (Ann Arbor, United States of America)

Measuring growth, change and health disparities among minority sub-populations in the United States is limited by the lack of reliable population estimates, particularly in terms of their elderly populations. The lack of baseline denominator information is unfortunate, as what were once considered small migrant groups have rapidly exerted a growing influence on the composition of the US population, particularly in the case Hispanic and Asian/Pacific Islander (API) groups. These demographic changes have significant implications for our understanding of the growth of the elderly populations in the US as labor force migration, late life family reunification and emigration to the country of origin all impact the accuracy of demographic estimates of population change. A grounded understanding of challenges to making estimates for sub-populations is essential as we increasingly recognize the role of internal heterogeneity within minority populations and wide variations in health outcomes, longevity and the need for public services within minority groups. Without denominator population estimates, we cannot accurately examine either the risks of the disease process or the potential cost of disease to the health care system. This paper presents a statistical approach to estimating adjusted growth projections that address the internal heterogeneity within minority populations in the United States. The analysis presented is an examination of API populations which face not only the impacts of migration on expected population size but also the effects of changes in the 2000 Census of Population which allowed people to self-identify race and ethnicity including designations of bi-racial or multi-racial classifications. We present a series of re-

weighted population estimates that identify the growth of the elderly API population between 1990 and 2000 from the perspective of the 1990 and 2000 definitions.

**PD6 697 THE ORGANIZATION AND USE OF SCALE DATA IN AGING RESEARCH: IMPROVING MULTIDISCIPLINARY RESEARCH OPPORTUNITIES**  
M. SAYRE\* (University of Michigan, Ann Arbor, United States)  
J. MCNALLY(1) - (1) University of Michigan (Ann Arbor, United States of America)

The ongoing recognition of the importance of scales in aging research and analysis is well established. Many surveys that routinely collected basic variables on a variety of topics including health, and socioeconomic status also either employ or create scale measures how specific behaviors were outcomes. Established projects routinely collect scale information but the composition, application and interpretation of the constructed scales can vary wildly, depending upon their specific research focus. Recently, a growing interest in the variety of scales available, their protocols, and their application in multidisciplinary research reflects the growing acceptance of this approach within mainstream social survey research. The growth in both the collection of information necessary for the construction of scales and the development of analytic models that incorporate a variety of scales in research frameworks argues that our science will benefit only if we can achieve a systematic understanding of how scales are collected across disciplines, how they are organized and how results from scales are interpreted. With greater multidisciplinary understanding we can more broadly introduce this kind of information into our research models. This poster presents an overview of recent work to catalog and systematically review the use of scales in social research at the NACDA Program on Aging. The poster reviews on how various types of scales on the aging lifecourse are collected and how different disciplines use different strategies in survey design and the creation of questionnaires and how this impacts collection protocols. The poster also introduces a summary of potential extensions of these various approaches to scaling information to social based research and how overcoming differences in technical language will overcome barriers to collaborative research between social and physical science practitioners.

**PD6 698 IMPACT OF WALKING SPEED ON THE ONSET OF FUNCTIONAL DEPENDENCE AND MEDICAL AND CARE COSTS IN JAPANESE OLDER ADULTS**  
H. YOSHIDA\* (Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan)

N. MARIKO(1), S. SHINKAI(1) - (1) Tokyo Metropolitan Institute of Gerontology  
(Tokyo, Japan)

**Introduction:** This study examined the impact of walking speed on the onset of functional dependence and medical and long-term care expenditures in Japanese older adults. **Methods and materials:** The subjects were those aged  $\geq 70$  years ( $n=512$ ) who participated in the baseline health-check (2002) in Kusatsu, Gunma, Japan. We followed up 406 individuals (79.3%) who did not receive any services under the long-term care insurance at that time until the end of October 2005 (3.3 year-period). We classified the subjects into three groups according to the baseline walking speed (m/min): low, middle and high walking speed groups,  $<60.0$  m/min ( $n=99$ ),  $60.0\text{-}81.1$  m/min ( $n=212$ ) and  $\geq 81.1$  m/min ( $n=95$ ). We identified the onset of functional dependence during the course, defined as the state at which a person started to receive any services under the long-term care insurance or died. We compared the period to the onset of functional dependence, the accumulated medical and long-term care expenditures over the follow-up period among the three walking speed groups. The Cox-proportional hazard models were used to examine the independent association between baseline walking speed and the onset of functional dependence with adjustment of potential key confounders (sex, age, important medical conditions, and self-rated health). **Results:** 41 subjects (10.1%) exhibited the onset of functional dependence. The adjusted hazard ratio (HR) against the onset of functional dependence was 2.07 (95% CI: 1.01-4.21) for the low walking speed group compared with the middle walking speed group. The accumulated medical and long-term care expenditures per capita per month were also higher in the low walking speed group compared with other two groups. **Conclusion:** Walking speed was not only a good predictor for the onset of functional dependence in the Japanese non-disabled older adults but had a strong impact on the future medical and long-term care expenditures.

**PD6 699 A STUDY ON THE CONSUMPTION EXPENDITURE DEPENDING ON RETIRING AGE**  
C. HYEJIN\* (Seoul National University, Seoul, Republic of Korea)  
C. HYUNJA(1) - (1) Seoul National University (Seoul, Republic of Korea)

Aging process of population alters the size and pattern of consumption by individual families and it is imperative that consumer's expenditure should be well adjusted. It is also very important to understand the proper level of consumption varied according to the time of retirement since the involuntary retirement is increasing since the financial crisis in 1998. Therefore this study will prove and analyze the consumer's expenditure by categorizing the retiree into early retirement(under 55 years of age), regular retirement(56-65), delayed retirement(over 66 years of age) and comparing the consumption. In order to do this, Korea Labor Institute conducted technical statistics, frequency analysis and

ANOVA on 268 retired families out of object families of 6th edition of Korea Labor and Income Panel Study to understand the structure of consumption and verified the difference of groups depending on the time of retirement. According to the result of the study, it was revealed that there was a big difference of expenditure according to the time of retirement. For the total amount of expenditure, the early retired family spent 15,510,000 won, Regular retired families spent 11,370,000 won and the expenditure of late retirement family was 669,000 won which was less than half the amount spent by early retirement families. The total expenditure compared to the total income is 83.6 % for early retired families, 59.6% for regular retirement and 77.1% for delayed retirement families, which showed that the expenditure of early retirement families are the largest. Through this study, we obtained the results which supports the preceding studies showing that the time of retirement greatly influences the consumption. The result of this study can be used as basic materials to design retirement on the basis of age.

#### **PD6 700 THE COSTS OF AGEING - A STRUCTURED STUDY ANALYSIS**

A. ESSLINGER\* (FAU Erlangen-Nuremberg, Nuremberg, Germany)  
J. BREITINGER(1), R. PRESS(2) - (1) FAU Erlangen-Nuremberg (Nuremberg, Germany); (2) FAU Erlangen-Nuremberg (Nuremberg, Germany)

The subject "costs of ageing" is becoming more and more important as ageing is a global phenomenon. Health care costs of ageing societies rise continuously and budgets are limited. Experts in the sector have to take allocation decisions. Therefore, they have to get insights about the future development of the costs of ageing. In order to get deeper insight one has to understand common theoretical approaches in this field. There exist three main theories: the theory of "expansion of morbidity" [Gruenberg 1977], the theory of "compression of morbidity" [Fries 1980] and the theory of "dynamic equilibrium" [Manton 1982]. The scientists surveyed 39 studies published between 1993-2008, detected by the use of databases (DIMDI, MEDLINE, NCBI, PUBMED, Metager, Google Scholar and EbscoHost). The studies were analyzed and structured by criteria such as theoretical approach, impact of costs, considered health care sector, country, database, duration of investigation, size of sample, age groups, results, and limitations. It turned out that there does not exist "one best way" of theoretical explanation. In contrary, each theory was supported by the different studies. Earlier work and studies was mainly undertaken in the USA, but later on scientists all over the world scientists undertook research in this field. The origin of data often is based on availability. The sizes of the samples show broad variety. The concerned age groups differ and the studies vary concerning their impact of costs and sectors. In order to get best results about the subject "costs of ageing", it is necessary to investigate a broad study. The design has to concern environmental factors. It must be based on independent data and has to be representative and longitudinal. It has to include all sectors of health care. Such a profound study could set a milestone for future decisions in the health care sector.

#### **PD6 701 ECONOMIC RATIONALITY AND MANAGEMENT STRATEGIES OF LONG-TERM CARE SUPPLIERS: A STUDY ON THE FRENCH NURSING HOME MARKET**

R. DE ALBUQUERQUE DAVID\* (Université Paris Dauphine, Paris, France)

Introduction The long-term care (LTC) sector is expected to represent a major interest in view of the further demographic development, putting a stress on LTC provisions. Nevertheless, if LTC research in economics constitutes a broad field to explore, it remains poor in France, especially for microeconomic studies. Methods and materials On one hand, this paper aims to present the intermediate results of my PhD thesis. It focuses on a review of the literature about microeconomics of long-term care supply. On the other hand, the study purposes to use statistical and econometric treatments of a survey dataset on nursing institutions providing LTC (skilled nursing facilities). Results The literature review seems to indicate that ownership (for-profit, non-profit or state-owned) has some influence on the structure and the performance of nursing homes, even if results are often contradictory. About the characteristics of LTC market in France, it is still not consolidated. The perspectives of the fast growth of demand for nursing home services seem to have an impact on the development of for-profit supply. As a result, new strategies appear such a movement of concentration due to the financial burden imposed by the compliance with growing security and technical standards. Among other factors, these standards contribute to improve quality. Nevertheless, they are also source of costs inflation since the literature points out that a higher quality care implies a higher price to users. As a consequence, the accessibility of LTC is reduced and increasingly submitted to mechanisms of selection of patients, which mainly bear their own LTC charges because of the current price-setting and public financing schemes. Conclusion The knowledge of the french nursing home industry must be improved, as well as researches about the determining factors of consumers' choices (in an environment where information asymmetry exist). Indeed, we still know very little about the rationality and the economic strategies of the agents of the field. This work is a contribution to partially fill this gap.

#### **PD6 702 DEVELOPMENT OF A FINANCIAL MODEL FOR GERIATRIC DAY HOSPITALS (GDH).**

D. GILLAIN\* (University Hospital of Liège , Liège, Belgium)  
F. FECHER(2), A. VELGHE(4), X. BOMAN(3), L. KOHN(5), C. LEONARD(5), F. MAMBOURG(5), N. VAN DEN NOORTGATE(4), J. PETERMANS(3) - (2)

Department of economics, University of Liège (Liège, Belgium); (3) Geriatric department CHU Liège (4000, Belgium); (4) Geriatric department UZ Gent (Gent, Belgium); (5) Belgian Health Care Knowledge Centre (Belgium)

Background: In order with the growing number of frail elderly, geriatric day hospitals (GDH) are developed all over the world. However financial models taking into account the geriatric profile are rare. This study wants to test a financial model taking into account the patient profile and level of activity of the GDH. Material and methods: From October 1 till December 31st 2006, all patients admitted in 45 belgian GDH were registered (n=2750) for patient demographics, performed activities (diagnosis, assessment, therapy, revalidation) and available assessment instruments. To find paired inpatients in acute beds, an administrative database which contains clinical and National Health Insurance billed data (FY 2003)was examined. Therefore, a group of patients whose hospitalization could have been avoided partially or totally was collected out the FY 2003, comparing their profiles with those of the GDH population in 2006. Results: to build the financing model, 3 components were implemented: (i) a fee-for-services which will only occur for the financing of the geriatrician, (ii) an admission fee which is an hospital-specific lump sum allocated for each admission in acute bed by the federal authorities, and (iii) a fee-per-pathology. The basic amount of this last package corresponds to the per diem fee used in classical hospitalization. As the package by admission, it is specific to the hospital and does not depend on the pathology. The pathology-related dimension is obtained by multiplying this package by the average number of days when similar patient stays in classic hospitalization. Conclusion: The final model seems equitable; it advantages the GDH which demonstrates a justified activity, with a suitable volume of patients (number of admissions per day), and a heavy case mix. In the proposed framework the budget, actually assigned in the pilot project, for the implementation of the GDH, is globally respected.

#### **PD6 703 A MARKOV MODEL OF THE COST EFFECTIVENESS OF DISEASE MANAGEMENT PROGRAMS IN ALZHEIMER'S DISEASE**

T. LAVAUD\* (Université Victor Segalen - Bordeaux 2 , BORDEAUX, France)

Alzheimer's Disease (AD) is a primary degenerative disease of the brain, characterized by cognitive and physical decline and an overall loss of independence. In France, nearly 860 000 individuals were estimated to have AD in 2004. According to the demographics' studies, AD could affect 2,16 million of elderly in 2040. The cost of AD is estimated at €9,9 billion and the health care expenditures will continue to rise, because there is no method to prevent or cure AD. The patients require long term care, associating with medical problems, social, psychological and financial problems. They need an active participation of the caregivers and a therapeutic education. A lot of professionals must take care of the patient : general practitioner, nurse, cleaning woman, ... Nevertheless, this variety of caregivers doesn't allow an optimal coordination of the health care. A possible solution is the development of the Disease Management (DM). These programs consist in bringing a support for the patient by bringing them informations relatives to their pathologies and advices on the adaptation of their way of life. Trials have shown the clinical effectiveness of the DM programs with different results : better quality of life for the caregiver, institutionalization delayed, fewer behavioural disturbances,...Despite trials showing effectiveness of the trials, there has been no formal published cost-effectiveness analysis of AD DM programs. In this study, we compare the expected costs and outcomes for a cohort of patient with AD who are (a) selected or (b) not selected for a preventive AD DM program. We constructs a Markov state-transition model using the Paquid study data for AD patient progression. Outcomes estimates includes the incremental cost-effectiveness ratio and cost per quality-adjusted Life-years gained. We hypothesizes that the preventive AD Disease Management program provides saving costs for patients.

#### **PD6 704 THE COST OF ILLNESS AND BURDEN OF DEMENTIA DISORDERS IN EUROPE**

P. KENIGSBERG\* (Karolinska Institute, Stockholm, Sweden)  
A. WIMO(5), K. ÉRSEK(1), L. GULACSI(1), A. GUSTAVSSON(4), A. JACQUES(6), L. JÖNSSON(4), K. KARPATI(1), . MCDAID(8), H. VALTONEN - (1) Corvinus University, Budapest, Hungary (Budapest, Hungary); (4) London School of Economics (Budapest, United Kingdom); (5) Karolinska Institute, Stockholm, Sweden (Sweden); (6) Alzheimer Europe, Edinburgh (United Kingdom); (8) London School of Economics, London, (United Kingdom)

Introduction The EuroCoDe (European Collaboration on Dementia) project from Alzheimer Europe convened an international group of economists to estimate cost of illness and burden of dementia disorders in the 27 European Union countries (EU27). Materials and methods A literature review was conducted for papers reporting cost of care for people with diagnosed dementia or possible/probable Alzheimer's disease; Two approaches were used: a bottom-up approach allowing stratification on disease severity and different cost types, and top-down cost of illness studies. Prevalence figures used for cost of illness estimates (7.2 million people with dementia in EU27) were based on a new EuroCoDe meta-analysis combined with population statistics from the United Nations. European cost model was built using 14 papers where both direct and indirect costs could be identified. For countries where no cost-of-illness figures were available, imputation was used, based on 4 identified care patterns: Northern (mainly formal care); Western (mix between formal and informal care), Southern and Eastern (mainly informal care).

Imputation figures were also adjusted for differences in gross domestic product per person between countries. Results Estimated total cost of illness of dementia disorders in EU27 in 2008 was 160 billion euros (1.3% of GDP), of which 71.7 billion (45%) were direct costs and 88.6 billion (55%) indirect costs. Annual costs per person with dementia were 22,194 €, of which 9,925 € in direct costs and 12,270 € in informal care. Burden of dementia disorders was 2.12 million DALYs (disability-adjusted life years) in EU27, or 441 DALYs/100,000 persons. Burden of dementia disorders is higher than burden of diabetes (1.29 million DALYs and 268 DALYs/100,000 persons in EU27). Conclusion Cost and burden of dementia disorders are high. Economic database for dementia is still small, although expanding. Methodology for economic data collection should be improved, and more data should be collected in Eastern Europe.

**PD6 705 BARRIERS TO CAREGIVER EDUCATION IN ALZHEIMER'S DISEASE**

S. PARIEL\* (Service de gériatrie et consultation mémoire, hôpital Charles Foix et Université Paris 6, Ivry sur seine cedex, France)  
E. FREDIANI(1), P. RODRIGUEZ(1), O. MASSIERE(1), C. OASI(1), J. BELMIN(1) - (1) service de gériatrie et consultation mémoire, Hôpital Charles Foix et Université Paris 6 (Ivry sur seine, France)

Background: Caregiver (CG) education is a major component for the management of Alzheimer's disease (AD), but many CG do not participate in educational programs, even when those are available. Objective: To understand why CG of AD patients did not participate to an educational program that has been proposed to them. Methods: During one year, all CG of AD patients attending to one clinic were proposed to participate in a free educational program. This included 4 three-hour group-sessions and 3 one-hour individual sessions, distributed for 2 months. An interviewer not involved in educational programs gave a phone call to CG who declined participation and ask to answer to 8 predefined questions designed to understand why they declined it. CG were asked to provide open comments. Results: Among the 28 CG called, 22 responded, 8 males and 14 females, including 8 spouses and 14 children or relatives. 8 CG lived with the AD patient. Three CG had forgotten the proposal to participate; 11 declined participation because they thought that care to the patient is more important than care to CG; 6 preferred to delay education until conditions became difficult. Seven thought they had enough information about AD; 5 did not want to get more information. Nine had difficulties to leave their patient alone to attend the program. Six were mistrustful of healthcare professionals. Eight felt that they were not sufficiently incited to participate by healthcare professionals. All CG outlined 2 reasons or more for declining participation (mean 4.0 +/- 1.6 reasons). CG comments showed that 10 CG had strong difficulties to cope, and 5 other underscore difficulties related to the situation. Conclusion: CG declined participation in educational program because of multiple and miscellaneous reasons. Understanding them might help improve their involvement in educational programs.

**PD6 706 AGING IN CONTEMPORARITY: TEACHING COMPUTER SKILLS FOR ELDERLY PEOPLE**

I. IRACEMA DE LIMA ARGIMON\* (Pucrs, Porto Alegre, Brazil)  
C. SARAIVA(2), I. ARGIMON(1) - (1) PUCRS - Pontifícia Universidade Católica do Rio Grande do Sul (Porto Alegre, Brazil); (2) Pucrs, Programa de Pós Graduação em Psicologia (Porto Alegre, )

The spread of technology among the society occurs at the same time Brazilian population is getting older. So, there is a demand for living the next years with a high quality of life. With the purpose to understand if there is a real contribution of computer science learning in healthy ageing, this study analyzed why some old people look for computer science lessons, interpreting the existence of multiple reasons in this apprenticeship process. The study counted with 20 elderly people who were 60 or more years old and that were studying or had already studied computer science. A socio-demographic form, organized for the study, the BDI-II and a semi-structured questionnaire were applied. The obtained data were analyzed by quantitative and qualitative methodologies, using Excel spreadsheet and Bardin's content analysis. It was verified a high socio-economic level, with a great incidence of female participants (75%). The most part of the sample (45%) were in the range between 71 and 80 years old and, in this range, were married, having operated computers for more than 3 years. The participants expressed how they have changed their behavior towards computers, the acquisition of self-efficacy and the importance of the relationship between teacher and learner. They also have shown a will to keep themselves inserted in the contemporary world. Besides, they related the pleasure of learning and the need of effectiveness in relationships. The teacher is a transformation agent who must have aging and computer knowledge, as well as being perspicacious, emphatic and patient, adapting the teaching to the rhythm and interest of each student. Finally, it was concluded that the computer, with all its possibilities, both in terms of knowledge, as of overcoming and reporting, may be another tool of helplessness to keep the person active and, therefore, aging in a healthy way.

**PD6 707 SENIOR-FRIENDLY COMPUTER INTERFACE TO ENHANCE LEARNING AND INDEPENDENT USE OF EMAIL AMONG SENIORS**

M. BORRIE\* (The University of Western Ontario, Toronto, Canada)  
J. LO(1), A. MENDEL(3), D. BORRIE(5), R. RUPSINGH(2) - (1) Biomedical Engineering Graduate Program, The University of Western Ontario (London, Canada); (2) Medical Biophysics Graduate Program, The University of Western Ontario (London,

Canada); (3) Department of Physiology, McGill University (Montreal, Canada); (5) Parkwood Hospital, St. Joseph's Health Care (Canada)

Introduction: Many senior adults have trouble or anxiety when learning to use the computer. Computer technology is unfamiliar to many of the elder generation, making it harder to learn tasks such as writing and reading email. In addition, vision, hearing and/or motor impairments can cause visual displays and audio cues to be misinterpreted and make the keyboard and mouse difficult, if not impossible, to use. To alleviate age-related computer difficulties and to encourage the use of computers among seniors, SoftShell Computers™ has designed a senior-friendly computer interface. Featuring large font and buttons, narrated user prompts, simplified instructions, touch-screen and voice-recording, this novel computer interface is intended to make email technology more accessible for seniors. Methods: Elderly subjects (78.9yrs+/-8.1) with little to no computer experience, were taught to login, read and write email on two interfaces: (1) Windows Live Hotmail® and (2) SoftShell Computers™. The time taken in seconds(s) and the number of errors made for each condition were recorded. A paired t-test, with significance set at 5%, was used for all comparisons. A subjective pre and post-study questionnaire assessed user confidence. Results: For the login task, users performed 78% faster using SoftShell™ (21.5s+/-6.3) versus Windows® (96.2s+/-61.3)( $p<0.005$ ). For writing an email, users performed 73% faster using SoftShell™ (58.7s+/-27.8) versus Windows® (216.2s+/-147.7) ( $p<0.01$ ). No difference was found for reading emails ( $p=0.197$ ) nor for number of errors made ( $p=0.12$ ). On average, SoftShell™ received a higher ranking based on a confidence scale of 1-5 (1=least confident, 5=most confident), although not significantly. Six of ten subjects preferred to use SoftShell™; the remaining four were comfortable using either system. Conclusion: These early results suggest that email is easier to learn and use with the SoftShell Computers™ interface. The SoftShell™ interface can increase the confidence level of elder users in using computer technology.

**PD6 708 CHINESE DIABETIC PATIENTS' COMMUNICATIVE HEALTH LITERACY: VIEWS FROM HEALTH PROFESSIONALS**

A. LEUNG\* (The University of Hong Kong, Hong Kong Special Administrative Region, China)  
D. CHU(2), S. CHAN(1), W. SHUM(3) - (1) The University of Hong Kong (nil, China); (2) Hospital Authority (nil, China); (3) Hong Kong Sheng Kung Hui Welfare Council (nil, China)

Introduction: Communicative health literacy, the ability to extract health information and derive meaning through communications, has been a concern in the field of health promotion. Little is known about the communication between diabetic patients and health professionals in Chinese society. This study aims to portray how doctors and nurses view Chinese older adults' ability and barriers to retrieve health information in clinical settings. Methods and materials: This qualitative study comprised of two focus groups (one for 6 nurses and the other for 5 doctors) which were performed in November/December 2008. Interviews were semi-structured and guiding questions were used to facilitate discussions. Each interview lasted for one and a half hour. All the interviews were carried out in Cantonese and audio-taped. The content was transcribed verbatim and then coded by two independent researchers. Result: Doctors and nurses perceived that most of the diabetic patients were capable to obtain and understand essential health information through individual or group counseling. They welcomed patients to ask questions and agreed that interactive communication was crucial. However, external factors (such as time constraint, manpower issue, confusion due to massive information from the Internet) and personal factors (such as language, low literacy level, Chinese cultural belief and mood problems) may hinder individuals' ability to communicate better with health professionals. Different strategies (such as "teach back" technique, authoritative figures, pictures or models, rapport building) were used to enhance communication. Conclusion: These findings encourage clinical practitioners to take a closer look to the issues and barriers in communicative health literacy. The current study is of significant importance to contribute to health literacy arena with Chinese culture and with information about people with diabetes mellitus.

**PD6 709 NATIONAL INITIATIVE FOR THE CARE OF THE ELDERLY (NICE): INTERNATIONAL NETWORKING AND KNOWLEDGE TRANSFER TO IMPROVE THE CARE OF OLDER ADULTS**

A. LOMBARDO\* (National Initiative for the Care of the Elderly (NICE), Toronto, Canada)  
L. MCDONALD(1) - (1) National Initiative for the Care of the Elderly (NICE) (Toronto, Canada)

Introduction: Canada, like many other countries, faces an aging population and significant challenges in meeting its needs, including a gap between evidence and practice and a dire shortage of professionals who can provide specialized care to older adults. The National Initiative for the Care of the Elderly (NICE) is a Canada-based international knowledge transfer network of researchers, practitioners, students and seniors dedicated to addressing these challenges. The network focuses on (1) moving research into practice and (2) improving education and training for students and practitioners in the field of aging. Methods: NICE has over 700 national and international members and institutional partners.

NICE operates through interdisciplinary "Theme Teams" and Committees in specific areas of elder care. The teams use evidence-based research to develop interdisciplinary, team-based tools which are disseminated through professional development initiatives. NICE Committees develop interdisciplinary resources to lobby for curricula changes; improve enrolment in aging-specific programs and careers; and promote professional development. Results: NICE "Theme Teams" have developed and disseminated numerous tools, aimed at practitioners, seniors, and seniors' friends, families and caregivers. NICE Committees have developed a compendium of core interdisciplinary competencies in geriatric care as well as a database of key teaching resources available online. NICE administers a Student Mentorship Program to attract and retain students to the field. Our international partners facilitate a mutually beneficial exchange of knowledge. Conclusion: NICE uses an innovative model of networking and knowledge transfer to improve the delivery of care to older adults. Networking and knowledge transfer is essential to ensure that (1) knowledge creators and knowledge users collaborate to create resources which respond to identified needs; (2) researchers and practitioners are aware of the work of their colleagues across the globe; and (3) rigorous research is put to practical use, to improve quality of care and quality of life for older adults.

**PD6 710 EXPECTATIONS OF PROFESSIONAL CARERS FOR ELDERLIES ABOUT TRAINING ON ALZHEIMER'S DISEASE IN THE HEALTHCARENETHVARSITY PROJECT.**

M. SEUX\* (Broca Hospital, Paris, France)

S. MEHRABIAN(1), I. MIRALLES(2), M. COHEN(3), Y. ABECASSIS(4), R. SKALKIS(5), M. ESCULIER(6), A. RIGAUD(1) - (1) Broca Hospital (France); (2) Foro Formacion (Spain); (3) OSE (France); (4) Clic-Facil (France); (5) Vilnius Hospital (Lithuania); (6) ORT (France)

Introduction : The early and accurate diagnosis of Alzheimer's disease (AD) is essential for the best disease management. Because nurses, social workers and care assistants are daily in contact with elderlies, it is important to improve their ability to recognize early signs of illness. In the frame of the HealthCareNetVarsity (HCNV) European project cofunded by the European Commission, an innovative blended learning program (eLearning combined with face-to-face sessions) was designed to provide the competencies to better understand and recognize the dementia but also to better act. Expectations about contents and training methods were assessed before its development. Methods: A questionnaire for needs analysis was distributed to a panel of nurses, social workers and carers working with elderlies in Spain and France. Results: Respondents were 218 individuals (121 French - 97 Spanish) mainly nurses, social workers and home-care assistants. Demographic data were similar in the two groups. Only 38% of the French group and 47% of the Spanish one have attended a course about AD. Among them, 65% of the French group and 78% of the Spanish one, expected further training to improve their knowledge or skills. Lack of time and cost were the main reasons for not following previous courses. Concerning training methods, 38% of French and 41% of Spanish respondents preferred eLearning rather than face-to-face and paper-based training sessions. In Spain all those (whereas 75.7% in France) who preferred eLearning have a higher level of education. Conclusions: In the two European countries the majority of professionals working with elderlies received a limited specialised training about dementia. New technologies such as eLearning (on-line courses, collaborative platform, multimedia contents, virtual classrooms...) could bring a solution to enhance quickly the knowledge of health care professionals. Input of eLearning methods has to be evaluated in target groups based on educational level.

**PD6 711 DIGITAL INCLUSION IN LATER LIFE: MOTIVATION AND OUTCOME OF COMPUTER CURSES IN SOUTH-BRAZIL**

J. DOLL\* (Federal University of Rio Grande do Sul, Porto Alegre, Brazil)

S. NEVES DE OLIVEIRA(1) - (1) Federal University of Rio Grande do Sul (Porto Alegre, Brazil)

Introduction The contemporary societies are marked by changes in social structures and in technological innovation, creating new forms of exclusion, especially for older adults. In this situation, processes of digital inclusion could provide new chances, despite the risk of also creating new dependencies. In this contradictory context, the paper aims to examine the reasons why adults and older adults attend courses of introduction to use the computer and what are the outcomes of such courses. Methods There are analyzed three different groups who participated in courses on digital inclusion within the last 7 years: workers of the metallurgical industry, general public over 45 years, and members of Senior groups. During the course, half-structured interviews with the participants were realized to access the reasons and the motivations of the participation. Several months after the course, the participants were contacted by telephone to see the actual utilization of the computer. Results The way, people come to realize computer courses, has a strong influence on the motivation: while the metal workers and the Senior groups showed stronger external motivation, both participated by invitation, or of the company or of the group coordinator, in the courses opened to the community appeared more internal and specific motivation: to communicate, to be independent, and for work. Several months after the course, most of the participants of the worker group and the Senior group didn't have used the computer since the course, while most of the group of general public continued using the computer. Conclusions Only realizing a computer course is certainly not sufficient to include adults and elderly in the digital world. Beside the motivation and the access, the most important

thing is that the utilization of a computer makes sense for the adults or elder adults to maintain the contact with the digital world.

**PD6 712 QUALITY OF LIFE IN NURSING CARE - APPLICATION OF APPRECIATIVE INQUIRY IN TEACHING PROJECTS**

B. KLEIN\* (Fachhochschule Frankfurt am Main - University of Applied Sciences, Frankfurt am Main, Germany)

Introduction To present the impact of demographic changes is a major challenge in teaching students in sociology, social work and nursing. Media often concentrates on scandals in care homes and present a picture of old age which is characterised by bad health status and high care needs. How is life in old age in reality, especially if people are in need of care? How do people of high age define quality of life? What do they dream about and try to achieve? Methods and Materials In the seminar students got an insight in the structures of geriatric care in Germany as well as different aspect of quality of life. They were taught the principles of the method "Appreciative Inquiry". Ethical requirements from professional bodies were introduced and students had to transfer these issues on the project they were performing. The approach "Appreciative Inquiry" has been developed by David Cooperider. This method is a particular way of asking questions and envisioning the future that promotes positive relationships. Based on the goodness in a person it focusses on the positive of a situation or an organisation, and utilizes a four-stage process: - Discovery – Appreciating what gives life - Dreaming – Envisioning what might be - Designing – Determining what will be - Delivery – Planning what will be (Reed, Jan: Appreciative Inquiry, 2007) Today, Appreciative Inquiry is mainly used in organisational development. The approach supports a system's capacity for collaboration and change. However, Jan Reed proposes also (as it was done in the start) to apply the method for research. In an international research project on »Managing Well-being in Old Age (people aged 65plus) – Appreciative Inquiry as Research method in the UK, Australia, Germany and South Africa« funded by Northumbria University in England, the method proved to achieve interesting results on factors attributed to well-being. The idea came up to use Appreciative Inquiry also in a setting where care needs were more advanced and quality of life factors probably slightly different to those living independently. Students developed in teams a research approach interviewing: - Elder people in different living settings (at home, flat (house)-sharing communities, care homes) - care staff - persons in the entertainment business offering services in care homes. Developed questions focussed on - the understanding of what means quality of life for the person interviewed - how does he or she experience quality of life or how can he or she contribute to quality of life of an elder person - to dream what could be possible in the best of all worlds and - steps to be done to achieve the dream. Students interviewed between three to five persons, recorded the interviews, transcribed and analysed them. Results First results indicate that "Appreciative Inquiry" works well with care staff and people still having enough perceived time to transpose future dreams. The approach might be challenging to apply in care home settings. However, there seems to be a variety of factors determining quality of life and sometimes interesting ways to achieve them. Conclusion The presentation will give an insight in the educational structure of the course, acceptance of the method by the students and shows by the means of examples what kind of results can be achieved.

**PD6 713 ATTITUDES OF MEDICAL STUDENTS TOWARDS OLDER PEOPLE AND CARING FOR OLDER PATIENTS**

H. KHOSHNAW\* (The Royal Surrey County Hospital NHS Trust, Guildford, United Kingdom)

H. WILSON(1) - (1) The Royal Surrey County Hospital NHS Trust (Guildford, United Kingdom)

Introduction In the coming decades, substantial growth is predicted in the proportion of the population aged over 65. It is therefore important that all medical practitioners who will treat older people have an understanding and interest in the welfare of this group. Today, almost all medical schools in the United Kingdom have introduced Geriatric Medicine into their undergraduate curriculum, but the breadth and depth of these programmes vary. The aim of this study was to explore the attitudes of final year medical students in our hospital towards older people and caring for older patients and to identify factors that might influence their interest in geriatric medicine. Methods and Materials Participants in this study were final year medical students from the University of Southampton based at our District General Hospital between 20th February and 3rd May 2006. We used a combination of quantitative and qualitative methods for our study: a questionnaire based on a validated Geriatrics Attitudes Scale (GAS) followed by a Focus Group. Results 11 students completed the questionnaire (Male/Female: 4/7). The average age of the students was 23 years. 9/11 stated that they had had previous clinical attachment in geriatric medicine in their 3rd and/or 5th year of medical school. Scores from the GAS indicated that participants had a positive attitude towards older people (mean score 3.76, standard deviation = 0.40). The discussions in the focus group demonstrated that the students had a reasonable understanding of geriatric medicine as a specialty and its important aspects. However they felt that the complex and chronic nature of diseases of old age make geriatrics less rewarding. Conclusion This study showed that medical students had moderately positive attitudes towards older adults and relatively low interest in

geriatric medicine. The future challenge is how we could make caring for older patients more appealing.

**PD6 714 KNOWLEDGE OF GERIATRIC MEDICINE BEFORE AND AFTER A CLINICAL GERIATRIC MEDICINE COURSE**

R. VISVANATHAN\* (The Queen Elizabeth Hospital (TQE), Adelaide, Australia)  
T. SILAKONG(1), S. YU(2) - (1) The Queen Elizabeth Hospital (Adelaide, Australia); (2) University of Adelaide (Adelaide, Australia)

**Introduction:** The majority of doctors will provide health care to older people. Graduating medical students must achieve the necessary competencies required to provide health care to older people. This paper describes the performance of 5th year medical students in multiple choice question (MCQ) examinations before and after Geriatric Medicine course. **Methods and Materials:** In 2008, 51 students (<50% 5th year cohort) received 2.5 week geriatric medicine teaching at the Queen Elizabeth Hospital, University of Adelaide. A 30-question MCQ test was administered at the commencement of the course. This included 18 questions from the validated UCLA geriatric medicine knowledge test and 12 questions taken from the American Geriatric Society Case-Based Geriatric Review (AGS). On the last day of the course, a 45-question MCQ test (including 30 repeated questions) was administered. **Results:** There was a statistically significant improvement in the MCQ scores from a mean of 62(SD 10.4) to 75.2(SD 7.9)% [p<0.001]. The total mean scores for the UCLA test improved from 65(SD 10.4) to 73(SD 11.7) % [P<0.001]. The total mean scores for the AGS questions improved from 59.3(SD 17.0) to 78.3(SD 12.1) % [P<0.001]. Post course, students scored equally well in the new questions, the validated UCLA test and the AGS questions (75.4 + 11.4 vs. 73 + 11.7 vs. 78.1 + 12.1). **Conclusion:** Students were passing (score 50% and above) the MCQ prior to the 2.5 week course supporting the concept of vertical integration of the geriatric medicine syllabus within the medical school curriculum. This paper confirms that a dedicated undergraduate geriatric medicine clinical teaching block can further increase students' knowledge in Geriatric Medicine. It remains to be determined if students have achieved desired competencies and if this knowledge is retained in subsequent years.

**PD6 715 EDUCATION FOR INVOLVEMENT: INNOVATIVE APPROACHES TO OLDER PEOPLE'S INVOLVEMENT IN SOCIAL CARE RESEARCH**

L. WARREN\* (University of Sheffield, Sheffield, United Kingdom)  
K. BOXALL(1) - (1) University of Sheffield (Sheffield, United Kingdom)

**Introduction** Older people are frequently asked for their views of the services they use and their involvement is increasingly required in research. Such involvement calls for researchers who have skills in undertaking research with 'user groups' and older people, as service users, who have skills in working with researchers. Though the two roles are not necessarily mutually exclusive, it can sometimes be difficult for researchers and service users to develop skills in working together, not least because of the widespread exclusion of service users from the academy. This paper describes and assesses a new course has been developed at Sheffield University to prepare students for roles which support service user involvement in research. **Methods** The course - Researching Together - is underpinned by the principle that we all - tutors, undergraduates and service users - have much to learn from each other about how to do research together. It is based on enquiry-based learning approaches which both emulate traditional research encounters and challenge conventional notions of research and knowledge production. In 2007, the course involved both final year undergraduates ('long course students') and service users ('short course students'), including older people, as students in the same classroom. It was evaluated through reflexive presentations as well as independently through questionnaires and group discussions with students. **Results and Conclusions** The paper demonstrates the importance of enquiry-based exercises, including examples of group-based and simulated research encounters, to collaborative learning and research work. It also shows how such approaches raise questions about knowledge which comes from older people's experience as 'service users' and its relationship to ('expert') knowledge generated by more traditional approaches to academic research. The emergence of 'access' as a key theme of the course indicates the crucial need to develop inclusive educational practices in close association with those in marginalised groups.

**PD6 716 TRAINING PROGRAM DEVELOPMENT FOR NURSES OF HOSPITALIZED ELDERLY PATIENTS IN JAPAN**

M. TORITA\* (School of Nursing Chiba University, Chiba, Japan)  
H. MASAKI(1) - (1) Chiba University (Chiba, Japan)

**Introduction** In Japan, the number of elderly people who need care is increasing. As a result, there is a demand for nurses with the related specialities and skills in general hospitals. The purpose of this study was to develop a training program for nurses who care for hospitalized elderly patients. The goal of the program developed by this study was to aid elderly patients in living more autonomously. **Methods and materials** The study subjects were nurses working in the same institution and in the same ward. The data were collected through focus group interviews and observation of fieldwork. The data were collected by the Action-Research Method and analyzed by the KJ Method. The process of the study was as follows: 1) issues limiting the autonomy of elderly patients were ascertained, 2) a plan to

address these issues was drafted, 3) the plan was tested by the selected nurses, 4) the results were evaluated. Results Twenty-four nurses working at hospital participated in this study. All of them were female, with an average age of 40.7( $\pm 8.9$ ). The training program included four items as follows: 1) identifying issues limiting the autonomy of elderly patients, 2) developing a plan to address these issues, 3) discussion and lecture on the issues limiting elderly patients' autonomy were held, 4) the plan was tested and further developed together with the nurse. **Conclusion** In the final analysis, the developed program was found to be effective in allowing nurses to aid elderly patients in achieving greater autonomy. Consequently, this program can contribute to improvement of the quality of the care for the elderly who are hospitalized.

**PD6 717 EUROPEAN MASTER**

A. VAN DILLEN\* (VU-University Amsterdam, Amsterdam, The Netherlands)

**Introduction:** In Europe, there has grown an increasing awareness of the imbalance of study programs in gerontology in higher education. Meanwhile, the growing number of older adults, and especially people of 85 and over, leads to an increasing need for qualified gerontologists. Till 2003, training programs have been deficient, especially in Eastern Europe, and entry requirements varied widely as well as the curriculum contents and final terms of the educational programs (Meyer, 2003). **Method:** The European Master's program in Gerontology (EuMaG: [www.eumag.org](http://www.eumag.org)) started in September 2003 with support from the European Commission. The EuMaG is a modular, two-year part-time international training program about the ageing process and its societal implications. The multidisciplinary curriculum emphasizes international comparison, focusing on current European debates concerning - among other things - policy and care for the elderly. Members of several gerontology programs deliver the program across Europe, i.e. VU-University Amsterdam (The Netherlands), Institute of Gerontology of the University of Heidelberg (Germany), Keele University (United Kingdom), and the Université du Versailles Saint-Quentin-en-Yvelines in Paris (France). All institutes are involved in aging research, which provides ample opportunities to inform students about the latest research. Part of the standard curriculum is the Summer School, which is a collaborative endeavor of the VU-University Amsterdam and one of the partner universities of the larger European network. **Results:** Since the start of EuMaG in 2003, a mix of participants with respect to age, nationality and background has entered EuMaG. More than 200 students subscribed for (parts) of the EuMaG program. Students evaluate the EuMaG as highly informative and inspiring. **Conclusion:** EuMaG rectifies a deficiency in higher education in gerontology in Europe. The establishing and consolidation of a European network of new generation-gerontologists will be the next step of the EuMaG admin center.

**PD6 718 STUDENTS KNOWLEDGE RELATED TO TEMPOROMANDIBULAR DISORDERS FROM THE VIEW OF GERODONTOLOGY**

S. KRALJEVIĆ ŠIMUNKOVIC\* (School of Dental Medicine, Zagreb, Croatia)  
I. BAGO(1), T. BADEL(1), V. FUGOSIC(2), J. KERN(3), S. KRALJEVIC ŠIMUNKOVIC(4) - (1) School of Dental Medicine (Zagreb, Croatia); (2) Department of Dental Medicine at School of Medicine (Zagreb, Croatia); (3) School of Public Health "Andrija Štampar" (Zagreb, Croatia); (4) School of Dental Medicine (Zagreb, Croatia)

**Introduction.** The purpose of this study is to evaluate undergraduate students' knowledge in Croatia about oral care of the elderly related to temporomandibular disorders (TMD). **Methods and materials.** The study carried out on 47 students of School of Dental Medicine University of Zagreb and 24 students of Department of Dental Medicine at School of Medicine, University of Rijeka. All students were in the last year of studying. The average age of all participants was 23.8 years, 29 were male and 42 female. The questionnaire consisted of general information, specific knowledge about oral care of the elderly, and level of relevant and current knowledge on TMDs (Likert's scale in which 0-3 means "disagree", 7-10 means "agree", and 4-6 means neutral standpoint). Data were analyzed by chi-squared test or Fischer's exact test. **Results.** High level of positive answers was given by both groups of students about importance of the increasing proportion of old adults in general population and a close connection with oral health and dental specialties. Both groups of students were not sure that the prevalence of TMD decreased with age; they answered neutrally. Students from Rijeka showed better knowledge that psychological condition could have influence on treatment of TMD (p=0.039). However, students from Zagreb considered that only clicking or crepitus in TMJs is not an obligatory indication for treatment (p=0.006). 57.5% of students from Zagreb were unsatisfied with education level from the field of dental care of geriatric population in the dental curriculum, and 45.8% of students from Rijeka answered neutrally (p=0.005). **Conclusions.** Specific geriatric education is expected to be provided by dental schools and be a part of undergraduate curriculum. The level of participants' knowledge of the evaluated groups showed that it is important to improve the undergraduate dental teaching including knowledge about TMD.

**PD6 719 THE SCRIPT CONCORDANCE TEST AS A FORMATIVE ASSESSMENT TOOL IN GERIATRIC MEDICINE**

A. BENETOS\* (CHU-Nancy, Vandoeuvre les Nancy, France)  
L. JOLY(3), M. BRAUN(1), J. FOURNIER(2) - (1) INSERM ERI13, Nancy, France (Nancy, France); (2) Faculté de Médecine de Nice-Sophia-Antipolis, France (Nancy, France); (3) CHU-Nancy (Nancy, France)

Introduction Script concordance test (SCT) aims at evaluate knowledge organization, which represents an essential component of clinical competence. Clinical reasoning learning (CRL) is used in medicine schools to implement teaching and learning activities for the purpose of improving students' clinical reasoning skills. So far, no research has been done to compare students' knowledge improvement following an educational intervention in geriatric domains provided by CRL assessment, and moreover to have a quantification of this improvement by a SCT questionnaire. Method The objectives of this investigative study are to verify the students' knowledge improvement in a geriatric ward, of 8 students enrolled at the same time, by assessing SCT . At the beginning and at the end of their clerkship ,student had to assess a SCT including 42 questions divided in 14 items, that 11 senior geriatric experts have done before. Students, then, have to work up predetermined geriatric clinical problems, in relation with SCT assessment, and to produce, during the CRL assessment, think aloud protocols which were analysed using a grid. Results SCT scores obtained by experts were higher than those obtained by students at the both sessions ( $76.9 \pm 7.6$  vs  $65.4 \pm 12.2$ ;  $p < 0.05$  for the first session and  $76.9 \pm 7.6$  vs  $69.8 \pm 10$ ;  $p < 0.05$  for the second session). At the end of their training, all the students have shown an improvement of their SCT score by  $4.4 \pm 2.2$ ;  $p < 0.05$ , and an improvement in their CRL assessment ( $47.2 \pm 15.3$  vs  $56.25 \pm 15.4$ ,  $p < 0.05$ , respectively for the first and the second CRL session). Conclusion Elaboration of a geriatric SCT should be used for students evaluation. SCT provided at the beginning and reassess at the end of the clerkship could allow to distinguish students with clinical reasoning difficulties.

**PD6 720 NATIONAL PROJECT FOR EXCELLENCE IN GERIATRIC CARE EDUCATION-A COMPREHENSIVE, INNOVATIVE AND PRACTICAL PROGRAM FOR LEARNERS OF DIFFERENT LEVELS**

M. LEE\* (Chung Shan Medical University, Taichung, Taiwan)

H. LIN(1), C. YEN(2) - (1) Center for Education and Research on Geriatrics and Gerontology, Chung Shan Medical University (Taichung, Taiwan); (2) Department of Family and Community Medicine, Chung Shan Medical University Hospital (Taichung, Taiwan)

According to the Taiwan census, the elderly population will approach 20% within the next 20 years. This enhances the need for skilled and experienced healthcare providers, in many health care settings, who can address and meet the needs of older people. Therefore, healthcare providers in Taiwan need to increase their work with the elderly. Gerontology is a multidisciplinary field. Invariably, the best research, training and service programs in gerontology emerge when professionals from a variety of disciplines are afforded the opportunity to work together, each contributing unique expertise while benefiting from the expertise of others. Therefore, With the financial aids from the Ministry of Education, Ministry of Interior and National Department of Health, Chung Shan Medical University (CSMU) established a National Project for Excellence in Geriatric Care Education (NPEGCE) which focuses on academic and practical experience for learners of undergraduate, graduate and postgraduate levels in understanding and working with the elderly. The philosophy of the curriculum design is "LOVE" (live, obligation, vitality, and Expertise). The NPEGCE consists of required and elective courses on gerontology/geriatrics through lecture, small group discussion with problem-based, practicum and participating research . The features of NPEGCE include: (1). to nurture students' ability for future job and career , (2). to emphasize the research ability on gerontology, (3). to set up a faculty team on geriatric education, (4). to establish a model of assessment on geriatric care education , (5). to strengthen the interaction and cooperation among academy, enterprise and official organizations, and (6). to exploit the opportunity on international cooperation. The NPEGCE is the first Geriatric program in Taiwan. Since the NPEGCE was well received by students and seemed to encourage them to be more nurturing towards the elderly, it can be regarded as a catalyst for better care for the elderly in the future.

**PD6 721 SEXUALITY AND AGEING WITH DEPENDENCE**

U. KARSCH\* (Pontifícia Universidade Católica de São Paulo, São Paulo, Brazil)

A. SALIMENE(1) - (1) Pontifícia Universidade Católica de São Paulo (São Paulo, Brazil)

Males who experience an Encephalic Vascular Accident (EVA) may develop sexual disorders in their relationship with their caregiving spouses or steady partners. Our study sought to identify and qualify the level of sexual dysfunction in ageing males who have suffered an EVA by analyzing their relationship with their dual-role sex partners from a personal, sociocultural, and economic perspective. Fifty EVA patients, 50 years old and over, were referred to us by four São Paulo hospitals in 2004. A semi-structured questionnaire was given to subjects at home to collect qualitative and quantitative data. 29 men and their sex partners were selected. The Descriptive Social Survey and the Golombok Rust Inventory of Sexual Satisfaction (GRISS) were applied. 40% of male respondents were aged 70-79, while 28% were aged 50-59. 60% of respondents were male, while 92% of the caregivers were female. 40% of these were aged 50-59. 87% of patients were married and their wives cared for them. 70% of patients had abandoned personally satisfying activities. 48% had an average monthly family income between US\$330.00 and US\$650.00. 57% of the couples mentioned that the EVA had a negative impact on their sexual arousal, while 14% of patients had not reported any sexual dysfunction, and 33% had become impotent. 71% of the wives had an active sexual life, while 37% experienced dyspareunia. Results showed that the quality of a couple's sexual life was directly proportional to the male patient's level of functional dependence. It was observed that the dual sex partner-

caregiver role may have an effect on the couple's relationship. Better-educated patients living in better economic conditions reported no sexual disturbance. The emotional bonds that existed before the EVA facilitated adjustment to the couple's new life situation. Those able to broaden their concept of sexuality seemed more sexually active.

**PD6 722 WHOQOL-BREF: THE CAREGIVER'S QUALITY OF LIFE FOLLOWING THE DEATH OF THE DEPENDENT ELDERLY BY STROKE**

U. KARSCH\* (Pontifícia Universidade Católica de São Paulo9, São Paulo, Brazil)  
B. OLIVEIRA(1), A. SALIMENE(1), I. MAZETO(1), A. HAYAR(1), T. SILVA RODRIGUES(2), S. REIS DE ANDRADE(2), M. ALVES(2), L. BATISTA DA SILVA(2), L. MONTEIRO LÚCIO(2), K. FERREIRA LOPES(2) - (1) Pontifícia Universidade Católica São Paulo (São Paulo, Brazil); (2) INSTITUTO ISRAELITA DE ENSINO E PESQUISA ALBERT EINSTEIN (São Paulo, Brazil)

INTRODUCTION: 20% of male patients suffering from Encephalic Vascular Accident usually die within one month after the episode; 50% of survivors present permanent disability and require assistance; 30% present neurological deficit but remain independent. Caregivers are usually female spouses, daughters, daughters-in-law or sisters. Conducted in 2008, the study sought to identify demographic traits and verify caregivers' quality of life following the death of their dependent elderly patient. METHODS: The study focused on 7 female widows subjects of the research conducted in 2004 and 2005 by São Paulo Catholic University's Caregiver Epidemiology Research Group (50 researchers). A semi-structured questionnaire and a WHOQOL-bref survey containing 26 questions grouped together under the headings Physical, Psychological, Social Relations and Environment were applied. Interviews were conducted at the caregiver's home by two researchers. RESULTS: Age bracket: first interview between 44 and 84 yo, average 66.4 yo (+12.9) and second interview between 46 and 85 yo, average 64.7 yo (+13.1); Marital status: 5 widows and 2 married daughters; Education: 3 illiterate women at first interview and one at second interview. At first interview, there was one caregiver who lived alone, and 2 at second interview. 5 cared for another family member at first interview, of whom 4 also looked after their grand-children; at second interview, 3 women cared for family members. Heading scores showed the following distribution: Social Relations – all respondents were satisfied and a significant improvement from first interview (61.8) to second (78.7) ( $p=0.015$ ). Psychological – wives (1.2/+20.5) and daughters (4.0/+12.7) were not satisfied; Physical and Environment – daughters were moderately satisfied (-7.0/+19.7 and -3.5/+0.7). CONCLUSION: Caring for the elderly for prolonged periods of time may result in biopsychosocial effects that compromise family structure. Caregivers presented altered quality of life, especially in the psychological and physical domains, a situation which persisted after the death of the patient.

**PD6 723 ARCHITECTURAL SPACE AND INDIVIDUAL CARE IN ASSISTED LIVING**

C. NORD\* (Linköping University, 601 74 Norrköping, Sweden)

Introduction Individual care of older people in assisted living is care in which the residents' personality, needs and wishes are acknowledged. This is a study of the relationship between architectural space and the individual care the staff provides. Methods and materials This is a ten months ethnographic study in an assisted living facility in Sweden. Observations and individual interviews with staff as well as residents were the main data collection methods. Analysis was done with a grounded theory approach. Results The spatial structure allowed few possibilities to the resident to express their individuality. All residents had similar private rooms which they furnished with their own furniture and assets. These assets were important tools to the staff to make acquaintance with the residents in order to give individual care. Residents stayed most of the time in their private rooms which they indicated as most important for their privacy. However, this is the space where they are most public in the sense that they are exposed to its outmost by intimate care. The staff used a number of spatial micro-strategies to help residents who were uncomfortable by this exposure. The public spaces were mostly frequented by the residents at the meals. The staff constantly rearranged the furniture in the dining-room in order to meet the wishes and needs of various residents so that they would attend the meals. Staff did not interfere with the residents' use of space according to their own wishes, not even for security reasons. Residents moved freely in the facility. Conclusion The spatial possibilities for individual care in assisted living are limited to the architectural micro level. This is, nevertheless, of great importance to the support of the individual since neither the private rooms nor the public spaces fully reflect or accommodate the individuality of the residents.

**PD6 724 WHO IS THE FAMILY CAREGIVER OF THE ALZHEIMERS PATIENT THAT FINDS POSITIVE ASPECTS IN THEIR CARE TASKS?**

M. FERNÁNDEZ-PASCUAL\* (University of Alicante, Alicante, Spain)

A. REIG-FERRER (1), F. ROSARIO(1), F. M<sup>a</sup> DOLORES(1), T. JOSÉ LUIS(1), A. NATALIA(1) - (1) University of Alicante (Alicante, Spain)

INTRODUCTION: Providing care and help within the family context to people with Alzheimers Disease (AD) is an extraordinary task that requires significant expenditure of both time and energy for the caregiver and family alike, often spanning years, requiring

performing tasks that can be exhausting and unpleasant, and often disturbing the carers other family and social roles. MATERIAL AND METHOD: Descriptive cross-sectional study using interviews and questionnaires using techniques of quality metrics. Full information was gathered, following informed and valid prior consent, from 287 carers (mean age 56 years; 83% women, 17% men) belonging to various associations of friends and relatives of AD in the Spanish province of Alicante, with regard to their sociodemographics, clinics, occupation, behaviour, health and perceived quality of life. RESULTS: A total of 68% of the caregivers reported finding positive aspects in their care tasks. The presence of positive aspects were independent of the age and sex of the caregiver. The caregivers reported more positive aspects when dealing with female AD patients in comparison with male patients ( $\chi^2=7.77; .005$ ). Of all the caregivers, 26% had to leave their job to care for their relative; these caregivers showed a significant tendency to report more positive aspects in the care they provide ( $\chi^2=4.93; .017$ ). No significant differences were found in other variables of sociodemographics, job, clinic and assessment of state of health, although they were found in the caregivers degree of overload, psychological distress, perceived quality of life and degree of satisfaction with life. CONCLUSION: Caregivers who perceive positive aspects in their tasks report a greater perceived quality of life, a lesser degree of psychological distress and overload of care, and a higher satisfaction with life. These results may be of interest in identifying those caregivers at increased psychosocial risk, and to design interventions to provide specific psychological help. Note: This research project received funding from the Conselleria de Sanitat de la Generalitat Valenciana through the Escuela Valenciana de Estudios de Salud in its 2006 announcement of grants for research projects on programmes of health and the prevention and prediction of illness.

**PD6 725 AN EXPERIMENT IN ENVIRONMENTAL IMPROVEMENT IN A GROUP HOME FOR ELDERLY WITH DEMENTIA**  
 H. SHIMOGAKI\* (Japan college of social work, Tokyo, Japan)  
 K. KODAMA(1) - (1) japan college of social work (tokyo, Japan)

This research focuses on an experiment in environmental improvement in a group home? The program constituted of 1) a lecture about the environment, 2) environmental assessment, 3) environmental improvement plan, 4) implementation of the plans, and 5) the plan assessment of the total program? There was highest evaluation concerning 'Opportunity for Personal Control' in the portion of the plan concerning environmental assessment performed by the care staff of the group homes. Furthermore, also in the plan of the created environmental improvement, the contents of joint work of the elderly with dementia and the care staff were well evaluated. It was suggested that programs focusing on environmental improvement in a group home should be included as part of community life care, which is the main characteristic of group home care. This process not only raised the consciousness of the care staff's environment, but promoted communication, and can also be considered to lead to the support of the maintenance of the total care environment

**PD6 726 INDEPENDENCE AT AN OLD AGE: RESEARCH EVIDENCE OF THE KLAIPEDA 80+ STUDY**  
 F. STEPUKONIS\* (Klaipeda University, Klaipoda, Lithuania)  
 J. JÖNSSON(1), T. SVENSSON(2) - (1) 1 (Reykjavik , Iceland); (2) 2 (Lund , Sweden)

Introduction: As older people are growing as a proportion of the population, and the probability of poor health increases with age, an increasingly larger proportion of dependent old people can be expected. However, there are several factors that contribute to the stabilization of the balance of the dependent/independent population, including healthier lifestyles, improved nutrition, and the latest medical and living environment technologies, conducive to sustaining functional health and independence of old people. The objective of this paper is to discuss the health aspects of maintaining independence at an old age. Methods and materials: The 80+ Studies in Klaipeda, Lithuania, Lund, Sweden, and Reykjavik, Iceland, account for collecting data regarding the medical, psychological, and social aspects of 80-year-old people. The 80+ Studies use identical instruments and a longitudinal method with a sequential design, i.e. including a new cohort every fifth year. In the present paper, the results of the 80+ Study in Klaipeda are discussed. The participants were 200 residents of Klaipeda (with the response rate of 34%), born in 1923. The data were collected during a participant's visit to a local clinic. The results show that the majority of the participants – 83.9% – did not need help or supervision in carrying out daily activities. In the SPT test the 80-year-olds demonstrated relatively good memories and recognition abilities. The health of the majority of participants proved to be rather good than poor: 47.6% self-rated their health as "very good" or "reasonably good", compared with those 17.5%, self-rating their health as "fairly bad" and "very bad". The corresponding figures of the physicians' health ratings were 66.3% and 6.5%. Conclusion: The research evidence contradicts the widespread stereotypes in accordance with which the majority of aged people are thought to be in a poor physical and mental condition, frail, and needing help and supervision.

**PD6 727 PROVIDING CARE TO MORE THAN ONE RECIPIENT AS A DETERMINANT OF CAREGIVER BURDEN**  
 M. DEN DRAAK\* (The Netherlands Institute for Social Research | SCP, The Hague, The Netherlands)

A. DE BOER(1), J. TIMMERMANS(1) - (1) The Netherlands Institute for Social Research | SCP (The Hague, The Netherlands)

Introduction: Research on informal caregivers has paid little attention to persons who provide care to more than one recipient (multicarers). However, it is plausible that multicarers may be more susceptible to overburdening. This study explores the determinants of burden in relation to caring for more than one recipient. What matters more: the number of care recipients or the characteristics of additional care situations? Methods and materials: Data come from the 2007 nationally selected sample of adult informal caregivers in the Netherlands. The sample consists of 1,403 caregivers of at least one older person (aged 65 and over). 25% of them provided care to more than one care recipient in the previous 12 months. Caregiver burden is examined using a 14-item scale on time restrictions and emotional involvement. The number of care recipients and characteristics of the caregiver, the main care situation and the main care recipient are included in the analyses. Results: Multivariate regression analyses reveals the number of care recipients as a determinant of burden. Preliminary results for the sample of multicarers show that the explained variance in burden increases when characteristics of a second care recipient are added. At the same time, the number of care recipients remains a determinant of burden. Conclusion: Persons who care for more than one recipient run a higher risk of being burdened. This risk is not only determined by the number of care recipients but also by the characteristics of the additional care situations.

**PD6 728 EFFECTS OF GREEN CARE FARMS ON ELDERLY PEOPLE WITH DEMENTIA**

S. DE BRUIN\* (Wageningen University, Wageningen, The Netherlands)  
 S. OOSTING(1), H. TOBI(2), F. STEENSTRA(1), M. ENDERS-SLEGERS(3), A. VAN DER ZIJPP(1), J. SCHOLLS(4) - (1) Wageningen University, Dep. Animals Sciences, Animal Production Systems Group (Wageningen, The Netherlands); (2) Wageningen University, Dep. Social Sciences, Research Methodology Group (Wageningen, The Netherlands); (3) Utrecht University, Dep. of Clinical and Health Psychology, Faculty of Social Sciences (Utrecht, The Netherlands); (4) Tilburg University, Dep. TRANZO, Faculty of Social Sciences and Maastricht University, Dep. of General Practice, Section Nursing home medicine (Maastricht, The Netherlands)

Introduction: In the Netherlands an increasing number of "green care farms" (GCFs) provide day care to community-dwelling elderly people with dementia. They offer an innovative and more home-like form of day care, contrary to regular day care services (RDCSs) that are often incorporated in residential homes. An earlier study showed that older persons with dementia at GCFs are more outdoors, participate in more domestic and outdoor activities, and are physically more active than those attending RDCSs. It was therefore hypothesized that GCFs are more beneficial than RDCSs in preventing deterioration of cognitive functioning and emotional well-being, and in preventing worsening of behavioral symptoms. The aim of this study was to compare the longitudinal change in these parameters between older people with dementia attending day care at GCFs and those attending RDCSs. Methods: In this cohort study 47 older persons with dementia from GCFs and 41 from RDCSs were followed during 1 year. Data were gathered at three times (at 6 months intervals) by interviewing the older persons with dementia themselves and their primary family caregivers at home. Results and discussion: During the course of the study, visitors of both types of day care showed a decrease in cognitive functioning and an increase in the number of behavioral symptoms, whereas minor changes were observed for emotional well-being. We could not demonstrate GCFs to be more beneficial than RDCSs. However, this study is one of the first evaluating the effects of this new care modality. The current policy of the Dutch government is to keep frail elderly, including the demented ones, at home as long as possible. Therefore supportive initiatives for these older people and respite possibilities for their family caregivers are important to delay or prevent early institutionalization. Future studies will yield insight into their ultimate effects on patient outcome.

**PD6 729 FAMILY CARE FOR SENIORS AS A "LABOUR OF LOVE" – NEW ARGUMENTS.**

H. JERABEK\* (Charles University in Prague, Fac. Social Sciences, Prague 5 - Jinonice, Czech Republic)

Abstract: Introduction: This paper compares the concept of "care as a labour of love" [Hilary Graham 1983] in contrast with the concept of the "defamilisation of care" [Evelyn N. Glen 2000]. The authors test the evidence for a relationship between the BADL and IADL indexes and the amount of family care (measured in hours of care) and the burden of caring person. Methods and materials: A survey of Czech adults caring for seniors in the family was made in 2006/2007. 435 standardised interviews were conducted with households that are caring for a dependent senior in the family. The main caregiver responded to questions concerning the amount of hours of informal care provided in the family for the well-being of seniors by all the family members and by professionals in home care. IADL was measured with 18 items about the instrumental activities of daily living for each senior. BADL was measured with 18 different items about the basic activities of daily living for each senior. The psychological and financial burden was measured for the main caring person. Results: The authors find that more demanding family care, measured as the level of IADL or BADL, is reflected in a growing number of

hours spent on family care. The authors also reveal significant differences in the psychological and financial burden experienced by the primary caregivers in relation to how demanding the level of care required is. Conclusion: The paper presents evidence of the existence of "collective family care" in situations where demanding personal care for a senior is required. The participation of other family members in providing care for a senior in situations of demanding personal care demonstrates some features of family cohesion. Keywords: BADL, IADL, family care for seniors, informal elderly care, labour of love

**PD6 730 COMBINING WORK AND CARE OF AN ELDERLY RELATIVE: CONSTRAINTS AND FEELING OF PRESSURE**  
**C. MARTIN\*** (EHESP, Rennes, France)  
**B. LE BIHAN(1) - (1)** EHESP (Rennes, France)

Combining work and care is mainly documented about childcare and very little, in France at least, concerning elderly care. In this paper we propose to develop the results of a qualitative research and to distinguish two main factors: the level of "objective" constraints imposed by this double front and the feeling of pressure experienced by the carers in their everyday life. What are the determinants of this feeling of pressure? In the literature, work family conflict is often operationalised through time, stress and pressure related measurements (Crompton, 2006). The quantitative analyses led on this subject (mainly on childcare), are often based on questionnaires which distinguishes objective elements which contribute to the pressure (the lack of free time for example, or the number of children to care for, or the non standard working hours) and the feeling of stress or pressure. The qualitative analysis of the interviews proposed in this research is also based on this distinction. Considering the 18 cases analysed, different elements contributing to the feeling of pressure can be questioned: the conception of one's role as a carer, the ambivalence of one's relationship with one's parents and also within the sibling, the closure of the social network, the relation to work.

**PD6 731 LOSSES, AUTONOMY AND DEPENDENCY IN THE AGING PROCESS**  
**V. HEREDIA\*** (University of Caxias do Sul, Caxias do Sul, Brazil)  
**D. DE LORENZI(1) - (1)** Universidade de Caxias do Sul (Caxias do Sul, Brazil)

The aim of this study is to describe how elderly persons perceive their aging process, and how they see losses and situations of dependency. It is a qualitative study which uses the content analysis method described by Bardin (1979) and Moraes (1994), and the narrative interview technique. The criteria for sampling selection were: gender; rural and/or urban origin; marital status; various occupations; educational level; to be over 60 years of age; physical and mental capability to give an interview and accept an informed consent. Thirty elderly persons were interviewed and distributed by a priori defined variables. Three analytic categories emerged from the narrative interviews, namely biological losses, affective losses and social losses. Among biological losses are corporal restrictions and decrease of functional capacity, which indicates cases of dependency. Concerning affective losses, not all of them were due to aging. The following came up: loss of children, premature losses, loss of parents, loss of loved ones, frustrations, and loss of affection. Among social losses, work is highlighted since for some elderly persons ceasing to work definitely was seen as the end of a social life. Retirement is appreciated by many of them, but it also represented loss of prestige and social status. Narratives show that elderly persons are aware of the losses they went through in the aging process, how they coped with them, and the relationship with dependency on family, relatives and friends. Further, the analysis points to contemporary issues such as understanding changes of social roles and the need to keep up to date in order to minimize generation conflicts and create support systems within the own family.

**PD6 732 KT-EQUAL : PUTTING AGEING AND DISABILITY RESEARCH INTO PRACTICE**  
**R. MCCRINDLE\*** (University of Reading, Reading, United Kingdom)  
**G. MOUNTAIN(1), J. CLARKSON(2), P. LANSLEY(3), T. COX(4), L. DAMODARAN(5), C. ECCELSTON(6), C. WARD THOMPSON(7) - (1)** Sheffield Hallam University (Sheffield, United Kingdom); (2) University of Cambridge (Cambridge, United Kingdom); (3) University of Reading (Reading, United Kingdom); (4) University of Salford (Salford, United Kingdom); (5) University of Loughborough (United Kingdom); (6) University of Bath (United Kingdom); (7) Edinburgh College of Art (United Kingdom)

INTRODUCTION: EQUAL ([www.equal.ac.uk](http://www.equal.ac.uk)), introduced by EPSRC in 1997, and subsequently SPARC ([www.sparc.ac.uk](http://www.sparc.ac.uk)), funded by EPSRC/BBSRC, both aimed to stimulate a multidisciplinary, collaborative, user-engaged approach towards ageing research. This encouraged high quality, novel research which addressed the needs of older and disabled people so that they could live full and active lives. Successful transferability of the products of this research necessitates sustaining relationships with industry, with professionals in health, housing and social services, with older and disabled people and their representatives, with health and social care staff, with national policy and decision makers, and with other research disciplines. This is the focus of the KT-EQUAL (Exchanging Knowledge – Extending Quality of Life) consortium. METHOD: The KT-EQUAL consortium is the product of proposed activities related to thematic areas of health and wellbeing, independent living and self management; links to three existing consortia

SMART, i'DGO Too and i-design; ensured continuity with EQUAL/SPARC programmes; and members highly experienced in public speaking, media engagement and other advocacy roles. RESULTS: The resulting KT-EQUAL Consortium has objectives: (1) work with stakeholders to identify knowledge needs; (2) encourage and enable world-class knowledge creation, analysis and storage; (3) facilitate exchange of knowledge between creators and users; (4) advocate the use of knowledge as a driver for change. Partnerships for knowledge exchange will be extended through close working with commissioners of health, social care and other public services, suppliers, technologists, designers and manufacturers, users and user advocacy groups. The views of the older person are central to the KT-EQUAL philosophy and its success. CONCLUSION: This paper will clarify our philosophy and how we will deliver an innovative programme reflecting the expertise and knowledge developed over the last 11 years but also be responsive to policy-led changes and other factors likely to influence stakeholder motivation and involvement, research activity, outputs and uptake.

**PD6 733 WAITING TO DIE:A STUDY OF WIDOWS IN VARANASI**  
**S. PRASAD\*** (Banaras Hindu University, Varanasi, India)

In Indian society, attaining "moksha" (liberation from the cycle of birth and death) has traditionally been the ultimate aim of human existence and all kinds of human activities have been directed towards this end. Kashi, the city of lights, has a unique distinction of being a place about which it is said that those who die here, attain moksha. According to mythological sources, Kashi is situated at the upper end of the "trishool" (weapon of Lord Shiva) of Lord Shiva. Therefore, the city has the blessings of Lord Shiva and thus, those who die here go directly to heaven and become free from the cycle of birth and death. The mythological saying combined with the low status of women in India has given rise to a unique custom unparalleled in the world. Earlier, widowhood was considered to be a curse in Indian society. A widow had to spend her life in a miserable condition. She was expected to spend her time worshipping the God so that after death she attains moksha. This practice has made Kashi the abode of many widows who had been left by their family members. The present paper is based on the study of such widows of Kashi. Based on the case study method, the paper explores the family background of these widows and the present condition in which they are living and concludes that the desire to attain moksha is not the main reason behind their stay in Kashi but apathy of their family members is the major factor which has forced them to spend their life like beggars in an unknown city. The paper further analyzes if the proposed 'Senior Citizens Bill 2007' could be of any help to these widows.

**PD6 734 ELDERLY, FAMILY AND CULTURE: A STUDY ON THE CONSTRUCTION OF THE CAREGIVER ROLE**  
**S. SANTOS\*** (Federal University of Santa Catarina, Florianopolis, Brazil)  
**T. RIFIOTIS(1) - (1)** Federal University of Santa Catarina (Florianopolis/SC, Brazil)

INTRODUCTION: Intercultural studies are useful for generating knowledge about the meaning assigned to dependency and family care to the elderly. This research aimed to understand how the carer role is among members of two different cultural groups and which are the meanings attributed to the experience of care between those families. METHOD: Qualitative research with ethnographic focus using participant observation and semi-structured interviews applied to six families of Japanese-Brazilian origin and six Brazilian families. Convenience sample, whose participants were matched by educational and economic criteria. Data collection was performed in their homes by scheduling and prior consent of the subjects. Data has been got through field registries, representations of relationships and interviews content transcriptions. We have used content analysis for data analysis. RESULTS: The examination of such material produced a hierarchy of meanings categories, from which we have extracted five major thematic axes: the construction of dementia as disease and the relative as a sick person; the family carers in their plurality; the complexity of the caring process; the domestic group and dynamics of interactions with family carers; tensions, dilemmas and conflicts experienced by caregivers. CONCLUSION: In both studied groups, the family is considered as the preferential locus of care. The tasks of care are basically shared by closest relatives and secondarily by other people who keep some type of relationship with the family nucleus. We call this extended group as domestic group, which may be described structurally as a network of carers. The main difference observed between the two groups of families consisted in the meaning attributed to family support, care by itself and aging care. The Japanese-Brazilian families mentioned, more than the Brazilians ones, their cultural references. Key-words:Elderly; cognitive impairment; family caregiving;culture.

**PD6 735 AGEING IN A PURPOSE-BUILT RETIREMENT COMMUNITY: TOWARDS A LONGITUDINAL STUDY**  
**J. LIDDLE\*** (Keele University, Keele, United Kingdom)  
**B. BARTLAM(1), M. BERNARD(1), T. SCHAFER(1), J. SIM(1) - (1)** Keele University (ST5 5BG, United Kingdom)

Introduction: Purpose-built retirement communities are increasingly being promoted as positive alternatives to traditional forms of housing and care in Britain. Such developments have been cited as suitable for both 'fit' and 'frail' older people, offering a home for life.

However, we know little about their ability to meet the diverse needs and expectations of residents over time. This poster outlines a study exploring such issues at Denham Garden Village (DGV) – Anchor Trust's flagship retirement development in the UK. The initial 3-year phase of the Longitudinal study of Ageing in a Retirement Community (LARC) began in 2006 and forms part of a 10-15 year longitudinal study. Methods: LARC adopts an innovative, mixed methods approach, reflecting the partnership between researchers from critical gerontology, medicine and health. Methods comprise biennial quantitative surveys and qualitative methods including ethnographic observation, diary-keeping, in-depth interviews, Directives, collating contextual documentation and photographic/audiovisual work. Collaboration between the research team, residents and staff at DGV and senior management at Anchor Trust reflects the participatory-action nature of the study. Results: Opportunities inherent in developing a mixed method longitudinal study such as LARC will be identified alongside a range of ethical, theoretical and practical challenges. These include building and sustaining relationships with participants and stakeholders, collecting, archiving and triangulating large data sets, maintaining high response rates and retaining as many original respondents as possible in subsequent samples. Conclusions: The development of a truly longitudinal study such as LARC provides a unique opportunity to undertake a ground-breaking and innovative programme of work. It has the potential not only to assess the extent to which DGV can address the challenge of providing housing and care for a diverse and changing population of older people, but also to inform evolving theory, policy and practice in the field of care and accommodation for older people.

#### **PD6 736 SOCIAL RELATIONS WITH NEIGHBORS AMONG THE OLD-OLD LIVING ALONE IN TOKYO**

S. SAWAOKA\* (The Dia Foundation for Research on Aging Societies, Bunkyo-ku, Tokyo, Japan)  
W. KOYANO(1), A. HONDA(2) - (1) Faculty of Human Welfare, Seigakuin University (Ageo City, Saitama, Japan); (2) School of Nursing, Faculty of Health & Social Work, Kanagawa University og Human Service (Yokosuka, Kanagawa, Japan)

In Japan, living alone becomes a common living arrangement in old age for both men and women. For seniors living alone, neighbors may possibly be important sources of social support. In this study, we observed neighborhood relationships of the old-old living alone in a Japanese urban area. Home-visit interviews were completed for 441 seniors, aged 75 years or older, randomly selected from the residents' registration of Sugimami City, Metropolitan Tokyo. Among the respondents, 16.8% were men; 71.0% had children living apart; and 73.9% had relatives with whom the respondents had contacts. Social interactions with neighbors were measured with availability of social support and feeling of emotional closeness. About 40% of the respondents had available sources of instrumental, informational, and emotional supports in their neighbors, and 50% had neighbors to whom they felt emotionally close. These percentages were significantly different between men and women: women were more likely than men were to have available sources of supports and to feel emotionally close to some of their neighbors. Further, men preferred to have distant relationships with neighbors, while women were more sociable. Gender differences in social relationships in old age have been frequently reported by social gerontologists. This study confirmed the gender differences in neighborhood relations of the old-old living alone who were supposed to need proximate sources of social support. The results of this study seem to indicate the necessity of special attention to senior men living alone who are likely to be at risk of serious social isolation.

#### **PD6 737 FUTURE ELDERLY IN POOR HEALTH AND LIVING ALONE: HOW CAN THEIR CHILDREN SUPPORT THEM?**

Y. DECARIE\* (Université de Montréal, Montréal, Canada)  
J. LÉGARÉ(2), Y. DÉCARIE(1), P. CHARBONNEAU(2), J. KEEFE(3), J. GAYMU(4) - (1) Université de Sherbrooke (Sherbrooke, Canada); (2) Université de Montréal (Sherbrooke, Canada); (3) Mount Saint Vincent University (Sherbrooke, Canada); (4) INED (Sherbrooke, France)

Introduction As we get older, both the probabilities of being in poor health and finding ourselves without a spouse increase sharply and unevenly by gender. Children may become key providers of support to their parents, but failure to provide such assistance may increase the need for formal support or institutionalization. Methods and materials This study examines elderly persons aged 75 and over in Canada and some European countries and presents projections up to 2030. Models used here differ from traditional cohort component projection method. In fact, microsimulation models were used, i.e. LifePaths in the case of Canada and LIPRO (Lifestyle PROjections) in the case of the European countries under study. By using these models, it is possible to project simultaneously a great variety of individual characteristics like age, sex, marital status, living arrangement, surviving children, etc. Results The population aged 75 and over being in poor health increases by more than 1.5 times in Europe and by almost 3 times in Canada between 2000/1 and 2030/1. From this population, we look at the most vulnerable ones in term of family support. We observe an increment of 2.1 times in the case of European men compared to 3.2 times for Canadian men between 2000 and 2030. For women, the situation is totally different as the European countries do not show a significant increment compared to a twofold increase for Canadian women. Conclusion This paper analyzes the future evolution of the minimal family network needed by elderly in poor health and living alone, this group being one of the most vulnerable in our societies. Results demonstrate that

Canada will have a higher proportional increase in vulnerable persons both in terms of poorer health and available family support than European counterparts. Our findings are demonstrate the way in which the demographic history of these countries have consequences both on the evolution of the number of elderly who cumulate these disadvantages and on the hazards to be submitted to these conditions.

#### **PD6 738 NAVIGATION IN FAMILIAR AND UNFAMILIAR TOWN CENTRES**

J. PHILLIPS\* (Swansea University, Swansea, United Kingdom)  
A. HOCKEY, N. FOREMAN, M. DEL AGUILA

As downtown and city landscapes change through regeneration or decline, the use of space changes and previously familiar places may become unfamiliar. Unfamiliarity can lead to insecurity, disorientation, fear over personal safety, social exclusion and loss of independence. Enabling navigation and orientation in built environments is essential to ageing in place and the increasing numbers of older people travelling the world as tourists. The present study investigates visits to familiar and unfamiliar town centres by two groups of participants aged 60+ years. Participant's who evidenced difficulty in following directions (as defined by a direct assessment of their functional ability to follow directions,) stayed in populated areas and relied on street signage. The participants who evidenced no difficulty with following directions would use landmarks in the built environment and ask local people for directions. Both groups expressed concern with visiting town centres in the evening. In a social network analysis, participants who follow directions were more "adventurous" travelling to more unfamiliar towns using different modes of transport and travel arrangements. The research informs spatial planners about how to improve navigation of periodically accessed built environments that contain services and facilities that are important to older adults continued independence.

#### **PD6 739 FAMILY CARE WITHIN THE SYRIAN-ORTHODOX COMMUNITY**

L. GROEN - VAN DE VEN\* (Windesheim University of Applied Sciences, Zwolle, The Netherlands)  
C. SMITS(1) - (1) Windesheim University of Applied Sciences (Zwolle, The Netherlands)

Introduction Family care for older people is often associated with problems, i.e. lack of family caregivers, stress associated with family care, and insufficient professional support. In some non-Western communities, family care of older people seems to be experienced more positively. The present study aims at exploring and comparing the experiences of family caregivers within the Syrian-orthodox community in the Netherlands and Dutch family care givers. Methods Semi-structured interviews were held with 15 family care givers within the Syrian-orthodox community. Interviews were held in Syrian language by a trained representative of the community. Interview topics involved, the care giving situation; the caring network; and qualities, experiences and motivations of the caregiver. Interviews were translated and transcribed verbatim by the interviewer and coded by the researcher. Both negative and positive experiences were analysed within the context of the care giving situation. Interviews involving the same topics will be held with 15 Dutch family care givers in order to compare the experiences of both groups. Results Conditions for good family care involve good health; being present, understanding and patient towards the older person; and speaking the (Syrian) language. Motivations to provide care involve the expectation to be rewarded in the hereafter, setting an example to their children with respect to family care, and the idea of paying back for the efforts undertaken by their parents. Through family care caregivers give meaning to their lives. Difficulties in the care giving process involve the burden of being the main caregiver and frictions within the relation with the older person. Conclusion Family care is associated with both positive and negative experiences, some involving ethnic or religious dimensions. This information will be confronted with information from the Dutch interviews in order to report recommendations to professionals supporting informal care givers and policy makers.

#### **PD6 740 QUALITY OF LIFE, DEPRESSION AND STRESS IN CAREGIVERS OF ELDERLY WITH DEMENTIA IN JALISCO, MÉXICO.**

E. ARIAS-MERINO\* (UNIVERSIDAD DE GUADALAJARA, Centro Universitario de Ciencias de la Salud, ZAPOPAN, Mexico)  
I. DÍAZ-GARCÍA(1), I. VELAZQUEZ-BRIZUELA(2), G. ORTIZ(2), A. MORALES-SANCHAZ(3), R. MEDA-LARA(3), J. CUEVA-CONTRERAS(3), J. CALLELA-RUIZ(3), N. MENDOZA-RUVALCABA(1) - (1) UNIVERSIDAD DE GUADALAJARA Centro Universitario de Ciencias de la Salud, DCSP (Guadalajara, Mexico); (2) INSTITUTO MEXICANO DEL SEGURO SOCIAL , CIBO (Guadalajara, Mexico); (3) UNIVERSIDAD DE GUADALAJARA Centro Universitario de Ciencias de la Salud, CA Psicología, Salud y Género. (Guadalajara, Mexico)

In Mexico, most of the patients with dementia continue to have a home-based care, given by their relatives. To give care to a patient with dementia has been associated with deterioration of the physical and mental health, social isolation, depression, overload and low quality of life. Purpose: To assess the impact in the quality of life related to health, depression and the load perceived by the primary caregivers of elderly with dementia in Jalisco, Mexico. Material and methods: Cross-sectional design (CONACYT52580). 184 primary caregivers of elderly with dementia that lived in communities in the state of Jalisco, Mexico, were studied. The Self Reporting Questionnaire 20-SRQ for psychiatric

disturbance, Spanish Center for Epidemiologic Studies Depression Scale (CES-D), Zarit Burden Interview (ZBI) and Quality of Life Index (QLI) were applied. Sociodemographic characteristics of the caregiver and the care given to the elderly were included. Results: The 78.9% of the caregivers were women. Mean age of  $50.5 \pm 15$  years, being single 31.3% and married 57.2%. Relatives without remuneration were 98.9% and the relationship with the patient is of son (46.4%) or husband (26%). The 90.6% were direct primary caregivers, 52.2% full-time. The 57.2% of the women were housewives and the 62.6% of the men were working or retired (21.1%). 55% of the caregivers showed pathological symptoms of mental health (60.6% women and 34.2 men), 81% reported depressive symptoms (84.5% / 68.4%). In relation to the ZBI, the 16.7% presented overload (19.7 / 5.3) and low QLI 17.2% (20.4% / 5.2 %). Conclusions: We found high prevalence of mental health problems in the caregivers. Their sociodemographic characteristics are very similar to other studies. We must consider the binomial ill-caregiver for the prevention and treatment of the dementia to give better quality in the health attention and improving quality of life for both.

**PD6 741 THE MEASURE AND MEANING OF DAILY LIFE: USING MIXED METHODS TO EXPLORE DISABILITY AMONG OLDER ADULTS IN NEW YORK CITY.**

A. COSTLEY\* (York College-City University of New York, New York, NY, United States)

Introduction: While quantitative measures of disability and dependence in later life invariably focus on the number of ADLs or IADLs that are "difficult" or require "assistance," much less is known about the social and cultural factors that influence the self-assessment of abilities, the need for help, and preferences for care. Methods: An ethnically diverse set of 64 community-dwelling adults in New York City (42 women and 22 men) were interviewed using standardized ADL and IADL indexes. Ages ranged from 69 to 91 (mean = 79, SD = 5.6). In addition to items on self-reported difficulty, open-ended questions explored preferences for care and the availability of daily support from family members and others. Descriptive statistics were used to compare frequencies and means. Results: A number of important distinctions emerged. While 91 percent needed no help preparing meals, 64 percent had moderate to advanced difficulty shopping for groceries. While 91 percent needed no help with mobility at home, 31 percent said mobility was difficult and 25 percent used canes or walkers often at home. While 83 percent needed no help to bathe or shower, 33 percent had difficulty and 19 percent bathed less often. While 80 percent never needed help getting dressed, 44 percent said it was difficult. Only 19 percent had any amount of paid home help, but 56 percent said that no family members would be able to help "over a sustained period of time" with basic daily activities. Yet, in qualitative comments, individuals expressed definite limits for when and how they would accept help and the involvement of close family members with different ADLs. Conclusions: Mixed methods can reveal important and often contradictory distinctions between "needing help" and "having difficulty" and reveal important social factors that influence daily negotiations over independence and the need for assistance.

**PD6 742 CAREGIVERS AND VIOLENCE AGAINST THE ELDERLY**

M. SCHLICKMANN PEREIRA HAYAR\* (Pontifícia Universidade Católica de São Paulo, São Paulo, Brazil)

Ú. KARSCH(1) - (1) Pontifícia Universidade Católica de São Paulo (São Paulo, Brazil)

INTRODUCTION: Today Brazil has a population of 18 million elderly people. Projections for 2020 indicate a 15% growth to 32 million, placing Brazil in sixth place among the countries with the largest population of elderly people that year. Studies reveal that currently 12% of the Brazilian elderly population suffer some form of violence and that their children are often the perpetrators of the aggression, the main victims being women. Aggressions usually occur at home. Violence against the elderly is connected to social violence. It is a universal concept and concerns violation of human rights. Traditionally, families in Brazil are in charge of caring for their dependent elderly. Family caregivers are usually exhausted from such a task and find themselves socially isolated. This may trigger violent behavior and the victim may be a disabled and frail elderly person. Our research regards the maltreatment perpetrated against the elderly population, and focuses on family caregivers and their dependent elderly. METHOD: Exploratory-descriptive and qualitative study using the Caregiver Abuse Screen (CASE) to screen caregivers' violence against the elderly among 10 subjects recruited from Public Hospitals in São Paulo. ANTICIPATED RESULTS: Provide knowledge on how and when maltreatment occurs; confirm the assumption that caregivers may perpetrate maltreatment resulting from their past history when they may have experienced violent situations, and obtain information from caregivers on the different forms of violence inflicted upon the elderly. CONCLUSION: The relationship between caregivers and the elderly is highly influenced by life situations that occurred prior to the dependence situation. It is thus imperative to gain an in-depth knowledge of the biopsychosocial traits of family caregivers who abuse their dependent elderly with a view to identifying the perpetrator and implementing public policies to address this issue.

**PD6 743 A SUBSTANTIVE THEORY OF CARERS' NEEDS POST STROKE.**  
L. BRERETON\* (University of Nottingham, Lincoln, United Kingdom)

Introduction: Family carers are vital to successful community care globally (Hanson et al 2006), especially post stroke; a major cause of disability internationally. U.K. policy gives carers the right to a needs' assessment and an expectation that they will become 'real partners' with services in care provision (Audit Commission 2004). Despite MRC (2000) recommendations that complex interventions should be underpinned by theory, a systematic review found interventions for carers post stroke lacked a theoretical basis (Brereton et al 2006). This paper presents a substantive theory that may inform future interventions. Methods & Materials: One hundred semi-structured, face-face, audio recorded interviews were conducted in a three phase, longitudinal constructivist study using Rodwell's (1998) guidance. Phase I – involved seven experienced spousal carers. Phase II – sixteen 'new' carers from two NHS Trusts were interviewed within a month of the stroke, then every two-three months for up to 18 months. Twenty four health and social service staff took part. Interviews were transcribed verbatim. Units of data were identified, 'sorted' 'lumped' into categories and constantly compared to assist theoretical sampling. Phase III - comprehensive member checks gained consensus on the co-constructed theory. Results: 'Seeking partnerships' with staff formed the core category. Carers' needs related to three themes: 'What's it all about?' – seeking to understand the situation 'Up to the job,' – seeking the best care for their relative initially from staff, then with regard to their own ability to provide care 'What about me?' – seeking respite from caring to meet their own needs. The extent to which carers' needs were satisfied influenced, and was influenced by, their relationship with staff. Satisfied carers trusted staff and engaged in partnerships with them. Dissatisfied carers met their own needs by 'going it alone' when possible. Conclusion: This substantive theory could inform future interventions for family carers.

**PD6 744 INFORMAL CAREGIVER PROFILE OF ELDERLY PEOPLE IN SOUTHWEST MUNICIPALITY OF SAO PAULO/BRAZIL.**

M. PARISOTTO\* (Paulista University and Regional Hospital of Assis , Assis-SP, Brazil)

A. ALINE(1), M. PEROLA(1), C. FERNANDA(1), B. ADRIANA(2) - (1) Paulista University (Assis-SP, Brazil); (2) Regional hospital of Assis (Assis-SP, Brazil)

The population aging is an emergent concern in Brazil, mainly for the change in the morbimortality standards, that raise the percentage of fragile elderly, and it brings an extensive social impact. With the current trend of the domiciliary treatment, it is common to find relatives exerting the caregiver role. Studies show that the most of them suffer from caregiver syndrome, which has as main symptoms, depression and stress in high degree. Objective: to characterize the informal caregiver profile of elderly people dependent in the domiciliary context, in the municipality of Palmital/SP. Material and Method: qualitative and quantitative-descriptive study, with not-probabilistic sample, in south-west municipality of São Paulo/Brazil, that has a medium size. For data collection, we used a semi-addressed interview, the Waldow scale and Caregiver Burden Scale (CBS), held in the residence of 89 dependent elderly. Statistical analysis was performed by the equivalence between reason and proportion of the found results. Results: informal caregivers of elderly are the most female (90.7%), sons (43%) or spouse (24%), with incomplete elementary school (77%), performing this function for over 5 years (46%), with no guidance as for cares (96%). According to the caregivers interviewed 61% of elderly were very dependent, however only 11% were classified as grade III dependent on the Waldow scale. In the CBS result the variable that most influenced negatively on the quality of life of caregivers, was the Isolation. Conclusion: the results point out informal caregivers that need health team support and information on the accomplishment of cares, as well as orientation relating to environment adaptation as a way to ease the physical burden imposed. We hope with this study awakening attention for these caregivers, providing subsidies for public policy in the development of projects aimed to improve the quality of life of caregivers and quality of care given.

**PD6 745 IN SEARCH OF THE RECONCILIATION BETWEEN THE WESTERN AND THE ASIAN VALUES: A CRITICAL APPROACH TOWARD THE RELATIONSHIP BETWEEN THE SENIORS AND THE PROFESSIONAL CARE-GIVER IN SOUTH KOREA**

B. HWANG\* (Pusan National University, Busan, Republic of Korea)

B. PARK (1), K. RYU (1), B. SHIN(1) - (1) Pusan National University (Busan, Republic of Korea)

South Korea has developed since 2005 various kinds of social policies addressing the challenges of its rapid aging society and deteriorating economy. Social services and Long-term care insurance systems are the main social policies not only in South Korea but also in other advanced capitalist countries. Some common issues related to the institutionalization of care-giving to the seniors include the social fixation of gender role and the colonization of life world. Unlike other countries, however, South Korea has met with different and various dilemmas and conflicts, such as individualism versus familialism and professionalism versus senior-respect social minds. The purpose of this paper is to examine various kinds of dilemmas that are happening in South Korea and to build a new perceptive framework toward the care-relationship in which possible antagonism between care-giver and care-receiver can be transformed to co-reliance and co-respect. Based on in-depth interview, participatory observation, and literature review on

feminist theory and Confucianism, this paper argues that both the principle of mutual-recognition between care-receiver and care-giver and the principle of open relationship between family and the state are critical to the successful running of social care systems.

**PD6 746 FROM HOME TO INSTITUTION : MENTAL HEALTH AND BURDEN OF FAMILY CAREGIVERS**

H. KERHERVÉ\* (Université Paris Ouest la Défense Nanterre, Nanterre, France)  
M. GAY(1), P. VRIGNAUD(1) - (1) Université Paris Ouest La Défense Nanterre (Nanterre, France)

Studies highlight the negative impact of the burden on the mental health of caregivers of a demented relative living at home (in France, Andrieu, 2003; Thomas, 2005). The Principal Component Analysis of the Zarit Burden Interview shows differences depending on the caregiver status. Spouse suffer from the consequences of caregiving on their personal and social life, while children feel more guilty (Ankri, 2005). When the care receiver live in a nursing home, few studies explore the caregivers mental health, although the burden seems to stay high (Lieberman, 2001). This study aims to determine the relationship between the burden's components and the mental health of French family caregivers, taking into account the differences between spouses and children of demented older adults living at home and in institution. It secondly explores the role of the perceived social support. In a sample of 264 family dyads, 176 care receiver living, at home and 88 in institution, self-rating scales were applied measuring : Burden (22 items Zarit Burden Interview; 27 items Sense of Competence Questionnaire), Depression (BDI-II), Anxiety (STAI-Y), Hostility (STAXI-II), Well being (Satisfaction With Life Scale), Perceived social support (SSQ), Other psychiatric disorders (Symptom Checklist SCL-90). Principal Components Analysis of the ZBI and SCQ showed differences in the nature of burden and mental health between spouse and children, at home and in institution. When the care-receiver is institutionalized, anxiety is lower but burden and depression stay high. Moreover both spouses and children feel more guilty and less competent in their caregiver's role. Specific differences among spouses and children also exist. At home, social support seems ineffective in reducing burden and depression among spouses and children living with the care-receiver. This study is supported by France Alzheimer ("young researcher in social sciences grant" in 2006).

**PD6 747 MOBILE LINK SERVICE – THE USE OF ICT AND CRM IN HONG KONG'S UNPRECEDENTED OUTDOOR SUPPORT AND CARE SERVICE**

I. SO\* (Senior Citizen Home Safety Association, Hong Kong, Hong Kong)  
C. NG(1), L. BARBARA S.L.(1), S. IRENE M.L.(1) - (1) Senior Citizen Home Safety Association (Hong Kong, Hong Kong)

Introduction Senior Citizen Home Safety Association (SCHSA) rendered a new outdoor support and care service, the Mobile Link Service (MLS), in Hong Kong in December 2008. It leverages on its 12-year experience of providing indoor emergency assistance service which has saved senior citizens' lives for more than 171,171 times and attended to more than 3 million assistance calls. With the use of information and communication technology (ICT), customer relationship management (CRM) and Mobile Link Device, senior citizens can seek assistance outdoor by simply pressing the one and only button to reach SCHSA's 24-hour operating call centre for timely assistance. They can enjoy their freedom and peace of mind in an outdoor environment, which fosters Active Ageing in the community. This could benefit both healthy and disadvantaged senior citizens whose mobility may have been hampered by chronic diseases, disability and dementia. Method and Materials An ongoing monitoring and evaluation exercise on the service usage and impact is being conducted regularly, including customer satisfaction surveys and interviews with users, their family members, internal staff and stakeholders. It is aimed at understanding the users' experiences and evaluating service impact in the public. Lessons learnt and customer feedback are collected timely and systematically for service improvements. Results and Conclusion Two months since the launch, there are 87 active MLS users, whose average age is 76. Some of them are in the early stage of dementia. A total of 47 surveys were completed, of which 25 were active users and 22 were user's family member. Most of the interviewees felt satisfied with the service and device. Comments and user experiences were shared providing insights for service improvements. More results of this ongoing service evaluation will be released and consolidated by coming summer. (For details of MLS, please refer to [www.mobilelink.hk](http://www.mobilelink.hk))

**PD6 748 THE INFLUENCES OF RESIDENTIAL RELOCATION ON FALL, PHYSICAL ACTIVITY AND QUALITY OF LIFE AMONG OLDER ADULTS**

I. CHEN\* (National Yang-Ming University, Taipei, Taiwan)  
C. SHUN-PING(2), Y. SHU(1), T. FU-IN(1), W. TZ-FANG(1) - (1) National Yang-Ming University (Taipei, Taiwan); (2) Lo- Sheng Sanatorium, Department of Health, Executive Yuan, (Taipei county, Taiwan)

Introduction: Prolonged life expectancy and changed societal and family structure increase the possibilities of relocation in older population. The information of residential relocation in this decade was rare, and the lower level of evidence quality in existing literature was also found. The purposes of this study were to examine the influences of residual relocation in older adults with leprosy. Methods and materials: A prospective observational

design was applied to evaluate the adaptation of voluntary residential relocation among older adults. Those residences who with inclusive criteria, without exclusive criteria, and voluntarily move to from their colony residential to retirement apartment complex were assigned to the experimental group. Those residences who choose to stay their colony residential were the subjects of control group. The data of personal information, fall (number and fall efficacy), physical activity (Chinese version of Modified Baecke Questionnaire) and quality of life (Chinese version of World Health Organization Quality of Life) were collected prior and post 6 months of relocation in both groups as the pre and post tests. Results: 250 subjects participated in this study (169 in experimental group and 81 in control group). After adjusted the age, number of disease, ADL, perceived health status, and the data of pre-test, the positive influences of relocation on fall efficacy, overall and psychological aspects of quality of life were found. Conclusions: This study enriched the higher level of evidence of interaction of aged and environment. The different findings of this study and other literatures were discussed from the points of decades, voluntary willing, and the familiarities with relocation situations (settings, neighborhood, and care providers). Observation the long term effects of voluntarily relocation was suggested. Voluntarily relocate to more supportive and personal based living settings could improve the fall efficacy and quality of life among older adults was identified.

**PD6 749 PRACTICAL RESEARCH OF THE HOME ENVIRONMENT IMPROVEMENT FOR ELDERLY PEOPLE WITH DEMENTIA**

C. OSHIMA\* (Den-en Chofu University, Tokyo, Japan)  
H. SHIMOGAKI(2), T. AKAGI(3), K. KODAMA(4) - (2) Japan College of Social Work (Tokyo, Japan); (3) Kogakuin University (2158542, Japan); (4) Japan College of Social Work (Tokyo, Japan)

1. Background and purpose In Japan, half of the elderly people with dementia who need to be cared for live at home. However, the practical applications of home environment improvement for their family caregivers are not established. For this issue, we organized the workshop for the house environment improvement for elderly people with dementia. The workshop not only consists of researchers in social welfare, psychology, and architecture, but caring experts, case manager, and architects. From 2005 to 2008, we had practiced eight group case studies in cooperation with family caregivers and demented elderly. The purpose of this report shows the concrete examples of home environment improvements for elderly people with dementia from eight case studies. And we show characteristics and significance of the workshop for the home environment improvement for elderly people with dementia. 2. Result Group case studies were conducted by the following process: 1) collect case examples; 2) analyze the cases; 3) feedback the analysis; 4) share the studies in the group. From eight cases, we had about one hundred home environment improvements. One of the main characteristics of the workshop is that various experts participated and studied one common topic, home environment for family care givers, together. Through the workshop, each researcher re-discovered the value of their specialty and the need for understanding other areas of study.

**PD6 750 RESPONSIBILITY AND AFFECTION IN FAMILIAL ELDER CARE: A CASE STUDY OF DIASPORIC CHINESE FAMILIES, VANCOUVER, B.C.**

S. CHAN\* (University of British Columbia, Vancouver, Canada)  
D. O'CONNOR(1), D. LAI(2) - (1) University of British Columbia (Vancouver, BC, Canada); (2) University of Calgary (Calgary, AB, Canada)

In North America, elder care in the context of ethnic minority families has focused on the influence of cultural values and norms vis-à-vis caring attitudes and roles and responsibilities. For diasporic Chinese families, filial piety or responsibility continues to be a dominant theme. This emphasis on responsibility neglecs, however, the importance of relational aspects of care. That is, despite growing interest in the care relationship, there exists a gap in the literature in relation to culturally diverse families. Emerging findings from an ongoing study suggest that responsibility and relationship are intimately connected and cannot be separated out. This paper will present findings from a qualitative investigation using case studies of three Chinese families living in Vancouver, British Columbia, Canada. Multiple in-depth interviews were conducted with familial carers to explore their everyday care experiences in general, and in particular, how they make sense and meaning of providing care for their elderly relatives. Interestingly, all familial carers attributed care provision immediately and directly to responsibility. However, this responsibility did not stand alone or apart from the relationship. Responsibility was enmeshed with feelings of love, affection and warmth, albeit in harmony at times and in tension at others. Best illustrated by one spousal carer, mutual responsibility fed into the build-up of strong affectionate bonds and she called these "ganqing". These bonds are found in close and usually long-term relationships that solidify over time and manifest themselves as responsible and affectionate relations in the everyday care of the partner.

**PD6 751 EMOTIONAL EXPERIENCES OF KOREAN URBAN ELDERLY IN EVERYDAY LIVES**

J. SON\* (Seoul National University, Seoul, Republic of Korea)  
J. JOO

The purpose of this study is to examine emotional experiences of Korean elderly in everyday lives. Specifically, this study is to explore the effect of place/locations of activity

and companions on emotional experience of daily activities. Data were collected from 144 urban elderly (men=74, women=70) in Seoul, using Experience Sampling Method(ESM). Along with ESM data, socio-demographic characteristics and information on overall quality of life are gathered using structured questionnaire. Cellular-phone is used as a signaling device, collecting ESM data. Respondents reported eight times a day for a week. They provided 5,398 self-reports, which were used as the unit of analysis of this study. Emotional experience was assessed with the 6-item adjective checklist which included 3 positive (happiness, contentment, relaxation) and 3 negative (stress, depression, irritation) categories. The statistical methods used for the data analyses were descriptive statistics, t-test,  $\chi^2$  verification, and ANOVA. Results show that the urban elderly in Korea spend quite substantial portion of their time in home where they feel most happy and relaxed. They spend largest share of their time in company with their spouse. Time with spouse seems to be emotionally positive experience than negative. Interesting gender differences are observed: Women report higher intensity of stress and irritation than men in terms of overall emotional experience. Emotional experience of daily lives and overall quality of life are shown to be related. Theoretical and policy implication of the results are discussed.

**PD6 752 A RESEARCH ON THE PROMOTION OF URBAN COMMUNITY CARE OF THE ELDERLY BY THE DEPT. OF SENIOR CITIZEN CENTER AT YMCA (A NON-PROFIT ORGANIZATION) IN SOUTH URBAN CITY OF TAIWAN**

P. CHEN\* (College of Medicine National Cheng Kung University In Tainan Taiwan, Tainan City 704, Taiwan)

R. YOU(1) - (1) Dept. of Senior Citizen Center for Nursing Home and Day Care and Home Care Service, The Tainan Young Mens Christian Association (Tainan, Taiwan)

Having considered the land and construction costs of residing in an urban community, it is difficult for non-profit organizations to plan and implement an integrated community service for the elderly. However, non-profit organizations that have practical experience in offering diverse and continuous elderly care services are capable of relocating the existing services from the suburb to the urban community. Consequently, this research provides a set of guiding principles and serves as a future reference. This research is based on literature reviews to discuss how community-based and non-profit organizations have developed active participation in elderly social welfare services in recent years. Non-profit organizations provide the coordination of services for the elderly according through three basic principles: the characteristics of non-profit cultural organizations, the community setting where welfare services are provided, and the continuity and quality of community-based services to the elderly. Questionnaires were administered to elderly participants at the YMCA, a non-profit organization that provides a five-year elderly care and community development program, to assess its effectiveness in helping the elderly to age in the community. The results indicated that non-profit organizations have to follow the three basic principles and comprise six crucial components in order to offer effective elderly care services in the urban community. The components are as follows: (1) the goals and objectives of setting up non- profit organizations (2) the ability of non-profit organizations to learn and grow (3) the integration of community resources (4) the continuity of elderly lives in their own communities (5) the diversity and continuity of elderly care services and (6) the flexibility and integration of various types of care services. In conclusion, non-profit organizations not only play a significant role in providing long-term care for the elderly, but also aiding the elderly to build a continuous social support network and help them to age in their own communities.

**PD6 753 GENDER DIFFERENCES IN THE EFFECT OF HEALTH ON OLDER ADULTS' SOCIAL RELATIONSHIPS**

J. HA\* (University of Chicago, Chicago, United States)

Introduction. Despite considerable health problems in old age, few studies have examined how deteriorating health conditions may influence older adults' social relationships. This study examined (1) the extent to which older adults' health conditions affect both structural and qualitative aspects of social support from children, family, and friends and (2) how these effects differ by gender. Methods. Using longitudinal data from Health and Retirement Study, a national probability sample of older adults aged 51 and over and their spouses, the analyses examined how self-rated health and the number of functional limitations in 2002 affect the frequency of social contact and support from various sources (e.g., children, other family members, and friends) in 2004 and 2006. Results. Findings suggest that for men, poorer self-rated health is associated with fewer contacts with children and lower levels of support from all sources both in the short and in the long term. The frequency of contact with friends was also negatively affected by poor health in the short term. For women, poorer self-rated health did not have a significant influence on support from children but it was associated with fewer contacts with and support from friends in the short term. Greater functional limitations were associated with lower levels of support from children in the short term for both men and women. Conclusion. Findings suggest that deteriorating health conditions in later life may negatively affect one's social relationships especially among older men. Interventions to minimize such disruptions and

implications of gender differences in social support in the face of declining health will be discussed.

**PD6 754 IMPACT OF THE FAMILY FUNCTION ON QUALITY OF LIFE AND FATIGUE IN KOREAN ELDERLY POPULATION**

S. PARK\* (School of medicine, kyungbook national university, Daegu, Republic of Korea) S. KIM(2), K. SON(1), S. CHO(3), H. CHUN(3), J. CHANG(4), B. CHO(1) - (1) Department of Family Medicine, College of medicine, Seoul National University, Seoul National University Hospital (Seoul, Republic of Korea); (2) School of medicine, Kyungbook National University (Daegu, Republic of Korea); (3) Graduate school of public health, Seoul National University (Seoul, Republic of Korea); (4) KLoSA team, Korea Labor Institute (Seoul, Republic of Korea)

Background: This study was attempted to evaluate the impact of family function on quality of life and severity of fatigue in Korean elderly population. Method: Cross-sectional survey was performed in randomly selected 534 elderly subjects of nationwide sample of Korea Longitudinal Study of Ageing (KLoSA) in 2008. In this survey, family function level was assessed using the family APGAR, which was categorized as highly functional, moderately dysfunctional, and severely dysfunctional family. SF-36 is frequently used survey tools to evaluate quality of life, and it is consisted of eight objects which are PF(physical functioning), RP(role physical), BP(bodily pain), GH(General Health), VT(vitality), SF(Social function),RE(role emotional), and MH(mental health). We used Korean version of Brief Fatigue Inventory (BFI-K) to estimate fatigue level. We calculated crude means and adjusted means of both SF-36 and BFI-K items according to the family APGAR level. Results: Of 534 subjects, 526 subjects who completed each questionnaire were included in analysis. In the dimensions of SF-36 such as PF, RP, BP, GH, SF,RE, and MH, subjects with severely dysfunctional family showed lower adjusted mean scores of quality of life than those with highly functional family ( $P<0.001$ ). Only adjusted mean scores of VT were not different according to the family APGAR level. Subjects with severely dysfunctional family were more likely to have severe fatigue level than those with highly functional family ( $P<0.001$ ). Conclusion: Our study showed that elderly population with severely dysfunctional family was likely to have impaired QoL and severe fatigue. More attention is needed to identify this vulnerable population and to develop intervention programs for them.

**PD6 755 EXPERIENCES OF PEOPLE LIVING WITH EARLY STAGE DEMENTIA AND THEIR SIGNIFICANT OTHERS**

H. PESONEN\* (University of Oulu, Oulu, Finland)

A. REMES(1), A. ISOLA(1) - (1) University of Oulu (University of Oulu, Finland)

Introduction: The incidence of dementia will increase along with the ageing of the population. Dementia has diverse psychosocial impacts on the life of the patient and the family and there is a need to develop rehabilitative and supportive nursing practices for people with dementia and their significant others. Most of the studies concerning peoples' subjective experiences of living with dementia are cross-sectional studies and there is a need for more longitudinal research. Materials and methods: This paper presents the ongoing longitudinal study that follows subjective experiences of both people living with early stage dementia and their significant others during the early phase of the illness. Research data consists of semi-structured in-depth interviews of both people with early stage dementia (n=8) and their significant others (n=8). The data has been collected at regular intervals during 1.5 – 2 years and is analysed using grounded theory -method. Results and conclusions: This study yields insight into the experiences of living with early stage dementia from the viewpoints of both people with dementia and their family members. Longitudinal research design enables to reach the people's experiences during the early phase of the illness. Findings can be used to develop nursing practices that involve both people with dementia and their family as an active participant in their care. This study confirms that it is necessary to hear the voices of people with dementia and their significant others through research.

**PD6 756 ELDER FINANCIAL ABUSE: ANALYSIS FROM PROFESSIONAL'S PERCEPTION**

R. FONTAINE\* (Université Paris-Dauphine, Paris, France)

M. JOËL(1) - (1) LEDa-LEGOS, Université Paris-Dauphine (Paris, France)

Introduction. The current research focuses on what the literature called « elder abuse » or « elder mistreatment ». Due to the aging of the overall population and greater concentration of wealth among older people, the number of elderly victims of mistreatment is increasing. Despite the methodological difficulties, recent studies provide information on the incidence of elder abuse. Faced with the importance of the phenomenon, others studies focus on the characteristics and the means to prevent or manage elder abuse. Aim and questions addressed. From a prevention perspective, the purpose of this research is to analyse the principal problem encountered by the previous studies: the difficulty to state a definition of elder abuse. Which elements allow to define a situation as a situation of mistreatment? From which moment do a situation become a situation that which can describe as a situation of mistreatment? Methods and materials. In order to answer these questions, we survey 50 professionals (paid caregivers, bank workers, insurance agents, judges and

notaries), witnesses of a situation of elder abuse. We gather and analyse two set of information: (i) their general perception of elder mistreatment and (ii) the characteristics of cases of elder abuse that they were personally witness. We focus the survey on financial abuse, one of the most common types of elder abuse. Results. The survey will be terminated shortly, but results available at this time allow (i) to define a conceptual framework of financial elder abuse, (ii) to construct a typology of elder abuse situations and (iii) to identify situations at risk. Conclusion. Elder abuse, in particular financial abuse, has serious implications for the victim's well-being and quality of life. This research highlights some preventive means and allows us to pave the way to a more extensive survey.

**PD6 757 NEEDS AND USAGE OF SUPPORT SERVICES TO AMELIORATE PSYCHOLOGICAL BURDEN AMONG JAPANESE INFORMAL CAREGIVERS**  
T. WAKUI\* (University of Tokyo, Tokyo, Japan)  
I. KAI(1) - (1) University of Tokyo (Tokyo, Japan)

Introduction: Since Long-term Care Insurance for the elderly was introduced in Japan in 2000, care services have helped informal caregivers by reducing the amount of physical care at home. On the other hand, caregiver's mental health has been largely neglected. Thus the prevalence of depression has been reported to be high among caregivers. The aim of this study was to describe the needs and usage of support services for mental health among caregivers. Also, the correlates of the needs and usage were examined. Methods and materials: The study was conducted using a convenience sample of 166 informal caregivers obtained through 34 home service organizations in metropolitan area of Tokyo. Self-administered questionnaire survey was conducted to ask the needs and usage of support services, such as telephone counseling, peer support group, and lectures to enhance care information. The physical and psychological burden of caregiving was also evaluated. Results: 69.3% were women, and average age was 62.3 ( $\pm 13.0$ ). 30% were daughters of the care recipients. 82% of the caregivers were willing to use at least one of the support services, suggesting potential needs for the services. On the other hand, 54.8% of the caregivers had not used any sort of the services at the time of the survey. Also, the data indicated that a person who had used one service was likely to use the other services as well. Conclusion: One of the reasons for not using the support services might be the lack of information on available support. Providing the opportunity of the services and persuading the use by care staff might increase the recognition of the services. Moreover, these interventions should target non-users of the services.

**PD6 758 EXPERIENCE OF WIVES WHO LIVE WITH ELDERLY APHASIC PATIENTS AFTER STROKE**  
A. SUZUKI\* (Kyorin University, Tokyo, Japan)  
T. MIZUNO(1) - (1) Tokyo Woman's Medical University (Tokyo, Japan)

Introduction: To describe the experience of families who are living with elderly stroke patients with aphasia for understanding the life of them. Subjects and Methods: Ten patients (mean age: 71.9years, 9 with cerebral infarction and 1 with hemorrhage) over 6 months after onset or 3 months after discharge were included in the present study. Interview to their wives (mean age: 65.2years) were performed regarding the transition of emotion, affection and attitude against the patients from August to October, 2008. Results: Mean duration of staying home since discharge from hospital was 3.5 years. As a result of data qualitative analysis, the experience that wives did that divided into five categories. (i) Irritation and frustration caused by insufficient communication; (ii) Evasion out of the irritation of the husband. Recognition of aphasia; (iii) Grief and confidence after struggle; (iv) discovery of a space; (v) Maintenance of their lives and interest to go forth. The categories of these experiences were changed step by step. Conclusion: The above data suggest that wives of the elderly aphasic patients accumulate their experience prospectively for them to live as they like.

**PD6 759 INTERGENERATIONAL RELATIONSHIPS OF GRANDPARENT-HEADED FAMILIES AND ADJUSTMENT OF GRANDCHILDREN IN RURAL KOREA**

J. LEE\* (Chonnam National University, Gwangju, Republic of Korea)  
Background & Purpose: There has been a sharp increase of grandmothers raising grandchildren in contemporary Korean Society. This phenomenon is mostly due to the increase of labor force participation of married women with children and also due to the recent increase of divorce and family dissolution. Rural area, especially, has more grandmothers raising grandchildren result from family dissolution than urban area. However, there is a lack of empirical research looking at the experiences of custodial grandmothers, intergenerational relationships and adjustment of grandchildren who is raised by grandmother without parent generation. In this regard, this study attempts to capture the effect of intergenerational relationships on adjustment of grandchildren. Methods: The data were gathered from 311 grandmothers raising their grandchildren in rural area as a primary care-giver, using structured questionnaire. The statistical methods used for data analysis were descriptive statistics, cross-tables, t-test, and regression analysis with SPSS WIN 12.0 programs. Results: There are differences in the factors influencing the level of grandchildren's adjustment in rural grandparent-headed families. Educational, economical and health status of the grandmother and health status of

grandchild are significant variables predicting the adjustment of grandchildren. Especially, the relationship between Grandmother and grandchildren is the most important factor on the adjustment of grandchildren. It suggests that the intergenerational relationship helps to identify grandchildren in trouble in rural grandparent-headed families. Findings highlight the importance of professional assistance and community services in minimizing the negative impact on grandchildren's well-being who is raised by grandmother in rural area.

**PD6 760 FAMILY CARERS OF OLDER PERSONS WITH STROKE – NEEDS AND RECEIVED SERVICE**

B. KREVERS\* (Dept of medicine and health, Linköping, Sweden)  
B. ÖBERG(1) - (1) Dept of medicine and health (Linköping, Sweden)

Introduction Family carers (FCs) of persons with stroke often provide much care and have high strain/burden. The aim of this study is to examine what FCs perceive as important service and service quality in relation to experienced strain/burden due to caregiving, and also explore to what extents FCs' receive these service and quality characteristics. Methods and materials The present data emanates from a sub sample of the Swedish part of the EUROFAMCARE-project focusing family caregiving of older people. Inclusion criteria in the present study are; someone who is 18 years of 65 $\geq$ age or older and care at least 4 hours per week for a person who is years that have had stroke not living in sheltered housing or institutional care. The final study sample includes 183 FCs, a comparison is made between 64 FCs with lower strain/burden and 119 FCs with higher strain/burden. FCs were interviewed following a structured assessment. Results FCs consider it important that services improve their quality of life, that service is individualised and provide information, relief, counselling and good quality concerning interaction. There are few differences between FCs' with higher and lower strain/burden concerning their preferences of important service and quality characteristics and to what extent they receive these. Often less than 60% receives important services. FCs with higher strain/burden provide more care and perceive less wellbeing and quality of life. Conclusion The level of FCs' strain/burden of caring doesn't settle what type of service or quality characteristics that are most important to them. Though only about half of the FCs receive service important to them. The fact that there are almost no differences between the compared groups to what extent important service meet their needs might elucidate that FCs strain/burden has little influence on service organisations' (mostly public) decisions on their provision of service.

**PD6 761 OLDER PERSONS IN MULTI-GENERATIONAL HOUSEHOLDS IN SOUTH AFRICA - "THIRD AGE" IDEALS; "SECOND PARENTHOOD" REALITIES.**  
J. HOFFMAN\* (University of Oxford, Oxford, United Kingdom)

Introduction: Entrenched inequality and pervasive poverty, exacerbated by an estimated 1, 2 million so-called HIV/AIDS orphaned children, set the overall context in which the majority of older persons in South Africa live. Sixty percent of these affected and/or infected children reside in grandparent households, thus obviously placing on the research and policy agenda the continuous asymmetrical dependency and needs of younger generations on older generations. Methods: Based on 46 narratives of HIV/AIDS affected and non-affected multi-generational households in urban and rural Mpumalanga, this contribution qualitatively explores the complexity of this asymmetrical dependency through thematic content analysis: How is it understood and perceived by older persons in relation to their understanding of the "traditional" intergenerational contract; what are the impacts on them? Results: The experiential aspects of these intergenerational relationships and how they relate to older persons' understanding of the intergenerational contract will be conceptualised and discussed to elucidate the multi-faceted and ambiguous nature of the intersection between the vulnerabilities, rights and contributions of these older generations.

**PD6 762 FAMILY SUPPORT OF ELDERLY FEMALES: THE IMPACTS OF MIGRATION AND HOUSEHOLD COMPOSITION ON SUPPORT NETWORKS IN VIETNAM**

M. MCNALLY\* (University of Michigan, Ann Arbor, United States)

Family support for the elderly in Vietnam, like many Asian nations, remains a central mechanism for the care of this growing population. Similarly, Vietnam shares the growing concerns associated the increased flows of rural to urban migration that can strip rural communities of working aged adults; typically the backbone of family support networks. In many Asian nations, these migration flows leave elderly in rural areas with a reduced pool of potential caregivers while often placing increased burdens on the elders as grandchildren often remain in family home when parents migrate for work. This paper present research on the change in household structure that contain aged females in Vietnam using data from the 1989 and 1999 Census of population. While considerable work has been done in Vietnam on reproductive behavior and family, little has been done quantitatively to date on the lives of the aged. This paper examines how household support systems have changed in urban and rural areas as a response to internal migration, particularly during the "Doi Moi" period of economic reforms. The paper shows that there have been marked transitions in the composition of households that contained aged Vietnamese females but that they continue to live within an extended household system. These changes do suggest, however,

that Vietnamese women are facing new challenges in the structure of their coresident support networks that may have negative impacts if trends follow that seen for other Asian and Pacific nations. Using the information for the two available time periods we project expected levels of change up to the 2009-2010 period which will allow for the validation or improvement of our predictive models using data from the 2009 Census of Vietnam now under development.

**PD6 763 CARE GIVERS OF PATIENTS UNDER HAEMODYALYSIS: A SOCIODEMOGRAPHIC ANALYSIS**

L. ANDREU\* (Escola universitaria de enfermeria de bellvitge, Barcelona, Spain)  
P. ARDITE(1), M. MUÑOZ(1) - (1) La Torassa, serveis a la dependencia (hospitalet del llobregat, Spain)

Introduction: A high number of patients under periodic haemodialysis are over 75 and they present a significant comorbidity. That situation significantly impairs their autonomy and represents an over pressure over their main care givers. Objective: To study the main sociodemographic characteristics of those patients as well as their health status perceived by their main care givers at home. Methods: Transversal descriptive study on 433 care givers of patients under non-hospitalary haemodialysis. Variables studied included, sex, age, family relationship, work status and perception of health status. When patients were studied we analyzed, age, sex, and level of dependence according to the Spanish Law that establishes three levels of dependence (moderate, severe and high dependence). Other variables relevant for the haemodialysis procedure such as care of the catheter, and administrations of drugs were included in the analysis. Results: The sex of the main care giver is mainly female (77%). Male care givers have a mean age of 76 (range 45-84). Females were 68 (range 38-86). As for their family relationship, 202 take care of their partner, 103 their parent, 30 their parent helped by their children, and 30 take care of another relative or friend. 46 people work outside home and 380 have helped for domestic tasks. The perceived health status by the care givers was fair for 294, poor for 144 and bad for 59. 232 care givers received specific training for taking care of patients under haemodialysis. Statistical analysis showed that the standard care giver was a female under 70 that does not work outside home. Conclusions: Patients under haemodialysis that are in the group of severe dependence are taken care mainly by old females, mainly their partners or daughters that show different perceptions over their health status.

**PD6 764 QUALITY ELDERLY CARE IN NURSING HOMES FROM FAMILY MEMBERS' POINT OF VIEW**

A. HABJANIč\* (University of Maribor, Maribor, Slovenia)  
A. ISOLA(1), S. ELO(1) - (1) University of Maribor (Maribor, Slovenia)

Introduction The purpose of the research was to investigate the current state of elderly care offered in Slovenian nursing homes, and to ascertain proposals to achieve or improve quality elderly care. There is relatively little within the literature concerning the roles that family caregivers might play following an older person's relocation to the nursing home. Methods Sixteen family members (n=16) from four nursing homes (N=4) in Slovenia have been interviewed. Content method analysis was used to conduct family members' suggestions for quality elderly care. Results Family members were primarily concerned about the quality food residents get served and that liquids should always be on disposal. Additionally, family members expressed the need for good personal hygiene without use of aggressive cosmetics. They also indicated that more technology could increase the quality of life of residents in a manner to decrease waiting times and therefore physically safer environment could be established. Apartments were also issue of quality elderly care since arrangements and furniture proved inadequate. Family members expressed desire for more social gatherings with nursing staff members or heterogeneous social activities in nursing homes. Nursing staff members should also try to improve human relationship towards elderly residents. Conclusion A short model of proposals has been introduced that could lead to improved elderly care without extensive organisational changes or financial costs. Results have been used to produce some research materials and dissemination about family members' perceptions was made. A number of studies suggest that role redefinition is a crucial task for family members following placement of their elderly family members in residential care. Family members possess knowledge in relation to the older person and their desire to convey this to nursing staff members, as a basis for care planning, is increasingly apparent.

**PD6 765 AGE AND GENDER IN A BRAZILIAN MILITARY LONG TERM CARE FACILITY FOR ELTERS.**

S. PINTO\* (Casa Gerontológica da Aeronáutica Brig. Eduardo Gomes, Rio de Janeiro, Brazil)

U.S. Bureau of Census (1992) states that the need for long term care for the elder population increases as the phenomenon of demographic transition develops. In Brazil this phenomenon has increased the number of facilities devoted to shelter old people. Gerontological literature indicates that age and gender have strong influence upon life expectancy and health demands, therefore they can be considered differential factors in terms of the attention to be provided by long term care (LTC) facilities. This study presents

a profile of the dwellers in a Brazilian military facility for elders, the Casa Gerontológica de Aeronáutica Brig. Eduardo Gomes (CGABEG), in terms of age, gender and period of stay. It also compares this profile to literature data. Methods and Materials The profile presented includes all the dwellers officially at the facility in 12.07.08 . Average calculation was applied to calculate average period of stay and age. Data source was the social promptuaries kept by CGABEG's Social Work Department (Seção de Serviço Social). Results POPULATION PROFILE BY GENDER DWELLERS BY GENDER NUMBER OF DWELLERS AGE (average) TIME OF STAY (in years MEN 29 84 4,29 WOMEN 85 82,91 7,44 TOTAL 114 83,19 6,64 Conclusion In this study men are, in average, 1 year older than women. This is opposed to Brazilian's life expectancy. Unfortunately, there's no available data concerning to life expectancy among Brazilian military personnel in order to verify if this discrepancy is a professional trait or a distinctive feature of the studied facility. Further studies about the clinical profile of these subjects may bring some light to the question. Women's period of stay in the facility is, in average, 3 years longer than men's. As it is at most Brazilian facilities, women stay longer and go younger to LTC facilities.

**PD6 766 FILLING THE GAP IN CARE: CUSTODIAL GRANDPARENTING IN THE PHILIPPINES**

E. LAGUNA\* (Bremen International Graduate School of Social Sciences, Bremen, Germany)

Introduction In Filipino family, it is common for grandparents to take an active role in raising grandchildren. This is facilitated by multi-generation living arrangements, and socio-economic and demographic trends such as increased participation of women in the labor force, improved health expectancy, high birth rates and the continued appeal of overseas labor migration. Methods and materials Based on the 2007 Philippine Longitudinal Survey of Aging, this study looks at the phenomenon of custodial grandparenting. It provides baseline on the proportion of older people involved in custodial grandparenting, and explores differences across socio-economic indicators. The 2007 PLSOA is a national survey of older people aged 60 and over. Results More than half of Filipino grandparents reported involvement in the care of their grandchildren. The most common form of care given by older people is babysitting and feeding. However, 35 percent of those who are involved in their grandchildren's care act as surrogates or custodial grandparents. Various reasons cited are employment of parents, including overseas work, child's own preference to live with them, marital separation of single parenthood. There is gender difference in the assumption of custodial grandparenting role, with slightly more females involved in grandchildren care than males. Results also show that custodial grandparenting is more pronounced in families with overseas migrant workers. Conclusion The involvement of older people in the care of grandchildren is expected of societies that emphasize strong family ties where high intensity of support is extended to family members. This also manifests Filipinos' concept of parental obligation that goes beyond one's nuclear family. The pattern however has important implications on older people's well-being.

**PD6 767 THE BURDEN OF FAMILY CARE GIVING SEVERE DISABLED POOR OLDER PEOPLE IN CHILE**

C. ALBALA\* (Institute of Nutrition and Food Technology (INTA), University of Chile , Santiago, Chile)  
L. LERA(1), A. FUENTES(1), H. SANCHEZ(1) - (1) INTA, University of Chile (Macul, Chile)

Introduction Chile is placed among the ageing countries of Latin America with LEB, fertility and mortality rates similar to European countries and the USA. The increasing age-associated health problems although limited resources for caring the elderly in a context of poverty, face government to a significant demand of health-care and social support. The aim of this study is to examine family care giving of poor elders in Chile Subjects and Methods Cross sectional study conducted in 2006-2007 in 221 home-bounded elders 35.8% men and 64.2% women (mean age 79.7y and 83.5y respectively) and their carers (89.6% women, mean age 53.1y). Socio-demographic, health, nutrition and living condition variables were gathered. The burden of care-giving was estimated through Zarit's burden of care-giving scale Results Main causes of dependency were stroke (38.1%) dementia (23.7%), and muscle-skeletal diseases (22.1.3%). Disabled subjects seldom lived alone (4.1%), 81.8% had <6y or no education, 93% received professional medical care and 68.4% have good nutritional state. The care was performed mainly by women (89.6%, 18% spouse, 53.8% daughters), 38.6% of carers have been the main caregiver for > or equal 6y and had no vacations during the last 6 years. Half of caregivers had received training or share the care with other relative. Care-givers self-perception of health was no good in 58.6%. A low burden of care-giving was associated with receiving help (OR 4,3 95% CI: 2,0 – 9,1) and negatively with dementia (OR 0.47 95%CI:0.2– 1.0). Taking care of severe disabled, being aged and taking > or equal 3 medications/day are negative factors for having good health perception (OR=0,42, OR=0,96 and OR= 0,43 respectively) Conclusion. The study depicts a high burden of care for women affecting their psycho-social

wellbeing. Initiatives supporting family caregivers are crucial to ensure the status and quality of care at home for both the recipient of care and the caregiver.

**PD6 768 COMPANIONSHIP, AFFECTION AND SEXUALITY AT END OF LIFE: ADAPTIVE NETWORKS FOR INTIMACY**

J. McNALLY\* (University of Michigan, Ann Arbor, United States)  
M. SAYRE(1) - (1) University of Michigan (Ann Arbor, United States of America)

It is generally believed that affection and physical contact represent important aspects of providing care and support to individuals facing life threatening health situations. Unfortunately very few representative sample surveys address both the issues of affection and sexuality in conjunction with declining health. This poster presents new finding on this subject using the recently released National Social Life, Health, and Aging Project (NSHAP) from the University of Chicago. Recognizing that the health of older adults is influenced by many factors, one of the least understood is the role that social support and personal relationships may play in healthy aging. NSHAP represents the first population-based study of health and social factors on a national scale, aiming to understand the well-being of older, community-dwelling Americans by examining the interactions among physical health, illness, medication use, cognitive function, emotional health, sensory function, health behaviors, and social connectedness. It is designed to provide health providers, policy makers, and individuals with useful information and insights into these factors, particularly on social and intimate relationships. Due to the unique design of the NSHAP, these data offer a unique opportunity to compare the measures and constructs of affection and sexuality among elderly in declining health as compared to those still in good health. The paper will reflect the evolving definitions of affection and sexuality and how these definitions evolve to incorporate, physical frailty, sexual dysfunction, and the emotional costs of care giving on the partner of the sick elder. We argue that the results reflect the positive benefits of affection and sexuality to overall health and emotional satisfaction even when behaviors normally defined as "sexual" become difficult and emotional satisfaction is achieved through other pathways that reflect affections and intimacy.

**PD6 769 THE STRENGTHS OF A „WEAK PROFESSION“—GERONTOLOGICAL SOCIAL WORK IN THE HELPLESS ENABLING STATE—THE CASE OF GERMANY**

U. OTTO\* (FHS St. Gallen, University of applied Sciences, Rorschach, Switzerland)

Introduction: In the discussion about professionalism Social Work is seen as a “weak” profession. Furthermore Gerontological Social Work often is seen only as an appendix to medical and healthcare professions. Especially in the care focussing work however, specific “weaknesses” are possibly turning into strength that is particularly asked for: the multi-professional cooperation, the multi-perspective and integrative view on “the case”, the systematic reference on people in their social environmental context and network relations. Methods and materials: The contribution argues (a) on a theoretical and analytic basis (i.e. welfare mix, social work as co-production, research on social networks and social support). It analyses (b) some important historical developments in Germany since the 1960s – including (c) own empirical research of some innovative network-intervention-models (i.g. “senior cooperatives”) and takes the international references into account. On this basis the contribution outlines (d) some programmatic conclusions. Results and conclusions: The presentation emphasizes cooperation, co-production and contextualizing in welfare mix as basic goal orientations – under the perspective of an impulse towards high quality work beyond professional boundaries rather than Social Work as a niche. It is argued that, based on the example of Germany, the situation in the sector of Old People’s Welfare represents a particularly suitable model for the examination of the concerning discipline-challenges and –chances of Social Work. It is outlined, that Germany in the face of the demographic changes turns into a “helpless enabling state” when not strengthening and implementing modern modes of “unprofessional professionalism”. As regards this development, the outlined approach of Gerontological Social Work could become an important pioneer, (a) also for other fields of Social Work and (b) for developments which are necessary for other professions in the realm of personal social services.

**PD6 770 CARING FOR NURSING HOME RESIDENTS WITH ADVANCED DEMENTIA: FAMILY INVOLVEMENT MATTERS**

C. REID\* (University of British Columbia Okanagan, Kelowna, British Columbia, Canada)  
N. CHAPPELL(1), H. KADLEC(1) - (1) University of Victoria (Victoria, Canada)

Introduction: Optimal care for nursing home residents with advanced dementia is more likely to take place when resident, family and staff work in concert toward that end. The resident's voice, however, may not be heard when faculties become impaired by dementia. Family involvement in care thus becomes that much more essential. In this study we explore the relationships between family involvement and changes over a one-year period in resident cognitive function, verbal and physical agitation and aggression, social skills, expressive language skills and affect. Methods and materials: Eighteen nursing homes in British Columbia, Canada participated in this study. Longitudinal data collection procedures were employed: at admission, at 6 months, and at one year following

admission. Sample size at admission was 198 residents. Relationships between family involvement and resident outcomes were measured at the individual resident and facility levels. Results: At the individual level, family involvement (e.g. as measured by trust in staff members, involvement in decision making, being informed about changes in resident condition) was related to less decline in cognitive function and social skills. At the facility level (i.e. family involvement and resident outcomes were aggregated for each facility), increased family involvement was associated with fewer residents who maintained good social skills but with a higher proportion of residents with lowered physical aggression but higher physical agitation. Conclusion: These results indicate that family involvement in care of dementia residents is important and complex, both at the resident level and at the facility level. The causal direction, however, for some of the associations requires further assessment.

**PD6 771 ETHNIC DIFFERENCES IN CAREGIVER BURDEN, SELF-EFFICACY, AND REWARDS AMONG WORKING ELDER CAREGIVERS IN UNITED STATES**

J. BRANIN\* (University of La Verne, La Verne, United States)

INTRODUCTION: The aging of the population will increase the costs to employers and employees caring for older adults and require family supports that may vary across different ethnic groups. Research has shown that providing elder care has physiological and psychosocial effects on working caregivers. This study examined the differences among White, Black and Latino working caregivers in caregiving skills, caregiver burden, caregiver self-efficacy, and caregiver rewards as well as the effects of caregiving on quality of life, health and well-being. METHODS AND MATERIALS: Using convenience sampling, 276 working White, Black and Latino adults who were providing elder care were personally interviewed. RESULTS: The typical working caregiver was a 47-year-old woman caring for her 77-year-old mother. In the past six months, she had taken off work more than twenty hours and used the telephone at work between 1-5 times a week for caregiving responsibilities. Caregiver Self Efficacy was positively related to Caregiver Rewards ( $\beta=.424$ ,  $p<.001$ ) and negatively related to Caregiver Burden ( $\beta=-.310$ ,  $p<.001$ ). Regarding Caregiving Skills, Blacks rated their skills in communicating with their older loved one more highly than other groups ( $\beta=.332$ ,  $p<.001$ ) and were more likely to have taken more than 20 hours off work ( $\beta=.201$ ,  $p<.05$ ). Both Blacks and Hispanics remained less confident of finding caregiving information and resources ( $\beta = -.175$ ,  $p<.05$  and  $\beta = -.183$ ,  $p<.05$  respectively). Those caregivers with greater self-efficacy and greater Caregiver Rewards reported greater quality of life. There were significant differences in Caregiver Burden ( $F=7.35$ ,  $p=.001$ ) with Blacks feeling greater levels of burden. CONCLUSION: An increasingly diverse workforce might have differing needs for caregiver supports. Programs that raise the knowledge, skills and self-efficacy of working caregivers may reduce caregiver burden, increase caregiver rewards, and have a positive effect on the working caregiver's quality of life.

**PD6 772 EXPECTANCY AND PERCEPTION REGARDING AGING IN A COMPANIONSHIP CENTRE FOR THE ELDERLY**

M. REAL SILVA\* (University of Sao Paulo, Cecap - Salto/SP, Brazil)

Objective: Analyse the expectancy and perception about the aging process of the members, and the staff who go regularly to a companionship centre. Representation: The descriptive research of the transversal kind: Materials and Methods: The Study was realized with 83 members and 18 employees who attend the activities developed in a companionship centre. The data was collected by a planned interview semi-structured based on the bibliographic review and in the results of the pilot project. The participants signed the term of free and cleared consent. The analysis of the interview was based on the technique of speech analysis proposed by Bardin. Results and Discussion: According to the samples, it became evident most of the female gender, married and with predominance in the average age between 60 and 70 years old. It was confirmed that the expectancy of the members and employees refer to the aspects of continuing, growing and improvement in the activities developed by the companionship centre, what distinguish the theme of belonging to the group was, it was more significant with elderly widows who live alone. Analysing the perception of the users about aging, it was verified that 22% of the employees and 48% of the members have a vision relatively negative, emphasizing speeches of unpleasant state of spirit, and the non recognition of aging. Conclusion: The expectation of the elderly directed to the colette stimulate the active participation in the companionship centre, corroborating the social integration and the identification of the potentialities. The negative perception about aging must be exploited and discussed in order to modify bias related to the moment with the employees and the members live. Educational gerontologic programs under the view of the permanent education, contribute to the end of mystification of myth related to aging.

**PD6 773 INTERNATIONAL FAMILY CAREGIVING: NEW TRENDS AND ALLIANCES**

H. GAIL\* (National Alliance for Caregiving, Bethesda, United States)

Nine countries have significant family caregiving infrastructure—Canada, Australia, UK, New Zealand, Ireland, Sweden, Finland, Taiwan, and the US—and they have been meeting for the past few years to develop an international alliance of carer organizations. This past

December, several of the countries were represented at the United Nations on a program to highlight caregiving issues. Gail Hunt of the National Alliance for Caregiving (US) has been spearheading the effort to incorporate the organization so that it can establish a formal relationship with the World Health Organization and the UN. This session will describe the mission of the new organization and how the group plans to share advocacy information through its website, and encourage more countries to develop their own carer organizations. Ms. Hunt will also describe recent caregiving legislation within these countries and new areas being researched, including support to carers in the workplace, young carers, and carer health.

**PD6 774 DOES PROVIDING SUPPORT FOR CHILDREN ENHANCE THE LIFE SATISFACTION OF OLDER ADULTS IN URBAN CHINA? THE ROLE OF PERCEIVED FILIAL PIETY OF CHILDREN**

M. GUO\* (University of Southern California, Los Angeles, CA, United States of America)  
I. CHI(1) - (1) University of Southern California (Los Angeles, United States of America)

Introduction This study investigated 1) whether providing monetary and instrumental support for children enhances the life satisfaction among older adults in urban China, and 2) whether older adults' perception of children's filial piety influences the relationship between support provision and parents' life satisfaction Methods and materials Data used in this study were from a large, representative national survey: The Sample Survey on Aged Population in Urban/Rural China(SSAPUR) in 2000. This study consisted of 10,171 Chinese elders aged 60 and over in urban areas. Multiple regression analysis was conducted to predict older adult's life satisfaction with two sets of variables entered sequentially: 1) socio-demographic variables of older adults, monetary and instrumental support provided by older adults to their children; 2) interactions of monetary and instrumental support with perceived filial piety of children respectively. Results It was found that helping children with housekeeping and caring for grandchildren were associated with enhanced life satisfaction among older adults. However, the positive relationship between providing support and life satisfaction was moderated by parents' perception of whether their children are filial toward them. It's only when parents viewed their children as filial that providing support to their children enhanced parents' life satisfaction. Conclusion Although previous studies have showed that actively participating in intergenerational support plays a key role in the well-being and social connectedness of older adults, the findings of this study shed lights on the importance of perceived parent-child relational qualities and the sense of children's filial piety in realizing the potential positive effects of support provision on older adults. It seems that only when parents view their support as "worthy" or rewarding that their supports to children enhance their own psychological well-being.

**PD6 775 ELDER MISTREATMENT AMONG CHINESE AND KOREAN IMMIGRANTS IN THE UNITED STATES: AN EXPLORATORY STUDY**

Y. LEE\* (SAN FRANCISCO STATE UNIVERSITY, SAN FRANCISCO, CALIFORNIA, United States)  
E. PEREZ-STABLE(1) - (1) UNIVERSITY OF CALIFORNIA SAN FRANCISCO (SAN FRANCISCO, CALIFORNIA, United States of America)

Introduction: Elder mistreatment (EM) has emerged as a serious public health problem affecting millions of elderly individuals in the United States. One of the greatest challenges in extant research is the lack of precise definitions and operational terms to facilitate the reliable assessment of elder mistreatment. Although sociocultural contexts significantly influence definitions about mistreatment, a paucity of data is available on Asian immigrant elderly, hindering the development of effective, culturally sensitive protocols for detection, identification, and intervention. We conducted a qualitative pilot study of definitions, perceptions, and experiences of elder mistreatment among Chinese and Korean immigrants in order to refine theoretical and conceptual constructs of elder mistreatment. Methods and Materials: The study was conducted in the San Francisco metropolitan area, California in the U.S. Data was collected concurrently from various participants through: (1) Phase 1: 20 in-depth interviews with mistreated Chinese and Korean elders (10 from each ethnic group) in partnership with the Department of Aging and Adult Services; (2) Phase 2: five focus groups (6 to 8 for each focus group; N=30-40)—(a) two groups with non-abused elders (one with each subgroup [Chinese and Korean]); (b) two groups with caregivers and non-caregiving adult children (one with each subgroup [Chinese and Korean]); and (c) one additional group with local professionals and interdisciplinary experts; and (3) Phase 3: 10 follow-up interviews with service providers who participated in the focus groups and agreed to be contacted for individual follow-up. Results: The findings suggested that the concept of elder mistreatment is quite complex and is intricately intertwined with the elder's cultural beliefs and attitudes about family, filial piety, caregiving responsibilities, and tangible and emotional needs. These beliefs impacted the perceptions and types of specific behaviors that are considered abusive or traumatizing to an elder. Conclusion: The findings of this study suggest the critical needs to capture the nature of elder mistreatment in cultural context and to integrate into existing elder mistreatment instruments. Social policy and government intervention must address the dire needs for the development of

culturally appropriate and specific definitions and operational terms to facilitate the reliable, valid, and generalizable assessment of elder mistreatment.

**PD6 776 LIVING AT HOME WITH DEMENTIA : THE RELATION BETWEEN BEING IN ONE'S OWN HOME AND HAVING A SOCIAL LIFE**

M. GUISSET-MARTINEZ\* (Fondation Médéric Alzheimer, Paris, France)  
B. PUIJALON(1) - (1) Université Paris XII, UFR SESS (Créteil Cedex, France)

INTRODUCTION The importance given in living in one's own home is generally admitted even when care is needed as in old age. Habitat is an habitus (Bourdieu 1980), and this habitus is an essential part of well being. Does this apply for people with dementia? On another hand, continuing to take part in family or social life is supposed to provide spatial and temporal landmarks which can represent a caring and securing cocoon for those with Alzheimer. This better understanding of the relation between living in own home and maintaining social links led to the development of a study project. METHOD Our study was based both on 8 focus group meetings with 30 professionals from social, medical, and management background working either in domiciliary care, in a hospital or in a nursing home and 12 study cases and 9 interviews were realized . The results and key points were then discussed within a pluridisciplinary research seminar including a philosopher, an anthropologist, a lawyer, and a psychologist. RESULTS As dementia gets more severe, people living in their own home experience an increasing lack of social relations, putting them at risk of social isolation. According to the person's situation, to the stage of the disease, living in own home seems often to be less important than having relations and a feeling of familiarity with those around. Social links become then the main reference points and moving to an institution may become a suitable solution. CONCLUSION Trying to meet the needs of a person with dementia and proposing a relevant solution implies considering the interaction between the living place and social surroundings. Interaction between the different professionals is thus required to avoid an over-simplistic vision, in order to build a more refined approach.

**PD6 777 EVOLUTION OF THE CONCEPT OF RESPITE AND RESPITE CARE SERVICES: AN INTERNATIONAL PERSPECTIVE**

M. VILLEZ\* (Fondation Médéric Alzheimer, Paris, France)  
L. NGATCHA-RIBERT(1), P. KENIGSBERG(1), M. GUISSET-MARTINEZ(1),  
K. CHARRAS(1), M. FREMONTIER(1) - (1) Fondation Médéric Alzheimer (Paris, France)

INTRODUCTION Respite care is a priority of the third French Alzheimer Plan 2008-2012. On behalf of the governmental follow-up committee, Fondation Médéric Alzheimer established a typology of the different respite care services, based on a French and international literature review. METHODS Our study is the result of two national focus groups with 30 professionals from social, medical, psychological background, 10 interviews of family carers and people with dementia, and on field visits for practice and projects observation. This approach was completed by a systematic analysis of more than four hundred articles published between 1990 and 2008. RESULTS The key points of our analysis are that the most effective programs are those directed jointly towards people with dementia and their carers, combining several approaches and methods of interventions (Brodaty, 2003 – Mittelman, 2006). We observed a real paradigm change about respite care design and implementation over the past few years. One of the major features is the new consideration of quality of life for both people with dementia and their carers and not only the satisfaction of carers respite needs alone. Moreover, respite care services are more and more targeted and adapted to the individual situation. To illustrate these new trends, we will present different initiatives, for example, offering mobile community services to get closer to both users, preserving relationship between people with dementia and their family carers. CONCLUSION These new pragmatic approaches allow to diversify intervention modes and to adapt them to complex life situations, within different family contexts. These new solutions attempt to create more accessible, acceptable and effective respite care services.

**PD6 778 RISK FACTORS FOR MENTAL ILLNESSES IN ELDERLY IN A ROMANIAN DISTRICT**

D. PODREA\* (West , Arad, Romania)  
D. NEGRU(1), L. NICULESCU(2), R. CHENDERES(3), I. JURCA(4) - (1) DSP (Arad, Romania); (2) DSP (Arad, Romania); (3) West (310022, Romania); (4) Centrul Judetean de Resurse si Asistenta Educationala Arad (Arad, Romania)

Objective: The evolution of the mental illnesses in Romania presents an ascending trend, from 507.4‰(1970) to 975‰(2007). We have identified the risk factors regarding to the demographical and social-economical Romanian context in subjects aged of 65 with mental illnesses. Material and methods: Our study was performed, according to ICD-10 diagnostic codes, on independent groups, using a randomized study group of 93 patients, comparing the data on two age categories(16-64 years; over 65 years), and appreciating the central tendency, variation, dispersion, and the degree of association between the variables. The data was statistically processed using the SPSS12.0forWindows. Results: Between 2005 and 2008, in the Arad County, we noticed a high frequency for anxious(143.75) and depressive disorders(104.25), numbers below the European, or world reported averages. The average of hospitalization days in psychiatric services during 1970-2007 is 26.8 days

for Romania, and 46.7 for the Arad County. The incidences of the mental illnesses in males present a high rise(0.22%oo(2005); 8.98%oo(2007)), due to the loss of socio-economically status(economical restructuring, unemployment). The median incidences on age categories increase from 38.26 in 16-64years group to 61.33 in the over 65years arm. In respect to cognitive decline, including dementia, this increase is steep in the over 65years arm, meaning 76.22vs.4.39. Age is a positive associate risk factor in women ( $p=.001$ ) and men ( $p=.041$ ), corroborated with the absence of professional activity(retirement). The risk rate for mental disorders is 8.33 in married and 2.92 in divorced people. Co-morbidities, such as HTA(24.7%), ischemic disease (18.3%), surgical trauma (17.2%) and metabolic syndrome (16.5%) are frequent associations in mentally ill subjects, when compared to the general population. Conclusions: The shortening of the hospitalization period with rapid family, social and eventually professional reintegration by the mean of the social support networks is of a high necessity. The treatment of co-morbidities may be beneficial by the lowering of the frequency of mental illnesses in elderly subjects.

**PD6 779 INEQUALITIES IN THE MORTALITY RATE AMONG ELDERLY INDIVIDUALS IN THE CITY OF SAO PAULO:SABE STUDY**

M. LEBRAO\* (UNIVERSITY OF SAO PAULO, SAO PAULO, Brazil)  
M. LOUVISON(1), J. SANTOS(1), Y. DUARTE(1), R. LAURENTI(1) - (1) UNIVERSITY OF SAO PAULO (Sao Paulo, Brazil)

Introduction: The ageing of the population occurs at an accelerated rate in developing countries, offering important new challenges. Longitudinal studies on the elderly allow the analysis of living conditions and health status in various cohorts over time. Studies on the inequality of morbidity, access to services and mortality rates are fundamental to identifying intervention needs regarding the prevention of premature death. Methods: The SABE Study on health, wellbeing and aging was carried out in 2000, in which 2143 individuals in the city of Sao Paulo aged 60 years or older were interviewed. In 2006, the study became longitudinal. Deaths were identified and inequalities in survival rates were analyzed in relation to health status and socioeconomic factors. The statistical analysis involved adjusted mortality rates, multivariate regression models and survival analysis. Results: A total of 649 deaths occurred in the study period (22.9%). The likelihood of death was greater among those with a more advanced age, males (29.2%), individuals with no schooling (32.0%), those in the lowest quintile of income (31.5%), those with self-reported bad health (41.6%), those having reported two or more chronic illnesses (28.5%), those reporting three or more difficulties in basic activities of daily living (62.1%) or instrumental activities (42.5%), those underweight (34.3%), those having fallen in the previous year (28.3%), those with cognitive deterioration (46.9%) and those hospitalized in the four months prior to the interview (34.2%). Conclusions: Social determination in the mortality rate among elderly individuals reflects inequalities in living and dying. Under the same health conditions, early mortality is identified as a function of probable unattended needs and difficulties in access to healthcare. The Brazilian healthcare system is a public policy focused on equity, but should seek to improve access to integrated care for chronic conditions and the early identification of frailty and vulnerability among older.

**PD6 780 FRENCH LEGISLATION IN END-OF-LIFE CARE: PARLIAMENT EVALUATION.**

S. VAN PRADELLES DE PALMAERT\* (Assistance Publique-Hôpitaux de Paris, Paris, France)  
L. TEILLET(1), F. MULLER(1), L. D'ARAILH(1) - (1) Assistance Publique Hopitaux de Paris (Paris, France)

Introduction: The French law of April 22, 2005, relating to the rights of patients and of the end of life -also called Leonetti law- clarified medical practices concerning situations of end of life and brought new rights to the patients. Three years after its promulgation, Leonetti law has been evaluated. The main three questions for investigators were: Is the law well known? Is it well applied in all France? Do we have to change the law to improve medical care in end-of-life situations? We present some results of this evaluation. Methods and Materials: The French Parliament mission has been organised during spring and summer 2008. Four members of the National Assembly gave an audition to 64 speakers: dying patients, disabled persons, their families, doctors, nurses, psychologists, and some sociological, juridical, philosophical and economical experts. We attended to each one of these auditions at the National Assembly. Then we analysed all interviews. Results: Leonetti law clarifies medical care in the great majority of end-of-life situations. 95% of speakers asked not to change the law, but to make it better known and better applied all over France. Only 22% of all health professionals have been educated about this law, although 46% think they're well informed about it. In geriatric concern, it appears that society is not aware to the fact that old people often die alone, whereas some tragic rare medical cases benefit from exceptional media coverage. Conclusion: Although France tries to improve its legislation, to clarify medical practices in end-of-life situations, its laws remain insufficiently known and applied by professionals and people. The whole society needs long awareness campaigns for having the Leonetti law be better known, so as to improve medical care in most of end-of-life situations.

**PD6 781 GENOCIDE IN RWANDA AND ITS EFFECT ON THE WAY OF LIFE OF OLD PEOPLE**

H. MARZI\* (University of Mainz, Ingelheim, Germany)  
J. NKURAYIJA(1) - (1) Faculty of Social, Politics and Administrative Science (Huye Butare, Rwanda)

Introduction: The question as to how far the genocide has changed the social structures of the rural country of RWANDA should be discussed. It is also important to consider possible consequences of this for daily life of the people living in extended families. Methods and Materials: I carried out ethnological field research during eight visits to RWANDA between 1990 and 2008. The results are documented on numerous tape recordings, slides, videos. Results: The genocide of 1994 has changed RWANDA, the system of government and social structure were destroyed, extended families were torn apart. Murder was committed within the families. The state was rebuilt, however the social order of the extended families never recovered. Traditional life of extended families broke down. Young people live in the towns, murderers were in prison or in other countries outside RWANDA. The separation of young and old in rural societies has serious consequences, as old people have always been cared for within the family according to an unwritten generation agreement. This states that "a hare that has become old is suckled by the young". However, old people are now left to care for themselves through hard work on the fields. Loneliness, weakness, hunger and despair have led to an increase in suicide, and there is no new generation agreement in sight. Conclusion: Today RWANDA is keen to modernize and develop economically, but is not willing to provide for the elderly. The government insists on this traditional system of caring for the elderly within the family, although the young and old drifted apart a long time ago. RWANDA must confront this dilemma and find a solution to suit the changed economic and family conditions of the country.

**PD6 782 "WHO AM I? THE PHYSICAL EDUCATION ASKS IN THE WORK WITH ELDERLY AGE"**

M. ACOSTA\* (Universidade Federal de Santa Maria, Santa Maria / RS, Brazil)  
I. STREIT(1), M. GOULART(2), R. DEPONTI(3), R. COUTINHO(4) - (1) 1 (Santa Maria / RS, Brazil); (2) 2 (Santa Maria / RS, Brazil); (3) 3 (Santa Maria / RS, Brazil); (4) 4 (Santa Maria / RS, Brazil)

Introduction. This project presents partial data of a research developed by Universidade Federal de Santa Maria, at south of Brazil, it was funded by network CEDES of the Ministry of Sports, it aims to diagnose the work developed by physical education professionals with the elderly population. Material and methods. The first step consists in the definition of the included cities, and it starts from following data: I. cities with at least 170 thousand habitants (this number was provided by Instituto Brasileiro de Geografia e Estatística – IBGE, representing the midsize cities which can create an impact in a reading of national coverage, it was researched more of 5500 brazilian cities); II. Cities with Physical Education Course with actions for the elderly population; III. Availability on line of the information. After, the instruments for data collection were prepared for prefectures, state governments, universities and systems "S" (SESC, SESI, SENAI, etc.), that subsequent were presented in a site on internet, in which the employees put the data and they can view a part of general results, establishing interlocution with others projects. Results. 31 cities are being investigated, where happen the actions through 38 higher educational institutions, prefectures, state governments and the system "S", 371 periodics are being searched, whose are inserted in the so-called "quals" in the qualifications of the Brazilian government (national and international) beyond analysis of 124 dissertations and 7 doctoral theses, they were produced within 1997/2007 and they talk about physical activities and elderly people. Conclusions. Some regional differences are perceptible, as the concentration of universities at south and southeast, and also the articles authors and research groups. The pioneering of the universities' work is also perceived.

**PD6 783 ACCURACY AND RELIABILITY OF THE SHORT-FORM 36 HEALTH SURVEY IN CHILEAN ELTERS. THE ALEXANDROS STUDY**

L. LERA\* (University of Chile, Santiago , Chile)  
A. FUENTES(1), H. SÁNCHEZ(1), C. ALBALA(1) - (1) INTA University of Chile (Santiago , Chile)

Introduction: Older people quality of life (QoL) is central in societies like Chile undergoing a rapid ageing. QoL validated instruments are required to guide the design and implementation of elder public policy. This study seeks to evaluate the validity of the Short-Form-36 Health Survey (SF-36) in a large sample of Chilean elderly. Methods and materials: Cross-sectional study in 3489 community-living subjects aged 60-92y (33% men and 67% women) conducted in Santiago de Chile, in 2005-2008. A structured interview including SF-36 was applied to the whole sample. Score of 8 subscales, Physical-Function (PF), Role-Physical (RP), Bodily-Pain (BP), General-Health (GH), Vitality (VT), Social-Functioning (SF), Role-Emotional (RE) and Mental-Health (MH), was calculated using the Standard method. Factor analysis was used to estimate scoring coefficients to build two summary measures from the 8 subscales. Lin's concordance coefficient was used to compare summary measures calculated by the Chilean-Specific and the Standard (US-based) scoring algorithms. Logistic regression analysis was used to estimate variables associated with the scores. Results: The subscales internal consistency was high and homogenous (Cronbachs alpha 0.84-0.85). Concordance between the Standard and the

Chilean-Specific scoring was very high (0.94). Factor analysis yield two factors -mental health (MCS) and physical (PCS)- accounting for 65.3% of total variance (MCS 55.1% and PCS 10.2%). High correlation (0.74-0.93) between MCS and MH, V, RE and SF were obtained. PCS correlated highest (0.78-0.85) with RP, PF and BP. Depression (GDS-15>5) was the main variable explaining low scores in both MCS and PCS (adjusted OR=16; 95%CI: 9.3-27.7; OR=2.1; 95%CI: 1.6-2.8, respectively). Conclusion: These results support the reliability of the SF-36 two-dimensional model. The SF-36 factor structure evince that MCS is more important than PCS among Chilean elders confirming the relevance of depression in this age group. Evidence is provided for using Standard algorithm as an accurate scoring for Chilean elder population. Funded by Fondecyt grant 1080589

**PD6 784 FACTORS THAT INFLUENCE THE CHOICE OF LIVING ALONE BY THE ELDERLY IN BRAZIL**

A. BOS\* (Pontifical Catholic University of Rio Grande do Sul, Porto Alegre, Brazil)  
M. FISCHER(1), I. SILVA(1) - (1) PUCRS (Brazil)

Introduction: Family arrangements, socio-economic status (economic participation, schooling) demographic characteristics (age group, gender, family size) and health status may affect the reason why an older person lives alone. This study used the data from a 2005 population-based study performed in the southern city Porto Alegre, in Brazil to understand how these factors influenced living arrangements of the elderly. Methods and materials: The cross-sectional study involved 1,078 (777 women, 301 men) urban subjects (60 years and older) who answered a questionnaire exploring their life-conditions in a multidimensional approach. We constructed frequency tables of each factor by living arrangement (living alone, with spouse, with kids, with other relatives or with other people), and tested by chi-square test. Results: The mean age of the 1,078 participants was 71.8 years. Almost a fourth (23.5%) of the elderly in the sample lived alone. Having or not having kids ( $p<0.001$ ), gender ( $p<0.001$ ), age group ( $p<0.001$ ), and schooling ( $p=0.003$ ) were significantly associated with living arrangements, whereas self-assessed health was not. Specifically, living alone was more common for those who did not have kids (42%); for women (26% of which lived alone, against 18% of the men); for the older (32% of those 81 and older lived alone, against 18% of those 70 and younger) and for the better educated (25% of those with college education lived alone, against 16% of those who are illiterate). Conclusion: Living arrangements are influenced by age group, gender, and schooling. Living alone may be a choice of the elderly as a way to preserve independence and autonomy.

**PD6 785 IBADAN STUDY OF AGEING – RATIONALE, METHODS, AND CHALLENGES**

L. KOLA\* (University of Ibadan, Ibadan, Nigeria)  
O. GUREJE(1), A. OGUNNIYI(1), B. OLLEY(1), A. OYEKAN(1), E. AFOLABI(1) - (1) University of Ibadan (Ibadan, Nigeria)

Introduction: The elderly population in sub-Saharan Africa has received very little research attention. This presentation describes the rationale and method of a large community-based study of the profile and determinants of healthy aging in a developing country. Method: The Ibadan Study of Ageing (ISA) is a prospective study of non-institutionalized elderly persons, aged 65 years and over, residing in the community in eight contiguous states in the south-west and north central regions of Nigeria. Selection was based on a multi-stage clustered random sampling of households. One eligible person per household was administered face-to-face interview. At both baseline and follow-ups, physical and mental health status (including cognition and depression), quality of life and supportive social network are assessed. Blood pressure, anthropometric indices as well as motor performance are determined at each wave of follow-up. Verbal autopsy is conducted to determine cause when death has occurred. Results: Baseline assessments were successfully conducted on 2152 persons in 2002-2003 (response rate = 74%). Of the projected 3 wave prospective follow-ups, 2 have been completed in 2007 and 2008 with the third on-going in 2009. Other than from death, attrition has been low. Community engagement has been found to facilitate recruitment and retention in the study. Inclusion of basic physical evaluation and the offer of incentives are added factors for respondent cooperation and compliance. Difficulty accessing some villages and seasonal movement of some groups are challenges. Conclusion: The ISA demonstrates the feasibility of a cohort study in a developing country. It shows also provides examples of ways to surmount challenges in the conduct of such study.

**PD6 786 SOCIAL INEQUALITY AND ORAL HEALTH: AN EPIDEMIOLOGIC STUDY OF CEARÁ'S ELDERLY POPULATION, IN BRAZIL**

W. MOURA\* (Federal University of Ceará, Fortaleza, Brazil)  
F. SOUSA(1), M. ALMEIDA(1), M. ARAÚJO(1), M. MOTA(1), P. ALMEIDA(1), P. ARRAIS(1) - (1) Federal University of Ceará (Fortaleza, Brazil)

Introduction: The Unified Health System research program: shared management in health (PPSUS), in the biennium 2004/2005 funded the study about the aging Ceará's population and their implications in the health system of the state. Part of the results will be shown with elderly of 60 years or more attended in Basic Unit of Family Health. Material and Methods: It is a study about (household – observational – cross) kind with probability sampling in the 22 regional health cells of the State of Ceará, involving 44 counties and

1069 elderly respondents through a structured questionnaire. The analysis of data was made by the program SPSS 10.0 for windows. Results: The results showed that the gender's ratio of Ceará (81.7) was superior than Brazil's, indicating the predominance of female on male, surpassing it in 22.4%. In education, it was found that 34.1% never studied, 27.5% were literate, 7.5% had completed elementary school, 26.4% started but not completed, while 4.1% reached the high school. Among men there is preponderance of retirees (82.4%), whose situation which is higher than women's (61.1%). For problems in oral health the majority (59%) found that the teeth were more affected, especially for residents in Fortaleza (71.3%) in comparison to the inside of Ceará (53.3%). The dental prosthesis was the most sought service between the various types offered, with 20.3% and 21.4% for males and females, respectively. When asked about access to dental services, 73.3% of elderly people without any financial income showed not had access. Conclusion: We conclude that the precariousness of the labor market, offering few or none chance of employment, ally to the livelihood of many families that are solely on account of public benefits and lack of offer of dental services, has provided a framework for dental mutilation and progressive exclusion of the elderly in Ceará.

**PD6 787 THE SPECIFIC AND UNIVERSAL ASPECT OF GETTING AND BEING OLD UNDER THE CULTURAL GERONTOLOGY PERSPECTIVE: A COMPARATIVE STUDY BETWEEN BRAZIL AND GERMANY**

S. MARINA \* (UFRB, Salvador - BA, Brazil)  
M. SILVA

Until the middle of the last century the aging process was almost considered a characteristic of the industry nations. This tendency begins to change since the 1960s, when the non-industry nations, such as Latin American countries, began to experiment this process in a very fast way. Sure that the perspective of being and getting elderly in both realities differs quite from another, but is there something universal and specific in it? How much the cultural aspects can influence the phenomena of getting elderly? The main goal of this study was to investigate the cultural influence on the elderly process into two different regions, such as Europe (Germany) and Latin America (Brazil), in order to get to know cultural peculiarities and universal aspects of this period of life. To attain the aim of this study, 50 seniors, aged 60-100 years, were previously select in both countries, 25 seniors in Brazil and 25 in Germany, according to a list of criteria: successful aging, longevity, widowhood, old and sickness, old and family, old and nurse home, old and profession, old and poverty, old and wealth and so on. The 25 criteria were selected in order to make possible the comparative study and to stabilize a "prototype" related to the aging itself. The 50 seniors were interviewed in both countries and become the same questions to answer, according to their native language. The questions were related to follow themes: old and identity, definitions of being old, positive and negative aspects of age, family and relationship, elderly and social rights, generation relationships, sickness and aging etc. The Interviews took more than one hour by each senior. They were transcribed and analysed with the support of the Win Max Program for qualitative data. In general the seniors from both countries do not recognise themselves as elderly persons, they have a good relationship with their parents, the half of them accept age and its decline, however women have more difficulties in doing it, specially the common-wealth ones. On the other hand, the elderly men have more difficulty in accepting the retirement as they women do, especially in Germany. German seniors are more concerned about memory declines and loosing their independency. The Brazilians are also concerned about it, but not in an intensive way as they Germans do. The Brazilians seniors are more concerned about the well-being of their family and physical aspects as the Germans. Finally, the cultural aspects have lots of influences on getting and being elderly, this is also a result of the image of aging in both countries.

**PD6 788 CAUSES OF HEALTHY YEARS LOST DUE TO LIVING WITH DISABILITIES IN OLDER POPULATION IN THAILAND**

K. BUNDHAMCHAROEN\* (International Health Policy Program Office, Nonthaburi, Thailand)  
P. ODTON(1) - (1) International Health Policy Program Office (Nonthaburi, Thailand)

Introduction: Longevity has shown substantial increase in developed world while mortality rates from chronic diseases increased faster in developing world. Thailand is a lower middle income country with rapid rising of older population and declining fertility rates during the last four decades. This paper aimed to examine the longevity and disabilities in older population in Thailand during 2004. Method: Years lived with disabilities were estimated for common 110 diseases in Thailand through incidence and prevalence data from secondary sources. Disability consequences from diseases were categorized into different weights according to severity-weighted disability from the Global Burden of Disease Study. Health Adjusted Life Expectancy was estimated based on Sullivan's method as in the Australian Burden of Disease Study. Result: Total years lived with disabilities in 2004 were 14 and 16 per 100 population for older men and women respectively. Their top three causes were similar in both men and women, i.e. cataract, deafness, and osteoarthritis. The following causes in men were COPD, and dementia while those in women were dementia, and diabetes. Expected lost healthy years (LHE) at age of 60 were 3.3 and 4.1 in men and women respectively. Conclusion: This study showed that expected healthy years lost decreased with increasing age but with higher proportion in years lived with disabilities. There is a gender difference that women were expected to live

longer than men but will spend a higher proportion of their life in poor health. Not only the results demonstrated how long is expected to live with disabilities, but also they highlighted its top three causes on which interventions should be focused in order to improve quality of life in older age.

**PD6 789 HOW TO PROMOTE THE ACTIVITY OF A MOBILE TEAM OF GERIATRICS?**

L. POUDENS\* (Centre hospitalier d'Aix-en-Provence, Aix-en-provence, France)  
P. CUADRAS(1), B. HASER(1), F. ZUNINO(1), S. TOURNIER(2), C. CASTAGNA(3) -  
(1) CH Aix en provence (AIX EN PROVENCE, France); (2) CH Aubagne (AUBAGNE, France); (3) CH Toulon (TOULON, France)

Introduction: It becomes necessary nowadays to show the added value which brings such a team for their respective hospital and concrete arguments in relation to tutelage to reinforce their composition. Methods and equipments: • Subjective Valuation by a questionnaire addressed to the patients, families, nurses, doctors, social welfare • Objective Valuation by the statement of our activity reinforced by the data of the Department of medical computer science. Results: • By the first method: collection of 395 questionnaires - Availabilities of the team: good in 80 % of answers - Pertinence of the contents of valuation: good in 90 % of answers - Effectiveness of the team: 95 % of answers families, 80 % for IDE, 50 % for the hospital doctors • By the second method: valuation of 2414 patients over 4 years (2005-2008) with an average of age of 85 years and in total 4353 consultations —> geriatrics diagnoses: Malnutrition : 85 % , Falls with repetition: 70%, Cognitivo-behaviour Cloudy : 55 % , Anxio-depressive syndrome: 40 %, Bedsores: 20 %, State bedridden invalid: 10 % Their codification is a concrete added value which brings back for the hospital if proposals are indeed followed. —> avoided costs for the hospital from our activity in the emergency service: - Reduction of the medium length of stay: - 2 days versus patient hospitalized not seen by the team. (between J8 and J10). - Avoided hospitalizations: 29 % of P.A. seen in Emergency are directly orientated in Services of following care and readjustment and 10 % at home Conclusion: The promotion of our activity is especially recovering from our involvement in Emergency but the follow-up in service is important to diagnose the associated comorbidities .

**PD6 790 COMPARING ORAL-HEALTH-RELATED-QUALITY-OF-LIFE IN ELDERLY OF THREE SOUTH-AMERICAN CITIES. SABE STUDY**

A. FUENTES\* (University of Chile, Santiago, Chile)  
C. ALBALA(1), L. LERA(1) - (1) Inta-University of Chile (Santiago of Chile, Chile)

Introduction: Given the fasting ageing process and the scarce resources in Latin-American countries, improving the oral health status of elderly is very concerning. To describe inequalities of oral-heath-related Quality of Life (OHRQoL) in the three Latin-American countries at the most advanced stage of demographic transition process: Chile, Uruguay and Argentina Methods' & Materials: Data were collected in a cross-sectional study (SABE, 2000) conducted in 7 Latin-American capitals assessing elderly health and wellbeing. OHRQoL measured using GOHAI - a 12 items 5-Likert scale scoring 12-60. Analysis based on representative-probabilistic samples of Santiago-Chile (n = 1301), Buenos-Aires-Argentina (n = 1043) and Montevideo-Uruguay (n = 1450) of independent-living elders 59+y (35% men and 65% women; mean= 70y in three-cities). Descriptive statistics was used to characterize relevant variables, non-parametric test Kruskal-Wallis to compare results, and linear regression to estimate variables associated to OHRQoL. Results: The majority of elders in the three-cities are partially- or totally-edentulous (95%-99%). Elders needing dental prostheses ranged from 15% (Buenos Aires and Montevideo) to 19% (Santiago), with inequalities by gender (men:18.3%-27.2% and women:11.1%-15.2%, p<0.001) and years-of-education (33% no-schooling elders versus 5% >12y, p<0.001) in the three-cities. The GOHAI-scores percentile distribution is lower in Santiago (50%-percentile: 52, 75%-percentile:56, range: 13-60), than in Buenos-Aires (50%-percentile: 55, 75%-percentile:59, range:18-60) and Montevideo (50%-percentile:56, 75%-percentile:60, range: 20-60). Applying GOHAI-Spain scoring criteria (>57) as a cut-off point for an acceptable oral health, 85.5% elders in Santiago, 62.8% Buenos-Aires, and 56.1% in Montevideo require dental care. Gohai-scores are associated with lacking-natural-teeth in Santiago (-2.36, 95%CI:-3.46,-1.2) and Buenos-Aires (-1.4,95%CI:-2.32,-.44) and years-of-education in the three-cities (1.27, 95%CI:0.66-1.89; 1.56,95%CI:0.92-2.21, 1.17,95%CI:0.77-1.56 for Santiago, Buenos-Aires, and Montevideo, respectively). Conclusions: Results show a very bad oral health status, particularly among Santiago-elders. Social gradients are observed suggesting that policy promoting OHRQoL should just not focus in the biomedical and clinical aspects but in socioeconomic factors as education through the lifespan.

**PD6 791 PERCEPTION OF HEALTH FACTORS AFFECTING THE QUALITY OF LIFE IN ELDERLY PEOPLE IN SANTIAGO, CHILE.**

I. ESPINOZA\* (University of Chile, Santiago, Chile)  
P. OSORIO(1), M. TORREJON(1), N. VOGEL(1), M. ANIGSTEIN(1) - (1) Facultad de Ciencias Sociales. Universidad de Chile (6850331, Chile)

Introduction: The perception of factors influencing the quality of life in elderly people in Chile has not been sufficiently analyzed. The aim of this study was to identify key domains

of health affecting the quality of life in this group. Material and Methods: A study with focus group was made in older than 60 year old, from different socioeconomic status living in Santiago, Chile. Participants of 16 groups were asked "factors that influence the quality of life"; areas related to health are described. The analysis was conducted with support of the Atlas ti 5.1. Results: With regard to health dimension, four major areas were perceived like factors affecting the quality of life: a) Acquisition of physical or mental illness affecting mobility, daily activities or the recognition of their surroundings and loved ones. The participants describe fear of progression of diseases associated with aging, also were identified process of adaptation to their present health situation. b) Medical Care: positive and negative perceptions are related to medical treatment, especially negative respect to drugs consumption, c) Quality of healthcare services: different possibilities of medical care support are perceived depending on the socioeconomic status. Healthcare is costly for their income, d) Prevention: It is related to physical activity, maintaining a daily routine of activities, having a good nutrition and avoids smoking and drinking. Several participants had recently purchased their negative life style behaviors and they describe as a personal responsibility to care for their own health. Conclusions: Older people recognized as determinants of health dimension affecting the quality of life, the likely future limitations of their physical and mental status and the healthcare support. Frequently, they describe the concern for their own healthcare for a future aging with best quality, assuming a personal responsibility. Programa Domeyko, Vicerrectoría de Investigación, Universidad de Chile.

**PD6 792 THE CONSTRUCTION OF CARE TECHNOLOGY FOR PARKINSON**

L. GONÇALVES\* (Federal University of Santa Catarina, Brazil, Florianopolis, Brazil)  
A. ALVAREZ(2), T. BENEDETTI(3), J. SCHIER(4), E. SILVA(5) - (2) Federal University of Santa Catarina (Florianopolis, Brazil); (3) Federal University of Santa Catarina (Florianopolis, Brazil); (4) Federal University of Santa Catarina (Florianopolis, Brazil); (5) State University of Southwest of Bahia (Brazil)

Purpose: Interinstitutional nature project which had the purpose of developing care technologies promoter of autonomy and social inclusion of elderly patients with Parkinson's disease. Methodology: Four subprojects have been part of the study: functional rehabilitation technology, corporal experience, music therapy and group mutual assistance. Reconstruction, testing and assessment of the technologies were performed in a period of two years (2007 – 2008), replicated in two socio-geographical various contexts: Florianópolis, located in the southern region and Jequié, in the northeast of Brazil. The study happened in the context of local universities by recruiting participants – the parkinsonians aged - that comprised a casuistry of around twenty, on each context. The research execution experience of methodological type that requires relatively long fieldwork time has been both a challenge and rewards. Results and Conclusion: The computational electronic resources currently available contributed significantly to the success of the research, making agile the procedures implementation of the study and retorting, at the same time, in two articulated environments. The expertise of the research team, both the object of the study and the methodology adopted, has been the highest point of the study. Lastly, the proposal of the study had adherence to the interests and needs of parkinsonians who remained assiduous in testing the technologies and they certainly benefited from the experience of care. Key words: Care, Technology, Elderly, Parkinson's disease.

**PD6 793 PASS'AIDANT: AN INSTRUMENT TO IDENTIFY THE NEEDS FOR HELP OF CAREGIVERS OF ALZHEIMER'S DISEASE PATIENTS.**

C. KULIBANOV\* (Service de gériatrie et consultation mémoire, Hôpital Charles Foix et Université Paris 6, Ivry sur seine, France)  
S. PARIEL(2), V. DROUGLAZET(1), E. CURCOFF(1), H. VENCHIARUTTI(3), C. OLLIVET, J. BELMIN(2) - (1) Mutualité Sociale Agricole, Caisse d'Ile de France (Gentilly, France); (2) Service de Gériatrie et consultation mémoire, hôpital Charles Foix et université Paris 6 (Ivry sur seine, France); (3) Direction Action sociale ile de france de la Caisse Nationale autonomie Vieillesse (France);

Background: Help for caregivers (CG) is a major component of the management of Alzheimer's disease (AD). Health care professionals and social workers who are not familiar with AD face difficulties to identify the needs of CG and to build a plan for help. Methods: We gathered a multidisciplinary groups of 10 persons involved in the AD patients care and caregiver education to list the needs of CG they identified in their practice. Questions were elaborated to exhibit one or several of these needs. Questions were formulated to be used as an autoquestionnaire. The needs were formally linked to one or several answers to questions and were implemented in a software. Results: Thirty one needs were listed and grouped into six dimensions: physical health, mental health, everyday life, knowledge, burden related to AD, relational environment. In addition, 9 factors of vulnerability were listed, as potential elements for weighting. The final questionnaire comprised 56 questions. It has been filled by 20 CG and was found to be easy to complete in less than 30 min. Minor clarifications were operated after this trial. In addition a simple software named Pass'Aidant was developed in order to automatically provide the needs from the CG answers, as well as personalized directions for helping them. Conclusion: Pass'Aidant might greatly help health care professionals and social

workers provide relevant advices to CG of AD patients. A formal validation process of this instrument is ongoing.

**PD6 794 SUPPORT NETWORK TO THE FAMILY CAREGIVER OF ELDERLY PATIENTS WITH ALZHEIMER**

A. ALVAREZ\* (Federal University of Santa Catarina, Florianópolis/SC, Brazil)  
S. SANTOS(1) - (1) Federal University of Santa Catarina (Florianópolis, Brazil)

Introduction: The complexity of the caring process of a demented elderly in the family environment in continuous and lasting ways is a challenge for his quality of life and also the relative caregiver. It is added the public health service deficiency in dealing with the matter in an effective and efficient form. Objective: Building a state network to support the carer family of the elderly in demential conditions from 2002 to 2008. Methodology: From the involvement of professionals and carer relatives it has been stimulated the creation of groups of mutual assistance tied to Academic Institutions, Municipal Secretaries of Health and Non Governmental Organizations in the state of Santa Catarina to the assistance for carer families of elderly patients with Alzheimer's disease or similar diseases. The targets of the proposal consisted of: granting mutual support to the relatives; professional guidance on specific care for the elderly at home and stimulate the groups for a legitimate claim to their social rights and health. Results: With this work we have expanded the supporting group existing in the city of Florianópolis, Capital of the State, to 12 more municipalities of the interior of Santa Catarina. Thus, we currently attend, on average, eight hundred carer families of demented elderly per month through the supporting network. In addition, we are articulated with the Alzheimer Brazilian Association and we represent it in the state, as an organization of civil society. Conclusion: The organization of a network, still expanding, can provide support for relatives to seek creative solutions for home care from the exchange of personal experiences in the care of his relative and the access to orientation. In addition to monitor the provision of health services that meet the specific needs experienced by the elderly and their families in general and local levels.

**PD6 795 ORGANIZING FOR INTEGRATED CARE IN THE NORWEGIAN HOSPITAL SECTOR**

M. SOGSTAD\* (Gjøvik University Collage, Gjøvik, Norway)  
T. ROMØREN(1), K. BENTE(1), H. ANDERS(1), B. GEIR(1) - (1) Gjøvik University Collage (Gjøvik, Norway)

Introduction In line with the Scandinavian welfare model Norway has a public health system with universal access and coverage which is predominantly tax financed. The state is owner of the hospitals and responsible for providing and financing hospital care. On the other hand the municipalities are responsible for institutional and home based long term care. Old patients are recognized as one of the most vulnerable groups in the transfer from hospital to municipal care. Different efforts have been made in order to reach the goal of Integrated Care. Materials and methods We approached 11 of totally 66 hospitals in Norway. Our cases represent both large and smaller institutions in four different health regions throughout the country. Information was collected through semi-structured interviews with managers and clinical leaders on different levels. Information was also collected from the hospitals' web pages. Results Organization All the hospitals have an "Integrated Care committee" consisting of representatives from both the municipals and the hospital. The daily activities are mainly managed in two different ways. Either they have a department (with great variation in staffing and tasks), or the responsibility is "in line" in the hospital organization. Although the sector is managed by central authorities a lot of local "grass root" initiatives were found. Agreements Formal agreements were negotiated in all cases. Some have an open agreement, mainly stating the mutual interest in Integrated Care and the common efforts needed to reach this goal. Others have a more specific agreement, describing different parts of the cooperation more in detail. Conclusions Various solutions in the challenge to reach Integrated Care in the Norwegian health sector have been developed. We plan a next step to study strengths and weaknesses of the different models.

**PD6 796 ANALYSING HEALTH PROMOTION DETERMINANTS FOR OLDER PEOPLE THROUGH SENTIMENT ANALYSIS**

P. KOKOL\* (University of Maribor, Maribor, Slovenia)  
H. BLAZUN(1), M. SLAJMER-JAPELJ(1) - (1) Univeristy of Maribor (Maribor, Slovenia)

Introduction Our research was based on the national reports produced in scope of the healthPROelderly project (2006-2008) that aimed to promote health promotion for older people through producing evidence based guidelines with recommendations – on EU, national and local levels. Methods and materials Data analysis presented in this study was conducted on textual descriptions of country specific models of good practice in the area of health promotion for older people. A novel technique in gerontology – i.e. sentiment analysis was used to analyse the data. Sentiment analysis is used for identification of specific psycho-social categories in textual documents and depends on writer and content of the document. Results Analysis of sentiment in documents from 10 countries resulted in some interesting statistical measurements for selected psycho-social word groups. Analysis of general positiveness in text, that was calculated as ratio of positive words which was reduced by the number of negative words, shows the highest degree of optimism in

description of Czech and the lowest degree in Austrian models. Another interesting group of words that was included in analysis included pain related words. Italian and Dutch models expressed the highest degree in this category while Spanish and Slovenian models show the lowest values. Sentiment analysis of other determinants shows the great diversity between countries in a single determinant and also in the importance of various determinants. Conclusion It has been shown that sentiment analysis can be used as a research tool for analyzing textual documents in the field of gerontology to assess trends, compare models and countries. However, due to relatively small amount of text one should take care at categories with small frequency of included words as the variance of results may seriously influence the results in such cases.

**PD6 797 EVALUATION OF THE USE OF PHYSICAL RESTRAINTS IN A GERIATRIC FACILITY**

S. CHANTELOT\* (LES BATELIERS, LILLE, France)  
A. DUROCHER(1), C. DI POMPÉO(1), F. PUISIEUX(1) - (1) les bateliers (lille, France)

Introduction The use of physical restraints for hospitalized patients with the aim of reducing the risk of falls and managing behavioral disorders is a frequent practice. The High Healthcare Authority had issued recommendations for the best practice of the physical restraints. Materials and Methods A study undertaken in 2002 over 21 facilities in the region of Nord-Pas de Calais has reached an assessment for the practice of physical restraint. And since then, awareness building trainings have been implemented. In 2008, a prospective and comparative study was done over a model of the clinical audit in order to assess the evaluation of the use of physical restraint. Results 1244 patients were included in the study. The prevalence of physical restraints was of a 65% increase in the three sectors of hospitalization (convalescence care, home care, and long-term home care facilities). The pathologies that were directly linked to physical restraint were falls (78%) or the fear of falls (79.6%) and dementia (60%). The decision to use physical restraint was taken after an agreement among the health care professionals in 74% of the cases. Reassessment of the interest in the use of physical restraint was of 47.2% and 93.6% of the means of physical restraint were adapted to the needs. Bed bars represented the majority of the restraints (96%) with a night prevalence of 66%. File traceability was of 64% and 26.5% were registered in the files. A 24-hour reassessment was performed in 14% of the cases. Discussion This study proves that awareness trainings lead to an improvement in the reflexes, in the team work and in the reassessment of the means of restraint. Conclusion This improvement in the approach is done in some facilities in the context of the evaluation of professional practices along with training sessions that should be pursued in order to provide high health care services for often frail patients.

**PD6 798 END OF LIFE CARE IN LONG TERM CARE INSTITUTIONS IN HONG KONG**

A. CHONG\* (City University of Hong Kong , Hong Kong , China)  
M. LEUNG(1) - (1) United Christian Hospital (Hong Kong, China)

Introduction: Long term care (LTC) institutions will increasingly face the issue of death. In Hong Kong, most dying residents of LTC institutes are sent to hospitals, which causes unnecessary interventions to the dying patients. Quality of care and quality of life would be much improved if end of life (EoL) care could be practiced in LTC institutions. This study examined the attitudes of stake-holders including the residents, their family members and service providers of LTC institutes toward EoL care and the prerequisites should EoL be implemented in the institutes. Methods and Materials: Five focus groups and two round table discussions were held in 2008. Thirty stake-holders were invited to the focus groups to explore their attitudes toward EoL service and to identify their concerns in implementing EoL in care homes. Twelve participants from four NGOs were then invited to participate in the first Round Table to explore the support required in launching EoL care in their institutes. Another twelve important stake-holders, including policy makers, professionals and NGO administrators were invited to the second Round Table to suggest ways to handle issues raised in focus groups and Round Table 1. Results: The older people and their family members supported EoL care. Respondents of different levels of care homes were also positive about implementing EoL care in their institutions; they had, however, three main concerns: (1) logistic arrangements that require support and planning (e.g. death certification, transferal to mortuary, manpower and space); (2) legal and policy issues that require clarification (e.g. coroner ordinance, advance directives); and (3) training and support for staff. Conclusion: Though there is a need to clarify uncertainties with policy-makers, to advocate policy change and to develop an operation protocol, the participants generally supported launching a pilot project on EoL care in LTC facilities.

**PD6 799 PROFILE OF ELDERLY PACIENTS ASSISTED IN A PRIVATE GERIATRIC ASSISTANCE IN HOME-VISITS IN THE CITY OF SÃO PAULO, BRAZIL**

H. DRUMOND MARRA \* (Instituto Toniolo de Geriatria, São Paulo, SP, Brazil)  
C. TONILO ZENATTI(1), P. RODRIGUES DE SOUZA(1), F. MAGALHÃES FILHO(1), R. DELMONTE PIOVEZAN(1), M. KAIRALLA(1), C. TONILO

ZENATTI(1), J. TONILO NETO(1) - (1) Toniolo Institute of Geriatrics (São Paulo, SP, Brazil)

**Introduction:** The care of the rapidly aging population that represents a major challenge to the health system, especially the accelerated growth of the portion of elderly and very frail elderly. This group has a great rate of chronic and disabling diseases, when compared to other age groups, resulting in an increasing demand for health services and new methods of approach, such as managed care and home care. The objective is to describe the profile of the elderly for medical service demand in a private home care (HC) in the metropolitan area of São Paulo in the period from January to July of 2008. **Material and methods:** Retrospective descriptive study through review and analysis of medical records. **Results:** We treated 63 patients with a mean age of 80.3 years ( $SD = \pm 10$  years), 25 men (39.7%) and 38 women (60.3%), totaling 99 treatments. Of these, 64 were recorded in 48 records found. The highest frequency of visits was in patients aged 80 to 94 years (56.25%), with prevalence of females (63%). The most frequent causes of attendances were due to neuropsychiatric disorders (25%), cardiopulmonary decompensation of disease (4.7%), infectious processes (26.5%), osteoarticular disorders (14%) and monitoring of clinical routine (34, 3%). There were 7 hospitalizations (11%). There were no deaths in the home. **Conclusions:** The analysis showed a prevalence of elderly care at home to very old, female, with a significant number of infectious and neuropsychiatric complications, highlighting the fragility of this population lead to multiple diseases and various degrees of functional dependence. The low number of hospital admissions suggests effectiveness of early intervention at home, and clinical control through constant monitoring of cases.

**PD6 800 MOVING TOWARDS THE ELDERLY-FRIENDLY HOSPITAL. A PARADIGM SHIFT FOR THE HOSPITAL-BASED CARE OF THE ELDERLY.**

N. LARENTE\* (McGill University Health Center, Montreal, Canada)  
J. MORAIS(1), J. VERDON(1), G. INGLIS(1), P. LYSY(1), W. CHIU(1), Y. BACHER(1), D. WAN-CHOW-WAH(1), A. BROWN-JOHNSON(1), J. FALUTZ(1), A. HUANG(1) - (1) McGill University Health Center (Montreal, Canada)

**INTRODUCTION:** Patients 65-years and older accounted for over 1/3 of all acute care discharges and over 7 of all acute hospital bed days in Canada in 2006. Up to 1/3 of the cohort of frail elderly loses independent functioning in one or more activities of daily living as a result of the "hostile environment" that is present in the acute hospitals. **METHODS:** We propose a paradigm shift in the culture and practice of event-driven acute hospital-based care of the elderly which we call the Elderly Friendly Hospital (EFH) concept. Guiding principles include: a favorable physical environment; zero tolerance for ageism throughout the organization; an integrated process to develop comprehensive services using the geriatric approach; assistance with appropriateness decision-making; and fostering links between the hospital and the community. **RESULTS:** The implementation of the EFH concept is in progress in our multi-site, academic healthcare institution. Key actions include: a) integration of Geriatrics into the highest levels of planning for the hospital redevelopment to ensure that the new physical environment and approach to care will adhere to the guiding principles; b) promotion campaign to communicate the EFH concept and catalyze change; c) early identification of patients in the ER at risk for the development of delirium, falls and functional decline, coupled to a systematized program to prevent and manage these problems; d) implement an interdisciplinary team to assess elderly patients prior to high risk interventions and surgeries; e) develop an acute care for the elderly unit and co-management with Orthopedics, Cardiology, Oncology and f) development of alternative care pathways for post-acute care. **CONCLUSIONS:** The EFH concept we propose may lead the way to enable hospitals in the fast-moving healthcare system to deliver high quality care without jeopardizing risk-benefit, function, and quality of life balances for the frail elderly.

**PD6 801 PARAMEDICS ASSESSING ELDERS AT RISK FOR INDEPENDENCE LOSS (PERIL) – DERIVATION OF A CLINICAL DECISION RULE**

J. LEE\* (Sunnybrook Research Institute, Toronto, Canada)  
R. VERBEEK(1), M. SCHULL(1), P. MACINTYRE(2), L. MORRISON(1), L. CALDER(3), I. STIELL(3), B. ROWE(4), S. SOOKRAM(4), D. RYAN(5), G. NAGLIE(6) - (1) Sunnybrook Health Science Center (Toronto, ON, Canada); (2) Toronto Emergency Medical Services (Toronto, ON, Canada); (3) Ottawa Hospital Research Institute (Toronto, ON, Canada); (4) University of Alberta Hospital (Edmonton, AB, Canada); (5) Regional Geriatric Program of Toronto (Canada); (6) Toronto Rehabilitation Institute (Canada)

**INTRODUCTION:** Older adults use emergency medical services (EMS) five times more than younger adults, and may depend on EMS as a safety net. Paramedics most often are called to provide care in older clients' homes. The study objective was to develop a clinical decision rule, using Paramedic observations, to identify older people at increased risk for adverse outcomes. **METHODS:** We conducted a prospective observational cohort study of people >65 years. We trained paramedics from 3 Canadian urban EMS services to complete a structured checklist of 40 predictor variables observed in the client's home. The primary outcome was death, hospitalization, or return to the Emergency Department within 1 month of the initial EMS encounter. Predictive variables were linked to population-based administrative databases to determine outcomes. We conducted multivariable logistic regression to identify a predictive model, and compared the final model to the

previously validated Identifying Seniors at Risk (ISAR) screening tool. **RESULTS:** Complete follow-up data are available for 571 subjects to date. The mean age was 80.1 years, and 61% were female. The two most common complaints were pain in (28.0%) and falls (21.8%). A multivariate predictive model with four independent predictors was significantly associated with our primary outcome (Goodness of fit Chi  $2 = 3.08$ , df=8,  $p=0.9292$ ), and performed better than the ISAR (AUC 0.65 vs. 0.59, -2log Chi sq =13.3, df=3,  $p< 0.005$ ). The PERIL decision rule is positive if a patient used EMS in the past 3 months, needed help with the activities of daily living, had chronic renal failure, or were judged by paramedics to be at high risk. The rule sensitivity was 87%, and specificity was 28%. **CONCLUSIONS:** Paramedics can identify a higher risk population of frail older adults. Future research will validate the PERIL decision rule and extend the follow-up period to one year.

**PD6 802 A RESEARCH OF CARING MODEL BY "EMPOWERMENT OF OLDER PEOPLE" APPROACH: AN EXAMPLE OF A NURSING HOME OF YMCA AT TAINAN CITY IN TAIWAN**

R. YOU\* (The Tainan Young Mens Christian Association, Tainan, Taiwan)  
P. CHEN(1) - (1) Institute of Gerontology College of Medicine National Cheng Kung University In Tainan Taiwan (Tainan, Taiwan)

"Empowerment of older people" has become an essential concept when we address "ageing in place". Older people began to act the role of self-management in their lives instead of being cared for by others. This is also an important transition for the social welfare field to explore long-term care for older people from the point view of empowerment. This study is a combination of analysis of existing documents and five months (from 1st August, 2008 to 15th January, 2009) observation data in a nursing home that was established by the YMCA in Tainan city in Taiwan. The nursing home was designed by applying the concept of "unit care" and "living place" for taking care of older people. The study divides "empowerment of older people" into three aspects, including empowerment of older people themselves, education and training of staff members in the nursing home, and coordination between families and communities, as the main research cores to explore the outcome of unit care in the nursing home in Taiwan. Addressing older people living in the the home in community and providing empowerment care and management in the nursing home, the results of this study indicate the following points are important in empowering seniors: 1. reconstruction of life in the unit, 2. interactions with the neighborhood and communities and establishment of a network, 3. improvement of daily healthy life, 4. professional integration between nursing and social work, 5. supports and flexible reactions of multiple care services, 6. extension and strength of the family network, and 7. establishment of community network and creation of holiday. In conclusion, older people can develop their maximum capabilities to manage their lives using their own choices and meanwhile can strengthen their interactions and networks with families and communities by implementing the concept of "empowerment of older people" and providing the "new" home for older people in the community. As older people recognize the "new" home, the nursing home can help older people rebuild their lives in the community.

**PD6 803 A MULTIFACETED APPROACH TO IMPLEMENTING HEALTH POLICY FOR IMPROVING THE CARE OF OLDER PEOPLE IN HOSPITAL**

S. RACE\* (DEPARTMENT OF HUMAN SERVICES, MELBOURNE, Australia)  
N. DORAN, S. FRASER(1) - (1) DEPARTMENT OF HUMAN SERVICES (Melbourne, Australia);

Introduction Older people are significant users of health services and in many instances an older person's functional independence deteriorates as a result of the hospital experience. Health policy articulated the direction required to enable older people to receive improved access to evidence-based care with an increased focus on the individual needs and understanding of the impact of ageing within the hospital setting. Methods A statewide approach to implementation was developed based on the need to demonstrate change in five key impact areas being: refocusing culture towards person-centred care, specific care needs, physical environment, training and development; and partnerships and networks. The changes involved for health services to deliver against the policy were significant and therefore a multifaceted and incremental approach to implementation was adopted. Results Significant improvements in the care of older people have been achieved. This required multifaceted change management at a number of levels including: - philosophical level, requiring a cultural reframing of how we understand and work with older people receiving health services to place the patient at the centre of their care; - clinical level, ensuring that we address the specific care areas that underpin the complexity and functional decline of older people in hospital; - physical level, making sure that our hospitals provide an environment that is conducive to maximising clinical care, self-care and access to services; - capacity building level, ensuring staff, patients and carers have the skills and resources required to address the changing needs of older people; - service system level, supporting health services to work within partnerships to achieve the best outcomes for older people. Health services have demonstrated a readiness to undertake the practice changes required to prepare for the increasing number of older people likely to require care and treatment in

the future. This has required a multifaceted and incremental approach to change management.

**PD6 804** REALISING THE POTENTIAL OF ICT: LESSONS FROM THE ACTION PROJECT

E. HANSON\* (FOU-Sjuhärad, Borås, Sweden)

L. MAGNUSSON(1), P. SVENSSON(1), F. ARVEVIK(1), M. NOLAN(2) - (1) University of Borås (S-50190, Sweden); (2) University of Sheffield (S5 7AU, United Kingdom)

Governments globally are promoting investment by health and social care providers in Information and Communication Technology (ICT). It is widely believed that ICT will enable people with long-term conditions to remain living independently in their own homes for longer improving their quality of life and that of their carers whilst reducing costs. However, despite numerous technological advances, the short history of research and evaluation in the field has demonstrated that the widespread adoption of ICT has yet to happen. The introduction of new technologies requires an understanding of the complex processes of 'innovation diffusion and adoption', increasingly known as 'translational research'. This means closes engagement with a variety of stakeholders including practitioners, providers, users and carers. This paper distils the lessons learned during the first 12 years of the ACTION project. ACTION uses ICT to support older people and their family carers in the community. It began life as a five country EU funded project (1997-2000) but since then has been through successive phases of development and refinement in Sweden. It has been adopted as a mainstream service in the municipality of Borås, West Sweden and is currently being piloted in 26 other municipalities. Central to the successful introduction is the active engagement and support of practitioners in the form of a 'community of practice' (CoP). The CoP is being facilitated by two experienced practitioners from Borås (Paul Svensson & Fredrik Arvevik) and delivered across diverse regions of Sweden using ICT as the medium. As a result, some of the complexities of 'translational research and how they can be addressed are being revealed. Lessons for wider application in other innovative scenarios will be shared.

**PD6 805** TESTING AND ADOPTING FLOOR-SENSOR SOLUTIONS IN DAILY PRACTICE FOR PATIENT SAFETY IN KUSTAANKARTANO NURSING HOME

R. OKSANEN\* (National Institute for Health and Welfare, Helsinki, Finland)

S. PALDANIUS(1), J. NYKANEN(1), M. LINNAVUO(2), K. RAIPIO(1), E. SEGERSTAM(1), R. SEPPONEN(2), L. POHJOLA(1), H. FINNE-SOVERI(3) - (1) Helsinki city social department (Helsinki, Finland); (2) Helsinki University for technology (FI-02015, Finland); (3) National institute for health and welfare (00271, Finland)

Patient safety is a prominent issue in nursing homes where falls, fractures and other injuries are unwanted outcomes of independent locomotion, particularly in presence of shortage in nursing staff. Technological devices for nurses to use in fall prevention programs need testing in living laboratories. Helsinki City Innovation Funds donated a 5-year grant to test and adopt technological solutions in Living Lab surroundings at Kustaankartano Nursing Home, Helsinki. In the first phase floors of ordinary two patient rooms were covered with movement sensors produced by ELSItechnologies, then an alarm system, functioning through cell phones, was tested. In the second phase, in connection with a large renovation work, ELSI technologies were installed under the floors in every patient room and all the living rooms in a three-floor nursing-home building for about 60 residents. In the poster, the sensitivity and specificity results of the step-by step testing process to detect and prevent falls are presented together with the results of a user-satisfaction survey.

**PD6 806** HOME CARE USERS CLUSTERS OF ACTIVITIES OF DAILY LIVING PERFORMANCE

C. BARBOSA\* (UNIFAI, Santa Maria da Feira, Portugal)

I. MARTIN(1) - (1) Unifai (Porto, Portugal)

Background. Patients' functional capacity and social network are two of the most important variables to consider in home care healthcare plan. Generally, at the patients' needs assessment, Scales of Daily Live Activities are employed. The aim of the study was to detect home-care users' clusters with similar functional performance. Methods. Basic Activities of Daily Living (7 items) and Instrumental Activities of Daily Living (5 items) were measured in 166 home-care users for seven organizations that promoted home-care. Biographic variables were measured too. Clusters analyses were used to create homogeneous groups of users. Parametric (t-students tests) and non-parametric test (chi-square) were used to validate differences between the groups created. Results. Two clusters emerged from non-hierarchical clusters analyses. In the first group, with 37 individuals (30,3% of the users), the individuals appeared to have low levels of functional capacity. Opposing to it, in the second group 85 individuals (69,7% of the users) had excellent functional capacity. 44 users (26,5% of the users) were excluded of any groups. There weren't different between of different groups on all the biographic variables (sex, age, education and civil status) and the time as home care users. Conclusions. The heterogeneity on patients' functional capacity may imply that the home care is deeply dependant on offer than on demand. Low incapacity levels' patients represent an important

subgroup (Cluster 2) and they are lower cost to the organizations. Although this study doesn't consider random sampling, conclusions are consistent with other similar studies.

**PD6 807** MODELS OF NURSING HOME ADMINISTRATION: EFFECTS AND IMPLICATIONS

R. RUPPRECHT\* (University of Erlangen Nuremberg, Erlangen, Germany)

F. LANG(1), S. ENGEL(1) - (1) Institute of Psychogerontology (Erlangen, Germany)

In order to reduce personnel costs in nursing homes some welfare organisations in Germany are trying to implement new models of nursing home administration: Instead of employing one nursing home administrator (NHA) and one director of nursing (DoN) for each nursing home ("standard model") they have one NHA responsible for more than one nursing home (model "A") or a NHA which is responsible for the tasks of the DoN at the same time (model "B"). Up to now there is no empirical data available, if these new models of nursing home administration have an effect of nursing quality. Therefore we started in 2008 an explorative field study in 75 randomly selected nursing homes (25 for each administration model) in Bavaria (Germany) with a multimodal approach combining the assessment of subjective views of residents, staff and relatives as well as NHAs and DoNs. N=404 rest home residents, N=468 members of nursing staff, N=417 relatives and N=140 NHAs respectively DoNs volunteered for the study. The results of the study show some differences between the administration models. Residents living in "model a" rest homes complained more often about lack of contact to the NHA. Their relatives also rated the contactability of the NHA lower in these institutions. The nursing staff in these rest homes reported lower levels of job satisfaction and assessed the job competence of the NHA as lower as in "model b" rest homes. On the other side we did not find similar results for "model b" rest homes. The NHAs and DoNs saw clear advantages of the standard model of nursing home administration. The two other models were associated with a higher workload and having not enough time for needs of the residents. Summarizing the results, the "standard model" should be preferred, especially in large institutions.

**PD6 808** SUPPORTING PEOPLE WHO ARE AFFECTED BY BOTH DEMENTIA AND SIGHT PROBLEMS: TOWARDS A MORE INTEGRATED SENSORY MODEL OF PRACTICE

R. BARTLETT\* (University of Bradford, Bradford, United Kingdom)

Introduction The aim of this paper is to report on a scoping study about dementia and sight loss. The study set out to assess the extent to which existing models of best practice in dementia care are sensitive to sight loss issues. A further aim was to identify and propose ways of increasing sensitivity to sight loss issues in existing models of dementia care practice. The paper provides (1) an overview of the range of models deemed relevant to working with people with dementia, including the nightingale-based model, enriched model, preserved implicit memory model, multi level activity based and teleological model and (2) an assessment of the degree of sensitivity given to sight loss issues in these models and psychosocial and cognitive interventions such as reminiscence, multi-sensory stimulation and cognitive stimulation. Methods and materials Medline was searched using the terms 'models' and 'dementia care' and texts on dementia care were reviewed for sensitivity to sight loss issues. Results Insufficient consideration is given to sight loss issues in existing models of dementia practice and the dementia care literature generally, and the particular needs, rights and entitlements of people who are affected by both dementia and visual impairment are not made explicit. Conclusion Existing models of dementia practice need to take more account of visual impairment. A more integrated sensory model of practice is proposed and discussed.

**PD6 809** CLIENT INVOLVEMENT IN IMPROVING INTEGRATED SERVICES: THE NETHERLANDS DEMENTIA CARE PROGRAMME

H. NIES\* (Vilans, Netherlands Centre of Expertise for Long-Term Care, Utrecht, The Netherlands)

R. DENIS(1), J. SCHUMACHER(1), M. MINKMAN(1) - (1) Vilans (Utrecht, The Netherlands)

Introduction Dementia is a multi-faceted problem, which requires well targeted interventions at multiple domains of life of clients and their informal carers. At regional level this implies a wide range of coherently operating and collaborating services. However, practice is far from this objective. Therefore, the Dutch government implemented a four year nation-wide programme to improve regional collaboration in dementia care. The views and needs of clients and their carers were taken as a point of departure at regional level and they were actively involved in the improvement process. Regional networks of care providers and health insurers were supported by a nation-wide collaborative project-structure. Methods and materials The views and needs of more than 600 service users were assessed in more than 100 regional panels, and by more than 1,700 questionnaires. Moreover, documents and questionnaires among clients, informal carers, participating organisations and supporting experts were analysed to describe the processes and outcomes of the programme. Results The regional explorations of views and needs of service users revealed – in 'layman' language – five main categories of problems: being fearful, angry and confused; it is getting too much; resistance against institutionalisation; there is something wrong (what is going on and what might help?); miscommunication

with professionals. Based on the regional inputs of carers and clients, the 57 networks (covering more than 90 % of The Netherlands) developed regional plans and implemented 206 improvement projects. The paper addresses the types of projects and processes of this nation-wide approach. Conclusions The role of clients and carers in regional improvement processes appeared to be significant and the collaborative approach proved to be very supportive. However, a risks of too limited endurable implementation was also observed as a consequence of insufficient involvement of management and boards of organisations as well as fragmented funding and policy frameworks.

**PD6 810 CARING INSTITUTIONS FOR THE ELDERLY. A SOCIOLOGICAL INVESTIGATION**

N. ZACCAI-REYNERS\* (Université libre de Bruxelles, Bruxelles, Belgium)

I am carrying out sociological investigation of care practices in nursing homes for the elderly. The investigation is informed by studies in contemporary moral and political philosophy. It also comes in the wake of recent developments in the ethics of care. The field survey is based on a qualitative methodology. It is so far based on a lengthy immersion in a nursing home. My survey examines in particular the scope of legal and ethical tools when it comes to the quality of care in institutions. For the literature basically points to two main ways to affect the quality of institutional care to improve the resident's overall welfare, namely, the setting of legal standards and requirements on the one hand and reliance on the moral resources of empathy on the other hand. My hypothesis is henceforth that, besides legal and moral standards, the quality of overall care requires "emotional work" (A. Hochschild), which must be studied for its own sake. This care work, given its attention to singularity, is refractory to formalisation. It seems to be transmitted primarily through on-the-job experience, by imitating peers during immersion in work situations. My investigation is striving to observe this unformalised transmission, such learning through mimetic immersion. I will present the results of this long qualitative observation in a nursing home and develop the hypothesis that should be deepened later on a comparative way.

**PD6 811 COMBINING WORK AND CARE: INTEGRATING CARE POLICIES WITH LABOR MARKET POLICIES**

M. LEWINTER\* (University of Copenhagen, Copenhagen, Denmark)

In the numerous studies of combining work and care, the focus is either on issues relating to labor market conditions or issues relating to care issues. A study of carers in Denmark that combined survey and qualitative interview indicates that it is necessary to think these two sets of policies together to be able to develop sustainable policies for carers and to insure frail people integrity and choice. This study comes from a country in which frail people are able to remain in their own homes (pensions allow this), in which home care is highly developed and in which the flexicurity model of labor market relations is advanced. It is also a society in which about 77% of women and even a greater percentage of men of working age are active on the labor market. The results of the study indicate that the home care services enable family members to keep their jobs and to supplement the care services. The labor market policies, on the other hand, while providing mechanisms for taking legitimate time off, are often structured in ways that do not recognize the specific carer needs. The paper will conclude with reflections about broader issues of thinking these two policy sets together.

**PD6 812 INVOLVEMENT OF A COORDINATING GERIATRICIANS' ASSOCIATION IN THE DISSEMINATION OF A NATIONAL PUBLIC HEALTH PLAN**

O. REYNAUD-LEVY\* (CHU Ste Marguerite, maison de retraite publique de Cassis, MARSEILLE, France)

L. TOSTI(1), L. LOPEZ DE LIMA(1), M. LEONARDELLI(1), S. DEMALLMANN(1), H. CERESOLA(1), G. RUAULT(2), S. DOUTRELIGNE(3) - (1) Association des Médecins Coordonnateurs des Bouches du Rhône (MARSEILLE, France); (2) Déléguée Générale SFGG (PARIS, France); (3) Coordonnateur National Mobiqual (PARIS, France)

Introduction The ministry of Health (General Directorate of Health) has entrusted the French Society of Geriatric and Gerontology to implement a plan for improving care practices in nursing homes for elderly dependant people (EHPAD) and, more widely, in healthcare facilities. Its name: MobiQual ( Mobilization to improve Quality of care practices). Methods and materials A multidisciplinary team has designed awareness, training and decision aid tools about pain, palliative care, "well-treatment" and depression. To spread this public health mission amongst the various EHPAD, which differ in terms of statutes, operating mode, management and internal functioning, this program must be presented to the largest possible number of healthcare facilities throughout the country and carried out by coordinating geriatricians, specialists in these facilities. Several dissemination strategies were considered to carry out these objectives, with a view to suiting this large inter- and intraregional variability. Meetings between administrators, relevant institutions and health professionals were held to decide on a dissemination strategy that takes into account local dynamics. Coordinating physicians' regional associations were part of that strategy. The experiment we present here was conducted in the South of France by a Coordinating Physicians' Association. Results It started on

December 2007 and all the kits were distributed after 10 months. A thematic approach for each meeting and a pedagogic presentation of the tools were found effective, with more participants at every meeting and an enlargement to include head nurses, hospital managers and gerontological networks. We still need to assess the benefits of these kits for their pertinence in helping health teams and improving care practices. Conclusion This dissemination plan also shows some limits: the EHPADs that never attended association's meetings weren't all able to benefit from MobiQual. A complementary dissemination strategy should be considered and improved by the assessment of dissemination and use of these kits.

**PD6 813 INTEREST OF A GERIATRIC POST EMERGENCY WARD WITHIN AN INTERNAL GERIATRIC MEDICINE WARD OF A TEACHING HOSPITAL**

M. PICAT\* (CHU Limoges, Limoges, France)

G. ARBO, K. DAVALOS, T. DANTOINE

Because of the ageing of the population and the increase of the morbidity, the attendance of the emergencies ward by the old persons is growing. A geriatric post emergency ward (GPE) was created in 2005 within an internal geriatric medicine ward (IGM). Ward of 8 beds welcomes the persons of 75 and more years old with polyopathy admitted in emergencies. Descriptive, retrospective study of patients admitted in 2006 GPE and IGM. Statistics realized by software STATA. In 2006: 652 admittances in GPE representing 8.35% of the persons of more than 75 years care for emergencies. Average age is of 85.5 years (+/-6.07) with sex ratio of 1,7 women to man. Average duration of stay is of 4,64 days (+/-2,14). Admittances are made for 96,8% via emergencies. Main met pathologies are: cardiovascular (25%), infectious (17%), cerebrovascular accidents (8%), fall (4%), dementia (3%). Majority of the patients got back to its home (51.5%), for the others, they were directed towards a following geriatric care (33.1%), towards a not geriatric specialty ward (1%), towards psychiatry (1.1%). Rate of death is 5.8%. Rate of another hospitalisation unless 28 days is 11%. IGM and GPE are not statistically different ( $p>0.005$ ) in term of age, sex, place of life and exit orientation but they are different ( $p<0.005$ ) in term of average duration of stay, of rehospitalisation. Rate of rehospitalisation of IGM (15%) is more important than the rate in GPE (11%) this although the duration of hospitalization is shorter. Patients of both wards get back to their home in a dominant way to avoid break autonomy. Hospitalization is short, lower in 5 days to avoid the break of autonomy. Psychosocialmedical evaluation is realized facilitating direct home returns without rise of rehospitalisation. The nearness of the unit of IGM allows a reorientation of patients requiring etiological investigations.

**PD6 814 CONCEPTION OF A NEW HEALTH CARE STRATEGY FOR THE ELDERLY IN HUNGARY**

B. BOGA\* (HAGG, Budapest, Hungary)

O. REGIUS(1), G. CSILLIK- (1) Hungarian Assiciation of Gerontology and geriatrics (Budapest, Hungary)

In Hungary recently elaboration of a new aging strategy has got onto agenda of the government. This strategy will include all respects of aging population and extends to next decades. HAGG participates in the preparations of it, mainly of health chapter. This strategy is urgent on the basis of recent facts: 1. 21,6% of the population are 60 years old or older 2. Life expectancy is less than that in Western Europe (by 8-10 years) 3. Difference between the total and healthy life expectancy is large (about 8 years) 4. 45% of the elderly are restricted by their health status in everyday activities. Elements of the new strategy: 1. Prevention: launched in middle-age. a. Primary prevention: retardation of aging process and prevention multimorbidity (mental hygiene, motion, gymnastics, nutrition, dwelling, education, etc.) It is task for all sectors of the society. Main responsibility is at general pratical. b. Secondary prevention: obligatory introduction of so-called milestone-screening at age 60,70, etc. Participation of the elderly in general screening program e.g. cancer. c. Tertiary prevention: it is part of the treatment on all levels with special attention in order to prevent progression, complications. 2. Special experts with geriatric knowledge in all medical disciplines 3. National geriatric care setting with 3 levels of health provision: a. Geriatric consultation for outpatients b. Mobile geriatric team: for all departments in hospital, for nursing homes, etc. c. Geriatric hospital department with acute, readaptation and day hospital subdepartments. A regional, territorial system is needed, with a geriatric center with all subdepartments, in other towns only post-acute and day hospital subdepartments. 4. Integrated health and social care system with common leadership and task distribution. 5. Education of staff, suitable infrastructure, legislation. The final approval is expected this year.

**PD6 815 DESCRIPTION OF HOME CARE SERVICES OF THE CITY OF BELO HORIZONTE, BRAZIL**

C. SEIXAS\* (Université René Descartes / Paris 5, Paris, France)

R. SENA(1), K. SILVA(1), N. HORTA(1), I. CALDEIRA(1) - (1) School of Nursing / Federal University of Minas Gerais (Belo Horizonte, Brazil)

INTRODUCTION This work is part of the research "Home Attention: cartographies of management and care". Home Attention constitutes an institutionalized health practice that is spreading worldwide because of the population aging, the augmentation of chronic

illnesses and the raised cost of hospital attention, making possible to reduce costs, to promote the dehospitalisation and to humanize the assistance. For a better understanding of Home Care working process and organization structure, a historical rescue of some services was proposed. METHODS AND MATERIALS Qualitative study that aimed to characterize relevant Home Care services in Belo Horizonte, Brazil. The services were selected based in the researchers experience in the field. An informer-key of each of six services that provide or have provided Home Care assistance was interviewed. RESULTS The analysis show that the oldest service appeared in 1972, offering patients removal from their houses to hospitals and, later, taking care of patients in their homes. Currently, three services stopped providing Home Attention and two continue to offer. The studied services were organized to assist patients with chronic illnesses or out of therapeutical possibilities and all had multiprofessional teams. The services presented various modalities of attention and one of them had even a Home Intensive Care service; another one use to rent medical material and removes patients from home to the hospital. The analysis discloses that all services had inclusion criteria such as having a care-giver, users with walking disabilities, need for multidisciplinary assistance, among others. CONCLUSION The resurgence of Home Care in Belo Horizonte confirms a tendency to valorize this modality of assistance in Brazil and in the world, principally in the search for care humanization. It was observed the maintenance of some common characteristics among the services, such as team composition and patient's profile.

#### **PD6 816 WHY THE ELDELY GO AT THE DOCTOR'S OFFICE?**

R. MARTÍNEZ\* (Hospital para enfermos crónicos de Tepexpan. Estado de México, Mexico)

M. MARTÍNEZ ESTEVES(1), F. MARTÍNEZ ARRONTE(1) - (1) Hospital para enfermos crónicos de Tepexpan (Acolman, Estado de México, Mexico)

**Summary:** The demographic and epidemiologic transition obligate to health programs around of the world to take into account adjustment that guaranteed the health attention suitable. The present study analize which is the principal cause of attention in the consultory. In two years, ours checking files pertaining to the poblation of the Hospital for chronic sick in Tepexpan, México. The first complain will be associted at symptom related with depression. Study type: Transversal, Retrospective. Method: Checking files, analize the first reason mentioned by the patient or your family. Analize in tendency central measurement. Results: The firts on account of consult will be the symptoms related with the depression, following to articular pain, arterial hypertension, demencia and metabolic diseases between others. Conclusion: The epidemiologic transicition obligated to the health workers haven knowledge of the diseases prevailing in the elder population for guaranteed an health attention suitable and active aging.

#### **PD6 817 PUBLIC POLITICS IN AGEING AND CARE: IDENTIFICATION OF HEALTH AND SOCIAL NECESSITIES AMONG LOW INCOME OLD ONES IN SAO PAULO-BRAZIL**

Â. MACHADO DE LIMA\* (University of Sao Paulo, Sao Paulo, Brazil)

J. LITVOC(1), N. CARNEIRO JUNIOR(2), E. FROLICH MERCADANTE(3) - (1) University of Sao Paulo (Brazil); (2) Medicine School of the Saint Marries of Sao Paulo (Brazil); (3) Catholic University (PUC) (Brazil)

This research was developed from a partnership of the university, represented by four institutions- FM/USP, EACH/USP, FCM of the Saint Marries of SP and PUC/SP-with the National Association of Gerontology-SP and Municipal General offices of Health and Social work of Sao Paulo. We carried out a quantitative study - financed by FAPESP for four years from 2004-2008- of population base integrated to qualitative approaches to identify necessities of health and social work to be included in public politics of attention for 60 year old ones of low income. We have interviewed a sample of 780 old residents in two regions, 352 in the centre and 428 in the periphery of Sao Paulo city. We have also approached health and social work services wokers and elderly of low income of these regions by qualitative techniques (interview, observation and focal group). The results point to the necessity of the development of intersectorial public politics in partnership between university institutions, public power and not government organization compromised in this research. Besides it may contribute to definition of priorities to application of regional strategies of implementation of the International Plan of Action on Ageing of Madrid, respecting the responsibility of the governments in accordance with his legal landmarks of promoting and offering social services and basic health services considering specific necessities of old people.

#### **PD6 818 THE FRENCH NATIONAL PLAN "AGING WELL"**

J. AQUINO\* (Clinique de la Porte Verte, Versailles, France)

A. JEAN-PIERRE(1), T. ANNE-MARIE(2), B. ZINNA(3), D. OLIVIER(4), K. ANNE(5), E. SONDÈS(6) - (1) Clinique Porte Verte (Versailles, France); (2) Direction générale de l'action sociale (Paris 14, France); (3) Direction générale de la santé (Paris, France); (4) Direction générale de la santé (Paris, France); (5) CNSA (France); (6) Secrétariat d'état aux sports

**Subject:** In France, the publication of the national Plan, "Aging well", in 2007, shows the ambitions in the field of preventive gerontology. Mission: The national Program "Aging

"well" preceded the national Plan of the same name and was launched in 2003. It emphasised the idea of proximity as an element of success in initiatives in the field. Becoming a genuine public health Plan in 2007, based on nine points of development uniting thirty-two measures, the national "Aging well" Plan (2007-2009) is placed under the aegis of the ministry of Health, Youth, Sports and Community life and the ministry of Employment, and family and solidarity social relations. Its target population is "seniors", and more particularly, people between the age of 55 and 75. This public health Plan provides preventive gerontology. It is in agreement with European recommendations within the "Healthy aging" plan. The French "Aging well" Plan is financed by a global budget of 168 millions euros over three years. But this amount integrates the cost of some measures intersecting with other plans and financed otherwise. 3 millions euros are added every year for call for tender, financed by the CNSA (the National Solidarity Fund for Autonomy). Results: Today, 21 of the 32 measures of the plan are a reality or on the point of becoming one. Three regional calls for proposals for projects have been made in 2005, 2006 and 2007. A total of 350 projects, proposed by actors have been selected according to chosen criteria and then financed. Evaluating these actions represents an essential point. The evaluation of the Plan's measures themselves is in progress. In addition, an evaluation of the selected projects over the last three years, assesses, in particular, their impact on health and socialisation; making it possible to propose practical and specially, procedural recommendations.

#### **PD6 819 FILIAL RESPONSIBILITY NORMS AND SUPPORT PATTERNS AMONG NORWEGIAN SONS AND DAUGHTERS**

K. HERLOFSON\* (NOVA - Norwegian Social Research, Oslo, Norway)

B. SLAGSVOLD(1) - (1) NOVA (Oslo, Norway)

**Introduction** It is often assumed that women hold stronger filial responsibility norms than men, that daughters provide more help to parents than sons, and that filial norms predict provision of support. Are these assumptions confirmed in Norwegian data? Together with the other Nordic countries, Norway has been a vanguard regarding gender equality. This raises the issue of whether gender contrasts will be less pronounced among Norwegians than what has been observed in other countries. **Methods and materials** The analysis is based on data from two waves of the Norwegian longitudinal study of life course, ageing and generations (NorLAG). The first wave of data collection (T1) was carried out in 2002/2003, the second (T2) in 2007/2008. A total of 3796 persons (40-79 years at T1) have participated in both waves. This presentation will focus on those with at least one parent living at T2 (n=1306). We analyse filial norms, actual support and the correlation between adherence to such norms at T1 and support behaviour five years later (T2) among adult daughters and sons. **Results** Preliminary analysis suggests that sons are more positive to filial norms compared to daughters, more daughters provide support to mothers but more sons provide support to fathers, and adherence to filial norms has a positive effect on actual support for sons but not for daughters. **Conclusions** Gender contrasts in filial norms and support among Norwegians are only partly in line with common assumptions. More daughters than sons are involved in help and support for parents. However, when analysing support to mothers and fathers separately, we see that this is only the case for support to mothers. Sons are more positive to filial norms and agreement with norms at T1 is a much stronger predictor of provision of support at T2 for sons than it is for daughters.

#### **PD6 820 ON THE DYNAMICS OF INTERGENERATIONAL FAMILY RELATIONS IN LATER LIFE: WHAT INDUCES TRANSFERS BETWEEN OLDER PARENTS AND THEIR ADULT CHILDREN?**

A. MOTEL-KLINGEBIEL\* (German Centre of Gerontology, Berlin, Germany)

K. MAHNE(1) - (1) German Centre of Gerontology (Berlin, Germany)

**Introduction** Research on private intergenerational transfers has gained more and more attention within social gerontology. It has become apparent that the allocation of private cash and non-cash benefits is salient, not only for the family as such, but also for the broader issues of social inequality and social policy. Analyses to date on the extent and the preconditions of private intergenerational transfers have remained cross-sectional, and have shown that resources of the giver, needs of the recipient, and relationship quality correspond in equal measure with familial support. Yet a reliable examination of theoretical assumptions being developed within the fields of social gerontology requires information on the dynamics of inter-generational support: can private transfers between adult generations in the family be described as reactions to shifts in resources or needs? **Method and materials** Analyses are based on the German Ageing Survey, a representative study on the German population aged 40 and older. Logistic regression is used to compare the structure of predictors (characteristics of parents, children and the relationship) of transfers cross-sectionally. Multilevel multinomial logistic regression is used to predict changes in transfer behaviour within parent-child-dyads by changes in the living situation of both generations involved and changes in the relationship itself. **Results** The predictor structure of transfer behaviour is consistent over a 6-years timespan. Longitudinally, shifts in parents resources are the strongest predictor for the dynamics of transfer behaviour – e.g. if there is a decrease in income, it is twice as likely that parents stop to support their children. On the other hand, if the child gets divorced or the relationship intensifies, it is less likely for transfers to cease. **Conclusion** The longitudinal results affirm that

intergenerational transfers can be seen as a function of resources, needs and relationship quality. Further research on intergenerational transfers should focus on its dynamic aspects.

**PD6 821 A TRASH-BODY: THE OLD-BODY FROM THE CHILDREN'S PERSPECTIVE**  
A. RAMOS\* (Universidade Federal do Rio Grande do Sul, Porto Alegre, Brazil)

**Introduction** Children have a lot to say about the social culture surrounding them. Through their background, children enable us to discover their habits, their day-to-day life, their games, as well as their wide knowledge of the society they live in. In this research, children are asked to emphasize their experiences regarding the elderly. During a period in which we live a verticalization of the familial relationships and a progressive multigenerational coexistence, it becomes fundamental to know the imaginations that different generations have of each other; in this case, the imaginations of the children about the elderly. **Methods and materials** This research has been performed with a Focal Group composed of sixteen boys and girls, between eight and ten years old, resident in Porto Alegre periphery, southern region of Brazil. Over eight meetings, the children drew, wrote and debated about the elderly, pointing out several aspects of their life, such as retirement, day-to-day life, diseases, intergenerational exchanges and the old-body. **Results** For this presentation, I propose to analyze the most outstanding and determinant part of this research, that is that one which tells about the old-body. We are old because our body gets old and we assign several social meanings to this ageing. In this research, children consider the old-body as a weak, dependent, wrinkled and ugly body; a body which is not desired, and which needs to be constantly improved and reset. **Conclusion** The children's knowledge is always the result of their own experience and the place where they live and is enriched by infantile ways of discovering and describing reality. Therefore, children's knowledge shows a wide cultural curriculum wherein they are included. This relates the old-body to certain attributes, which influence their way of being, acting and living, opposing it to the agile, muscled and desired young people's body.

**PD6 822 A COMPARATIVE ANALYSIS ON SUPPORT WITH PARENTS AND PARENTS-IN-LAW FROM MARRIED WOMEN IN KOREA, JAPAN AND CHINA.**  
J. KIM\* (Tokyo University of Social Welfare, Isesaki, Japan)

1. The purpose of this study The social security system and public support play a significant role in the financial well-being of old people, especially those with low income, but elderly people are still willing to accept financial and non-financial support from their families. On the end hand, Korea, Japan and China have both similarities and differences in their respective traditional family systems and kinship organizations. In Korea and China, filial obligations and expectations of kin support generate consensual agreement that only sons should provide the necessary security for elderly parents, while in Japan, daughters also have support for elderly parents. The purpose of this study was to comparatively examine whether financial support given to parents and parents-in-law by married women in Korea, Japan and China. 2. Methods. We analyzed three data sets, summarized below. The Korean National Family Survey (KNFS03) was conducted from September to November 2003 by the Korea Women's Development Institute. There were 5,412 original household questionnaires and the completion rate was 64.7%, yielding 3,500 respondents. A National Family Research of Japan Survey (NFRJ03) was conducted from January to February 2004 by the National Research Committee of the Japan Society of Social Family Sociology. The research population was aged 28-77 years and the total sample size was 10,000 and the completion rate was 63%, yielding 6,302 respondents. The family survey of China was conducted from September 2006 to February 2007 (FSC06). The primary sampling locations were Dalian, Shanghai, Chengdu, and Nanning. The research population was aged 30-75 years and the total sample size was 4800 ( 2400 from Chengdu, 800 each from the other cities) 3. Results and Conclusion. In Korea there was a higher discrepancy between giving and receiving financial support to parents-in-law, but receiving support from parents is similar to those who are providing financial support to parents. In contrast, in Japan, married women receiving financial support from parents and parents-in-law was a little higher than those who are providing financial support to parents and parents-in-law. But in China, married women receiving financial support from parents and parents-in-law was higher than those who are providing financial support to parents and parents-in-law.

**PD6 823 INTERGENERATIONAL SUPPORT AND SELF-RATED HEALTH FOR CHINESE OLDER ADULTS IN ONE-CHILD FAMILY—THE DIFFERENCE BETWEEN URBAN AND RURAL AREAS**  
L. XU\* (University of Southern California, Los Angeles, United States)  
I. CHI(1) - (1) School of Social Work (Los Angeles, United States of America)

**Introduction:** As a result of the one-child policy, increasing number of older adults has only one child in China, which puts pressure on the traditional family-based support system for the elderly. This study is aimed at investigating the relationship between intergenerational support and self-rated health of one-child Chinese older adults, and examining whether there is a difference between urban and rural areas. **Methods and Materials:** Data (N=1101) were from a sub sample of people aged 60 and over who participated in the nationwide 2000 Sample Survey on Aged Population in Urban/Rural China (SSAPUR). Intergenerational support was measured through four dimensions of structural, instrumental, financial and emotional support. T-test and Chi-square analyses were first

conducted to exam the urban/rural difference on main variables. Hierarchical multiple regression was then used to test the effects of these four dimensions of intergenerational support on Chinese older adults' self-rated health in urban and rural areas. **Results:** Results of t-test and Chi-square showed that there were significant differences in terms of age, gender, education, marital status, and financial strain between urban and rural older adults who have only one child. In terms of the dimensions of intergenerational support, the results indicated that except the structural support, the other three dimensions of intergenerational support were significantly different between urban and rural one-child older adults. However, the findings from the hierarchical multiple regression analysis showed that only emotional support directly influenced older adults' self-rated health ( $t=3.93$ ,  $p<.001$ ) in both areas after controlling the demographic variables. Intergenerational support explained 28.8% and 30.7% variances in self-rated health for urban and rural older adults respectively. **Conclusions:** The results suggested that health benefits from emotional support should not be ignored when developing elder care policy in China to meet the needs of the one-child older adults in the coming years.

**PD6 824 FROM PATRILINEAL TO BILATERAL? : INTER-GENERATIONAL RELATIONSHIPS IN KOREA**  
G. HAN\* (Seoul National University, Seoul, Republic of Korea)  
Y. LEE(1), S. KIM(2) - (1) Yunsuk Lee (Republic of Korea); (2) Sangwook Kim (Republic of Korea)

With rapid societal changes and consequent changes in family values and norms, intergenerational relationship dynamics changed dramatically in recent Korea. Main question underlying this study is whether intergenerational relationship changed from a patrilineal to a bilateral one in contemporary Korea. In order to answer this question, we examined whether there is a lineage differences in the types of intergenerational relations and related factors. Data are gathered from 552 adult children with at least one own parent and one parent-in-law alive. The latent class models are used to determine the minimum number of unique groups needed to represent the intergenerational relations. Multinomial logistic regressions are performed in order to identify the factors related with the probability of being in a particular relationship type. All the analyses are done separately by lineage and results are compared between maternal and paternal line. Main results are as following: Three types are identified both in the relationship with paternal and maternal parents. Yet, prevalence of relationship types differs by lineage. There also are lineage differences in the factors affecting levels of contact and support exchange between generations. Characteristics of maternal parents influence the relationship with paternal parents and vice versa. About 53% of the respondents keep close relationship both with paternal and maternal parents while only 20% have traditional, patrilineal type of intergenerational relationship. Results are interpreted as an empirical evidence of weakening of the patriarchal/patrilineal emphasis on intergenerational relationships in Korean family. Theoretical and policy-wise implications are discussed.

**PD6 825 THE ELDERS AND THEIR NEW ROLES: FROM DEPENDENT TO SUPPLIER AND THE MAIN HEAD OF THE FAMILY.**  
C. LEONIA \* (Universidade de Santa Cruz do sul, Santa Cruz, Brazil)  
S. COUTINHO AREOSA(1), L. CAPAVERDE BULLA(2) - (1) Universidade de Santa Cruz do Sul (Santa Cruz do Sul, Brazil); (2) Pontifícia Universidade Católica do Rio Grande do Sul (Santa Cruz do Sul, Brazil)

**Introduction:** The peoples increase in the age group above 60 years is transforming the profile of the Brazilian families. Commonly in the past the elder was seen as a dependent person, but this tendency is being modified. Nowadays the elders are sustaining or helping to sustain the family and many elders are becoming the main head of the family. This research intends to investigate the new family configurations and the relationships between the aged and their relatives. **Methods and materials:** The elders of different social classes that seek the services of a Brazilian University were interviewed. In a first phase it was studied the 1098 registered seniors profile and of this universe a senior aleatory sample of 217 was selected who compose the qualitative part of the study. At the end of the data collection, being taken into account the saturation criterion the sample was composed by 34 elders and 34 family members. In the sample two instruments were applied: a semi-structured interview and Thematic Aperception Test - TAT (MURRAY, 1995). The results were analyzed through a technique of the content analysis. **Results:** It was verified a significant number of elders in the condition of head of the family, several family configurations with many children living with the elder parents, divorced sons and daughters returning to live with their parents, besides elders who help other relatives. **Conclusion:** The elder is playing a new role in the family, receiving the family's recognition for being the provider and being valued as somebody important that takes care, that welcomes and that takes responsibilities in relation to their relatives. These aspects reinforce the autonomy and the independence of these elders ones, that continue deciding about their lives, maintaining a social life activates and participating in their communities.

**PD6 826 THE ATTITUDES TOWARD SUPPORTING PARENTS IN TAIWAN: DO GENDER AND MARRIAGE OF CHILDREN MAKE THE DIFFERENCE?**  
P. LU\* (Chengchi University, Taipei, Taiwan)

**Purpose:** The cultural norm of supporting elderly parents varies by society. In Chinese culture, following patriarchal system, sons and daughters-in-law take on the main responsibility of family giving. However, as the pattern of intergenerational transfer from

parents to daughters changes due to the social trend of low fertility, improvement of gender equality, etc., the social norm regarding daughters' responsibility may change. This study examines public attitude towards sons' and daughters' responsibility for supporting parents. In addition to gender, social norm regulating children's responsibility may be conditioned by their marital status. Furthermore, this study seeks to identify the factors that affect the attitude. Data and Methods: Data came from Taiwan Social Change Survey (2006). A sample of 2102 respondents was interviewed. Analysis was to compare the attitudes towards married sons, unmarried sons, unmarried daughters, and married daughters. Moreover, hierachic regression model was employed to analyze data. Results: Firstly, gender of children has the effect on the responsibility for supporting parents; controlling marital status, sons are expected more to support parents than daughters. Secondly, the effect of marriage of children on the responsibility for supporting parents was not found for sons, whereas, there is substantial difference between married daughters and unmarried daughters. Married daughters are least likely to be expected to supporting parents. Implications: The results indicate that married women gave the priority to play the role of daughter-in-law, rather than to play the role of daughter; and consequently provide less assistance to their biological parents. Social policy should address the unmet needs of the elderly with no children or no sons.

**PD6 827** RESPONSES TO AN ARCHITECTURAL INNOVATION FOR AGING IN PLACE

Y. LEE\* (Yonsei University, Seoul, Republic of Korea)  
C. AHN(1) - (1) Yonsei University (Seoul, Republic of Korea)

The aging population is becoming a serious risk burden to the future of Korea faster than any other in the world and jeopardizes the future of the rest of Asia which constitutes a considerable chunk of world population and furthermore causes the stagnant rest of the global world which also suffers from Aging population. The elderly is no longer the minority and will be the majority in the future. To cope with this risk, architectural innovation is also needed among many other alternatives, such as smart home, community integrated group home, cohousing and etc. In the presentation, an architectural innovation was developed and the responses to the plan were identified and evaluated as a means to promoting aging in place. The innovative plan was "unit building insertion system" where elderly housing facility unit can be easily inserted as the number of the senior residents grows enough, into the existing building. In this case, older residents can remain in their existing community, while maintaining diverse demographic characteristic. The major research methodology was web survey. The survey instrument was made of graphics showing the system and a series of questions about its utilization. Graphics were developed by professional architects and designers according to the guidelines given from researchers. Data were collected from 300 respondents, and analyzed using SPSS package. As results, people's responses were favorable and found slight differences according to respondents' socio-demographic backgrounds. This research indicated that the Unit Building Insertion System has a great potential to alleviate social exclusion problem of the elderly, especially in low income public apartment. In conclusion, to cope with fast growing number of the elderly in Korea, the architectural innovation can be expected to play a significant role in integrating the elderly into existing community effectively. The details will be discussed in the conference.

**PD6 828** TOWARDS CONVERGENCE IN LONG-TERM CARE ALLOCATION PRACTICES? DETERMINANTS OF LTC USE IN EUROPEAN COUNTRIES.  
J. GEERTS\* (University of Antwerp, Antwerp, Belgium)

Introduction In recent years several European countries have fundamentally reformed their long-term care (LTC) systems. However, levels of protection still vary substantially, one of the main differences being the extent to which a needs-based right to public services/allowances is effectively guaranteed. Our aim was to study what impact these institutional differences have on the way care-dependent individuals are cared for, by examining cross-national differences in determinants of care use. Methods and materials We used data from the 2004 Survey of Health, Ageing and Retirement in Europe (SHARE), which covers eleven European countries. Our analyses included respondents aged 65+ living at home (N=12,173). We examined cross-country differences in the effect of functional limitations, household composition and availability of children on formal LTC utilisation (household help, home nursing, any type), using multinomial and logistic regression models, and controlling for other needs indicators and socio-structural and enabling factors. Results Using Belgium as reference category, we found evidence of a more needs-related utilisation of formal care services in the Nordic welfare states, where allocation criteria have been tightened, and in such Continental welfare states as Austria, Germany, the Netherlands and France, which have (recently) introduced a needs-based right to care services/allowances. In these countries, France excepted, services also seem to be targeted more at elderly without informal support, albeit through fundamentally different mechanisms: tighter formal allocation criteria in Scandinavia and the Netherlands versus a stronger familialistic culture in Germany and Austria. Conclusions Long-term care allocation practice and the resulting profile of long-term care users seem to be converging towards greater targeting according to need and informal care availability in the Nordic and in most Continental European welfare states. Any evaluation of this trend must take due

account of the consequences for elderly people and their carers in terms of health and quality of life.

**PD6 829** THE ROLE OF LEADERSHIP IN FACILITATING SUSTAINABLE CULTURE CHANGE IN IRISH NURSING CARE SETTINGS

R. BOND\* (Dundalk Institute of Technology, Dundalk, Ireland)  
B. LYNCH(1), A. COYLE(1), L. CARRAGHER(1) - (1) Health Services Executive (Ireland)

Introduction The Irish Health Service Executive is supporting an evaluation of the Teaghlaigh Model on the culture of two of its nursing homes and to compare it with two traditional nursing homes, matched for size, location and leadership. The Teaghlaigh Model promotes person-centred care and a homelike environment, with domestic style units or households where residents direct their own lives, supported by consistent and valued teams. While person-centred care is acknowledged as the best outcome for patients (Farley, 2001) and nursing care staff are increasing expected to deliver the necessary changes in the culture of organisations (Health Information and Quality Authority, 2008), sustainable cultural change remains largely an aspiration of many nursing homes. Patterns of work can be so deep-rooted, inter-connected, and invisible, that attempts at change frequently do little more than scratch the surface (Price & Akhlaghi, 1999). The aim of this study is to explore the role of leadership in facilitating sustainable change in nursing home settings. Method A mixed-methods approach will be used to gather data pre-and-post implementation (November 2008 to February 2009). This will include interviews, observations, and focus groups with staff, residents and family members to provide an insight into working practices and attitudes to interventions. Data analysis will be based on grounded theory, which is an appropriate tool for studying organizational cultures (Strauss & Corbin, 1990). Results Preliminary results suggest care staff are supportive of the underlying ethos linked to culture change, but have many concerns around health and safety issues. Discussion Preliminary findings from this study point to a need for more open debates on the tensions between health and safety and quality of life of residents. Ongoing support has emerged as an important factor in terms of the meaningful engagement of resident and staff and the sharing of values, beliefs and norms.

**PD6 830** ASSOCIATION BETWEEN DISTURBING BEHAVIOUR IN THE ELDERLY AND THE USE OF RESTRAINTS IN INSTITUTIONAL ELDERLY CARE

R. SAARNIO\* (University of Oulu, Institute of Health Sciences, Oulu, Finland)  
A. ISOLA(1), U. MUSTONEN(2) - (1) University of Oulu (Oulu, Finland); (2) University of Oulu (Oulu, Finland)

Introduction. The aim of the study was to describe nursing staff's modes of action in situations where they care for elderly people with disturbing behaviour in institutional elderly care in Finland. Methods and materials. The data were collected from nursing staff (n=1,148) working in healthcare wards, municipal and private nursing homes in Finland using a semi-structured questionnaire. The data were analysed using both descriptive statistics and multivariable methods. Results. The nursing staff used three different approaches when confronted with an elderly person with disturbing behaviour: 1) understanding, 2) indifference and 3) use of physical or chemical restraints. 88% of the nursing staff often acted in a manner that understands the elderly person. Restraining was used often by 14% and sometimes by 56%. 44% and 56% of nursing staff treated an elderly person with disturbing behaviour with indifference rarely or never, respectively. The use of physical and chemical restraints showed a highly significant correlation with the number of beds in the unit ( $p=0.001$ ) and the nursing staff's level of education ( $p=0.001$ ). Restraints in the care of elderly people with disturbing behaviour were used most often by nurses and practical nurses, while those with training other than nursing or no training used them least. Conclusion. Based on the results of our study, the use of physical and chemical restraints could be reduced in institutional care of elderly showing disturbing behaviour by limiting the number of beds in the units to no more than 20. The association of nursing education with the use of restraints is an ethically interesting finding that calls for further study. Our finding suggests that in nursing education, more emphasis is put on maximising the safety of elderly patients than on their right of self-determination.

**PD6 831** AMOUNT OF FORMAL CAREGIVING IS ASSOCIATED WITH RISK FOR HOSPITAL AND NURSING HOME ADMISSIONS

L. SANDS\* (Purdue University, West Lafayette, Indiana, United States)  
H. XU(1), M. WEINER(2), C. DOEBBELING(3), M. ROSENMAN(2), B. CRAIG(1), J. THOMAS(1) - (1) Purdue University (United States of America); (2) Indiana University School of Medicine (United States of America); (3) Indiana Office of Medicaid Policy and Planning (United States of America)

BACKGROUND. Dementia-related declines in functioning increase patients' dependence on others to complete basic activities needed for health and survival. Typically, formal caregiving is used when patients' needs exceed informal caregiving resources. Many prefer home-based formal caregiving over institutional care. Little information exists about whether amount of formal caregiving is associated with patients' risk for subsequent hospitalizations and nursing home placement, potential consequences of insufficient caregiving. METHODS. Indiana Medicaid recipients with dementia were followed after

initiation of formal home-based caregiving. To assess whether amount of personal care and homemaking were associated with time to nursing-home admission, a Cox proportional hazard model was constructed. The Anderson Gill extension of that model was used to assess their association with hospitalizations. Both models adjusted for comorbidities, functional status, age, gender, race, marital status, region, insurance status, and presence of informal care. RESULTS. The median age of recipients was 80.5; 82% were female, and 68% were white. Patients receiving 5 hours of personal care and 2 hours of homemaking per month had lower hazards for hospitalizations compared to those receiving no formal care (HR=0.57; 95% CI= .43 - .77 and HR=0.58; 95% CI=.18 - .89, respectively). These hazards were 40% lower among patients who received 25 hours of personal care and 6 hours of homemaking per month. Each 5 hour increment in hours of personal care per month was associated with a 5% lower hazard of nursing home placement (HR=0.95; 95%CI=.92-.98), and each 5 hour increment in hours of homemaking per month was associated with a 20% lower hazard of nursing home placement (HR=0.79; 95%CI=.03-.65). CONCLUSION. Long-term care policy makers should consider that greater amount of formal home-based caregiving is associated with lower subsequent acute care and long-term care utilization.

**PD6 832 WHO PREFERS "DIRECT PAYMENT"? CLINICAL CHARACTERISTICS OF TWO GROUPS OF LTCI-BENEFICIARIES**  
V. GARMS-HOMOLOVÁ\* (Alice Salomon Hochschule, Berlin, Germany)

Introduction: In many EU states, the "direct payment" has been developed. Individuals that need care get money instead of service, to "purchase" care according to their needs. In Germany, this policy has been tested during the past four years. Individuals eligible for benefits of the LTCI could choose between benefits in kind and in money. The presentation will compare clinical characteristics of receivers of benefits in money and in kind. Methods and Materials: A subsample of the test participants receiving benefits in money (n=303, only persons 65+years) were assessed by trained care managers, who applied the standardized MDS of the RAI HC (Morris et al 1997). A control sample (n=608) selected of "regular home care users" underwent the same assessment. Results: No significant age and gender differences were found. The living arrangements were different: The service users more often lived alone and in housing of good quality than the receivers of the direct payment. Striking differences were found in the prevalence and distribution of disabilities (measured by ADL, Cognitive Performance Scale, Communication Scale), co-morbidities and symptoms. The prevalence of Alzheimer amounted to 31.8% in the sample of the money receivers (4.5% in the control group). 31.7% of money receivers, but 17.6% of the control group suffered from other dementias. The prevalence of "somatic" diseases (Hypertension, Heart failure, Diabetes) was higher in the control group. Conclusion: Persons who chose "money" were more disabled than clients of "normal" home care, and were characterized by a high degree of disability, clinical complexity, diseases, and symptoms, that required more than "just care and nursing", but counselling, support for informal caregivers, and rehabilitation. Reference: Morris J, Fries B, Steel K, Ikegami N, Bernabei R: Comprehensive clinical assessment in community setting. Applicability of the MDS HC. Am Geriatr. Soc.(1997) 45, 8, 1017-24

**PD6 833 MANAGING THE AGED CARE MARKET: THE CASE OF LONG-TERM CARE FOR ELDERLY IN JAPAN**  
Y. KADOYA\* (University of Sydney, Glebe, New South Wales, Australia)

It is often said that the market mechanism does not enhance service quality in care market as there is information asymmetry between users and the providers. This research investigates the three arguments for this proposition by following methods: a) "Contract Failure" model claims that in care market the users can not choose a provider based on its service quality as there is the information asymmetry between users and providers. Thus, the user see the ownership of providers as the signal of service quality. To see if this "contract failure" model is valid, it needs to investigate the correlation between the actual service quality and the market share by ownership. b) Medical Arm Race (MAR) model argues that the competition in care market tends to lower the service quality. To be competitive in the market, providers spend money on advertisement or building (or equipment) renovation rather than improving the service quality itself. To see if this is happening it is valid to compare the performance between the providers in a competitive area and the provider in a non-competitive area c) Satake and Suzuki (2001)'s model claims that new entries in care market do not contribute to improvement in the market's service quality. In care market, they may spend resource on advertisement rather than service quality improvement. To test the validity of this model, it is necessary to compare the service quality performance between new and old entries. The methodology for the study utilizes the third party service quality evaluation of Group Home (a type of nursing home) in long-term care insurance (LTCI) market in Japan. Comparing the quality performance by attributes, all three models are not supported. Analyzing the causes, the research has found that the information disclosure of the third-party evaluation was very effective at bridging the information asymmetry.

**PD6 834 CHARACTERISTICS OF PRACTICAL HOME HELP USERS IN DENMARK**  
Y. YAMADA\* (University of Copenhagen, Copenhagen K, Denmark)  
M. VASS(1), T. ISHIBASHI(2), K. AVLUND(1) - (1) University of Copenhagen (Copenhagen, Denmark); (2) Keio University (Tokyo, Japan)

Introduction Public practical home help is provided widely in Denmark. The eligibility and range of services are decided at municipality level, primary based on an individual

assessment on cohabitating status, capacity of caring and disability levels. This study aims to clarify whether psychosocial and behavioural factors were related to the use of public practical home help. Methods and materials Analysis was based on secondary data from the Danish Intervention Study on Preventive Home Visits in 34 municipalities conducted in 1999-2001. The study population included 2,990 non-institutionalised 75- and 80-year-old men and women independent in functional mobility at baseline, and psychosocial variables were measured with questionnaires. Information on use of public home help services was obtained quarterly through municipal registration. Logistic regression was performed using practical home help as dependent variable, and age, gender, cohabitating status, tiredness in mobility-activities, conducting light exercise, conducting vigorous exercise, life satisfaction, social diversity, social participation and instrumental social support as independent variables. Analyses were adjusted for intervention. Results 8% of the target population used public practical home help. Receiving home help was strongly associated with demographic variables, cohabitating status and disability level. After adjusting these eligibility-related factors, people with sedentary lifestyle and low quality of life, were associated with larger odds ratios of receiving home help. Variables related to social relations were not associated with use of home help except for instrumental social support. Persons receiving instrumental social support were associated with public practical home help during one year. Conclusion Sedentary lifestyle and poor psychological function in older people were associated with the use of more practical home help, while social relations were not.

**PD6 835 ACTUAL DISCUSSION ON QUALITY OF CARE IN GERMAN NURSING HOMES**  
E. SCHNABEL\* (Institute of Gerontology at Technical University of Dortmund, Dortmund, Germany)

Introduction Since the introduction of long term care insurance in Germany, the question of quality of elderly care in nursing homes remains a big challenge. Despite a profound growth in knowledge there is still a lack of transparency especially concerning data with regard to the actual provision of care and quality aspects in nursing homes. Against this background the Institute of Gerontology at the University of Dortmund, the Institute of Nursing Care at the University of Bielefeld and the Institute of Social Work in Frankfurt realised the project 'Reference Models for the Promotion of Quality Development in Nursing Homes' (2004 – 2006). Main objective of this project was the development and evaluation of performance descriptions and quality criteria and their implementation into everyday life of nursing home care to improve the life and accommodation quality of the residents. Methods New developed care concepts were implemented in 20 nursing homes in North-Rhine Westphalia and evaluated. The evaluation process provided data concerning performance measures, actual provision of care and the design of the care process (qualification of staff, expenditure of time for individual care, organisation of care). Results The introduction of the concepts resulted in changes in care performance. With regard to a more intense resource supporting arrangement of care the amount of interventions adopted completely by nurses could be reduced, also an increase of more supportive interventions could be realised. In addition the allocation of psycho-social assistance was ameliorated. Discussion From the results of the project it is able to draw further conclusions for the reform process of the long-term-care -insurance in Germany. The evaluation therefore provides impulses for improved services for residents in nursing homes, a quality orientated assignment of nurses as well as basis for resident assessment and questions on expenditure of staff.

**PD6 836 PERSONAL CARE BUDGETS IN GERMANY AN INNOVATIVE APPROACH IN THE GERMAN LONG-TERM CARE INSURANCE**  
T. KLIE\* (DGGS , Freiburg, Germany)

For five years, the personal care budget has been experimented with as an alternative to care in kind. 900 people participated in seven regions of which 621 were part of the participating group, the accompanying research included regular assessments and re-assessments as well as interviews with the participants and their relatives. Moreover, surveys for a possible implementation were evaluated. The results: The people in need of care had more time and purchased different services than the ones offered by the long-term care insurances. - The relief of strain of family members in the participating group is significantly higher than the relief in the comparison group - The benefits of the personal care budget are a lot more cost-efficient than care in kind-benefits - The option of self-organisation and self-determination is highly important for the feeling of autonomy and thus for the quality of life - The personal care budgets limited feedback is in the first place linked with the resistance of established care providers, but also with budget-related transaction costs anticipated by the care-needing people and their relatives. - Additionally, the German nursing allowance is an alternative not requiring proof of usage - Flanking the grant of budgets by case management proved to be reasonable and effective regarding the quality of nursing care

**PD6 838 AGE AND POOR FUNCTIONAL HEALTH AS LIMITATIONS FOR EMPLOYMENT AMONG SENIORS**  
P. SOLEM\* (NOVA - Norwegian Social Research, Oslo, Norway)  
M. NICOLAISEN(1), H. FINSERAAS(1) - (1) NOVA (Oslo, Norway)

Introduction Poor health is a well-documented reason to be out of work. But how poor a functional health is it possible to have and still be gainfully employed? In most industrial

countries there is a need for more workers to remain employed up in higher ages and with poorer functional health than to day. Methods and materials Data are from the Norwegian study of Life Course, Generation and Gender (LOGG). Age groups 40-79 years are included in the analyses (N=9120). Employment is measured as at least one hour paid work last week or temporal absence from paid work. Health is measured by SF-12 (Gandek et al. 1998) with some health dependent functions added, e.g. the distance one is able to walk without taking a pause. SF-12 scores are transformed to a decile scale. Results Health has a stronger effect on employment with increasing age. In the age group 40-54 years 53% of those in the lowest decile (the 10% with the poorest health) are working, compared to 41% of those 55-61 years of age in the same health decile. Thus many are working despite poor health. From 62 to 66 years optional pension is available for the majority of workers and larger proportions of those with good health are out of work. Above the age of 67 the majority are out of work even when their functional health is good. Conclusion Poor health is a limitation for work, but there is no clear cutting point where work becomes impossible. Age adds to the negative effect of health. With comparable health, older persons are more often out of work, even before normal retirement age. This age effect may reflect negative stereotypes of older workers.

**PD6 839 THE INFLUENCE OF AGE AT RETIREMENT ON SELF-PERCEIVED HEALTH.**

K. RIJS\* (Longitudinal Aging Study Amsterdam (LASA), VUmc Amsterdam, Amsterdam, The Netherlands)

R. COZIJNSEN(1), D. DEEG(2) - (1) Longitudinal Aging Study Amsterdam (LASA), VUmc Amsterdam (Amsterdam, The Netherlands); (2) Longitudinal Aging Study Amsterdam (LASA), VUmc Amsterdam (Amsterdam, The Netherlands)

Introduction Because of the ongoing public debate about increasing the age at retirement, it is important to determine the health consequences of age at retirement. The current study is aimed at the influence of age at retirement on change in self-perceived health. Methods and materials The sample for this study consisted of 200 retired persons aged 54-64 from the Longitudinal Aging Study Amsterdam. Retirement was defined as having a paid job of one hour or more at baseline and no paid job at follow-up. Multinomial logistic regression analysis was applied to test the association between age at retirement and change in self-perceived health. Several health measures and demographical, psychological, job and retirement characteristics were tested for possible confounding and modifying influence. Results Persons who retired one year older, had a 37% higher chance to experience a decrease in self-perceived health after retirement. Moreover, persons who had a partner and persons who were recently retired had a higher chance to experience a decrease. Persons who had not planned their retirement in advance however, had a higher chance of increased self-perceived health. Conclusion The current study shows that age at retirement does influence self-perceived health, with an increased chance of a negative effect when retiring at an older age. However, the findings underscore retirement does not categorically influence health.

**PD6 840 THE BIODEX BALANCE PLATFORM IMPROVES THE BALANCE IN ELDERLY**

N. GUSI\* (University of Extremadura, Cáceres, Spain)

P. OLIVARES(1), J. ADSUAR(1), A. LEAL (2) - (1) University of Extremadura (Cáceres, Spain); (2) Hospital of Cáceres (Cáceres, Spain)

Introduction: The accidental falls are the most common cause of injuries in older people, and often result in disability and handicap, emotional distress and greater use of health and social services. The balance or postural stability can be described as the ability to maintain the body's center of gravity on the basis of support or support. Objective: Evaluate the effect of 6 months training with proprioceptive weight changes with the Bidex Balance System on fear of falling measured by the questionnaire FES-I test and risk of falls (Fall risk test) of the Bidex Balance System. Material and Methods: A randomized clinical trial in which analyzed 31 subjects older than 65 years, with a history of falling at least in the last 2 years (n = 17 exercise, control = 14). The intervention consisted of a training program conducted in the Bidex Balance System platform. Measuring instruments were the International Falls-Efficacy Scale (FES-I) to measure the fear of falling, and the level of risk of falls (Fall Risk Test) provided in the software Bidex Balance System Sd. Results: There was an improvement in the rate of risk of falls of 53.3% (95% from 13.5 to 82.8) ( $p < 0.01$ ). It also found a statistically significant improvement ( $p < 0.001$ ) in fear of falling assessed with a questionnaire FES-I, which is 18.6% (95% from -5.4 to 45.1). Both improvements are correlated with a Pearson correlation of .50 ( $p < 0.01$ ). Conclusions: 6 months of proprioceptive training with changes of weight in the platform balance Bidex Balance System produced statistically significant changes in the level of fall risk as measured by this platform in the fear of falling.

**PD6 841 A STUDY ON THE RELATIONSHIP BETWEEN PRE-ELDERLY PEOPLE'S PERCEPTION OF VOLUNTEER AND THEIR VOLUNTARY PARTICIPATIONS.**

M. SEO\* (Graduate School of Social Welfare, Ewha Womans University, Seoul, Republic of Korea)

B. KIM(2), Y. LEE(3), Y. SHIN(4), M. CHO(5) - (2) Graduate School of Social Welfare, Ewha Womans University (Seoul, ); (3) Graduate School of Social Welfare, Ewha

Womans University (Seoul, ); (4) Graduate School of Social Welfare, Ewha Womans University (Seoul, ); (5) Graduate School of Social Welfare, Ewha Womans University

The pre-elderly people are healthier, more highly educated, and more economically stable than the aged of present and past in South of Korea. It would be needed to activate the voluntary work that enables the pre-elderly people to enjoy an independent and successful aging. The purpose of this study is to examine the perception of volunteer and voluntary participation of the pre-elderly who are over 50 and less than 64 years old. The study pursues research strategies: First, how would the pre-elderly people perceive the volunteer services? Second, how would the pre-elderly people participate in the voluntary work? Third, what is the relationship between the perception of volunteer and voluntary participation of the pre-elderly people? This study employed survey method with the questionnaire. Data were collected from 300 respondents who were selected by random sampling. The data were analyzed using statistic methods such as reliability test, frequency, simple correlation, between the recognition and participation of volunteer. As a result, we found as follows; first, in the perception of volunteer, the highest correlation between social exchange and seeking experience was showed. Second, the majority of the pre-elderly people were highly positive to participate in the voluntary work after their retirements. Third, the relationship between perception of volunteer and voluntary participation was moderately positively correlated. In conclusion, this study suggests that 1) it is necessary to publicize the volunteer service programs more actively; 2) Information concerning voluntary work needs to be given to the retiree at the time of retiring. 3) it is necessary to emphasize the social responsibility for aging life, which encourage the pre-elderly to participate in voluntary work.

**PD6 842 DEMOTIVATION OF THE ELDERLY AFTER ENTRY IN NURSING HOME**

P. JOUANNY\* (University Hospital, Rennes, France)

B. SUEUR(1), A. PAUTRET(1) - (1) University Hospital (Rennes, France)

Introduction: The profile of seniors entering institution has evolved over the last twenty years from a person of 70 years, little dependent but wishing overcome daily contingencies, to a very elderly over 85 years dependent and who can no longer remain at home. Therefore entry becomes a decision more imposed than wanted. Method: The purpose of this work is to assess the experience and the psychological determinants of older people entering an institution for less than 3 months. The motivation is a symptom difficultly evaluated by several tools (SHAPE, EAD, Habib scores), which give different results, but partially correlated ; none can be regarded as the reference. Results: Of the 52 respondents, 34 were cognitively preserved (MMSE > 20) and 5 presented with demotivation. The questioning of the person found a correlation with the notion of frailty (Strawbridge scale), including sensory level. The assessment by the care worker correlated with the concept of dependence (GIR scale), especially in locomotion. The medical evaluation correlated with depression (Dep Ger scale). Atheism seems to be a marker of risk. Discussion: Identified determinants of demotivation are age, sensory and neuromuscular deficiency, polypharmacy and in particular a history of depression and, more generally, anything that might undermine the autonomy of the person, such as psychotropic drugs use for example. The lack of religious thinking also aggravates demotivation. However, dependency - as long as it does not provide too mothering care - seems rather a consequence than a cause of demotivation. A parallel can be outlined between somatic frailty and psychic demotivation. These variables were significantly correlated and appeared both as areas of autonomy. A global score is proposed combining the most clinically relevant issues. Then a four items questionnaire is proposed as a screening tool in retirement homes or in general medicine. This approach is justified only to better prepare the institution entering during the initial contact and the personalized individual support after the entry.

**PD6 843 OBESITY, PHYSICAL ACTIVITY, AND LIFE SATISFACTION AMONG RESIDENTS IN AN AGE-RESTRICTED OLDER ADULT PLANNED COMMUNITY**

J. FREELOVE-CHARTON\* (California State University, Chico, Chico, United States)

R. GITELSON(1), H. CHING-HUA(2), A. TAVAKOLI(3), V. WALDRON - (1) California State University, Chico (Chico, United States of America); (2) National Kaohsiung Hospitality College, Department of Leisure, Recreation & Tourism Management (Kaohsiung, Taiwan); (3) University of South Carolina (Chico, United States of America)

Introduction: Increasingly retirees are relocating to age-restricted planned communities that claim to promote active-living lifestyles through community design. Yet few studies have examined the health and healthy aging behaviors, especially obesity and physical activity, of older residents residing in a planned community for multiple years. The purpose of this study was to examine this relationship. Methods: A stratified random sample of residents in an age-restricted planned community in the southwestern United States were mailed a self-administered survey (N = 1268). Six hundred-eighteen residents of age 46-91 years (M = 67.6 +/- 9.6 yrs., men = 247 and women = 371) completed data for assessing body mass index (BMI), physical activity (PA), health status, years of residency, and demographics. BMI was formed into four groups. PA was categorized into three groups: meeting PA recommendations; under-active; sedentary. Chi square and analysis of variance (ANOVA) was used to examine group differences in the data. Results: Of the

residents, 63% meet the recommendations for PA (49.3% men, 76.8% women). At age > 85 yrs., 40.4% meet the recommendation. At age > 70 years, 77.1% men and 70.7% women meet the PA recommendation. Sixty-two percent of residents who lived in the community for > 8 years meet the PA recommendations suggesting continued engagement with PA overtime. The prevalence of obesity for both genders increased with age; however, men (25.5%) were significantly ( $p>0.01$ ) more likely to be obese compared to women (15.9%). Among obese residents, 62.8% were physically active on four or more days/week. Poorer life satisfaction was significantly ( $p>0.05$ ) related to obesity despite PA level. Conclusion: Older adults living in an age-restricted planned community appear to maintain their physical active and health regardless of age or sex. These findings contrast national normative data on retirees, indicating that planned communities can promote health in the aged.

**PD6 844 THE KEY TO A HAPPY, HEALTHY AND SUCCESSFUL LAST STAGE OF LIFE.**

A. GUY\* (University of Canberra, Australia, Canberra, Australia)

Introduction: - One effect of increasing longevity is to increase the number of years beyond 65, the traditional retirement age. This period of life may now stretch for decades. This research investigates the optimum way of using these years. Methods and materials: - A 'where we are at' profile of older Australians was established using a recognized Australian data base. Contributing factors to physical and mental health from the data base were identified. This was enhanced by interviews with 7 outstanding, achieving older Australians. Results: - The final stages of life are likely to be more successful, in terms of both physical and mental health, if older people plan for their retirement and have a purpose for these later years. Conclusion: - Older people need to be made aware that if they wish to have a physically and mentally healthy, successful latter part of their lives, planning is needed. They need to have a purpose, or life plan. This can involve continuing with work, either full or part time, or taking up a new interest or expanding an existing one, either paid or unpaid, the equivalent to full or part time work. Healthy old age requires physical and mental well being. Exercising and sport can assist physical wellbeing but having a purpose, feeling wanted, useful and part of the community are prerequisites for good mental health. Being involved in either paid or unpaid work and having a sense of purpose satisfies this need.

**PD6 845 INTEGRATED NETWORKS IN FRANCE: THE NECESSITY OF INTEGRATING THE PUBLIC POLICY MAKING FRAMEWORK**

H. TROUVE\* (PRISMA France- HEGP-APHP, Paris 15, France)  
D. SOMME(1), F. ETHERIDGE(2), Y. COUTURIER(2), H. LAHJIBI-PAULET(3),  
O. SAINT-JEAN(1) - (1) PRISMA France- HEGP-APHP-FNG (Paris, France); (2) Centre on Aging ,Health and Social Services Centre - University Institute of Geriatrics of Sherbrooke (Sherbrooke, Canada); (3) HEGP-APHP-Université Paris Descartes (Paris, France)

Introduction: The implementation of a model of integrated services delivery for older people – called PRISMA-, is currently investigated in France. PRISMA is an evidence-based model developed in Quebec. The first step of the model is to build coordination boards at different level of decision-making power. These boards bring together institutional groups, organisations and professionals and are guided by whole system thinking. They work in a joined-up, co-ordinated manner to insure high-quality services delivery. Methods: We used a qualitative analysis based on a triple approach. 1) We made a comprehensive analysis of the French national context through administrative, legislative and regulatory documentation. 2) We analyzed semi structured interviews with actors from all level of decision-making (national, regional, local) participating to PRISMA France. 3) We made observations and transcription of speeches during meetings of the coordination boards joined. Quality was insured by triangulation of analyses of different data sources and saturation of new themes. Results: A main theme emerged: the absence of a real institutional governance of healthcare and social policy for older people. The sequential, structural and incomplete reforms from a bismarckian system to a beveridgean one result in the cohabitation of three concurrent policies: central (national), regional and local. In this context, no authority has the main accountability to define the policy for older people. From these statements, the literature surrounding healthcare and social policy and social welfare allows to explain that the implementation of an integrating model is particularly complex and time-consuming in France. Conclusion: As Compare to Quebec, the implantation of the PRISMA model in France requires an important approach of integrating the national authorities. The lessons learned from this project are important for the current national Alzheimer plan which proposes to implement "homes for integration and autonomy for Alzheimer patients" (MAIA).

**PD6 846 GENERAL PRACTICE IN RESIDENTIAL HOMES: SUBJECTIVE NEEDS OF RESIDENTS**

L. DORLAND\* (Radboud University, Nijmegen, The Netherlands)  
Y. KUIN(1), T. KARDOL(2), P. VERSCHUREN(1) - (1) Radboud University (The Netherlands); (2) Vughterstede Residential Care (The Netherlands)

Introduction: In the Netherlands national policy on quality of care indicates care should be demand-oriented care. However, little is known about the demands of elderly people in

residential homes and senior housing. Therefore in this qualitative study residents were asked about their subjective needs for care by general practitioners (GPs). The focus was on GP care because GPs play a key role in providing care for residents. Method: Semi-structured interviews were conducted with a representative sample of 40 residents in residential homes and senior housing in rural and urban areas. Questions focused around subjective evaluations and needs concerning care for physical and psychosocial problems. Results: The majority of respondents is satisfied with their GP and is very reluctant to admit imperfections. Satisfaction was higher in the rural area. Most residents consider the relationship with the GP as more important than the actual care given by the GP. They believe GPs are very competent, especially in case of somatic problems. But according to the doctor-patient relationship residents have clear needs. Almost all want their GP to visit them on his/her own initiative, at least after they have been ill. They want a GP who is understanding, friendly and interested, which can be shown by taking time to listen. Due to sensory impairment and memory problems most residents prefer to have a nurse present during consultations, because she is very well informed about the residents' functioning. Afterwards she is helpful in remembering the advice of the general practitioner. Conclusion: Regardless of patient satisfaction being high in this study, there are still unmet subjective needs, especially in the domains of GP-patient relationship and the supportive role of nurses. The results of this study will be used to improve demand-oriented GP care in residential homes and senior housing.

**PD6 847 CARE CREDITS IN THE BRITISH AND GERMAN PENSION SYSTEMS: HOW DO THEY WORK AND ARE THEY ENOUGH?**

A. VLACHANTONI\* (Centre for Research on Ageing, University of Southampton, Southampton, United Kingdom)

European pension systems have been under pressure to reform in the last two decades or so, as a result of population ageing, the rise in pension expenditures and the changing structure of labour markets. The provision of care credits are an essential aspect of modern pension reform and protection, as the demand for eldercare continues to rise, however our understanding of their policy significance within pension systems but also more broadly as part of welfare protection, remains limited. Care credits, regardless of whether they are provided for child care or for the care of adult dependants, operate in three ways; firstly, as a compensatory mechanism for those who devote significant amounts of time to caring for dependants; secondly, as a vehicle for promoting greater gender equality given that the majority of caring is still undertaken by women; and thirdly, as a policy instrument for maintaining a carer's link with the labour market. This paper presents the first stage of a larger research project studying the role and significance of care credits in the British and German pension systems, focusing on the first of the three functions of care credits outlined above. The paper reviews the current policy context in the two countries to assess the level and nature of compensation provided to carers in the form of credits to their pension contributions, and the differences in provision between different occupational sectors and modes of employment.

**PD6 848 AGE-FRIENDLY CITIES' EPISTEMOLOGICAL ITINERARY: A CONTENT ANALYSIS OF FIVE INTERNATIONAL POLICIES IN AGEING DEVELOPMENT.**

M. PARIS\* (Research Centre on Aging, Sherbrooke, Canada)  
M. BEAULIEU(1), S. GARON(1) - (1) Research Centre on Aging (Sherbrooke, Canada)

Age-friendly Cities of the World Health Organization (WHO) is an international program aiming at a better integration of older adults in their own community. It proposes a vision that benefits every citizen: "Children, the young and the old". Increasingly governments from several countries build upon the Age-friendly Cities program in order to meet the specifics needs of seniors living in urban areas. This program integrates the Active Ageing framework from WHO. More precisely, it's based on three concepts: health, participation, and security. This presentation will focus on presenting a reflective and critical look on these three fundamental concepts by analyzing their theoretical or epistemological background. Our aim is to understand Age-friendly Cities by grasping its historical foundations. For more than two decades, many international organizations have produced frameworks for public and social policies of ageing all around the world. Our work is based on a structural and a thematic content analysis of five international policies in ageing: 1) In 1982, the first World Assembly on Ageing in Vienna; 2) In 1999, the United Nations Principles for Older Persons; 3) In 2002, the Second World Assembly on Ageing in Madrid; 4) In 2002, Active Ageing framework; and 5) In 2007, the Global Age-friendly Cities guidelines. The results of our content analysis are divided into three parts. First, we will highlight the ideologies, value systems and representations found in each policy of ageing. Then we will compare the similarities and conceptual differences between these frameworks by insisting on the evolution over the time. Finally, we will draw the conceptual and theoretical pathway that lead to Age-friendly Cities program by insisting on the background related to each of the main concepts: health, participation and security.

**PD6 849 ASSESSING THE REGULATIONS REGARDING THE ACCESSIBILITY OF THE INTERSTATE LAND PASSENGER TRANSPORTATION SYSTEM (STRIP) TO ELDERLY PEOPLE: THE BRAZILIAN CASE**

S. NUNES\* (Universidade de Brasília, Brasília, Brazil)

P. MIGUEL ANGELO(1), S. LUIS(1), M. ROCHA(1) - (1) Universidade de Brasília (Brasília, Brazil)

The Brazilian Public Authorities have been concerned about the accessibility of the Interstate Land Passenger Transport System - STRIP to elderly people. As a result, they have established a regulatory framework of measures to relieve the problem. However, the enacted measures don't always contribute to solve the problems they were meant to. Some measures are unacceptable because they make passengers with special needs go through embarrassing situations; others can make the STRIP unaffordable to low-income disabled riders. This type of flaw happens, among other reasons, because policy makers are not fully aware of how the proposed measures affect the accessibility of the system. This gap, in turn, is caused by the lack of knowledge of the factors that determines the STRIP accessibility; of the causality relations between the accessibility factors and the enacted measures and of the potency of the effects. Consequently, these factors hinder a coherent assessment of the accessibility measures. In addition, they lead to enacting ineffective regulations. This paper makes it contribution by studying the concept of accessibility to define assessment criteria for the accessibility measures for elderly peoples to the Interstate Land Passenger Transportation System - STRIP. These criteria aims to help policy makers revise the existing regulations and make more informed decisions on measures that are to be enacted. We will present a case study in which we assess Brazilian regulations against the defined criteria and then propose adaptations to the existing legislation. To achieve our objectives, five main methodological stages were undertaken. We took the following steps: a) revisited the theoretical concept of accessibility and identified its determining factors; b) defined criteria to assess accessibility measures c) identified enacted measures in the legislation; d) evaluated the accessibility measures comprised in the Brazilian legislation; e) proposed adaptations to the Brazilian legislation regarding the accessibility of STRIP to disabled peoples and peoples with restricted locomotion.

**PD6 850 COPING PROFILES AND PATTERNS OF THE ELDERLY LIVING ALONE IN JAPAN**

S. TAKEI\* (Sophia University Graduate School, Tokyo, Japan)

Y. SHIMIZU(1), M. SAITO(2), M. YAMAGUCHI(3) - (1) Sophia University (Tokyo, Japan); (2) Sophia University Graduate School (Tokyo, Japan); (3) Japan Lutheran College (Tokyo, Japan)

Introduction: According to the ecological perspective, which is the widely-accepted social work theory, social work needs are brought about through interaction of stressors against a person and his/her coping attitudes and behaviors toward them. Therefore, coping attitudes and behaviors are one of the most important aspects for social work assessment. The purpose of this study is to describe coping profiles of the elderly living alone and to break down them into several patterns. Methods: The subjects were 2,907 elderly who actually lived alone, randomly selected from residents' registration of Itabashi Ward of Tokyo. Home-visit structured interviews were completed for 1,391 elderly. The Brief Scale of Coping Profile which consisted of 18 items was utilized to asses their coping profile. Results: Six factors were elicited by factor analysis and named as follows: 1) changing mood, 2) changing a point of view, 3) avoidance and suppression, 4) active solution, 5) consulting with others, 6) emotional expression involving others. Cluster analysis was performed using the average of total raw score of each factor. The five clusters proved to be the best explanation for patterns of their coping. The characteristic of the first cluster is that the score of all factors were high. Those who belonged to the second cluster showed higher score regarding "active solution". The third cluster was characterized by higher score regarding "changing a point of view" and "avoidance and suppression". The score of "changing mood" is higher in the fourth cluster. As for the fifth cluster, the score of all factors were very low. Conclusion: These results suggest that social workers need to approach to the elderly living alone considering their own coping patterns. For instance, social workers should especially be supportive for those belonging to the fifth cluster because they rarely try to take any coping attitudes and behaviors.

**PD6 851 THE EARLY DIAGNOSIS OF ALZHEIMER DISEASE : HOW THE MEDICAL AND SOCIAL ORGANISATION GIVES A HELP TO THE GP ?**

E. CANDAS\* (Conseil général des Hauts-de-Seine, Nanterre, France)

D. LEMBEYE(1), S. GONIN(1), P. WINTREBERT(1) - (1) Conseil général des Hauts-de-Seine (Nanterre, France)

Introduction: The team of medical staff and social workers of the Conseil Général of the Hauts-de-Seine (CG92) visits each person applying for the Allocation Personnalisée Autonomie; they notice that many persons have cognitive troubles, with no diagnosis. The objectives of this work are to point out these patients to their General Practitioner (GP) and check out if they consult a specialist. Methods and materials: First, we organised sessions, under the authority of Pr Bruno Dubois, to inform the GP about psychometric tests and clinical characteristics of the Alzheimer disease and other dementia. Then, we informed the GP that we would use the IADLs test - besides AG-GIR - to point out the first signs of loss of the social link: the results of both IADLs and AG-GIR would be sent to them

afterwards. This work, named DPMA92, started in 2006 as decided by the Plan Gérontologique 2005-2010. Secondly, we gave the epidemiologic and statistic analysis of the whole population Pr JF Dartigues. Results: 4484 cases were registered during 2007: 20,0 % had a diagnosis of MA or other dementia, 38,3 % had signs of cognitive impairment. The first results of the inquiry to the GP showed that among the 38,3 %, 18 % attended a geriatric consultation: the diagnosis was confirmed in 10,8 % of cases, 2,1 % were not, and 5,1 % were still being assessed. 82 % of cases never contacted the specialist because mainly of the patient himself (19,4 %), or of his family (6,9 %) or of his GP (25,5 %). Conclusion: The aim of the Plan Gérontologique of CG92 was to increase the number of patients led to the specialized consultation. This study shows that the diagnosis is slowed down by the person itself or/and the family or/and the GP.

**PD6 852 WELFARE STATES AND QUALITY OF LATER LIFE - DISTRIBUTIONS AND PREDICTIONS OF QOL IN A COMPARATIVE PERSPECTIVE**

A. MOTEL-KLINGEBIEL\* (German Centre of Gerontology (DZA), Berlin, Germany)

L. ROMEU GORDO(1) - (1) German Centre of Gerontology (DZA) (Berlin, Germany)

Demographic transitions are a driver of social change and societal ageing influences the resources and chances in life of different age groups. As a contribution to the debate on (potential) results of the transformation of social security in ageing societies, the impact of social security systems on distributions of quality of life in later life is discussed. Three basic hypotheses are examined and thoroughly tested: the hypothesis of (relative) levels, the distribution hypothesis and the social structure hypothesis. The empirical investigation includes the following questions: How do levels of quality of life in later life depend on welfare state arrangements? Is the variability of objective and subjective quality of life related to welfare state arrangements? What is the relevance of social structure indicators for this variability and how is it related to old age security systems? What can be learned for the perspectives of current debates on equity and social security reforms? The analyses apply data from 12 countries. While most of them are included in the first wave of the international comparative research project SHARE, data for England come from the English Longitudinal Study of Ageing (ELSA). Descriptive analyses as well as multivariate models prove an interconnection between welfare state systems and quality of life indicators but not all three hypotheses can be fully confirmed. The analyses confirm the 'level hypothesis' for three out of four indicators applied. Analyses only partly back the 'distribution hypothesis' as well as the hypothesis of social structure effect can also only be partly confirmed. Finally, a basis for extended future analyses is outlined.

**PD6 853 RESOURCES, EVALUATIONS AND SOCIAL CONTEXTS - DIVERSITY AND INEQUALITY IN LATER LIFE IN A MULTI-LEVEL PERSPECTIVE**

M. ANDREAS\* (German Centre of Gerontology (DZA), Berlin, Germany)

O. HUXHOLD(1) - (1) German Centre of Gerontology (DZA) (Berlin, Germany)

Socio-economic status and resources and evaluations are pre-conditions for quality of life, autonomy and life planning in later life. The changing balance between age groups in ageing societies lead to a re-allocation of status, goods and positions - and therefore to a shift in inequality patterns. It also may lead to changes in trajectories into later life and new dynamics in later life courses. This is true for objective resources as well as for subjective evaluations and expectations of future dynamics. Both shape older people's behaviour in consumption and social participation but e.g. also influence retirement decisions, saving behaviour and social relations. These evaluations are connected to standards of comparisons on different societal levels. Hence, analyses must take into account the multi-level context of national points of reference as well as municipalities, neighbourhoods, social networks, birth cohorts and life courses. This presentation will, firstly, review the discussion on diversity and inequality dynamics in later life, discuss concepts and measures, and will, secondly, assess to what extent such dynamics in later life are effected by the dynamics of contexts. Empirical findings from multi-level analyses in a cohort-sequential and longitudinal perspective will be presented. Empirical analyses from prove independent impact of different context levels and their development over time on objective and subjective measures of economic well-being (and others) and its future development. This presentation will apply cross-sectional and longitudinal data from the German Ageing Survey.

**PD6 854 FAMILY CARE IN SWEDEN: POLICY, RESEARCH AND PRACTICE**

L. JOHANSSON\* (Nat Board of Health & Welfare, Stockholm, Sweden)

Introduction: In Sweden, care of the elderly is a public responsibility. Yet, family carers are the major providers of services and support for older people. Methods: The 1990s was the decade when the family was "re discovered" in elder care in Sweden. This promoted new policies and legislation to provide support for family caregivers. Research in family care has shifted direction from a pure descriptive to a more applied and interventionist approach. Further, service development has been stimulated through national grants to municipalities to develop and provide service support for family caregivers. Results: Family caregivers are now more visible and recognised. A growing 'carers' movement' is lobbying local and national governments to provide easily accessible, flexible and tailored support for carers. Problems with targeting, service coverage, and quality of supportive services prevails. Future challenging tasks are to reach working carers, diverse caregiver populations and to

integrate family carers into the health and social service system. Conclusions: The carers' issue continues to stay at the top of the social policy agenda. In general, lack of evidences regarding the effects of support to caregivers has hindered the development services so far. Then, to ensure that services for carers will be improved, additional state grants have been made available for service developments, research, developmental work and knowledge dissemination. However, the Swedish government is now in the process of instituting legal rights to support for carers, to be enacted in July 2009.

**PD6 855 LIVABLE COMMUNITIES FOR OLDER ADULTS: THE PERSPECTIVE OF OLDER ADULTS FROM PUERTO RICO**

N. LABAULT\* (Universidad de Puerto Rico/EGSP, San Juan, Puerto Rico)  
E. RUIZ CORA (1), M. OLIVER(1) - (1) University of Puerto Rico (San Juan, Puerto Rico)

Introduction: The present study ascertains the perspective of older adults in Puerto Rico on their communities, and identifies the challenges and prospects of the livable communities' model. Livable communities is a model of urban planning that assures that communities have the infrastructure that provides older adults access to the activities and services for successful aging. Methods: Three communities were selected that were over 30 years old, of lower middle-class socio-economic status, and had at least 25% of the population over 65. Three data collection strategies were used: key informant interviews; structured observation of external environments; and focus groups. Data was collected on the domains of the concept of "livable communities"; transportation, social and health services, pedestrian infrastructure, security, recreation and shopping. Data was also gathered on older adult's views of their community, its history and development, and the characteristics of communities for older adults. All data was triangulated to insure validity and explain inconsistencies. Results: Older adults define community on the basis of social relationships. The infrastructure of communities and different development trajectories have an effect on older adult's perceptions of the quality of social relations in a community and their ability to meet their needs. Some community developments, such as the commercialization of residential areas have brought mixed results, increasing access but raising other concerns. Other factors identified that affect perception and development of livable communities are: immigrating populations, and community organization. Conclusion: Our results indicate that besides the need for infrastructure, older adults perceive the need for meaningful social relations for a community to be "livable". Moreover, the different challenges present in the three communities studied suggest that the development of the "livable community model" needs to be tailored to the particular needs of the community under consideration.

**PD6 856 HETEROGENEITY OF DISABILITY AND ITS CONSEQUENCES FOR PROJECTING FUTURE CARE NEEDS OF OLDER CANADIANS 2006-2031**

J. LÉGARÉ\* (Mount Saint Vincent University, Halifax, Nova Scotia, Canada)  
J. KEEFE(1), P. CHARBONNEAU(1), J. DECARIE(1), J. LEGARE(1) - (1) Université de Montréal (Montreal, Canada)

Introduction: Our research examines multiple factors that contribute to projecting the numbers of the population who will have care needs and proposes different scenarios in recognition of the heterogeneity of disability. Method: Using the 2002 General Social Survey, logistic regressions estimated levels of disability and those with long term health problems. Seven activities (a)personal care; b)everyday housework; c)meal preparation; d)grocery shopping; e)household maintenance/outside work; f) transportation; and g) banking/bill paying were analyzed in 3 groups. Group 1 includes those receiving at least 1 of a-d; Group 2 received both 1 of a-d and 1 of e-g; and Group 3 received at least 1 of e-g. The parameters were applied at five-year intervals in Statistics Canada LifePaths microsimulation model to project future demand. Results: Results indicate that G2 is very different than the 2 other groups and likely the group on which subsidized home care programs will want to focus. For example, compared to G1 and G3, G2 has a higher proportion of females, less educated, older, more often widowed, with a higher degree of severity. In comparison, only 20% of persons in G2 have no disability (39 percent are severely disabled) compared to about half of people in G3 and 1/3 in G1. Hours of support is 10 times higher in G2 (10.3 hours/week) than either G1 or G3 (1 hour per week) reflecting the importance of including the heterogeneity of disability in projecting future needs of older persons. Conclusions: Findings suggest that in the short term the proportion of levels of disability may slow down but the absolute numbers of persons receiving assistance to remain in their home will rise. Understanding these projections of people needing assistance to 2031 by the type of assistance needed will facilitate the development of targeted chronic home care policies for the future.

**PD6 857 THE ARCHITECTURE OF THE GERIATRIC CLINIC OF HOSPITAL SÃO PAULO - UEGHSP.**

M. SPINOLA NAJAS\* (UNIFESP - Universidade Federal de São Paulo , São Paulo, Brazil)  
A. SATIRO DE SOUZA (1), A. ROMEIRO ALMEIDA PRADO(1), J. TONIOLO(1),  
S. MAYUMI KOMORITA(1) - (1) UNIFESP - Universidade Federal de São Paulo (São Paulo, Brazil)

Objective: to adapt the architectural project to the elderly user after a study of the premises of the Geriatric Clinic of Hospital São Paulo. Methodology: research study based on the qualitative method, whose subject was the relationship and meanings produced in the elderly individual's dynamics when interacting at UEGHSP. Personal data were collected through non-participatory and participatory observation. The researcher followed the routine of users, employees, multidisciplinary team and events that occurred at the clinic, observing behaviors and daily interactions. In the participatory observation, an open, semi-structured questionnaire was administered. Selection criteria: Users Inclusion - Being older than 60 years; Having well-preserved functional capacity; Having mobility, even if it is reduced; Being capable of answering the research. Exclusion - Being younger than 60 years; Having cognitive deficit; Being on a bed and/or without mobility in arms and legs; Having speech difficulties. Professionals Inclusion - Working directly with patients above 60 years who are hospitalized at the clinic. Exclusion - Not working directly with patients above 60 years who are hospitalized at the clinic. Results: The set of collected information showed the inadequacy of the space in meeting the elderly patients' needs. The inadequacies are: · Lack of space for circulation and health examination · Inadequate furniture · Lack of safety · Absence of cognitive and physical stimuli in the clinic Conclusions: The analysis of the collected data resulted in the design of an architectural project to adapt the premises. The need to adapt the current space of UEGHSP was confirmed, but the collected data showed that the perception of the spatial difficulties involves technical and safety issues, and the opportunity to socialize the user, independently of the physical premises' conditions. In the final proposal, the clinic's spatial limitation was considered determinant, and the resulting architectural project was adapted to this limitation.

**PD6 858 HOUSING ASSETS AND THE FUNDING OF LONG-TERM CARE IN ENGLAND**

J. MALLEY\* (London School of Economics and Political Science, London, United Kingdom)  
R. WITTENBERG(1), R. HANCOCK(2), D. KING(1), A. COMAS-HERRERA(1),  
L. PICKARD(1), M. MORCIANO(2) - (1) London School of Economics (London, United Kingdom); (2) University of East Anglia (Norwich, United Kingdom)

Introduction: In England debate continues about long-term care financing in the light of concerns about the sustainability and fairness of the current system. A controversial issue is how older people's housing assets should be treated in the means tests for public support with the costs of care. Currently, housing assets are considered with other savings and income when assessing an individual's means to pay for residential care. Many perceive this as unfair. Methods and materials: The study involved linkage between macro- and micro- simulation models of long-term care financing. The former comprises cell-based modules projecting the numbers of disabled older people, numbers of service recipients, and public and private expenditures. The latter simulates the incomes and assets of future cohorts of older people and their ability to contribute toward care costs, using data from the Family Resources Survey. Projections are made of future public expenditure on long-term care for older people in England under a range of potential reforms to treatment of housing assets for residential care. The impact of the changes on different sections of the income distributions is assessed. Gains and losses are measured as changes in users' disposable incomes after meeting care costs. Results: Projected public expenditure is higher under scenarios that disregard housing wealth. The level of increase in public expenditure depends on assumptions about the impact of the change on care home fees and how the policy is implemented. Immediate gains are above average for those in the middle income quintiles. Projecting into the future, gains would be greatest for those in the lowest 60% of the income distribution. Conclusion: The impact of options to disregard housing assets for residential care depends significantly on how the policy is implemented and the particular features of the older population.

**PD6 859 GENDER DIVERSITY IN MICROENTERPRISES OF ELDERLY WORKERS**

M. ODDONE\* (Universidad de Buenos Aires / CONICET/ FLACSO, Buenos Aires, Argentina)  
L. CHERNOBILSKY, N. MENDIZABAL

Introduction This paper is based on a research work carried out on elderly workers (45 years and over according to IWO) who face difficulties to re integrate into the labour market when they were expelled from it due to specific questions linked to their age ("ageism"). The basic question was to find out the keys of the success in microenterprises established after the Argentina's crisis in 2001 and managed by elderly workers. We asked what type of activity are they carrying out, who are their owners, how they emerge and perform interacting with the social, political and economic system, and what is their analysis of the present business situation. Methods and materials A qualitative study was carried out on successful microenterprises managed by male and female elderly workers, using the "case study" with the interview in depth and participating observation techniques in order to describe their characteristics and development phases. Results The results have allowed us to prepare a description of the interviewed organizations divided into: a) those established by the elderly workers themselves, and b) those established with the support of social policies -enterprises incubator. The cases analysis describes the Enterprising Development System that consists of stages: a) Gestation, comprising motivation, the

abilities acquisition, and the opportunities identification; b) Launching, taking into account the project's preparation and evaluation, and the resources organization; and c) Initial Development involving the entry into the market and the initial steps. In order to know the sustainability of the studied enterprises a SWOT analysis has been conducted so completing their assessment. Conclusion From the results, a set of recommendations is established to draw up social policies designed to favour the success of these initiatives, and the assessment of specific social policies for elderly female entrepreneurs (Woman's Bank, etc.) is presented.

**PD6 860 OLDER PEOPLE'S PERSPECTIVES ON THE CAUSES OF SOCIAL EXCLUSION**

L. DAHLBERG\* (Sheffield Hallam University, Sheffield, United Kingdom)  
T. BOWERS-BROWN(2) - (2) Sheffield Hallam University, Education and Humanities (Sheffield, United Kingdom)

**Introduction:** This paper presents data from a study examining how and to what extent older people are socially excluded, factors leading to social exclusion, and how social exclusion can be prevented/reduced. The data is drawn from the first qualitative phase of the study that explores the factors that older people report as causing social exclusion. **Methods and materials:** Older people were recruited within each of the five districts of Barnsley Metropolitan Borough, England, via networks established by Age Concern. All individuals recruited within a given district formed the membership of a focus group, with each of the five groups meeting on two separate occasions. A total of 40 older people participated. Discussions were guided by a topic schedule and analysed using the framework method. **Results:** Being active was seen as important for life satisfaction by all participants. However, not all participants were able to achieve a satisfactory level of activity and some reported being isolated and lonely. Contributing factors to low levels of activity were identified as depression, low self confidence and caring responsibilities. A minority of participants argued that lack of activity was the individual's own fault. Analysis identified factors linked to social exclusion in general: deterioration in community spirit; fear of crime; life changing events such as retirement and widowhood; frailty; poor finances; transport; and accessibility including the physical environment. **Conclusion:** There was a consensus among older people that being active is central to preventing social exclusion. The data suggest a model of social exclusion in which many of the factors identified as related to social exclusion may act on an individual's quality of life primarily through their effects on social activity levels. This model will be tested in the next stage of the study, a questionnaire survey of 1,200 older people in Barnsley.

**PD6 861 TESTING THE CAPACITY FOR CULTURAL CHANGE IN IRISH PRIMARY CARE**

F. MARKEY\* (Dundalk Institute of Technology, Dundalk, Ireland)  
L. CARRAGHER(1), D. GETTY, R. BOND - (1) Dundalk Institute of Technology (Dundalk, Ireland)

**Introduction** Recent Government policies have placed an increased emphasis on more social, person centred models of care within a community setting. This focus on care in the community is influenced by current demographic predictions which suggest an increasing demand on in-patient health services resulting from increasing longevity and instances of chronic illness within the population. The Irish Primary Care Strategy - A New Direction (2001) promotes the idea of a team-based approach to achieve better co-ordination and integration across the system based on the creation of multi-disciplinary primary care teams. This objective is still in its infancy, with entrenched cultural differences linked to professional boundaries continuing to present challenges. Given the dominance of the medical model in shaping approaches to care in Ireland, this ongoing doctoral study is concerned with the capacity for culture change in Irish primary care. It aims to examine the values, attitudes, beliefs and artefacts of a pilot multi-disciplinary home support team delivering care to community dwelling older people. In integrating theories of organisational culture, Schein's (1992) model of organisational culture is employed as a theoretical fulcrum. **Methodology** A phenomenological methodology is employed, involving in-depth interviews with team member and recipients of care, focus groups with home care workers and observations of team working. **Results** Preliminary analysis suggests that the intervention and control groups share understandings and values of person centred care but not empowerment. Care attitudes that are person centred and reflect empowerment of client and carer worker are more obvious in the intervention group data than the control group. **Discussion** Shared ideological cultures aspiring to person centred care and empowerment do not necessarily manifest as shared cultural attitudes. Positive person centred and empowered attitudes motivated by shared beliefs and values may be inhibited by traditional, inflexible, top down health care structures and funding pressures.

**PD6 862 SOCIAL AND SUPPORT NETWORKS OF RURAL SENIORS IN CANADA**

L. WEEKS\* (University of Prince Edward Island, Charlottetown, Canada)  
N. KEATING(1), R. STADNYK(2), J. SWINDLE(1) - (1) University of Alberta (Edmonton, Canada); (2) Dalhousie University (Halifax, Canada)

**Introduction:** Most research examining the networks of older adults is conducted in urban areas or on the general populations of older adults, providing little insight into the

experiences of rural seniors. It is unclear whether rural places provide strong connections and essential support to older adults. We examined the social networks and the networks that that provide everyday support for older rural Canadians, focusing on the extent to which they meet social and support needs. **Methods:** Data from a national telephone survey of older adults living in rural communities in Canada, stratified by age group and sex, formed the basis of this analysis (n=1,312). K-means cluster analysis resulted in the development of a typology of support network types. **Results:** While social networks ranged from 1-29 (M=9.4) members, support networks ranged from 1-12 (M=3.3) members. Several social networks characteristics (i.e. size, age and proximity) were related to receiving support. Cluster analysis revealed that 9% had very small support networks, receiving support primarily from a spouse. Others received support from very specific groups of people, such as primarily female children (20%), or primarily male non-kin (19%), while the remainder received support from larger and more varied networks. However, 15% of the older adults did not have anyone in their support network, some of whom exhibited advanced age, poor health, and a lack of financial resources. **Conclusions:** The results indicate that great diversity exists in the social and support networks of rural Canadian seniors. While the vast majority of older rural adults have a social network that has support potential, they differ considerably in access to a network that provides support for everyday needs. As rural communities can range from being highly supportive and caring to socially isolating, this research helps to deconstruct the idea of the universal supportiveness of rural communities.

**PD6 863 DOUBLE JEOPARDY OF INCOME SUPPORT PROGRAMS FOR THE FEMALE SENIORS: A FEMINIST EVALUATION OF JOB PROVISION PROGRAM FOR THE AGED IN SOUTH KOREA**

H. BORAM \* (Pusan National University, Busan, Republic of Korea)  
A. BOO(1), S. KIM(1) - (1) Pusan National University (Busan, Republic of Korea)

South Korea has since the late 1990s various kinds of income support programs for the seniors. Job Provision Program for the Aged is an income support program that is regarded as an affirmative tool to integrate the seniors into society in both terms of purchasing power and time/space-appropriating capacity. Considering the longer life expectancy and the higher poverty rate among the female seniors, income support programs for the seniors should be gender-sensitive. The purpose of this paper is to examine the extent to which the job provision program accommodates the needs of the female seniors for those ends. Based on observation and questionnaire and in-depth interview, this paper argues that the Job Provision Program contributes little to Korean female seniors, due to the lack of durability and the space-segregating nature of the jobs provided with women seniors, in addition to the lack of consideration of female seniors' health and life-time career. This paper also finds that women in rural regions are disproportionately excluded from the program, due to the lack of accessibility and affordability.

**PD6 864 EFFECT OF OPORTUNIDADES ON VACCINATION COVERAGE OF MEXICAN RURAL ELDERLY LIVING IN POVERTY**

A. SALINAS-RODRÍGUEZ\* (National Institute of Public Health , Cuernavaca, Morelos, Mexico)  
B. MANRIQUE-ESPINOZA (1), R. PÉREZ-NÚÑEZ (1), M. MOJARRO-ÍÑIGUEZ(1), E. SERVÁN-MORI (1), M. TÉLLEZ-ROJO (1) - (1) National Institute of Public Health (Cuernavaca, Morelos, Mexico)

**Introduction:** Oportunidades is an incentive-based poverty alleviation program which eligibility was determined in 2 stages, first by identifying low-income communities and then by choosing low-income households within those communities. Recently a component, consisting in cash transfers for the elderly conditioned to preventive utilization, was added. To estimate the independent contribution of Oportunidades on the coverage of rural elderly living in poverty for three different vaccines, an analysis of the 2007-Oportunidades Evaluation Survey (ENCEL-2007) was conducted. **Methods and materials:** ENCEL-2007 is a faced-to-faced survey carried out in households from 741 rural communities (<2,500 inhabitants) of 13 Mexican states. For the first time the evaluation included data regarding people  $\geq 65$  to evaluate the Oportunidades effect on this specific group of age. Dependent variables were self-report of coverage for Tetanus, Pneumococcal and H.Influenzae vaccination. Through logistic regression analysis, propensity of being beneficiary of Oportunidades was estimated to control for potential selection bias. Participants were matched, using genetic matching, on different characteristics found associated. Using the matched data multivariate logistic regression analyses were estimated to evaluate the effect of the Program. **Results:** 12,146 elderly were surveyed. Vaccination coverage was 76%, 48% and 44% for Tetanus, Pneumococcal and H.Influenzae respectively. Indigenous population, non-insured and elderly living with functional dependence have lower coverage rates. Oportunidades increases the probability of been covered with the three vaccines, although only for Tetanus was statistically significant after matching. Having one or two of the other vaccines, substantially increases the probability of been vaccinated with the third one. This is the case for all three vaccines. This could be result of an adequate promotion work at the facilities although highlights potential access barriers to the first contact. **Conclusion:** Some social inequalities are evident since coverage tends to be lower in even more vulnerable groups. Although

Oportunidades seems to have positive effect on vaccination coverage, low coverage rates and inequalities evidenced are invaluable information for policy-makers.

**PD6 865 FACTORS INFLUENCING THE ACCEPTANCE OF SERVICES PLANNING BY CARE MANAGERS AMONG COMMUNITY DISABILITIES.**

L. CHEN\* (Institute of Health Policy and Management, College of Public Health, National Taiwan University, Taipei, Taiwan)  
S. WU(1), H. HSIUNG(2) - (1) Institute of Health Policy and Management, College of Public Health, National Taiwan University (Taipei, Taiwan); (2) Chang Gung Institute of Technology, Department of Nursing (Tao-Yuan County, Taiwan)

Care management has been introduced into the long term care system and care managers have performed practical tasks, such as assessment needs, care planning, implementation of services, monitoring and evaluation. Because client-oriented service is the basis of care management, it is not all service which care manager planned was accepted by the client. The purpose of this study was to identify which factors influencing the acceptance of services planning by care managers. Data pertaining to 985 disabled was collected in a baseline of case assessment and program evaluation of Chia-Yi City selected for the Pilot Program for Long Term Care Development. 48.4% of the community disabilities used one of these services planning by care managers. Results of logistic regression analyses indicated that eligible for government support program, living arrangement, severity of functional disability, awareness of services demand and whether the caregiver having any one IADL have shown significant influence the acceptance of services planning by care managers after controlling a gender, age, education, marriage status, number of chronic conditions, cognitive impairment, relationship with caregiver, care burden and ability of care manager. Our findings implied that policy should pay more attention to the acceptance of services planning by care managers among community disabilities with different sociodemographic status, and develop well-training program for care managers in response to the growing disabled population in Taiwan.

**PD6 866 MATERIAL SECURITY AND INTERACTING SOCIAL BEING: THE CASE OF 'HARD TO REACH' ELTERS IN HONG KONG**

V. LOU\* (The University of Hong Kong, Hong Kong, Hong Kong)  
C. WONG(1) - (1) The Chinese University of Hong Kong (Hong Kong, Hong Kong)

Introduction: During the aging process, it is believed that keep being interacting social beings would promote subjective well-being of the elders, and also help them cope with life stress. In 2008, the Hong Kong government initiated proactive outreach services targeting 'hard to reach' elders. This study aims to examine material security and interacting social being of 'hard to reach' elders in Hong Kong. Method: Qualitative method was adopted by using in-depth interview. Semi-structured interview guideline was developed that focused on whether s/he was depending on social security; objective and subjective indicators of social being (e.g. social network, living arrangement; social support and loneliness). Social service agencies that provide outreach services for the 'hard to reach' elders helped recruiting respondents. After obtaining informed consent, a total of ten elders were successfully interviewed by trained interviewers. The interview processes were recorded and transcribed for data analysis by using NVivo. Results: Concerning material security, it was found that all of the interviewees were depending on certain types of social security (e.g. Comprehensive Social Security Assistance or Old Age Allowance) at the time of the interview. However, they were either living alone or living with their spouse only; they reported having very limited social network including family, peers and neighbourhood network. Their subjective evaluations of life were also unsatisfactory – they felt lonely, being neglected by the society, and experienced low life satisfaction. Among the ten respondents, four of them reported that they experienced positive gain after receiving interventions from the social service agencies. Conclusion: While material security could help fulfill basic needs of those who depend on it, 'hard to reach' elders had difficulties to keep being interacting social beings. Proactive outreach services seemed helpful for some of the 'hard to reach' elders, which had policy implications.

**PD6 867 EDUCATION, WORK HISTORY, AND DYNAMICS OF POVERTY: A LONGITUDINAL ANALYSIS OF OLDER ADULTS IN JAPAN**

K. HARADA\* (Jissen Women's University, Hino, Tokyo, Japan)  
H. SUGISAWA(1), Y. SUGIHARA(2), H. SHIBATA(1) - (1) Graduate School of J.F.Oberlin University (Japan); (2) Tokyo Metropolitan Institute of Gerontology (Japan)

Introduction: The risk of poverty among older Japanese and the effects of educational attainment, work history and life events on the experience of poverty was investigated over a 6-year period. Methods: Data were obtained from a national probability sample of 2,533 men and 1,440 women aged 55 to 64 that were conducted in 1999. Follow-up surveys of this sample were conducted in 2001, 2003, and in 2005. Multinomial logistic regression analyses were used to identify the correlates associated with the experience of poverty. A man and a woman living together was defined as poor if their annual income was less than 1.2 million yen (1 Japanese yen = approximately 0.01 U.S. dollar in 2005). Results: The poverty rate was 4.0% among men, 7.6% among women in 1999. Over the 6-year period, 13.6% of men and 26.4% of women experienced at least one spell of poverty.

Participants who had higher educational attainment were less likely to become poor, and the longest-held occupation had a significant effect on the probability of becoming poor. During the survey period, male participants who became unemployed and participants who became widowed were more likely to move into poverty. For women also, the spouse's longest-held occupation was associated with the probability of becoming poor. Conclusion: The longitudinal analysis indicates that a larger percentage of the elderly population is subject to the risk of poverty over the lifetime than has been suggested by cross-sectional data. Our results show that stratification established early in the life course, such as education and occupational status, affects the risk of becoming poor in old age.

**PD6 868 HEALTH AS A DETERMINANT OF PENSIONERS' WEALTH IN RUSSIA**

J. LEZHNINA\* (State University Higher School of Economics, Moscow, Russian Federation)

After retirement Russian pensioners suffer from the declining of standard of living as Pension system cannot ensure a dignified old age. Pensioners themselves cannot solve this problem because of bad health: their health requires extra costs and constrains labor activity as a source of revenue. The empiric base includes: • Russian Longitudinal Monitoring Survey, panel research, 2005-2007 (more than 12000 respondents every year); • pan-Russian surveys "Social policy and social reforms", 2006 and "Needy people in Russia", 2008 hold by IS RAS (nearly 2000 respondents each). According to the results: - elderly population has worse health than the rest of Russians, for example, it has various chronic diseases much more often (heart disease - three times more often); - Russian pensioners' health is much worse than the health of their peers from the developed countries (widespread in the world method to assess the public health Euro-Quol (EQ-5D) was used along with other methods): in Great Britain 36.5% of people aged 61 are healthy, in Russia - 8.2%; - pensioners' social feeling is also bad and has a negative impact on health. - State Pension system is ineffective: • formal level of disability does not reflect reality: one third of bedfast has no status of disable; • state payments do not allow to pay for medical care in case of necessity. - pensioners cannot solve these problems themselves because: • poor health (especially heart disease) restricts their activity; • on the labor market older professionals face discrimination and unskilled workers – hard working conditions that worsen their health. So situation with health of retirees in Russia is much worse than in European countries and it has a great impact on economic situation of pensioners. Social policy for this social group must be based on not only Pension system, but also Health system.

**PD6 869 PHENOMENOLOGICAL STUDY ON THE EMPLOYMENT EXPERIENCE OF PRE-ELDERLY WOMEN IN KOREA**

M. KIM\* (Graduate School of Social Welfare, Ewha Womans University, Seoul, Republic of Korea)  
H. SUH(2), M. SEO(3) - (2) Graduate School of Social Welfare, Hallym University (Chuncheon, Gangwon-do, Republic of Korea); (3) Graduate School of Social Welfare, Ewha Woman's University (Seoul, Republic of Korea)

Introduction Elderly women takes important place in Korean welfare. Expressively women in 50's so called pre-elderly face the critical period demanding preparation for their older life through getting a job. This study purposes to understand their employment experiences which they have undergone in personal, family and social context with the emic perspective. Methods and materials To understand their complicate experiences, this study uses phenomenological research method by a snowball sampling. Eight women in 50's interviewees who have experienced newly employed status within a year regardless of their occupations and careers are selected. Data are collected through 2 or 3 times in-depth interviews with each individual of which takes one and half hours per session. Results Pre-elderly women's employment experience consists of a set of process and constituents, 1) the moment to decide to get a job – 'I, myself decided after careful consideration,' 2) job seeking and getting process- 'doubt and grave' in their abilities and careers. 'being barricaded' in the society, 3) workplace experience – overcoming hardship feelings and trying not to be told, "You don't act like it" from her young boss, 4) meanings of work and life - harmonious life, dignity of her life, appreciation her health enough to work, not to rely with her adult children. Employment experience of pre-elderly women seem to brighten women's dim future which will be outreached their long older life. Conclusions Policy implications are suggested. First, the importance of pre-elderly women's employment can be emphasized for the aged welfare with the women's life course perspective. Second, job agencies and education programs for the aged or for women should provide more gender-sensitive, integrated services in the communities. Third, labor market policy should support equal opportunities for pre-elderly women without discrimination by sex and age.

**PD6 870 FUNCTIONS OF THE INSTITUTIONS FOR ELDERLY PEOPLE IN POSTWAR JAPAN**

M. NAKATA\* (NIHON FUKUSHI UNIVERSITY, Sapporo, Japan)

Welfare systems in Japan have started as one of assistances for needy persons. They have acted as safety nets for them. It is said that the welfare institutes as safety nets have been

weakening gradually. In this study, functions of the present welfare institutions and policies for elderly persons are looked back and their challenges for the future are examined. Statistical materials concerning nursing homes, the long-term care system, and old care receivers, which are published from Ministry of Health, Labor and Welfare and Japanese Council of Senior Citizens Welfare Service, are used in this study. And I considered the transitions of the policy concerning elderly people and institutions for them. The elderly people institutions have been rapidly provided with progress in aging after the 1970s. After the 1980s, many varieties of the institutions have emerged and they could have responded to the every kind of needs of elderly people. The long-term care insurance system was installed in 2000, and cares for the older began to provide from not only the public facilities but also the private organizations. Welfare institutions have become more diverse through elimination of unnecessary regulations at the installation of the long-term care system. After that, by the reinforcement of benefit principle, the poor have been hardly able to receive welfare services. New kinds of welfare institutions have established by the needs for care, medical services and living. A lot of kinds of welfare institutions that have different ground have coexisted and so they have?had differences in management and equipments. Inclusive social work services are important to avoid a relocation effect. And special elderly nursing homes exist as retirement homes. But as the facilities that people stay in the end of life, the regulations that the nursing home can have cooperation with medical agencies are needed.

#### **PD6 871 METHOD OF EMPATHY BASED STORIES IN GERONTOLOGICAL NURSING RESEARCH**

M. VUOTI\* (University of Oulu, Kempele, Finland)

A. ISOLA(1), P. KINNUNEN(2) - (1) University of Oulu (Oulu, Finland); (2) University of Lapland (Rovaniemi, Finland)

**Introduction:** In the future there is more people who are living into old age than at any time in past. Population ageing is seen as major force transforming at various level like in health and social care services and in society as a whole. **Method and materials:** Method of Empathy-based stories in this research produces stories about future and future aging. The respondents received orientation and a script to assist them in the writing essays or stories following instruction given by the researcher. Instructions have the temporal perspective of the stories focused on the future, in year 2030. The idea of this method based in variations. In other words, one or two central elements in the script are purposefully varied, but the main structure of the script is maintained the same. The stories were analyzed qualitatively by categorizing the responses by themes. In this research respondents are Finnish baby boomers who were born between 1945 and 1950. This generation was exceptionally large and that kind of phenomenon haven't been seen before or after in Finnish history. Respondents consisted of 5 Members of Parliament, 23 municipality or city persons who are elected to a position of trust and 12 ordinary baby boomers. **Results:** Respondents described what aging means for them and what brings happiness, healthiness and well-being to them when they will be old. They also have written about the future society, social and health services and other services, community, networks and technological developments. **Conclusion:** As a research method, method of empathy-based stories produced very rich material about possible futures and images of the future. It also produced signals about new aging culture and model. In this research method produced themes, which are used to planning to design more comprehensive study by a quantitative method.

#### **PD6 872 GERIATRIC AND PSYCHOGERIATRIC CARE PROGRAMME: SHARING EXPERIENCE**

M. LUSSIER\* (CHU La Milétrie, Poitiers, France)

R. BEGUE(1), J. PORCHERON(1), C. PRADERE(1), S. VALERO(1), I. MERLET-CHICOINE(1), I. MIGEON-DUBALLET(1), C. CORNILLON(1), M. PRINER(1), J. POUPET(1), M. PACCALIN(1) - (1) CHU La Milétrie (Poitiers, France)

In the context of hospital reforms initiated since 2005 with a great number of laws and a high level of needs in the geriatric fields, the Geriatric Department of the University hospital of Poitiers has developed a geriatric care organisation to offer a more efficient access to the health care system for the general practitioners (GP) and the elderly. The project was to set up geriatrics structures correlated to the loco-regional needs. The plan care was built to consider patients inside the hospital, home care and focused on psychogeriatrics solutions. The first step inside the hospital was to improve the geriatric assessment in the emergency room, and to evaluate the appropriate number of acute care beds and rehabilitation care beds. The second step was to adapt the consultations to the main geriatric medical problems: dementia, falls, pressure sores. To improve the accessibility, a specific phone number was created to facilitate the contact with the GP. To ensure the continuity we formalized process with different stakeholders as psychiatric hospital, council of community and the regional agency for the hospitalisation. In conclusion we will share the necessary tools for the implementation, the limits and the point of development in the future.

#### **PD6 873 FEAR OF CRIME AMONG THE ELDERLY: THE INFLUENCE OF VULNERABILITY BEYOND PHYSICAL HEALTH**

L. DE DONDER\* (Free University of Brussels (Vrije Universiteit Brussel), Brussels, Belgium)

D. VERTÉ(1), N. DE WITTE(2), T. BUFFEL(1), S. DURY(1) - (1) Free University of Brussels (VUB) (Brussels, Belgium); (2) Hogeschool Gent Vesalius (Brussels, Belgium)

The concept of diversity within the older population has long been a popular idea in gerontology to counter ageist discourse. One of these systematic stereotypes is 'elderly being petrified by an irrational fear of crime' since early studies show that elderly display the highest levels of fear of crime and the lowest levels of victimization. The aim of this study was to question whether and how differences in the extent of fear of crime among older persons occur. The paper starts with extending current theoretical notions on vulnerability beyond the usual physical frailty and we suggest that feelings of vulnerability should not be seen in isolation from other daily insecurities. A sample of 46,989 Belgian elderly were interviewed on numerous indicators. In multivariate regression analyses the influence of vulnerability (financial resources, marital status, loneliness, housing problem and need for mobility assistance) on fear of crime was measured. In a first phase the analysis was employed on elderly in general, whereas subsequent analyses were performed on different age groups (60-69, 70-79, 80 and over). Analysis of the total sample yielded that loneliness and physical health produce the most significant effect on fear of crime. Furthermore, mobility problems and limited financial resources increase fear of crime significantly. Housing problems and marital status did not contribute to the global regression model. Analysis on the different age groups identifies that need for mobility assistance has only an impact on fear of crime for respondents between 60 and 69 years old. For those aged 80 and over, housing problem becomes an extra indicator of fear of crime. Findings revealed the importance of a broad definition of vulnerability in research on fear of crime. Different predictor sets, however, were noted for different age groups. Diversity among elderly is thereby related both with vulnerability as with age.

#### **PD6 874 DELAYED HOSPITAL DISCHARGE: POLICY SOLUTIONS, IMPLEMENTATION STRATEGIES AND PRACTICE; AND IMPACT ON OLDER PEOPLE'S TRAJECTORIES THROUGH ACUTE CARE.**

M. GODFREY\* (University of Leeds, Leeds, United Kingdom)

**Introduction** The 'problem' of delayed hospital discharge in the UK is identified as a system level issue: leading to inefficiencies in acute bed usage; reflecting inter-organisational boundary disputes between health and social care and between acute and community services; and contributing to poor patient outcomes. It assumes current significance because of the re-shaping of acute care: the designation of hospitals as settings where specialist diagnosis and high technology treatment is provided to acutely ill patients. **Methods** The paper draws on a recently completed comparative, multi-method case study of the implementation and impact of two different approaches to tackling delayed hospital discharge in England and Scotland; the former borrowing from policy initiatives adopted in Scandinavian countries that applied financial sanctions directed at social care partners to reduce 'delays'. The aims were to examine policy implementation processes; assess their effect on inter-organisational relationships, service development and practice to reduce delays; and on the experiences and outcomes for older people, at risk of, or subject to delay. Data gathering methods included: the collection and analysis of documents; interviews with strategic and operational managers in health and social care (n=56), with patients (n=68), operational staff responsible for their care/discharge planning (n=132), informal caregivers (n=40); and observation of decision-making and practice. Patients and caregivers were followed up around six months after the first interview. **Results and Conclusions** The paper considers two linked sets of findings: first, the impact of 'carrots' and 'sticks' as policy drivers on the construction of 'delays' and on organisational and behavioural change to manage them; second, the impact of policy on older people who are 'delayed', the contexts in which 'delays' occur and the implications for acute care organisation of managing treatment and care of very old people with multiple health and co-morbid problems in the last years of life.

#### **PD6 875 GENERATIONAL HABITUS AND MEASURING THE MATERIAL DEPRIVATION OF OLDER PEOPLE**

D. PRICE\* (King's College London, London, United Kingdom)

**Introduction** Poverty is a contested concept but there is wide consensus that it reflects those who lack the financial resources to participate in the norms and customs of everyday life. 'Material deprivation' measures come closest to operationalising the complexity of the experience of poverty, and are of increasing importance in Europe. These measure the extent to which people have or participate in a prescribed list of material items and social activities, and the reason for any non-participation. Contrary to expectation, over 65s tend to emerge from these measures as less deprived than other age groups. As material deprivation measures gain political currency across Europe as formal poverty measures for policy making purposes, it becomes important to assess the extent to which they are accurately capturing the deprivation of older people. **Methods and Materials** The Family Resources Survey is an annual household survey of approximately 24,000 UK households. This paper uses multivariate logistic regression analysis of the FRS 2005/6 to investigate three possible explanations for the finding that older people emerge from these measures as less deprived: (i) Older people are genuinely less deprived, (ii) age differences are caused by 'generational habitus' (Gilleard and Higgs, 2002), or (iii) caused by the internalisation of poverty (dissonance theory). **Results and Conclusions** The results suggest that older people's measured lower material deprivation is driven by generational differences in the

ways questions are being answered. Relying on material deprivation measures in policy making will lead to the needs of older people not being identified. Further, deprivation measures might show the older population getting poorer over time, reflecting the tendency of younger generations to view their circumstances as more deprived rather than any decline in objective standards of living. Gillear, C. and Higgs, P. (2002) The third age: class, cohort or generation, Ageing and Society, 22: 369

**PD6 876 MOTIVES TO REALLOCATE IN OLD AGE. FINDINGS FROM THE BELGIAN AGEING STUDY.**

N. DE WITTE\* (University College Ghent, Ghent, Belgium)  
D. VERTÉ(1), L. DE DONDER(1), T. BUFFEL(1), S. DURY(1) - (1) Vrije Universiteit Brussel (Elsene, Belgium)

**Introduction** The widely used concept of 'ageing in place' has achieved great popularity among academics, social policy makers and health care providers. Several studies indicate that ageing at home, without changing residence, is the older peoples most preferred strategy, even when they are in need of care, have economic difficulties or live in inadequate houses or deprived areas. Different authors suggest that ageing in place is an ambiguous position, signifying rootedness as well as rigidity. In this paper, we examine the motives for reallocation among older people. Both push-factors or conditions that drive people to leave their homes as well as pull-factors of the new environment are addressed. **Methods and materials** For these analysis we used the data collected from the Belgian Ageing Study (N=46989) in over 100 municipalities in Flanders, Belgium. Results Overall, exactly 14.4% of the elderly stated they've reallocated during the past ten years. The main reason to reallocate is a pull-factor; the prospect of a better environment. Health (27.9%) and housing problems (24.5%) are the second and third most important motive. New facilities in the area (18.5%) and not willing to rely on their children (17.6%) complete this top five. Furthermore, our findings indicate that motivation changes with age. Elderly aged 70-79 are more motivated because of the new facilities (22.5%). Not willing to rely on their children varies from 19.0% for the elderly 70-79 to 21.0% for people aged 80 and over. The latter group also state that feelings of loneliness are important to reallocate (19.4 %) Conclusion As found in the literature, only a small percentage of elderly reallocates in later life. Most elderly prefer staying in their own house. The motivation to move varies for the different age groups, suggesting a differentiated policy is appropriate.

**PD6 877 50+ FOR 50+, EXCELLENT SENIOR CARE**

K. KNIPSCHEER\* (Vrije Universiteit, Mook, The Netherlands)  
M. ZIEKEMEYER

**Introduction** Excellent Senior Care is the name of a Dutch experimental project special for 50+ people who are working or want to work in a nursing home for elderly care. Three main reasons: 1. it will upgrade the ambiance in the nursing home, 2. it offers jobs to women over 50, and 3. it contributes in the dealing with the shortage of personnel in the care homes. Through a Dutch Plus- Magazine we checked the availability of persons over 50 willing to work in care homes. We conducted also a pre study in the selected care home to see if and how a 50+ pilot for a special ward/division is realizable. We concluded that it is, under special conditions. These are: \* A special way of the designing the care-work, with special focus to the physical part of the work as well as the special senior qualities in this situation, \* A durable designed work setting, \* And the availability of an appropriate team of consultants in pilot process, \* giving sufficient room to the 50+ expertise which may give additional joy and internal satisfaction. **Methods and materials** 50+ Job Profile - For the sake of the project the AgeProof Agency has designed a special 50+ job profile and 50+ job description, where in we combined tasks of three care jobs and took all these aspects into account. The pilot study was funded in October 2008 by the Dutch government and the introductory period has started in December 2008 and the pilot period will run up to December 2010. During the pilot period our basic material will be outcomes of regular participant observations, diaries of the 50+ carers/nurses. In addition we will administer in the beginning, halfway and at the end the Work Ability Index. Also costs and revenues will be examined. Results In July we plan to report our first results about the implementation of the pilot study, the recruiting of the 50+ personnel and about the satisfaction of personnel and clients in the care home. Conclusion In July we hope to give some provisional conclusions

**PD6 878 ELDER ABUSE AND INDEPENDENT ADVOCACY - DEVELOPING RESEARCH, POLICY AND PRACTICE IN ENGLAND**

A. DUNNING\* (Swansea University, Swansea, United Kingdom)

**Introduction** There has been growing recognition of the need for independent advocacy to represent the rights, choices and interests of otherwise vulnerable older people in the UK. The author draws upon work undertaken as part of an exploratory research and development project initiated by the Older People's Advocacy Alliance UK. The broad aims of the project were:- 1. To obtain a better understanding of the impact of advocacy on elder abuse. 2. To explore the relationships between advocacy organisations and statutory safeguarding bodies. 3. To identify best practice in order to inform policy and practice. **Methods and Materials** A variety of methods and materials were employed, including:- 1. A review of academic research, official reports and "grey" literature. 2. Questionnaires

completed by advocacy workers in 13 advocacy organisations. 3. Group meetings and reflective practice sessions with advocacy workers. 4. Follow up telephone interviews with 6 advocacy organisations. **Results** 1. Most advocacy organisations are working closely with older people who have been subject to physical, psychological, financial and sexual abuse and neglect. 2. The goals identified by the older person and the advocate have been achieved in most cases. 3. Advocacy organisations may have an ambivalent relationship with statutory safeguarding bodies. 4. There can be significant ethical, political and practical dilemmas for advocates in this field, which calls for more guidance and support. **Conclusions** 1. There is a need for more research to explore the advocacy process as well as outcomes and the direct views of older people themselves. 2. There is a need for policy makers to make provision for advocacy for older people who fall outside the current statutory framework. 3. There is a need for advocacy practitioners to have greater opportunities for reflection, learning and support in working with elder abuse.

**PD6 879 THE EFFECTS OF HUMAN CAPITAL AND SOCIAL CAPITAL ON THE PERCEPTION OF THE IMAGE OF ELDERLY PEOPLE**

J. SEOMUN\* (Kangnam University, Young-In, Kyunggi-Do, Republic of Korea)  
J. LEE(1) - (1) Kangnam University (Young-In, Republic of Korea)

**Introduction:** The purpose of this study was to examine the effects of human capital and social capital on the perception of the image of elderly people. The elderly need to perceive the positive image of elderly people in order to achieve the elderly development task successfully. **Methods and Materials:** Data of "the 2004 national elderly people conditions and welfare needs survey", which was executed by Korea Institute for Health and Social Affairs, were used. The number of the elderly respondent was 2,638. The human capital was measured by the status of education, health, income, employment. The social capital was measured by trust status(the number of neighbors and friends to give counselling) and network status(cohabitant spouse, number of emergence contacts, frequency of come-and-go with acquaintances). The image of elderly people as subordinate variable was measured by healthy, intellectual, emotional and economic images. The logistic regression was used to analyze the effects of human capital and social capital as independent variables on the perception of the image of elderly people. **Results:** Results of this study showed that health status (Exp(B)1.733), economic status (Exp(B)1.110), number of neighbors and friends to give counselling (Exp(B)1.024), cohabitant spouse status (Exp(B)1.225) and frequency of come-and-go with acquaintances (Exp(B)1.104) had statistically significant effects on healthy image. Health status (Exp(B)1.319) and frequency of come-and-go with acquaintances (Exp(B)1.136) had statistically significant effects on intellectual image. Health status (Exp(B)1.448), economic status (Exp(B)1.146), number of neighbors and friends to give counselling (Exp(B)1.041), cohabitant spouse status (Exp(B)1.255), number of emergence contacts (Exp(B)1.030) and frequency of come-and-go with acquaintances (Exp(B)1.083) had statistically significant effects on emotional image. Health status (Exp(B)1.413), economic status (Exp(B)1.196), employment status (Exp(B)2.184), number of neighbors and friends(Exp(B)1.068), cohabitant spouse status (Exp(B)1.574) and frequency of come-and-go with acquaintances (Exp(B)1.109) had statistically significant effects on economic image. **Conclusion:** This study revealed that as the status of human capital and social capital was increased, the perception probability of the positive image of elderly people was increased.

**PD6 880 AGEING AND POLICY RESPONSES : CHANGES AND CHALLENGES CREATING A GERO-INFORMATICS IN SOUTH KOREA**

E. KIM\* (College of Medicin, Pochon CHA University, Gyeonggi-do, Republic of Korea)  
W. JUNG(1) - (1) College of Medicne, Pocho CHA University (Gyeonggi-do, Republic of Korea)

As an inevitable consequence of this demographic transition to increasing longevity and decreasing fertility, South Korea(hereafter Korea) is undergoing a rapid aging process. The impact of the growing number of elderly people has become a dominant social concern in Korea, particularly in relation to issues of security and well-being. In order to fulfill the needs and expectations of the growing numbers of elderly people in Korea and to overcome the problems associated with later life especially ill-health, considerable debates have emerged in terms of welfare services and health systems for elderly people. Korea indeed has been forced to develop new attitudes towards old age and new ways of providing welfare services for the elderly, due not only to the increasing numbers elderly people but also because of societal change such as changing family structures. Influenced by these aspects, Korea has concerned on the development of policy for elderly people and finally established 'Long-term Care Security System'. However, much of the interest related to establishing health policies and provisions for elderly people does not embed these concerns within the context of rapidly changing social environments. Korea is representative of a country that has experienced rapid development of information technology and using internet, and as a result, elderly people in Korea have shown on highly skilled using internet. It is furthermore acknowledged that the increased more educated and better-off elderly people expect to independent living even if they are ill. Here is this paper contention that Korea should focus on constructing appropriate policy and strategies for embodying gero-informatics considering the existing patterns of provision and social trends. This study will perform a critical review of literature and discuss the information and service based gero-informatics in Korea. The purpose of this study is to suggest a potential strategies for improving health of elderly people. Drawing on

a range of data, first, this study will examine the existing scope and nature of provision for elderly people. Then, this study will discuss how current public health policy and service efforts for elderly people are limited to meet the needs of the aged. Preliminary suggestions of this study may be helpful to improve the health care approach in order to better serve elderly people.

**PD6 881 A RESEARCH AGENDA TO SUPPORT POLICY DEVELOPMENT ON ICT-BASED ASSISTIVE TECHNOLOGY FOR OLDER ADULTS**

J. DAMANT\* (Michigan State University, East Lansing, MI, United States)  
P. FREDDOLINO (2), M. KNAPP(1), M. ELLIS(1), E. MITLETON-KELLY(1) -  
(1) London School of Economics (United Kingdom); (2) Michigan State University -  
School of Social Work (United States of America)

**Introduction** In recent years a number of assistive technologies for older adults based on Information and Communication Technologies (ICTs) have been developed and tested, and some are being brought to market. However, there are many uncertainties as to their cost effectiveness and overall impact. There is also controversy over who will or should pay for such technologies, even when their use would enable older adults to remain in their homes and communities longer. **Methodology** This study reviews existing literature related to potential policy development in this arena, and then proposes a stakeholder-focused research agenda that would provide the range of information required for rational policy development. **Results** The proposed research agenda identifies the types of data required from the most important stakeholder groups on both the demand side (e.g., users and payers) and the supply side (i.e., providers) in the market for relevant ICT-based technologies. Topics include, among others: What are the needs of the potential users of such technologies? What is the ability and willingness of potential payers (families, government, and NGOs) to purchase these technologies, and what criteria would have to be met? What vendors are in the market, who are their competitors, and what will it take to keep them in the market to provide products that are determined to be cost-effective? **Conclusion** Rational policy development requires an adequate base of relevant up-to-date information. In the case of policy regarding potentially expensive ICT-based technologies to support older adults in the community, these data are not currently available. Implementation of the proposed research agenda would provide this much-needed data.

**PD6 882 ACHIEVEMENTS AND PROBLEMS OF AGEING POLICIES IN RUSSIA**

G. MINNIGALEEVA\* (Senior Resource Center Wisdom Ripening, Tuymazy, Russian Federation)

**Introduction.** The policies towards aging people in Russia are officially guided by international declarations and domestic laws. However, implementation of most of them is still hindered because of the economy and ideology transition of the 90s. **Methods.** Analysis of legislation developments and its implementation reveals the tendency of improving attitudes towards seniors and positive changes in ageing policies in Russia in the 90s. From being "mercy" driven (1995, Law "About Social services for older persons and pensioners") it moved to acknowledging and promoting participation of older adults in social life (Federal Programme "Older Generation", 1997, revisited in 2002). However, the Programme "Older Generation" was closed in 2004 and has never resumed. **Conclusions.** Currently the Government does not follow any unified positive ageing policy. Moreover, there is no specific division in any legislative body responsible particularly for ageing policies. Despite the fact that lately the Government has intensified efforts on solving demographic issues and economic problems they entail, most of the efforts concentrate on birth rates increase, and little attention is paid to retaining and using the great potential of senior citizens. Even the guaranteed Governmental pensions for which persons become eligible at the so called "official age of retirement" (55 for women and 60 for men) instead of bringing some level of personal freedom, often serve as a basis for age discrimination at work place. However, the Government does play a profound role in service delivery for older people, which has a twofold effect. On the one hand most of social services, welfare, pension plans are guaranteed by the Government. On the other hand, variety of the services is quite limited and quality is sometimes not satisfactory. Unfortunately, the Governmental policies towards nongovernmental nonprofit organizations, which could help to compensate for such shortages, are not cooperative enough to allow for their significant contributions.

**PD6 883 VARIATION IN THE PREVALENCE OF PSYCHIATRIC DISORDER AND TREATMENT RATES AMONG OLDER PEOPLE LIVING IN ENGLAND**

K. SADLER\* (National Centre for Social Research, London, United Kingdom)  
S. MCMANUS

**Introduction** In England there remain significant gaps in treatment and services for older people with mental ill health. An integral part of improving and supporting the delivery of mental health services for older people is our ability to monitor the prevalence of mental health disorders and their association with treatment received. Good quality and nationally representative data covering both treated and untreated disorders are therefore vital for the effective planning of clinical services. **Methods and materials** Using data generated from a nationally representative random probability survey carried out in 2007 (the Adult Psychiatric Morbidity Survey, APMS) with 7,400 people, we will describe the prevalence

of mental health disorders in older people living in the community and compare rates with the rest of the adult population. We will provide a description and analysis of the level of psychotropic medication, counselling and talking therapies and health and community care service use, and also explore age-related inequality in access to treatment among older people with mental ill health. **Results** The prevalence of mental health disorder identified by the study declined with age. Preliminary analysis shows a decreased likelihood of older people receiving talking therapies and an increased likelihood of receiving psychotropic medication. The data are currently under embargo prior to publication. We will provide analyses focussing on levels of treatment and service use, their distribution by key demographic variables and associations with measures of mental ill health among older people. **Conclusion** APMS is a key data resource used in the planning of national mental health services and policy in England. This analysis focussing on older people will provide evidence that can be used to inform the development of service provision for older people.

**PD6 884 A STUDY OF THE INFLUENCING FACTORS ON WORK OF THE KOREAN ELDERLY**

K. MEE HYE\* (Ewha Womans University, Seoul, Republic of Korea)  
M. CHO(1) - (1) Ewha Womans University (Seoul, Republic of Korea)

The rising life expectancy and the low birth rate causes aging society in Korea. Ascending dependency rate and descending fertility rate become a public concern. The purpose of this study is to identify the influencing factors on work of the Korean elderly with two research questions; 1) why is work important to elderly?; 2) what are factors influencing on work of the Korean elderly?; 3) how are these factors changed during 10 years? This study uses the dataset collected by KIHASH in 1994, 1998 and 2004 surveys titled "Living Profile and Welfare Service Needs of Older Persons in Korea". The total of respondents aged 65 years old and over was about 2,300 individuals in the dataset of each research. This study employs multiple linear regression by using a set of predictors which are sufficient to explain the reasons the elderly want to work. The result finds six variables which had significant effects on work of the elderly: gender, health, education, personal income, community activity, life satisfaction. The completed model had an adjusted  $R^2$  of 0.62,  $F=74.2$ , and  $P<0.001$ . Six variables has not been changed but the degree of effect of each variable has been changed. The variable of health has been stronger than others and the variable of gender has not been changed in the degree of effect. In conclusion, this study would suggest that 1) the elderly need to be encouraged to maintain their work as long as they are healthy regardless of gender; 2) it is necessary to increase life-course flexibility in order to allocate their time to work and others; 3) work of the elderly provides society with productivity; 4) on individual level, they can enjoy golden years by themselves.

**PD6 885 POVERTY AND WELL-BEING OF OLDER PEOPLE IN TAJIKISTAN**

M. EVANDROU\* (University of Southampton, Southampton, United Kingdom)  
J. FALKINGHAM(1), G. GRANT(1), A. BASCHIERI(2) - (1) University of Southampton (United Kingdom); (2) London School of Hygiene (United Kingdom)

**Introduction** The break-up of the Soviet Union and the subsequent transition to market-led economies has been accompanied by a decade of economic and social upheaval on an unprecedented scale. There is now a substantial body of literature detailing the impact on the population of the decline in economic and social well-being in the new Republics of the Commonwealth of Independent States (CIS) during the 1990s. However, older people are largely invisible in this literature, despite facing particular challenges. This paper presents the first results from an ESRC-DFID funded project examining the living conditions and sources of finance and social support (both state and family) amongst older people living in one of poorest countries of the former Soviet Union - Tajikistan. **Methods** The project combines quantitative analysis of the living standards of older people of recently available household survey data, with qualitative research providing deep insight into the reality of life for older people today. **Results** Poverty rates amongst older people in Tajikistan are highly sensitive to household composition and to the assumptions made concerning economies of scale within the household. Using medium economies of scale, around 40 percent of older people live below \$2.15 a day. Both public and private transfers play an important role in alleviating poverty. Transfers from the family via remittances play a more significant role than old age pensions from the state. **Conclusion** The public pension system continues to play a major role in alleviating poverty. However its effectiveness is diminished by the low level of benefits and reform is urgently required.

**PD6 886 NON-INSTITUTIONAL SERVICES OF THE CIVIL SECTOR TO THE OLDER PEOPLE IN SERBIA AND PARTNERSHIP WITH THE PUBLIC SECTOR**

M. VRACEVIC\* (Red Cross of Serbia, Belgrade, Serbia)  
N. TODOROVIC(1), A. KALASIC(2) - (1) Red Cross of Serbia (Belgrade, Serbia);  
(2) Institute of Gerontology (Belgrade, Serbia)

**Introduction** This paper demonstrates the rise in importance and outreach of the non-institutional services provided by the civil sector to the older people, complementing the institutional solutions by the public sector in Serbia. It describes the difference in approach and capacity and the rising influence of the civil sector in strategic planning. **Materials and Methodology** Materials for this paper were collected through interviews with the representatives of civil sector and surveys (The Elderly Non-residential Care in Serbia,

Amity 2007; First and Second reports on the implementation of the Poverty Reduction Strategy, Government of Serbia 2007 & 2008; Civil Sector Services to the Older people Red Cross of Serbia 2006, Survey of older people poverty, Amity 2009). Results The results of the survey demonstrate that starting from 2000 the number of beneficiaries covered by the civil sector has been on the constant increase. The civil sector has served approx. 17,000 older beneficiaries per month in 2007 with Red Cross alone having approximately 11,000 beneficiaries per month (in comparison with approx. 4,000 in 2001 when the programme started). The authorities in Serbia increasingly recognise civil sector as an important resource in providing services to older people. This has lead to participation of civil sector in some of strategic public documents and reform laws (Poverty Reduction Strategy, 2002; National Strategy of Ageing, 2006; Strategy for the Development of Social Welfare, 2006; The Law on Social Protection, 2006). Conclusion The synergy between the grassroots approach and search for systematic, strategic solutions is what marks the ongoing cooperation between the two sectors. It is expected that the civil sector role will be formally defined through the process of outsourcing part of the service delivery package to non governmental actors in the next two years.

**PD6 887 ASSISTED LIVING RESIDENCE AND SOCIAL POLICIES: SOME OVERVIEW OF THE EUROPEAN AND USA FRAMEWORK**  
GOMEZ JIMENEZ\* (University Of Malaga, Malaga, Spain)

Assisting living is a vital component of long-term care in the United States as it is in Europe. In Spain the significance of getting older is linked to the need of setting new policies connecting housing research, health care and seniors citizens policies. Thus, the Dependency act which came into force a pair of years ago show that the coordination between public bodies and policies can make the difference. The aging in place process which is also emphasized in both set of laws has a different effect if we consider the choices that public authorities set to reach the goal of a healthy and well cared seniors population. This paper emphasize in both aspects to propose an alternative in the assisted living area.

**PD6 888 EXPLORING DETERMINANTS OF CULTURAL PARTICIPATION: FINDINGS FROM THE BELGIAN AGING STUDY**  
S. DURY\* (Vrije Universiteit Brussel, Brussels, Belgium)  
D. VERTÉ(1), N. DE WITTE(1), L. DE DONDER(1), T. BUFFEL(1) - (1) Vrije Universiteit Brussel (Brussels, Belgium)

Introduction: This study examines cultural participation of the elderly. After a period of undifferentiated observation of the population, there is now a tendency to further divide the various classes of age and sex. The influence of aspects of vulnerability and environmental factors or thresholds, however, remains under researched and poorly understood. This study explores the extent and nature of older people's participation in cultural life. The main purpose is to investigate what key factors determine cultural participation among the elderly. In particular, the research looks at the relative impact of socio-demographic variables, income, physical health, transport modes and the degree of urbanization on cultural participation. Method and materials: This study uses data from the Belgian Aging Study ( $N = 46,989$ ) with respondents aged sixty and over living in 100 municipalities in Flanders, Belgium. To analyse the key factors that determine cultural participation we applied a binary logistic regression. Results: The regression analysis indicates that physical health is the most important predictor of participation in cultural life, followed by the extent of mobility. Furthermore, the results highlight the importance of financial resources and gender. Contrary to our expectations urbanization appears to be unimportant. Conclusion: Findings indicate that cultural participation of elderly is rather low. However, placing an exclusive emphasis on age appears to be too simplistic. We conclude that vulnerability (financial, physical ...) plays an important role in the domain of older people's cultural participation. Finally, study limitations and strengths, potential paths for future research and implications for social policy are formulated.

**PD6 889 AN EXPLORATORY STUDY ON THE DETERMINANTS OF LIFE SATISFACTION AMONG THE ELDERLY IN KOREA**  
H. LEE\* (Kangnam University, Yongin Gyeonggi, Republic of Korea)

The aim of this study was to explore the determinants of life satisfaction for the elderly in Korea. Especially, this study attempted to find out how social capital of the elderly and their general characteristics — socio-demographic, economic, and health traits — influenced on their life satisfaction. The data was collected through face-to-face interviews of 300 elderly. Data on social capital, general attributes and the discrepancies in the level of life satisfaction was analyzed by using univariate and bivariate analysis, while the effects of social capital and their general characteristics on their life satisfaction were analyzed by multiple regression analysis. Results of this study showed us that social capital, level of education, participation in religious activity, income level and subjectively perceived health condition were the predictors to the level of life satisfaction for the elderly. Among them, the social capital was one of the key predictors. In other words, social capital can make the aged better off and give them a sense of security and satisfaction for the elderly. Finally, these findings may be used for realizing us the importance of social capital of the elderly and developing and designing new promising

approaches of social policies and programs, which meet social needs of the elderly as well as their psychological needs.

**PD6 890 QUALITY OF LIFE IN AGED PEOPLE THAT PARTICIPATES ON THE LONGEVITY PROGRAM OF THE CITY HALL OF RIO DE JANEIRO – BRAZIL**  
C. LOZANA\* (Department of Healthy Aging and Life Quality of Rio de Janeiro City - SESQV, RIO DE JANEIRO, Brazil)  
H. FURTADO(1), R. FARJALLA(1), E. SANTOS(1), M. MOSCA(1) - (1) Secretaria de Envelhecimento Saudável e Qualidade de Vida (Rio de Janeiro, Brazil)

The world population is getting older, basically due to better conditions of sanitation, medicine evolutions against diseases and small birth rates. According to the Instituto Brasileiro de Geografia e Estatística (IBGE, 2005), in 2025, elderly people will represent 15% of brasiliian population and in the city of Rio de Janeiro that population can achieve 14%. Therefore, it's important to discover solutions to make their elderly healthier. The aim of this study was to evaluate quality of life in aged people that participates on the Longevity program. The methodology used was the application of the WHOQOL-OLD questionnaire to 196 voluntaries. The questionary was separated in five parts to analyze the results: physical, psychological, independence level, social relations and ambient. In what refers to the physical part, 70,92% of the participants related to be extremely important to be free from any kind of pain. The psychological part shows that according to 65,31% it's very important to don't have negative feelings about life. In relation to the level of independence the most answered questions were about the capacity of realize home task's by their own and don't have any dependence of medicines, with 61,73% and 59,18% respectively. In the social relations part, 55,10% of the participants answered that it's very important to have a social support of the government. About the ambient, 57,14% of the interviewed pointed out that it's extremely important the disponibility and quality of social and healthy care programs. The results founded on the study corroborates with the objectives of the Longevity program, that claims to promote greater levels of functional autonomy, by doing exercise's with professional orientation and to achieve better levels of personal relations, trying to stimulate not only the physical conditioning, but also the social questions in aged people, helping them to achieve a healthier elderly.

**PD6 891 HEALTH INEQUALITIES AMONG VERY-OLD BRAZILIANS WHO UTILIZES THE PUBLIC AND PRIVATE HEALTH SYSTEMS**  
I. ROSSET\* (São Paulo University, Porto Alegre, Brazil)  
M. RORIZ-CRUZ(1), S. FABRÍCIO-WEHBE(2), F. SCHIAVETO(2), T. VENDRÚSCOLO(2), T. DELLA MOTTA(2), B. HENRIQUE(2), R. RODRIGUES(2) - (1) Federal University of Rio Grande do Sul (Porto Alegre, Brazil); (2) São Paulo University (Ribeirão Preto, Brazil)

Introduction Health inequalities occupy a central place in thinking about international health policies and Public Health Systems (PubHS), especially in the developing world. Brazil is one of the countries where the very-old population group is growing fastest in the world. We evaluated similarities and differences in health among very-old Brazilians who utilizes the Public and Private Health Systems (PriHS). Methods and materials The probabilistic sample was composed by 273 south and southeast urban very-old Brazilians ( $\geq 80$  years) living in the community. The cross-sectional, population assessment was performed at home. Evaluation included socioeconomic and lifestyle characteristics, comorbidities, Mini-Mental State Examination (MMSE), Instrumental Activities of Daily Living (IADL) and the 15-item Geriatric Depression Scale (GDS). P-values  $>0.05$  were considered Non-statistically significant (NS). Results PubHS users comprised 41%, and females were 67% of the sample. Mean age was 84.3 ( $\pm 4.3$ ) among PubHS users and 84.9 ( $\pm 4.0$ ) in the PriHS group (NS). Mean schooling-years was 2.8 ( $\pm 2.9$ ) for the former and 4.3 ( $\pm 4.3$ ) for the latter group ( $P=0.001$ ). Among PubHS users, 17% consumes alcohol regularly and 33% are smokers or ex-smokers, whereas among PriHS users these values were 26.0% and 24.5%, respectively. PriHS user's income (International Dollars [ $\$=1,047$ ] was almost twice higher than that of PubHS ( $\$=549$ ) users ( $P < 0.001$ ). MMSE score and number of chronic diseases were not significantly different between the groups. Among PubHS users, 26% presented depressive symptoms and 73% were dependent for IADL, as compared with 21% and 76%, respectively, among PriHS users (NS). Conclusion Although very-old PubHS users presented worse socioeconomic conditions, they did not present significant differences in terms of functionality, number of comorbidities, cognition, or depressive symptoms. These findings are not readily explainable, but survival effect, improved quality of the Brazilian PubHS, or even inefficiency of both systems in preventing age-associated worse outcomes among the very-old are possible explanations.

**PD6 892 FEATURES OF AN AGE-FRIENDLY COMMUNITY: INSIGHTS FROM A PHOTOVOICE STRATEGY WITH OLDER ADULTS**  
S. NOVEK\* (University of Manitoba, Winnipeg, Canada)  
T. MORRIS-OSWALD(1), V. MENEC(1) - (1) University of Manitoba (Canada)

It is widely recognized that cities and communities throughout the globe will need to adapt and improve public policy in response to an aging population. Furthermore, it is recognized that quality of life for many older individuals is highly dependent upon the ability of their local communities to meet their needs by providing a range of supports and opportunities.

This paper presents the findings from a participatory research project conducted in three communities in Manitoba, Canada. The goal of the study was to explore the concept of an 'age-friendly' community from the perspective of older adults. Method: The study employed photovoice technique with high-functioning community based seniors. Through the photovoice process, older adults were provided with cameras and took photographs to illustrate community features that they believe either enhance or diminish quality of life for older persons. The photographs then became references around which both individual interviews and focus groups were conducted. Results: Participants identified a number of priorities for improving their local communities, explored barriers to be overcome, and identified key action items. Some of the major findings from the study will be presented, and illustrated through the photographs and commentary provided by participants. Conclusions: The Age-Friendly Photovoice study enabled community based seniors to give voice to a variety of concerns and needed improvements at a community level. The research also has potential to engage decision-makers in a critical discussion of public policy impacts on older citizens.

**PD6 893 PROJECT DANCE AND LIFE: HELPING AGED PEOPLE TO HAVE MORE AUTONOMY AND QUALITY OF LIFE IN THE CITY OF RIO DE JANEIRO, BRAZIL**  
 H. FURTADO\* (Department of Healthy Aging and Life Quality of Rio de Janeiro City, Rio de Janeiro, Brazil)  
 C. LOZANA, E. SANTOS, R. FARJALA

Introduction: The dance is part of the history of the humanity and can represent beliefs, cultures and the participation of the nation in different situations in the entire world. Dancing is a physical activity well accepted by aged people, because it can remember old memories, is rich in different movements and contributes for self expression and creativity. Methods and materials: The program Dance and Life occurs in public places in different neighborhoods of the city with a total of 20 teams. Each team is composed by a teacher and a monitor that develops different kinds of classes, based on specific methodologies in different dance styles, like: forró, valsa, bolero e samba. There is also a nurse to help in the first aids in a possible situation with aged people and a support to help the control of the periodicity of the participants and organize all the material to the classes. The classes occur three times a week in the night period and have the aim to develop important aspects for a better quality of life, as physical aspects (strength, resistance and balance), social aspects, recreation and hobby. The evaluations realized in each nucleus analyze quality of life (WHOQOL-OLD), functional activity (RIKLI and JONES, 1999) and balance (TINETTI, 1995). Results: The results evidences that the number of participants that joined the program was bigger compared to the first expectations, with an amount of 2.317 aged people. Conclusions: Dance demonstrated to be an activity with enormous success in elderly people because besides having an socialization idea, can promote a better functional activity by raising strength, resistance and reducing risks of falling, showing that is possible to reduce investments on public health by doing preventing actions.

**PD6 894 GERONTOLOGY AS A MORAL SCIENCE? THE CASE OF THE BELGIAN AGING STUDY**  
 D. VERTÉ\* (Vrije Universiteit Brussel, Brussels, Belgium)  
 T. BUFFEL(1), N. DE WITTE (2), L. DE DONDER (3), S. DURY(4) - (1) VUB (Brussels, Belgium); (2) VUB (Brussels , Belgium); (3) VUB (Brussels , Belgium); (4) VUB (Brussels , Belgium)

Introduction: In this article we discuss some theoretical and methodological perspectives for studying the needs of older people. The main purpose is to examine how these various approaches can be fitted into the 'theoretical discussion' on the 'public role' of social science. Starting from the debate on professional versus public sociology, the paper reflects upon issues concerning the extra-academic purpose or engagement of gerontology. Using the case of the Belgian Aging Study (BAS), we discuss the implications of gerontology as a moral science. Method: First, we elaborate on the specificity of the BAS-method to reveal the needs of older people. A survey was developed to collect information about a variety of topics, including demographic characteristics, health, well-being, participation, etc. A sample of 46.989 residents aged sixty and over was interviewed. The research project was carried out in cooperation with provincial governments, local authorities and members of local senior organizations. Older people are involved in this research, not only as sources of information, but also as experts and actors by playing a role as voluntary poll-takers (peer-research). Every sample is representative for a specific municipality, offering local governments tools for evidenced-based policy. Secondly, various aspects of the BAS-method are situated in the broader theoretical framework about the project of public sociology. Results: The process of this research in which older people actively engage as partakers and develop a sense of co-ownership shows how gerontology can play a role in the public sphere. In particular, it is argued that certain aspects of the BAS-method increase older people's political participation. Conclusion: Recognizing gerontology as a moral science suggests the need of revitalizing the discipline by leveraging its insights and

methods to engage in debates not just about what is or what has been in society, but about what society might yet be.

**PD6 895 FACTORS ASSOCIATED WITH VOLUNTEERISM AMONG COMMUNITY DWELLING OLDER ADULTS IN URBAN CHINA**  
 I. CHI\* (University of Southern California, Los Angeles, United States)  
 H. LI(2), L. XU(1) - (1) University of Southern California (United States of America); (2) University of Illinois at Urbana-Champaign (United States of America)

Introduction: The benefit of volunteerism to the society and older adults is clearly documented. However, volunteerism is still a relatively new concept in the developing countries. Very few studies have focused on older adults' volunteering activities in China. This study documented the prevalence of and identified factors related to volunteering activities performed by urban community living older adults in China. Methods: The data used in this study were extracted from a national representative Sample Survey on Aged Population in Urban/Rural China (SSAPUR) that was conducted by the China Research Center on Aging in 2000. This study included 10,139 urban community living older adults aged 60 years or older. The participation of volunteering activities was assessed by whether older adults participated in public security, voluntary labor, volunteer groups, mutual aid groups, and educating youth in the past 12 months. A logistic regression analysis was used to identify the factors related to older adults' volunteering activities. Results: In this sample, over one third (35.8%) of older adults participated in at least one of the volunteering activities. Logistic regression analysis showed that males ( $OR=.77$ ,  $p<.000$ ), college education ( $OR=.61$ ,  $p<.000$ ), no party affiliation ( $OR=.69$ ,  $p<.000$ ), had a paid job ( $OR=1.51$ ,  $p<.000$ ), self-rated health ( $OR=1.19$ ,  $p<.000$ ), ADL limitations ( $OR=.92$ ,  $p<.05$ ), IADL limitations ( $OR=0.95$ ,  $p<.000$ ), and life satisfaction ( $OR=1.06$ ,  $p<.05$ ) were statistically significant factors in relation to the participation of volunteering activities. Conclusion: A surprising high percentage of urban, community dwelling older adults in China participated in volunteering activities. The significant predictors of volunteerism identified may help organizations locate the potential volunteers more effectively. Given the benefits of volunteerism, this result highlights the importance that policy makers at different levels need to develop strategies that facilitate and promote older adults' participation in volunteering activities.

**PD6 896 A CROSS-NATIONAL COMPARISON OF FRONT-LINE CARE WORKERS IN CARE HOMES IN CANADA, SCOTLAND AND THE US**  
 R. JOHNSON\* (University of Stirling, Scotland, Stirling, United Kingdom)

As the world population and the prevalence of dementia increases it becomes more imminent to prepare front-line care workers to provide appropriate care for the residents with dementia that they will be providing care for living in long-term care centers. This qualitative research employed multi-ethnographic methods to interview and observe front-line care workers in these three countries. The basic research questions for front-line care workers were: do you feel as if you were adequately trained to do your job; if so, where did you get that knowledge; and an observation tool was developed to measure if they used that knowledge. The preliminary results found that these three countries recruit and employ different socio-economic status levels of front-line care workers based on each country's training requirements and health care policy. In addition this research looked at how the elderly are valued in each country. In conclusion, significant differences were found among the countries compared in terms of several variables, some including: pay and benefits; career ladders; training requirements; and front-line care worker turnover. These variables should be investigated further for quality care for people with dementia living in long-term care.

**PD6 897 THE RISE OF HIV/AIDS AMONG THE ELDERLY: EVALUATING RISKS AND INTERNATIONAL POLICY RESPONSES**  
 J. MCNALLY\* (University of Michigan, Ann Arbor, United States)  
 V. PHUA (1) - (1) Gettysburg College (Gettysburg, United States of America)

Current research in HIV/AIDS has focused on two core issues of concern related to this disease process and its impacts on older populations. The first concern is that of the social and economic costs of aged parents caring for children and younger relatives suffering from this disease. The elderly who engage in this type of family support not only face the increased burden of care giving for these sick and dying family members but they also face the loss of the very family members they would often depend upon for care in their later years. Work by Knodel et al (2001) and others have clearly laid out the issues relevant to this topic and they have established a research framework that is increasingly employed by other researchers in this area. The research presented here addresses the second core issue, increasing our understanding of growing prevalence of late life exposure and contraction of HIV/AIDS among people aged 50 and older. Studies by numerous researchers have shown that the incidence of HIV/AIDS among the mid-life and aging populations has long represented 10 percent or more of the identified HIV positive population and is now increasing at an alarming rate. As of 2001, the decade long cumulative number of AIDS cases reported to the Centers for Disease Control and Prevention in adults aged 50 years or older quintupled, from 16,288 in 1990 to 90,513 by the end of 2001 (Mack and Ory, 2003). Recent work by Henderson et al (2004) has found that the knowledge and understanding of

risks associated with contracting HIV/AIDS among older women (50 plus) was surprisingly limited and this lack of knowledge contributes to the increased risk of contracting HIV. We will present the evolution of HIV among the aged and evaluate policy responses to this new concern.

**PD6 898** BRIDGING THE DIVIDE: A NEW ROLE FOR SENIOR CENTERS TO ADDRESS NEIGHBORHOOD HEALTH AND LONGEVITY DISPARITIES  
M. FAHS\* (Hunter College, City University of New York, New York, New York, United States of America)

Introduction. Innovative models for targeting effective prevention services among urban community-based older adults are urgently needed. Yet a paucity of studies differentiates health status and use of evidence-based preventive services by race/ethnicity and neighborhood. This study compares utilization predictors by race/ethnicity and neighborhood among NYC seniors attending senior centers, a potentially vital structural component of urban aging policy. Methods. The research design is cross-sectional. In-person interviews were conducted in six languages using standardized health status instruments (e.g. EQ-5D; PHQ-9). A representative sample of seniors attending senior centers was randomly selected to represent racially/ethnically diverse neighborhoods in NYC. The sample (n=1,861) is composed of White non-Hispanics (n=724), Latino/Hispanics (n=424), African Americans (n=347), Asian/Pacific Islanders (n=226), and Others (n=138). Logistic regression models were used to estimate the effects of neighborhood and race/ethnicity on preventive service use, controlling for socioeconomic and health characteristics. Results. Strikingly, senior center participants are representative of the US population of community-based older adults, based on nonsignificant differences in physical and mental health scores. Yet important differences by race/ethnicity were identified. For instance, 24.2% of Latinos were depressed, compared with 15.1%, 13.3%, and 9.0% ( $p < .001$ ) among Blacks, Asians, and Whites, respectively. However, after controlling for health status, place of birth, age, education, access, and insurance status, logistic results reveal neighborhoods to be highly significant predictors of health care access and specific preventive service use, e.g. colonoscopy and mammograms, mediating the effects of race/ethnicity. Conclusion. Neighborhood-based senior centers have the potential to contribute to age-friendly cities and healthy urban aging. However, difficult challenges remain to integrate or "modernize" senior centers with evidence-based disease prevention and health promotion. New policy initiatives to address the complex interactions of race/ethnicity with neighborhood-based determinants of healthy urban aging are discussed.

**PD6 899** ALZHEIMER'S DISEASE ON THE FRENCH POLITICAL AGENDA  
L. NGATCHA-RIBERT\* (Fondation Médéric Alzheimer, Paris, France)

INTRODUCTION The aim of this presentation is to analyze the processes implemented by the emergence, development and institutionalization of public actions and programs dealing with Alzheimer's disease and related disorders. Since "senile dementia" was regarded as almost "normal" aging until now, dementing illnesses among elderly people have only recently received a peculiar attention from researchers and policy makers. METHODS We have examined the different reports and amendments published since the 1960s, and illustrated them by different media supports and interviews (with policy makers, physicians such as geriatricians, neurologists and psychiatrists, and family associations), which are considered as precious indicators about the evolution of conceptions and policies about Alzheimer's disease. RESULTS Official and political recognition of Alzheimer's disease is a slow process, as well as the evolution of norms and conceptions going from "disabilities" to "Alzheimer's Disease" via the very French notion of "dependency". We have identified different actors efforts building this issue as a "public problem" and guiding public decisions. CONCLUSION It shows that Alzheimer's disease has been redefined many times according to beliefs, institutions and actors at each period of time.

**PA7 001** THE VARIABILITY OF THE UCP1 GENE AFFECTS SURVIVAL IN OLD FEMALES  
G. PASSARINO\* (University of Calabria, Rende, Italy)  
P. CROCCO(1), P. D'AQUILA(1), F. DI CIANNI(1), F. TALLARO(1), D. BELLIZZI(1),  
G. ROSE(1) - (1) Department of Cell Biology, University of Calabria (Rende, Italy)

Uncoupling proteins (UCPs) belong to a family of anion transporters located in the inner membrane of mitochondria, that uncouple substrate oxidation from ATP synthesis. The brown fat specific uncoupling protein 1 (UCP1) is involved in thermogenesis, a process by which energy is dissipated as heat in response to cold stress and excess caloric intake. Several studies in model organisms indicate that thermogenesis has potential implications for body mass control and cellular fat metabolism. In humans, the A-3826G polymorphism

in the 5' region of the UCP1 gene is associated with obesity, fat gain and metabolism. The A-3826G polymorphism is in strong linkage disequilibrium with the C-3740A variation, that disrupts a site for the binding of ATF/CREB factor. Since fat metabolism is one of the key-pathways in lifespan extension, we tested the possible effects of this polymorphism on survival. A Genetic Demographic (GD) approach was applied on a sample of 844 subjects from southern Italy (371 men and 473 women; age range 18-109) screened for A-3826G variability. To test for the functional role of the A-3826G polymorphism we cloned in pGL3 promoter vector upstream of the Luc-transcriptional unit the sequences containing the A-3826G and C-3740A variations. The reporter constructs were transfected in MCF-7 cells. By analysing allele specific survival functions we found out that in females the G allele modulates survival in the elderly. Consistently, transfection experiments showed that the luciferase activity of the construct containing the A-C haplotype was significantly higher than to that containing G-A haplotype. Interestingly the construct containing the G-C haplotype was totally lacking of luciferase activity. These results suggest a functional effect of the A-3826G and C-3740A polymorphisms on UCP gene expression which affects survival in old females.

**PA7 002** APOE GENOTYPE IN NONAGENARIAN FROM THE BASQUE COUNTRY

F. GOMEZ BUSTO\* (Residencia San Prudencio, Vitoria-Gasteiz, Spain)  
X. ELCOROARISTIZABAL (1), D. GAMARRA(1), C. SERGIO(1), M. MARTINEZ DE PANCORBO(1), I. ARTAZA(2), M. FERNANDEZ (3), L. GALDOS(4) - (1) University of the Basque Country (Vitoria-Gasteiz, Spain); (2) Alder Oru (Amorebieta, Spain); (3) Hospital de Cruces (Barakaldo, Spain); (4) Hospital de Txagorritxu (Vitoria-gasteiz, Spain)

OBJETIVE/INTRODUCTION To analyze APOE genotypes in a nonagenarian group from the Basque Country (northern Spain) in relation to their cognitive state. METHODS This study includes 48 nonagenarian individuals, 32 of them suffering from cognitive impairment disorders. Additionally, a sample of 265 controls without cognitive impairment disorders was analyzed. All the individuals were tested with MMSE. Values below 20 points within the nonagenarian group were considered cognitive impairment disorders, while a value of 28 points was set to controls. Genetic analyses were carried out in the DNA Bank facilities at the University of the Basque Country UPV-EHU (Spain). Two techniques, polymerase chain reaction (PCR) and restriction fragment length polymorphism (RFLPs) with HaeII and AflII enzymes, were used to determine the APOE genotype. RESULTS 1.57 years. The group± The average age of nonagenarian was 96.50 consisted of 85.4% of women. We compared the frequency of APOE genotypes between nonagenarians and controls by chi-Pearson and significant differences were found ( $p = 0.03$ ). There was a higher frequency of genotype 3.3 in nonagenarians than in the control group. On the other hand, the presence of 3.4 genotype was lower. Nonagenarians were divided by cognitive state. Taking this classification into account, we observed the absence of the APOE 4 allele in subjects without cognitive impairment. CONCLUSIONS The APOE 4 allele, a key factor in the onset of neurodegenerative processes and the development of cognitive impairment, was absent in nonagenarians without cognitive impairment.

**PA7 003** ANALYSIS OF FV-LEIDEN AND FACTOR II G20210A SNP FREQUENCIES IN A GROUP OF SICILIAN NONAGENARIANS

Introduction: The analysis of the genetic profile of centenarians aims to identify the genes and allelic variants which may be involved in life expectancy and which can be considered as predisposing factors for ageing associated diseases. The process of aging is characterized by signs of increased activity of coagulation enzymes, indirectly expressed by high levels of factor VII, fibrinogen and fibrin degradation products that well correlate to the pro-inflammatory state associated to the aging. These increases are counterbalanced by regulatory proteins, as TFPI (tissue factor inhibitor), that increases in the elderly in parallel to the factor VII. In this work we assessed allelic frequencies of the G1691A mutation (FV Leiden) and G20210A polymorphism of factor V and II in ultranonagenarians Sicilian subjects and young controls to assess whether genotypes predicting increased functionality and levels of these haemostatic proteins might affect the achievement of an advanced age. Methods and Materials: The identification of the alleles in the two polymorphic sites of factor V and Factor II were obtained by Real Time PCR allelic discrimination assays on a 7300 Real Time PCR System - Applied Biosystems in 106 nonagenarians and 120 controls. For both polymorphisms were used probes specific for the wild-type alleles marked at the 5' end with the fluorochrome Fam, and probes specific for the mutated alleles marked with the fluorochrome Vic. Results and conclusions: Analysis of the distribution of genotypic and allelic frequency of the mutation G1691A (FV Leiden) of FV and the prothrombin G20210A polymorphism allows to find no significant differences between the two groups studied. The data presented here, in good agreement to those obtained by other studies, confirm that the presence of gene variants

associated with a higher production or increased functionality of the clotting factors is not detrimental to the achievement of longevity.

**PA7 004 CALORIE RESTRICTION MODIFIES THE EXPRESSION OF COENZYME Q BIOSYNTHESIS GENES IN MICE**

C. PARRADO-FERNANDEZ\* (University Of Cordoba, Cordoba, Spain)  
G. LOPEZ-LLUCH(2), R. LUQUE(1), I. BURÓN(1), R. DE CABO(3), P. NAVAS(2),  
J. VILLALBA(1) - (1) (Cordoba, Spain); (2) (Seville, Spain); (3) (Baltimore, MD, United States of America)

Introduction Knowledge of molecular mechanisms controlling longevity provides a means for establishing the rules to maintain cells and tissue efficiency with aging. Caloric restriction is the only non genetic manipulation that increases mammal longevity. Coenzyme Q and related enzymes regulate aging processes through the maintenance of cellular redox homeostasis. Materials and methods We studied by QPCR-RT the effect of calorie restriction (40%) diet on liver, brain, muscle and kidney mRNA levels of mSPS1, mDLP1, mCOQ2 and mCOQ7 in thirty six mice during one month of treatment. These genes encode enzymes catalyzing the final steps of coenzyme Q biosynthesis. Amounts of CoQ<sub>9</sub> and CoQ<sub>10</sub> were quantified by reversed-phase HPLC. Data were analysed by the Student t-test in SPSS 11.0 statistical software. Results Results showed an increase ( $p<0.05$ ) in mCOQ2 and mCOQ7 mRNA levels of liver and kidney in calorie restriction conditions. mSPS1/mDLP1 ratio increased ( $p<0.01$ ) in liver and kidney, and Q<sub>9</sub>/Q<sub>10</sub> ratio in liver was also increased ( $p<0.05$ ). We also observed significant changes ( $p<0.01$ ) in redox ratio of CoQ. Conclusion Our data indicate that short-term calorie restriction diet involves a series of changes in cellular coenzyme Q and genes encoding enzymes of the final stage of coenzyme Q biosynthesis. Given the well established effect of calorie restriction extending life span and enhancing stress responsiveness, our results supports a role for coenzyme Q as a target of calorie restriction in longevity promotion.

**PA7 005 EFFECT OF ORAL CARE TO PREVENTION OF PNEUMONIA TO THE PATIENTS IN SANATORIUM - IS THERE RELATIVITY OF ORAL CARE TO THE CAUSE OF DEATH?**

S. TAKAKI\* (Tokyo Dental College, Ichikawa, Japan)  
M. TONOGI(1), R. YAZAKI(1), A. EDAHIRO(1), H. MORISHITA(1), K. TADA(1),  
T. USHIODA(2), Y. YAKEYESU(1), Y. WATANABE(1), Y. OZAWA(3), G.  
YAMANE(1) - (1) Tokyo Dental College (Ichikawa, Japan); (2) Tama-Hokubu Medical Center (Higashimurayama, Japan); (3) St. Luke's International Hospital (Tokyo, Japan)

Purpose It is clear that oral care is effective in prevention of pneumoniathe to the patients in sanatorium . We executed a statistical examination whether the oral care is effective or not, to the patients in sanatorium. We investigated the cause of death as our first report, and we prospectively evaluated the usefulness of the oral care. Method We retrospectively investigated the death certificates for the long-term treating patients in sanatorium until March 31, 2008 to October, 1996. The study consisted of the oral care group, (30 patients), and non-oral care group(50 patients) . And , randomized intervention design was used. We investigated the comparative study of the age, sex, the average hospitalization period, the cause of death, the presence of the oral ingestion, and the usage condition of the antimicrobial. Result The Average hospitalization days results : OC group was high for 1285.26 days in non-OC group 591.946-day ( $P<0.001$ ) and some thought. The sex ratio were : OC group female (62%), OC group man(38% ) , non- OC group the female (66%) non-OC group man (34%). The great difference is recognized by neither of the groups. The ratio of the oral ingestion was almost equal to OC group 36.7% Non-OC group 34%, and non-OC groups obtained a high result in the cause of their death the ratio of pneumonia : OC group 16%Non-OC group 38% . That is, in the OC group the feature with a lot of deaths by geromarasmus was seen. And in the non-OC group, it turned out that there were a lot of death cases due to pneumonia. Consideration OC group of the average hospitalization days were significant long, the ratio of the oral ingestion was almost equal to each groups. In the OC group it turned out that there were less cases due to pneumonia. So, we consider that there is close relationship between the oral care and life prolongment.

**PA7 006 FUNCTIONAL STATUS OF THE SEMI-SUPERCENTENARIANS**

Y. GONDO\* (Osaka university, Suita Osaka , Japan)  
N. HIROSE(1) - (1) Keio medical school (Japan)

healthy aging and longevity phenotype is a persistent problem. Centenarians have been used as a case merely due to their remarkable age. However, the recent expansion of the centenarian population and the increasing number of frail centenarians raise question regarding the appropriateness of centenarians in general as a case phenotype. We focused on semi-supercentenarians(SSC) who have survived beyond 105 years birthday as a representative of healthy aging and longevity phenotype, because mortality leveling off was observed people over 105 years old in Japan. However, we are not sure whether SSC are healthy aging and longevity phenotype, who maintained functional status through the life span or frail survivors who spend most of the time in bed in final stage of life. To confirm the validity of adopt mortality level off as a criterion age, we compared the functional level of both surveyed age (over 105) and age at 100 years old between SSC and centenarians who had dead before 105 years old. Results showed that the functional level

of SSC at the surveyed age were lower in comparison with centenarians. Functional level at 100 years, however were higher in SSC. In addition, cumulative frequency of bed-bound individuals by age in SSC glows slower. Well maintained functional level at the age of 100 and beyond in the SSC indicates that they have special characteristics to live healthier and longer. Also indicates that SSC are good target to tap longevity genes. This framework might be beneficial for discriminating case individuals harboring genes that are likely to confer extreme longevity in any population, regardless of average life expectancy

**PA7 007 MITOCHONDRIAL DNA CONTROL REGION: BASE COMPOSITION AND CORRELATION WITH MAXIMUM LIFE SPAN IN MAMMALS**

G. LEHMANN\* (Ben-Gurion University of the Negev, Beer-Sheva, Israel)  
L. SEGAL(1), R. TACUTU(1), V. FRAIFELD(1), K. MURADIAN(2) - (1) Ben-Gurion University of the Negev (Beer-Sheva, Israel); (2) Institute of Gerontology AMS Ukraine (Kiev, Ukraine)

Introduction: Mitochondrial DNA (mtDNA) consists of two functionally and topologically different parts: coding sequences and non-coding control region (CR). The CR covers a relatively small part of mtDNA (on average, less than 8%), yet it plays a leading role in regulation of mtDNA replication and transcription. Given a strong association between mtDNA and maximum life span (MLS), the CR could be of particular interest. Here we focus on CR compositional features and their correlation with MLS in mammals. Methods and materials: Data on 159 mammalian species with completely sequenced mtDNA and reported MLS was analyzed. CR was divided into 10 equal segments (decimals). Base composition, strand asymmetry, and their correlation with MLS were estimated for each decimal. Results: Base composition of the entire CR does not differ significantly from that of the coding mtDNA. However, in contrast to coding sequences, CR displays a clear pattern of gradual compositional alterations along its length. For example, thymine/cytosine ratio declines gradually from 3.2-4.2 in the peripheral decimals to 1.3-1.5 in the central decimals. Accordingly, strand asymmetry is minimal in the central part of CR, where the content of all four nucleotides is almost equal, as could be expected from a random distribution. This pattern could presumably be attributed to regional differences in the rate of spontaneous or transcription-associated DNA unwinding. For each of the bases, correlation with MLS is significant in the peripheral decimals and decreases gradually to lower or even to insignificant values in the central decimals. Conclusions: In mammals, correlation of MLS with mtDNA base composition and strand asymmetry declines gradually along CR, from the periphery towards the center. The results obtained show for the first time an association between longevity and CR. In a broad sense, the results highlight a possible role of non-coding mtDNA in determination of mammalian longevity.

**PA7 008 ENDING AGING - SHOULD WE AIM FOR IT?**

P. DERKX\* (University for Humanistics, Utrecht, The Netherlands)

In 2007 Aubrey de Grey (with Michael Rae) published the book "Ending Aging: The Rejuvenation Breakthroughs That Could Reverse Human Aging in Our Lifetime". De Grey represents a growing group of people who expect substantial life-extension to be possible within this century based on stem cell technology, genomics engineering, caloric restriction mimetics, etc. Based on the study of recent papers by prominent biogerontologists such as Richard Miller, Judith Campisi, Jan Vijg and Rudi Westendorp this presentation will start with the issue of whether this is a realistic possibility. The main topic of this presentation, however, is the fundamental socio-ethical question whether substantial life-extension should be a goal of public policy. Should governments install a Marshall plan against aging to reap the benefits of a longevity dividend? Based on the most important relevant literature it will be argued that there are hardly any decisive ethical arguments in principle against substantially prolonged human lives (arguments of freedom, well-being and meanings of life). The most important principled argument against might be the one related to population growth and the fundamental choice between either a world of many very old people with hardly any children or a continuing cycle of new generations. The arguments from justice and efficiency do not constitute an absolute objection against substantial life-extension. They do make clear, however, that (a) biogerontological research will be very important in the coming decades but (b) social and governmental priorities should be different from engineering substantially prolonged human lives. For the time being aging well is as important as ending aging.

**PA7 009 THYROID HYPOFUNCTION AS A LONGEVITY ASSURANCE MECHANISM IN OLD AGE**

M. ROZING\* (Leiden University Medical Center, Leiden, The Netherlands)  
R. WESTENDORP(1), E. SLAGBOOM(1), M. FRÖLICH(1), C. WIJSMAN(1),  
S. MOOIJART(1), A. DE CRAEN(1), D. VAN HEEMST(1) - (1) LUMC (Leiden, The Netherlands)

Introduction: An accumulating body of evidence suggests the involvement of thyroid hormone metabolism in the regulation of the life and health span in rodents. Several age-related changes in the hypothalamic-pituitary-thyroid axis have been observed during the human aging process as well. However, it remains unknown whether this altered thyroid function in human old age represents a dysfunction contributing to the aging process or an adaptive mechanism in response to damage, aimed to enhance longevity. The purpose of this study was to explore the role of thyroid hormones in the processes of human aging and

longevity. Methods and materials: To this end we investigated the relation between thyroid hormones and metabolic parameters as well as inflammatory markers among 555 subjects, age 85, and 606 middle-aged subjects. Results: In agreement with previous studies we observed a decline in thyroid function with age. In addition we found that low thyroid hormone was associated with a more beneficial glucose and lipid metabolism in both middle-aged and old-aged subjects. In contrast to middle-aged subjects, in old-aged subjects low thyroid hormone was related with higher inflammatory markers. Moreover, lower thyroid hormone levels were associated with a higher mortality risk. Conclusion: our findings are indicative of suppression of the thyrotroph axis in elderly individuals as part of an adaptive response to delay age-related pathology.

#### **PA7 010 EFFECTS OF ELASTIN PEPTIDES ON CERAMIDE-INDUCED APOPTOSIS**

L. DEBELLE\* (Université de Reims Champagne Ardenne, Reims, France)  
B. CANTARELLI(1), L. DUCA(1), C. BLANCHEVOYE(1), F. DELACOUX(1),  
L. MARTINY(1) - (1) Université de Reims Champagne Ardenne (Reims, France)

Elastin is an essential component of the extracellular matrix. Mechanical fatigue or enzymatic degradation of this molecule produce oligopeptides called elastin peptides (EP) which can exhibit several biological activities. When human skin fibroblasts (HSF) are stimulated with EP, a high activation of the PI3K/p110 $\gamma$  is observed. As this kinase plays an important role in cell survival, we hypothesized that EP could disturb cell apoptosis which is required to dispose of damaged cells. When HSF are treated with ceramide they rapidly enter apoptosis. But when EP are present this phenomenon is reduced. Signalling pathways analysis demonstrated the involvement of the PI3K/110&gamma;. Following EP treatment, the anti-apoptotic protein Akt is phosphorylated resulting in its full activation. This in turn leads to the phosphorylation and subsequent inhibition of several pro-apoptotic proteins: the Bad protein which is involved in the mitochondrial apoptotic pathway, the forkhead family transcription factor Foxo3a which promotes pro-apoptotic protein production and caspase-9 which is part of a structure found in the mitochondrial apoptotic pathway. As EP accumulate with ageing, our results indicate that EP could somehow prevent cellular apoptosis, and promote cellular senescence thereby contributing to tissue ageing. EP are less efficient when cells are aged. This unexplained phenomenon is termed "receptor uncoupling" because it seems that the receptor is literally disconnected from its signalling pathways. As the simplest explanation is that the receptor is less expressed with age, we analysed its expression in 4 strains of young HSF (<25y), 5 strains of old HSF (>60y) and 1 strain of senescent HSF. Surprisingly, we did not observe any variation. This finding strongly suggests that the uncoupling of the receptor cannot be explained by a modification of its expression level. The receptor is still present but for reasons that deserve further investigations it is no more efficient.

#### **PA7 011 THE INDUCTION OF AGE-RELATED CHANGES IN YOUNG IMMUNE SYSTEM: STUDY ON THE HETEROCHRONIC PARABIOSIS**

I. PISHEL\* (Institute of Gerontology AMS of Ukraine , Kiev, Ukraine)  
D. SHYTIKOV(1), T. ORLOVA(1), A. RODNICHENKO(1), Y. LEONOV(1),  
T. DUBILEY(1), M. YUZYK(1), M. KUCHMA(1), G. BUTENKO(1) - (1) Institute of Gerontology AMS of Ukraine (Kiev, Ukraine)

Introduction. The decrease of the immune parameters with age is a well established fact. It can be assumed that these effects are mediated either by changes in the cells, lymphoid organ's niches, or by humoral factors, or by some unknown regulatory influences at the cell population level. In order to analyze the trigger mechanism of age-related changes in the immune system we made the heterochronic pairs with different terms of coexisting. The aim of this investigation: to ascertain the initial changes, and determine the sequence of age-related alterations in the young immune system. Materials and methods. Young and old male CBA/Ca mice were joined by parabiosis for immunological tests. There were made 6 groups: young and old single controls, young and old isochronic pairs, and heterochronic pairs with 3, 6 and 12 weeks of coexisting. Young and old male FVB.Cg and FVB.Cg-Tg(GFP)5Nagy/J mice were joined by parabiosis for cell migration analysis. For investigations routine immunological methods, FACS-analysis, ELISA and Western Blotting were used. Results. It was observed the age-related changes of the immune parameters in young heterochronic partners, which progressed with term of coexisting. Old heterochronic partners have some rejuvenation effect only at early term of coexisting (3 weeks). Initial changes in immune parameters concern to the T-cell subpopulation in the peripheral lymphoid organs. The first of them - the increase of high proliferate CD8+CD44+ cell number in the spleen, which have young origin. The changes in lymphoid cell population which led to final dysfunction of the immune system were analyzed. Conclusions. The immune system aging is inducible process. Understanding of its mechanism can lead to the knowledge of aging process. The study was supported by Institute of Biology of Aging (Moscow, Russia).

#### **PA7 012 IMPAIRED AGE-RELATED RESPONSE TO HYPERTERMIA IN A NON-HUMAN PRIMATE**

J. TERRIEN\* (UMR CNRS/MNHN 7179, Brunoy, France)  
F. AUJARD(1) - (1) UMR CNRS/MNHN 7179 (Brunoy, France)

The heat wave of 2003 increased death prevalence from hyperthermia in the elderly. To test how aging affects evacuation of excedentary body heat, thermoregulatory experiments were conducted in a non-human primate, *Microcebus murinus*. First, to test the response to

exposure to a warm environment adult and aged mouse lemurs were exposed during 10 days to an ambient temperature of 25°C and then at 34°C. Core temperature was continuously recorded by a telemetric device. Then, fever was pharmacologically induced in adult and aged mouse lemurs at the reference ambient temperature of 25°C by the injection of isoproterenol, a enhancer of body heat production via activation of non shivering thermogenesis. Respiratory metabolism and skin temperature were recorded as representative parameters of body heat production and evacuation in this protocole. Exposure to 34°C induced higher effects in aged than in adult animals. Indeed, the minimal level of Tc raised by 2°C between 25 and 34°C in aged mouse lemurs and only by 1°C in adults. More, the temporal organization of the daily rhythm in Tc was strongly disturbed in aged animals while no such effects were observed in adults. After the induction of fever, both adult and aged mouse lemurs exhibited an increase in respiratory metabolism, revealing the enhancement of body heat production. However, skin temperature only increased in adult animals, whereas it did not vary in aged ones. More, respiratory metabolism was maintained higher than the control level during a long time in aged mouse lemurs, whereas it rapidly decreased to reference values in adult ones. Thus, difficulties in evacuating the excedentary body heat in both experimented hyperthermia conditions were revealed during aging. An impaired age-related response in the vasodilatation/vasoconstriction balance might be the origin of this trouble and should be further investigated.

#### **PA7 013 AGE-RELATED DIFFERENCES AND SIMILARITIES IN BRAIN ACTIVATION DURING INHIBITION AND SWITCHING**

M. LAGUË-BEAUVAIS\* (UQAM, Montreal, Canada)  
J. BRUNET(2), L. GAGNON(3), M. DEHAES(4), F. LESAGE(5), L. BHERER(1) - (1) Département de psychologie, Université du Québec à Montréal (Montreal, Canada); (2) Département de psychologie, Université de Montréal (Montreal, Canada); (3) Athinoula A. Martinos, Center for Biomedical Imaging, Massachusetts General Hospital (Charlestown, United States of America); (4) INSERM, Laboratoire d'Imagerie Fonctionnelle, UPMC Université Paris 06 (Paris, France); (5) Département de génie électrique et Institut de génie biomédical, École Polytechnique de Montréal (Canada)

Younger (M = 24.38 years) and older (M = 63.80 years) adults performed a computer version of the Modified Stroop Test, including an Inhibition condition (IC; naming the color of a color-word) and a Switching condition (SC; alternating on cue between naming the color and reading the color-word). As expected, younger and older adults were faster in the IC than in the SC, and older adults were slower than younger adults across all conditions and less accurate in the IC and SC. Near Infra-Red Spectroscopy (NIRS) allowed an assessment of oxyhemoglobin and deoxyhemoglobin concentrations in four regions of interest (ROI), i.e., anterior and posterior dorsolateral (DLPFC) and ventrolateral (VLPFC) prefrontal cortex. Results for younger adults showed an increased oxyhemoglobin concentration in the anterior DLPFC during the IC and an increased oxyhemoglobin concentration in both anterior regions during the SC when compared to other ROIs. Concerning deoxyhemoglobin concentration, younger adults showed a greater concentration in the right than the left hemisphere in all conditions. Older adults also showed an increased oxyhemoglobin concentration in both anterior regions during SC compared to other ROIs. A greater deoxyhemoglobin concentration was observed in the SC compared to the IC in older adults. When comparing better performing and poorer performing older adults (based on reaction times and accuracy measures) to younger adults, NIRS results revealed that poorer performing older adults had a greater oxyhemoglobin concentration in the right than in the left hemisphere during the IC, while better performing older adults and younger adults showed no hemispheric difference in oxyhemoglobin concentration. No significant differences were found among the three groups for deoxyhemoglobin. Consequently, NIRS results suggest a hemispheric differential involvement for younger and older adults in deoxyhemoglobin concentrations during the Stroop Test and between better and poorer performing adults in oxyhemoglobin concentrations in the Inhibition condition.

#### **PA7 014 CHARACTERIZING A MOUSE MODEL OF IGF-1 IN AGING**

R. MCCARTER\* (Pennsylvania State University, University Park, PA, United States)  
M. MATZKO(1), J. STOUT(1), S. MOTCH(1), C. SELL(2) - (1) Pennsylvania State University (University Park, PA, United States of America); (2) Drexel University (Philadelphia, PA, United States of America)

Introduction: 'Midi' mice have chronically low levels of IGF-1 and exhibit extended longevity in comparison with control mice. These mice have a null insertion in the Igf-1 gene and have approximately half the circulating IGF-1 concentration as controls, similar to levels of IGF-1 in calorically-restricted (CR) mice. Our aim was to measure metabolic properties known to change with CR so as to assess the potential role of IGF-1 in CR. Methods: Male and female mice were measured at 7-11 months for body composition (DEXA) and 24-hour values for body temperature (Minimitter implants), physical activity (beam breaks), and metabolic rate (indirect calorimetry). Plasma values of insulin and other metabolites were also measured at six-hour intervals over 24-hours. Results: No significant differences between control and experimental mice were found for body temperature, physical activity, metabolic rate, respiratory quotient, bone density, and percent fat mass. Insulin levels of midi mice were significantly higher than control mice, whereas body weight and IGF-1 levels were significantly reduced. Conclusion: Decreased plasma IGF-1 may be a sufficient stimulus to slow the aging processes in these mice

despite the presence of elevated insulin levels. Similarly, midi mice display a caloric restriction phenotype only in their longevity but not in other parameters of metabolism. The results suggest that, at least in the C57BL/6 background, plasma IGF-1 levels may play a major role in slowing aging processes. Supported by: NIA #AG022443.

**PA7 015 MICRORNA EXPRESSION PROFILE IN CELLULAR SENESCENCE**

R. FARAONIO\* (University, Naples, Italy)

T. NAPPI(2), P. SALERNO(2), C. SEDIA(1), G. SALVATORE(2), M. SANTORO(2), F. CIMINO(1) - (1) University of Naples Federico II-Department of Biochemistry and Medical Biotechnology (Naples, Italy); (2) University of Naples Federico II-Department of Cellular and Molecular Biology and Pathology (Naples, Italy)

Cellular senescence is a form of permanent growth arrest that is considered a possible contributor to tissue aging. Various stimuli, including dysfunctional telomeres, mild oxidative stress, DNA damage and activation of certain oncogenes, trigger cellular senescence that is controlled by p53 and p16-Rb tumor suppressor pathways. Recent evidences support the hypothesis that cellular senescence contributes to aging not only by accumulation *in vivo* of senescent cells in different tissues, but also by reducing the regenerative potential of the tissues, as a consequence of the stem cell senescence. Cellular senescence is characterized not only by the appearance of some biochemical markers, but also by modification of gene expression pattern. We previously reported that young human embryo fibroblasts (IMR90) exposed for only few days to low doses of the GSH-depleting agent diethylnmaleate (DEM), acquire the senescent phenotype. MicroRNAs (miRNAs) are a class of small non-coding RNAs, that act as post-transcriptional regulators of gene expression. miRNAs suppress gene expression by binding to complementary sites in target mRNAs causing translational repression or transcript degradation. In order to investigate whether miRNAs play a role in the induction of cellular senescence (either induced by repeated *in vitro* cell culture passages or provoked by a mild oxidative stress), we analyzed the expression profiles of 365 known human miRNAs by quantitative RT-PCR, using TaqMan Array Human miRNA Panel, in young and senescent fibroblasts as well as in DEM-treated young IMR90. 200 miRNAs out of the 365 tested resulted expressed in IMR90 cells. The miRNA expression profile was altered in senescent cells, with 8% of them being up-regulated, and 25% being down-regulated. This suggests that specific miRNAs are involved in the senescence program induced by mild oxidative stress and by repeated cell passages and demands functional experiments to prove their involvement in such processes.

**PA7 016 NONEQUIVALENT CHANGES IN THE IMMUNE SYSTEM AND SERUM HORMONE LEVELS IN YOUNG HETEROCHRONIC PARTNERS**

D. SHYTIKOV\* (Institute of Gerontology AMS of Ukraine, Kiev, Ukraine)

T. ORLOVA(1), S. MYGOVAN(1), T. DUBILEY(1), M. YUZYK(1), M. KUCHMA(1), I. PISHEL(1), G. BUTENKO(1) - (1) Institute of Gerontology AMS of Ukraine (Kiev, Ukraine)

Introduction. The functional capacity of different systems decreases during aging. The attempts to prevent the age-related changes by heterochronic parabiosis led to the controversial results – age-related changes in the immune system of young heterochronic partners. The aim of this investigation: to study the homeostatic mechanism of these changes. Materials and methods. Surgery for the formation of the parabiotic pairs was performed with CBA/Ca male mice. There were made 6 experimental groups: young and old single controls, young and old isochronic pairs and heterochronic pairs with 3, 6 and 12 weeks of coexisting. There were studied some immunological, biochemical and endocrinology parameters, the aim of which were to get information about homeostasis. For investigations routine immunological and biochemical methods, ELISA and FACS-analysis were used. Results. It was observed rapid and dramatic age-related changes of the immune system of young parabionts in heterochronic pairs, while old partners seemed to have no signs of rejuvenation in the late period of coexisting. It was established that old and young heterochronic parabionts had equal serum thyroxin level with young isochronic pairs. The level of corticosterone was increased in all groups of parabionts, what gives evidence of the chronic stress. Simultaneously such factors as insulin and glucose levels had no serious changes in heterochronic pairs and for the most of this parameters young and old organism behaved as separated organisms with its own regulatory mechanisms, even on the late periods of parabiosis. Conclusions. The immune parameters and some hormone levels changed independently in heterochronic partners. It seems that age-related changes may be regulated by various mechanisms which are controlled with different plasticity. The study was supported by Institute of Biology of Aging (Moscow, Russia).

**PA7 017 GHRELIN AS THE METABOLIC SIGNAL OF CALORIC RESTRICTION IN AGING**

M. MATZKO\* (Pennsylvania State University, University Park, PA, United States of America)

J. STOUT(1), B. BARNES(2), E. SZELENYI(2), S. MOTCH(1), W. HYMER(1), R. MCCARTER(1) - (1) Pennsylvania State University (University Park, PA, United

States of America); (2) United States Army Research Institute for Environmental Medicine (Natick, MA, United States of America)

Introduction: Caloric Restriction (CR) is a well-known strategy to extend lifespan in diverse animal species. The numerous physiological benefits which arise during CR animals are retained long after their body weights and metabolic rates have adjusted to the reduced caloric level. We propose ghrelin as the metabolic signal which maintains not only the sense of hunger in these animals but also the CR phenotype, perhaps in part because of ghrelin's stimulatory effect on the growth hormone-IGF-1 axis. Prior work by Yang et al. (2007) has indeed demonstrated ghrelin is up-regulated in CR. Methods: We have compared two mouse models of CR or its mimetics. The first was a 10-day restriction at the 40% and 60% of ad libitum-fed in heterogeneous stock (HS) male and female mice. In the second, HS male and female mice fed a low-methionine diet were compared with a group receiving 40% less food than controls. In these models, measurements were made of plasma ghrelin, insulin, IGF-1, and glucose as well as body composition (DEXA), 24-hour physical activity (beam breaks), 24-hour metabolic rate, body weight and food consumption. Results: Preliminary results from animals on the low-methionine diet show an up-regulation in total plasma ghrelin in addition to an increase in food consumption compared to ad libitum controls. Animals on short term, severe calorie deficits displayed a sex difference in total plasma ghrelin and an up-regulation in stomach tissue ghrelin mRNA expression. Within these models, there were mixed effects on plasma insulin, glucose and other variables, and no significant changes in 24-hour metabolic rate or physical activity. Conclusions: There is suggestive evidence from these studies supporting the role of ghrelin as an agent in the orexigenic and anti-aging effects of CR. **PA7 018 ABSENCE OF MUTATIONS IN LAMIN A/C GENE IN FOUR WIEDEMANN-RAUTENSTRAUCH SYNDROME PATIENTS**

H. ARBOLEDA\* (Universidad Nacional de Colombia, Bogotá, Colombia)

L. MORALES(5), G. ARBOLEDA(2), N. RAMÍREZ(2), D. FORERO(3), J. YUNIS(1) - (1) Universidad Nacional de Colombia - Departamento de Patología (Bogotá, Colombia); (2) Universidad Nacional de Colombia - Grupo de Neurociencias (Bogotá, Colombia); (3) Applied Molecular Genomics Group, VIB Department of Molecular Genetics, University of Antwerp (Antwerp, Belgium); (5) Universidad Nacional de Colombia - Facultad de Medicina (Colombia)

Introduction: The Wiedemann-Rautenstrauch syndrome (OMIM 264090) characterises a premature aging syndrome in which several features of aging are apparent at birth. Other progeroid syndromes have been already mapped, but WRS's causing gene is still unknown. Hutchinson-Gilford progeria syndrome and some cases of Atypical progerias show alterations in the coding sequence of the Lamin A/C gene, a nuclear structural protein related to the nuclear membrane stability, structural regulation of chromatin and genetic transcription, among others. Materials and Methods. Peripheral blood was obtained under parents written informed consent. Genomic DNA was isolated using modified salting-out procedure. The entire Lamin A/C coding regions were amplified using Polymerase Chain Reaction, and the fragments were purified and sequenced using BigDye Terminator kit in an ABI Prism 3130 capillary sequence machine (Macrogen Inc. Soeul, South Korea). Results. We did not find mutations in the twelve exons and UTR's of the Lamin A/C gen in four WRS patients, and in particular, we did not find the G608G mutation (GGC>GGT transition) which is associated with most cases with Hutchinson-Gilford progeria (OMIM 176670). Discussion. The premature aging syndromes are excellent models for the study of normal aging. The present report is based on the analysis of four well clinically characterized WRS patients: one previously described, and three unreported cases who present the typical phenotypical WRS characteristics. This is the first report analyzing LMNA gene in this number of probands. Clinically, WRS has been clearly defined to represent a progeroid entity different from HGPS. Based on this study, WRS may also be considered to be genetically different from HGPS. The next step is to analyze genes involved in the metabolism of Lamin A/C, other nuclear structural proteins and metabolic pathways such as Protein kinase B/AKT signaling. This work was supported by DIB-Universidad Nacional de Colombia (Grant # 7707) and COLCIENCIAS (Grant # 1101-405-20117).

**PA7 019 WHOLE BODY PROTEIN AND GLUCOSE KINETIC RESPONSES TO THE FED-STATE CLAMP IN OLDER ADULTS**

E. GOULET\* (McGill University, Montréal, Canada)

S. CHEVALIER(1), L. WYKES(1), R. GOUGEON(1), J. MORAIS(1) - (1) McGill Nutrition and Food Science Centre (Montréal, Canada);

INTRODUCTION: This study was aimed at determining how the aging process influences protein turnover in women during fed conditions. Because anabolism occurs in the postprandial state, and that aging is associated with loss of muscle mass, we hypothesized that aging would be associated with reduced net muscle protein synthesis and whole-body net protein balance in response to feeding. METHODS AND MATERIALS: Eight young (24 +/- 3 yrs, BMI: 21 +/- 2 kg/m<sup>2</sup>) and five elderly (74 +/- 8 yrs, BMI: 24 +/- 3 kg/m<sup>2</sup>) women were studied after 6 days of controlled diet and activity. Whole body [<sup>13</sup>C]leucine and [<sup>3</sup>H]glucose kinetics were compared in the postabsorptive state and during a simulated fed steady-state clamp that maintained insulin (~350 pmol/L), glucose (~8 mmol/L) and

branched-chain amino acids (BCAA, ~700 µmol/L) at physiological postprandial levels. RESULTS: In response to the clamp, there were no differences in glucose utilization and infusion rates, leucine flux, oxidation, synthesis or net balance between groups. However, in elderly women, the rates of amino acid infusion to maintain BCAs were lower (0.8 +/- 0.2 ml/min vs. 1.2 +/- 0.2 ml/min, p = 0.02, adjusted for FFM) and leucine breakdown was less suppressed (-21 +/- 7 µmol/min vs. -32 +/- 5 µmol/min, p = 0.01, adjusted for FFM) compared to young. Suppression of protein breakdown and amino acid infusion rates were indeed correlated ( $r = 0.75$ ,  $p < 0.01$ ). CONCLUSION: These preliminary results indicate that despite a net protein balance and insulin sensitivity of glucose metabolism that are comparable to those of young, protein breakdown is less inhibited by insulin, glucose and amino acids in elderly women. Muscle protein synthesis and expression of key components of the Akt/mTOR signaling pathway and of ubiquitin-proteasome will be determined in quadriceps needle biopsies.

**PA7 020 MODELLING INSULIN AND INSULIN-LIKE SIGNALLING (IIS) AND ITS TRANSCRIPTIONAL RESPONSE**  
D. SHANLEY\* (Newcastle University, Newcastle Upon Tyne, United Kingdom)  
G. SMITH, T. KIRKWOOD

Introduction Nutrient sensing, particularly the insulin and insulin-like signalling (IIS) pathway, is a primary regulator of ageing and lifespan. Mutations of many proteins in the pathway have been found to modulate lifespan and it is important in the lifespan-extending effect of caloric restriction: this occurs in large part through the FOXO transcription factors which initiate a programme of stress response. We are developing computational models of IIS in order to gain insight into its responses, interactions and regulation. Methods Models are represented as stochastic differential equations, and are implemented in Systems Biology Markup Language (SBML) which allows the models to be developed in a modular and extensible fashion and to be shared. Simulations are carried out with the locally-developed Biology of Ageing e-Science Integration and Simulation (BASIS) system. Results We have modelled the IIS pathway from receptor binding of Insulin/IGF-1 to the activation of downstream kinases and their targets. We have extended a published model to put it into the stochastic framework and introduced additional positive and negative feedbacks and interaction with the TOR pathway. We show how these can lead to alterations in the sensitivity of IIS, and moreover how this can occur in a tissue-specific manner. The subcellular localization, transcriptional activity and stability of FOXO is controlled by a complex system of post-translational modifications in response to IIS and other signalling pathways. We have unified these into a single computational model, and we show the effects on FOXO of the interplay between multiple input signals acting with a variety of temporal patterns. Conclusion We have shown how an integrated model of the nutrient sensing system can be used to gain insight into the regulation of key molecular mechanisms of the maintenance, repair and resource allocation systems.

**PA7 021 VASCULAR OXIDATIVE STRESS AND INFLAMMATION ARE INCREASED WITH AGE AND AMELIORATED BY LIPOIC ACID SUPPLEMENTATION**

T. HAGEN\* (Oregon State University, Corvallis, United States of America)  
A. SMITH(1), B. FREI(3) - (1) Oregon State university (Corvallis, United States of America); (3) Oregon State university (Corvallis, United States of America)

Introduction: Increased oxidative stress and inflammation appear to be contributing factors to age-related atherosclerosis and cardiovascular diseases. Our previous work has shown that alpha-lipoic acid (LA) has anti-inflammatory and antioxidant properties. Methods and materials: We investigated biomarkers of systemic and vascular oxidative stress and inflammation in old (22-24 months) and young (3-4 months) male F344 rats and the ameliorating effects of dietary supplementation for 2 weeks with 0.2% (wt/wt) LA. Results: Markers of oxidative stress, viz., NADPH oxidase activity and levels of superoxide radicals, were increased in aorta of old vs. young rats, whereas superoxide dismutase (SOD) activity was decreased. Aortic mRNA and protein levels of the NADPH oxidase subunit, NOX4 (found in vascular cells), but not phagocytic NOX2 or p22phox, also were markedly increased with age, in agreement with the increased NADPH oxidase activity. The activities of xanthine oxidase and catalase were unchanged. Markers of inflammation, viz., NFkB DNA binding activity and mRNA and protein levels of vascular cell adhesion molecule-1 (VCAM-1) in aorta, and the concentration of monocyte chemoattractant protein-1 (MCP-1) in plasma, were significantly increased with age. Dietary supplementation with LA resulted in a non-significant decrease in NADPH oxidase activity in aged aorta, accompanied by a significant decrease in mRNA but not protein levels of NOX4 and VCAM-1. Furthermore, LA reversed the age-dependent decrease in aortic SOD activity, while decreasing plasma MCP-1 levels. Conclusion: These data suggest that vascular oxidative stress and inflammation increase with age, and LA ameliorates some of these age-dependent changes, thereby potentially lowering risk for cardiovascular diseases. This work was supported by grant 0760018Z from the American Heart Association, a grant from the Center for Healthy Aging Research at Oregon State

University, and NIH grant AT002034. Key Words: aging • aorta • lipoic acid • inflammation • oxidative stress

**PA7 022 THE RHYTHM OF AGING: WHY OUR IMMUNE SYSTEMS DO NOT AGE AT THE SAME RATE (AND US WITH THEM)?**

J. WITKOWSKI\* (Medical University of Gdańsk, Gdańsk, Poland)  
E. BRYL(1), A. JÓZWIK(1), M. SOROCZYŃSKA-CYBULA(1), A. DACA(1), K. LISOWSKA(1) - (1) Department of Pathophysiology, Medical University of Gdańsk (Gdańsk, Poland)

Introduction. Experience teaches us, that organisms do not age at the same rate. We hypothesize this must be true also for the aging of immune system, considered one of the most important factors in the organismal aging process. The latter is reflected inter alia by greatly varying ages at which people succumb e.g. to the autoimmune diseases, usually associated with middle or older age, like rheumatoid arthritis (RA), systemic lupus erythematosus, Alzheimer's disease, or certain forms of chronic renal insufficiency. All of these diseases shorten life expectancy, so they can be considered accelerators of aging. There is a plethora of published observations of age-associated and/or age-dependent changes in the qualitative and quantitative changes of the immune system cells' phenotypes and functions. However, so far at least neither of them can be pinpointed as a singular cause of the immune system aging. Methods. Using flow cytometry, we have compared changing phenotypes (especially aging- or activation-related and T-regulatory cell markers) and proliferative functions (using our modification of the dividing cell tracking technique) of the CD4+ lymphocytes in the patients suffering from one of the aforementioned diseases and age-matched controls. Results. While certain phenotype changes observed in the patients are similar to those observed in healthy aging (e.g. increased proportion of the memory cells), other (especially the proportion of Tregs) are variably changing for different diseases. Also, the dynamic parameters G1 time) of CD4+ proliferation in vitro (especially cycle length and G0 vary between the diseases and only in the RA are similar to those seen in healthy aging. Conclusion. Aging- or aging-like (disease-) related immune cells' dysfunction may exhibit various forms, yet lead to the same general consequence: age- and/or disease-related immunodeficiency. Causes of the deterioration are greatly individualized and probably depend on the antigen-exposure history and genetic makeup of any single individual.

**PA7 023 CARDIAC CONTRACTION DETERIORATES WITH AGE IN VENTRICULAR MYOCYTES FROM MALE BUT NOT FEMALE RATS**  
S. HOWLETT\* (Dalhousie University, Halifax, Canada)

Introduction. Cardiac contraction is initiated by membrane depolarization, which triggers release of sarcoplasmic reticulum (SR) calcium (Ca), a process known as excitation-contraction (EC)-coupling. This study investigated whether age-related changes in cardiac EC-coupling differed in ventricular myocytes from male and female Fischer 344 rats. Methods. Ca concentrations (fura-2) and cell shortening (edge-detector) were measured simultaneously in cells from young adult (~3 months) and aged (~24 months) rats. Cells were voltage clamped and paced with conditioning pulses at 2 Hz. Results. The amplitudes of contractions and Ca transients were smaller in myocytes from aged males than in younger cells. Ca current density also declined with age in males. SR Ca content, assessed by caffeine, was similar in males regardless of age. However, Ca released per unit Ca current, an estimate of EC-coupling gain, declined dramatically with age in male cells. Fractional release of SR Ca also declined with age in males. In contrast to the results in males, contraction and Ca transient amplitudes were unaffected by age in female myocytes. Ca current density and fractional SR Ca release did decline with age in females, but EC-coupling gain was not affected by age in female myocytes. Interestingly, SR Ca content increased dramatically in aged female myocytes compared to younger cells. These age and sex differences in cardiac EC-coupling were maintained when conditioning pulse frequency was increased to 4 Hz. Conclusion. In short, age-associated changes in cardiac EC-coupling are more prominent in myocytes from males than in females. The increased SR Ca content in aged female cells may compensate for reduced Ca current, so as to maintain contraction. This increased SR Ca may be a female advantage that limits detrimental effects of age on cardiac EC-coupling.

**PA7 024 ACTIVATION OF AMP-ACTIVATED PROTEIN KINASE STIMULATES NUCLEAR TRANSLOCATION OF GAPDH IN HUMAN DIPLOID FIBROBLASTS**  
E. YEO\* (Gachon University of Medicine and Science, Incheon, Republic of Korea)  
H. KWON(1), J. RHIM(2), S. PARK(2) - (1) Gachon University of Medicine and Science (Incheon, Republic of Korea); (2) Seoul National University (Seoul, Republic of Korea)

• Introduction: Beside the metabolic function of glyceraldehyde 3-phosphate dehydrogenase (GAPDH) in the cytoplasm, it is involved in organization of the cytoskeleton and endocytosis, modulation and transport of nucleic acids, translation and transcription, replication control, DNA repair, cell proliferation and apoptosis. Its diverse activities appear to be regulated according to its subcellular localization and oligomeric structure. We here investigated the intracellular distribution of GAPDH after serum depletion and re-addition of serum, platelet-derived growth factor (PDGF), and lysophosphatidic acid (LPA). Since phosphoinositide-3 kinase (PI3K) has been reported to

be involved in other nuclear import signals and AMP-activated protein kinase (AMPK) inversely interacts with PI3K, their involvement in the serum- and growth factor-induced nuclear translocation of GAPDH was examined in the present study. • Methods and materials: The intracellular distribution of GAPDH was investigated by confocal laser scanning microscopy of immuno-stained young human diploid fibroblasts (HDFs). We addressed our study in the signal transduction pathways using their inhibitors, activators and siRNAs. • Results: Serum withdrawal from young HDFs led to a gradual accumulation of GAPDH in the nucleus and its nuclear accumulation was reversed by re-addition of serum and growth factors PDGF and LPA. The nuclear export induced by re-addition of serum and treatment with PDGF and LPA was prevented by LY 294002 and SH-5, inhibitors of PI3K and protein kinase B (Akt), respectively, suggesting an involvement of the PI3K signaling pathway in the nuclear export of GAPDH. AICAR (5-Aminoimidazole-4-Carboxamide-1-beta-D-Ribofuranoside), an activator of AMPK, stimulated nuclear translocation of GAPDH and prevented its nuclear export by serum and growth factors. AMPK inhibition by compound C and its depletion by siRNA partially prevented the serum withdrawal- and AICAR-induced nuclear translocation of GAPDH. • Conclusion: AMPK activates nuclear import signal of GAPDH, whereas PI3K signaling pathway acts mainly as its nuclear export signal.

**PA7 025 THE NITRIC OXIDE-PRODUCING ACTIVITY OF MACROPHAGES FROM SENESCENCE ACCELERATED MOUSE (SAM)**

T. HOSOKAWA\* (Kyoto University of Education, Kyoto, Japan)  
C. KOSHIDE(1) - (1) Kyoto University of Education (Kyoto, Japan)

Introduction • SAMP1 is one of the inbred strains of senescence accelerated mouse (SAM). Mice of the strain show an age-associated early decline in immune activities, such as antibody production and natural killer activity. However, macrophage functions of the mice have been investigated only partly. In this series of research, we studied age-associated changes in macrophage functions of the mice, in order to discuss causal relations between macrophage functions and accelerated aging of the mice. Here, we investigated the nitric oxide (NO)-producing activity of peritoneal macrophages from various ages of SAMP1 mice. Methods and Materials • Three- to 12-month-old SAMP1/Kue and 3- to 24-month-old C3H/HeS1c mice were used. Peritoneal adherent cells from each mouse were used as macrophages and were cultivated in the complete RPMI1640 medium with lipopolysaccharide (LPS) or IFN- $\gamma$  for 2 days at 37 degree, 5% CO<sub>2</sub> in a CO<sub>2</sub> incubator. Supernatants of each culture were assayed for NO<sub>2</sub><sup>-</sup> by the Griess method. Results • The magnitude of LPS-stimulated NO-producing response of the C3H/He macrophages did not change significantly with aging, whereas that of IFN- $\gamma$  stimulated response showed an increase with aging to a peak at age 6 month and a decline with age from 6 to 24 month. In contrast, the magnitude of LPS-stimulated NO-producing response of SAMP1 macrophages increased significantly with age from 3 to 12 month. The magnitude of IFN- $\gamma$ -stimulated response of SAMP1 macrophages also showed similar age-associated increase. Conclusion • The NO-producing activity of macrophages from SAMP1 mouse increases with aging in spite of age-associated early decline of other immune activities. These results suggest that activated macrophage may increases in number in aging SAMP1 mouse with being involved in the accelerated aging.

**PA7 026 THE PHAGOCYTIC ACTIVITY OF MACROPHAGES FROM SENESCENCE ACCELERATED MOUSE (SAM)**

K. NISHIOKA\* (Kyoto University of Education, Kyoto, Japan)  
T. HOSOKAWA(1) - (1) Kyoto University of Education (Kyoto, Japan)

Introduction • SAMP1 is one of the inbred strains of senescence accelerated mouse (SAM). Mice of the strain show an age-associated early decline in immune activities, such as antibody production and natural killer activity. However, macrophage functions of the mice have been investigated only partly. In this series of research, we studied age-associated changes in macrophage functions of the mice, in order to discuss causal relations between macrophage functions and accelerated aging of the mice. Here, we investigated age-associated changes in the phagocytic activity of peritoneal macrophages from SAMP1 mice. • Methods and Materials • Three- to 20-month-old C3H/HeS1c mice and 3- to 14-month-old SAMP1/Kue mice were used. Peritoneal adherent cells from each mouse were used as macrophages. In a CO<sub>2</sub> incubator, macrophages were incubated for 2 hours at 37 degree with sheep red blood cells (SRBC) or SRBC treated with mouse anti-SRBC IgG antibody. Engulfed SRBC by macrophages were hemolyzed with dimethylsulfoxide. Concentration of hemoglobin in the resultant solutions was measured at 415 nm with a microplate reader. • Results • Phagocytic activity of macrophages tended to increase in 12-month-old and older C3H/He mice. In SAMP1 mice phagocytic activity of macrophages appeared to increase at earlier age as compared with C3H/He mice. Antibody-treated SRBC were engulfed by C3H/He macrophages more vigorously than untreated SRBC. By contrast, untreated SRBC engulfed by SAMP1 macrophages as vigorously as antibody-treated SRBC. • Conclusion • SAMP1 macrophages appear to increase the phagocytic activity at earlier age than C3H/He mice. SAMP1 mice show an age-associated early decline in antibody production and natural killer activity. Therefore,

we suggest that macrophage functions in SAMP1 mice may be enhanced to compensate the early decline in the lymphocyte functions.

**PA7 027 STUDIES ON THE ROLE OF NQO1 IN REPLICATIVE SENESCENCE OF MOUSE EMBRYONIC FIBROBLASTS**

L. JÓDAR MONTILLA\* (UNIVERSITY OF CORDOBA, CORDOBA, Spain)  
F. ALCAÍN TEJADA, I. BURÓN, R. DE CABO, J. VILLALBA MONTORO

Introduction. Senescence is generally defined as an irreversible state of G0/1 cell cycle arrest in which cells are refractory to growth factor stimulation. This state is characterized by oxidative stress and the expression of a number of senescence-associated markers. In most rodent cells, induction of the tumor suppressor p53 is critical to the induction of senescence, as its mutation allows escape from replicative senescence and causes immortalization. NAD(P)H-quinone oxidoreductase 1 (NQO1) is an ubiquitous cytosolic flavoenzyme that is involved in the protection against oxidative stress and carcinogenesis and in the stabilization of p53, particularly under oxidative stress conditions. This work was aimed at the study of the putative role of NQO1 in cellular senescence. Methods and materials. Mouse embryonic fibroblasts (MEFs) were derived from E12.5-E14.5 embryos and cultured in Dulbecco's Modified Eagle's Medium with 10% fetal bovine serum. Growth curves, NQO1 activity, p53-galactosidase were studied and p21 levels, and senescence-associated during cell passages using a 3T3 protocol. Results. Cessation of MEFs growth was observed at passages 5-9. As expected, cellular senescence was associated with a significant increase of p53 and p21 levels. Interestingly, NQO1 activity increased to reach a maximum from passage 5 to 10 and then, a decline took place after passage 15. At passage 20, very low NQO1 activity and p53 levels were observed. Conclusion. We have demonstrated changes of NQO1 activity associated with p53 stabilization and replicative senescence in MEFs. NQO1 could play an important role in the regulation of cellular lifespan by controlling p53 levels.

**PA7 028 EFFECT OF MITOCHONDRIA TARGETED ANTIOXIDANTS ON AGEING OF PODOSPORA ANSERINA: ULTRASTRUCTURAL STUDY.**

S. OJOVAN\* (Faculty of Bioengineering and Bioinformatics, Lomonosov Moscow State University, Moscow, Russian Federation)  
O. KAMZOLKINA(2), O. SHTAER(2), M. VYSOKIKH (3) - (2) Biological Faculty, Lomonosov Moscow State University (Moscow, Russian Federation); (3) Biological Faculty, Lomonosov Moscow State University (Moscow, Russian Federation)

Since many years ageing processes have been extensively studied in various model organisms and systems with an aim to find a base for the development of effective interventions to counteract several age-related diseases in humans. The bases of several theories of ageing include the hypothesis that ageing is basically caused by oxidative damage mediated by reactive oxygen species (ROS) leading to an accumulation of molecular defects which result eventually in organism death. Malfunctioning of mitochondria caused by oxidative damage was claimed as a process leading to ROS overproduction. During many years Podospora anserina has been extensively studied as an ageing model. Works of more than fifty years of research have demonstrated a clear mitochondrial etiology of ageing which subsequently has been repeatedly verified. Mitochondria targeted antioxidants (MAT) were previously shown to be effective in living systems to protect cells and subcellular structures under oxidative stress conditions and ageing [1]. In our work comparative analysis of MAT effect on ageing of Podospora anserina was performed in relation to mitochondrial structure. Podospora anserina tissue pieces were prefixed with paraformaldehyde-glutaraldehyde fixator in phosphate buffer at pH=7.4 for 2.5 h. Then the material was post-fixed with 2% OsO<sub>4</sub> water solution for 2 h. Dehydration with ethanol was done by increasing the ethanol concentration (70% ethanol was saturated with 1% uranyl acetate). Samples were embedded in an epoxy resin and then sectioned by ultramicrotome (75nm). Staining was performed by Reynolds' method. Samples were analyzed using the HU-11B electron microscope "Hitachi". Treated mycelium has significantly prolonged life spans. The electron microscopy analyses evidenced that treatment of wild type Podospora anserina cultivated on M2 medium with lypophilic plastoquinone derivates protects mitochondrial structure under oxidative stress conditions induced by superoxide donor paraquat and ageing. [1] Anisimov A.N. et al. Biochemistry (Mosc). (2008); 73(12): 1329-42.

**PA7 029 EFFECTS OF METABOLISM ON LIFESPAN IN LABORATORY MICE**

L. DUARTE\* (University of Aberdeen, Aberdeen, United Kingdom)  
J. SPEAKMAN(1) - (1) University of Aberdeen (Aberdeen, United Kingdom)

Introduction The link between energy expenditure and longevity has raised strong debate over the past few years. The intuitively attractive "rate of living – free radical damage" theory, which states that increase in energy expenditure decreases lifespan, has been recently contested. This theory is mainly based on the presumption that ageing and death are consequences of toxic by-products of metabolism. There are two commonly used measurements of metabolism: by estimating total energy expenditure, known as daily energy expenditure (DEE), and by measuring resting metabolic rate (RMR). Here we measured DEE and RMR on mice and evaluate how it affects ageing and death by comparing mice lifespan. Methods and materials DEE and RMR were measured in 55

mice. DEE was measured directly by double labelled water method (DLW) using elimination rates of stable isotopes. RMR was assessed from the rate of oxygen consumption at 30°C. After the procedures, mice were kept in groups of four until natural death. Results Both RMR and DEE was highly correlated with Body Mass ( $F=10.0$ ,  $P=0.003$ ,  $R^2 = 0.16$  and  $F=51.87$ ,  $P<0.001$ ,  $R^2 = 0.5$ ). Lifespan was not significantly correlated with RMR ( $F=0.05$ ,  $P=0.09$ ), but was negatively significantly correlated with residual RMR ( $R^2=-0.09$ ,  $F=5.51$ ;  $P=0.023$ ). There was no significant correlation between lifespan and DEE or with residual DEE. Conclusions Although, the negative association between lifespan and RMR points to the direction of the rate of living theory, our DLW data do not corroborate it, suggesting that differences in the levels of locomotor activity may also play a role and contribute differently to the process of ageing. This result highlights the importance of separating the effects of different components of total energy expenditure e.g. resting and activity metabolic rate, to understand how they separately contribute to the ageing process.

#### **PA7 030 EXPRESSION OF mTOR IN SENESENCE MESANGIAL CELLS AND AGING KIDNEYS IN RATS**

G. CAI\* (PLA General Hospital, Beijing, China)

L. ZUO(1), X. CHEN(1), B. FU(1), W. LIU(1), Q. HONG(1) - (1) Department of Nephrology, PLA General Hosp. (Beijing, China)

**Introduction:** Most genes that affect longevity encode components targeted by the rapamycin (mTOR) pathway. However, the links between the mammalian targets of rapamycin (mTOR) signaling and mammalian longevity have not yet been reported. **Methods and materials:** Rat mesangial cells were obtained from male Wistar rats at the ages of 3, 12 and 24 months, respectively. The senescence-like phenotypes included enlarged and flattened morphology, increased granularity and expression of senescence-associated beta-galactosidase (SA- $\beta$ -gal). The renal tissues were processed for morphometric and senescence analysis. The expression and location of mTOR and P21 WAF1/CIP1/SDI1 in kidneys or in mesangial cells were studied by immunohistochemistry or immunofluorescence. The mRNA and protein levels of the mTOR, p-mTOR, P21 WAF1/CIP1/SDI1, P27 KIP1 and P53 were detected by Western blot and/or RT-PCR, respectively. **Results:** Substantial tubulointerstitial injury occurred at the age of 12 months, but significant glomerular structure alterations were observed at the age of 24 months. An increase of SA- $\beta$ -gal staining was seen in tubules that varied in frequency and intensity with aging. The mTOR staining appeared in the mesangial matrix and interstitium. The protein of P21WAF1/CIP1/SDI1 was localized in the tubulointerstitial cells. The staining intensity of mTOR and P21WAF1/CIP1/SDI1 in kidneys of old animals were markedly increased compared to that of young and middle-age rats. The mRNA levels of mTOR and P21 WAF1/CIP1/SDI1 were significantly increased in aging kidneys, compared to that in kidneys at the ages of 3 and 12 months. The protein expressions of mTOR, p-mTOR, P21 WAF1/CIP1/SDI1, P27 KIP1 and P53 were dramatically increased with advancing age. The mTOR protein was localized in the cytoplasm and nucleus of rat mesangial cells, and the fluorescence intensity showed markedly increased in senescent cells. The transcription levels of mTOR, P21 WAF1/CIP1/SDI1 and CyclinD1 were increased in senescent mesangial cells. The protein expression of mTOR, p-mTOR, P21 WAF1/CIP1/SDI1, P27 KIP1, P53 and CyclinD1 were significantly increased with age. **Conclusion:** mTOR may play an important role in the initiation and/or progression of rat mesangial cellular senescence and renal lesions in aging.

#### **PA7 031 REPLICATIVE SENESENCE IN NQO1-NUL MOUSE EMBRYONIC FIBROBLASTS**

J. VILLALBA\* (University of Córdoba, Córdoba, Spain)

L. JÓDAR-MONTILLA(1), C. PARRADO-FERNÁNDEZ(1), F. ALCAÍN(1), M. BURÓN(1), R. DE CABO(2) - (1) Universidad de Córdoba (Córdoba, Spain); (2) Laboratory of Experimental Gerontology (Baltimore, United States of America)

**Introduction.** NAD(P)H-quinone oxidoreductase 1 (NQO1) plays well established roles in bioactivation, chemoprevention, and in antioxidant defense. Recently, it has been shown that NQO1 also participates in the stabilization of p53, which relies in the direct interaction between NQO1 and p53, which avoids p53 degradation by 20S proteasomes. Since replicative senescence of mouse embryonic fibroblasts (MEFs) is associated with oxidative stress, and relies mainly on p53 function, the aim of this work was to study the role played by NQO1 expression in replicative senescence by using a NQO1 knockout model. **Methods and materials:** Wild-type and NQO1 $^{-/-}$  mouse embryonic fibroblasts (MEFs) were derived from E12.5-E14.5 embryos and cultured in Dulbecco's Modified Eagle's Medium with 10% fetal bovine serum. Growth curves, NQO1 activity, p53 and p21 levels were studied during cell passages using a 3T3 protocol. Results. The lack of NQO1 gene expression in NQO1 $^{-/-}$  MEFs did not inhibited p53 stimulation at the initial passages of MEFs subcultures. On the contrary, p53 and p21 levels were found elevated between passages 4 and 9, which correlated with lower rates of cell growth of NQO1 $^{-/-}$  MEFs. However, at passage 16, the NQO1 status had a strong influence on both p53 and p21 levels, which were significantly reduced in NQO1 $^{-/-}$  compared with wild-type MEFs. **Conclusion.** NQO1 does not appear to play a major role in p53 stabilization during the first passages of MEFs subculturing. At later passages however, the lack of NQO1 has a great impact on p53 levels, which is in accordance with its demonstrated role on p53 stabilization. This, the

impact of NQO1 status on p53 and p53-dependent gene expression varies according to cell passage in senescent MEFs.

#### **PA7 032 AGE RELATED CHANGES OF SOLUBLE ENDOGLIN**

B. JURASKOVÁ\* (Charles University in Prague, Hradec Králové, Czech Republic)

C. ANDRYS, J. KREJSEK, D. HRNČIARIKOVÁ, E. MALÁ, D. SOLICOVÁ, H. VAŘÍKOVÁ, I. HOLMEROVÁ

**Introduction:** The role of endoglin in the development of oncologic diseases has been described by many authors, however only few studies focused on its possible role in normal ageing and in the process of neurodegeneration. In 2008 we have started an investigation of possible role of endoglin in neurodegeneration and ageing. Here we present our preliminary results of changes of endoglin levels in the course of ageing. **Materials and methods:** In this study we examined 63 healthy young volunteers (32 women, 31 men, average age 34.7 years), 58 healthy younger seniors (44 women, 14 men, average age 83.5 years) and 33 healthy older seniors (20 women, 13 men, average age 93.0 years). Soluble form of endoglin (sCD 105) in serum was assessed by ELISA using diagnostic kits manufactured by R&D Systems, USA. Statistical analysis of data was performed using MedCalc (Belgium) statistical software. Normal distribution of data was assessed. Student's t-test for independent groups was used. Probability level less than 0.05 was considered as significant. **Results:** Soluble endoglin levels were  $4.88 \pm 0.95$  ng/ml in the group of healthy young volunteers,  $6.11 \pm 1.38$  ng/ml in the group of younger seniors and  $6.25 \pm 2.17$  ng/ml in the group of older seniors. We have found significant difference between young volunteers and younger seniors ( $p < 0.001$ ) and a positive trend in group of older seniors compared to younger seniors which was not significant. Serum levels of endoglin were significantly correlated to age. The value of the correlation coefficient was 0.4796 ( $p < 0.001$ ). **Conclusion:** The level of soluble endoglin increases with age according to our findings. The increase of endoglin level is probably decelerating in very old age (over 90). Further investigations are necessary to show its dynamic in healthy old and very old adults and in old individuals with different conditions including neurodegeneration. This research project was supported the institutional research plan MSM 0021620843 FHS UK and Research Project MZO 00179906.

#### **PA7 033 IRON METABOLISM IN THE RETINA : ROLE IN NORMAL AGING AND IN AGE MACULAR DEGENERATION (AMD)**

**Introduction:** Altered iron homeostasis is associated with AMD. To determine the role of iron homeostasis proteins under oxidative stress conditions and as a function of age, we compared the expression of the main iron proteins in mice(I)heterozygous for the H Ferritin chain (HFT $^{+/-}$ ); in mice(II)overexpressing human Transferrin (hTf) gene and in rd10 mice(III) expressing a gene defect inducing photoreceptors death and the hTf gene. In (I), we compared their susceptibility to light induced damage; in (II) we compared *in vitro* susceptibility of Müller cells to iron induced toxicity; in (III), we analysed the potential *in vivo* effect of an excess of Tf on the rate of retinal degeneration. **Methods:** We used the retina from (I)HFT $^{+/-}$  mice at 3-4 and 16-18 months old. They were exposed to white light (13000 lux) for 24 hours and analysed 24 hours later for iron regulation proteins expression (H and L Ferritin, hephaestin, ceruloplasmin, ferroportin, Tf, Tf receptor, hepcidin, IRP1 and IRP2) by RT-qPCR. In (II), we treated Müller cells with different amounts of iron and analysed their viability. In (III), we analysed retinal degeneration by determining nuclear layer thickness at different time. **Results:** I) We observed decreased HFT in young mice retina. With light, Tf and Tf receptor expression varied in opposite direction but HFT decreased. II) Müller cells from hTf transgenic mice were less sensitive to iron stress than control cells. III) Hybrid mice carrying rd10 genotype and hTf genes displayed overtime a strong delay in degeneration. **Conclusion:** These results demonstrate an adaptation of the iron metabolism proteins in the retina related to age or stress conditions. An excess of iron has been observed in normal aging correlated with a decrease in the number of photoreceptors and also in AMD. Thus the control of iron homeostasis could be an important target to protect the retina in AMD.

#### **PA7 034 A TRADE-OFF BETWEEN THE RATES OF AGING AND INITIAL MORTALITY: WHAT ROLES DO CONTROL SYSTEMS AND THE ENVIRONMENT PLAY?**

A. KHALYAVKIN\* (Institute of Biochemical Physics of RAS & Institute for Systems Analysis of RAS, Moscow, Russian Federation)

A. YASHIN(1) - (1) Duke University (Durham, United States of America)

The important role of homeostatic and control systems as well as reparative and restorative ones in the maintenance and survival of individuals is well recognized. Perhaps a possible programmed and/or stochastic impairment of these systems also plays an important role in the emergence and development of senescence. However, new findings paradoxically

highlight the capability of old mitochondria, precursor cells, tissues, and organs to rejuvenate during the vital activity at appropriate conditions (Isobe et al., 1998; Conboy et al., 2005; Adler et al., 2008; Zhang, Cuervo, 2008; etc.). We suggest it is so because an optimal or inadequate regulation and control of the maintenance function is associated with various regimens of the vital activity, which in turn are responses to different external influences. Biological considerations allow us to conclude that a reasonable amount of the environmental pressure plays a stimulating role for functioning, and within this range the organism can completely renew itself. However, such range of the environmental pressure forces a heavy extrinsic mortality. To reduce this mortality, the organism will have to try to take advantage of a less aggressive environment. It thus compromises by sacrificing the optimal functioning (complete renewal) to the benefit from a less aggressive environment. As a result, renewal becomes incomplete, and senescence generates an age-related increase in the mortality rate. This age-related mortality augmentation is compensated for by a more significant decline in the mortality due to external causes. So we suggest that senescence may be caused by an inadequate interaction of an organism with its environment. Recognition of a previously underestimated direct role of the environmental influences in emergence of the nonpathological senescence will provide a better insight into the primary cause of aging and its basic mechanisms, and pave the way for developing better strategies aimed at deceleration of aging.

**PA7 035 TELOMERE SHORTENING IS ASSOCIATED WITH ENVIRONMENTAL INSULTS AMONG COMMUNITY-DWELLING ELDERS**  
Y. YEN\* (E-Da Hospital, I-Shou University, Kaohsiung County, Taiwan)

Introduction: Shorter telomere length has been associated with mood disorders and dementia in some studies. However, the influence of living environment on inhabitants' telomere length remains unclear. The aim of this study was to explore the role of environmental insults in shortening of telomere length, taking depression and cognitive impairment into account. Methods and Materials: A random household sample of older adults aged 65 to 74 was selected from a community in southern Taiwan. Of 500 subjects attending our study, 301 agreed to have venous blood withdrawn for telomere length measurement. Exactly 227 subjects completed the questionnaires (the Taiwanese Depression Questionnaire for depressive symptoms; the Short Portable Mental Status Questionnaire for cognitive ability; the Neighborhood Quality Index for perceived neighborhood quality of living) and genetic analysis. Results: Most of them were male (58.4%), married (75.9%), and received education for 6 years or less (93.3%). Their telomere lengths ranged from 0.41 to 4.29 kb with a mean of 1.93 (SD 0.95) kb. In the model of linear regression including gender, age, education, marital status, income, depressive state, cognitive function, and three neighborhood quality indicators (social support, environmental safety, and facilities), telomere was significantly associated with the environmental safety. A one-unit increase in environmental safety score was associated with a decrease of 0.082 (95% CI 0.009–0.154,  $p=0.027$ ) kb, adjusting for gender, age, education, marital status, income, depressive state, cognitive function, and two other neighborhood quality indicators. On the other hand, the presence of depressive state or cognitive impairment was not significantly associated with telomere length. Conclusion: Those results of this cross-sectional study support for the chronic stress model of accelerated cellular aging. Stress from unsafe neighborhood may predict shorter telomere length. Further longitudinal study is needed to confirm the causal relationship.

**PA7 036 GLOBAL DNA METHYLATION ALTERATIONS IN THE AGING NERVOUS SYSTEM**
