Epigenetics influence gene function without affecting the DNA nucleotide sequence. DNA methylation, together with histone modifications, is the best characterized epigenetic modifications. DNA methylation is a heritable modification of DNA; crucial for development, transcriptional regulation and genomic stability. Abnormal DNA methylation of individual genes is a characteristic of cancer progression and important in neurological disorders such as Rett syndrome. It has also been shown to play a significant role in Werner syndrome. Importantly available evidence suggests that changes in DNA methylation accumulate during aging. Early studies identified global hypomethylation in a number of different tissues with advancing age. Later studies have shown also region-specific hypermethylation during aging. Global hypomethylation may cause genome instability and increase transcriptional "noise". Genome instability and hypomethylation have been linked not only to tumorigenesis but also to replicative senescence. Little is known about changes in global methylation in postmitotic cells such as neurons. Our hypothesis is that hypomethylation may be one mechanism undermining the normal neuronal phenotype in aging. We have analyzed global methylation in discrete regions of the central nervous system from rats of different age and sex, up to the median expected survival age using the LUMinometric Methylation Assay (LUMA). LUMA is based on combined DNA cleavage by methylation-sensitive restriction enzymes and polymerase extension assay by pyrosequencing. The results indicate increasing hypomethylation with advancing age. A process, which may have started as early as in the middle-ages. Preliminary data suggests that global alteration in DNA-methylation during aging, at least in part, has a gender specific pattern. Finally, the data indicate that these changes are

region-specific, consistent with the notion of a select vulnerability to the aging process among subsets of neurons. In conclusion, our data support the notion that changes in the epigenetic organization of DNA may be an important mechanism in cellular aging.

**PA7 037 THE NETWORK ROBUSTNESS-FRAGILITY HYPOTHESIS OF AGING, LONGEVITY, AND AGE-RELATED DISEASES**

V. FRAIFELD \* (Ben-Gurion University of the Negev , Beer-Sheva, Israel)  
R. TACUTU (1), A. BUDOVSKY(1), M. WOLFSON (1) - (1) Ben-Gurion University of the Negev (Beer-Sheva, )

Hundreds of genes have been identified as being associated with longevity of model organisms and with human age-related diseases (ARDs). These studies highlight that aging, longevity, and ARDs are influenced by multiple genetic factors. Yet, the trend to focus on individual genes and/or their products continues to dominate, reflecting in part a current paradigm in biomedical research — searching for the specific targets that offer the potential for the development of highly specific drugs. In spite of enormous efforts and accumulated knowledge, our capabilities for tackling aging and ARDs, and ultimately to promote longevity are still very modest. What is lacking — essential knowledge of key players or efficient analytic tools, or both? Here we discuss how the existing data may be integrated and analyzed using a network-based approach and the tools developed in our lab, focusing particularly on the role of microRNA-regulated protein-protein interaction networks in linking the human aging, longevity, and ARDs. Simulations of node attacks revealed groups of proteins that might be of crucial importance for normal functionality and integrity of the system. The predictive power of the model has recently received an experimental validation. A gradual decrease in the network robustness along with an increased fragility of individual nodes are proposed as being the common mechanisms of both aging and ARDs. This work was supported by the European Union FP7 Health Research Grant number HEALTH-F4-2008-202047

**PA7 038 BENEFITS OF GLUTAMINE SUPPLEMENTATION IN MUSCLE GLUTAMINE SYNTHESIS IN VERY OLD FEMALE RATS ARE NOT MAINTAINED POST-TREATMENT**

D. MEYNIAL-DENIS\* (INRA and Human Nutrition Research Center, Clermont-Ferrand, France)  
A. BEAUFREIRE(1), P. PATUREAU MIRAND(2) - (1) 1 (Clermont-Ferrand, France); (2) 2 (Clermont-Ferrand, France)

Glutamine synthetase (GS) a key enzyme in the production of glutamine is preserved in skeletal muscle during early aging (<24 mo). GS activity is enhanced in very old female and male rats. Hence, glutamine has a specific role in very old rats (up to 25 months of age). In addition, the up-regulated GS muscle activity observed in very old rats decreased when rats were Gln supplemented, with no change in plasma and muscle Gln concentrations. This was probably related to the increased Gln requirement with very advanced age. In contrast, nothing is known about the duration of this effect after discontinuation of Gln supplementation. We decided therefore to study muscle GS response 15 days after the end of treatment. Changes in GS activity were examined in the tibialis anterior (TA) muscle in 8 mo and 27 mo-old Wistar rats. As described elsewhere, adult and very old animals were exposed to Gln supplementation by the addition of Gln to drinking water for 7 consecutive days a month (20% of dietary protein) but during 50 % of their age and not during 5 months of their life. The treatment was discontinued 15 days before the rats were sacrificed and not just before. As expected, Gln supplementation had positive effects in very old rats: 1) it prevented the loss of body weight caused by very advanced aging; 2) it did not prevent sarcopenia (no improvement in decreased muscle mass). In contrast, interrupting treatment did not maintain the decrease in up-regulated GS activity observed in Gln-supplemented very old rats, as previously demonstrated. Neither muscle Gln concentration nor plasma level was modified by the preservation of increased muscle Gln synthesis. Because there was no accumulation of Gln in both muscle and plasma, this is additional evidence suggesting that Gln requirements increase with advanced age.

**PA7 039 THE PREPONDERANCE OF NEGATIVE SIGNALING EXPLAINS THE ALTERED CLONAL EXPANSION OF T CELLS WITH AGING**

C. FORTIN\* (Research center on Aging, Sherbrooke, Canada)  
J. LAMOUREUX(1) - (1) Research center on Aging (Sherbrooke, Canada)

Introduction: Aging is accompanied by a decrease in immune functions, called immunosenescence. The exact cause is still not known. Changes in T cell sub-populations, thymic involution were invoked. We have demonstrated that the signal transduction is altered with aging. In the present work we studied the negative regulatory molecules in the T cell signaling to explain the altered activation of T cells with aging leading to decreased clonal expansion. Methods: 25 healthy young and elderly subjects were studied. Lymphocytes were separated by Fycoll-Hypaque. The molecules participating in the negative control loop of Lck were studied by Western blot. The surface expression of CTLA-4 has been studied by FACScan and confocal microscopy. The translocation of the molecules in the membrane lipid rafts (MLR) was also studied by Western blot. The activity of phosphatases was also determined. Results: We found that the phosphorylation of PAG was altered with aging explaining the decreased release of Csk from MLR and the

decreased Lck activation. The activation of FynT was also altered. The phosphatase activity studies showed an increase in their activities with aging. The CTLA-4 expression was higher after stimulation in T cells of elderly. Conclusion: These results suggest that the negative regulation is preponderant in T cells with aging on the positive activation and as such explaining the defect in T cell functions with aging. This opens new therapeutic avenues in the future.

**PA7 040 THE LEVEL OF PCP4, THE NEUROPROTECTOR CAMSTATIN, IS SENSITIVE TO AGING AND REVERSED BY CALORIE RESTRICTION IN BRAIN**  
N. CREAU\* (University Paris Diderot, Paris, France)  
S. THOMAS(1), R. RATTENBACH(1), D. ELARIBI(1) - (1) BFA (Paris, France)

Pcp4 (Pep19) is expressed only in neurons of adult brain. It has been observed to protect against apoptosis and its level is frequently observed decreased in several brain pathologies. Pcp4 is a modulator of Ca++-CaM activation (camstatin) and therefore interfere in calcium signaling. This neuroprotector has been studied in C57Bl/6 mice during normal aging (from 2 to 24 months). Evaluation of the level of brain expression by *in situ* hybridization and QRT-PCR showed an important global decrease at 24 months of age, while until 12 months, no significant change in expression was observed. This decrease was observed in all regions where neurons expressed the gene. In calorie restriction (CR) diet treated mice of 24 months of age, this decrease was no more observed after either 4-months or 12-months CR duration. In mice 6 months of age and submitted to the same treatment, no effect on pcp4 expression was observed. This suggests that the mechanism responsible for the decrease of pcp4 expression at 24 months is sensitive to SIRT1-related calorie restriction. Pcp4 is located on human chromosome 21 and on mouse chromosome 16. Thus three copies of the gene are present in Down syndrome. To evaluate the consequences of the three copies of the Pcp4 gene in aging phenotypes, current investigation of its level in mouse models of Down syndrome (trisomic and transgenic) during aging are performed. It will confirm if the level of pcp4 may be altered during aging in this situation and therefore may contribute to variability in aging phenotypes in Down syndrome.

**PA7 041 EFFECTS OF A PROLONGED LEUCINE SUPPLEMENTATION ON ADIPOSE TISSUE IN ELDERLY RATS**  
O. MOLATO\* (CHU de Nice, Nice 3, France)  
G. ZEANANDIN(1), I. MOTHE-SATNEY(1), N. GAUTIER(1), M. BALAGE(2),  
D. DARDEVET(2), X. HÉBUTERNE(1), E. VAN OBBERGHEN(1), S. SCHNEIDER(1) - (1) Pôle Digestif du CHU de Nice, INSERM U907 (France); (2) Unité de Nutrition Humaine, UMR1019, INRA-CRNH Auvergne (France)

Introduction: Age-related sarcopenia is characterized by a reduced muscle mass and increased fat mass. Leucine supplementation is a promising therapeutic approach, due to its direct effect on muscle protein synthesis through a stimulation of the mTOR pathway, synergistic with insulin. Leucine also exerts effects of adipogenesis and fat morphogenesis, but its long-term effects are poorly known. This study aimed at determining the effects of a prolonged oral leucine supplementation on the adipose tissue of elderly rats. Methods: 71 male Wistar rats, aged 18 months, were fed ad libitum for 5 months a diet with 15% protein, supplemented in glycine (Gly, 35 rats) or leucine (Leu, 36 rats), with a follow-up of food intake and weight. On sacrifice, tissues were harvested, including the peri-renal adipose tissue that was used to measure proteins and/or mRNAs involved the insulin and mTOR pathways, adipokines and PPAR&gamma. Results: On sacrifice day, when compared with Gly rats, body weight was higher in Leu rats ( $718 \pm 17$  g vs  $618 \pm 14$  g,  $P < 0.05$ ), due to a 40% gain in adipose tissue ( $P < 0.001$ ) with no difference in other tissue weights including skeletal muscles. This weight gain was obtained during the first two weeks of the experiment and was concomitant to a higher food intake. The only difference in proteins between groups for the insulin and mTOR pathways was an increase in PKB&beta; and phosphorylated mTOR in the Leu rats ( $P < 0.0003$ ). PKB&beta; and Rictor mRNAs were lower in Leu rats and PPARY mRNAs higher in Leu rats, with no differences in adipokine levels. Conclusions: A prolonged oral leucine supplementation in elderly rats induces a significant adipose tissue gain along with an increased adipose differentiation, with no effects on muscle mass. This data needs to be confirmed, but may question the interest of leucine supplementation in sarcopenia.

**PA7 042 MOLECULAR ANALYSIS OF ABETA AMYLOID AGGREGATION IN THE MODEL ORGANISM PODOSPORA ANSERINA**  
M. MADDELEIN\* (CNRS UMR5089, Toulouse, France)  
V. RAMILLION(1), M. CHIMEN(1) - (1) CNRS UMR5089 IPBS (Toulouse, France)

Introduction Abeta amyloid peptides represent the core component of amyloid plaques found in Alzheimer disease brain patients. From genetic to molecular studies, Abeta peptides aggregation is clearly involved in the disease. Therapies have aim at inhibiting aggregation of Abeta peptide. Nevertheless, neither the molecular mechanism of amyloid aggregation nor the amyloid structure acquired *in vivo*, have been established. Several structural models of Abeta amyloid fibers have been proposed. However, until now, all molecular analyses of Abeta peptides aggregation have been conducted *in vitro*. Recently, it has been pointed out that initial conditions of aggregation strongly define the structure

adopted and propagated by Abeta peptides. This structural flexibility in amyloid structure well explains the existence of prion strains. Consequently, structural models deduced from *in vitro* conditions might not represent exactly Abeta aggregates formed *in vivo*. Methods and materials In order to characterize *in vivo* aggregation of Abeta amyloid peptides, we expressed them in the model organism *Podospora anserina*, already used for studies of infectious amyloids. We realized site direct mutagenesis on Abeta peptides fused to Green Fluorescent Protein and analyzed the solubility of the fusion by fluorescence microscopy and western-blot. This molecular screening was also carried out on Abeta synthetic peptides for biochemical and structural analysis. Results & Conclusions We found that Abeta peptides expressed in *Podospora* formed aggregates spontaneously, even when attached to a globular domain. *In vivo* Abeta aggregation can be suppressed by replacement of some key amino-acids. As we did for the HET-s amyloid protein of *Podospora*, systematic mutagenesis of Abeta amino-acids will permit to correlate *in vivo* aggregation with *in vitro* structural elements. Our molecular studies should bring significant advance in the understanding of *in vivo* Abeta amyloid aggregation. Overall the fundamental knowledge, these *in vivo* data are crucial to design therapeutic agents targeting amyloid structure recognition.

**PA7 043 DYNAMICS OF MITOCHONDRIAL PROTEINS IN YOUNG AND SENESCENT CELLS**  
D. DIKOV\* (Goethe University, Frankfurt, Germany)  
V. SUKHORUKOV(1), S. MAI(1), M. JENDRACH(1), J. BEREITER-HAHN(1) - (1) Goethe University (Frankfurt, Germany)

Introduction: Mitochondria and their membranes are highly complex structures but also very dynamic. While in young cells mitochondrial fission and fusion events are a frequent process, in senescent cells mitochondrial dynamics are significantly reduced. Furthermore, also extensive intramitochondrial dynamics of the mitochondrial outer and inner membrane as well as of mitochondrial proteins and DNA take place. Inter- and intramitochondrial distribution of damaged mitochondrial components is hypothesized to act as rescue mechanism of impaired organelles by replacing damaged proteins with functional ones and therefore to contribute to mitochondrial functionality and maintenance. During ageing the mitochondrial inner and outer membrane change their morphology, composition and therefore fluidity as well. The aim of this work was to analyse putative age-induced changes in dynamics of mitochondrial proteins. Methods and Material: As cell model, young chicken embryo fibroblasts (CEF) were used, which were compared to CEF that had been aged *in vitro*. To analyse the dynamics of the mitochondrial matrix-, inner and outer membrane proteins, fluorescence-labelled proteins were analysed by FRAP (fluorescence recovery after photobleaching) in young and senescent cells. The fission factor Fis-1 was used as a model protein for the outer mitochondrial membrane, subunits of respiratory complexes were used to analyse dynamics of the inner mitochondrial membrane and furthermore a GFP-tagged protein was inserted into the matrix. Results: By using a sophisticated mathematical approach, we were able to determine the diffusion properties of these proteins, which are mainly influenced by their location and less by ageing, indicating that the differential dynamics of the mitochondrial proteins are reflecting the complexity of the mitochondrial membrane architecture. Conclusion: By using FRAP, we can show for the first time the comparison in the dynamics of mitochondrial proteins in young and senescent cells, indicating that short term diffusion does not constrain the mitochondrial fusion and fission in age.

**PA7 044 MRI TO CHARACTERIZE ALZHEIMER DISEASE PROGRESSION OVER SEVERAL YEARS: COMBINING RESEARCH AND CLINICAL SCANS**  
S. NESTOR\* (University of Western Ontario, London, Canada)  
J. TRUEMNER(2), R. BARTHA(1), M. SMITH(2), M. BORRIE(2) - (1) Centre for Functional and Metabolic Mapping, Robarts Research Institute (Canada); (2) Lawson Health Research Institute, Parkwood Hospital (Canada)

Introduction: The rate of cerebral ventricular enlargement measured from  $T_1$ -weighted 1.5 Tesla magnetic resonance images (MRI) is an indirect measure of Alzheimer disease (AD) progression. This is a highly reproducible technique. Clinical MR scans are often acquired in subjects who also participate in clinical/observational research studies. Consolidating clinical and research MR scans and deriving ventricular volumes may allow characterization of biological AD progression over long periods. Objectives: (1) To assess the association between ventricular volume changes in AD over several years in comparison to measures of cognitive decline in three persons with probable AD (2) to examine the viability of combining multiple research and clinical MR scans. Methods: MRI, clinical, and neuropsychological data were collected for three persons with probable AD. All patients consented to release of their information. Patient 1, male, age=77, 2 clinical trials, total 7 scans, average scan interval=4/-+3 (months); patient 2, female, age=71, 1 clinical trial and 1 observational study, 5 scans, average scan interval=5/-+6; patient 3, female, age=62, 1 clinical scan and 1 clinical trial, 7 scans, average scan interval=12/-+12. Ventricular volume was computed using Brain Ventricle Quantification (Cedara). All analyses were completed blind to subject group, and time of scan. Pearson correlations tested associations between ventricle and cognitive measures. Results: Subject 3 demonstrated a strong association between ventricular change (average change  $+/-SD=2.5/-+2.9\text{cm}^3$ ) and change on the Mini Mental State Exam (MMSE) (average change  $+/-SD=-1.5/-+4$  points) ( $r=-0.9, p=0.037$ ). Patient 1 demonstrated a trend for an association

between cognitive decline measured on the MMSE (average decline  $-+SD=-1/-2$  points) in relation to ventricular enlargement (average enlargement  $-+SD=6.4/-15\text{cm}^3$ ). Conclusion: In this small sample, ventricular change is associated with MMSE measured cognitive decline in certain subjects. Ventricular volumes derived from different studies may be combined to characterize an individual's biological AD progression over long intervals and may complement cognitive tests.

**PA7 045 DIFFERENCE IN FMRI ACTIVATION LEVELS IN ELDERLY SUBJECTS WITH HIGHER AND LOWER OLFACTORY PERFORMANCE**  
 B. CERF-DUCASTEL\* (San Diego State University, San Diego, United States)  
 L. MORIN-AUDEBRAND(1), L. HAASE(2), J. ROYET(1), C. MURPHY(2) - (1) UMR CNRS (Lyon, France); (2) SDSU & UCSD (San Diego, United States of America)

Introduction: Olfactory function is impaired in older adults. The underlying cortical substrate for age-related differences in performance in an odor paradigm was investigated in the present study employing fMRI. Methods and Materials: Nineteen healthy elderly subjects ( $68.4 \pm 3.2$  y.o.) participated in the study. Odors were presented in a continuous flow of air in synchronization with the subject's inspiration and were followed by a 10 s rest. Fifty odors were presented during a first run during which subjects performed a detection task, and 100 odors, i.e. 50 old and new odors were presented during a second run, during which subjects performed a recognition task. Performance was coded with hits, misses, correct rejections (CR), false alarms (FA) and discriminability index  $d'$ . fMRI images were preprocessed with Statistical Parametrical Mapping (SPM2, Friston et al., 1995) and processed with AFNI deconvolution algorithm (Cox 1996). Results: Subjects were separated into two groups according to their performance on  $d'$ : one group was composed of 13 subjects with  $d'>0.1$  (higher-performers), and the other group was composed of 6 subjects with  $d'<0.1$  (lower-performers). A region of interest (ROI) analysis was conducted on 15 regions including frontal areas, mesio temporal areas, pifiform cortex, cingulate gyrus, caudate nucleus, insula, lingual gyrus. An ANOVA showed an interaction between ROI, hemisphere, type of response (hits, misses, FA, CR) and performance (higher, lower). Conclusion: This study suggests that levels of activation in different cortical areas are associated with differences in performance in the odor paradigm. Supported by Programme de Recherche en Alimentation (PRA) and the Programme National de recherche en Alimentation et Nutrition Humaine (PNRA) to J.P. Royet and NIH Grant R01AG04085 to C. Murphy.

**PA7 046 ASSOCIATION BETWEEN ADIPONECTIN GENE VARIANTS IN SUBJECTS OF METABOLIC SYNDROME IN ELDERLY TAIWANESE —A HOSPITAL-BASED STUDY**  
 C. LIN\* (China Medical University Hospital, Taichung, Taiwan, Taichung, Taiwan)  
 C. LIU(1), . LIN(1) - (1) China Medical University Hospital, Taichung, Taiwan (Taichung, Taiwan)

Introduction: People with metabolic syndrome (MS) are at greater risk for atherosclerotic cardiovascular disease. Most are also insulin resistant. Serum adiponectin levels and its several single nucleotide polymorphisms (SNPs) in the adiponectin gene have been reported associated with the metabolic syndrome. This study investigates the relationship between adiponectin gene variants in elderly subjects of metabolic syndrome in Taiwan. Methods: This was a cross-sectional hospital-based study. We analyzed the health status of elderly who voluntarily visited the China Medical College Hospital in Taichung for preventive services from January to December 2006. The preventive services included history taking, physical examination, and measurement of fasting blood biochemistry and adiponectin SNP 45 and SNP -11426 were measured in this study. The MS criteria were modified from the Third Report of the National Cholesterol Education Program's Adult Treatment Panel (ATP III, 2001). Results: Of the 215 persons, 42% were men and 58% were women (mean age,  $63.6 \pm 7.2$  years). The MS prevalence rate was 40% (86/215). After adjusted for appropriate covariates, individuals with adiponectin SNP45TT and SNP-11426 AA had a 1.62-fold risk (95% CI, 0.53-4.94) and 1.49-fold risk (95% CI, 0.37-6.02) to develop metabolic syndrome than those with SNP45GG and SNP-11426 GG. Conclusion: Our study showed the high prevalence of metabolic syndrome in elderly in Taiwan. However the polymorphisms of adiponectin SNP45 and SNP-11426 can't modify the influence on metabolic syndrome risk in elderly Taiwanese.

**PA7 047 VITAMIN C DEPLETION INCREASES SUPEROXIDE GENERATION IN BRAINS OF SMP30/GNL KNOCKOUT MICE**  
 Y. KONDO\* (Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan)  
 T. SASAKI(1), S. HANNA(1), N. MARUYAMA(1), A. ISHIGAMI(2) - (1) Aging Regulation, Tokyo Metropolitan Institute of Gerontology (Tokyo, Japan); (2) Department of Biochemistry, Faculty of Pharmaceutical Sciences, Toho University (Chiba, Japan)

Vitamin C (VC) has a strong antioxidant function evident as its ability to scavenge superoxide radicals in vitro. We verified that this property actually exists in vivo by using a real-time imaging system in which Lucigenin is the chemiluminescent probe for detecting superoxide in senescence marker protein-30 (SMP30)/gluconolactonase (GNL) knockout (KO) mice, which cannot synthesize VC in vivo. SMP30/GNL KO mice were given 1.5g/L VC [VC(+)] for 2, 4, or 8 weeks or denied VC [VC(-)]. Coronal slices of brain from both groups were rapidly prepared and incubated in a chamber filled with oxygenated Krebs-

Ringer solution with Lucigenin for 120 min. Next, the conditions were made hypoxic for 15 min before a return to the oxygenated environment, and incubation continued for up to 120 min. Images of brain slices were acquired every 15 min during each conditions. Total VC was measured by using a high-performance liquid chromatography-electrochemical detection method. Total superoxide dismutase (SOD) activity was measured by using the SOD Assay Kit-WST. Protein levels of Mn-SOD, Cu,Zn-SOD and catalase were determined by western blot analysis. At 4 and 8 weeks, VC levels in brains from VC(-) KO mice were  $<6\%$  of that in VC(+) KO mice. Accordingly, superoxide-dependent chemiluminescence levels determined by ischemia-reperfusion at the 4- and 8 weeks test intervals were 3.0-fold and 2.1-fold higher, respectively, in VC(-) KO mice than in VC(+) KO mice. However, total superoxide dismutase activity and protein levels were not altered. VC depletion specifically increased superoxide generation in a model of the living brain.

**PA7 048 COMPLEXITY ANALYSIS OF HUMAN POSTURAL SWAY IN ELDERLY**  
 B. SEIGLE\* (University of Montpellier 1 , Montpellier, France)  
 S. RAMDANI(1), P. BERNARD(1) - (1) University of Montpellier 1 (Montpellier, France)

INTRODUCTION Stability corresponds to the faculty of the body to maintain a position of balance. The latter depends on the mechanisms of postural regulations which mobilize the sensitivo-sensory, visuo-vestibular and kinesthetic systems. Recently, many studies (Sabatini, 2000; Roerdink et al., 2006; Duarte et al., 2008) aimed to describe and explain the dynamical properties of the center of pressure (CoP) fluctuations during quiet standing. In this paper, we propose to use the sample entropy (SampEn) algorithm to investigate the effect of vision on the complexity of CoP time series in a group of elderly subjects. METHODS AND MATERIALS 100 elderly participated to the stabilometric tests. They had to maintain stance quiet with eyes open and eyes closed on a force platform. The SampEn index (Richman and Moorman, 2002) was calculated for each time series in both directions (anterior-posterior, AP and mediolateral, ML). The SampEn is basically a quantification of the regularity of a signal. This statistic increases with the complexity (irregularity) of the dynamics. RESULTS Our main result was that the SampEn significantly decreased with absence of vision in AP direction ( $p=0.02$ ). This result is consistent with the loss of complexity theory for physiological and behavioral systems with aging, disease and constraint (Vaillancourt and Newell 2002; Goldberger et al., 2002). Generally, this loss of complexity is explained by a reduction of the number of structural components involved in the dynamics of the system and/or an alteration of the coupling existing between these components. CONCLUSION Based on a robust complexity quantification algorithm, the present study demonstrated the ability of the SampEn index to detect modifications in CoP dynamics induced by the absence of vision in elderly people.

**PA7 049 NEUROFUNCTIONAL CHARACTERIZATION OF VERBAL FLUENCY AS A FUNCTION OF AGING AND PRODUCTION TIME**  
 Y. MARSOLAIS\* (CRIUGM / Université de Montréal, Montréal, Canada)  
 V. PERLBARG(2), O. MONCHI(1), H. BENALI(2), Y. JOANETTE(1) - (1) Centre de recherche, Institut universitaire de gériatrie de Montréal (Montréal, Canada); (2) UMR-S 678, INSERM/UPMC, Faculté de médecine Pitié-Salpêtrière (Paris, France)

Introduction: Optimal cognitive functioning in older adults has been associated with various changes in patterns of brain activations. Yet, few studies have investigated the neurofunctional changes underlying expressive language abilities such as verbal fluency, which tends to get harder over time within a criteria. Moreover, most studies have relied on the sole identification of isolated activated brain regions, which may not be integrated in a neurofunctional network. The goal of this study was to use functional Magnetic Resonance Imaging (fMRI) and a functional connectivity approach called NEDICA (Network Detection Using Independent Component Analysis) in order to assess age and time-related changes in fMRI activations and functional networks associated with a verbal fluency task. Methods and materials: 12 younger (aged 20 to 31) and 12 older (aged 60 to 73) healthy, highly-educated, right-handed French speaking adults performed a verbal fluency task in a 3T fMRI scanner. They were asked to say as many words as possible given 4 orthographic and 4 semantic criteria, within a limited amount of time (90 s/criteria). The reference task consisted of repeating the months of the years. The fMRI acquisitions were made within a mixed design consisting of a single functional run (1600 s, TR = 2) and were blocked a posteriori according to production time and criteria. Results: At the behavioural level, only the main effect of time was significant; both groups showed fewer productions over time. At the neurofunctional level, age-related differences were found for both activation maps and functional networks. For instance, fewer functional networks were identified in older adults, who also showed less significant activations than younger adults. Conclusion: Although both age groups performed similarly at the behavioural level, considerable differences were found at the neurofunctional level. Such results are discussed in light of current age-related neurofunctional reorganization literature.

**PA7 050 AGE-RELATED INCREASE OF SUPEROXIDE GENERATION IN THE BRAINS OF MAMMALS AND BIRDS**  
 T. SASAKI\* (Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan)  
 K. UNNO(2), S. TAHARA(1), A. SHIMADA(3), T. KANEKO(1) - (1) Tokyo Metropolitan Institute of Gerontology (Tokyo, Japan); (2) Pharmaceutical Sciences,

University of Shizuoka (Shizuoka, Japan); (3) Institute for Developmental Research, Aichi Human Service Center (Aichi, Japan)

Oxidative stress, an imbalance between endogenous levels of oxygen radicals and anti-oxidative defense, increases with aging. However, it is not necessarily clear which factor is more critical to the age-related increase of oxidative damage, increase in oxygen radical or decrease in anti-oxidative defense. To clarify the production of oxygen radicals increases with age, we examined oxygen radical-dependent chemiluminescent signals in ex-vivo brain slices using a novel photonic imaging method "real-time bioradiography" (Sasaki et al, Brain Res 2006, Aging Cell 2008). Age-related changes of superoxide levels in brain, superoxide-dependent chemiluminescence was measured in living brain slices prepared from different aged animal brain during hypoxia-reoxygenation treatment as follows. Coronal brain slices were prepared from male senescence accelerated mouse (SAM) P10-TaSl and SAMR1/TaSlc mice, C57/BL6 mice, Wistar rats, and pigeons brains. Slices were pre-incubated in the imaging chamber filled with 50 mL of Krebs-Ringer solution containing 2 mM of Lucigenin under a continuous flow of oxygen gas. After a preincubation, chemiluminescent images of brain slices were acquired during hypoxia (nitrogen gas) and reoxygenation(oxygen gas) in the temperature-controlled imaging box. Lucigenin-derived chemiluminescence intensified during reoxygenation. Chemiluminescence intensity in SAMP10 (short life strain) and SAMR1 (control) brain slices under oxygenation (basal) and reoxygenation was increased with aging. The slope of increase of intensity with age in P10 was steeper than those in R1. Age-dependent increase of chemiluminescence intensity was also observed in C57BL/6 mouse, Wistar rat and pigeon. However, superoxide dismutase activity in brain tissue of these animals was not changed significantly with age. These results suggest that superoxide production itself is increased with aging. We speculate that reactive oxygen may be a kind of signal for aging and its levels in tissue may determine the aging process and life span.

**PA7 051** CONTROL OF VANCOMYCIN-RESISTANT ENTEROCOCCI OUTBREAKS IN A 900-BED GERIATRIC HOSPITAL IN PARIS AREA: A FIVE YEAR EXPERIENCE.

L. DRIEUX\* (Groupe Hospitalier Charles Foix - Jean Rostand, Ivry sur seine, France)  
F. BROSSIER(1), P. CHAIBI(2), A. AUBRY(1), S. LEFRANÇOIS(2), J. PAUTE(1),  
E. DOYEN-BRUNET(2), C. KHAVAS(2), A. GOUOT(2), C. FORASSASSI(2),  
V. JARLIER(1) - (1) Groupe Hospitalier Pitié-salpêtrière (paris, France); (2) Groupe Hospitalier Charles Foix-Jean Rostand (Ivry sur Seine, France)

Between 2004 and 2007, our hospital experienced several outbreaks of vancomycin-resistant Enterococcus faecium (VRE). We describe here the measures implemented to control these outbreaks. Materials and Methods. Case was defined as patient with (a) VRE isolated from clinical specimen and (b) from rectal swab from contact patients. Rectal swabs were plated on Bile-Esclaine-Azide agar containing vancomycin (10mg/L) and resistance genes were identified by Genotype Enterococcus assay. The clonality of VRE strains was studied by pulsed-field gel electrophoresis (PFGE). Measures aimed at controlling cross transmission: identification of carriers using a specific self-stick label, barrier precautions, promotion of hand hygiene, cohorting of cases and contact patients with dedicated staff, weekly screening of contact patients by rectal swab. Results. The 1st VRE outbreak started in December 2004, generating 9 cases in single ward (attack rate 30%). No new case was detected after April 2005. Between September 2005 and April 2007, a hospital-wide outbreak involved 70 patients in seven wards (incidence densities of 0.08, 0.25 and 0.05 per 1,000 days of hospitalization in 2005, 2006 and 2007, respectively). This outbreak was controlled after cohorting (a) all the VRE patients from the seven wards in a single unit with dedicated staff, and (b) all the contact patients in another unit. The outbreak began to decline in June 2006 and the last case was identified in April 2007. No new case occurred till December 2008 although 9 VRE patients and 15 contact patients were still in the Hospital. The strains involved in both outbreaks were E. faecium carrying vanA gene but, based on the susceptibility and PFGE patterns, the strain of the 1st and the 2nd outbreak differed. Conclusion. Successful control of VRE outbreaks is possible in geriatric hospital if a strict policy of active surveillance, cohorting and reinforcement of barrier precaution is implemented.

**PA7 052** IMPACT OF AN EDUCATIONAL PROGRAMMME ON FLUOROQUINOLONES (FQs) CONSUMPTION AND RESISTANCE TO FQs IN A 900-BED GERIATRIC HOSPITAL.

L. DRIEUX\* (Groupe Hospitalier Charles Foix - Jean Rostand, Ivry sur seine, France)  
C. BAILLON(2), I. PEYRON(2), S. GALLAH(2), V. JARLIER(1), A. AUBRY(1) - (1) Groupe Hospitalier Pitié-salpêtrière (Paris, France); (2) Groupe Hospitalier Charles Foix-Jean Rostand (Ivry sur Seine, France)

Fluoroquinolones (FQs) are easy-to-use antibiotics in geriatrics. The rate of resistance to ciprofloxacin in Escherichia coli increased from 8 to 31% between 1998 and 2005. We implemented an educational programme on antibiotic prescription in 2006. We describe here the impact of this programme on FQs prescription and susceptibility to FQs in E. coli. Methods. The educational programme included (a) guidelines on antimicrobial therapy providing clinical indications for each class of antibiotics, (b) systematic review of every FQs prescription based on patient clinical and microbiological data and (c) recommendation for switching for antibiotics other than FQs (e.g. nitrofurantoin for lower

UTIs, coamoxiclav or macrolides for LRTIs...) or stopping antibiotic administration when FQ prescription appeared inadequate. Results. Seventy percent of FQs prescriptions (mean 15 per month) were in agreement with guidelines. Switch for antibiotics other than FQs or stopping antibiotic administration was obtained in most (89%) of the cases of non-agreement. A decrease in overall consumption of antibiotics from 272 to 216 defined daily doses (DDD) per 1,000 patient-days (PD) (-20%) was observed between 2005 and 2007. This decrease was stable in 2008 (210 DDD/1,000 PD) and was entirely the consequence the decrease of FQs consumption from 32 to 12 DDD/1,000 PD, -62%) during the same period of time. Simultaneously, the resistance to ciprofloxacin in E. coli decreased significantly. Conclusion Controlling FQs prescriptions by interactive and educational programme can lead to decrease FQs prescriptions and curb trend to resistance in major bacterial species.

**PA7 053** TELMISARTAN, AN ANGIOTENSIN II TYPE 1 RECEPTOR BLOCKER, PROTECTS FROM RENAL INJURY PARTIALLY THROUGH INHIBITION OF NOTCH PATHWAY IN AKITA (INS2(AKITA)) DIABETIC MOUSE  
K. MASAYA\* (Chiba University Graduate School of Medicine, Chiba, Japan)  
M. TAKEMOTO(1), S. SATO(1), Y. SAITO(1), K. YOKOTE(1) - (1) Chiba University Graduate School of Medicine (Chiba, Japan)

Introduction: Chronic kidney disease (CKD) is one of the risks for cardiovascular disease in elderly patients, and diabetic nephropathy (DN) is a leading cause of CKD. It has been recently reported that the Notch pathway is involved in the pathogenesis of DN. In this study, we investigated the activation of the Notch pathway in Ins2 Akita (Akita mouse), a murine model of DN, and the effects of telmisartan on the Notch pathway. Materials and Methods: Akita mice and control mice received telmisartan (5 mg/kg/day) or no treatment, respectively, for 15 weeks (n = 8 in each group). Body weight, blood pressure, and urinary albumin excretion were measured every 2 weeks. The effects of telmisartan on the Notch signaling pathway were studied by RT-PCR and immunohistochemistry both in vivo and in vitro using cultured murine podocytes. Results: Compared to the control mice, the levels of urinary albumin excretion, serum BUN, and creatinine were higher in the Akita mice (10.9 mg/day,  $22.2 \pm 3.8$  mg/dl, and  $0.07 \pm 0.01$  mg/dl vs. 50 mg/day,  $64.7 \pm 12.3$  mg/dl, and 0.19 mg/dl, respectively;  $P < 0.05$ ). Telmisartan treatment significantly decreased the levels of urinary albumin excretion, serum BUN, and serum creatinine in Akita mice (33 mg/day,  $30.2 \pm 6.7$  mg/dl,  $0.09 \pm 0.01$  mg/dl, respectively;  $P < 0.05$ ). The expression of the intracellular domain of Notch1 and its ligand, Jagged1, were increased in podocytes in Akita mice. However, telmisartan treatment significantly ameliorated those expressions. TGF- $\beta$  increased the expression of the Notch target gene, Hairy/Enhancer of split-related (Hey1), in cultured podocytes, and telmisartan suppressed this expression. Conclusion: The Notch signaling pathway was activated in podocytes in Akita mice. Telmisartan suppressed the Notch pathway both in vivo and in vitro. Our results indicate that telmisartan protects from DN, possibly through inhibition of the Notch pathway.

**PA7 054** VITAMIN D SUPPLEMENTATION WITH CALCIFEDIOL IN POSTMENOPAUSAL OSTEOPENIC WOMEN  
Y. CHUNG\* (Ajou University School of Medicine, Suwon, Republic of Korea)  
E. KIM(1), M. LEE(1), T. KIM(1), Y. LEE(1) - (1) Ajou University School of Medicine (Suwon, Republic of Korea)

Introduction: The purpose of this study was to evaluate the effects of vitamin D (calcifediol) supplementation on bone metabolism in postmenopausal osteopenic women. Methods: The phase IV clinical trial of randomized double blind placebo-controlled study of either calcifediol (Caldiool®, Medica Korea Co., Korea) 20ug daily or placebo were conducted for 8 weeks. Serum 25(OH)D3 and parathyroid hormone(PTH) were measured at 0, 4, and 8 weeks. Bone mineral density of lumbar spine, total hip and femoral neck were measured at baseline. Results: Of 30 patients, 16 were calcifediol group and 14 were placebo group. In calcifediol group, serum 25(OH)D3 level significantly increased from  $12.4 \pm 0.68$  (baseline) to  $31.8 \pm 2.57$  (4 weeks) and  $42.24 \pm 3.32$  (8 weeks) ng/mL. Serum PTH slightly decreased from  $25.3 \pm 2.5$  (baseline) to  $20.3 \pm 1.1$  (4 weeks) and  $21.4 \pm 2.0$  (8 weeks) pg/mL. In placebo group, there were no difference of serum 25(OH)D3 and PTH from baseline to follow-up. Conclusion: Calcifediol improved vitamin D status in terms of serum 25(OH)D3 levels in postmenopausal osteopenic women.

**PA7 055** TELOMERASE ACTIVATORS AS POTENTIAL ANTI-SENESCENCE AGENTS  
I. TARKANYI\* (University of Debrecen, Medical and Health Science Center, Debrecen, Hungary)  
J. ARADI(1), J. MOZES(1), G. BAKO(2) - (1) University of Debrecen, Department of Biochemistry and Molecular Biology (Hungary); (2) University of Debrecen, 3rd Department of Internal Medicine (Hungary)

Introduction: Proliferation of telomerase negative cells results in progressive telomere shortening. When telomeres reach a critical length, proliferation will be irreversibly arrested. Although telomere shortening and onset of senescence termed to be the traditional faith of primary proliferating cells, it seems that deficiencies in telomere maintenance mechanisms will install an early senescent phenotype with the loss of function at cellular

and systemic level. Manifestation of chronic diseases, independent from etiology, has been associated with shorter telomeres and "telomerized" tissues were proposed as solution. Methods: Application of molecules that activate already present telomerase enzyme could be the clinically safest method to activate telomerase. We discovered previously, that an oligonucleotide (termed C16AS), composed of a 13-mer antisense moiety against the template site of the telomerase RNA component and a 5' attached 16-mer oligocitidate, is able to activate the telomerase enzyme. We tested activation properties of C16AS in cell free *in vitro* systems using a modified version of the Telomere Repeat Amplification Protocol. We designed derivates of C16AS with modified primary sequences thus altered three dimensional structures in order to identify sequence motifs affecting activation efficacy. Results: We observed that derivates with 14 or 18-mer citidate moieties preserve activating properties, with a slight increase in activation potency in case of the 18-mer. Using derivates where oligocitidate was fully or partially replaced resulted in diminution or complete loss of activation. Conclusion: Therapies targeting chronic diseases and regeneration, as well as methods aiming rejuvenation, like application of telomerase activating agents, might have an increased importance in the future. According the results, it seems that C16AS acquires a specific three dimensional structure and activates telomerase with an aptamer-like effect. Derivates of the original compound have enhanced activation properties, thus further development into an *in vivo* telomerase activator seems to be reasonable.

**PA7 056 TELMISARTAN, A SELECTIVE PPAR&GAMMA; MODULATOR, SHOWS ANTI-AGING EFFECT THROUGH THE REGULATION OF MITOCHONDRIAL FUNCTION IN SKELETAL MUSCLE**

K. SUGIMOTO\* (Geriatric Medicine, Suita, Osaka, Japan)

T. FUJISAWA(1), K. KAMIDE(1), M. OHISHI(1), T. KURTZ(2), H. RAKUGI(1) - (1) Geriatric Medicine, Osaka University Graduate School of Medicine (Suita, Osaka, Japan); (2) Laboratory Medicine, UCSF Medical Center (San Francisco, United States of America)

Introduction: Recently, the relationship of mitochondrial dysfunction or mitochondrial DNA (mtDNA) variants to metabolic disorders as typified by diabetes has begun to attract increasing attention. Mitochondrial dysfunction in skeletal muscle has been implicated in a wide variety of pathological processes including insulin resistance or senescence. Telmisartan is an angiotensin II receptor blocker and a selective PPAR $\gamma$  modulator reported to increase energy expenditure and improve glucose and lipid metabolism compared with other angiotensin II receptor blockers. To clarify the detailed mechanism of these effects of telmisartan, we focused on regulation of mitochondria function in skeletal muscle and performed several comparative experiments using other compounds activating PPAR pathways. Methods: In the current study, measurement of ATP and reactive oxygen species (ROS) production, and real-time PCR to measure expression of mitochondria-related genes and mtDNA copy number were performed using C2C12 cell line. Results: C2C12 myotubules exposed to telmisartan increased ATP production as much as those exposed to a PPAR $\delta$  agonist, GW501516, however, those exposed to a PPAR $\gamma$  agonist, troglitazone did not. C2C12 myotubules treated with telmisartan reduced ROS production as much as those treated with troglitazone. Mitochondria cytochrome c oxidase I (MTCO1) expression was increased in C2C12 myotubules exposed to telmisartan ( $p<0.05$  compared with control), and MnSOD expression was increased in C2C12 myotubules exposed to telmisartan ( $p<0.05$  compared with control). MtDNA copy number in C2C12 myotubules treated with telmisartan was not significantly increased in comparison with control. Conclusion: The current results are consistent with the possibility that telmisartan may regulate mitochondrial function through activation of PPAR pathway at least in part. Telmisartan might be recognized not as just an antihypertensive drug but as a drug having anti-aging effect via increasing energy production and decreasing oxidative stress.

**PA7 057 DEVELOPMENTAL THEORY OF REJUVENATION**

O. KVITKO\* (Institute of genetics and cytology, Minsk, Belarus)

Introduction. The available means of life extension are based on the treatment of the diseases that are caused by ageing but not on the intervention in the process of ageing itself. Because of the limited maximum human lifespan and significant prolongation of the average human lifespan that has already been achieved further perspectives are bleak if the means of extending life beyond its species-specific upper border will not be found. The practical value of the elaboration of new biotechnologies (including stem cell transplantation) aimed at the treatment of various diseases will progressively decrease and even can soon become negligible. Without a theoretical understanding of biological ageing and finding the means of extending maximum human longevity the whole complex of medical-biological disciplines in the not too far distant future may simply run to a deadlock. Methods and materials. Theoretical analysis of articles on aging, development and neuroendocrine regulation. Results. According to the developmental theory of rejuvenation during aging epigenetic changes accumulate that distort the gene expression. In embryogenesis and postnatal growth the special mechanism reverses epigenetic mistakes and rejuvenates the cells. This salutary process is driven by extracellular fluctuations of morphogenetic molecules that regulate embryogenesis. For a permanent rejuvenation and extending life of the organism intensive (embryo-like) morphogenetic oscillations should be produced in tissues. Morphogenetic fluctuations may be stimulated with the aid of specific brain-induced sequences of electrical impulses that can be named

rejuvenating brain waves. Antiaging waves are generated effectively by the brain due to a new kind of mental practice that trains the ability "to think of everything simultaneously" and, thereby, greatly enhance the neural information processing. Conclusions. The developmental theory of rejuvenation offers a special mental practice that may enhance the brain information processing and produce special electrical impulses (rejuvenating waves) that can extend the maximum human lifespan.

**PA7 058 A POTENTIAL ROLE FOR FOXO1 IN THE EFFECT OF CALORIE RESTRICTION**

S. ISAO\* (Nagasaki University Graduate School, Nagasaki, Japan)

H. YAMAZA(1), T. KOMATSU(1), T. CHIBA(1), H. HAYASHI(1), T. FURUYAMA(2), N. HONDA(3), I. SHIMOKAWA(1) - (1) Nagasaki University Graduate School (Nagasaki, Japan); (2) Sonoda Women's University (Hyogo, Japan); (3) Nagasaki Clinical Laboratory Chuken, Co., Ltd. (Nagasaki, Japan)

Reduction of IGF-1 signaling is reported to extend lifespan in animals. Calorie restriction (CR), a well-known experimental intervention that retards the aging and extends lifespan, also reduces plasma GH and IGF-1 concentrations in rodents. Rats whose GH-IGF-1 axis was modestly suppressed shared phenotypes with CR rats. These findings suggest a role for the GH-IGF-1 axis in the effect of CR. Extension of lifespan by reduced insulin-like signaling in nematodes requires a transcription factor named Daf-16 (mammalian FoxO1, 3a, and 4). We investigated a potential role for FoxO1 in the effect of CR using FoxO1 knockout (+/-) mice. In the liver, FoxO1-mRNA levels were significantly increased by CR, while not for FoxO3a or 4. We evaluated resistance to oxidative stress, gene expression levels, glucose-insulin homeostasis, and lifespan in KO and wild type mice subjected to CR. CR enhanced resistance to the oxidative stress induced by 3-nitropropionic acid both in wild type and KO mice. CR similarly affected glucose-insulin profiles in KO and wild type mice. CR also increased lifespan in KO mice to the same extent of that in wild-type mice. Although FoxO1 is known to affect gene expression of metabolic and stress response genes, the present results suggest that the effect of CR is induced by factors other than FoxO1.

**PA7 059 INFLUENCE OF ENVIRONMENTAL ENRICHMENT AND NICOTINE ADMINISTRATION ON EXPLORATORY BEHAVIOR IN MICE**

R. REDOLAT\* (University of Valencia, Valencia, Spain)

P. MESA(1), A. PÉREZ-MARTÍNEZ(1) - (1) University of Valencia (Valencia, Spain)

INTRODUCTION: Recent evidence indicates that a complex environment may prevent some of the age-related cognitive deficits observed in elderly people. In rodents, environmental enrichment induces neurochemical and behavioral effects. However, few studies have evaluated emotional reactivity in mice reared in enriched environments. Our main aim was to evaluate combined effects of enriched environment and chronic nicotine administration on exploratory behavior. Nicotine may have neuroprotective effects, and different nicotinic agonists are being tested as treatments for neurodegenerative disorders. METHODS AND MATERIALS: Half of the male NMRI mice (n=64) were exposed to an enriched environment (EE) and the other half remained in standard cages (SC) with or without oral nicotine (100  $\mu$ g/L). After 3 weeks, mice were tested in the actimeter and in the hole-board (a test which reflects exploratory activity and novelty seeking). RESULTS: ANOVA was performed taking into account the factors "Housing" and "Nicotine". There were significant differences in exploratory behavior between EE and SC mice both in the total number of head-dips ( $p<0.05$ ) and in the number of activity counts in the actimeter ( $p<0.001$ ): EE mice displayed lower number of head dips and reduced locomotor activity than SC mice. No significant effects of nicotine administration were obtained in any of the two tests. CONCLUSION: Exposure to an enriched environment, but not chronic oral nicotine, modifies locomotion and emotional reactivity. These results agree with previous data both in young and aged mice, and suggests that decreased motor and exploratory behavior may influence cognitive abilities displayed by animals reared in enriched environments. Environmental enrichment has been considered a useful paradigm exploring new treatments against neurodegenerative disorders such as Alzheimer's disease. Our results suggest that changes in exploratory behavior induced by an enriched environment may be taken into account when interpreting results obtained in learning/memory tasks using this experimental paradigm.

**PA7 060 NEW STRATEGIES TO TREAT CELL AGING CONSEQUENCES BY ANTI-INFLAMMATORY MOLECULE AISA 5203-L**

P. D'ALESSIO\* (University Paris Sud, Paris, France)

M. MIRSHAHII(1), A. BENNACEUR(2) - (1) Centre de Recherches des Cordeliers UMRS 872 (Paris, France); (2) INSERM U 935 (Villejuif, France)

Introduction : Stress-induced premature aging is detrimental for cells, stem-cells niches and organ function. It is associated to a high concentration of pro-inflammatory cytokines, thus accelerating cells and stem cell senescence. Methods and Results : 1/ We have characterized the mechanism of action of a monoterpene AISA 5203-L and its major metabolite POH in *in vitro* and *in vivo* studies documenting their anti-inflammatory and anti-stress activity. 2/ By a FOB (Functional Observation Battery) we have attested analgesic effects and observed enhanced motility. We have found an exceptional capacity

to restore epithelia both in colon and skin toward pro-inflammatory agonists and toxic substances, sustained by the inhibition of circulating TNF-alpha, as well as Interlukin-6 and Interlukin-1 and locally expressed vascular endothelial adhesive molecule inhibition (P-selectin). 3/ Here we show data attesting the anti-angiogenic capacity of AISA 5203-L and POH at non toxic doses in a HUVEC model. These results confirm previous ex vivo results attesting an important NO (Nitric Oxide) dependent vasodilation. Conclusions: We propose that the supplementation of the diet of an elderly person characterized by frailty syndrome, with AISA Therapeutics anti-inflammatory molecules could successfully treat its chronic mood alterations, consequently limiting immobilization. Also ulcerous skin and gut alterations characteristic of the elderly, would be treated concomitantly, enhancing the comfort of the patient. Finally, the mentioned treatment could anticipate the failure of stem cell niche compliance, and thus cancer development.

#### **PB7 061 EFFECTS OF EXERCISE ON THE NUMBER AND SIZES OF CARDIAC NEURONS IN WISTAR RATS DURING THE AGEING PROCESS.**

R. RODRIGUES DE SOUZA\* (São Judas Tadeu University, São Paulo, Brazil)  
E. FLORENCIO GAMA(1), A. COPPI MACIEL RIBEIRO(1) - (1) (São Paulo, Brazil)

It is well known that aerobic training is accompanied by changes within the cardiovascular system. However, the effects of exercise on the cardiac neurons, a group of neurons located on the surface of the atria, that control the cardiac activity at rest and during exercise were not studied. The present investigation sought to evaluate cardiac neurons adaptations, such as cell number and sizes to chronic exercise training in a rat model. Methods and materials. Twenty 3-month old male Wistar rats (*Rattus norvegicus*) were divided at random in two groups: Group 1 (G1) – Sedentary control group, comprising ten 3-month old animals that were sacrificed at the age of 13 months; Group 2 (G2) - Exercised rats, comprising ten 3-month old animals that were submitted to running on a treadmill for 10 months, sacrificed at the age of 13 months and an additional group of 10 animals (young control group, G3), that was killed at 3 months of age. Results. The number of cardiac neurons was decreased in the sedentary group (30%) when compared to the trained rats (10 months of running on a treadmill 3 times a week, 0.9 Km/h) ( $P < 0.05$ ). Furthermore, there was a notable increase in the percentage of small neurons in the rats submitted to the training compared to the sedentary group ( $P < 0.05$ ). Conclusion. These results demonstrate that the exercise training affected significantly the number and the size of the cardiac neurons in Wistar rats. These neuronal adaptations seem to be a result of the training presumably with the objective of increasing the excitability of the neurons for the vagal action and resulting facilitation of the sinus bradycardia observed in the rest and in the exercise.

## **Track B – Health Sciences and Geriatric Medicine**

#### **PB7 062 AN AUSTRALIAN AGENDA FOR DEMENTIA RESEARCH RELATING TO ETHNIC MINORITY GROUPS**

L. LOW\* (University of New South Wales, Coogee, Australia)  
B. DRAPER(1), A. CHENG(2), B. CRUYSMANS(3), N. HAYWARD-WRIGHT(3),  
Y. JEON(4), D. LOGIUDICE(5), H. WU(1), G. ZOGALIS(6), H. BRODATY(1) - (1) University of New South Wales (Kensington, Australia); (2) Australian Nursing Home Foundation (Burwood, Australia); (3) Alzheimer's Australia NSW (Macquarie Park, Australia); (4) Australian National University (Canberra, Australia); (5) University of Melbourne (Australia); (6) Multicultural Mental Health Australia (Australia)

Introduction One-in-five Australians are from ethnic backgrounds, as are one-in-four Americans and one-in-six French. This proportion is projected to rise with increasing global migration. Methods and materials During a one-day meeting invited experts presented reviews on key areas followed by group discussion with invited stakeholders. Consensus on nine key research recommendations for Australia was reached. Results The review of each area revealed a paucity of Australian and international literature relating to dementia research in ethnic minorities. There is low quality of evidence to inform care to these groups. No dementia epidemiological study in Australia has been conducted that included ethnic minority persons with poor English skills; this limits service planning. Persons from ethnic minority groups present later for assessment, usually at crisis point, and underutilize services. Diagnosis is complicated by the lack of culture and language appropriate assessment tools. Medical management is based on research on predominantly Caucasian subjects. The level of cultural competency of medical and care staff is not known and in Australia a high proportion of care staff are from an ethnic minority background. Challenges to minority research include: the heterogeneity of minority groups; cultural differences that necessitate changes to traditional research designs; lower participation rates; lack of valid assessment instruments; need for appropriate translation and bilingual staff; and limited significance of some projects decreasing the chance of receiving funding and increased costs. Suggested methods to increase ethnic minority research include setting national and cross-national research agendas, encouraging grassroots impetus, providing pilot funding, linking researchers and ethnic communities intra- and internationally, having a central repository of resources and results and influencing policymakers to demand research. Conclusion More dementia research

involving ethnic minority groups is needed. The development of research agendas is one strategy to encourage this.

#### **PB7 063 PREVALENCE OF COGNITIVE IMPAIRMENT ADJUSTED BY AGE AND EDUCATIONAL LEVEL: SEX AND PATHOLOGY EFFECTS**

J. MILLÁN-CALENTI\* (University of A Coruña, A Coruña, Spain)  
J. TUBÍO(1), I. GONZÁLEZ-ABRALDES(1), T. LORENZO(1), R. LÓPEZ(1),  
A. MASEDA(1) - (1) University of A Coruña (A Coruña, Spain)

Introduction: The estimation of the prevalence of cognitive impairment in a representative sample of Spanish older people using the Mini-Mental State Examination (MMSE) and applying corrective factors based on age and educational level was the aim of this research. Secondly, we evaluated the relationship among cognitive impairment and social and medical conditions. Methods and materials: A representative sample was randomly selected, 600 people, aged 65 and older, living in Naron Council (A Coruña). Socio-demographic and biomedical data have been collected and cognitive status has been assessed using the MMSE, the cognitive impairment cut-off was corrected by age and educational level. Results: A total of 591 subjects completed the assessment (98.5%). We determined variations in the prevalence from 35.2% without applying age or educational level adjustments to 22.2% if applied. Average score in women was significantly lower than in men (22.6 vs. 25.5) for all age levels and showed higher probability of cognitive impairment (odds ratio [OR], 2.19). Negative correlation was observed between the age and the MMSE score (Spearman correlation rho = - 0.45, p<0.001), increasing the possibility of developing cognitive impairment yearly (OR = 1.11). Cognitive impairment has been associated with an increase of morbidity and mortality in the elderly. This association has been found with the presence of dementia (p = 0.000), heart failure (p = 0.017), anaemia (p = 0.043), stroke (p = 0.016) and auditory deficits (p = 0.007). Conclusions: There is a high prevalence of cognitive impairment among elderly. To avoid overestimated ratios, it's necessary to adjust the cognitive impairment's cut-off by age and educational level in the assessment using the MMSE in old population. We found cognitive impairment was significantly associated with health problems (heart failures, strokes, anaemia or dementia)

#### **PB7 064 CARDIO ANKLE VASCULAR INDEX AS A PREDICTOR OF COGNITIVE IMPAIRMENT IN THE DWELLING ELDERLY PEOPLE: FIVE YEAR FOLLOW UP**

N. YAMAMOTO\* (Tokyo Women's Medical University, Medical Center East, Arakawa, Tokyo , Japan)  
T. YAMANAKA(1), N. HOTTA (1), E. TAKASUGI(1), M. ISHIKAWA (1),  
G. YAMANAKA(1), S. MURAKAMI(2), M. ISHINE (3), K. MATSUBAYASHI(3),  
K. OTSUKA (1) - (1) Department of Medicine, Tokyo Women's Medical University, Medical Center East (Arakawa, Tokyo, Japan); (2) Cardiology, Osaka Medical College (Takatsuki city, Osaka, Japan); (3) Center for Southeast Asian Studies, Kyoto University (Sakyo-ku, Kyoto, Japan)

Introduction: Symptomatic cerebrovascular disease correlate cognitive function; however, whether high arterial stiffness marker without symptomatic cerebrovascular disease can predict for advancing cognitive impairment is unclear. Cardio-Ankle Vascular Index (CAVI) is an index of arterial stiffness without influencing by blood pressure. We evaluated whether the CAVI is associated with advancing cognitive impairment after 5 years in dwelling elderly people. Methods and Materials: In August 2004, we recruited 93 subjects aged above 75 years from free health screening in Japan. Patients with cerebrovascular dementia and symptomatic peripheral artery disease were excluded. We divided the subjects into two groups by CAVI in baseline. More than 10m/sec with CAVI was defined as an AS (+), and less than 10m/sec was defined as an AS (-). Cognitive function test including Hasegawa Dementia Scale Revised (HDSR) were performed and compared in two groups every year from 2004 to 2008. Results: HDSR in baseline did not difference between both groups (AS (+) vs. AS (-) = 26.5vs. 26.4 points). HDSR in AS (+) significantly decreased more one year later compared with HDSR in AS (-) (AS (+) vs. AS (-) = 26.5, 25.1, 25.6, 25.8, 24.7 (P < .005) vs. 26.4, 26.3, 26.7 26.4, 26.7 points (n.s.), between AS (+) vs. AS (-), P < .001, two way ANOVA). After adjustment for age and sex, quantity of fall in HDSR as five years was significantly large in AS (+) than AS (-) (-1.8 vs. 0.3 points, P < .006). The ratio of more than 4 points decline in HDSR for every year, was significantly higher in AS (+) than AS (-) (P = .026, OR was 1.66, 95% CI [1.05, 2.81]). Conclusion: The finding of the present study is that CAVI predicted the occurrence of cognitive declining beyond the prediction by age, gender and blood pressure.

#### **PB7 065 IS PRESBYACUSIS A RISK FACTOR FOR DEMENTIA? ACODEM STUDY**

L. VERGNON \* (GRAP, Vincennes, France)  
D. POUCHAIN, L. VERGNON, J. HAMDAOUI, C. DUPUY

Background: Although it's intuitively logic to think that there is probably a relationship between presbyacusis and cognitive disorders, there is no evidence for that. AcouDem study aimed at showing that cognitive disorders prevalence was significantly higher in older patients with hypoacusis than those with a normal audition. Research question: Is

presbyacusis a risk factor for dementia? Methods: Comparative transversal epidemiological study in an institutionalised elderly population in the fourth age. 319 subjects aged over 75 years have been assessed for their auditory acuity by a verbal acoumetry and for their cognitive status by 3 validated tests. The prevalence of patients with cognitive disorders was compared between patients with presbyacusis and those having a normal audition by means of Chi<sup>2</sup> test. Results: The mean age was 85.3 years. Groups with or without auditory defect were comparable for all other characteristics. The relative risk for cognitive disorders development was 2.48 in patients with presbyacusis (IC95% = 1.54-3.99, p < 0.0001). Odds ratio between presbyacusis and cognitive disorders remained significant, independently of age: OR = 2.09; IC95% = 1.07-4.07, p = 0.004 between 75 and 85 year old and OR = 2.46; IC95% = 1.20-5.07, p = 0.02 after 85, and of sex: OR = 2.33; IC95% = 1.32-4.12, p = 0.005 for women and OR = 3.43; IC95% = 1.38-8.51, p = 0.01 for men. Conclusion: AcouDem is the first study as well as the first stage to prove a link between presbyacusis and dementia. Next stages will be a case-control study followed by a randomised control trial in order to test the efficiency of auditory prosthesis and orthophonic rehabilitation in slowing down cognitive impairment in patients with slight to moderate dementia.

#### **PB7 066 IADL DISABILITY IN DIFFERENT STAGES OF ALZHEIMER'S DISEASE AND FRONTOTEMPORAL DEMENTIA**

R. SAMPER-TERNENT\* (University of Texas Medical Branch/Pontifícia Universidad Javeriana, Galveston, United States of America)  
C. CANO(1), D. MATALLANA(2), P. REYES(2), C. ESCUDERO DE SANTACRUZ(2), K. OTTENBACHER(3) - (1) Fundación Santa Fe de Bogotá (Bogotá, Colombia); (2) Pontificia Universidad Javeriana (Bogotá, Colombia); (3) University of Texas Medical Branch (Galveston, United States of America)

Introduction: Disability measured by limitations in Instrumental Activities of Daily Living (IADL) is an important prognostic factor in patients with dementia. This study aims to identify which IADL, measured with a modified version of the Lawton Scale, were affected in patients with Mild Alzheimer's Disease (AD), Moderate AD and Frontotemporal Dementias (FTD) and if there were differences between the stages of AD and between the different types of dementia. Methods: A total of 386 patients were included. Patients were evaluated at the Memory Clinic of Hospital San Ignacio, an academic hospital in Bogotá, Colombia, between 2000-2005. National Institute of Neurological Disorders and DSM-IV criteria were used to diagnose AD and the Lund and Manchester criteria were used to diagnose FTD. Standardized tests for cognition and affective disorders were given to all patients. Activities of Daily Living (ADL) were assessed with the Barthel scale and IADL were measured with the Lawton Scale. Results: A statistically significant difference was observed in the Mini-Mental State Exam Score (MMSE) in patients in both stages of AD (p<0.01). Significant differences were also observed between patients with AD and patients with FTD (p<0.01). Overall, there was only one IADL that was not compromised in FTD, all other IADL had a significant decline compared to both stages of AD (p<0.05). Conclusion: IADL disability was observed in the 3 groups. Compared to Mild AD 33% more activities were affected in Moderate AD and 29% compared to FTD. The only IADL not affected in FTD was walking around the house. IADL affected in FTD were those that require adequate executive function, this was not the case for AD. Future research needs to address the pathophysiological pathways and clinical implications of differences in functional decline depending on the diagnosis.

#### **PB7 067 EFFECTS OF COMMUNITY OCCUPATIONAL THERAPY ON SELF-PERCEIVED PERFORMANCE AND SATISFACTION IN DEMENTIA PATIENTS AND CAREGIVERS.**

M. GRAFF\* (Radboud University Nijmegen Medical Center, Nijmegen, The Netherlands)  
M. VEROOIJ-DASSEN(1), M. THIJSSEN(1), J. DEKKER(2), W. HOEFNAGELS(1), M. OLDERIKKERT(1) - (1) Radboud University medical Center (Nijmegen, The Netherlands); (2) Free University Amsterdam (Amsterdam, The Netherlands)

Introduction: Dementia has far reaching consequences for patients and caregivers and is a major driver of costs in health care. Major problems are losses in independence, initiative, and participation in social activities, decreasing patients' and caregivers' quality of life. Caregivers often experience feelings of helplessness, social isolation, and loss of autonomy. Unfortunately, drugs are not yet effective in improving the symptoms of dementia. Community occupational therapy (OT) is a tailor-made, client-centred intervention directed at improving patients' daily functioning and participation in social activities and is directed at increasing caregiver's sense of competence in handling behavioural problems. These outcomes are increasingly being considered more clinically relevant than measures of cognitive outcome. A recent randomised controlled trial proved that community OT for people with dementia (n = 135) and caregivers was effective on dementia patients' daily functioning, caregivers' sense of competence and both patients' and caregivers' quality of life, mood and health status. Also the effects on patients' and caregivers' self-perceived performance in daily activities and satisfaction on their individually defined problem areas was investigated. Methods: Single blind randomized controlled trial. Assessors were blinded for treatment allocation. Results: Significant improvements relative to baseline were found on patients' (1.5; 95% Confidence Interval [CI], 1.0 to 2.0; effect size 1.4) and caregivers' (2.0; 95% CI, 1.6 to 2.4; effect size 2.1) self-perception on individually defined problems in daily performance and significant improvements on patients' (1.6; 95% CI, 1.1 to 2.1, effect size 1.5) and caregivers' (1.6;

95% CI 1.2 to 2.1; effect size 1.6) satisfaction with their performance, after 10 visits community OT. Effects remained at 3 months follow-up. Conclusion: These results confirm the client-centeredness of this community occupational therapy programme.

#### **PB7 068 THE RELATION BETWEEN MEMORY COMPLAINTS AND AGE IN NORMAL AGING**

T. LIMA-SILVA,\* (University of São Paulo, São Paulo, Brazil)  
M. YASSUDA(1) - (1) University of São Paulo (São Paulo, Brazil)

Introduction: Normal aging can be characterized by a gradual decline in some cognitive functions, which depend on neurologic processes. Some aspects of memory are affected significantly by the aging process. In this context, memory complaints are common among older adults, and may reflect their biopsychosocial status. Memory complaints may signal depression, anxiety, mild cognitive impairment, or initial dementia. The objective of this study was to investigate the association between memory complaints and age in cognitively unimpaired older adults, and the relation between memory complaints and memory performance. Methods and materials: Cognitive screening tests as well as memory complaint questionnaires validated for the Brazilian population were used: Mini Mental State Examination (MMSE), Geriatric Depression Scale (GDS), Memory Complaint Questionnaire, Memory test of 18 pictures, Forward and Backward Digit Span (WAIS-III). 57 older adults were invited to participate, with 4 to 8 years of education, who used to participate in activities in SES. Results: Results did not reveal a significant association between cognitive complaints and age or cognitive performance. Older participants in this sample did not show worse performance or higher level of complaints. Conclusion: We concluded that participating in group activities for many years may protect older from cognitive decline and favor healthy aging.

#### **PB7 069 THE PRACTICE OF GATEBALL AND MAHJONG AMONG JAPANESE OLDER ADULTS AND DESCENDENTS: CONTRIBUTIONS OF LIFESTYLE TO COGNITION.**

M. SANCHES YASSUDA\* (University of São Paulo, São Paulo, Brazil)  
M. MASAKO KANASHIRO(1), M. YASSUDA(1) - (1) University of São Paulo (São Paulo, Brazil)

Introduction: In senescence cognitive aging is heterogeneous. In part, it depends on personal choices. There is room for achievement, which may depend on lifestyle choices that favor quality of life and meaning in existence. The aim of this study was to describe the cognitive profiles of community dwelling older adults who belong to the Japanese culture in São Paulo, who practiced gateball and mahjong. These activities are popular in this culture. Another aim was to investigate the frequency of activities carried out in this sample. Methods and Materials: A cross-sectional study compared 30 older adults who practiced each activity (gateball or mahjong). To evaluate cognition the CERAD neuropsychological battery was used, and to analyze activity level the Adelaide Activity Profile (AAP) was used, adapted to Brazilian Portuguese for this research. Results: The results indicated that mahjong group had significantly higher performance than the gateball group, in the word list memory task (immediate recall and delayed recall). The AAP data suggested that the participants of both groups were active individuals. In this sample (n = 60) men were more active in social activities. Women were more active in domestic services, services to others and in intellectual leisure. Conclusion: The differences in cognitive performance revealed that lifestyle, with weekly practice playing mahjong, seem to contribute to maintenance of cognitive functions. It is important to consider the direction of the causal relation between intellectual activity and cognitive performance. It is not known if the individual who has good cognitive abilities is inclined to perform mental tasks, or if the individuals who practice these activities develop superior abilities. It is possible that complex cognitive activities may favor high cognitive performance, contributing for the well-being, autonomy and longevity of the individuals.

#### **PB7 070 REST-ACTIVITY IN PATIENTS WITH FRONTOTEMPORAL LOBAR DEGENERATION (FTLD)**

G. DOWLING\* (University of California, San Francisco, San Francisco, United States)  
M. JENNIFER(1), H. ERIN(1), K. ROBIN(1), M. JUDY(1), M. BRUCE(1) - (1) University of California, San Francisco (San Francisco, United States of America)

Introduction: FTLD is the third most common cause of dementia. Little is known about the impact of FTLD on rest-activity rhythms. This ongoing descriptive study explores characteristics of actigraphically assessed nighttime rest and daytime activity in two FTLD subtypes, semantic dementia (SD) and frontotemporal dementia (FTD). Methods and materials: Two weeks of actigraphy and sleep diary data were collected and analyzed to describe and compare rest-activity patterns. Demographics and patient Clinical Dementia Rating (CDR) scores were collected. Results: To date 31 community dwelling subjects have participated (SD=11, FTD=20), average age 63 years. FTD patients had higher CDR scores (p=.02) compared to SD. There were no differences between subtypes on mean bedtime duration (9.9 +/- 1.3 hours), nighttime inactivity scored as sleep (8.3 +/- 1.2 hours), or nighttime sleep efficiency (83 +/- 7%). Mean daytime inactivity scored as sleep was 24.8 +/- 18%. FTD subjects had more daytime inactivity (3.9 +/- 2.5 hours) compared to SD (2.5 +/- 2.0 hours)(p<.05). Average 24-hour sleep time for both subtypes was 12 +/- 3 hours. Correlation analyses revealed significant negative correlation between

total sleep time at night and total wake time during the day ( $\rho = -.610$ ,  $p < .001$ ). There was a stronger effect size for daytime wake and CDR score in the SD group ( $\rho = -.593$ ,  $p = .054$ ) compared to the FTD group ( $\rho = -.314$ ,  $p = .178$ ). Conclusion: Regardless of subtype, subjects had abnormally long bedtimes and high daytime inactivity. An unexpected finding was that increased nighttime sleep time was associated with decreased daytime wake time, particularly in the FTD group. This finding was not associated with CDR score. Further research is needed to explore the systems responsible for maintaining nighttime rest and daytime activity.

#### **PB7 071 DELIRIUM IN A POPULATION OVER 90-YEAR OLD RECOVERED IN RSA**

A. SANTANGELO\* (UNIVERSITY OF CATANIA, CATANIA, Italy)  
M. TESTAI(1), M. ATTERITANO(2), D. TAVERNA(1), V. FIORE(1),  
G. MAMAZZA(1), C. ZUCCARO(1), D. MAUGERI(1) - (1) Università di Catania - Scuola di Specializzazione in Geriatria (catania, Italy); (2) Università di Messina- Istituto Medicina Interna (Italy)

**INTRODUCTION:** Delirium is a Acute Confusional State caused by physiological consequences of a medical disease. Delirium is a predictive index of severity disease and survival time, also in rehabilitation settings standing for index reliable to programme goal for reaching functional rehabilitation. **METHODS AND MATERIALS** In this Study we valued , on random pool of total population of 123 patients , the populations of older over 90yr aged recovered (29 patients) in the care of a RSA (Residential Sanitary Assisted in Italy or Nursing Home) , compared with population younger afferent in RSA Goal in this study is to value the Prevalence and Incidence of Delirium in over 90yr aged population recovered in RSA **RESULTS:** In the populations recovered in RSA studied is evident the prevalence of Delirium in the population over 90 year aged is most common compared to other population studied (44% vs 17%), as major seem to be the Incidence of Delirium in over 90 year population (33.3% vs 12.76%). This data confirm the existence of biological frailty in the very old over 90 year aged. Moreover this data demonstrate reduction of rates Delirium's Incidence compared with prevalence's rates in a Setting of Care focused elderly needs as RSA as opposed to other Non Geriatric Acute Setting (Surgery, Orthopaedics, Medicine, Neurology, Rehabilitation) from which derive. The 3-Months Mortality is major in the 90 year old compared to non 90 year old population (33.3% vs 18%) confirming a predictive role of Delirium. **CONCLUSIONS:** This study showed Delirium is a Marker of Biological Frailty and it is an index predictive inauspicious about the survival of patient. Moreover is marked the RSA, Geriatrics Contents Structures, performs important role of delirium's prevention by means of removal of the risk factor avoidable and a careful control of causes.

#### **PB7 072 WHAT DRIVES QUALITY OF LIFE IN DEMENTIA ACCORDING TO SELF-REPORT – ARE WE BETTING ON THE RIGHT HORSE?**

P. BOSBOOM\* (WA Centre for Health and Ageing (WACHA), Crawley, Australia)  
O. ALMEIDA(1) - (1) Western Australian Centre for Health and Ageing (WACHA), University of Western Australia (M573) (Crawley, Australia)

Introduction Without a cure for Alzheimer's disease (AD) improvement of Quality of Life (QoL) in AD should have high priority in care, management, treatment and research. However, the factors that mediate QoL in AD are unclear. Many studies focusing on QoL in other chronic diseases have shown significant correlations between QoL and cognitive impairment. We designed the present study to determine which domains of cognitive dysfunction (if any) contribute to modulate QoL in AD. Methods and materials This is an ongoing cross-sectional investigation of community-dwelling older adults with probable AD (mild to moderate). We assessed cognitive function with the CAMCOG-R and a comprehensive neuropsychological testbattery. Psychological and behavioral symptoms associated with dementia were rated with the Neuropsychiatric Inventory (NPI). The QoL-AD was used to measure QoL by self-report and proxy-reports from two perspectives (i.e. proxy-patient and proxy-proxy). Results At the time of writing, 70 community-dwelling older adults with AD had been recruited (mean age 78.8(3.0) years, 66.6% women and 45% completed high-school education). Informants were either the spouse (64.6%) or child (35.4%). Mean CAMCOG-R score is 66.1(13.9). Partial correlations showed that the most robust association with self-rated QoL was language (Pearson  $r = .629$ ,  $p = .005$ ); with proxy-rated QoL (from both perspectives) executive functioning ( $r = -.575$ ,  $p = .013$ ) and with proxy-patient-rated QoL NPI ( $r = -.595$ ,  $p = .009$ ). Conclusion Our results show significant correlations between cognitive dysfunction and QoL in AD, but different correlations for self-report, proxy-patient and proxy-proxy reports. These findings highlight the multiplicity of perspectives on QoL in AD and suggest that impaired ability to communicate may represent the most robust predictor of QoL for older adults with AD.

#### **PB7 073 IMPACT OF AN EDUCATIONAL PROGRAM FOR CAREGIVERS OF DEMENTED PATIENTS**

Z. BARROU\* (APHP, UPMC Paris 6, Paris , France)  
A. LEMAIRE(1), M. BOURIFFET(1), B. DIEUDONNE(1), M. BRIHIER(1),  
M. GODARD(1), J. BODDAERT(1), M. VERNY(1) - (1) APHP, UPMC Paris 6 (Paris, France)

Introduction: Caregivers of elderly patients with Alzheimer's disease and related disorders often face high distress, resulting in frailty. We implemented an educational program with 5 sessions for informal caregivers. We provide information about the disease and its

management, with the goal to improve the everyday life and reduce the burden. Methods and materials: preliminary results of a prospective study. We evaluate quality of life and vulnerability of the caregiver with the Pixel scale, and his burden with the Zarit caregiver burden scale. Evaluation is performed before the educational program (T0), when it ends (T1) and 6 months later (T6).Degree of satisfaction (at T1) and knowledge of caregivers (at T0 and T1) are also evaluated by questionnaires. Results: the program has involved 16 caregivers (13 women; 3 men) whose relation to the patient was spouse in 12 cases, daughter in 3 cases and 1 close friend. The mean age of the patients was 79.8 years and they had a mean MMSE score of 19.6. The degree of satisfaction with the program was high. However, no change was observed between T0, T1 and T6 for the quality of life score (respectively 73.6, 71.4 and 75.7%), the vulnerability score (20.7, 29.3 and 25.7%) and the Zarit caregiver burden scale (36, 35.9 and 34.7). Our knowledge questionnaire was also unchanged with 3.17 errors (on a scale of 21) at T0 and 3 at T1, but its sensitivity was probably limited. Conclusion: our results suggest that there is no improvement in the caregiver's burden with an educational program. However, these caregivers report a high degree of satisfaction and we cannot exclude that these results were influenced by the small number of participants. More inclusions are needed in our ongoing program.

#### **PB7 074 EVIDENCE AGAINST AN ASSOCIATION BETWEEN ALCOHOL INTAKE AND COGNITION IN THE ELDERLY. THE ZARADEMP PROJECT.**

E. LOBO\* (Universidad De Zaragoza & Cibersam, Zaragoza, Spain)  
C. DUFOUIL(1), B. QUETGLAS(2), G. MARCOS(3), P. SAZ(4), A. LOBO(3) - (1) INSERM U708 (Paris, France); (2) Hospital Clinico Universitario de Zaragoza (Zaragoza, Spain); (3) Hospital Clinico Universitario; Universidad de Zaragoza; CIBERSAM (Zaragoza, Spain); (4) Universidad de Zaragoza; CIBERSAM (Zaragoza, Spain)

**Introduction:** Recent studies are in favour of moderate alcohol intake to be protective against dementia onset. However the plausibility of this association is questionable and debated. **Methods and materials:** The ZARADEMP project is a longitudinal study which main aim was to investigate the incidence and risk factors of dementia. A stratified random sample of individuals aged 55 and above, drawn from census lists of Zaragoza (Spain), was invited to participate and 4,803 people were included. Subjects were followed up 2 and 4 years after enrolment. At each study wave, cognitive performances were assessed using Mini-Mental State Examination as well as the "Geriatric Mental State" and "History and Aetiology Schedule" questionnaires. The diagnosis of dementia was based on DSM-IV-TR criteria. Usual total daily alcohol intake was carefully recorded from a validated questionnaire and quantified in grams per day. Logistic and multiple linear regression models were used to estimate the relationship of baseline alcohol intake with subsequent cognitive decline or dementia risk over 4-year follow-up after adjusting for potential confounders. Analyses were computed in men and women separately. **Results:** The proportion of lifetime alcohol abstainers was 87% in women and 34% in men. Crude analyses showed that, in men, former alcohol drinkers were at higher risk of cognitive decline or dementia at follow-up than lifetime abstainers ( $OR = 1.58$ ,  $85\% CI = 1.0-2.5$ ). Multivariable analyses were not in favour of moderate alcohol intake to protect against dementia in neither men nor women. **Conclusion:** In a large population-based study of Spanish elderly, when distinguishing lifetime abstainers, former drinkers and current drinkers, we do not observe an association between alcohol consumption and dementia or cognitive decline incidences. One must remain cautious before promoting the beneficial effect of alcohol on the health of elderly individuals.

#### **PB7 075 INFLUENCE OF ANTI-DEMENTIA DRUGS ON PURCHASES OF PSYCHOTROPICS IN PATIENTS WITH ALZHEIMER'S DISEASE**

M. LAITINEN\* (University of Kuopio, Kuopio, Finland)  
S. HARTIKAINEN(1) - (1) University of Kuopio (Kuopio, Finland)

**Introduction** The aims of this study were to describe how patients with Alzheimer's disease (AD) purchased psychotropics, and the difference between patients using and not using anti-dementia drugs (cholinesterase inhibitors or memantine). **Methods and Material** This nation-wide study was based on the National Prescription Register, which records all purchases of reimbursable prescribed drugs made by permanent non-institutionalized residents in Finland. Before getting eligibility to reimbursement for anti-dementia drugs, the patient with AD must send a medical certificate from his neurologist or geriatrician to the Social Insurance Institution in Finland to verify the diagnosis and the severity of the disease. At the end of the year 2005, there were 28093 registered patients with AD. During the year 2005, 24100 of them had purchased anti-dementia drugs and 3993 had not. There were no differences in age and sex distribution between these groups (32 % men, 68 % women, mean age 80 years). Defined Daily Dose (DDD) was used to prescribe the amounts of purchased drugs. **Results** Psychotropics were widely used among patients with AD. Patients using anti-dementia drugs purchased more likely than non-users any kind of psychotropics except conventional antipsychotics and tricyclic antidepressants. During one year period 57% (n=13837) of patients with anti-dementia drugs and 41% (n=1643) without, purchased psychotropics. The respective numbers for antipsychotics were 23% and 17%, for hypnotics and sedatives 32% and 24% and for antidepressants 32% and 21%. Patients using anti-dementia drugs seem also to purchase bigger amount of psychotropics (mean 293 DDD during one year period) than the non-users (mean 265 DDD). **Conclusions**

The purchasing of psychotropics was substantial in patients with AD, and the use of anti-dementia drugs did not lower it.

**PB7 076 THE BERLIN STUDY ON STRUCTURES AND OUTCOMES OF SMALL-SCALE LIVING ARRANGEMENTS FOR PEOPLE WITH DEMENTIA**

K. WOLF-OSTERMANN\* (Alice Salomon University of Applied Sciences, Berlin, Germany)

T. FISCHER(1), I. WULFF(1) - (1) Charité Universitätsmedizin Berlin, Institut für Medizinische Soziologie (Berlin, Germany)

**Introduction** During recent years a new form of small-scale living facility evolved in Germany. It takes the form of a shared housing arrangement for 6 to 12 older persons, frequently suffering from dementia. Situated predominantly in large apartments in mostly urban settings, these arrangements are being served by community care service and are completely disconnected from traditional residential facilities. It is postulated that these arrangements are beneficial to residents in terms of health outcomes, compared to traditional residential care. Nevertheless, research on outcomes is widely lacking. **Methods and Materials** Using a longitudinal design, new residents of small-scale living arrangements suffering from dementia (MMSE < 24) are surveyed for one year. They are assessed at the time of moving in as well as six and eleven months later. Measures for physical and psychological health outcomes include ADL functioning and behavioural aspects and additional social factors. Secondly, using a cross-sectional questionnaire design, all small-scale living arrangements in Berlin are surveyed concerning service structures and resident characteristics. Both approaches are supplemented with data collected in the same way on special care units for people with dementia to allow for comparisons. **Results** Residents which were recruited into the longitudinal study have an average age of 81 years, symptoms of depression and behaviour problems were equally observed in all residents. The results indicate that the percentage of severe dementia disorders was higher in special care units than in small-scale living arrangements. Psychotropic drugs were slightly more often prescribed for residents in nursing homes. **Conclusion** Small-scale living arrangements of the described kind constitute a new segment of care that is rapidly growing. Service structures, resident characteristics and preliminary outcome results indicate that they are a reasonable option for some older persons with dementia.

**PB7 077 PERCEPTIONS OF THE ALZHEIMER'S DISEASE IN THE FRENCH POPULATION – A COMPARISON OF TWO STUDIES**

S. PIN LE CORRE\* (National Institute for Prevention and Health Education, St-Denis, France)

P. ARWIDSON(1), P. GUILBERT(1) - (1) National Institute for Prevention and Health Education (St-Denis, France)

**Introduction.** The social perception of Alzheimer's disease is poorly explored, although this picture necessarily influences the behaviour of people involved, how they deal with symptoms, diagnosis and care. **Methods and material.** Two studies will face different methodology to explore the social representations of Alzheimer's disease in France. A study by qualitative interviews and focus groups was conducted among a hundred people. Three types of people have been interviewed: people not concerned, caregivers, health professionals. A quantitative telephone survey was conducted among a representative sample of 2013 people aged 18 and over. Descriptive analysis (Chi2 prototypical analysis) and inferential (logistic regression) were done. **Results.** The qualitative study helps to highlight the emotional dimension of Alzheimer's disease perceptions: fear and powerlessness are strongly present, shared by all persons surveyed. Clinical aspects of the disease do not appear spontaneously, and assimilation between Alzheimer's disease and old age is consistent. In the quantitative survey, the perception of the disease varies by age: if the 18-65 year-old associate the disease with memory loss, for the elderly dependency is the main issue. Alzheimer's disease is the third concern for respondents (59%). This fear increases significantly with age as well as the proximity to the disease. It is related to an attitude of unease towards Alzheimer's patients. However, 91% of respondents would like to know their diagnosis. **Conclusions.** The perception of the disease is extremely negative and leads to a tendency to distance the patient, symbolically or in practice. Efforts to change the perception on patients are to promote and evaluate.

**PB7 078 THE IMPACT OF CIRCADIAN RHYTHM AND ACETYLCHOLINE LEVELS ON SLEEP AND MEMORY WHEN CONSIDERING CHOLINESTERASE INHIBITORS IN THE TREATMENT OF ALZHEIMER'S DISEASE**

A. NIEOULLON\* (Université de la Méditerranée, Marseille, France)

D. BENTUE-FERRER(1), R. BORDET(2), M. TSOLAKI(3), H. FÖRSTL(4) - (1) Laboratoire de Pharmacologie Expérimentale et Clinique - Faculté de Médecine (RENNES, France); (2) Département de Pharmacologie Médicale - Faculté de Médecine, Université Lille 2, CHU (LILLE, France); (3) Aristotle University of Thessaloniki - G. Papanicolaou Hospital (THESSALONIKI, Greece); (4) Klinik und Poliklinik für Psychiatrie und Psychotherapie - Technische Universität München (MUNICH, Germany)

**Introduction:** In Alzheimer's disease (AD), symptom exacerbation in the late afternoon or evening, or at night, suggests disturbance of chronobiology and natural rhythmicity.

**Methods:** With reference to available literature, we reviewed the relationship between sleep, memory and AD, and the importance of rhythmicity and acetylcholine levels when considering medication. **Results:** Disruption of the sleep wake cycle for patients with AD is greater than for similarly aged healthy individuals: sleep is more fragmented and disruption increases with disease progression. Sleep disturbances can exacerbate behavioural disorders. Acetylcholine is involved in maintaining normal sleep patterns, which are important for memory consolidation. During slow-wave sleep, low levels of acetylcholine are needed to consolidate declarative memory. Disrupting nocturnal cholinergic activity may provoke sleep disorders and worsen memory problems. Such disturbances may be influenced by the type of cholinesterase inhibitor prescribed for patients with AD, and the time of administration. Consideration of differences in pharmacokinetic and pharmacodynamic properties of cholinesterase inhibitors and their effect on circadian fluctuations of cholinergic transmission may help in optimising therapeutic benefits. With some cholinesterase inhibitor therapy, plasma levels of the drug are high when normal circadian rhythmicity would produce low levels of acetylcholine release. However, plasma levels of galantamine reflect the natural circadian rhythmicity of acetylcholine release, with high levels during the waking day and low activity at night, which may be beneficial for sleep, memory and, possibly, evening agitation. **Conclusions:** Taking into account the pharmacokinetic properties of cholinesterase inhibitors may prevent interference with sleep architecture and optimise cognitive effects

**PB7 079 IMPACT OF BEHAVIOURAL AND FUNCTIONAL SYMPTOMS OF ALZHEIMER'S DISEASE: A CARER'S PERSPECTIVE**

J. GEORGES\* (Alzheimer Europe, Luxembourg, Luxembourg)

**Introduction** Problems related to activities of daily living (ADLs), eg., dressing, washing, and handling money, and behavioural difficulties, eg., mood swings, agitation, and aggression, are common in Alzheimer's disease (AD). Furthermore, the recent dementia carer's survey indicated that these symptoms were amongst the most troubling aspects of the disease for carers. **Methods** The dementia carer's survey explored the impact of dementia on carers throughout Europe. It was an 100% anonymous, self-completion questionnaire, conducted through Alzheimer Europe's member organisations in Germany, Spain, UK (Scotland), France and Poland. Overall, 1181 completed questionnaires were returned (minimum 200 per country), and evaluation of responses helped to identify the aspects of AD that carers find most burdensome. **Results** The symptom group of activities of daily living (ADLs) was most commonly cited as the most problematic area (68% of carers), due to difficulties with specific symptoms such as showering/bathing, being left alone, and incontinence. Fifty percent of carers found behavioural symptoms to be troubling, specifically agitation/aggression, personality changes, and irritability. Perhaps surprisingly, cognitive difficulties were problematic for only 45% of carers. The initial impact of these symptoms is illustrated by the list of specific difficulties that first prompted the carer to seek help. Memory/confusion (81%), and concentration/attention (56%) were the most common reasons for seeking help, as well as ADL- and behaviour-related problems: finding belongings (55%), financial activities (46%), following conversation (46%), shopping (41%), and personality changes (39%). Considering the longer term, the survey found that a notable proportion of carers (20–50% depending on disease severity) spent >10 hours/day performing caregiving tasks. **Conclusions** This survey illustrates the burden that disease symptoms place on carers, and why it is so important to identify (and consequently, target) those symptoms that are found to be most troublesome.

**PB7 080 SPARED AND IMPAIRED ABILITIES AT TRANSITION TO SEVERE ALZHEIMER'S DISEASE**

A. GILLIOZ\* (University Hospital, Rennes, France)

H. VILLARS(2), S. GILLETTE-GUYONNET(2), S. ANDRIEU(2), F. NOURHASHEMI(2), P. JOUANNY(1), B. VELLAS(2), G. REAL.FR(2) - (1) Rennes University Hospital-CMRR (Rennes, France); (2) Toulouse University Hospital-CMRR (Toulouse, France)

**OBJECTIVES:** To describe through comprehensive geriatric evaluation patients with Alzheimer's disease (AD) at transition to the severe stage (MMSE <10). **DESIGN:** Cross-sectional study based on the longitudinal REAL.FR study. **SETTING:** The REAL.FR (Réseau sur la Maladie d'Alzheimer Français) study, France. **PARTICIPANTS:** One hundred twenty-six patients identified among the 686 patients of the REAL.FR cohort.

**MEASUREMENTS:** Comprehensive geriatric evaluation when an MMSE score <10 was first observed during the REAL.FR follow-up. Cognitive (MMSE, SIB), behavioral (NPI), nutritional (MNA) and functional (ADL) assessment and evaluation of support received (Zarit score, use of support services). **RESULTS:** MMSE and SIB scores showed the best-preserved cognitive abilities were social interaction and response to own name, while praxis, orientation, memory and language showed greatest decline. Loss of independence in daily living followed a hierarchical order, locomotion being best preserved (71% independent patients) and personal hygiene deteriorating most (15.5%). Behavioral disturbances were frequent (>70% of patients had at least one disturbance of frequency\*gravity ≥4), principally apathy, aberrant motor behavior and agitation. The MNA showed that 68.5% were malnourished or at risk of malnutrition (score <23.5). Caregiver burden remained mild to moderate for 69.8% (Zarit score ≤40). 80.2% of patients still lived at home and 71.6% used at least 2 support services, mainly physician visits (62.8%) and home helps (54.9%). **CONCLUSION:** At transition to severe AD,

identification of remaining cognitive and functional abilities and principal behavioral disturbances allows appropriate management targeted at preserving these abilities and treating complications in order to optimize patients' quality of life.

**PB7 081 EVALUATING THE SEVERE COGNITIVE IMPAIRMENT IN A SPECIALIZED CLINIC**

A. GRATÃO\* (Universidade de São Paulo, Ribeirão Preto, Brazil)  
F. DE ASSIS CARVALHO DO VALE(1), L. DA SILVA TALMELLI (2), T. RAMOS PEREIRA VENDRUSCOLO(2), R. PARTEZANI RODRIGUES(2), L. CORREA FIGUEIREDO(3) - (1) Hospital das Clínicas da Faculdade de Medicina de Ribeirão Preto da Universidade de São Paulo (Ribeirão Preto, Brazil); (2) Escola de Enfermagem de Ribeirão Preto da Universidade de São Paulo (Ribeirão Preto, Brazil); (3) Centro Universitário do Norte Paulista (São José do Rio Preto, Brazil)

**Introduc/Objective:** We describe the process of translation and adaptation, for the Portuguese language of the scales TSI (Test for Severe Impairment, SMMSE (Severe Mini-Mental State Evaluation) and SIB (Severe Impairment Battery) that evaluate the moderate and severe dementia. The objective was to translate and evaluate the applicability Portuguese version of the mentioned scales and compares them with the MEEM score. **Methods:** After careful process of translation (forward and backtranslation) for the Portuguese language, the final version of the TSI, SMMSE and SIB was gotten. To evaluate the applicability, a pre-test was did in a group of 24 patients, age of 50 years or older, with diagnosis of dementia, either the scores 2 and 3 determined through the CDR and patients that had been evaluated in the period of June to August, 2007, in the Behavioral Neurology Outpatient Clinic at the Clinics Hospital of the Ribeirão Preto, São Paulo, Brazil. **Results:** The patients had understood adequately the items of the three scales. The average score of the TSI was of 11,5 (maximum of 24), SMMSE, 12,4 (30) and the SIB was 13,6 (50). These values had been higher than the MEEM score, that was about 6,9 (maximum of 30). **Conclusion:** The final version for the Portuguese of the scales was considered adjusted for clinical use in serious demenciaos patients. The validation of these instruments contributes for the process of better communication with the patient, thus preventing frustrations related to the interventions not adjusted.

**PB7 082 RESILIENCE CONDITIONERS AMONG CAREGIVERS OF AGED PEOPLE WITH ALZHEIMER**

A. FUREGATO\* (College of Nursing at Ribeirão Preto, Ribeirão Preto SP, Brazil)  
C. GAIOLI(1), J. SANTOS(2), F. VALE(2) - (1) College of Nursing at Ribeirão Preto (Ribeirão Preto, Brazil); (2) Medical School at Ribeirão Preto (Ribeirão Preto, Brazil)

**Introduction:** It is believed that resilient caretakers have a better ability and competence to deal with negative effects brought by stress, anxiety and depressive symptoms of aged individuals with Alzheimer disease. The purpose of this study was to characterize some resilience conditioners of caregivers to aged individuals with Alzheimer disease. **Method:** Cross-sectional study. A pre-test was performed with ten subjects of an estimated 150 caregivers of elderly patients seen at the Behavioral Neurology Ambulatory at the Clinics Hospital in Ribeirão Preto (HCFMRP/USP). The caregivers have worked in this activity for over one year, caring for Alzheimer patients aged over 60 years, clinically evaluated and with CDR and MEEM results. Data was collected using the Beck Depression Inventory, the Pesce Resilience Scale, and the Caregiver clinical-social and demographic profile Questionnaire. The possible associations were analyzed using Fisher's Exact Test. **Results:** Every Alzheimer patient in this study received a CDR score between 0.5 and 2, and MEEM showed that nine subjects had diminished cognition. Among the caregivers, it was observed there was no depression and all had a good resilience index. The Fisher test showed a significant association between the caregiver's age and the Resilience Scale ( $P = 0.024$ ). Caregivers older than 50 years reported being fulfilled with this activity. On the other hand, 100% of the caregivers under 50 years of age have under-median resilience. The caregiver's self-evaluation of their mental health and the aged individual's CDR point to a tendency of association with the resilience ( $P=0.20$  and  $P=0.16$ ), which can be confirmed with the ongoing research. **Conclusions:** Resilience of the elderly patient caregivers increases with age. Evaluation of the caregivers mental health and the CDR of the elder may have relationship with resilience.

**PB7 083 EFFICACY OF PPAR-GAMMA AGONIST PIOGLITAZONE IN ALZHEIMER**

T. SATO\* (Tokyo Medical University, Tokyo, Japan)  
H. HANYU(1), K. HIRAO(1), H. KANETAKA(1), H. SAKURAI(1), T. IWAMOTO(1) - (1) Tokyo Medical University (Tokyo, Japan)

**Purpose** PPAR-gamma agonists have been shown to exhibit neuroprotective effects and alter beta-amyloid homeostasis. The aim of this study was to test the effects of the PPAR-gamma agonist pioglitazone on cognition and regional cerebral blood flow (rCBF) in patients with AD and MCI. **Methods** Thirty-nine patients with AD or amnestic MCI with type II diabetes mellitus (DM) were enrolled after providing informed consent. Patients were randomly assigned treatment with pioglitazone 15-30 mg daily (n=20, pioglitazone group) or not (n=19, control group). We assessed changes from baseline to Month 6 in MMSE, ADAS-Jcog, and WMS-R logical memory-I, and rCBF on single photo emission

CT (SPECT). **Results** At baseline, no significant differences were found on measures of cognition and rCBF between the two groups. At Month 6, the ADAS-Jcog score significantly decreased in the pioglitazone group, while they significantly increased in the control group. The WMS-R logical memory-I scores significantly increased in the pioglitazone group, but not in the control group. SPECT studies showed a significant increase of rCBF in the parietal and frontal lobes in the pioglitazone group, while showed no significant changes in the control group. Conclusion PPAR-gamma agonist pioglitazone in animal models of AD has showed the reduction of numbers of activated microglia associated with a lower plaque burden and a modest reduction in soluble beta-amyloid levels. Consistent with these experimental studies, we demonstrated that pioglitazone exhibited cognitive and rCBF improvements in AD and MCI patients with DM. Pioglitazone may offer a novel strategy for the treatment of AD and MCI.

**PB7 084 THE ATROPHY OF PARAHIPPOCAMPAL GYRUS AND LIPID METABOLISM - A VSRAD ANALYSIS OF SENILE DEMENTIA**

H. MURAI\* (Kanazawa Medical University, Kahoku-Gun, Ishikawa, Japan)  
T. NAKAHASHI(1), M. ATSUMI(1), I. TOYOTA(1), H. YANO(1), K. NOMURA(1), H. TSUCHIYA(1), K. IWAI(1), S. MORIMOTO(1) - (1) Kanazawa Medical University (Kahoku-Gun, Ishikawa, Japan)

**Introduction.** The VSRAD, voxel-based specific regional analysis system, indicates the degree of brain atrophy and has been known as a powerful tool for the diagnosis of early Alzheimer's disease. The aim of this study is to elucidate the relationship between regional brain atrophy and factors influencing senile dementia. **Methods and materials.** 152 outpatients were recruited to this study (mean age 78.0 +/- 6.3 years old, 46 males). All patients were examined by brain MRI and analyzed the degree of atrophy of gray matter (indicated by %) and parahippocampal gyrus (indicated by z score) by VSRAD. The ratio of hippocampal gyrus atrophy over whole brain atrophy was also analyzed. The relationship between those parameters and clinical factors was analyzed. **Results.** Patients with low serum albumin level (< 3.5 g/dL) showed severer whole brain atrophy (14% vs. 8%), and decreased MMSE score (15 vs. 21) than normal albumin level group. Also patients with low serum HDL-cholesterol level (< 40mg/dL) showed severer whole brain atrophy (12% vs. 6%), and decreased MMSE score (15 vs. 21) than normal HDL-cholesterol level group. However, patients with high serum total cholesterol level (> 220 mg/dl) showed lesser whole brain atrophy (7% vs. 10%) than normal total cholesterol level group, and patients with high serum triglyceride level (> 150 mg/dL) showed lower z score (1.4 vs. 2.4) and lower hippocampal gyrus atrophy ratio (2.7 vs. 5.4) than normal serum triglyceride level group. On the other hand, relationship between hypertension and whole brain atrophy was only observed among mild cognitive impairment group (MMSE = 24 or more). **Conclusion.** These findings suggest that life style modification, such as lipid metabolism modification, blood pressure control, and nutrition control, may play a preferable role on the development of senile dementia.

**PB7 085 ACTION RESEARCH ON PERSON-CENTERED CARE USING DEMENTIA CARE MAPPING FOR ELDERLY INDIVIDUALS WITH DEMENTIA: QUALITATIVE ANALYSIS FOR FEEDBACK DISCUSSIONS**

M. SUZUKI\* (Hamamatsu university, Hamamatsu, Japan)  
Y. MIZUNO(1), C. GREINER (2), A. FUKAHORI(3), T. ISOWA(4), R. SAKAMOTO(5), C. SUMIGAKI(6), M. KANAMORI(7), D. BROOKER(8) - (1) Imaise Mental Care Centre (Japan); (2) Japanese Red Cross College of Nursing (Japan); (3) Formerly at Mie Prefectural College of Nursing (Japan); (4) Mie University (Japan); (5) Yokkaichi City Hall (Japan); (6) National Center for Geriatric and Gerontology (Japan); (7) Biwako Sport College (Japan); (8) University of Bradford (United Kingdom)

**Dementia Care Mapping (DCM)** is an evaluation system that includes the action observation technique and provides feedback for improving the quality of person-centered dementia care. DCM was conducted for six hours once a month during a three-month period. Feedback was given to the care staff who participated in this study. The feedback consisted of discussions between nurses and caregivers and the researchers. Subsequently, all care staff were given written reports of these discussions. Each care report was analyzed using Berelson qualitative analysis and the effects on elderly individuals with dementia were clarified. The subjects were elderly individuals with dementia and their care staff at a long-term care insurance geriatric facility. DCM briefing sessions were held for care staff in May 2007 in order to provide feedback and discuss the quality of care for each elderly individual. Monthly DCM sessions were conducted from June to August for twelve elderly patients with dementia. Two-day feedback conferences were held after each DCM session and descriptions of the feedback were written as reports for all staff. All staff reports were analyzed three times using content analysis according to qualitative analysis method. A total of seven categories were extracted during content analysis. Most items were categorized as care plans based on interpersonal relationship construction with the staff, followed by care plans involving talking about the activity in order to familiarize each elderly patient, and care for role- and work-related activities. The present findings suggest

that the DCM intervention improved the care staffs awareness of dementia care and the quality of person centered care for elderly individuals with dementia.

**PB7 086 EPISODIC MEMORY AS PREDICTOR OF CONVERSION TO ALZHEIMER'S DISEASE IN MILD COGNITIVE IMPAIRMENT**

E. DIERCKX\* (Vrije Universiteit Brussel, Brussels, Belgium)

S. ENGELBORGH(S)(2), R. DE RAEDT(3), M. VAN BUGGENHOUT(2), P. DE DEYN(2), D. VERTÉ(1), I. PONJAERT-KRISTOFFERSEN(1) - (1) Vrije Universiteit Brussel (Brussels, Belgium); (2) University of Antwerp (Antwerp, Belgium); (3) Ghent University (Ghent, Belgium)

**Introduction** Identification of early Alzheimer's disease (AD) has become very important as new treatments are being developed. Episodic memory tasks appear to have predictive power for indicating early AD as episodic memory function is anatomically located within medial temporal lobe structures, which is the location with highest densities of AD neuropathological lesions. Most studies that have addressed the issue of neuropsychological prediction of conversion to AD in MCI patients, have emphasised the diagnostic value of free delayed recall deficits. This prospective, longitudinal study aims at investigating whether cued recall tasks are also able to predict conversion to AD amongst MCI patients. Methods and materials At baseline the cognitive part of the Cambridge Examination for Mental Disorders of the Elderly (CAMCOG), a Dutch variation of Rey's Auditory Verbal Learning Test (free delayed recall), the Memory Impairment Screen plus (MISplus; verbal cued recall) and the Visual Association Test (VAT; visual cued recall) were administered to 40 patients diagnosed with MCI. After 18 months, MCI-patients were reassessed and a follow up diagnosis was established. Of those who were seen for follow up (n=31), 7 fulfilled (NINCDS-ADRDA) criteria of probable AD, while 24 did not convert. Results The forward binary logistic regression analysis, with free delayed recall, MISplus and VAT as possible predictors, showed that only the MISplus remained in the analysis, indicating that this test contributed most to the prediction of conversion (Wald X<sup>2</sup>(1)= 5.78, p = .016 (O.R. = 0.28, C195%:0.099-0.790)). With the MISplus, a predictive accuracy of 87% was obtained. With the VAT and free delayed recall, predictive accuracy was lower, respectively 84% and 77%. Conclusion Verbal cued recall is a better predictor of conversion to AD in Mild Cognitive Impairment than free delayed recall and visual cued recall.

**PB7 087 VISUOSPATIAL DISORDERS IN SEVERE DEMENTIA AND**

**DIAGNOSIS OF POSTERIOR CORTICAL ATROPHY: A CLINICAL CASE**

C. JEANDEL\* (Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1, Montpellier, France)

J. ERKES(1), R. DURANT(1), C. GENY(1) - (1) Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1 (Montpellier, France)

**Introduction** Higher visual and spatial functions can be primarily affected in neurodegenerative diseases. However, because patients first complain about vision disorder, diagnosis may be dramatically delayed. We describe the case of a patient whose complaints about visual and attentional problems, first inadequately characterized, were later related to a perfectly identifiable visuospatial perturbation, even after 7 years of evolution, leading to the diagnosis of a posterior cortical atrophy (PCA). **Method and results** This 58-years-old patient had first cognitive difficulties in 2000. The association of attentional, mild memory disorders and apraxia led to a diagnosis of Alzheimer's disease (AD). In 2007, the patient consulted in our geriatric yard because of a rapid deterioration in cognition. MMS score was at 9/30. Neuropsychological assessment indicated an atypical cognitive profile, with massive visuospatial and constructive disorders, an alexia, an apraxia and language disorders. Time orientation, episodic memory, judgment abilities and executive functioning were globally preserved. A second assessment found the clinical characteristics of PCA : Balint syndrom, Gerstmann syndrom and confirmation of apraxia and severe visuospatial disorders. Analysis of clinical history with the patient's wife showed inaugural visuospatial problems that had not been taken into account at that time. In the cerebrospinal fluid, typical AD biological abnormalities were found. Anatomical (MRI) and functional (SPECT) imagery showed abnormalities in the occipital and parietal lobes, comforting the diagnosis of PCA. **Conclusion** PCA is a rare clinical syndrome characterized by deficits firstly affecting higher visual and spatial perception, evolving towards dementia. Histopathological changes are often those of AD, but located predominantly in posterior cerebral areas. PCA is rarely diagnosed at early stage, due to its first atypical symptoms. In elderly, hypothesis of PCA is seldom suggested. Performing a simple visuospatial test and a detailed analysis of patient clinical history could improve diagnosis.

**PB7 088 TECHNOLOGY CAN DEFINITELY SUPPORT THE WELL-BEING OF PEOPLE WHO LIVE AT HOME WITH (MILD) DEMENTIA.**

C. HUIJNEN\* (Smart Homes, Eindhoven, The Netherlands)

E. DE WIT(2), A. VAN BERLO(1) - (1) Smart Homes (Eindhoven, The Netherlands); (2) SVVE de Archipel (Eindhoven, The Netherlands)

More and more attention is devoted to aging in place. For some people, this is more obvious and easy than for others. For people with (mild) dementia for example, this seemingly simple wish, suddenly becomes unrealistic and out of reach. Also for (informal) caregivers the burden increases as the health of the person deteriorates. Fortunately, a

number of rather quick win solutions/aids can be identified that may have a positive effect on people's lives. This paper presents the methods, results and conclusions of a research and validation project that studied the effects of a number of technological aids on the daily lives of people with (mild) dementia and their caregivers. A number of different technical organizations, knowledge institutions and care organizations cooperated to provide 40 households with (mainly) technological aids to provide support to a number of activities in their daily life. For each household, first a needs analysis was carried out to extract the most urgent needs of people and to match the corresponding aid or technology. Subsequently, these technologies or products were installed in their homes and people could use them. All these products have been evaluated by means of ethnographic home tours and interviews after a number of weeks of usage. For a number of participants, both care-receivers and caregivers, these aids have caused beneficial effects in people's daily lives. Effects that have been reported are, for example, comfort, feeling of safety, more independency, less frustrations and less of a burden for the caregiver. Results and main recommendations will be discussed in this paper. In conclusion, we are optimistic about possible support that can be given, but it is crucial that different disciplines start to work together as a team with one and the same goal; to support people in their daily lives.

**PB7 089 THE EFFECT OF COMPUTERIZED COGNITIVE TRAINING ON COGNITIVE FUNCTION IN OLDER PATIENTS WITH MILD DEMENTIA**

T. DWOLATZKY\* (Mental Health Center, Beersheva, Israel)

Y. ZILBERSHLAG(2), Y. GRINSHPUN(1), M. FRIGER(1), A. CLARFIELD(1) - (1) Ben-Gurion University of the Negev (Beersheva, Israel); (2) Maccabi Health Services (Givat Shmuel, Israel)

**Introduction** With the increase in the number of elderly worldwide, a significant number of people suffer from age-associated diseases such as dementia. The medical treatment of dementia is limited in its effectiveness and it is thus important to investigate alternate methods of therapy, such as cognitive training. Previous studies of cognitive training in this population group have shown limited value, possibly due to methodological constraints. We thus conducted a randomized controlled study to evaluate the influence of computerized cognitive training on cognitive function of older patients suffering from mild dementia. **Methods** Patients were randomized to either participate in bi-weekly computerized cognitive training sessions of half-hour duration each over a period of a month, or to a control group where usual daily activities were continued. The "Savon" program (Melabev, Jerusalem), which includes memory, language, arithmetic and geometric exercises, was used as the intervention for the training group. Both groups underwent computerized cognitive assessment using Mindstreams® (NeuroTrax Corp., N.Y.) initially and at completion of the study. For each Mindstreams ® index, the differences were compared within each group utilizing "Wilcoxon Signed Ranks test" and between the groups utilizing "Mann-Whitney U test". Results 56 participants completed all stages of the research (27 from the training group and 29 from the control group). There were no statistically significant differences between the training and control groups at baseline. Compared to controls, there were significant improvements in global cognition and memory in the training group (P value <0.01). Conclusion Computerized cognitive training resulted in significant cognitive improvement, especially in memory, in older patients suffering from mild dementia. These findings suggest that patients with mild dementia retain the capacity to learn and that cognitive training is of therapeutic value. Based on these results, further research should be encouraged.

**PB7 090 HYPERHOMOCYSTEINEMIA, METHYLENETETRAHYDROFOLATE REDUCTASE GENOTYPE AND ALZHEIMER'S DISEASE**

C. FOSSATI\* (Umberto I Policlinico di Roma, Sapienza Università di Roma, Roma, Italy)

G. DE BENEDETTO(1), V. MARIGLIANO(1), V. MANTINI(1), M. CICERCHIA(1), M. SERRA(1), A. SERVELLO(1), A. PETRILLO(1) - (1) Umberto I Policlinico di Roma (Roma, Italy)

**Introduction:** Recent research has focused on homocysteine (Hcy) as a neurotoxic factor. The aim of our study was to evaluate the relationship between elevated total plasma Hcy levels, single nucleotide polymorphism of Methylenetetrahydrofolate-Reductase (MTHFR) genotype and Alzheimer's disease (AD). **Methods and Materials:** 30 patients over 65 years old were included in this study: 10 AD patients, 10 vascular dementia (VaD) patients, 10 healthy control subjects. We performed on all the subjects Mini-Mental-State-Examination (MMSE), cerebral Computed Tomography (CT) or Magnetic Resonance Imaging (MRI), Neuro-Psychiatric-Inventory (NPI), Geriatric-Depression-Scale (GDS), total plasma Hcy, serum Vit B12 and Folate, DNA extraction from peripheral blood lymphocytes for MTHFR C677T and 1298A/C gene single nucleotide polymorphism evaluation. The presence of atherosclerotic organ damage was investigated by means of clinical history and instrumental diagnostic procedures in all subjects in order to include in the control group only those without any evidence of atherosclerotic organ damage. Moreover, we excluded from our study all subjects suffering from possible causes of Hyperhomocysteinemia (HHcy) other than age. **Results:** 60% of AD patients resulted to have HHcy and, regardless of Hcy levels which could be age-related, 60% of our AD patients carried an heterozygous or homozygous C677T gene mutation, or an heterozygous or homozygous 1298A/C gene mutation or a compound heterozygous C677T and 1298A/C gene mutation. Moreover, 15 of our 30 subjects suffered from behavioural disorders; 11 of these 15 were carrier of a MTHFR gene mutation. **Conclusion:** Elevated levels of Hcy can

cause neuronal cell death through glutamate dependent excitotoxicity, DNA hypermethylation and poly-ADP-Ribosome-Polymerase's hyperactivation mediated neuronal apoptosis. These elements can explain the possible role of HHCy and MTHFR gene mutations in the pathogenesis of AD and behavioural disorders.

**PB7 091 ABNORMALITIES OF HORIZONTAL AND VERTICAL SACCADES IN DEMENTIA WITH LEWY BODY**

Z. KAPOULA\* (CNRS, Paris, France)

Q. YANG(1), B. DIEUDONNÉ(2), S. GREFFARD(2), M. VERNY(2) - (1) IRIS, FRE3154, CNRS (Paris, France); (2) Service de gériatrie, Hôpital Pitie Salpêtrière (Paris, France)

Introduction : Mosimann et al. (2005) reported problems with horizontal saccades in dementia with Lewy body (DLB) but not in Alzheimer's disease (AD). The goal of the study is to go further in this field examining both horizontal and vertical saccades. Methods: we examined horizontal and vertical saccades in 10 healthy elderly and 15 patients with DLB. Two conditions were used: the gap (fixation target extinguishes prior to target onset) and overlap (fixation stays on after target onset); the former task is known to promote more reflexive saccades. Eye movements were recorded with EyelinkII eye tracker. Results: (i) As for controls, DLB patients showed shorter latencies in the gap than in the overlap task by 118ms (versus 105ms in controls). (ii) Yet, for both tasks mean latencies were longer for DLB patients than for controls and this was the case for both directions. Mean latencies for horizontal saccades were 343ms vs 183ms (in the gap task), 476ms vs 292ms (overlap). For vertical saccades latency values were 376ms vs 197ms (gap) and 480 vs 267ms (overlap). Conclusions: Long saccade latency in DLB patients for both directions even in the gap task reflects wide-spread deficits in the cortical (e.g. parietal and frontal) and subcortical areas including the distinct brainstem generators of horizontal (paramédian pontine reticular formation) and vertical saccades (medial longitudinal fasciculus )

**PB7 092 FOLLOW-UP OF SEVERE DEMENTIA AFFECTED PATIENTS AFTER DISCHARGE FROM A SPECIAL ACUTE CARE UNIT: A PILOT STUDY**

H. VILLARS\* (Gerontopole, Toulouse, France)

P. SOLER(2), V. GARDETTE(2), S. SOURDET(2), S. GILLETT(1), F. NOURHASHEMI(1), B. VELLAS(1) - (1) 1 Gérontopôle Service de Médecine interne gériatrique (Toulouse, France); (2) 2 Service d'Épidémiologie, économie de la Santé et Santé communautaire (Toulouse Cedex, France)

Introduction Alzheimer's disease (AD) complications are responsible for many acute admissions and emergency hospitalisations. Predictive factors of hospitalisation are exhaustion of the informal caregiver, poor nutritional status and loss of ADL abilities. Objectives: To limit unjustified early readmission to hospital. Methods and materials: Setting: Special Care Unit for older adults with AD in the Toulouse University Hospital. Participants: 184 patients (among the 445 admitted to the SCU from January to November 2008) identified as "at high risk for rehospitalisation". Patients who experienced severe disruptive behaviours such as aggression, or psychosis were included. Patients newly admitted to nursing home (NH) suffering from behavioural and psychological symptom of dementia (BPSD), patients living alone in the community, and patients whom informal caregiver was exhausted were also included. The intervention was an individualised follow-up designed to be feasible and practical. Each patient underwent a comprehensive geriatric assessment. At the time of discharge, the follow-up was explained to the GP (general practitioner) and the caregiver. It targeted individualised objectives ( i.e. preserving functional abilities detect and prevent BPSD, prevent falls, weight loss or exhaustion of the caregiver). The geriatric nurse called the caregiver during the first week after discharge, and after at 1, 3 and 6 month. The medical consultation occurred 3 weeks after discharge. In crisis situation such as relocation to NH, BPSD, or medical issue the team could be phoned. Intervention such as phone counselling, support to the caregiver or medical consultation, could be implemented depending on circumstances. Results The rehospitalisation rate at one month after discharge was 10, 6% in 2006 (from January to November of each year), compared to 11.6% in 2006. Conclusion Prevent unjustified emergency hospitalisations is a major challenge in the care of AD patients. Randomised controlled trials are needed to evaluate the effectiveness of such collaborative care.

**PB7 093 DELETION OF THE PROGRANULIN GENE IN A FAMILY WITH FRONTOTEMPORAL DEMENTIA OR LATE ONSET PARKINSON DISEASE**

V. DERAMECOURT\* (Lille University Hospital, Lille, France)

M. MACKOWIAK(1), A. ROVELET-LECRUX(2), S. LEGALLIC(2), C. MAURAGE(3), T. FRÉBOURG(2), D. HANNEQUIN(2), D. CAMPION(2), F. PASQUIER(1) - (1) Memory Clinic, EA2691, Lille University Hospital (Lille, France); (2) INSERM U 614, Faculty of medicine, Rouen, France (Rouen, France); (3) Department of Pathology and INSERM U837, Lille University Hospital (Lille, France)

Background : Progranulin gene (PGRN) mutations cause ubiquitin-positive frontotemporal lobar degeneration (FTLD) linked to chromosome 17. In these diseases, age at onset is variable and the neurological troubles may occur after 75 years old. Material and methods : We identified a near complete deletion of the PGRN gene in a French family with a rich

history of dementia, language reduction, behavioural modifications, and parkinsonian syndrome. Results : The proband was aged 64 at first visit and complained of progressive swallowing difficulties. He further developed a typical progressive non fluent aphasia and became mute 6 years later. He also had severe apathy, disinhibition and emotional blunting. His brain MRI showed considerable atrophy of the left frontal, temporal and parietal lobes. He died 8 years after onset and the neuropathological analysis showed typical FTLD-U lesions. The PGRN deletion was equally present in one 82-year old sister presenting with typical Parkinson disease (PD) with left rest tremor, bradykinesia, extrapyramidal rigidity and gait troubles. Her neuropsychological examination only showed mild impairment in executive functions consistent with PD. Although she had neither language nor behavioural symptom, her cerebral CT scan showed significant left frontotemporal atrophy, suggesting that she may be developing FTLD at a preclinical stage. Conclusions : This observation underlines the diversity of clinical presentations associated with PGRN mutations, and the considerable variability of the age at onset. The link between PD and PGRN deletion can only be discussed at present time. A diagnosis of autosomic dominant FTLD is possible in geriatric populations.

**PB7 094 THE IMPORTANCE OF A MULTIDISCIPLINARY APPROACH TO FRACTURED DEMENTED PATIENTS**

R. SCOYNI\* (CASA DI CURA , ROMA, Italy)

I. TRANI(1), M. D'IMPERIO(2), B. FELLI(2), P. BELLi(2), M. DE CRISTOFORO(2), V. CAMPONI(2), M. PACITTI(3), C. SCHIAFFINI(2), D. CARRATELLI(3), C. MOROCUTTI(4) - (1) ASL RMH (Italy); (2) Casa di Cura (Italy); (3) UOC Neurologia Ospedale Santo Spirito Roma (Italy); (4) Università di Roma (Italy)

Comorbidity in geriatric patients is of prognostic value on quality of life and survival but it often causes the exclusion of elders from clinical trials that are used to draft guidelines. We present the case of a 79 year old man suffering from multi-infarct encephalopathy, decompensated ischemic-hypertensive cardiopathy, persistent atrial fibrillation who was admitted to hospital for a dislocated right hip and periprosthetic omolateral fracture. His physical conditions contraindicated surgical treatment. Months later he was admitted to "Villa Grazia", a clinic specialized in treating mild to moderate demented patients through cognitive and physical rehabilitation programmes. At admittance the patient could not walk and had been bedridden for months. His right leg was shorter than the left and was turned outward. The functionality of the right hip was reduced and the right long extensor muscle of big toe was showing a deficit. He could not move the right leg and showed only a slight flexion of the right leg. With the agreement of the orthopedics of the Hospital S. Eugenio he underwent a revision hip replacement after which he was readmitted to "Villa Grazia". A brace was needed to correct the slight outward deviation he still had. He started a rehabilitation program of passive and active assisted kinesis at the end of which the mobility of the right hip improved to a fairly good level parallel to an increase in muscle tone and trophism. The patient was able to perform postural changes on his own using his upper limbs, he could sit and stand without help. He could walk using a forearm crutch. This case shows how the synergy of different medical facilities helps reducing the hospital stay, improving outcomes and quality of life even in patients affected by dementia are usually excluded from guidelines.

**PB7 095 GENERAL PRACTITIONERS AND DEMENTIA: UTILITY OF A SPECIFIC NEUROPSYCHOLOGICAL REPORT IN MANAGEMENT?**

J. MABIRE\* (Fondation de Rothschild, Paris, France)

S. REINGEWIRTZ(1), J. DE ROTROU(2) - (1) Fondation de Rothschild (Paris, France); (2) Hôpital Broca (Paris, France)

Introduction As recommended, general practitioners (GPs) have to play an important role in dementia management. Their understanding of neuropsychological assessment could be helpful. A standardized grid summarizing neuropsychological assessment results accompanying reports of memory centers specialists could be relevant. Such a grid would provide a quick reading of preserved and impaired cognitive functions as well as behavioral symptoms. In addition GPs could be more involved in early screening and monitoring. Methods and materials A specific grid was designed and validated for memory centers specialists. The usefulness of this grid for GPs was investigated. French GPs have been contacted by means of 2 questionnaires concerning: 1 - Their involvement in dementia monitoring. 2- The neuropsychological assessment. These GPs received the same neuropsychological assessment in three different presentations: a report type and two different synthetic grids. Questions have been asked for their understanding, opinions, expectations and interests according to the type of report. Results The expected results are: 1 - GPs will be involved in the screening and the monitoring of dementia patients. 2 - They will be interested in the availability of a synthetic and popularized grid easily meaningful in the reports of specialists. Conclusion French GPs have a central role and are involved in the early detection and monitoring of cognitive impairment. 1 - GPs may enjoy practical tools allowing them to better understand neuropsychological data. 2 - Further studies could show if they are more involved in early screening and contribute to be more effective in the disease management. If so, it could lead to a cost effectiveness improvement.

**PB7 096 IMPACT OF DONEPEZIL THERAPY ON FUNCTION IN RELATION TO MMSE IN PATIENTS WITH ALZHEIMER'S DISEASE**

G. SERGE\* (Douglas Hospital, McGill Centre for Studies in Aging , Verdun, Canada)  
O. LOPEZ(1), E. SCHWAM(2), G. WALDEMAR(3), R. JONES(4), D. WILKINSON(5),  
R. ZHANG(2), R. SCHINDLER(5) - (1) University of Pittsburgh (Pittsburgh, United States of America); (2) Pfizer, Inc (New York, United States of America); (3) Rigshospitalet (Copenhagen, Denmark); (4) St Martin's Hospital (Bath, United Kingdom); (5) Moorgreen Hospital (United Kingdom)

**Introduction:** To evaluate the effect of donepezil on function in relation to Mini-Mental State Examination (MMSE) scores in patients with Alzheimer's disease (AD). Cognition often correlates with activities of daily living (ADL) in patients with AD. **Methods and materials:** Data from 2177 patients with mild to severe AD (MMSE 5–26) were pooled from 6 randomized, double-blind donepezil studies. Because different functional scales were used in these studies, a standardized functional scale (SFS) was developed by mapping individual items from each of 5 common functional scales to matching items on the Disability Assessment for Dementia and transforming scores to a 100-point scale (0 representing total independence/100 representing total dependence). Changes from baseline to Week 24 on individual SFS items were assessed in placebo and donepezil groups and in mild (MMSE 18–26; n = 1155), moderate (MMSE 10–17; n = 879) and severe (MMSE 5–9; n = 143) subgroups. **RESULTS:** At Week 24, 11 of the 12 SFS item scores showed greater decline in the placebo group than the donepezil group with significant treatment differences in favor of donepezil for 5 ( $P < .05$ ). In the mild category, 8 items showed a greater decline in placebo patients, however treatment differences were nonsignificant. In the moderate category, all 12 items showed a greater decline in placebo patients with significant treatment differences in favor of donepezil for 7 ( $P < .05$ ). In the severe category, 7 items showed a greater decline in placebo patients with a significant treatment difference in favor of donepezil for 1 ( $P < .05$ ). Both instrumental and basic ADL were stabilized by donepezil treatment. **CONCLUSIONS:** Donepezil treatment was associated with a reduced decline in ADLs in patients with mild to severe AD. In addition, a novel method of standardizing and pooling different ADL scales was employed.

**PB7 097 THE ASTHENOEMOTIONAL SYNDROME IN ELDERLY: CLINICAL, LABORATORY AND NEUROPSYCHOLOGICAL DATAS**

B. AFFONSO MADALOSO\* (Faculdade De Medicina De Jundiaí, Jundiaí-SP, Brazil)  
M. JOSÉ EDUARDO(1), M. MARTINELLI(1), B. MADALOSO(1), M. BELLODI(2),  
J. CECATO(1), I. APRAHAMIAN(1), B. DAMASCENO(3) - (1) Faculdade De Medicina De Jundiaí (Brazil); (2) Faculdade De Medicina De Marília (Brazil); (3) UNICAMP (Brazil)

**Introduction** The Asthenoemotional Syndrome (AES) is one of the six basic syndromes described in Organic Psychiatry and the most frequent in clinical practice. It is relatively unknown as it was described by Lindqvist & Malmgren, 1993, who, created a classificatory scheme based on german psychiatry concepts and clinical experience. It is important to disseminate in the clinical environment what AES represents, demonstrate that it is not uncommon and that the symptomatologic ensemble that defines the syndrome is common to several diseases that are not entirely developed. The main objective of the study was to identify the factors related to AES etiology. **Methods and materials** We examined 129 individuals, seventy two (52 men, 72 women, age between 60 and 93 years,  $77.61 \pm$  years) were identified as possible SAE cases. All patients suspected of AES identified by anamnesis, were submitted to laboratory and neuroimaging investigations, neuropsychiatric exam including the MMSE, CAMDEX and the clock drawing test (CDT). **Results** We observed: Hypothyroidism 29.2%; Alzheimer's disease 23.6%; Hyperthyroidism 13.9%; normal pressure hydrocephalus 11.1%; hyperdensity on cerebral white matter 9.7%; mild cognitive impairment (MCI) 8.3%; pancreatic cancer, subdermal hematoma and type C Hepatitis performed 1.4% each. Thyrotrophic hormone (TSH) was the only one of diagnostic utility. MCI and Hyperthyroidism patients had a better performance on total memory tests than normal pressure hydrocephalus ( $p=0.032$ ). Concerning recent and evocative memory tests, MCI patients had higher scores compared to normal pressure hydrocephalus ( $p=0.045$ ). Hyperthyroidism patients displayed better performance than Alzheimer's disease ( $p=0.001$ ), hyperdensity on cerebral white matter ( $p=0.001$ ) and normal pressure hydrocephalus ( $p=0.001$ ), whereas MCI patients had higher scores when compared to hyperdensity on cerebral white matter ( $p=0.032$ ) and normal pressure hydrocephalus patients ( $p=0.045$ ). Conclusion AES affects social performance and can be diagnosed accurately based on its symptoms. TSH measurement and neuropsychologic tests may help identify specific causes of AES.

**PB7 098 CROSS-CULTURAL VARIATIONS IN THE HEALTH EXPECTATIONS OF INDIVIDUALS WITH ALZHEIMER**

K. LEUNG\* (University of Calgary, Calgary, Canada)  
C. COHEN(1), W. DALZIEL(2), V. EMERSON(3), L. GARCIA(4), S. HUM(5),  
P. JARVIS(6), S. KOEHN(6), J. KOZAK(7), D. LAGROIX(4), H. LEOPOLDOFF(4) -  
(1) University of Toronto, Sunnybrook Health Sciences Centre (Toronto, Canada);  
(2) Ottawa Hospital - Civic Campus (Ottawa, Canada); (3) Acuity Research Group Inc. (Ottawa, Canada); (4) University of Ottawa (Ottawa, Canada); (5) Women's College

Hospital (Canada); (6) Centre for Healthy Aging at Providence (Canada); (7) Centre for Healthy Aging at Providence (Canada)

**Introduction:** As the prevalence of Alzheimer's disease increases, effective health care necessitates understanding the expectations of patients and their caregivers. Health expectations are a person's probability-driven beliefs regarding the likelihood that specific health-related events will occur. These beliefs are informed by socio-cultural attitudes, which in turn can influence when a diagnosis is sought and access to services. Although relatively little research has been conducted, findings suggest that unrealistic patient expectations may be related to psychosocial maladjustment, and perceived societal expectations to provide care may be associated with caregiver burden. This presentation examines the expectations expressed by individuals with early-stage Alzheimer's disease and their caregivers. **Method & Materials:** As part of a cross-cultural study exploring the pre-diagnosis period of Alzheimer's disease, four Anglo-Canadians from Calgary, five French-Canadians from Ottawa, eight South-Asian Canadians from Toronto, ten Chinese-Canadians from Vancouver, and their primary caregivers participated in semi-structured interviews which explored their expectations of the condition and health care. All interviews were audio-recorded, transcribed, and analyzed using an analytic inductive framework. **Results:** The findings suggest that while caregivers articulated more preferences for medical care compared to patients, cross-cultural differences were evident in their specific expectations. Anglo-Canadians and French-Canadians tended to view dementia as a disease, and held strong expectations for medical treatment and drug therapy. In contrast, South-Asian Canadians and Chinese-Canadians viewed memory loss as a natural and expected part of aging, with South-Asian Canadians emphasizing the importance of social support and Chinese-Canadians identifying acceptance of the condition as coping mechanisms. **Conclusion:** Cross-cultural differences exist regarding beliefs and expectations about Alzheimer's disease and aging. A better understanding of these expectations may promote patient-centered care for individuals affected by Alzheimer's disease.

**PB7 099 THE EFFECTS OF DONEPEZIL ON PATIENTS WITH MILD TO SEVERE ALZHEIMER'S DISEASE RESIDING IN ASSISTED LIVING FACILITIES**

A. ROSENBLATT\* (Johns Hopkins School of Medicine, Baltimore, United States)  
J. MACKELL(1), J. PRODAFIKAS(2) - (1) Pfizer Inc (New York, United States of America); (2) Eisai Inc (Woodcliff Lake, United States of America)

**Introduction:** Assisted living facilities (ALFs) are a rapidly expanding residential option for the elderly population. However, as the number of elderly individuals residing in ALFs increases, so does the prevalence of dementia in this environment. A recent retrospective study suggested that 67% of 198 ALF residents had dementia, 59% of which was identified as Alzheimer's disease (AD) based on DSM-IV criteria. Due to the increasing prevalence of AD in ALFs, it is important to consider the potential benefits of treatment in this environment. While donepezil, an acetylcholinesterase inhibitor, has been shown to preserve patient function and slow symptom progression in AD patients, there have been no prospective studies to date evaluating donepezil in AD subjects residing exclusively in ALFs. This study assessed the efficacy and safety of donepezil in patients with mild to severe AD residing in ALFs. **Methods and Materials:** Approximately 100 subjects with mild to severe AD residing in ALFs were evaluated in this 12-week, multicenter, open-label study. The primary efficacy measure was the Mini-Mental State Examination. Additional efficacy measures included the Neuropsychiatric Inventory, Disability Assessment in Dementia scale, Caregiver Activity Survey, and Alzheimer's Disease-Related Quality of Life. Safety assessments included neurologic examinations, clinical laboratory tests, and adverse events. Following psychometric and safety baseline evaluations, subjects received 5 mg donepezil once daily for the first 6 weeks, after which their dosage was increased to 10 mg once daily for the remaining 6 weeks based on tolerability. Both efficacy and safety measures were assessed at Weeks 6 and 12. The outcome of the study was based on analysis of the primary efficacy variable at study end point. **Results:** These analyses are ongoing. The results of this study will be presented at IAGG. **Conclusions:** Appropriate conclusions will be determined based on the results.

**PB7 100 IMPROVEMENT OF DUAL TASK PERFORMANCE IN PATIENTS WITH MILD TO MODERATE DEMENTIA.**

M. SCHWENK\* (Bethanien-Krankenhaus an der Universität Heidelberg, Heidelberg, Germany)  
T. ZIESCHANG(1), P. OSTER(1), K. HAUER(1) - (1) Bethanien-Krankenhaus an der Universität Heidelberg (Heidelberg, Germany)

**Introduction:** In patients with dementia attention-related motor performances such as dual tasks are especially impaired. Deficits in Dual-Task performances may represent a relevant causal model for the high risk of falling in these patients. It has not been studied so far, whether such dual task performances can be improved by a specific training in impaired patients with dementia. **Target:** To study the effectiveness of a combined motor and attention-related training on dual task performances in patients with dementia.. **Methods:** Study participants. 52 geriatric patients ( $81.49 \pm 7.51$  yrs.) with mild to moderate dementia (MMSE  $21.41 \pm 2.93$ ). Intervention: a 10-week controlled-randomised Intervention study. Intervention group (IG) (2hrs./2 times a week) progressive strength and functional trainings, attention-related training (dual7 single Tasks). Control group (CG): 1hour/

2 times/week: unspecific stretching exercise while seated.. Gait performance (max gait speed) (V), Stride Length (SL), and other gait variables had been measured by a computed based gait analysis system GAIRITE®). Cognitive performance (Counting in forward in steps of 2 (serial 2 forward = S2), counting backwards in steps of 3 (serial 3 retro=S3), had been measured by voice recorder and tested during single and dual task conditions. Study endpoint had been the decrease of gait speed and cognitive performance during dual tasks compared to single tasks. Results: Compared to the control group the intervention group showed a significantly smaller decrease in gait performance during the more challenging cognitive task (S3retro) after training (V: IG: -19,4±13,6%, vs. CG:-36,6±17,9%; P<0,001; SL: IG: -5,09±12,59%, CG: -16,96±15,70%; P<0,001), as during the less challenging cognitive task (DT-S2) no significant differences could be reported. In the IG the cognitive performance (correct calculations per second=cc/s) during DT-S3 conditions (T1: 0,31±0,20cc/s; T2: 0,65±0,35cc/s, P<0,001) improved, cognitive performance in the control group remained unchanged (T1: 0,39±0,27cc/s; T2: 0,38±0,29cc/s). Conclusions. A combined Motor- and Attention-related training increases significantly dual task performances in demented patients comparable to performance levels in patients without dementia. **PB7 101 NEUROPSYCHIATRIC SYMPTOMS IN ALZHEIMER'S DISEASE: USING BUBBLE PLOTS TO EVALUATE DONEPEZIL TREATMENT EFFECTS**  
**J. MACKELL** \* (UCLA School of Medicine, Los Angeles, United States of America)  
**J. CUMMINGS** (5), **E. SCHWAM**(1), **R. JONES**(2), **D. WILKINSON**(3),  
**G. WALDEMAR**(4), **R. ZHANG**(1), **R. SCHINDLER**(3), **J. MACKELL**(1) - (1) Pfizer, Inc (NY 10017-5755, United States of America); (2) St Martin's Hospital (NY 10017-5755, United Kingdom); (3) Moorgreen Hospital (NY 10017-5755, United Kingdom); (4) Rigshospitalet (NY 10017-5755, Denmark); (5) UCLA School of Medicine (United States of America)

Introduction: In order to further our understanding of target symptoms identification and treatment response in patients with AD, these analyses investigated a novel analytical technique relating neuropsychiatric symptoms across individual strata of MMSE scores in patients with AD treated with placebo or donepezil. Methods and materials: Data were pooled from 1106 patients with mild to severe AD (MMSE: 5-26) in 5 randomized, double-blind, placebo-controlled studies of donepezil who had data for the 10/12-item Neuropsychiatric Inventory (NPI). Bubble matrices were generated by plotting individual baseline MMSE scores (y-axis) against the 12 NPI items (x-axis). A bubble, representing the magnitude of effect size (NPI raw mean change/SD for mean change at week 24 for corresponding NPI item and MMSE score), was fitted into each matrix cell. Treatment effects were analyzed by evaluating differences between placebo and donepezil matrices and measuring the number and magnitude of positive and negative changes. Statistical analyses were performed using the McNemar and Wilcoxon Signed-Rank tests. Results: Comparing overall bubble patterns between placebo and donepezil (N = 241 pairs of MMSE scores and NPI items) showed a significant donepezil treatment effect (57% of bubble cells showed a positive change, P<0,024). Changes between the placebo and donepezil matrices were predominantly positive for 10 of the 12 NPI items. An overall positive treatment effect was observed for the magnitude of positive and negative changes (P<0,049). Nine of the 12 NPI items showed an overall positive change in item score. Conclusion: Using this novel analytic technique it is possible to evaluate an overall effect on individual neuropsychiatric symptoms at each level of MMSE score. This approach may help identify target symptoms and evaluate their responsiveness to treatment.

**PB7 102 COMPARING EARLY ONSET DEMENTIA TO LATE ONSET DEMENTIA**  
**L. VOLPE-GILLOT\*** (Groupe hospitalier Paris Saint Joseph, Paris, France)  
**F. BONTÉ**(1), **B. DURAND-GASSELIN**(1) - (1) groupe hospitalier paris Saint Joseph (Paris, France)

**BACKGROUND :** Diagnosis of early-onset dementia is a problem that physicians have to face more and more frequently, with the increase of memory clinics. Nevertheless this diagnosis is under estimated and remains a challenge. Literature shows differences in the etiologic characteristics and clinical features between early (eod) and late onset (lod; age of onset > or = 65 years) dementia but there is a huge heterogeneity in function of studied populations. **OBJECTIVES :** The aim of this study is to focus on the differences between eod and lod among a population of over 800 patients, assessed in a memory clinic during year 2008. **METHODS:** We studied, in a retrospective way, eod patients and their caregivers demographic characteristics, type of diagnosis, clinical features and severity at the time of diagnosis, and the type of complain leading to the consultation, and compared to lod population. **RESULTS:** even if there was traumatic brain injuries and alcohol in the étiologies, frontotemporal dementia and Alzheimer's disease remain the more frequent causes in our population. Eod patients were more frequently addressed by psychiatrists, with a follow up for depression, or behavioural disturbances. The caregivers have greater perceived difficulties, and are often unable to take care properly of their relatives. **CONCLUSION:** Early onset dementia is a relatively common and frequently misdiagnosed condition. It is important to identify these patients better, because they need a specific

medical and nursing project, taking into account the differences in the type of diagnosis, the course, and management. Therefore authorities must open to this population, financial aids, and caregiving structures.

**PB7 103 RELATIONSHIP BETWEEN THE INTELLECTUAL ABILITIES AND THE TAKING OF A PRESCRIBED MEDICATION**

**K. BOIVIN\*** (Centre hospitalier universitaire de Québec, Québec, Canada)  
**L. ROBICHAUD**(1), **P. BOUDREAU**(2) - (1) Centre de recherche du CHA de Québec (Québec, Canada); (2) Hôtel-dieu de Lévis (Québec, Canada)

The autonomy to take prescribed medications is an important factor in ensuring safe community living for older people. Detection of potential incapacity to take medication is of particular interest to the health care team during discharge planning. It is known that cognitive function plays a major role in the activity of taking medication. However, the literature reviewed does not clearly specify which intellectual abilities are involved or what level of disability indicates a risky medication management. The goal of the study was to acquire better knowledge about the relation between intellectual abilities and the taking of medication. **Methods:** A cross-sectional study was conducted in two geriatric units of an acute care hospital. Fifty-eight participants were recruited during their hospitalization. The taking of medication was measured with a medication auto-administration program (MAAP) over a period of at least five days. The intellectual abilities were measured with classic tools and with the process scale of the Assessment of Motor and Process Skills (AMPS). **Results:** A logistic regression model adjusted for education, medication intake method changes, as well as complexity of medication was applied to the most relevant variables identified in preliminary analysis. It showed that the Mini Mental State Exam (MMSE), the Rivermead Behavioral Memory Test (RBMT) and the AMPS are related with the MAAP result. Furthermore, the logistic regression model with AMPS is not affected by co-variables, contrary to MMSE and RBMT. Finally, AMPS showed a good potential as a screening tool for medication intake difficulties (sensitivity of 92% and specificity of 80%). **Conclusion:** This study confirms the relation between the taking of medication and intellectual abilities. Moreover it identifies a stronger relation with the process skills.

**PB7 104 INCIDENCE OF DEMENTIA AND RATE OF CONVERSION OF CDR=0,5 CASES, IN A COHORT OF ELDERLY LIVING IN SAO PAULO, BRAZIL**

**L. RAMOS\*** (UNIFESP, São Paulo, Brazil)  
**M. MONTAÑO**(1) - (1) UNIFESP (São Paulo, Brazil)

Incidence of dementia is a major public health problem in aging populations, particularly in developing countries where the elderly population has grown explosively. Identification of risk groups is vital to implement health promotion. The Clinical Dementia Rating (CDR) is a valid scale to classify the severity of dementia cases (mild, moderate, severe), also enabling the identification of borderline cases, when the subject no longer has a normal cognitive status for his age, but has not yet met criteria for dementia. There are many evidences that this group has a significantly higher rate of conversion to dementia than normal. This study aims to verify the incidence of dementia in a cohort of elderly (70+) living in São Paulo, a large urban center in Brazil, particularly among borderline cases with a CDR=0,5, and to identify factors associated. A sample 156 members of the cohort (n=424) included every elderly with a MMSE below 26 and a sample of those with a MMSE equal or above 26, all clinically evaluated for dementia. A Portuguese version of CDR (previously validated by authors) was applied to the closest relative or carer. After refusals and deaths, 92 elderly were re-evaluated after an average 3-years interval. From the 77 who did not meet criteria for dementia in baseline (39 CDR=0 and 38 CDR=0,5), 23% converted to dementia – 10,3% in CDR=0 and 36,8% in CDR=0,5 (RR=3,58). Among those with a CDR=0,5 and a box-score above 1 conversion rate was 50% (RR=4,8). Incidence of dementia was high, as expected given cohort's age, and comparable to the literature. The 3-year risk of conversion to dementia, was higher among those with CDR=0,5 and much higher if the box score was above one. Implications for health planning and research will be discussed.

**PB7 105 INTEREST OF LOCOMÉTRIX TO ASSESS GAIT'S PROFILE IN SPECIFIC OLD POPULATIONS.**

**S. GILLAIN\*** (Centre Hospitalier Universitaire de Liège, Liège, Belgium)  
**E. WARZEE**(1), **F. LEKEU**(1), **V. WOJTASIK**(1), **D. MAQUET**(1), **J. CROISIER**(1), **E. SALMON**(1), **J. PETERMANS**(1) - (1) C. H. U. de Liège (Liège, Belgium)

Introduction: a global assessment is essential in geriatric situations. It is well known that alterations of gait appear early with cognitive decline. An analysis of the gait profile is difficult in clinical practice; clinical procedures are useful to determine the risk of falling. A new instrumental method (Locometrix®) is tested to characterize the gait of old subjects. Material and method: 47 patients were evaluated: 21 normal subjects (NS), 14 mild cognitive impairment patients (MCI), and 12 Alzheimer patients (AD). They were 65 years or older, with no fall or hospitalisation history in the last 6 months. They all walk easily, with no walking aid, without pain, they did not have any prosthesis and were living at home. The patients were assessed by a walk of 40 meters with accelerometric device (Locometrix®). This procedure was realized in simple (ST) and dual task (counting down) (DT). A neuropsychological evaluation (MMSE, Mattis scale, Grober and Buschke test,

Rey complex figure test, divided attention test and Lawton scale) was performed to determine cognitive profiles. Petersen criteria were used to classify MCI. Results: Locométrix shows that NS and AD subjects are different for speed in ST and DT, stride frequency in DT and stride length in DT with p value <0.05. Furthermore, MCI are different from NS by the frequency in TS ( $p < 0.05$ ). Performance in counting down in ST permits to differentiate NS and AD subjects. In DT, performance in counting down is different between the three groups. Conclusion: In simple and dual task, Locométrix identifies specific parameters in correlation with cognitive profile. And the counting down in DT shows a significant difference between the three groups.

**PB7 106 DAY CARE HOSPITAL FOR PEOPLE WITH LATE ONSET AND EARLY ONSET DEMENTIA**

F. BONTÉ\* (Groupe hospitalier Paris Saint Joseph, Paris, France)

L. VOLPE-GILLOT(1), B. DURAND-GASSELIN(1) - (1) groupe hospitalier paris Saint Joseph (Paris, France)

**BACKGROUND :** Early-onset dementia (eod, age at onset < 65) is suffering of too few investigations. However, even when the diagnosis is settled, the follow up of these patients shows many acute problems, different than in the late onset dementia (lod). Patients and caregivers are involved in professional and family responsibilities, that are leading to difficulties in the daily management. **OBJECTIVES:** The aim of this study is to focus, on the needs of this population, and the response given to patients followed in a day care hospital program, where a support for lod patients is also provided. **METHODS:** We studied, in a retrospective way, eod patients and their caregivers demographic characteristics, type of diagnosis, clinical features and severity at the time of diagnosis. We added the assessment of the Neuropsychiatric Inventory, and the burden of Zarit. We also note the kind of benefits of psychological support and cognitive stimulation for the patients **RESULTS:** The caregivers have greater perceived difficulties, NPI and burden were higher, They need financial, social and logistical support, in the long term. The acceptance of the disease is hard, and they suffer of the social bad representations. Their inclusion among lod patients is not a problem. **CONCLUSION:** Day care hospital programs for eod patients, associated with support program for their caregivers seems to be a good response to the particular difficulties showed by this population. Caregivers find relief and informations they are lacking so much, patients are repromoted by activities adapted to their capacities.

**PB7 107 ACTIVITIES OF DAILY LIVING THAT MATTER MOST TO CAREGIVERS**

D. CHRISTENSEN \* (University of Utah School of Medicine, Salt Lake City, United States)

R. GOLDMAN(1), J. MACKELL(2) - (1) Pfizer Inc (New York, United States of America); (2) Pfizer Inc (New York, United States of America)

**INTRODUCTION:** This study was designed to ascertain the most relevant activities of daily living (ADLs) for caregivers of loved ones with Alzheimer's/memory loss. **METHODS AND MATERIALS:** Caregivers, recruited from an aggregated sample pool pulled from magazine and product inserts, direct mail, phone survey opt-ins and Alzheimer's websites, were invited by direct mail and email to participate in an interview. Approximately 40 caregivers were interviewed in each week of August and September 2008. For the interview, caregivers were presented with a list of 11 ADLs and asked to select up to 5 that were the most relevant/important to them. **RESULTS:** 138 caregivers were interviewed in August and 160 in September. Approximately 75% of the caregivers and two-thirds of the patients were female. On average, 65% of the caregivers were  $\geq 40$  years, with the mode (22%) being 55–64 years. Over 80% of patients were  $\geq 65$  years, with the mode (45%) being 75–84 years. Disease severity for the majority was rated as mild (56%) or moderate (32%). Of all caregivers, nearly 70% said reminding to take medications and 60% said going out (shopping, social activities) were the most relevant activities, while around the house activities (bathing, walking, eating) were less prominent. For caregivers of both loved ones who were ( $n = 135$ ) or were not ( $n = 163$ ) treated, reminding to take medications and going out remained the most relevant activities, but respondents of treated patients were almost twice as likely to report house activities as relevant than were those of untreated loved ones. **CONCLUSION:** Reminding to take medications and going out were the most relevant ADLs to all caregivers. House activities were more relevant to caregivers of treated loved ones. These results have implications to guide pharmacologic and non-pharmacologic interventions that have a meaningful impact on the patient and caregiver.

**PB7 108 SCREENING FOR MILD COGNITIVE IMPAIRMENT IN IDIOPATHIC PARKINSON'S DISEASE: IS THE CLOCK DRAWING TEST USEFUL?**

E. MATTEAU\* (Laval University, Quebec, Canada)

L. JEAN(1), D. NICOLAS(2), M. SIMARD(1) - (1) Laval University (Quebec, Canada); (2) CHA-Enfant-Jésus (Quebec, Canada)

**Introduction:** The Clock Drawing Test (CDT) has been recently shown to detect patients with Mild Cognitive Impairment (MCI). The objectives of this study were to validate the CDT in screening for MCI in idiopathic Parkinson's Disease (PD-MCI) and to compare

three scoring methods. **Methods and materials:** Nineteen (19) patients with PD-MCI and 20 healthy controls (HC) matched according to age, education and gender were recruited. According to Petersen's criteria, diagnoses of PD-MCI were made if individuals scored around 1.5 SD below the mean of normative data in at least one of the five cognitive domains assessed. Global cognitive status was evaluated using the Mattis Dementia Rating Scale. The CDT was scored according to the Rouleau (10-point), Cahn (10-point) and 18-point scoring systems. **Results:** The distribution of the PD-MCI subtypes was as follows: non-memory single domain (37%), non-memory multiple domains (32%), memory multiple domains (21%), and memory single domain (10%). PD-MCI patients received their diagnosis when aged 59.5 (SD= 11.0) years, and their disease duration was 9.8 (SD= 5) years. ANOVAs controlling for global cognitive function revealed that all three CDT scoring methods differentiated PD-MCI from HC (Rouleau:  $p = .001$ ,  $d = 1.54$ ; Cahn:  $p = .000$ ,  $d = 1.94$ ; 18-point:  $p = .002$ ,  $d = 1.36$ ). Sensitivity and specificity for PD-MCI respectively ranged from 78.9% to 89.5% and from 70% to 80%. Taking into account the likelihood ratio (LR), the Cahn's protocol was the best to distinguish clinically diagnosed PD-MCI from HC. With a cut-off point established at 9, it correctly classified 89.5% of the PD-MCI and 70% of the HC. **Conclusion:** Although a screening cognitive test would never replace an exhaustive neuropsychological evaluation, our results confirm that the CDT could help to identify patients with PD-MCI. Hence, the CDT can quickly and effectively alert clinicians as to which individuals are at higher risk of developing dementia.

**PB7 109 AN INTEGRATED MEMORY CLINIC OF A DISTRICT GENERAL HOSPITAL IN HONG KONG: A RE-VISIT**

C. YUNG\* (United Christian Hospital, Kwan Tong, Hong Kong)

T. YIM(1), S. FUNG(1) - (1) United Christian Hospital (Kwan Tong, Hong Kong)

**Introduction:** Elders with cognitive disabilities should have access to memory clinics which have developed using a range of service models but providing similar functions. **Material:** The development and operation of an integrated memory clinic are described. **Results and Conclusion:** United Christian Hospital, a district hospital in Hong Kong, started a memory clinic in 1999 for patients aged 65 and older. This is a service that essentially hived from the Psychogeriatrics Clinic operated by psychiatrists. However, this clinic bears several prominent differences. The team comprises not only psychiatrists but also geriatricians. Others include: occupational therapist and psychiatric nurses. Clinical assessment (medical and psychiatric) is inter-disciplinary and is performed either solely by geriatricians or psychiatrists. Assessment tools used include: MMSE, GDS, Lawton IADL Scale, Neuropsychiatric Inventory and Relatives Stress Scale. Routine blood tests, calcium, fasting glucose, thyroid function, vitamin B12, folates and VDRL are checked. Plain head CT with width measurement of medial temporal lobe is almost a routine. Assessments are discussed and care plans are formulated. We described our findings in the first 100 patients (63 women) with mean age of 83.3. 95 patients completed assessment. 93 had CT scan. 86 met DSM-III-R criteria for dementia. 3 had other organic brain syndrome. 6 were not demented. 43 had Alzheimer's disease, 12 vascular dementia and 31 mixed. Among the non-demented, 2 had depression and 6 had no mental disorders but had physical illness which could affect memory. All depressed patients improved with treatment. However no case of reversible dementia recovered. According to needs, upon discharge, 39 were followed up at Geriatrics Clinic whereas 43 at Psycho-geriatrics Clinic. This alternative model of memory clinic with full inter-disciplinary integration of geriatric and psychogeriatric inputs could facilitate assessment and management of dementia. Our memory clinic is a

**PB7 110 EXPLORING THE EFFECTIVENESS OF COGNITIVE STIMULATION THERAPY FOR MILD TO MODERATE DEMENTIA**

N. YUILL\* (University of Alberta, Edmonton, Canada)

V. HOLLIS(1) - (1) University of Alberta (Edmonton, Canada)

**Background:** As populations age, the prevalence of Alzheimer's disease (AD) and related dementias have increased. Pharmacological treatments for mild to moderate dementia have resulted in limited improvements in cognition, highlighting a need for effective non-pharmacological approaches. Cognitive stimulation therapy (CST) is a person-centered group program for optimizing cognitive function through reality orientation and reminiscence therapy. The program is based on an extensive review of the literature on non-pharmacological approaches for this population and is consistent with research that suggests cognitively stimulating activities may facilitate the prevention of certain forms of dementia including AD. CST may be administered by any health care professional. This critical literature review examined the effectiveness of CST and related intervention strategies. **Methods:** A resource librarian assisted with appropriate search strategies and an expert verified search terms. Twenty-four databases and 13 'grey' sources were searched. Clinical trials examining the effectiveness of CST in enhancing/optimizing cognitive function of individuals with mild to moderate dementia and comparable programs were included. Two reviewers analyzed papers meeting the inclusion criteria, using the McMaster Critical Literature Review Guidelines and Jadad Validated Quality Scale. **Results:** The search yielded 23 papers. Twelve met the inclusion criteria and were of relatively high quality. Cognitively stimulating programs appear to be effective in optimizing residual cognitive functioning for individuals with mild to moderate dementia and may improve overall quality of life. **Conclusions:** Although research in this area is limited, the strength of evidence suggests that CST and related interventions may provide a useful structural framework on which to build

rehabilitation programs for individuals with mild to moderate dementia. Due to the complex nature of this disorder, such strategies may be most effective when implemented as part of a holistic multimodal approach. Further research into this area is required.

**PB7 111 QUANTIFICATION OF BRAIN LESIONS FOR FUNCTIONAL MAGNETIC RESONANCE IMAGING RESEARCH ON OLDER ADULTS USING AN INDEX VARIABLE: PRELIMINARY RESULTS AT 4 TESLA**

K. ROCKWOOD\* (No, Tianjin City, China)

W. CHEN(2), X. SONG(1), R. D'ARCY(1), S. DARVESH(3) - (1) National Research Council (Halifax, Canada); (2) Graduate School of Tianjin Medical University (Tianjin, China); (3) Division of Geriatric Medicine, Dalhousie University (Halifax, Canada)

**Introduction:** Brain degeneration is common in older adults. Neuroimaging studies have reported a 5-90% incidental finding rate for a diverse extent of problems, including diffuse and local lesions and global atrophy. Even so, functional magnetic resonance imaging (fMRI) research comparing patients with particular disorders under investigation and matched healthy subjects often merely examines group differences, regardless of apparent heterogeneity of brain damage. Unfortunately, brain damage inevitably affects blood circulation and functional responses, making inference of functional changes difficult. Existing lesion rating scales rely on a thorough evaluation of clinical imaging, which is not always possible for an fMRI study. We propose a T1-weighted imaging index of brain lesions for fMRI investigations. Methods: Healthy older adults (NC) and people with mild Alzheimer's disease (AD; n=25, women=13, age=65-89 years, education=16±4 years, 3MS=71-100) underwent MRI scans (4-Tesla Varian-Oxford human imaging system). A T1-weighted whole brain anatomic image was acquired using 3DMPFLASH (FOV=307x192x192, matrix=256x160, 1.2mm thickness). For validation purposes, a T2-weighted image was acquired using FSE on several occasions. A brain lesion index (BLI) was constructed by summarizing problems in the white matter (WM) including lesions in periventricular areas, deep WM, and basal ganglia, infratentorial abnormal signal intensities, and global atrophy. Characteristic differences of the BLI among participants were calculated for the subjects. Results and Discussion: Various aspects of structural problems were detected in the study sample. The most common type of deficits were periventricular WM lesions (100% for AD and 83% for HC subjects), followed by deep WM lesions and brain atrophy. This is consistent with previous studies. The BLI ranged between 3.5-14 in AD (3.0). It reasonably 4.2 and 1.5-11.5 in NC (average 6.4±average 9.7 measures the overall brain damage in the subjects. There existed a clear overlap in the BLI distribution among people in the two groups. Conclusions: Our study suggests that caution needs to be taken in comparing group differences in brain functional changes. The BLI may be applied to practically adjust variations in the functional data. Ongoing research on a larger sample will evaluate how the BLI relates to cognitive and functional measures.

**PB7 112 THE FACTORS ASSOCIATED WITH DEMENTIA IN AUSTRALIAN ABORIGINAL AND TORRES STRAIT ISLANDER PEOPLES**

K. SMITH\* (University of Western Australia, Perth, Australia)

L. FLICKER(1), A. DWYER(1), D. ATKINSON(2), O. ALMEIDA(1), N. LAUTENSCHLAGER(1), D. LOGIUDICE(3) - (1) University of Western Australia (Perth, Australia); (2) Kimberley Aboriginal Medical Services Council (Perth, Australia); (3) National Ageing Research Institute (Perth, Australia)

**Introduction** This project, based in a remote region of Australia, determined the risk factors for dementia amongst older Aboriginal and Torres Strait Islander peoples. Methods and materials 363 Aboriginal people aged over 45 years from the Kimberley region in Western Australia were assessed with the Kimberley Indigenous Cognitive Assessment (KICA), previously developed and validated by the researchers. All those scoring less than 37 on the KICA, and a proportion of those scoring 37 or more were reviewed by specialist clinicians and consensus diagnoses obtained from two independent specialists blinded to KICA results. Information on risk factors was collected from participant or informant report, medical records and geriatrician review. Results The prevalence of dementia was 12.4%, 5.2 fold greater than the overall Australian prevalence of 2.4%. Factors associated with dementia included older age, male gender (OR 3.1, 95% CI 1.4, 6.8) and no formal education (OR 2.7, 95% CI 1.1, 6.7). After adjusting for age, sex and education, dementia was associated with current smoking (OR 4.5, 95% CI 1.1, 18.6), previous stroke (OR 17.9, 95% CI 5.9, 49.7), epilepsy (OR 33.5, 95% CI 4.8, 232.3) and head injury (OR 4.0, 95% CI 1.7, 9.4). Conclusion Factors associated with dementia in this sample indicate that an accumulation of health insults may contribute to the development of dementia at an earlier age in Aboriginal and Torres Strait Islander peoples. Chronic disease, injury and a lack of formal education are highly prevalent in the Aboriginal and Torres Strait Islander population, and these factors were found to be strongly associated with dementia. The poor access to quality health services for Indigenous people living in remote areas may also contribute to the development of ageing conditions such as dementia. Further methodologically rigorous studies to document cognitive impairment in indigenous populations worldwide are needed.

**PB7 113 COMMUNITY KNOWLEDGE OF DEMENTIA AND ITS RISK FACTORS**

F. MILLARD\* (James Cook University, Townsville, Australia)

L. KENNEDY(1), B. BAUNE(1) - (1) James Cook University (Townsville, Australia)

**Introduction:** Patients in the doctor's waiting room create an opportunity to raise awareness of dementia and its risk factors and encourage positive attitudes to risk reduction, symptom

presentation and active management. Method: Our design is to recruit 1000 patients aged over 30 years to receive a one page survey about dementia and its risk factors. They are randomly assigned to one of two groups: group 1 receiving only the survey and group 2 receiving an additional dementia information page, Alzheimer's Australia 'Mind Your Mind' summary of dementia risk factors. Results: Analyzing the first 120 responses on SPSS produced the following: 65% group 1 and 56% group 2 described dementia as 'memory loss', and 19% group 1 and 26 % group 2 as a 'brain problem'. The source of information about dementia was mostly from acquaintances, 50% of each group, and next, the media: 39% and 34% groups 1 and 2 respectively. Only 3/59, all from group 1, indicated they would not seek help for memory problems but of the combined groups, 86% answered they would seek help from a doctor, although only 17% indicated they had heard about dementia from a doctor. When asked if they would like a memory test, 56% and 59 % of groups 1 and 2 respectively answered 'yes' but only 14% of the combined groups over 70 years answered that they had been offered one. Patients were asked if they thought dementia risk factors could be reduced and 49% group 1 and 59% group 2 responded positively. Only 11% of the combined groups did not wish to learn more about dementia risk reduction with no difference between groups Chi<sup>2</sup> 4.553, p=.871. Conclusions: Initial data indicates the usefulness of the Alzheimer's Australia 'Mind Your Mind' risk reduction summary in improving attitudes, knowledge and awareness about dementia.

**PB7 114 A SURVEY OF DEMENTIA OUTCOME MEASUREMENT TOOLS FOR INDIGENOUS AND CULTURALLY AND LINGUISTICALLY DIVERSE GROUPS**

J. SANSONI\* (University of Wollongong, Wollongong, Australia)

N. MAROZZEKY(1), E. SANSONI(1) - (1) University of Wollongong (Wollongong, Australia)

**Introduction:** One of the aims the Australian Dementia Outcomes Measurement Suite (DOMS) project was to examine the appropriateness of recommended dementia outcomes measurement tools for culturally and linguistic diverse (CALD) groups and indigenous groups within the general Australian population. Methods and materials: The first step was to examine the cultural applicability of recommended measures by looking at publications about their use (and therefore language translation) in different countries across the globe. The next step used clinical experts to examine the item content of the recommended dementia outcomes measurement tools. Finally a bibliographic literature review was conducted to find relevant cross-cultural instruments and procedures. Results: The language translation survey found that the older and more established dementia measures have many language translations. However having a workable language translation is only the first requirement. There is still a need to establish cultural equivalence and for the development of clinical and normative data. In terms of item content analysis, many of the recommended instruments contained small problems with item wording and a potential for cultural bias. Cultural bias was found for some clinical / proxy rating scales which described behaviour and general functioning. Western value judgements and cultural stereotypes were also embedded within some instruments. Some cognitive testing items were identified as having questions which reflected, to some extent, a degree of acculturation and specific knowledge about the dominant culture. Some instruments examined from an indigenous perspective contain inappropriate language, concepts and timeframes. There is also a need to examine the performance of both urban and remote indigenous groups on culturally appropriate instruments. A number of cross-cultural instruments and procedures were found including some recently developed in Australia. Conclusions: This paper provides a brief survey of published measurement tools for the measurement of dementia in culturally and linguistically diverse groups and indigenous populations.

**PB7 115 OPERATIONS IN PSYCOGERIATRIC UNIT OF MEDIUM STAY IN BARCELONA, CATALUNYA (SPAIN). DESCRIPTION OF PACIENTS ADMITTED**

L. REIG\* (Hospital Sociosanitari del Hôpital, L'Hôpital de Llobregat, Spain)

E. MARTINEZ(1), M. FERNANDEZ(1), A. OTERO(1), A. DELGADO(1), N. CANO(1), N. MARTIN(1), R. JIMENEZ(1) - (1) Hospital Sociosanitari del Hôpital (L'Hôpital de Llobregat, Spain)

**INTRODUCTION** The Unit of Psychogeriatric of Medium Stay was open in September 2001. It is in the Hospital Sociosanitari del Hôpital. The Unit is formed by five beds in a closed unit. The patients are admitted for temporal stay for: 1/ Control of Behavioral problems; 2/Physical Therapy; 3/Diagnostics of dementing process; and 4/control of medical pathologies in demented patients. MATERIAL AND METHODS Analysis of medical records of patients admitted in the period. RESULTS Between September 2001 and June 2006 231 patients are admitted. 130 (56.3 %) are women. Married 108 (46.8 %), widows 107 (46.3%). Medium age: 80 ± 8.3 years (49-97). Medium stay: 30.5 ±15 days (1-97). Diagnostics: Alzheimers Disease 101 (43.7%), Vascular 36 (15.6%), Frontotemporal 11 (4.8 %), Dementia-Parkinson 14 (6.1 %), Lewy Body Disease 6 (2.6%), Normotensive Hydrocephalus 5 (2.2%). The reason for admission are: Behavioral disorder 164 (71%), Physical therapy 33 (14.3%), Diagnostics 14 (6.1%). Origin of patients are: house 182 (78.8%), hospital 36 (15.6%), nursing home 8 (3.5%). Functional state at admission are: Barthel Index 40.5 ± 25, at discharge 56 ± 26. Charlson Comorbidity Index: =< 2 192 (83.1%); > 2 39 (16.9%). Nutrition are correct in 133 (57.6%) and altered in 93 (40.2%). Depression is present in 81 (35%). Medium punctuation in Global Deterioration Scale (GDS) are: 6.2 ± 0.7. Medium punctuation in Neuropsychiatric Inventory (NPI) are

$35 \pm 20$  points. Aggressiveness is present in 74 (32%), insomnia in 156 (67.5%), psychosis in 88 (38.1%), nutritional alteration in 52 (22.5%). CONCLUSIONS Patients admitted are 80 years old, GDS>6, are functionally dependent, come from home, and the most common problem for admission are insomnia. Medium stay in unit are 30 days.

**PB7 116 THE EFFECTIVENESS OF THE TEA-ZEN WELFARE APPROACH TO IMPROVING THE MENTAL HEALTH OF OLDER ADULTS WITH MILD DEMENTIA**

I. KIM\* (Pusan National University, Busan, Republic of Korea)  
K. KIM(1), K. LEE(2), Y. JUNG(2) - (1) Pusan National University (Busan, Republic of Korea); (2) Pusan Women's College (Busan, Republic of Korea)

Purpose : This study applied a Tea-Zen-Welfare program to the elderly with mild dementia and examined the effectiveness of this program in decreasing depressive symptoms and suicidal ideation of the program participants. 'Tea-Zen-Welfare Approach' is an Interdisciplinary approach which has been developed by our research team based on the Korean tea culture with Zen-meditation in terms of welfare. Methods : This study was conducted in the Prevention Care Rehabilitation Center, Busan Metropolitan City in Korea. Ten older adults(average age 75) with mild dementia participated in a 12-session Tea-Zen-Welfare program from September 1st, 2008 through December 4th, 2008. This study utilized a one-group pretest-posttest design. In order to measure the effectiveness of the program, both Geriatric Depression Scale(GDS) and Scale for Suicide Ideation(SSSI)-BECK were used both the Wilcoxon singed-rank test and the paired t-test were conducted using SPSS. This program consists of the following three major components: (a) understanding tea culture and enhancing positive interaction with people via tea drinking ceremonies (b) practicing the meditation, and (c) applying social work practice. These components embedded in the each session of the program, and some of the examples of session topics include understanding origins of tea, facilitating five senses through colors, flavors, and beauties of tea, meditating, and practicing tea-gymnastics. Results : The statistical tests results indicated that the program was effective in decreasing depressive symptoms of the study participants. Eight out of ten study participants' test scores were decreased( $p<0.05$ ). Moreover, it was found that the study participants' suicidal ideation test scores were also significantly decreased at the post-test assessment( $p<0.05$ ). In terms of the program process evaluation, participants reported high satisfaction toward the overall program, staffs and volunteers. Conclusion : This Tea-Zen-Welfare program, based on the Korean traditional culture, was effective in reducing depressive symptoms and suicidal ideation among the elderly with mild dementia. We can suggest that the program can be applied to elderly with alcohol problems.

**PB7 117 MEMANTINE SHOWS BENEFICIAL EFFECTS ON FUNCTIONAL ABILITIES IN MODERATE-TO-SEVERE ALZHEIMER'S DISEASE**

B. WINBLAD\* (Karolinska institutet, Stockholm, Sweden)  
S. GAUTHIER(1) - (1) McGill Centre for Studies in Aging (Verdun, Canada)

Introduction: Functional abilities are severely impacted in Alzheimer's disease (AD). Loss of the ability to perform complex (instrumental) and basic activities of daily living (ADL) leads to decreased independence and increased caregiver burden. This post-hoc analysis investigates the effect of memantine (20mg/day) on ADLs, combined from Alzheimer's Disease Cooperative Study-Activities of Daily Living 19-item (ADCS-ADL<sub>19</sub>) and 23-item (ADCS-ADL<sub>23</sub>) scales, in patients with moderate-to-severe AD. Methods and materials: Patients with MMSE<20 from 6 randomised, placebo-controlled, double-blind, 6-months studies of memantine were included. ADCS-ADL<sub>19</sub> and ADCS-ADL<sub>23</sub> were pooled, and 14 identical items, with a score range of 0-39, were identified and included in the analysis. Basic ADLs (BADLs) were defined as eating, walking, toileting, bathing, and grooming, and instrumental ADLs (IADLs) as non-basic ADLs comprising: using a telephone, watching television, conversing, clearing a table, finding belongings, obtaining a beverage, disposing of garbage, travelling outside the house, and being left alone. Change from baseline on single-item, BADL (range: 0-15), IADL (range: 0-24), and total 14-item ADL scores were analysed for observed cases using ANCOVA, with centre and treatment as categorical explanatory variables and score at baseline as a covariate. Results: 959 patients (76 years, 67% women, baseline MMSE score: 12.3) were treated with memantine and 867 patients (76 years, 63% women, baseline MMSE score: 12.2) received placebo. 82% of the memantine-treated and 77% of the placebo-treated patients completed the studies. Memantine-treated patients had a less decline from baseline on the 14-item ADL score, compared with placebo ( $p<0.0001$ ). Memantine also showed benefits for BADLs ( $p<0.05$ ) and IADLs ( $p<0.001$ ), compared with placebo. Memantine-treated patients showed less worsening than placebo-treated for the ADL items: toileting ( $p<0.01$ ), grooming ( $p<0.01$ ), finding belongings ( $p<0.01$ ), and travelling outside the house ( $p<0.05$ ). Conclusion: Memantine shows benefits, compared with placebo, for both basic and instrumental ADLs for patients with moderate-to-severe AD.

**PB7 118 RELATIONSHIPS BETWEEN HYPERCHOLESTEROLEMIA AND COGNITIVE IMPAIRMENT**

F. ROLLAT\* (HOPITAL BROCA, PARIS, France)  
E. DURON, F. LABOURÉE, M. SEUX, A. RIGAUD, O. HANON

Background: To study the relationships between cognitive impairment and hypercholesterolemia in an elderly population with a memory complaint. Methods: Links

between hypercholesterolemia, statins and cognitive functioning have been studied among 496 consecutive subjects attending a geriatric outpatient clinic. Cognitive function was assessed using the Mini-Mental-State-Examination (MMSE) and validated neuropsychologic tests (Cognitive Efficiency Profile = CPE). A cerebral tomodensitometry, and biologic sample including total cholesterol, LDL-cholesterol, HDL-cholesterol, triglycerides dosages and ApoE genotype determination were also performed. At the end of this evaluation, the patients were classified in 3 groups according to their cognitive status: normal cognitive functioning, mild cognitive impairment (MCI), Alzheimer Disease (AD). Subjects with other dementia (vascular dementia, Lewy Body Disease...) were excluded. Results: In this  $76 \pm 8$  years elderly population including 71% women, 42% of patients suffer from AD, 34.5% had a MCI and 23.5% had a normal cognitive functioning. After adjustment on age, sex, weight, education level, ApoE genotype and cardiovascular diseases, a positive correlation between plasmatic cholesterol dosages and cognitive impairment was found. Patients with hypercholesterolemia (total cholesterol > or = 6.5mmol/l) had lower cognitive function than patients with normal cholesterol (MMSE score  $24 \pm 4/30$  vs  $26 \pm 3/30$ ,  $p < 0.01$ ; PEC score  $56 \pm 18/100$  vs  $62 \pm 17/100$ ,  $p < 0.001$ ). Furthermore, patients with AD had total cholesterol significantly more elevated than patients with normal cognitive function ( $6.1 \pm 1.0$  vs  $5.7 \pm 1.1$ mmol/l,  $p < 0.01$ ). However, no significant association between statins therapy and AD prevalence was found, after adjusting on age, sex, education level, ApoE genotype and cardiovascular diseases (OR: 1.53; IC 95% = 0.88-2.66). Conclusion: This study indicates a significant association between hypercholesterolemia and cognitive impairment or AD in an elderly population with memory complaint. Nevertheless, the statins therapy is not associated with a slightest prevalence of AD.

**PB7 119 ALZHEIMER'S DISEASE, PRESBYCUSIS AND HEARING AIDS: INVESTIGATION OF A NEW STRATEGY**

S. RICHARD\* (Hospices Civils de Lyon, Pierre Benite Cedex, France)  
X. PERROT(1), C. PETITOT(4), F. CHAPUIS(5), L. FORNONI(1), L. VILLENEUVE(5), C. DUBREUIL(3), . COLLET(1), . BONNEFOY(2) - (1) Audiologie Hospices Civils de Lyon (Pierre Benite Cedex, France); (2) Medecine geriatriqueHospices Civils de Lyon (Pierre Benite Cedex, France); (3) ORL Hospices Civils de Lyon (69495, France); (4) Generale de Sante (Rennes, France); (5) Pole information Medicale Evaluation RechercheHospices Civils de Lyon (France)

Introduction: Alzheimer's disease and deafness are two major public health issues more particularly occurring in elderly patients. Since pharmacological strategies are still limited, non pharmacological approaches must be defined. Recently, it has been shown that the relative risk for cognitive disorders development was higher in institutionalized patients with presbycusis than in those with a normal hearing. Few studies have reported cognitive and behavioural benefits of deafness management in demented patients. However, up to now, no case control study or randomized controlled trial have been led through standardized methodology in this field of research. Methods and materials: The purpose of our survey is to seek for the prevalence of presbycusis and to evaluate management of hearing aids among 150 French Alzheimer patients compared to a matched control population of non-demented subjects. Firstly, a one-year follow-up study is investigating the relationship between auditory status and cognitive functional decline. Secondly, a twelve-month randomized controlled trial aims at studying the benefits and the tolerance of bilateral hearing aids in 30 hearing-impaired patients suffering from mild-to-moderate stage Alzheimer's disease. Benefits are assessed in the field of cognition, behaviour, quality of life and medical economy through standardized tests, questionnaires and scales. Results: Preliminary results show that audiometric tests are pathological for 88% of Alzheimer patients. Though half of them are suffering from this hearing impairment in everyday life, only 18% of them are fitting with hearing aids. According to Alzheimer patients and their relatives, communication skills and social interactions are enhanced. Unfortunately, for 62 % of Alzheimer patients which are suffering from presbycusis without audiological care, nobody advised them to wear hearing aids. Conclusion: If benefits related to management of bilateral hearing impairment are proved, an awareness campaign will be necessary and social covering to support this new strategy will have to be considered.

**PB7 120 COGNITIVE DIFFERENCES BETWEEN EARLY-ONSET AND LATE-ONSET IN ALZHEIMER'S DISEASE**

P. GIL\* (Hospital clinico san carlos madrid, Madrid, Spain)  
M. C(1), R. M(1), V. A(1), G. P(1), R. JM(1) - (1) hospital clinico San Carlos Madrid (Madrid, Spain)

Aims: To describe the differences in the performance of cognitive assessment tasks between patients with early or late onset of Alzheimer's Disease. Method: Prospective study. Patients with early and late onset of Alzheimer's Disease (AD) were included in the sample, defined as follows: early-onset patients (EAD) were younger than 70 years of age; and late-onset patients (LAD) were older than 75 years of age. Diagnosis of Alzheimer's Disease was done based on NINCDS-ADRDA criteria. The Global Deterioration Scale were used to classified the patients in stages. Neuropsychological battery included: Mini-Mental State Examination (Folstein), Logical Memory WMS-III, Digit Span, Boston Naming Test, Verbal Fluency (phonetic and semantic tasks), Clock Test and ideomotor praxia. The statistical analyses of the data were done with SPSS 14.0. Results: 81 patients

were included in the sample, and divided as follows: early-onset N = 37 and late-onset N = 44. Mean age was: 66 for EAD, and 82 for LAD. 24,5 % of the EAD group were men, and a 13,6% in LAD group. Not differences were found in the educational level between the two groups. Nor even differences were found in the GDS being all patients in the 4 stage. We found significant differences between the groups in their performances in the MMSE (p: .000), the Boston Naming Test (p: .003), phonemic fluency (p: .004), semantic fluency (p: .008) and ideomotor praxia (p: .000). No significant differences were found in Logical Memory WMS-III, Digit Span forward or backward and not even in the Clock Test. Conclusions: 1.- There are significant differences in the performance of cognitive tasks between early-onset and late onset patients with AD 2.- The cognitive differences between early and late onset in AD are related to language and praxis 3.- Early-onset AD patients have better performance in naming, phonemic and semantic verbal fluency and ideomotor praxias compared with late-onset AD patients.

#### **PB7 121 THE EDUCATIONAL LEVEL, IN RELATION WITH ALZHEIMER**

P. GIL\* (Hospital clinico san carlos madrid, Madrid, Spain)  
D. L(1), Y. R(1), V. A(1), M. C(1), G. P(1), R. JM(1) - (1) hospital clinico San Carlos Madrid (Madrid, Spain)

**OBJETIVE:** To establish the relationship between educational level, and diagnosis of Alzheimers disease, and vascular dementia. **METHODS:** Retrospective cross-sectional study. Data collected by clinical interview: demographic data, medical history, cognitive assessment, functional and behavioral. We included patients diagnosed with probable Alzheimers dementia (AD), according to NINCDS-ADRDA criteria, and patients diagnosed with probable vascular dementia (DV), according to NINCDS-AIREN criteria. The patients were classified by years of education: ≤ 10 years of formal education / > 10 years of formal education. Data analysis made with SPSS 14.0 with a significance level of 95%. **RESULTS:** A total of 204 patients: 165 diagnosed with AD and 39 diagnosed with DV. Average age for AD: 79.75; and for DV: 79. Men were 28.5% of patients with AD and women were 43.6% of patients with DV. In AD's group a 91.1 % had educational minor or equal level to 10 years. We found significant differences between the two groups (p 0.024). In DVs group 22.2 % had educational level of more than 10 years. We found no statistical differences between the two groups (p 0.562). **CONCLUSIONS:** 1. We found a relationship between educational level and the diagnosis of AD. 2. No relationship was found between the educational level and prior diagnosis of DV. 3. The educational level appears to have a protective role for the development of AD

#### **PB7 122 ELDERLY PATIENTS WITH END STAGE RENAL DISEASE:**

**COGNITIVE IMPAIRMENT, DEPRESSIVE SYMPTOMS AND QUALITY OF LIFE**  
A. RAMOS-CERQUEIRA\* (Botucatu Medical School - São Paulo State University - UNESP , Botucatu, Brazil)

Q. CAMILA DE MORAES TEIXEIRA (1), B. ANDRÉ LUIZ(1) - (1) Botucatu Medical School - São Paulo State University - UNESP (Botucatu, Brazil)

**INTRODUCTION:** End Stage Renal Disease (ESRD) is an important public health problem. Patients with ESRD show greater cognitive impairment compared to the general population, associated with depressive symptoms. Besides the disease itself, these factors can negatively influence patients' quality of life (QL) and they are more severe among the elderly. The study aimed to estimate the prevalence of cognitive impairment, depressive symptoms and evaluate QL in elderly patients with ESRD on Renal Replacement Therapy (RRT) compared to younger patients. **METHODS AND MATERIAL:** A cross-sectional study evaluated all patients (n=182) on RRT in a university hospital of São Paulo State, Brazil. The Mini Mental State Examination (MMSE) and Beck Depression Inventory were applied, together with the SF-36 to evaluate QL and a standardized form for recording sociodemographic and clinical variables. Associations were analyzed using the Chi square and Mann-Whitney tests. **RESULTS:** Mean patient age was 57.5 years-old, while among the 67 elderly individuals, age varied from 60 to 88 years-old. Analysis of the MMSE results showed that the elderly presented a significantly greater proportion of cognitive impairment (73%) compared to younger patients (p=0.001), while 27.6% presented depressive symptoms (p=0.27). Concerning QL, significant differences occurred in scores obtained by the elderly patients for functional capacity (54.5; p=0.05) and vitality (64.2; p=0.002), while a tendency toward statistically significant differences was obtained for the physical aspects (31.0; p=0.08) and mental health domains (68.9; p=0.08). **CONCLUSIONS:** Elderly ESRD patients on RRT presented greater cognitive impairment and greater compromise of QL in relation to their functional capacity and vitality compared to younger patients, suggesting the need for special care and the offer of support and more specific guidance to more cognitively impaired individuals and their families.

#### **PB7 123 HIGHER SYNCHRONIZATION LIKELIHOOD IN PATIENTS WITH MCI: A MEG STUDY**

P. GIL\* (Magnetoencephalography center Dr. Perez Mondrego, Madrid, Spain)  
B. R(1), M. F(1), N. A(2), G. P(2), Y. R(1), P. F(1) - (1) Magnetoencephalography center Dr. Perez Mondrego (Madrid, Spain); (2) hospital clinico San Carlos Madrid (Madrid, Spain)

**Objetivos:** The integration of information across brain regions is being a matter of recent investigation with functional neuroimaging techniques. In Magnetoencephalography (MEG) several methods of functional connectivity have developed. Synchronization Likelihood (SL) is non-linear measure of functional connectivity. **Methods:** Here, we measure brain magnetic activity in 9 healthy subjects and 14 Mild Cognitive Impairment (MCI) patients. **Results:** During the performance of a memory task MCI patients showed higher synchronization values across left temporal and right frontal region in the gamma band. Conversely, control subjects showed higher synchronization between the anterior and posterior region and between the left and right posterior sensors in the gamma band. **Conclusion:** These patterns of synchronization indicate a double dissociation between patients and control and could allow to have a better understanding of the neurophysiological basis of cognitive impairment in MCI patients.

#### **PB7 124 IS THE MINIMENTAL STATE EXAMINATION A MARKER OF LONG-TERM MORTALITY? TOLEDO STUDY OF AGING.**

F. GARCIA GARCIA\* (Hospital Virgen Del Valle, Toledo , Spain)  
E. MARTIN(1), M. CHECA(2), S. HUMANES(1), A. CRUZ(1), V. ESCRIBANO(1), V. RENTERIA(1), S. AMOR(1) - (1) Hospital Virgen del Valle (Toledo, Spain); (2) Consejeria De Sanidad De CMMC (Toledo, Spain)

**INTRODUCTION:** Several studies show the MMSE being a useful instrument as a marker of mortality. This study tries to determine if the MMSE is a marker of long-term mortality in the Spanish population of over 65 years of age. **MATERIAL AND METHODS:** Population cohort study in people of over 65 years of age of the judicial party of Toledo. The subjects were extracted by a Multistage Aleatory Sampling in 1994 for a study of prevalence and incidence of dementia. 3,214 subjects were evaluated in 1994. In 1996, 2,651 were evaluated (incidence survey). Follow-up of mortality (1996-2007). **MEASUREMENTS:** Sociodemographic data, Katz and Lawton Index, yesavage's GDS, Folsteins MMSE, consumption of alcohol and tobacco, social support (OARS), self reported comorbidity and performance measurements. **STATISTICS:** The Standardized Residual (SR) in the MMSE were identified through linear regression adjusted by age, sex and educational level. The SR were encoded in 4 Standart Deviation groups (SD) <-1.5, -1.5 to 0, 0 to 1 and >1. In order to adjust the risk of mortality of cognitive level for the reported confounding factors, Coxs Proportional Hazard Analysis model was used. Coxs analysis was performed on 1,982 persons (729 deceased) for accumulative losses. **RESULTS:** 2,651 subjects were evaluated (56,4% female); the mean age was 75.9 (6.9) years. The mortality percentage was 75.7, 38.3, 35.1, 43.0 and 38.8 for respectively the <-1.5, -1.5 to 0, 0 to 1 and >1 (p <0.001) SD. In the Cox's analysis adjusted by cofactors, no significative relation between the cognitive level and mortality (p=0.13) was noted, showing that the principal confounding that deteriorates the association is the entry of functional evaluation variables. **CONCLUSION:** Our study doesn't confirm the association between cognitive level and long-term mortality.

#### **PB7 125 MAGNETOENCEPHALOGRAPHIC PROFILES OF MCI PATIENTS**

P. GIL\* (Magnetoencephalography center dr. perez mondrego, Madrid, Spain)  
M. F(2), C. P(1), Y. R(2), G. P(2), V. A(2), O. T(1) - (1) Magnetoencephalography center dr. perez mondrego (madrid, Spain); (2) hospital clinico san carlos madrid (madrid, Spain)

**Objective:** We investigate, by means of Magnetoencephalography (MEG), whether spatio-temporal profiles, of neuromagnetic activity could differentiate between MCI and age-matched elderly participants. **Methods:** neuromagnetic activity was obtained from 15 elderly MCI patients and 20 age-matched controls during the performance of a modified version of the Sternberg paradigm. **Results:** The performance during the memory task did not show differences between groups. MCI patients showed bilateral higher activity in the ventral pathway formed by the ventral prefrontal region, the mid temporal region, the medial temporal lobe and the inferior parietal lobe. **Conclusions:** this increased activity in MCI patients could be considered as a compensatory mechanism in order to achieve a behavioural performance similar to the control group. The biomagnetic profiles obtained by MEG in MCI patients could be useful to differentiate between healthy aging and MCI patients.

#### **PB7 126 FUNCTIONAL DIFFERENCES BETWEEN AN EARLY-ONSET IN LATE-ONSET ALZHEIMER**

P. GIL\* (Hospital clinico san carlos madrid, Madrid, Spain)  
R. M(1), M. C(1), Y. R(1), G. P(1), R. JM(1) - (1) hospital clinico san carlos madrid (madrid, Spain)

**OBJETIVES:** 1) Describe the functional impairment in patients diagnosed with Alzheimers disease (AD) 2) To analyze the influence of age on the functional dependence in these patients. **PATIENTS AND METHODS:** A prospective study. Patients diagnosed with AD (according to criteria of NINCDS-ADRDA were used) in the memory unit. They were divided into two groups according to age at diagnosis of AD [ $<70$  years of early-onset AD (EAD) and  $> 75$  years of late-onset AD (LAD)]. Clinical, functional and neuropsychological index (Katz, Blessed, Lawton, battery of neuropsychological tests). Discusses the influence of age on the data of functionality. Statistical analysis: comparison of medium and proportions by chi-square. 95% confidence interval. SPSS 14.0.

**RESULTS:** 81 patients were divided into two groups: EAD, n = 37 and LAD, n = 44. The mean age was 66 years for the group of 82 to EAD and LAD. 24.5% of the EAD were men and 13.6% of LAD. There were no differences in clinical variables, demographic, and educational. No significant differences in Lawton ( $p = 1.000$ ) or in Blessed ( $p = 0.200$ ). But in Katz index ( $p = 0.024$ ). There were significant differences in neuropsychological tests between the two groups and the striking difference in MMSE ( $p = 0.000$ ) at diagnosis of AD. **CONCLUSIONS:** 1) Older patients are more functional dependence at the time of diagnosis of AD than younger. 2) Both patients are instrumental activities affected, but the older are more dependent on the basic activities of daily living

**PB7 127 INFLUENCE OF THE NEUROPSYCHIATRIC SYMPTOMS IN ALZHEIMER DISEASE (AD) IMPAIRMENT (IDEAL STUDY)**

J. TOBARUELA-GONZÁLEZ\* (Hospital Virgen De La Poveda, Navalcarnero, Spain)  
J. PORTA-ETESSAM(1), C. RABES(2), J. COLLAR(2) - (1) Hospital Clínico San Carlos (Spain); (2) Grünenthal-España (Spain)

**INTRODUCCIÓN** Neuropsychiatric symptoms (NS) often appear in the evolution of AD creating a great impact on the patient and caregivers. This study aims to analyze the influence of NS in the cognitive and functional evolution of patients with moderate AD. **MATERIAL AND METHODS** IDEAL study is a multicentric epidemiological study in which 180 investigators included 1413 patients with moderate AD. We analyzed several aspects of the disease: sociodemographic features, cognitive (MMSE) and functional (Barthel Index) evolution, prevalence of depression (Cornell S.), neuropsychiatric symptoms (NPI-Q) and treatment at baseline and six months later. **RESULTADOS** The average age of patients was 77.8 years (46-97) and they had a moderate cognitive impairment (MMSE mean: 15.58) and a mild degree of dependence (Barthel mean: 77.8). The prevalence of depression (Cornell S.  $\geq 8$ ) was 55.2%. We found at least one neuropsychiatric symptom in 93%: the most common were apathy/indifference (60.4%), anxiety (55.5%) and depression/dysphoria (50.4%) and less frequent were hallucinations (18%), disinhibition (16.8%) and elation/euphoria (9.3%). The symptoms that led to a greater stress of the caregiver were delusions, agitation/aggression and hallucinations and the least were excitement/euphoria and eating disorders. 51.4% received memantine, 31.5%, donepezil, 21.7% rivastigmine and 17.7% galantamine. One fifth (21.5%) received antipsychotic drugs: risperidone (59.4%), quetiapine (16.8%) and haloperidol (15.8%). 45.4% took antidepressants: sertraline 20%, citalopram 16.6% and escitalopram 13.9%. Six month after baseline we found an increase of the cognitive and functional impairment (MMSE 14.73 vs. 15.58 and Barthel I. 73.13 vs. 77.98) ( $p < 0.001$ ) but we didn't find any correlation between the neuropsychiatric symptoms (NPI-Q score) and cognitive ( $p = 0.52$ ) and functional ( $p = 0.59$ ) evolution. **CONCLUSIONES** The neuropsychiatric symptoms are very common in the AD and produce a significant impact on the patients and a great burden on their caregivers but the presence of these symptoms don't modify the cognitive or functional evolution.

**PB7 128 ALZHEIMER'S DISEASE AND DRIVING. OBSERVATIONAL STUDY**  
M. ZEA SEVILLA\* (Universitry Hospital La Paz-Universidad Autonoma de Madrid, Madrid, Spain)

Z. MARIA ASCENSIÓN(1), G. RAQUEL(1), V. MERITXELL(1), J. NURIA(1), T. ANTONIO(1), F. ANA(1) - (1) University Hospital La Paz-Universidad Autonoma de Madrid (Madrid, Spain)

**OBJECTIVES** To drive motor vehicles represents independence, trial ability and competence. At present, the decision to limit or to prevent someone to drive is controversial because it entails a great deal of legal and social connotations. Some laws exist warning against driving vehicles (DV) in patients with dementia, but little is known about which proportion of subjects over 70 years don't drive anymore and what is the reason for. The aim of this study is to determine whether changes in the DV could constitute a predictive factor for the diagnosis of Alzheimer's disease (AD). **PATIENTS AND METHODS** Relatives of AD, mild cognitive impairment (MCI) patients and healthy volunteers older 70 years who attended a Dementia Uni between January 2008 and December 2008 were invited to answer a questionnaire inquiring on 17 dichotomous items on three variables: 1) changes in driving habits, 2) registration of failures, and 3) record of accidents. A statistical descriptive analysis were done to compare between groups ( $t$  Student,  $\chi^2$ ) **RESULTS** We analyzed 64 questionnaires from 38 AD patients, 15 MCI subjects and 11 control volunteers. Percentages of people who ever had driven (actually or in the past) were: 44.73%, 40% and 54.54% respectively for each group. Among active drivers, MCI patients, unlike controls, showed changes in the DV (lane departures, doubt, distraction with external auditory stimuli, inadequate responses to unexpected situations and increased irritability); no AD patients did drive actually. **CONCLUSIONS** Unlike healthy people, MCI patients show changes in the DV which could be considered as a possible predictor for future dementia. Larger size sample should be needed to assess these results and to allow definitive conclusions.

**PB7 129 QUANTITATIVE MEASUREMENT OF BRAIN HYDRODYNAMICS IN VASCULAR DEMENTIA, ALZHEIMER'S DISEASE AND NORMAL ELDERLY SUBJECTS : A STUDY BY PHASE-CONTRAST MAGNETIC RESONANCE IMAGING.**

N. MENJOT DE CHAMPFLEUR\* (CHU de Montpellier, Montpellier (, France)  
R. DURANT(2), J. ERKES(2), E. LE BARS(1), A. BONAFÉ(1), C. JEANDEL(2) - (1) CHU de Montpellier - Neuroradiology department (Montpellier, France); (2) CHU de Montpellier - Centre de gérontologie clinique (Montpellier, France)

**Introduction** Phase-contrast magnetic resonance imaging (PC-MRI) is a noninvasive technique which allows quantification of cerebrospinal fluid and cerebral blood flows. The goal of this work is to study the relation between brain hydrodynamics and neuropsychological tests in a group including subjects with vascular dementia, Alzheimer's disease, and normal elderly persons. **Method and materials** This prospective study included 15 subjects (mean age, 80 years; range 75 to 85). All patients underwent MRI at 1.5T and neuropsychological tests: Mattis Dementia Rating Scale and executive function tests such as verbal fluency, Stroop test. The scanning protocol included flow images, acquired with a 2D cine PC-MRI sequence. Different velocities encoding were set for the vessels, the aqueduct, and the cervical subarachnoid space. Two acquisition planes were selected: a section through cervical level, used to measure flows in the cervical arteries and a section through Sylvius aqueduct to measure blood flows in the basilar artery and the straight sinus. Data were analyzed with a semi-automated in-house image processing software. For the arterial flows, arterial pulse volume, cerebral vascular resistance, and arterial compliance were calculated. For the cervical subarachnoid spaces and the aqueduct, stroke volume was calculated. Correlations between cerebral hydrodynamic parameters and neuropsychological tests were calculated. **Results** Amongst all cerebral hemodynamic parameters, arterial compliance showed significant correlation with the Stroop test results ( $p=0.03$ ). The stroke volume at cervical level was correlated to the verbal fluency testing results ( $p=0.02$ ). There was a trend toward correlation between verbal fluency testing and arterial compliance ( $p=0.06$ ), and Wechsler Adult Intelligence Scale and cervical subarachnoid peak flows ( $p=0.06$ ). **Conclusion** There was a correlation between arterial compliance and Stroop test results, and between stroke volume at cervical level and verbal fluency testing. These results indicate that there might be a correlation between cerebral hydrodynamic parameters and executive function tests.

**PB7 130 COGNITIVE LEISURE ACTIVITY AS A PROTECTIVE FACTOR IN A PROSPECTIVE AGEING STUDY IN GERMANY**

J. SCHROEDER\* (University of Heidelberg, Heidelberg, Germany)  
C. SATTLER(1), J. SCHRÖDER(1), P. TORO(1) - (1) University of Heidelberg, Section of Geriatric Psychiatry (Heidelberg, Germany)

**Introduction:** Growing epidemiological evidence suggests that premorbid participation in cognitive leisure activities reduces the risk of dementia. We investigated if this protective effect was present in the population-based Interdisciplinary Longitudinal Study on Adult Development and Aging (ILSE) and thus modulated the risk for developing either mild cognitive impairment (MCI) or Alzheimer's disease (AD) in a representative birth cohort born between 1930 and 1932. The investigation of a representative birth cohort offers decisive advantages, such as an exclusion of age effects and age-related cohort effects. **Methods and materials:** 500 participants of the ILSE-study were examined in 1993/94 (t1), 1997/98 (t2) and 2005/07 (t3). Participants were carefully screened for physical and mental health through extensive medical interviews as well as physical and neuropsychological examinations throughout all examination waves. In addition the participants were asked to fill out a questionnaire concerning their current frequency of participation in cognitive and other leisure activities (e. g. reading, solving crossword puzzles). Participants were categorized as highly, moderately or poorly cognitively active according to their questionnaire statements. **Results:** 381 participants of the original cohort were re-examined at t3. Prevalence of MCI increased from 13 % to 23 % and 29 % over time. In addition 7 % of the participants developed AD at t3. Subjects who were highly cognitively active at t1 showed a reduced risk of developing MCI or AD in the 13-year follow-up period compared to healthy controls ( $OR=0.23$ , 95 % CI 0.06-0.81,  $p<0.05$  – scores adjusted for education and household income). **Conclusion:** Our results confirm the hypothesis that a high level of premorbid cognitive activity constitutes a protective factor for the development of MCI and AD. This effect remains significant after adjustment for education and household income.

**PB7 131 DETERMINANTS OF COURSE PATTERNS OF MILD COGNITIVE IMPAIRMENT (MCI)**

H. VAN DEN BUSSCHE\* (Center for Psychosocial Medicine, Hamburg, Germany)  
M. EISELE(1), W. MAIER(1), H. VAN DEN BUSSCHE(2), B. WIESE(3), H. KADUSZKIEWICZ(2) - (1) University of Bonn (Bonn, Germany); (2) University Medical Center Hamburg-Eppendorf (Bonn, Germany); (3) Hannover Medical School (Bonn, Germany)

**Introduction:** The concept of MCI was developed to gain a predictor for future dementia. Annual conversion rates differ in short- and long term studies and the lack of a linear trend between both suggest that MCI subsumes a heterogenic group of more than one disorder, which may be stable, improve or progress to dementia. To distinguish progressive MCI from stable or remittent MCI, this study investigates indicators predicting the course of MCI and allowing a prognosis of the risk of future dementia. **Methods:** 357 subjects from the AgeCoDe cohort with MCI at baseline were followed up for 36 months by interviews and cognitive testing. Groups of remittent, unstable, stable and progressive MCI were built and analysed by multivariate and CART analysis for possible baseline-predictors for future course. **Results:** The group of progressive MCI consisted of 22.4% of all subjects with MCI. The following variables were found to predict the conversion to dementia in a statistically significant manner ( $p < 0.01$ ): MCI subtype, Hypercholesterolemia, history of TIA, renal insufficiency, and a poor score of 14.5 points or lower in the CERAD Wordlist

learning and recall subtest. The latter alone increases the risk of conversion to dementia from 22.3% to 48.6%. A score of > 14.5 points decreases the risk of progressive MCI to 10.8%. No clear determinants were found for courses of unstable and stable MCI. Conclusions: In persons with MCI a poor score of 14.5 points or lower in the CERAD Wordlist learning and recall subtest is the best predictor of progression to dementia. For courses of unstable and stable MCI no clear predictors were found.

#### **PB7 132 COGNITIVE STIMULATION EFFICACY: THE CAREGIVER**

C. D'ANASTASIO\* (Memory and Cognitive Disorders Unit, Geriatric Unit, Ospedale Maggiore, Azienda USL Bologna, Italy, Bologna, Italy)  
 C. MARCHETTI(1), E. FERRIANI(1), P. PAGNI(1), V. RANALDI(1), F. MAIOLI(1), R. CIARROCCHI(1), M. COVERI(1), V. NATIVIO(1), S. LINARELLO(1), V. PEDONE(1) - (1) Memory and Cognitive Disorders Unit, Geriatric Unit, Ospedale Maggiore, Azienda USL di Bologna (Bologna, Italy)

Introduction Cognitive stimulation treatment might contribute to the well-being of both dementia patients and carers, by taking into account undividual needs and using a person-focused approach. The Cognitive Disorders Unit at Maggiore Hospital in Bologna carried out a psycho-cognitive stimulation program for small groups of patients affected by mild or moderate dementia. The program required caregivers' involvement who were instructed by professional personnel during dedicated meetings to use informal stimulation techniques. Aim of our study was to evaluate efficacy's perception of such a program by the caregiver. Methods and materials 74 patients (M/F 33/41, mean age 76.38+ 6.32, range 58-87 yrs, mean MMSE 21.24+ 3.43, range 12-29) attending our memory clinic and 60 caregivers (M/F 20/40, spouse 51.6%, children 43.3%, others 1.7%, living together 61.7%) participated to the cognitive stimulation program. Caregivers were asked to fill a questionnaire about "efficacy perception" before, immediately after and two months later the cognitive stimulation treatment. The questionnaire evaluates frequency of cognitive impairment in different domains: memory, attention, orientation, language, identification and praxia, logical-abstract thinking, social attitudes, self-esteem, mood. Answers were given according to Likart 5 grade scale (1=never 5=usually). A questionnaire about satisfaction was also administered (Likart 5 grade scale: 1=very unsatisfied 5=very satisfied) Results Caregivers show a high level of satisfaction towards several aspects of this initiative: organization (mean score 4.33+0.73), program usefulness ( mean score 4.23+0.72), topics (mean score 4.18+0.69). 72% think that attending the cognitive stimulation program has facilitated the daily management. In their opinion patients improved in items of the following domains: memory ( $p<0.035$ ), orientation ( $p<0.000$ ), logical/abstract thinking ( $p>0.003$ ), praxia ( $p<0.000$ ), mood ( $p<0.000$ ). Conclusions Our results show that caregivers perceive improvement in mastering cognitive, mood and functional adaptation after attending an integrated cognitive stimulation program. Improvement is maintained after two months from treatment.

#### **PB7 133 ASSOCIATION BETWEEN PERCEPTION OF SUBJECTIVE MEMORY AND MANUAL SKILLS IN WORKSHOP FOR ELDERLY IN DIGITAL INCLUSION**

I. ARGIMON\* (Pontifícia Universidade Católica do Rio Grande do Sul, Porto Alegre, Brazil)  
 Z. LINDÓSO(1), L. MACHADO(1), Â. FRAQUELLI(1), C. TACQUES(1), A. FERREIRA(1), M. CAMMAROTA(1), C. SCHWANKE(1) - (1) Instituto de Geriatria e Gerontologia da Pontifícia Universidade Católica do Rio Grande do Sul (PUCRS) (Porto Alegre, Brazil)

Introduction: In order to satisfactorily perform the tasks of daily life manual skills must be emphasized as important. Hands not only serve as an information receiver, but also as a response executer. The manual skill interacts with the cognitive functions, forming a complex system of integrated movements. Thus, the objective of this work was to verify the association of subjective perception of memory with manual ability in the elderly participants of a workshop of digital inclusion. Methods and materials: 51 elderly people (60 to 78 years) participants in the workshops of Digital Inclusion Project Potentiation of the Institute of Geriatrics and Geriatrics and Gerontology of the Pontifical Catholic University of Rio Grande do Sul – PUCRS, Brazil were evaluated. For the development of the research were used a questionnaire containing general information, the Functional Assessment Brief, the test of subjective perception of memory, Memory Test Logic I and II and the Action Research Arm Test (ARAT). Results: it was observed that women perceive their memory in a more negative way than men. Men showed better performance on the Logical Memory Test from Home, more in general, both sexes had satisfactory results. Already in Late Logical Memory test of the medium is considered. There was significant correlation between the initial and delayed memory, manual skill on the right side to the left side, manual skill on the right side to the subjective perception of memory. Conclusion: The results of this study support the hypothesis that there is an association between the subjective perception of memory and manual skill. This is an original study, since other studies involving memory and perception of manual skill were not found. Additional studies involving this issue are suggested.

#### **PB7 134 THE SELF-PERCEPTION AGEING FROM THE BODY IMAGE SIZE IN OLDER WOMEN ASSISTED BY HEALTH INSURANCE AT BRASILIA, FEDERAL DISTRICT, BRAZIL**

C. MENDONÇA\* (Universidade Católica de Brasília, BRASÍLIA, Brazil)  
 C. CAMARGOS(1), C. CARMEN(1) - (1) Universidade Católica de Brasília (Taguatinga, Distrito Federal, Brazil)

Introduction: The contemporary society super overvalues young human being and more important than the benefits/defects of youth are the bodily impressions conveyed to the outside world. Objective: Understanding the ageing and its relationship to body image formed by self-perceptives signs of overall health status and its mediation by behavioral, cultural and social factors. Methodology: Study quanti-qualitative and descriptive correlational. It used a questionnaire to obtain information concerning the sociodemographic characteristics, subjective perception and health self-refer problems and body image perception. To data analysis: used up procedures of descriptive statistics, association measures and non-parametric analysis, adopting significance level of 5%. Results & Quarrel: The average of elderly women interviewed is 66 years old (60,7%). Most are widowed (53%), receive retirement through governmental departments (100%), lives alone (38,1%), has completed higher education (84%), has an average monthly income of 10 minimum wages (60,3%) and belongs primarily to the Economic Class A (68,8%). In terms of health indicators: 65,3% has a positive health perception. Moreover, most of the group mentioned as the main presence of "health problems" is the need for carrying out cosmetic-surgical interventions (97,4%), and that 84% reported having done any cut of this procedure, and the most predominant application was botulinum toxin (40%). About body image dissatisfaction, classified by Stunkard Figures Scale: 54% of the surveyed were dissatisfied, mainly by weight excess (35,1%) which was associated with BMI, in which the increase in this Index category increased the dissatisfied percentage of elderly women. Conclusion: It noted in this context, the need for completion of other studies that incorporate the same proposal from a directly qualitative approach and to analyses the speech of elderly women about their expectations and body images, current and desired.

#### **PB7 135 SUCCESSFUL AGEING IN LATE SIXTIES: FACTS AND FACTORS**

J. PARK\* (Catholic University of Daegu School of Medicine, Daegu, Republic of Korea)  
 S. CHOI(1) - (1) Dongsan Medical Center (Daegu, Republic of Korea)

INTRODUCTION Successful ageing (SA) could be defined as ① living long and ② living both subjectively satisfactory and objectively high-functioning life until the endpoint of life. In this study it was considered as being composed of 3 domains: ① independent community living and social engagement in the social domain, ② life satisfaction and spared cognitive function in the psychological domain, and ③ physically independent daily living and disability-free state in the physical domain. METHOD AND MATERIALS Facts and factors concerning the SA was investigated in the young elderly (N=2,223 with 914 males, 41.1%) aged from 66 to 71 in a outskirts of a Korean metropolitan area. Barthel's ADL, Lawton's IADL, Life Satisfaction Index-A, Short-Form-36 Health Survey, Mini-Memory Test and Katz Adjustment Scales were employed for the assessment of SA subdomains. Standardised measurements for independent variables were UCLA Loneliness Scale, Social Readjustment Rating Scale, Geriatric Depression Scale and Self-Efficacy Scale. Other factors were also included in as independent variables. RESULTS 25.6% was classified as having high SA, 64.1% as having middle SA and 10.3% as having low SA. Low Geriatric Depression Scale score and high Self-Efficacy were psychological factors were related to the higher level of SA. Of physical variables young age, male sex, adequate body-mass index and low score on the Short-Form-36 Health Survey were related to higher SA. It was related to such social factors as education, income, economic status, spouse and life stress during the past year and also to life habits including smoking, drinking and regular exercise. CONCLUSION SA is an integrated concept consisting of multiple domains. Based on the criterion of this study, about 10% is already experiencing the low SA. It seems to be influenced by many biological, psychological and social factors and life habits. And many of the influencing factors seem to be modifiable.

#### **PB7 136 THE ANTI-AGING EFFECT OF BLACK RICE AGAINST H<sub>2</sub>O<sub>2</sub>-INDUCED PREMATURE SENESCENCE**

S. YEONG OK\* (Pusan National University, Busan, Republic of Korea)  
 E. CHO(1), M. CHOI(1), H. KIM(2), T. YOKOZAWA(3) - (1) Pusan National University (Busan, Republic of Korea); (2) Jinju National University (Jinju, Republic of Korea); (3) Institute of Natural Medicine, University of Toyama (Toyama, Japan)

Introduction : The cellular aging model using human diploid fibroblasts (HDFs) has become a classical experimental model, since HDFs lose their ability to proliferate and become senescent. In addition, HDFs exhibit the stress-induced premature senescence (SIPS) phenotype by oxidative stress. In the present study, after the induction of SIPS by treatment with H<sub>2</sub>O<sub>2</sub>, the anti-aging effect of black rice was investigated. Methods and materials: After induction of SIPS in WI-38 cells by treatment of H<sub>2</sub>O<sub>2</sub> for 60 min, cell viability and lipid peroxidation were determined. Furthermore, cellular life span was calculated by established method, last PDL+log2(collected cell number/seeded cell number). Results : H<sub>2</sub>O<sub>2</sub>-treated WI-38 cells showed the decrease in cell viability and elevation in lipid peroxidation, indicating induction of SIPS. However, the both of pre- and post-treatment of methanol extract from black rice to WI-38 cells under SIPS exerted dose-dependent elevation in cell viability and inhibition in lipid peroxidation. In addition, black rice extract showed the extension of cellular life span. Conclusion : The present results

indicate that black rice delay cellular aging process through the attenuation of oxidative stress, suggesting the promising anti-aging agent.

**PB7 137 INCIDENCE OF UNDIAGNOSED SKIN CANCERS IN GERIATRIC HOSPITAL**

J. FONTAINE\* (Hôpital Charles foix, Ivry sur seine, France)  
S. MIELCZARECK, S. MEAUME, P. SENET

Incidence of undiagnosed skin cancers in a geriatric hospital. J. Fontaine, S. Mielczarek, S. Meaume, P. Senet Université Pierre et Marie Curie Paris VI, France Service de gerontology, AP-HP, Hôpital Charles Foix, pavillon l'Orbe, 7, avenue de la République, 94205 Ivry sur Seine cedex, France. Background. The incidence of nonmelanoma skin cancers is closely correlated with age. The aim of this prospective study was to evaluate the prevalence of undiagnosed skin cancers among patients hospitalized in rehabilitation and long term care units in a geriatric hospital. Patients and methods. All the patients, resident in four rehabilitation and long-term care units and for whom no dermatological advice had been given, were systematically examined by a dermatologist. Clinical data included patient age at the time of the study, gender, relevant historical information, skin phototype and description of the cutaneous lesions. Biopsies were performed for all lesions of suspicious appearance. Results. Three hundred and six patients (79.4 % women and 20.6 % men aged from 55 to 103 years) were included in the study. Among all the patients, 69.3 % were hospitalized for more than one year. Skin phototype was clear for 93.5 % of the patients. Thirty-two out of 306 patients (10.5%) presented 42 suspicious lesions and these were diagnosed by histological examination as 16 basal-cell carcinomas, seven squamous cell carcinomas and two in-situ melanomas. Skin cancers were localised on the head and neck in 80% of the cases. The prevalence of patients with skin cancers was 5.6% in this population. Conclusion. The prevalence of skin cancers among patients hospitalized in geriatric hospitals justifies improved training of geriatricians regarding early recognition and dermatological assessment of cutaneous tumors.

**PB7 138 GERIATRIC ASSESSMENT IN DIGESTIVE CANCER PATIENTS : CONTRIBUTION OF THE GERIATRICIAN**

L. GIRARD\* (Groupe hospitalier Bichat-CI Bernard, Paris, France)  
T. APARICIO, J. SOULE, S. LEGRAIN, A. RAYNAUD-SIMON

Objective. To evaluate the contribution of a complete geriatric assessment (C-GA) by a geriatrician after a mini geriatric assessment (m-GA), more easily and rapidly used by gastroenterologists, in elderly digestive cancer patients. Methods. In a pilot prospective study, we included 20 consecutive patients with digestive tract cancer aged 75 years or more. Patients were examined by a gastroenterologist with a m-GA composed of 8 simplified items : comorbidities, memory, mood, nutritional status, dependency, polymedication, creatinine, social context. Oncologic treatment was decided in multidisciplinary staff. Then, patients were examined by a geriatrician with a C-GA: comorbidities (CIRS-G), cognitive function (MMSE), mood (mini-GDS), nutritional status (MNA, albumin), walking (falls, stand on foot), dependency (ADL, IADL), evaluation of treatments, renal function, hemoglobin, social evaluation; the geriatrician then proposed adaptation in care. Results. Eleven men and 9 women were included, with a mean age of 80.5 years [min-max 75-87], presenting with cancer of colon-rectum (9), oesophagus (3), pancreas (3), biliary tract (3), small intestine (1) and anus (1). Eleven patients had metastasis. Evaluation by the m-GA by gastroenterologists resulted in a modified oncologic treatment in 10 patients, non-oncologic treatment in 2 patients. Eight patients received standard treatment. Further C-GA by a geriatrician resulted in modified non-oncologic treatment in 17 patients and social care in 8 patients. Conclusions. All patients presented with a geriatric problem (m-GA), some of them justifying a change in oncologic treatment by gastroenterologists. Geriatric assessment by a geriatrician resulted in no further change in oncologic treatment in this small sample of elderly cancer patients. However, the geriatrician's evaluation allowed to optimize care in non-oncologic and social care.

**PB7 139 NEUROENDOCRINE CANCER OF THE PROSTATE: REPORT OF ONE CASE AND REVIEW OF LITERATURE**

S. MOULIAS\* (CHU A. Paré, Boulogne, France)  
W. MOUSSOUS(1), T. CUDENNEC(1), J. LAGRANDEUR(1), L. TEILLET(1) - (1) UCSG CHU A. Paré (Boulogne, France)

Mr. C, 86 years old, was hospitalized for exploration of hematuria. His antecedents include moderate Alzheimer's disease, renal insufficiency (creatinine clearance 12 mL/mn), hypertension, coronary stent and prostate surgery 18 years ago (adenomyoma). The explorations found: An anemia at 8 g/dL with EPO deficiency and bleeding. • A prostatic mass with normal cystoscopy. • The scanner showed a prostatic mass with invasion of the rectal • anterior wall and the bladder's floor and an ureteric compression with left ureterohydronephrosis. PSA were normal. • After discussion with urologists, neuroendocrine cancer is suspected. This was confirmed by a minimal increase of NSE and most of chromogranin A. The patient had a blood transfusion and hormonal therapy was initiated (androgen privation by LHRH agonists). Neuroendocrine cells originally exist in the normal prostate acini and duct, regulating prostatic growth, differentiation and secretion. Neuroendocrine cancers of the prostate are very rare (2.1% of prostatic cancers)

and are often diagnosed at the stage of complications. They are insensitive to hormonotherapy, however their care usually includes LHRH agonists trying to curb the cancer evolution. Surgery is difficult because the diagnosis is often at the stage of local complications. Other treatments are radiation therapy and chemotherapy with platinum. As always with uncommon diseases, it's difficult to do prospective studies for treatment. Evolution is often unfavorable quickly.

**PB7 140 IMPACT ON AUTONOMY OF BIWEEKLY DOCETAXEL AS FIRST-LINE CHEMOTHERAPY REGIMEN IN ELDERLY WITH METASTATIC BREAST CANCER (MBC)**

V. GIRRE\* (Fédération Nationale des Centres de Lutte Contre le Cancer, Paris, France)  
F. ROUSSEAU(1), E. BLOT(2), S. GOURGOU-BOURGADE(3), F. GOUTTENOIRE(4),  
J. GENÈVE(4), S. DELALOGE(5) - (1) Institut P. Calmettes (Marseille, France);  
(2) Centre H. Becquerel (Marseille, France); (3) Centre Val D'Aurelle (Marseille, France);  
(4) Fédération Nationale des Centres de Lutte Contre le Cancer (FNCLCC) (Marseille, France); (5) Institut G. Roussy (France)

Introduction: Besides quality of life and symptom palliation, autonomy appears as a major factor to consider in elderly patients undergoing chemotherapy. The main objective of this study dedicated to elderly women with first-line MBC was to evaluate the impact of a biweekly docetaxel regimen on autonomy, through the assessment of instrumental activities of daily living (IADL) during and after treatment. Methods: Women > or equal 70 years old with measurable MBC not previously treated by chemotherapy for metastases, together with standard satisfactory haematological, renal and liver functions and scores of autonomy (IADL or ADL&superiororequal;4) were scheduled to receive up to 6 monthly cycles of docetaxel biweekly (50 mg/m<sup>2</sup>). Results: Between 05/2005 and 07/2006, 27 patients were included. Baseline characteristics: median age 76 (70-86); PS 0/1 48%/52%; median IADL/ADL scores 8 (4.5-8)/6 (5.5-6); metastatic sites: bone 54%, lung 46%, liver 44%; prior adjuvant chemotherapy/hormone therapy 30%/48%. A total of 117 cycles were administered. Median treatment duration was 3 months. The trial was stopped prematurely due to 2 toxic deaths both related to pulmonary events: one lung interstitial toxicity attributed to docetaxel and one pneumocystis infection. Significant grade 3-4 toxicities observed on treatment (%cycles/%patients): neutropenia (14%/27%), nail changes (3%/12%), dyspnea (3%/12%), diarrhea (1%/4%), mucositis (1%/4%). Evaluation at 2 months showed 18%, 9% and 44% of patients with decrease of IADL, ADL, or geriatric depression scores. Among 26 evaluable patients, there were 4% complete responses, and 23% partial responses. Disease control rate was 41%, while 27% had progressive disease. Conclusion: Despite interesting disease control and low objective toxicities rates, especially on autonomy parameters, docetaxel biweekly is associated with unexpected fatal events precluding its routine use in elderly patients.

**PB7 141 FOLLOW-UP AND 6-MONTHS OUTCOME OF ELDERLY CANCER PATIENTS AFTER INITIAL ONCOGERIATRIC ASSESSMENT.**

M. BERLE\* (Henri Mondor's Hospital, Créteil, France)  
P. CAILLET(1), J. VOURIOT(1), J. GRENIER(2), S. KRYPCIAK(1), S. CULINE(2),  
S. BASTUJI-GARIN(3), E. PAILLAUD(1) - (1) Henri Mondor's Hospital, Dpt. of internal  
and geriatric medicine (Créteil, France); (2) Henri Mondor's Hospital, Dpt. of Oncology  
(Créteil, France); (3) Henri Mondor's hospital, Department of clinical research and public  
health (Créteil, France)

Objectives. To study the follow-up and 6-months outcome of elderly cancer patients (>70y) after a Comprehensive Geriatric Assessment (CGA). Patients and method. Retrospective and descriptive study of the evolution and the 6-months outcome during the treatment of 104 cancer patients after the initial CGA. Results. The average age was 80.2±5.4 years. Women outnumbered men (55.8 vs. 44.2%). The patients had gastrointestinal (78.9%), breast (9.6%) or other cancers (9.6%), most often with lymphatic node (42.3%) and/or metastatic (30.8%) development. Most of the patients (87.5%) belonged to Group III of Balducci-Extermann's classification: "frail elderly". The CGA influenced the initial cancer therapy in 36.5% of cases, including decisions of surgery, chemotherapy, hormonotherapy and therapeutic abstention. Surgical treatment (22.1%) was always performed and was accompanied by a post-operative complication in 37% of cases. Initially proposed chemotherapy determined (45.2%) was not feasible in 5.8% of cases. Usually done in day hospital (67.6%), the chemotherapy protocol was amended or terminated in 28.2% and 15.4% of cases respectively, mainly because of its toxicity (91.7%). Radiotherapy (14.4%) and hormonotherapy (3.8%) were always possible, without modification or discontinuation of treatment protocol. During the 6-months long follow-up, 47 patients (45.2%) required at least one hospitalization in a short stay unit and 26 patients (25%) at least one hospitalization in a functional re-education unit, outside the strict oncologic treatment framework, mainly due to the cancer evolution and/or to the loss of autonomy. The mortality rate of the overall population was 30.8% at 6 months. Conclusion. The majority of patients belonged to the Balducci-Extermann's Group III "frail elderly". In our study, only chemotherapy presented safety problems requiring

adjustment or discontinuation of treatment in half of cases. Finally, half of the patients required one hospitalization at least for a reason other than cancer treatment.

**PB7 142 A FRENCH SCREENING TOOL TO IDENTIFY CANCER PATIENTS NEEDING A COMPREHENSIVE GERIATRIC ASSESSMENT**

M. PACCALIN\* (CHU de Poitiers, Poitiers, France)

S. VALÉRO(1), V. MIGEOT(1), G. BOUCHE(1), M. THOULOUZAN(1), B. DREYFUS(1), N. RABAN(1), B. ROULLET(1), J. TOURANI(1) - (1) CHU de Poitiers (Poitiers, France)

Introduction: The number of cancers in the elderly is increasing. A preliminary screening step before Comprehensive Geriatric Assessment (CGA) could help to identify patients who really need CGA. To screen patients over 75 years with a first diagnosis of cancer, we designed a simple tool for oncologists (called FOG) assessing 5 risks of frailty: functional status, nutritional status, depression, cognition and comorbidity. We assumed that patients with 1 to 3 risks were concerned by CGA. We aimed to measure the accuracy of this tool compared to CGA. Methods and patients: All cancer patients diagnosed in the university hospital of Poitiers (France) who agreed to participate and signed the informed consent were included. Oncologists completed the FOG during the first consultation. Then, the gerontologist performed CGA blinded to the results of the tool. In 2007, patients were randomized for CGA. In 2008, all patients had CGA which was presented as an integrated step for the management of their cancer. Sensitivity and specificity of the FOG were measured. Results: From the 514 eligible patients, 275 patients were included. The gerontologist performed CGA in 160 (58%) patients (46 in 2007), while 115 (42%) patients (83 in 2007) did not come to the appointment or declined. Patients who participated in the study were younger ( $p=0.006$ ), had a lower risk of impairment of functional status ( $p=0.04$ ) and a lower risk of depression ( $p=0.05$ ) than patients who declined. Finally, 116 (74%) out of 156 patients had 1 to 3 risks identified by the CGA. Sensitivity was 86% [80%-92%] and specificity 45% [30%-60%]. Conclusions: In our study, 3 out of 4 patients really needed CGA. The FOG identified 85% of the patients needing CGA and could be helpful for oncologists. When CGA is presented as an integrated step of the management of cancer, its acceptability is better.

**PB7 143 MULTIDISCIPLINARY INTERVENTION AT A PALLIATIVE CARE UNIT. THE ROLE OF THE FAMILY.**

H. BARAHONA\* (Hospital clinico san carlos madrid, Madrid, Spain)

V. A(1), S. M(1), H. E(1), M. C(1) - (1) hospital clinico san carlos madrid (madrid, Spain)

Death and disease are both experiences that make families face one of the biggest challenges in life. This essay deals with the case of a family crisis treated with a multidisciplinary intervention that led to a healthy psychosocial adaptation. The patient is a 75 year-old male, married and father to five children. Medical history: Diagnosis: Bladder cancer (1-2007), with prostatic spreading and lung metastasis. The patient underwent chemotherapy treatment till May 2008 and had a bilateral nephrostomy (6-2008) and colostomy (7-2008). Because of clinic and radiological progression, active treatment is discarded. Current state: After 48 hours displaying psychomotor agitation, heteroaggressive and inappropriate behavior, he comes to the Emergency Room Service (ER) (28-7-2008) to have the nephrostomies checked due to malfunction and also because of his behavioural disorder. Emergency (ER) intervention: The patient refuses any diagnostic or therapeutic intervention. A brain CT-Scan is performed to discard the existence of brain metastasis: no significant findings (the radiologists recommend to perform a MNR). At ER, the assessment of the palliative care team is requested, and after this, we decided to ask for a psychiatric intervention: delusional ideas of prejudice related to his family. Diagnosis at ER: Acute confusional state/delirium. In these circumstances, being unable to make any decision, the psychiatrist promoted an involuntary admission at the Acute Palliative Care Unit. Palliative care unit intervention: The goals at admission were as follows: to discard brain metastasis, have a differential diagnosis, improve family relations as well as patient's self-esteem, and have him back home at hospital discharge. A multidisciplinary intervention took place while the patient was staying at hospital. Both the patient and his family were treated using cognitive-behavioural therapy. Conclusions: The multidisciplinary intervention was successful because not only the patient was satisfied but also the therapeutic goals agreed by both parts were achieved

**PB7 144 TUMORS OF THE PANCREATIC AREA IN THE ELDERLY: A COHORT STUDY OF 36 PATIENTS**

K. BYEULA\* (Hôpitaux Universitaires Lyon, Lyon, France)

E. CASTEL-KREMER (1), B. KIM(1), S. AZZAQUI-CUZON(1), C. LOMBARD-BOHAS(2), C. TERRET(3), B. COMTE(1) - (1) Hopital E Herriot unité de Gériatrie (lyon, France); (2) Hôpital E Herriot Cancérologie digestive (Lyon, France); (3) Centre anticancéreux Léon Berard (Lyon, France)

Aim of study Describe the diagnosis and treatment-decision process in patients aged 70 years and older with pancreatic tumor within the Geriatric Oncology Program of Lyon (PROLOG) Methods Older patients with a diagnosis of pancreatic mass underwent a multidimensional geriatric assessment (MGA). Patient cases were then discussed in oncogeriatric collaboration meetings in order to define individualized treatment and

management plan. Results Thirty six pts (26 women) aged 70 years and older were included in the cohort study (mean age: 78.6, 70-88). Most pts had adequate functional status (ADL = 6/6; 25 pts; IADL = 8/8; 22 pts); moderate comorbidity (mean CIRS-G score: 9.25; 24 pts with Grade 3 or 4 Comorbidity); adequate cognitive function (MMSE score  $\geq 24$ ; 27 pts) whereas malnutrition was common (MNA <23: 29 pts) and polypharmacy ( $\geq 5$  medications) was reported in 11 pts. Depressive symptoms were detected in 19 pts; most pts had correct physical capacities. The tumor site was mainly pancreas (33), 5 and 3 of them were endocrine tumors and ampulloma of Vater's papilla respectively. Pathologic diagnosis was not confirmed in 5 pts. At diagnosis, pts had lost weight (17) or jaundice (9), pain (9) or glucose metabolism disorders. Based on oncogeriatric collaboration meeting conclusions, treatment recommendations were chemotherapy (17), pancreatic surgery (14), biliary tract prosthesis (8) and also supportive care (nutritional support, psychotherapy, palliative care). Conclusion Prognostic of tumors of the pancreatic area depends on the pathological diagnosis. Older pts with pancreatic tumors require both a comprehensive oncological review and a multidimensional geriatric assessment. Then, individualized effective care plans can be proposed based on oncogeriatric meeting recommendations.

**PB7 145 INTEREST OF STROKE UNITS FOR THE ELDERLY PATIENTS.**

F. BLOCH\* (Hopital Broca (AP-HP), Paris, France)

A. SAUTERAU(1), L. JOFFREDO(1), S. HAULON(1), V. GAUTIER(1), G. ABITBOL(1), M. MANKOUR(1), T. JOUCDAR(1), N. CHARASZ(1) - (1) Hopital Broca (AP-HP) (Paris, France)

Introduction Stroke units have demonstrated their interest in the early management of strokes in terms of survival and reduction of loss of autonomy. However, few studies have examined the benefit of such units for very old subjects. The purpose of this study was to compare the evolution of elderly patients admitted to geriatric sub-acute care after a stroke according as they come from a stroke unit or not. Methods and materials We analysed retrospectively the files of 169 patients admitted in our sub acute care unit after a stroke from January 2006 to June 2008. We compared the group coming from stroke units (SU) to the one coming from other structures (OS). Results Ninety seven patients came from SU and 112 from OS. There were no significant differences in terms of age, sex ratio, mechanism of the stroke and mean delay from the stroke to the arrival in sub-acute care unit. The average NIHSS at admission was also not different but was missing in 97% in OS versus 53% in SU. The nutritional status was significantly better in patients coming from SU (albumin was  $33.5 \pm 3$  vs  $31.8 \pm 5$ ;  $p<0.008$  and pre-albumin was  $0.2 \pm 0.05$  vs  $0.17 \pm 0.07$ ;  $p<0.001$ ). The number of patients returning home, transferred in institution or dying in the first months was similar according to the origin. Otherwise, physical autonomy at the end of the stay in sub acute care unit was better for patients coming from SU than for those coming from OS (41% vs 57%;  $p<0.05$ ). Conclusion If stroke units seem to be important for the short term prognosis of elderly subjects, we must now demonstrate that appropriate care for them in sub-acute care units can optimize it.

**PB7 146 DIFFUSE SYSTEMIC SCLEROSIS IN ELDERLY: ABOUT 5 CASES**

S. FOUCART\* (Hopital bichat, Paris, France)

N. FAUCHER(1), O. LIDOVE(2), A. RAYNAUD-SIMON(1) - (1) Geriatrie Hopital Bichat (paris, France); (2) Médecine interne Hopital Bichat (paris, France)

Objective. Systemic sclerosis is a rare, multisystemic, autoimmune disease, affecting small arteries, micro vessels and fibroblasts resulting in vascular obliteration, collagen accumulation and fibrosis of skin and internal organs. The peak incidence is found between 45 and 64 years of age. Few data are available in older patients. Methods. Descriptive study of 5 cases of diffuse systemic sclerosis in elderly, in or out-patients, in geriatric and internal medicine department of a French university hospital. Results. Five patients (4 w, 1 m; 73-88y when referred to us) who were aged 63 to 87 years old at diagnosis. First symptoms occurred from 3 to 58 years before diagnosis, for 4 patients it was Raynaud's phenomenon. Four patients had prognostic visceral lesion at diagnosis: 2 had pulmonary interstitial fibrosis (PIF) and 2 had both pulmonary hypertension (PH) and PIF. Specific anti-nuclear antibodies were found in 4 patients: anti centromere (n=3 at the threshold of 1/1280) and anti Scl 70 (n=1). Recommended scheduled specific surveillance tests were rarely done. Multidisciplinary care was provided, with 3 to 6 specialized practitioners taking care of each patient. They were all treated with calcium channel blockers, 2 were treated by antagonist receptor of endothelin 1 and one was treated with cyclophosphamide for PIF. One patient died within one month following diagnosis of the PIF and HP. Another died 4 years after the diagnosis of PF and 3 years after PH diagnosis. Conclusion. In those 5 cases, diagnosis was usually made 25 years after the first symptoms and readily presented severe visceral lesions. It seems important to make an early diagnosis of systemic sclerosis because multidisciplinary care can also improve quality of life in elderly patients.

**PB7 147 THE EFFECT OF A SUPPORTIVE EDUCATIONAL PROGRAM ON KNOWLEDGE, SELF-CARE BEHAVIOR, AND THE LEVEL OF SEVERITY OF HEART FAILURE**

S. MONKONG\* (Department of Nursing, Bangkok, Thailand)

J. KIATSEESAKUL(1), O. PANPAKDEE(2), T. CHOON-NGARM(1) - (1) Rajavithi Hospital (Bangkok, Thailand); (2) Department of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University, Bangkok, Thailand)

**Introduction** The research aimed to investigate the effectiveness of a supportive educational program on knowledge, self-care behavior, and the level of severity of heart failure based on the self-care theory proposed by Orem. **Methods and materials** The subjects were 60 patients with heart failure who had been admitted to hospital. They were selected by purposive sampling. Of these, 30 were assigned into the experimental group, and the other 30 were assigned into the control group. The former received a supportive educational program together with routine nursing care, whereas the latter received only routine nursing care. Data were collected from October, 2006 to August, 2007. The instruments used included a questionnaire concerning knowledge about the prevention of water and sodium retention; a questionnaire regarding self-care behavior; and a questionnaire concerning the level of severity of heart failure. Data were analyzed in terms of descriptive statistics and inferential statistics. **Results** The findings of the study showed that, after participating in the supportive educational program, the experimental subjects' knowledge and self-care behavior to prevent water and sodium retention increased with a statistical significance at the .001 level. In addition, after participating in the supportive educational program the experimental subjects mean scores of knowledge and self-care behavior were higher than those of the control subjects with statistical significance at the .001 level. However, the level of severity of heart failure within group and between groups of subjects were not statistically significantly different at the .05 level. **Conclusion** The supportive educational program could be used to promote knowledge and self-care behavior of patients with heart failure, so healthcare professionals should implement the program to offer medical and nursing care to patients with heart failure to help them maintain health and prevent possible complications to ensure quality of life.

#### PB7 148 ORTHOSTATIC HYPOTENSION IN ELDERLY PATIENTS IN EMERGENCY DEPARTMENT

N. MOREL\* (Hôpital Pitié-Salpêtrière, APHP, UPMC Paris 6, Paris, France)  
S. DELERME(1), S. CASTRO(1), M. GODARD(2), P. RAY(1), M. VERNY(2),  
B. RIOU(1), J. BODDAERT(2) - (1) Emergency department, Pitié-Salpêtrière hospital, APHP, UPMC Paris 6 (Paris, France); (2) Geriatric department, Pitié-Salpêtrière hospital, APHP, UPMC Paris 6 (Paris, France)

**Introduction** The aim of our study was to analyse its frequency, significance and management of orthostatic hypotension (OH) in emergency elderly patients. **Methods and materials** During 14 consecutive days, we included elderly patients presenting in our emergency department (ED) for medical and surgical reasons. At admission and before any medical management, an orthostatic test was performed: OH diagnosis was considered in presence of systolic blood pressure (SBP) fall  $\geq$  20 mmHg and/or diastolic blood pressure (DBP)  $\geq$  10 mmHg one minute after standing. If OH was proven, a compression knee sock was immediately applied, and OH was controlled after 30 minutes. We followed patients by a phone call at one year after ED admission. Results Orthostatic test was performed in 119/206 consecutive patients  $>$  75 years old admitted in our ED, and was not feasible in 87/206 patients, mainly for fracture suspicion. OH was noted in 37/119 (31%) patients. Patients with OH presented with lower ADL (4.9 vs 5.5, p=.0194), more previous diseases (3.9 vs 3.0, p=.0188), congestive heart failure (16 vs 4%, p=.0252), fall history (49 vs 36%, p=.0297), and symptoms during OH test (33 vs 5%, p=.0003). Socks were applied in 25/37 (68%) patients with OH, and OH was still noted in 9/25 (36%) patients in OH test 30 min. despite socks, with only 5% remaining orthostatic symptoms. At one year, preliminary results showed that patients with OH had a poor socks compliance (19%), with poor outcome: fracture (6%), fall recurrence (25%), house caregivers (73%), hospitalization (81%) and death (20%). **Conclusion** Orthostatic hypotension is a frequent condition in emergency elderly patients, and is associated with a poor outcome at one year. Emergency socks could reduce immediate OH, but its long-term compliance is poor.

#### PB7 149 OPTIMISING STROKE PREVENTION IN THE ELDERLY WITH AF VIA A COMPUTERISED ANTITHROMBOTIC RISK ASSESSMENT TOOL (CARAT)

B. BAJOREK\* (University of Sydney / Northern Sydney Central Coast Health Service, Sydney, Australia)  
N. MASOOD(2), I. KRASS(1) - (1) Faculty of Pharmacy, University of Sydney (University of Sydney (Sydney) NSW, Australia); (2) Wyong Hospital, Northern Sydney Central Coast Health (Kanwal NSW, Australia)

**Introduction:** As the population ages, the incidence of stroke due to Atrial Fibrillation (AF) is rapidly increasing. Prevention strategies rely on the use of antithrombotics (warfarin, aspirin). However, these agents present many medication safety considerations including the challenges of risk/benefit assessment, leading to their under-utilisation in practice. This study aimed to develop, and then evaluate the utility and feasibility of, a novel computerised antithrombotic risk assessment tool (CARAT) to aid decision-making regarding appropriate therapy in elderly patients. **Methods:** Development of CARAT was based on algorithms which facilitate systematic patient review by assessing various factors impacting on treatment selection; the inputs were adapted and then computerised. The tool was evaluated and modified through an iterative process, canvassing the perspectives of a multidisciplinary clinical panel on its usability and practicality. To evaluate the tool, hospital-based clinicians pre-tested the CARAT using hypothetical vignettes; a purpose-designed structured questionnaire was administered to gain feedback on the usability of CARAT, including its relevance, currency and evidence-base. **Results:** A final model of the CARAT was developed and evaluated. Overall, 94% of surveyed clinicians (clinical

pharmacologists, cardiologists, haematologists, geriatricians; n=27 yielding 216 responses) were satisfied with CARAT's format. Most (72%) clinician responses agreed with CARAT recommendations for the patient cases; over two-thirds agreed with its estimate of stroke and bleeding risk. However, geriatricians were 3.5 times more likely to disagree with CARAT recommendations than cardiologists, particularly in specific cases (eg high falls risk). Overall, 63% responded that CARAT was at least "somewhat useful" for their clinical practice, with 22% indicating it was 'very useful'. **Conclusion:** The CARAT may efficiently support clinicians in decision-making regarding appropriate antithrombotic therapy in elderly patients with AF. Its full impact on clinician prescribing and patient outcomes is yet to evaluated.

#### PB7 150 LOW PERCEPTION OF DYSPNOEA IN ELDERLY PATIENTS

M. GODARD\* (APHP, UPMC Paris 6, Paris, France)  
P. RAY(2), B. RIOU(2), J. BODDAERT(1) - (1) Geriatric department, Pitié-Salpêtrière hospital, APHP, UPMC Paris 6 (Paris, France); (2) Emergency department, Pitié-Salpêtrière hospital, APHP, UPMC Paris 6 (Paris, France)

Dyspnoea is a subjective difficulty or distress in breathing that consists of qualitatively distinct sensations. Older people are less sensitive to added respiratory loads and their ventilatory response to hypercapnia and hypoxia is reduced by 50% compared with younger people. To our knowledge, there have been few studies on the perception of dyspnoea in the elderly. Some studies have reported that dyspnoea is less intense with age, during acute bronchoconstriction, and others have observed that patients  $>$  80-years of age are at greater risk of not receiving inhaled steroid therapy. These studies suggest that there could be a link between a decrease in perception of dyspnoea and under-use of effective therapy. Elderly patients are characterized by their polypharmacy and many underlying conditions can result in dyspnoea including cardiac failure, chronic obstructive pulmonary disease (COPD) and anaemia. Some studies have reported a 'language' of breathlessness which is able to differentiate people with and without a prior diagnosis of COPD. The pathological conditions characterized by multiple descriptive words suggest that dyspnoea can be described in more than one way. The subjective and unmeasurable nature of breathlessness can make clinical evaluation difficult. To the best of our knowledge, no verbal rating scale has been validated for acute dyspnoea. However, some scales like the numerical rating scale, modified Borg scale, or visual analogue scale (VAS) have been validated in chronic dyspnoea. We have set up a prospective comparative study in an emergency unit to determine the effect of age on the perception of dyspnoea. We also aim to compare and validate three verbal rating scales (numerical verbal scale, modified Borg scale and VAS), and determine the relationship between qualitatively distinct descriptors of breathlessness and causal pathology.

#### PB7 151 PREVALENCE OF PULMONARY ARTERIAL HYPERTENSION IN ELDERLY PATIENTS : AN ECHOCARDIOGRAPHY BASED STUDY

G. GAVAZZI\* (University hospital of Grenoble, Grenoble, France)  
K. OUZAID(1), L. TRANCHANT(1), I. LANIECE(1), N. ZEHROUNI(1),  
P. COUTURIER(1) - (1) Clinique Universitaire de Medecine Geriatrique, CHU de Grenoble (Grenoble, France)

**INTRODUCTION:** Pulmonary arterial hypertension (PAH) is a life threatening disease associated with a very bad outcome when PAP is higher than 55 mmHg. The PAH is considered as a rare disease whatever aetiology. However, this pathology seems underdiagnosed in elderly patient; no data is available to consider the prevalence of the disease. The aim of this study was to investigate the prevalence of pulmonary hypertension in hospitalized elderly patients who had a transthoracic echocardiography. **METHOD:** This is a retrospective study; data from May 2005 to April 2007 in all patients who were 80 years old and over, and had a measure of systolic pulmonary arterial pressure (SPAP) by a transthoracic echocardiography were analyzed. Patients were classified in 2 groups: group 1 with a PAH, defined by SPAP higher than 45 mm Hg and group 2 without PAH. We analyse the potential relationship between PAH and age, gender, presence of atrial fibrillation, and left ventricular function dysfunction measured by echocardiography. **RESULTS:** Out of 1083 patients included, PAH was present in 32.4%, and 11% have a severe PAH ( $>$  60mmHg). There was no difference according to age and gender (33.19% male 31.82% female). Nearly 30% with a normal left ventricular function (>50%) exhibits a PAH (n= 323). There was a positive correlation between presence of atrial fibrillation and PAH. **CONCLUSION:** This study demonstrates in a selective elderly group a very high prevalence of PAH. A large part of PAH is not explained by Left ventricular dysfunction. Further studies are necessary to analyze the aetiology and the consequences of PAH in elderly population.

#### PB7 152 ELEVATED BRACHIAL-ANKLE PULSE WAVE VELOCITY PREDICTS CARDIOVASCULAR MORTALITY IN THE COMMUNITY-DWELLING ELDERLY

T. OZAWA\* (Kochi Medical School, Nankoku, Japan)  
I. MIYANO(1), M. NISHINAGA(1), N. YASUDA(1), Y. DOI(1) - (1) Kochi Medical School (Nankoku, Japan)

Carotid-femoral pulse wave velocity (cfPWV) is known to be a marker of arterial stiffness and a strong predictor of cardiovascular diseases(CVD). Recently developed brachial-ankle

PWV (baPWV), measured by form/ABI (Omron-Colin Com.), showed a good correlation with cfPWV and related to aging, systolic blood pressure and other cardiovascular risk factors. The purpose of this study is to clarify whether increased baPWV is predictive of total and cardiovascular mortality in the community-dwelling elderly Methods and materials : We recruited 414 older adults 65years or over (mean, 77 years, men:female, 148:266) in the Japanese rural community By the median of baPWV level, we divided them into two groups: the low baPWV group (men, < 1862 cm / sec; female, < 1932 cm / sec; n=207), the high baPWV group (men, > 1862 cm / sec; female, > 1932 cm / sec; n=207). Results: (1) Within three years, 31 deaths were observed. High baPWV level was significantly associated with the increase in three-year total mortality after adjustment for age, gender, and anti-hypertensive medications (OR=2.58, 95%CI.=1.13-5.87, p=0.024). (2) CV deaths was observed in 13 subjects and High baPWV level was significantly associated with the increase of cardiovascular mortality.(OR=9.39, 95%CI.=1.20-73.67, p=0.033 ). Conclusion: Elevated baPWV is considered to be a independent predictor of total and CV mortality in the elderly.

**PB7 153 CABG IN THE ELDERLY: EFFECT OF AGE ON 30-DAY MORTALITY AND HOSPITAL PERFORMANCE EVALUATION**

A. MARASCHINI\* (Italian National Institute of Health, Rome, Italy)  
P. D'ERRIGO(1), S. ROSATO(1), G. BADONI(1), F. SACCARECCIA(1) - (1) Italian National Institute of Health (Rome, Italy)

Introduction- The demand for CABG in elderly patients has been increasing. Aim of this analysis is to evaluate the presence of "effect modification" by age in hospital performance evaluation. Methods- National HDRs were used. The study population consisted of all adult patients undergoing isolated CABG during 2003-2005 in Italy. Only hospitals performing more than 250 interventions during the study period were analyzed. Thirty-day in-hospital mortality was considered as endpoint. Patients were stratified by age: <75, >=75 years. Comorbidities recorded in previous and current hospital admissions were used to define patients' health status and to build the adjustment model. A group of 4 hospitals with the lowest mortality rates were used as reference category. An interaction term (age\*hospital) was introduced in the model to test the presence of "effect modification". Adjusted ORs, stratified by age, were estimated when the interaction term resulted statistically significant (p<0.10). Results- The study population consisted of 7173 patients (age>=75=17.5%). A total of 85 hospitals were analyzed. Patients >=75 ranged between 7.5 and 29.8%. Thirty-day in-hospital mortality was 2.64% (2.05 and 5.39 for age <75 and >=75 respectively). Nine hospitals showed a significant "effect modification" by age. In all of theme ORs for patients >=75 were higher than those for patients <75. In two hospitals, the overall mortality rate was comparable to that of the reference category but a strong significant excess risk for patients >=75 was found (ORs = 4.1 and 3.5; p<0.01). Conclusion- Thirty-day in-hospital adjusted mortality rates resulted higher in elderly than in young patients. An effect modification by age was found. These findings suggest that in elderly patients, besides preoperative comorbidities, postoperative complications could increase in-hospital mortality and affect hospitals performance.

**PB7 154 A STROKE STUDY OF AN URBAN AREA OF IRAN: RISK FACTORS,**

**LENGTH OF STAY, CASE FATALITY AND DISCHARGE DESTINATION**

A. DELBARI\* (Karolinska Institute, Stockholm, Sweden)  
J. LOKK (1), . SALMAN ROGHANI(2), S. TABATABAEI (2), RAHGOZAR(2) - (1) Karolinska Institute (Stockholm, Sweden); (2) University of Social Welfare & Rehabilitation (Tehran, Islamic Republic of Iran)

Background: The Iranian population is aging rapidly which causes huge medical concern for health care of this population. This trend will lead to a rise in stroke incidence in the future, so stroke profile and characteristics could help us in developing health policies for our population. Material and method: a Cross sectional, multihospital-based study performed on all consecutively discharged and diagnosed, ischemic stroke patients in the city of Qom, Iran between March 2006 and September 2007. Findings: 953 patients, 48.9% men and 51.1% women were included. The mean age was  $67.96 \pm 13.82$  years. 64.11% patients were >65 years and 4.93% was <45 years. Hypertension was found in 64% of patients, followed by Diabetes mellitus (36%), Heart disease (HD) (34%), hypercholesterolemia (32%), and smoking (20%). Median Barthel Index score was 85 with an inter-quartile range from 55 to 100. It was significantly associated with the number of risk factors ( $p = 0.046$ ). The average length of stay (LOS) was 7.71 days (95% CI, 7.18-8.23). Females had a significantly longer LOS compared to males (8.40 vs. 6.98,  $p=0.0075$ ) and Patients with HD had a significantly longer LOS (8.88 days, 95% CI, 7.79-9.97,  $p=0.004$ ). Overall one month fatality rate was 15.3%. More than 98% of patients went home after acute phase discharge and only 2% went nursing care. Discussion and Conclusion: HTN & D.M is more frequent than average global findings, acute phase LOS was similar to other studies, one month case fatality was higher than European countries but less than developing countries. The most interesting difference comparing developed countries is the destination which should be addressed. We strongly recommend for establishing a stroke registry, primary prevention and promoting rehab.

**PB7 155 ANTICOAGULATED PATIENTS OLDER THAN 65 AT AN EMERGENCY DEPARTMENT.**

R. MARTOS\* (Universidad Europea de Madrid, Villaviciosa de Odón, Spain)  
E. PINTOR(1), B. PADERNE(2), M. MIRANDA(2), M. ZUGASTI(2), B. HERREROS(1) - (1) Universidad Europea de Madrid (Villaviciosa de Odón, Spain); (2) Hospital de Mostoles (Spain)

Introduction: Different cardiovascular pathologies such as atrial fibrillation and venous thromboembolic disease are very common on geriatric population. Oral anticoagulants or antiplatelets are the two most frequent possibilities of choice. Patient older than 65 that are taking acenocoumarol sometimes need urgent care. Methods and materials: We included all the patient that were admitted at an emergency department of an university hospital (Mostoles, Madrid, Spain) in a period of 3 months (january-march 2008) that were receiving oral anticoagulants and were older than 65 years. We collected several items including: sex, gender, mental and dependence state, cause of urgent care, bleeding, type of bleeding, INR value and treatment received at emergency. Results: 169 patient were included in this study. 55% were female, mean age: 77.5 years. Most of them were anticoagulated with oral anticoagulations (Acenocoumarol) because of atrial fibrillation.

The main cause of consulting was disnea related to heart failure. 18 (10,6%) of these were attended because of bleeding (16 were minor bleeding and 2 were mayor), most frequent if the patient had developed a previous bleeding related to anticoagulation therapy. Most patients had an INR level at emergency among therapeutic range (2-3.5). There were no statistically differences between bleeding o not bleeding regarding INR value at emergency, neither age, sex, mental state or taking antiplatelets. Conclusions: 1-Most patients older than 65 years old that take acenocumarol and need emergency care is not related to anticoagulations therapy. 2-The possibility and intensity of bleeding is low. 3-Patients that have developed bleeding related to oral anticoagulant therapy should have an "special" control on INR values. 4-Despite of urgent diseases, most of them keep on therapeutic INR values.

**PB7 156 55- PON1 (PARAOXONASE 1) POLYMORPHISM AND RISK OF ISCHEMIC STROKE (IS) IN THE ELDERLY.**

I. SAULNIER\* (CHU Limoges, Limoges, France)  
D. MIREILLE(2), D. JEAN(3), M. LOUIS(3), C. JEAN-PIERRE(1), D. THIERRY(1) - (1) CMRR Pôle Gérontologie CHU Limoges (Limoges, France); (2) Laboratoire d'immunologie (Limoges, ); (3) Laboratoire de pharmacologie (Limoges, )

Introduction: PON1 is an High Density Lipoproteins (HDL) associated esterase with anti-atherosclerotic properties related to its antioxidant effect on Low Density Lipoproteins (LDL) and its hydrolysis of lactones. Among risk factors (RF) of ischemic stroke (IS), lipid oxidative stress could play a major role in the development of cerebral atherosclerosis and vascular dementia. Our group showed a relationship between PON1 serum activity and IS in the elderly. This study explored the relationship between IS and PON1 genetic polymorphism (192Q/R, 55M/L, promoters: 107C/T, 824G/A). Methods: PON1 polymorphisms were identified by PCR-SSP in 87 subjects suffering from IS (58 men (M) and 29 women (W), mean age:  $82.6 \pm 7.2$  from 66 to 97 years). PON1 polymorphisms distributions of IS group were then compared to 103 healthy subjects (HS) (48 M and 55 W, mean age:  $73.1 \pm 4.7$  from 66 to 88 years). Student's t test compared mean age and Chi2 test compared sex and PON1 polymorphisms distributions between IS and HS. Results: IS were significantly older than HS ( $p < 0.05$ ), especially in 55L-PON1 gene +. In HS group, W numbers were higher than M ( $p < 0.05$ ). 55M-PON1 was overexpressed in IS ( $p = 0.0006$ ) and a positive relationship between 55M/L-PON1 and 107C/C promoter ( $p = 0.01$ ), between 55M-PON1 and 824A promoter ( $p < 0.05$ ) and between 55M-PON1 and 192R-PON1 ( $p < 0.05$ ) were found. Conclusions: This study focused on the overexpression of the 55M-PON1 polymorphism in the elderly with IS whereas in other younger populations 192R-PON1 polymorphism was overexpressed. These results should be confirmed by sex and age matching.

**PB7 157 MANAGEMENT OF ELDERLY PATIENTS WITH HEART FAILURE WITH PRESERVED EJECTION FRACTION. AN OUTPATIENT FRENCH SURVEY.**

O. HANON\* (Broca hospital, Paris, France)  
P. DE GROOTE(1), F. DIEVART(2), M. GALLINIER(3), G. HABIB(4), D. HERPIN(5), Y. NEUDER(6), J. TROCHU(7), R. ROUDAUT(8), Y. JUILLIERE(9), M. KOMAJDA(10) - (1) Department of cardiology (Lille, France); (2) Department of cardiology (Dunkerque, France); (3) Department of cardiology (Toulouse, France); (4) Department of cardiology (Marseille, France); (5) Department of cardiology (France); (6) Department of cardiology (France); (7) Department of cardiology (France); (8) Department of cardiology (France); (9) Department of cardiology (France); (10) Department of cardiology (France)

Background: Heart failure with preserved ejection fraction (HFPEF) is very common in the elderly. These patients are often hospitalized but few data are available in a population of outpatients. Objectives: To analyze the clinical characteristics and the management of a large population of outpatients with HFPEF. Methods: A prospective observational study was conducted in French cardiologists who had to include outpatients with stable HFPEF. Results: We included 1168 patients, mean age was  $76 \pm 10$  years and 51% were women. The main cardiovascular diseases were atrial fibrillation (42%), coronary heart disease (34%), peripheral arterial disease (15%) and stroke (10%). A majority of patients had multiple cardiovascular risk factors (66%), particularly hypertension (81%) and diabetes

mellitus (29%). Similarly, these patients had several non-cardiovascular co-morbidities (56%), mainly neuro-psychiatric disorders (23%), pulmonary diseases (19%), renal failure (17%) and walking disorders (11%). Most patients had several HF decompensations (2 episodes in 52% of cases, ≥ 3 episodes in 18%). Blood pressure was  $144\pm19/82\pm10$  mmHg, heart rate was  $78\pm17$  beats/min, creatinine was  $12.2\pm4.1$  mg/l. Median BNP was 450 pg/ml. Mean ejection fraction was  $60\pm9$  %. Treatment included diuretics (88%), renin-angiotensin blockers (87%), betablockers (60%), calcium-antagonists (25%), aldosterone-blockers (18%). Patients also received several non-cardiological drugs such as antidiabetic agents (26%), psychotropic drugs (16%) and gastro-intestinal agents (17%). Conclusions: This observational study of a large population of outpatients with HFPEF included elderly patients, with more co-morbidities and cardiovascular diseases than subjects usually included in therapeutic trials. These heterogeneities could probably explain the difficulty to demonstrate the efficacy of a single pharmacological agent. A multidisciplinary approach will probably be required in order to improve the management. Data on 6 months mortality will be available for the presentation in July 2009.

**PB7 158 ASSOCIATION OF AGE AND DIFFERING ANTHROPOMETRIC PARAMETERS WITH SEVERITY OF CORONARY ARTERY DISEASE**

C. SCHWANKE\* (PUCRS, Porto Alegre, Brazil)  
P. DURGANTE(2), P. CARAMORI(1), I. GOMES(2), C. BARCELLOS(3), T. GALDINO(2), P. HICKMANN(3), M. DEUTRICH(4), P. RECH(4) - (1) UFRGS (Porto Alegre, Brazil); (2) PUCRS (Porto Alegre, Brazil); (3) Hospital São Lucas da PUCRS (Porto Alegre, Brazil); (4) UFCSPA (Porto Alegre, Brazil)

Introduction: Once old age and overweight/obesity are associated with coronary artery disease (CAD), the aim of this study is to analize the association of age and differing anthropometric parameters with severity of coronary artery disease in patients undergoing coronary Angiography. Methods and materials: In 97 patients undergoing coronary angiography we assessed the body mass index (BMI), waist circumference (WC), waist-to-hip ratio (WHR – hip circumference was measured at the widest circumference of the buttocks at the area of the greater trochanters), abdominal circumference (AC - measured on a horizontal plane 1 cm above the iliac crest), abdominal-to-hip ratio (AHP) and neck circumference (NC-measured at mid-neck height, between mid-cervical spine and mid-anterior neck just below laryngeal prominence). The severity of coronary artery disease was determinate throught the Friesinger index (FI - the index range from 0 to 15; each of the three main coronary arteries is scored separately from zero – no CAD - to five – high severe). Results: The mean age of patients was  $61.6 \pm 11.4$  and was associate with CAD ( $r=0.254$ ;  $p=0.005$ ). Eighty-one patients (83%) had CAD ( $FI >= 1$ ). Just WHR showed association with CAD ( $0.92 \pm 0.83$  vs  $0.84 \pm 0.12$ ;  $p=0.004$ ), and a moderated correlation with FI showed ( $r=0.544$ ;  $p<0.001$ ). Conclusion: We found an association between age and WHR with CAD severity. So we recommend the use of this parameter to prevent CAD in primary and secondary care attention sets.

**PB7 159 PROBLEMS WITH ASTHMA TREATMENT IN ELDERLY PATIENTS.**

A. BOZEK\* (Klinika Chorób Wewnętrznych, Dermatologii i Alergologii, Zabrze, Poland)  
J. JARZAB(1) - (1) Klinika Chorób Wewnętrznych, Dermatologii i Alergologii (zABRZE, Poland)

Nonadherence with asthma therapy is common and may contribute to poor clinical outcomes. Elderly patients with bronchial asthma are a specific group with particular needs. These must be addressed in order to provide appropriate asthma care. Older patients often have problems with compliance and self-management due to age-specific factors. Older patients with asthma are often misdiagnosed, due to an impaired patient perception of symptom severity and not sufficient communication skills. Often the quality of life is impaired by asthma. Improvement in self management skills in a special way may enhance the health status of elderly patients with asthma. The aim of the study was assessment of patients adherence to prescribed treatment of asthma. Methods: 456 patients 65-93 yrs old with diagnosed chronic asthma (medical history, Uniper questionnaire, examinations, positive referable bronchial test) were included to prospective observations of treatment adherence during 12 months by the use patients diary. There were monitoring proper using of inhaled therapy and concomitant drugs. Results: Adherence to inhaled corticosteroids use was about 58%, LABA 63%, SABA 91%, antilecotriens 63% and theophyllinum 71% during 12 month observations. The total adherence to therapy of asthma was good when only one inhaler or one pill per day were prescribed. It was about 72%. However two drugs prescribed per day reduce the adherence to 57% and three to 43%. Powder inhalators were better compliance and technique of using than MDI. There were also problems among older patients with changed therapy themselves during asthma exacerbations. In this case the compliance reduced about 30%. Conclusion: We observed a great problems with adherence with asthma drugs among older patients. There were often underdiagnosed and undertreated asthma in elderly people.

**PB7 160 ARE THE RECOMMENDATIONS FOR TREATMENT OF ACUTE CORONARY SYNDROMES APPLIED FOR ELDERLY IN GERIATRIC CARE UNITS?**

I. LANDRIN\* (CHU de Rouen - Hôpital de Petit-Quevilly, Le Petit-Quevilly, France)  
M. PARISSET(1), C. CAPET(1), M. CAUSSIN(2), J. DOUCET(2), N. KADRI(1) - (1) CHU de Rouen (Le Petit Quevilly, France); (2) CHU de Rouen (Rouen, France)

Introduction In 2007, the French National Authority for Health (HAS) published recommendations for treatment of acute coronary syndrome (ACS). The aim of this study was to evaluate the application of these recommendations among aged patients and the reasons of possible discrepancy. Methods Before beginning the study, all doctors were informed about these recommendations. We included 50 patients over 75 years (mean age 83 years, 60% patients  $\geq 85$  years) admitted in two geriatric care units with an ACS (which was defined by at least 2 criterias among 3: thoracic pain, increased troponin, alteration of segment ST on ECG). Cardiovascular risk factors, conditions of life, cognitive and nutritional status, autonomy, glomerular filtration rate, treatments at admission and at discharge were recorded. At discharge, the application of recommendations was evaluated. We looked for the reasons why recommendations were not applied. Results At admission, 40% of patients received a beta-blocking agent, 34% an angiotensin converting enzyme inhibitor (ACEI) or an angiotensin II antagonist (ARAII), 58% an antiplatelet drug and 26% a statin before ACS. After ACS, a beta-blocking agent was introduced in 68% of patients; the lack of prescription was justified for 8/12 patients. All patients received an antiplatelet drug. An ACEI/ARAII and a statin was started only in 57% and 32% of patients respectively. The lack of prescription of an ACEI/ARAII was justified for 7/21 patients. The lack of prescription of statin was justified by age and/or nutritional alteration for 24/28 patients. Conclusion The difficulty with elderly patients is to apply the recommendations about the treatment of ACS which takes into account results from studies performed with younger patients. The prescription of beta-blocking agents is now well applied in geriatric care units. Prescription of ACEI/ARAII and statin is missed or judged useless.

**PB7 161 OUTCOME OF ELDERLY PATIENTS WITH CARDIOGENIC PULMONARY EDEMA TREATED WITH NITRATES BOLUS IN EMERGENCY DEPARTMENT.**

Y. FREUND\* (APHP, UPMC Paris 6, Paris, France)  
S. DELERME(1), J. BODDAERT(2), S. CASTRO(1), P. HAUSFATER(1), B. RIOU(1), P. RAY(1) - (1) Emergency department, Pitie-Salpêtrière hospital, APHP, UPMC Paris 6 (Paris, France); (2) Geriatric department, Pitie-Salpêtrière hospital, APHP, UPMC Paris 6 (Paris, France)

Previous data suggested a superior efficacy of high doses of nitrates by bolus compared to continuous perfusion in cardiogenic pulmonary edema (CPE), but data remain scarce. In an observational study, we compared outcome of emergency elderly patients with CPE receiving or not nitrates bolus. Material and methods Monocentric retrospective study in an emergency department (ED) during a one year period. Inclusion of patients  $\geq 75$  years old admitted with a final diagnosis of CPE based upon the medical according to an expert committee. Patients receiving 3 mg nitrates bolus were compared with patients without bolus. Results During the study, 215 patients ( $77 \pm 13$  years) were admitted for CPE (hypertension (63 %), diabetes mellitus (29%), previous heart failure (43%), dementia (5%)). 40/215 patients (19%) received nitrates bolus ("bolus patients"). There was no difference between groups (bolus patients vs no bolus) for past medical history, and ED treatment including oxygen (90 vs 93%, NS) and diuretics (93 vs 84%, NS). Bolus patients had higher systolic blood pressure (SBP  $> 160$  mmHg : 40 vs 12%,  $p<0.01$ ) and received more nitrates continuous perfusion (55 vs 14%,  $p<0.01$ ). There was no difference between groups for pH, PaCO<sub>2</sub>, PaO<sub>2</sub> or lactate dosage but troponine  $> 0.14$  µg/L was more frequent in bolus patients (28 vs 14%,  $p<0.01$ ). Outcome data revealed no differences for hypotension during and after treatment (mean SBP  $118 \pm 19$  vs  $115 \pm 19$  mmHg, NS), but rate of intensive care unit admission was higher in bolus patients (40 vs 17%,  $p<0.01$ ) despite no differences in hospital length of stay (10 vs 9 days, NS) or death (3 vs 11 %, NS). Conclusion Nitrates bolus appears to be well tolerated in elderly patients with CPE, but its efficacy compared to conventional treatment in comorbid elderly patients has to be precised.

**PB7 162 AGING AND LIPID LEVEL IN CORRELATION WITH CORONARY ARTERY DISEASE IN PATIENTS UNDERWENT ANGIOGRAPHY**

I. SYAMSUL HUDA MZ\* (Kariadi Hospital, Semarang, Indonesia)  
R. ANDAYANI RAHAYU(1), K. PRANARKA(1), H. MARTONO(1) - (1) Kariadi Hospital (Semarang, Indonesia)

Background and Objectives: Coronary artery atherosclerosis is one of the most prevalent cause of death worldwide. Increasing age is the most powerful risk factor for cardiovascular disease. One of the other major risk factor is dyslipidemia. The purpose of this study was to determine aging and lipid level effect on the coronary atherosclerosis in angiographically documented patients. Materials and Methods: Sixty patients that for clinical reasons had coronary angiography were randomly assigned into check for blood lipid (total cholesterol, triglyceride, HDL, LDL) level. Age of patients were divided into two groups: age. Coronary atherosclerosis lesion that reported by angiography noted as the number of vessel disease. Blood lipid level is as dependent variable. Results: Sixty patients (30 elder, the mean of age is about 67.6 yrs, mean of total cholesterol is 193.3, mean of triglyceride is 118.8, mean of HDL is 38.0, mean of LDL is 122.0) and (30 adult, mean of age about 51.7 yrs, mean of total cholesterol is 198.4, mean of triglyceride is 182.0, mean of HDL is 34.9, mean of LDL is 122.2). The result of coronary angiography noted (elder: 1 vessel disease in 3 pts., 2 vessels disease in 5 pts., 3 vessels disease in 22 pts. and adult: 1 vessel disease in 5 pts., 2 vessels disease in 11 pts., 3 vessels disease in 14 pts.) The significance interaction between age and the number of vessel disease with total cholesterol is ( $p=0.069$ ), with triglyceride is ( $p=0.592$ ), with HDL is ( $p=0.079$ ), and with LDL is ( $p=0.045$ ) Conclusion: There is a more significantly interaction between aging and

the number of vessel disease as a consequence of LDL level. Keywords: Elderly patients, Coronary atherosclerosis, Angiography, Cholesterol, Triglyceride, HDL, LDL

**PB7 163 EXERCISE AS TREATMENT FOR PERIPHERAL ARTERIAL DISEASE: A SYSTEMATIC REVIEW**

B. PARMENTER\* (University of Sydney, Lidcombe, Australia)  
M. FIATARONE SINGH(1), J. RAYMOND(1) - (1) University of Sydney (Lidcombe, Australia)

**Introduction** The prevalence of peripheral arterial disease (PAD) rises to 15-20% in persons over the age of 70. The Trans-Atlantic Inter-Society Consensus working group currently recommends walking to a high level of claudication pain as an initial treatment for intermittent claudication (IC); however, there is a subset of older adults who are unwilling or unable to complete such exercise prescriptions due to claudication or the presence of comorbidities. Our aim was to therefore systematically review the evidence for the effectiveness of various forms of exercise, including parameters such as modality, volume, intensity, duration and supervision, on symptoms and quality of life in PAD. **Methods** A comprehensive literature search was performed using multiple databases for all randomized controlled trials (RCTs) of isolated exercise interventions for adults with IC. Hemodynamic, functional and subjective measures of disease severity were included as outcomes. Results Thirty-five trials met the eligibility criteria: 33 aerobic training; 2 lower body progressive resistance training (PRT). In total 2293 subjects were studied and of those almost 80% were male with few over the age of 75. Most modes and intensities of exercise significantly improved walking capacity, with additional comparative analysis revealing no significant difference between walking and some alternative aerobic exercise prescriptions. The relative effect size (ES) for PRT for initial walking capacity was 1.52(0.4 to 2.65) vs. a median ES of 1.61(0.4 to 2.65) for aerobic exercise. Conclusion We have identified 35 RCTs using exercise for treatment of IC. Modes of aerobic exercise other than walking are clearly beneficial for PAD symptoms and overall function. The benefits of PRT appear promising but little data are published on this modality, and additional work is required using PRT, particularly in older cohorts with multiple comorbidities and more severe PAD.

**PB7 164 CHOLESTEROL LEVELS AND USE OF SERUM LIPID MODIFYING AGENTS AMONG ELDERLY PERSONS**

P. TUUKKALA\* (University of Kuopio, OULU, Finland)  
H. ENLUND(2), R. SULKAVA(3), S. HARTIKAINEN(1) - (1) Kuopio Research Centre of Geriatric Care (Kuopio, Finland); (2) Department of Pharmacy Practice, Kuwait University (Kuwait); (3) School of Public Health and Clinical Nutrition, University of Kuopio (70211, Finland)

**Introduction:** Since 1990s the use of serum lipid modifying agents is increased rapidly, mostly among the oldest-old, peaking in the age group 70-79 years in both sexes. The aim of this study was to describe the changes in cholesterol levels and the use of statins (C10AA) among a random sample of elderly persons. **Material and methods:** This study is part of the population-based GeMS cohort study. The target population comprised all the inhabitants of the City of Kuopio, Finland aged 75 or more years on November 1, 2003. From this population, sample of 1000 persons was drawn. This study is based on information from all elderly persons examined in 2004 and 2006 with serum total (TC), low-density lipoprotein (LDL) and high-density lipoprotein (HDL) cholesterol measurement ( $n=622$ ). The basic demographic and clinical data were collected by interviews. To define concomitant diseases, we used the Social Insurance Institution Special Refund Registers. **Results:** The mean TC in 2004 was 5.0mmol/l, LDL 3.1mmol/l, and HDL 1.37mmol/l. In 2006, the levels were: 4.7mmol/l, 2.9mmol/l, and 1.39mmol/l. Of all, 29% ( $n=179$ ) used regularly statins in year 2004 and 34% ( $n=211$ ) in year 2006 ( $p<.001$ ). In 2004, 54% of elderly persons with coronary artery disease and 41% of elderly persons with diabetes used statins. In 2006 respective proportions were 57% and 50%. In 2004, 16% of the elderly persons without coronary artery disease, diabetes and hypertension used statins. In 2006 respective proportion was 21%. **Conclusions:** The use of statins increased and the levels of TC and LDL decreased. The use of statins among the elderly persons targeted to the secondary prevention. Still, 1 in 5 of the elderly without risk factor for cardiovascular outcome used statins.

**PB7 165 PERIFERAL ARTERIAL DISEASE IN THE ELDERLY PATIENTS AND THERAPY WITH CLOPIDOGREL**

G. POPESCU\* (National Institute of Geriatrics and Gerontology , Bucharest, Romania)  
D. GHIORGHE, D. TEIXEIRA, D. KHAYAT

**Introduction:** The peripheral arterial disease (PAD) because of atherosclerosis is present in the elderly around 18,8% over 70 years old; about two-third of these patients are a long time asymptomatic. Coronary heart disease (CHD) is associated in 50-60% of cases, and cerebrovascular events in 25%. Therefore, early diagnose and treatment of PAD could play an important role to delay the progression of atherosclerotic cardiovascular disease into global context. The goal: The present study analysed the effect of Clopidogrel 75 mg./day, versus Aspirin 100 mg./day, in PAD, in relationship with evolution toward fatal coronary or cerebrovascular events. **Method:** There were analyzed retrospectively on three years, 256 patients (males and females) – group A – with PAD stage II Leriche, aged between 59-75 years old, hospitalized at every 6 month, with or without other cardiovascular disease (CHD, stroke), treated with Clopidogrel 75 mg./day, versus a control group of 232 patients – group B – with similar age and pathology, treated with Aspirin 100 mg./day. During the

3 years, 2% from group A treated with Clopidogrel, progressed toward fatal results, while group B treated with Aspirin, progressed in 11% of cases. **Conclusions:** The diagnosis of PAD could be predictive for other vascular atherosclerotic determinations. The antiplatelet therapy in PAD could delay progression of CHD and/stroke. In our study, Clopidogrel was demonstrated to be more effective than Aspirin both in primary and secondary prevention of coronary or cerebrovascular atherosclerosis.

**PB7 166 IMPACT OF AGE IN THE MANAGEMENT OF ACS: MEDICAL POLICY AND HOSPITAL OUTCOME IN ELDERLY PATIENTS**

P. D'ERRIGO\* (Italian National Institute of Health, Rome, Italy)  
F. SECCARECCIA(1), S. ROSATO(1), A. MARASCHINI(1), G. BADONI(1) - (1) Italian National Institute of Health (Rome, Italy)

**INTRODUCTION**-Age is a powerful determinant of prognosis in ACS, affecting both disease characteristics and medical policy. This analysis aims at describing the impact of age on clinical presentation and hospital outcome in a large sample of ACS patients. **METHODS**-The study population consisted of all adult patients admitted to hospital for an ACS during 2004-2005 in 3 Italian regions (Lombardia, Emilia-Romagna, Friuli-VG). National hospital discharge records were used. Patients discharged or transferred within 48 hours of hospital admission were excluded. According to ICD9CM codes, ACS was classified as UA/NSTEMI and STEMI. Thirty-day in-hospital mortality was considered as end-point. Risk factors and comorbidities, as recorded in previous and current hospital admissions, were used to compute risk-adjusted mortality rates. Patients were stratified by age (<65; 65-75; >75). **RESULTS**-The study population consisted of 70476 patients. On the whole, about 40% of events were classified as STEMI and 60% as UA/NSTEMI. An inverse association between age and the likelihood of presenting with STEMI was found (OR=0.79 age>=75 VS age<65). Among patients aged >=75, more than 24% of UA/NSTEMI and 34% of STEMI were treated in General Medicine Departments (GMD). Of these, only 8.2% of UA/NSTEMI and 4.5% of STEMI underwent a coronary procedure or were submitted to extensive investigations. As expected, in-hospital mortality rates increase with age (<65=1.1%, 65-75=2.8%, >75=10.2%). An additional strong association with the department of treatment was found. For both UA/NSTEMI and STEMI, 30-day adjusted mortality rates of elderly patients admitted to GMD were about twofold higher than those of elderly patients treated in cardiologic departments (7.7% VS 4.2% for UA/NSTEMI; 26.4% VS 16.7% for STEMI). **CONCLUSION**-Elderly ACS patients are less likely to present with ST-elevation but they are markedly less intensively investigated and less likely to be treated in cardiologic departments. This medical policy influences elderly in-hospital mortality rates.

**PB7 167 FACTORS INFLUENCING PROGNOSIS OF THE FRAIL ELDERLY**

T. NAKAHASHI\* (Kanazawa Medical University, Kahoku-Gun, Ishikawa, Japan)  
M. ATSUMI(1), H. MURAI(1), I. TOYOTA(1), H. YANO(1), K. NOMURA(1), H. TSUCHIYA(1), K. IWAI(1), S. MORIMOTO(1) - (1) Kanazawa Medical University (Kahoku-Gun, Ishikawa, Japan)

**Introduction.** The life expectancy at the age of 80 is about 11.3 years for women in Japan. However the prognosis of the frail elderly, such as post stroke or pneumonia patients, is very poor. The aim of this study is to evaluate the prognosis of the frail elderly and to elucidate the factors influencing their life expectancy. **Methods and materials.** All discharging patients from our facility were recruited and followed up at least 2 years. After evaluation of 2 years survival, patients were divided into 3 groups, group L surviving 2 years or more after discharge, group S surviving 30 days to 2 years, and early-death group died within 29 days after discharge. Clinical factors and examinations were compared between L and S groups. **Results.** 515 patients were followed up for 2 years. 119 patients for S group (mean 84.4 +/- 6.7 years old, male 49%) and 335 patients for L group (mean 79.6 +/- 9.6 years old, male 33%) were compared. The characteristics of S group were as follows; higher age, higher percentage of male, lower chance to go back own home after discharge (25.2% vs. 63.3% in L group), lower Hasegawa Dementia Scale (5.8 points vs. 14.1), higher percentage of tube nutrition (28.6% vs. 6.9), higher percentage of bed ridden (53.8% vs. 19.4). The morbidity of dementia, cerebrovascular disease, lung disease, heart disease, or cancer, was higher in S group. However, the morbidity of hypertension and hyperlipidemia was lower in S group. All these differences were statistically significant. **Conclusion.** The low 2 years survival rate of the frail elderly (65%) was observed in this study. Cerebrovascular disease and dementia may contribute to lung disease and malnutrition which influence the life expectancy of the frail elderly.

**PB7 168 ASSOCIATION BETWEEN HIGH BLOOD PRESSURE AND DISABILITY IN AN ELDERLY POPULATION**

E. DURON-GARNIER\* (Broca hospital, Paris, France)  
D. DUBAIL(1), H. BLAQUART(1), J. GAUBERT(1), F. LATOUR(1), O. HANON(1) - (1) broca hospital (Paris, France)

Stroke is the major aetiology of disability among the elderly but the direct association between blood pressure level and disability is not well-known. **Objective** To assess the association between hypertension and disability in a cohort of subjects over 70 years old. **Design and methods** 944 outpatients of a geriatric clinic benefited from a complete

geriatric assessment, including Systolic Blood Pressure (SBP) and Diastolic Blood Pressure (DBP) measurements. Blood Pressure was measured 2 times (by a nurse and then, by a physician) after 15 minutes of rest seated, using a validated electronic device. Hypertension was defined by a SBP and/or a DBP  $\geq$  140/90 mm Hg or antihypertensive treatment's consumption. Disability was assessed by 2 validated scales: Instrumental Autonomy of Daily Living (IADL, 14 items) and Autonomy of Daily Living (ADL, 6 items). Patients also benefited from a Brain-CT scan and complete biological testing. A global comprehensive cognitive assessment was performed to diagnose dementia. Results In this elderly population (mean age= 76± 6 years; 70% of women, 48% of demented subjects), hypertension was diagnosed in 71% of cases. Mean SBP /DBP was 144±21/77±13 mmHg. Mean ADL and IADL were respectively 11.9±2.9 and 5.8±0.7. Cardiovascular diseases (Stroke/ transient ischemic attack, coronaropathy, heart failure, atrial fibrillation) were observed in 29% of cases. After adjusting for age, gender, educational level cardiovascular diseases and dementia, hypertensive subjects appeared more disabled than non hypertensive subjects (IADL score = 11.7±3.0 vs 12.4±2.3 p<0.001, ADL score = 5.7±0.8 vs 5.8±0.4, p<0.05). Conclusion Our result indicates a significant association between hypertension and disability independently of cognitive disorders, stroke and cardio-vascular diseases.

**PB7 169 IMPACT OF METABOLIC SYNDROME ON LEFT VENTRICULAR EJECTION FRACTION AS ASSESSED BY 64-MULTIDETECTOR-ROW COMPUTED TOMOGRAPHY**

R. MITSUTAKE\* (Fukuoka University Hospital, Fukuoka, Japan)  
S. MIURA(1), Y. SHIGA(1), K. SAKU(1) - (1) Fukuoka University Hospital (Fukuoka, Japan)

Introduction The metabolic syndrome (MetS) which may be due to dysfunction of adipocytokine is associated with increased risk for cardiovascular diseases and related mortalities. We analyzed the association between left ventricular ejection fraction (LVEF) as determined by a non-invasive method, multi-detector row computed tomography (MDCT), and the MetS using an accurate method for determining criteria. Methods and materials Subjects included 513 consecutive patients (male/female= 54%/ 46%, age= 64 ± 11 years) who underwent coronary angiography using MDCT. We quantified coronary artery calcification score, visceral fat area (VFA), subcutaneous fat area and waist circumference, and measured blood pressure, ABI and PWV. We also analyzed plasma levels of adiponectin, lipid profile, HbA1c, blood glucose and uric acid. Results Of the total of 513 subjects, 209 (41%) were diagnosed as MetS. LVEF after adjusting for body surface area in MetS group was significantly lower than that in non-MetS group. Furthermore, there was no difference in LVEF among MetS or non-MetS group in subject age < 70 years, while LVEF in MetS group was significantly lower than that in non-Mets group in subjects  $\geq$  70 years. When all subjects were divided into five groups (0-4) according to the number of metabolic factors, LVEF were significantly decreased as the number increased. Conclusion This study suggested that MetS contributed to reduced LV systolic function, especially in older subjects.

**PB7 170 RELATIONS BETWEEN INDICES OF ARTERIAL COMPLIANCE AND ARTERIAL BLOOD PRESSURE IN HYPERTENSIVE ELDERLY SS.**

L. BERGAMINI\* (Università di Modena e Reggio Emilia , Modena, Italy)  
M. FINELLI(1), A. ANGELINI(1), C. BENDINI(1), E. FERRARI(1), F. NEVIANI(1), B. MANNI(1), A. PELOSI(2), G. RIOLI(1), M. NERI(1) - (1) Department Geriatrics Modena and Reggio Emilia university (Modena, Italy); (2) Department of Psychology, Parma University (Parma, Italy)

Introduction: Hypertension is a risk factor for a long-lasting arterial walls remodelling leading to stiffness. HDI overcomes some of the problems arising with more-time consuming method (Ambulatory Blood Pressure Monitoring, ABPM) and give information about arteries's walls elasticity. We studied relationship between pulse pressure (PP) measured by HDI (PPHDI), large (LA-C) and small arteries compliance (SA-C) and few well-established indices of ABP. Materials and methods: sample consists of 75 hypertensive Ss, aged 65+. LA-C, SA-C and PPHDI were measured by pulse wave analysis of radial artery (HDI PWCR-2000). Pearson's correlation found relationship between index drawn from ABPM, LA-C and SA-C separately; repeated regressions were applied to study LA-C and SA-C variance in the sample. Receiver Operator Characteristic (ROC) curves for thresholds of PP were generated, and Areas Under the Curve (AUC) calculated for PPHDI, PPABPM to visualize differences in their sensitivity/specificity. Result: Significant correlations between LA-C and HR, PPABPM and PPHDI were found. SA-C relates with HR, and Sistolic Blood Pressure lying and standing. Applying a stepwise regression analysis we found a model with two predictive factors PPHDI and HR that explain LA-C variance. SA-C variance was explained only by SBP lie-down. ROC curves for thresholds showed that PPHDI reached levels of sensitivity/specificity similar to those of the other (PPABPM) more time-consuming method. Conclusion: Surveillance of ABP through hemodynamic indices and in particular SBP, is essential, nevertheless is not known the advantage of this control in a elderly population where organ damage is already evident. PP describe the condition of "arterial tree". It needs necessarily an instrumental

measurement; PPHDI result similar in reliability towards PPABPM, but is more rapid and well applicable in a elderly population.

**PB7 171 IMPROVING STROKE PREVENTION, TREATMENT, CARE AND SUPPORT THROUGH COLLABORATIVE WORKING: THE SOUTH YORKSHIRE (UK) COLLABORATION IN LEADERSHIP FOR HEALTH RESEARCH AND CARE STROKE**

T. RYAN\* (University of Sheffield, Sheffield, United Kingdom)  
P. ENDERBY(1), M. MARSHALL(1), G. VENABLES(1), A. JONES(1), S. BRUMFITT(1), K. FRYER(1), M. AZIZ(1), T. FURNESS(1), R. PALMER(1) - (1) University of Sheffield (Sheffield, United Kingdom)

Background Stroke is the third biggest killer in the UK and the primary cause of disability amongst adults. The increased incidence of stroke with age has also been noted in the UK (Rothwell et al 2005). The South Yorkshire Collaboration in Leadership for Health Research and Care Stroke Theme is a programme of joint clinical, academic and voluntary sector research and development projects aimed at enhancing stroke services through: • reduced incidence of stroke within the South Yorkshire (UK) • improved long-term provision and effectiveness of rehabilitation • improved self-management, independence, recreation and participation of persons living with the effects of stroke. This presentation is aimed at informing the gerontological research and practice community of the programme's aims and objectives. Method The programme is seeking to utilise a range of methods in order to contribute to an improved evidence base around stroke. • Project 1 seeks to raise stroke awareness through the evaluation of targeted public health interventions. • Project 2 aims to improve access to early treatment, particularly transient ischemic attack (TIA) services. • Project 3 sets out to develop and evaluate an educational intervention centred upon patient and carer self-management. • Project 4 addresses issue of inequality in stroke unit provision through qualitative and action research methods. • Project 5 will evaluate, through the use of an RCT, the effectiveness of a Telecare rehabilitation intervention. • Project 6 will explore issues of participation with stroke patients through interpretive and case study strategies. Results The programme will commence in February 2009. Whilst findings will not be available, the poster presentation will provide a detailed account of the proposed methodology. In addition base line data will be outlined and progress on the establishment of collaborative networks between academic, clinical and third sector communities will be described.

**PB7 172 CATHETER EMBOLECTOMY IN THE TREATMENT OF MASSIVE PULMONARY EMBOLISM: A CASE REPORT.**

J. BODDAERT\* (APHP, UPMC Paris 6, Paris, France)  
M. ROUMIER(1), M. GODARD(1), P. CLUZEL(2), M. BRIHIER(1), M. VERNY(1) - (1) Geriatric department, Pitié-Salpêtrière hospital, APHP, UPMC Paris 6 (Paris, France); (2) Radiologic department, Pitié-Salpêtrière hospital, APHP, UPMC Paris 6 (Paris, France)

Introduction Management of massive pulmonary embolism (PE), defined by an associated cardiogenic shock or hypotension (systolic BP  $<90$  mmHg, and/or a pressure drop  $\geq 40$  mmHg), is particularly difficult in elderly patients, because age and comorbidities are associated with increasing haemorrhagic risk and perioperative complications. Report: An 88-year-old woman, with Alzheimer disease and breast cancer past history, was admitted in geriatric unit for metorrhagia. On the 5th day, outcome was suddenly characterized by a massive pulmonary embolism, with circulatory and respiratory failures (blood pressure 70/40 mmHg). Arterial blood gas analysis revealed hypoxemia of 69 mmHg, hypocapnia of 22 mmHg, pH of 7.39, lactic acid of 7 mmol/l despite 15 l/min oxygen. A pulmonary computed tomography confirmed the diagnosis. Intravenous heparin was immediately started. Embolectomy and thrombolysis were not considered because of associated comorbidities and active genital bleeding. A percutaneous mechanical thrombectomy was performed, using a selective catheterism of the right and left pulmonary trunks with thrombo-aspiration, with a good angiographic result. Patient rapidly improved, allowing circulatory or pulmonary supports to be stopped. After 10 days, patient was addressed to a rehabilitation unit. Discussion: Massive PE is a life-threatening condition with a high early mortality rate (up to 65 % according to some studies) due to acute right ventricular failure and cardiogenic shock. Thrombolysis is potentially life-saving but difficult to use in the elderly because of an increased bleeding risk, such as prior surgery, trauma, or cancer. The American college of Chest Physicians recommends the use of percutaneous mechanical thrombectomy in patients with contraindication for thrombolysis. In our patient, thromboaspiration was preferred to avoid thoracic surgery, and successful for rapidly reversing right ventricular failure. Conclusion Catheterism with thromboaspiration could be a promising tool in management of massive PE in elderly patients with contraindications for thrombolysis and surgical embolectomy.

**PB7 173 EXTENDING CARE TO SENIORS WITH HYPERTENSION THROUGH COMMUNITY PHARMACIES LINKED BY E-HEALTH TO FAMILY PHYSICIANS**

L. CHAMBERS\* (Elisabeth Bruyère Research Institute, Ottawa, Ontario, Canada)  
J. KACZOROWSKI(1), L. DOLOVICH(2), A. MIVILLE(3) - (1) University of British Columbia (Vancouver, Canada); (2) McMaster University (Hamilton, Canada); (3) Elisabeth Bruyère Research Institute (Ottawa, Canada)

**Introduction** The Cardiovascular Health Awareness Program plus Action Plan (CHAP+AP) is an ongoing, community-based cardiovascular disease (CVD) and stroke disease prevention program targeting high risk populations. This study describes program activities and outcomes based on ongoing delivery of the program in 13 communities across Ontario. **Methods** Regular assessment sessions are promoted using community-wide advertising, referrals and/or personalized letters from family physicians to older adult high risk patients. Sessions are delivered with support from pharmacists, community nurses, and local organizations. At the sessions, volunteer peer health educators assist participants in using a BpTRU™ automated device to record blood pressure and other risk factors on a standardized form. With permission from the participant, summary risk profile forms are sent to the participant's family physician and pharmacist. Each participant receives a copy of the assessment, along with risk factor-specific cardiovascular health education materials and a list of local resources. Results In 13 Ontario communities there were 4579 assessments completed in 2008. CHAP+AP is run by a local coordinator and a total of 137 peer health volunteers in 13 communities assist with the program delivery. CHAP+AP sessions took place in 107 pharmacies or other community settings during 2008. Attendees' average age was 68.9 (SD=12.9) years and 62% were female. 26% (99 of 383) of family physicians are currently participating in CHAP in these communities. A community nurse was alerted to a participant with high blood pressure 159 times and 28 participants were recommended to see the pharmacist during the CHAP+AP sessions. Conclusion Hypertension represents a significant primary health care problem, and its under-detection and under-treatment leads to an economic burden in health care expenditures and potential years of life lost. Using e-health CHAP+AP offers a viable, sustainable, community-based, low-cost program by which to potentially reduce the older adult population risk for CVD and stroke.

#### PB7 174 WHAT DECISION CRITERIA FOR ANTITHROMBOTIC TREATMENT OF ATRIAL FIBRILLATION IN THE ELDERLY ?

J. DOUCET\* (Rouen University Hospital, Rouen, France)  
E. GREBOVAL(1), O. DELAUNAY(1), T. PESQUE(2) - (1) Rouen University Hospital (Rouen, France); (2) General Hospital (Dieppe, )

**Introduction:** Oral anticoagulant treatment (OAT) is more efficacy than aspirin to prevent neurologic complications of atrial fibrillation (AF), but the bleeding risk increases with ageing. The aim of this prospective study was to evaluate the parameters of decision for antithrombotic treatment of AF in the elderly. **Methods :** 209 inpatients, 70 or more aged (84.7±7 years, women 60.8%), with a chronic AF needing OAT were included. The patients were distributed into 2 groups (OAT or aspirin) according to medical decision. All the parameters of decision for OAT or aspirin were recorded: underlying cardiopathy, conditions of life, clinical examination, cognitive evaluation (MMSE), walking evaluation, Charlson's score of comorbidity, evaluation of risk of falls and glomerular filtration rate. Then we compared the thrombo-embolic risk and the bleeding risk to the modified Chads' score of thrombo-embolic risk and to the Beyth's score of bleeding risk. **Results :** 102 inpatients (48.8%) received OAT and 107 inpatients received aspirin (ASP). ASP group was significantly older (86.5±6.5 vs 82.9±7.1 years), with more frequent social isolation, higher systolic blood pressure, and it had more important subjective bleeding risk and risk of falls than OAT group. OAT group had more frequent valvulopathies and a more important subjective thrombo-embolic risk. Thrombo-phlebitis antecedents, dementia, denutrition and walking alterations were slightly but not significantly more frequent in ASP group. Physicians significantly under-estimated thrombo-embolic risk in one third of patients and they over-estimated bleeding risk in half patients in both groups. After 3 months, OAT and ASP groups did not significantly differ for deaths, bleeding or ischaemic events. Falls were more frequent in ASP group. Conclusion : In common practice, OAT treatment was prescribed only in half elderly inpatients with AF because it was important to take into account other parameters than cardio-vascular parameters.

#### PB7 175 FLUINDIONE ANTICOAGULATION LEVEL IN VERY ELDERLY INPATIENTS: THE PREPA STUDY

D. BONNET-ZAMPONI\* ( hopital bretonneau APHP; université paris diderot, Paris 75018, France)

**Introduction :** Octogenarians have an increased risk of hemorrhage associated with Vitamin K antagonists (VKA). Fluindione is the most prescribed VKA in France, but very little information is known about the dose-response relationship and the factors influencing it. Our objective was to assess the impact of comedication, comorbidity and initial fluindione dose on International Normalized Ratio (INR) values obtained one week (D8) after starting anticoagulation. **Methods and Materials:** A multicentric prospective observational study was conducted in six care units (geriatrics, internal medicine, cardiology, and cardiac surgery) in two French university hospitals. 80 years who needed VKA≥Participants were

recruited among inpatients for the first time or after a 15-day wash out. The optimal target range for the INR was 2.0 to 3.0 for all participants. Initial and subsequent doses were chosen by physicians without restriction. Comorbidities (especially malnutrition), comedication, initial and subsequent doses of fluindione were recorded until discharge. **Results:** 140 patients were included (mean age 85 years, 66% of female, mean of 8 drugs per day, mean Charlson index 7 (4-14) ), 52 of whom underwent a recent cardiac surgery. The median of first prescribed fluindione doses was 10 mg (min 5 mg-max 20 mg). At D8, only 38% of INR were between 2 and 3, whereas 38% were <2.0 and 24% were >3.0 There was no difference between the initial dose for patients with INR over or under 3 (9.6 mg versus 9.0 mg respectively, NS). Conclusion: Results of the PREPA study in octogenarians with comorbidities and comedication should help clinicians to better manage VKA.

#### PB7 176 AORTA MYCOTIC ANEURYSM DUE TO STREPTOCOCCUS PNEUMONIA : A DIFFICULT DIAGNOSIS WITH AN UNUSUAL PATHOGEN.

S. KRYPCIAK\* (Henri Mondor's Hospital, Créteil, France)  
C. MILLOT(1), E. TAILLANDIER-HÉRICHE(2), P. LESPRIT(3), G. LENCZNER(4), M. KHOLLER(2), E. PAILLAUD(1) - (1) Albert Chenevier's hospital, Dpt. of internal and geriatric medicine (Créteil, France); (2) Henri Mondor's hospital, Dpt. of internal and geriatric medicine (Créteil, France); (3) Henri Mondor's hospital, Infection Control Unit (Créteil, France); (4) Henri Mondor's hospital, Dpt. of Radiology (Créteil, France)

**Introduction:** Infections of major vessels leading to mycotic aneurysms can be a diagnostic dilemma for clinicians and require prompt medical and surgical treatments. **Methods and Materials:** We reported a case of an infrarenal aorta mycotic aneurysm in a 78 years old man due to streptococcus pneumoniae with a review of the literature. **Results :** an elderly man was admitted for falls and weakness. He developed fever during the course of his hospital stay. Blood cultures grew streptococcus pneumoniae. Multiple investigations were performed. The abdomen computed tomography scan revealed finally a large saccular infrarenal aortic aneurysm with an infiltrate of mesenteric fat around the aneurysm. A diagnostic of probable mycotic aneurysm was made and the patient was taken to the operating room for radical resection and reconstruction in one stage. During the surgery, the patient had a hemorrhagic shock, which was treated successfully. The patient was treated for 6 weeks with high-dose penicillin and was discharged to a rehabilitation unit. Streptococcus pneumoniae was reported as a rare causative pathogen. Since 1945, only 58 cases have been documented in literature. In less than half of the cases, the patient's medical history revealed a previous lower respiratory tract infection **Conclusion :** Mycotic aortic aneurysm is a rare and grave infectious disease. Streptococcus pneumoniae was reported as a rare causative pathogen. Mycotic aortic aneurysm may potentially progress to rupture and death unless early diagnosis and appropriate treatment is instituted.

#### PB7 177 IMPLEMENTING GUIDELINES FOR THE USE OF LOW MOLECULAR WEIGHT HEPARIN (LMWH) IMPROVES MEDICAL PRACTICES IN GERIATRICS

L. D'ARAILH\* (Groupe hospitalier sainte péreine, Paris, France)  
F. MULLER(1), D. THOREZ(1), S. VAN PRADELLES(1), L. LECHOWSKI(1), L. TEILLET(1) - (1) hopital Sainte Péreine (paris, France)

**Background.** Prevalence of venous thromboembolic diseases increases with age. A safe prescription of LMWH is necessary because side effects increase with age and inappropriate use. **Methods and materials.** This is an interventional monocentric study conducted on a given day in a Parisian geriatric university hospital. We have constructed guidelines based on selected references in the literature identifying indications, against indications, dosages, duration of treatment and monitoring biological optimal. They were distributed to all physicians in the hospital. Two months after the implementation, we selected patients on a given day receiving LMWH. Using a scale of assessment, we analysed the adequacy requirements of the guidelines. Finally, we compared these data with those from a descriptive study conducted in 2006 in the same center. **Results.** The study population had an average age of 85+- 7 years with 74% women. LMWH prescriptions concern 54 patients (10% of patients in the hospital) for 26% in acute care, for 23% in rehabilitation and for 4% in long term care. Indications were preventive in 80% of cases with 39% medical situations. Dosages were adjusted in 91% of cases (against 55.5% in 2006 - p <0.0001). Biological monitoring was optimal in 54% of cases (against 30.5% in 2006 - p <0.02). Indications were relevant in 85% of cases (against 76% in 2006 - ns). The period of prescription was appropriate in 59% of cases (against 51% in 2006 - ns). Conclusion. The implementation of guidelines for LMWH use by physicians in a geriatric hospital improves quality of care especially for doses and biological monitoring.

#### PB7 178 SPLENIC INFARCT: DIFFERENCES IN PRESENTATIONS IN YOUNG AND ELDERLY PATIENTS.

C. GEFROY\* (Service de Médecine Interne Gériatrique et Neurologie, Pôle Autonomie, Neurologie et Prise en charge, Blois, France)  
E. BEAUFILS(1), S. KORICHI(1), A. AZEBAZE(1), S. LEPAGE(1), P. FRIOCOURT(1) - (1) Service de Médecine Interne Gériatrique, Pôle Autonomie, Neurologie et Prise en charge du vieillissement Centre Hospitalier de Blois (Blois, France)

**Spenic infarct** is an infrequent disease whose presentation may vary in younger and older patients. **Methods and materials:** In an internal medicine unit, a retrospective analysis

found 6 files of patients hospitalized between 1996 and 2008 after diagnosis of splenic infarct. Results: Three patients (group A) were 70 years old or less (47, 53 and 69 years old) and three patients (group B) were over 70 years old (74, 86 and 87 years old) at the time of the diagnosis. The younger patients (group A) suffered mainly of abdominal pain, while the older patients were hospitalized for fever (1 case), weight loss (1 case) or abdominal pain (1 case). Etiology was embolic disease for all the patients in group B, one of them had a history of a heart rhythm disorder (atrial fibrillation) treated by aspirin. In group A, 2 patients had a hematologic disease (thrombocythemia, Evans's syndrome), and no cause was found for the third patient. The CT-scan showed that the three patients of group B had other abdominal embolic infarcts (kidney and liver), while no supplementary infarct was found for patients in group A. Chronic anticoagulation therapy was prescribed for 2 patients in group A and group B, and antithrombotic therapy with aspirin was prescribed for the patient of group A having no identified cause of splenic infarct and for a patient in group B diagnosed with dementia. Conclusion: Splenic infarct may have different presentations in young and older adults, but other studies are required to clarify this.

#### **PB7 179 IMPACT OF TROPONIN I ON LONG TERM MORTALITY AFTER EMERGENCY ORTHOPAEDIC SURGERY IN OLDER PATIENTS**

C. CHONG\* (The University of Melbourne, Victoria, Australia, Epping, Australia)  
Q. LAM(3), J. RYAN(3), R. SINNAPPU(1), W. LIM(2) - (1) Department of Aged Care, The Northern Hospital (Epping, Australia); (2) Northern Clinical Research Centre, Northern Health and Department of Medicine, Austin and Northern Health, The University of Melbourne, Victoria, Australia (Epping, Australia); (3) Department of Biochemistry, The Northern Hospital (3076, Australia)

Objectives: To determine the association between post-operative troponin rises and longer term (2 year) mortality after emergency orthopaedic surgery in patients over 60. It has previously been found that troponin I is a prognostic marker for mortality and cardiac events at 1 year in this patient population. Methods: In 2006, 102 patients were recruited prospectively and had troponin I measurements during their in-patient stay (one pre-operative sample and three post-operative days) for emergency orthopaedic surgery. These patients were followed up by telephone call annually to determine if they had survived and whether there were any cardiac events sustained. Cardiac event was defined as myocardial infarction, congestive cardiac failure, atrial fibrillation or major arrhythmia. Results: At two years, 29.4% (30/102) of patients had died. Twenty-five patients (25/54 or 49.3%) with a troponin rise were dead at two years, compared with five patients without a troponin rise (5/48 or 10.4%) which was significantly different  $p<0.0001$ . Patients with a higher troponin level ( $>0.1\text{mcg/L}$ ) were more likely to be dead at 2 years compared with those with lower level troponins or no troponin rise. However, when adjusted for other comorbidities the association between troponin elevation and death at 2 years did not persist. Using multivariate analysis, only one factor, sustaining an in-hospital cardiac event, was associated with 2 year all-cause mortality OR 6.4 (95% CI 1.8-22.2,  $p=0.003$ ). Furthermore, patients who sustained a symptomatic troponin rise ( $p<0.0001$ ) or asymptomatic troponin rise ( $p=0.004$ ) were more likely to have died at 2 years compared with those with no rise. Three factors were significantly associated with a cardiac event during the second year: post-operative troponin rise OR 2.7 (95% CI 1.0-6.8,  $p=0.043$ ), pre-morbid atrial fibrillation OR 5.6 (95% CI 1.5-21.0,  $p=0.011$ ) and post-operative renal failure OR 12.3 (95% CI 3.1-48.6,  $p<0.001$ ). Conclusion: Elevated post-operative troponin levels are predictive of one year but not two year mortality in older patients undergoing emergency orthopaedic surgery.

#### **PB7 180 THE ELDERLY AT RISK IN HOSPITAL?**

P. LAKHAN\* (The University of Queensland, Brisbane, Australia)  
L. GRAY(1) - (1) Academic Unit of Geriatric Medicine, The University of Queensland (Woolloongabba, Brisbane, Australia)

Introduction Hospitalisation can be associated with negative outcomes for the older person. This paper reports finding of research into development and validation of screening tools to assess for risk of two negative outcomes of hospitalisation: requiring a higher level of care at discharge and decline in ability to perform activities of daily living at discharge in patients aged  $\geq 70$  years admitted to acute general medical hospital units. Method A prospective cohort study of 413 patients, aged  $\geq 70$  years and consecutively admitted to an acute care metropolitan 700-bed teaching hospital was conducted. Assessments for presence of predictive factors in the pre-morbid period and during hospitalisation for risk of negative outcomes were conducted. Patients were randomly allocated to a development and validation cohort. Results Risk factors associated with the first outcome, identified from the development cohort were: 'use of community services prior to admission'; 'short term memory problems', 'dependence in toilet use' and 'dependence in hygiene'. A screening tool developed to assess patients at lower and higher risk had a sensitivity, specificity, positive predicted value (PPV) and negative predictive value (NPV) of 77.27%, 73.66%, 36.56% and 94.29% respectively. Validation of this tool in 91 patients found a sensitivity, specificity, PPV and NPV of 60%, 76.32%, 33.33% and 90.63% respectively. Risk factors associated with the second outcome in the development cohort included 'history of falling', 'no interest in things enjoyed normally', 'dependence in management of finances' and 'hearing problems'. The tool had sensitivity, specificity, PPV and NPV of 74.55%, 69.13%, 36.6% and 92% respectively. In the validation sample, sensitivity, specificity, PPV, NPV were 45%, 65.79%, 25.7% and 82%. Conclusion Scientifically

tested screening tools are useful for identifying older patients at risk of negative outcomes in hospital. The tools developed in this research need further validation larger diverse settings.

#### **PB7 181 ASSOCIATION OF PULSE WAVE TRAVELTIME WITH AGE AND ARTERIAL HYPERTENSION**

A. KUZNETSOV\* (Institute of Internal Medicine SB RAMS, Novosibirsk, Russian Federation)  
I. LAPITSKAYA(1), L. LATYNCEVA(1), T. KRUPA(1), K. MAKARENKOVA(1), Y. NIKITIN(1) - (1) Institute of Internal Medicine SB RAMS (Novosibirsk, Russian Federation)

Introduction It is known that arterial rigidity increases with age. Simultaneously the frequency of arterial hypertension also grows in elderly. Estimation of association of arterial rigidity with age depending on presence or absences of arterial hypertension is a study of interest. Methods and materials 56 dispensary patients (11 men and 45 women) were examined after exception of coronary heart disease, cardiac insufficiency, stroke, peripheral arteries diseases, diabetes, other diseases in severe or acute stage, serious arrhythmia, disturbances of intraventricular conduction. Dyasis Integra (NOVACOR) device used to register diurnal changes of blood pressure, Pulse rate, ECG and patient's body position with automatic calculation of QKD interval. Results 19 (min 24, max 89), $\pm$ The average age of the examined patients was 68.14, diastolic BP $\pm$ 12 kg, systolic BP 119 $\pm$ 9 cm, body weight 72 $\pm$ height 165.18 ms, $\pm$ 11 bpm, average daily interval QKD was 192 $\pm$ 10, Pulse 73 $\pm$ 77 Arterial hypertension was registered in 10 (18%) patients. Patients were divided into 2 groups by age: 1st group less than 65 years old (32 patients), 2nd group over 65 years old (24 patients). Data analyzed in multivariant general linear model (GLM) with simultaneous control of such variables as gender, height, body weight, pulse rate and a presence of arterial hypertension, revealed that the only relevant and independent of the above factors, including arterial hypertension, determinant of the QKD index was the age over 65 years ( $p=0.005$ ; adjusted means of QKD interval in the two age groups were 28 ms respectively), $\pm$ 26 and 178 $\pm$ 196 Conclusion The findings are demonstrating that age is a relevant determinant of arterial rigidity independently of arterial hypertension.

#### **PB7 182 STUDY OF THE QUALITY OF LIFE IN HYPERTENSION ADULTS AND ELTERS, WHO SUBMITTED A PHARMACOLOGICAL TREATMENT.**

F. ARBEX\* (Universidade Estadual de Campinas, Campinas, Brazil)  
M. GUARINTO, E. ALMEIDA

Knowing the impact of arterial hypertension (AH) in the elder's life constitutes a challenge nowadays. After the diagnosis, the elderly people experience changes in their quality of life (QoL). This study intends to evaluate the QoL of elderly with AH submitted to pharmacological treatment. It's a descriptive research with a convenience sample of elderly men and women excluding those with cognitive impairment and / or AH complications. It was used a sociodemographic questionnaire, the modified Baecke questionnaire for elders and a QoL questionnaire for patients with AH. The data was evaluated with the qui-square test and logistic regression. We evaluated 156 patients, and found 85 (54.58%) with 60 years old or more and 75.64% were female. The odds ratio showed significance for the physical activity related to the elderly group. Those with lower score in the physical activity showed 11.2% (100 – 88.8) lesser probability of being included in the better QoL group. Those with controlled AH presented 3 times more probability of being included in the better QoL group. Considering the age criteria, the adults presented 7.5 times more probability of being included inclusion in the better QoL group. Associated chronic diseases and use of medicines didn't show any significant difference. Therefore, we concluded that adults and elders with AH presented significant difference in matter of QoL requesting a specific consideration in matter of treatment.

#### **PB7 183 ACCURACY OF THE 3-OUNCE WATER SWALLOW TEST IN AN ACUTE GERIATRIC WARD TO ASSESS ASPIRATION RISK**

M. LE CRANE\* (Sainte Perine APHP, Paris, France)  
B. DENIS(1), L. LECHOWSKI(1), S. VON PRADELLES(1), L. D'ARAILH(1), D. TORTRAT(1), L. TEILLET(1) - (1) Sainte perine APHP (PARIS, France)

Introduction: Aspiration pneumonia is a frequent and a serious problem for elderly, with high mortality. Little is known about accuracy of tests to predict aspiration episodes or aspiration pneumonia. The aim of the study was to determine accuracy of the 3-ounce water swallow test (3-oz test) in all patients of an acute geriatric ward to predict aspiration or pneumonia. Method: It was a prospective study in a French 19-bed acute geriatric ward, including 159 consecutive inpatients (mean age=87.9 $\pm$ 5.3 years, women 69%, mean length of stay 12.5 days). Prevalences of main diseases were 61% for dementia, 34% for delirium, 15% for congestive heart failure and 7% for stroke. The 3-oz test was performed on admission by trained geriatricians. Cough or postswallow wet-hoarse vocal quality defined a positive test. Aspiration episode was defined as accidental inhalation of oropharyngeal content assessed by a nurse. A total of 24 pneumonia including 10 aspiration pneumonia, were diagnosed by a geriatrician on the basis of clinical, biological and radiographical data. Results: The 3-oz test was available in nearly all patients (155/159) and was positive in 28 patients. Sensibility of the 3-oz test for predicting an aspiration episode was equal to

60%, specificity was equal to 89%. Sensibility and specificity of the 3-oz test for predicting all pneumonia, including aspiration pneumonia, were respectively 46% and 87%. Sensibility and specificity for predicting aspiration pneumonia were respectively 50% and 84%. Delirium was more prevalent in the positive 3-oz test group than in the negative group (57% vs 29%, p<0.005). Conclusion: The 3-oz test, easy to carry out in this acute geriatric ward, was useful to detect patients with high risk of aspiration, and of pneumonia, with aspiration mechanism or not. Preventive strategy should be conduct as early as possible in such patients to reduce the risk of aspiration.

**PB7 184 BENEFIT OF ORAL ANTICOAGULATION THERAPY FOR VERY ELDERLY PATIENTS WITH ATRIAL FIBRILLATION**

G. ORVOEN\* (Hôpital BROCA, PARIS, France)  
S. SHAHKARAMI(1), D. SEMANI(2), J. AL ALOUCY(3), F. LABOUREE(1),  
F. ROLLOT(1), Y. SPIVAC(1), D. DUBAIL(1), M. SEUX(1), O. HANON(1) - (1)  
Hôpital BROCA (Paris, France); (2) Hôpital Paul Doumer (Liancourt, France); (3) Hôpital  
de la Pitié Salpêtrière (Paris, France)

**Background:** Several studies have demonstrated the benefit of oral anticoagulant therapy (OAT) in prevention of stroke, but few have included very old patients. **Methods:** We performed a retrospective study including 347 patients with atrial fibrillation (AF), aged 80 years and older, hospitalized in Geriatrics department between 2004 and 2007. The analysis compared mortality, stroke and bleeding events at discharge, according to the oral anticoagulant therapy or not. The follow up was conducted by phone interview with physicians, patients themselves or their families. The primary aim was to evaluate the benefit of OAT on mortality in very old patients with AF, after a hospitalisation in Geriatrics department. **Results:** The mean age in this population was 87±6 years, 63% of women, including 39% of patients with dementia. During index-admission, a significant increase of use of oral anticoagulants from 30% to 42% was observed. In multivariate analysis, the determinants of oral anticoagulation prescription were: younger age (p=0.006), new diagnosis of AF (p=0.003), low dependency (p=0.02), lack of fall (p=0.03), and heart failure (p=0.04). After a mean follow-up of 1.7 years, mortality was observed in 45% of cases (156/347), stroke in 6%, and bleeding events in 7%. The results indicate that oral anticoagulants were associated with significant reduction of mortality (38% with OAT vs 50% without OAT, p=0.02). Moreover a significant reduction of stroke were observed (2% vs 9%, p=0.008). Inversely, a significant increase of bleeding events was reported with anticoagulant agents (11% vs 4.5%, p=0.03). Nevertheless the severe cerebral bleeding remained low (0.6%) and similar in both groups (0.7% vs 0.5%, p=0.81). **Conclusion:** Our results emphasize that oral anticoagulants are associated with a significant decrease of mortality and stroke in AF subjects over 80 years.

**PB7 185 ASSESSMENT OF BLEEDING RISK FACTORS IN VERY ELDERLY PATIENTS USING ANTICOAGULANT THERAPY.**

A. PERRIN\* (Hôpital Broca, Paris, France)  
F. ROLLOT(1), F. CHEDHOMME(1), E. DURON(1), G. ORVOEN(1), O. HANON(1) -  
(1) HOPITAL BROCA (Paris, France)

**Introduction:** Several scales evaluate bleeding risk in patients using anticoagulant therapy, but none had been validated in very old patients. Our objective was to validate the HEMORRHAGES score in patients aged ≥ 75 years hospitalized in a geriatric department. **Methods and Materials:** Retrospective study on patients aged of 75 and more years-old, hospitalized in a geriatric department (acute care, rehabilitation and long-term care) in 2007, treated with anticoagulants. Hemorrhagic events during hospitalization and their severity were listed for each patient. Clinical and biological bleeding risk determinants were searched and the HEMORRHAGES score was calculated (prior bleed, hepatic or renal disease, ethanol abuse, malignancy, age > 75 years, thrombocytopenia, uncontrolled hypertension, anemia, genetic factors, excessive fall risk and history of stroke). **Results:** In this population of 251 patients aged of 86 years-old on average (75 to 103 years), including 76% of women, 40 hemorrhagic events occurred (prevalence: 16%). Sixteen were considered as severe (death, cerebral haemorrhage or blood transfusion) (prevalence: 6%), one of them was fatal (0.4%). The HEMORRHAGES score was significantly associated with bleeding (5.8 vs 4.7, p<0.0001) and severe bleeding (6.1 vs 4.8, p<0.001). A score ≥ 5 is associated with an increased bleeding risk of, OR : 3.42, IC 1.53-7.64. In multivariate analysis, thrombocytopenia (OR=8.84, IC=2.62-19.8) and prior bleed (OR=1.99 ; IC=1.34-2.95) appeared to be the two main determinants of the bleeding risk. On the contrary, factors usually mentioned by practitioners not to anticoagulate the old patients such as advanced age, cognitive disorders, prior falls or comorbidities (Charlson score), were not significantly associated with bleeding. **Conclusion:** The results suggest that the HEMORRHAGES score can be used in patients ≥ 75 years hospitalized in geriatric department for screening bleeding risk. Thrombocytopenia and prior bleed are the two main independent determinants of the bleeding risk.

**PB7 186 HOME SELF BLOOD PRESSURE MEASUREMENT IN A SAMPLE OF ELDERLY PARTICIPANTS OF A POPULATION-BASED COHORT**

C. TZOURIO\* (Inserm U708, Paris, France)  
C. DUFOUIL(1), O. HANON(2) - (1) Inserm U708 (Paris, France); (2) Hôpital Broca  
(Paris, France)

**Introduction :** There has been to date few studies on the comparison between BP office measurement and home self blood pressure measurement in elderly individuals from the general population. **Design and population :** Sample of a population-based cohort study, the 3C study in Dijon. Recruitment was based on electoral rolls in 1999-2000 and participants were then followed-up every two years. Participation rate to the study on self blood pressure measurement was 87.5%. Blood pressure was measured at the study centre by investigators who also trained participants on how to use the device (OMRON M6) and to make the reports. Participants were then asked to measure their BP at home during the next couple of weeks after their visit to the study centre. They were instructed to have 3 measures in the morning and 3 in the evening during 3 days. **Results :** Overall, 1746 patients participated in the study. They were 72 yrs of age and older, 21% being older than 82, and about 40% were men. Mean SBP was 147 mmHg and mean DBP was 77 mmHg. Prevalence of hypertension (SBP≥140 or DBP≥90) was 66%. Prevalence of masked hypertension was estimated to be about 10% and associated with age, and white coat hypertension was about 19% and higher in women. During the presentation details on the comparison between office measurement and home measurement will be given. **Conclusion :** In this large sample of elderly people drawn from the general population, we found that acceptability and feasibility of home self blood pressure measurement was high after a minimal training and that the prevalence of white coat hypertension was 19% and the prevalence of masked hypertension was 10%.

**PB7 187 THROMBOPHILIC DEFECTS FACTOR V LEIDEN AND PROTHROMBIN GENE VARIANT IN PATIENTS OVER 75 YEARS WITH VENOUS THROMBOSIS**

H. ANARD-MICHELOT\* (Hôpital Charles foix (AP-HP), Ivry sur seine, France)  
E. PAUTAS(1), I. GOUPIN-THIBAULT(2), S. BÉRIGAUD(1), V. SIGURET(2) -  
(1) hôpital Charles Foix (AP-HP) (ivry sur seine, France); (2) Inserm U765 université Paris Descartes (paris, France)

**Introduction:** The importance of acquired thrombophilic conditions in the elderly is well known. However, few data are available regarding genetic risk factors for venous thrombosis in this setting. In the present study, we assessed the prevalence of Factor V Leiden 1691G>A and 20210G>A prothrombin (FII) gene variant in patients over 75 years who presented with unprovoked recurrent venous thromboembolic disease or venous thrombosis at unusual site. **Methods and materials:** over a 8-year period, we retrospectively analysed data from patients who were referred to us for laboratory diagnosis of Factor V Leiden and 20210G>A FII gene variant. The physicians fulfilled a questionnaire evaluating the risk factors for venous thrombosis. Patients were eligible i/ if they were Caucasians older than 75 years; ii/ if they have had two or more episodes of unprovoked confirmed venous thromboembolic disease or if they have presented with venous thrombosis at an unusual site. Patients were excluded if one or more clinical acquired risk factors for thrombosis were present. Results 107 patients, mean aged 87 ± 6 years were included: 14 patients (13%) and 9 patients (8.4%) were heterozygous carriers of the factor V Leiden and of the 20210G>A FII mutation, respectively. One patient was a double heterozygote. None was homozygous. Overall, 22 patients (20.5%) were carriers of at least one genetic thrombophilic defect. **Conclusion:** even though patients were highly selected in the present study, the prevalence of hereditary thrombophilic defects was much lower than in younger cohorts with recurrent unprovoked venous thrombosis or thrombosis at unusual site. These results confirm the relative high importance of environmental risk factors for venous thrombosis compared to the minor role of genetic ones in the elderly as compared to younger patients.

**PB7 188 ELASTIC AGEING IN THE CARDIOVASCULAR SYSTEM**

O. FRITZE\* (University Hospital Tübingen, Tübingen, Germany)  
M. SCHLEICHER(1), B. ROMERO RUIZ DE LA HERMOSA(2), J. BUJAN(2),  
M. JACOB(3), B. STARCHER(4), K. SCHENKE-LAYLAND (5), U. STOCK(1) -  
(1) Dept. Thoracic and Cardiovascular Surgery, University Hospital Tübingen (Tübingen, Germany); (2) Faculty of Medicine, University of Alcalá de Henares (Madrid, Spain); (3) INSERM, Hôpital Bichat, Université Paris 7 (Paris, France); (4) University of Texas Health Center at Tyler (Texas, United States of America); (5) Cardiovascular Research Laboratory, University of California (United States of America)

**Introduction:** Ageing is accompanied by a variety of cardiovascular diseases. Most involve tissue disorganization associated with loss of tissue elasticity resulting in decreased vascular function. Objective of this study is to gain further insights into the pathology of cardiovascular diseases by understanding the complex mechanism of elastic tissue production and turn over in human aortic blood vessels. **Material and Methods:** 180 human aortic punches from 118 adult patients (88 male) undergoing coronary artery bypass grafting (40 to 86 years) were measured. Overall extracellular matrix (ECM) architecture was examined by multiphoton laser scanning microscopy (LSM) and histology. The content of desmosine, a cross-link specific to elastin was measured radiometrically. mRNA levels of tropoelastin were determined by quantitative reverse transcriptase real-time PCR (qRT-PCR). The remodelling of extracellular matrix (ECM) was quantified by ELISA for matrix metalloproteinases 2 and 9 (MMPs) and tissue inhibitors of MMPs (TIMPs) 1 and 2. Samples were classified by age as well as diabetic and non-diabetic co-morbidity. **Results:** Age related destruction of the vascular elastic laminae as well as a loss of interlamina cross links was observed by multiphoton LSM. These results were confirmed by

histology where age related formations of inter-lamina gaps were observed as well as pathological alterations in the vessel structure. There were neither significant differences in terms of desmosine content nor in matrix turnover components. A decrease of elastin mRNA of approximately 50 % every 10 years of ageing (A: 100%, B: 45%, C: 26%) was observed. Diabetes had no impact on elastogenesis. Conclusion: These findings indicate that ageing is accompanied by a destruction of the elastic vascular structure. As a compensation tropoelastin is expressed throughout the life. However expression levels decrease constantly. Further studies using younger tissue samples will help to elude elastic tissue maturation and earlier ECM ageing.

**PB7 189 CARDIOVASCULAR RISK FACTORS AND COMPREHENSIVE GERIATRIC ASSESSMENT: INFLUENCE ON MORTALITY IN NONAGENARIAN PATIENTS**

C. ROQUETA\* (Servicio de Geriatría del IMAS. Instituto de Atención Geriátrica Sociosanitaria (IAGS). Centro Fórum, Alella, Spain)  
M. ALVARO(1), M. MARTÍNEZ(1), K. PUENTE DE LA VEGA(2), A. CERVERA(1), R. MIRALLES(1) - (1) Servicio de Geriatría del IMAS. Instituto de Atención Geriátrica Sociosanitaria (IAGS). Centro Fórum. Hospital de la Esperanza. Hospital del Mar. (Barcelona, Spain); (2) Medicina de Familia y Comunitaria (Barcelona, Spain)

Objective: To assess the relationship between cardiovascular risk factors, the parameters of comprehensive geriatric assessment and mortality in nonagenarian patients admitted to an intermediate care unit from an acute care hospital. Patients and methods: A two years retrospective study of all patients aged over 90 years was performed. Cardiovascular risk factors such as high blood pressure, diabetes and dyslipemia were registered from all patients' charts history. Previous functional status (Lawton Index), functional status at the moment of hospital admission (Barthel index), cognitive function (Mini-Mental State Examination of Folstein (MMSE)) and nutritional status (serum albumin levels) were also registered. Results: The sample is composed by 81 nonagenarian patients (62 women); mean age  $92.1 \pm 2.1$  years. The nine patients who have died during hospitalization (11.1%) had  $0.6 \pm 1.6$  in Lawton Index;  $19.0 \pm 18.6$  in Barthel index at admission;  $2.7 \pm 5.5$  in MMSE and  $2.6 \pm 0.5$  in serum albumin levels. The rest of the sample had  $2.6 \pm 2.8$  ( $p=0.04$ );  $27.8 \pm 17.9$  ( $p=0.16$ );  $19.5 \pm 6.1$  ( $p<0.001$ ) and  $3.0 \pm 0.4$  ( $p=0.019$ ), respectively. Hypertension was present in 5 of the 9 patients who died (55.6%) and in 42 of the 72 patients who were also alive (58.3%) ( $\chi^2=0.0253$ ;  $p=0.87$ ). Diabetes was present in 1 (11.1%) and in 13 (18.1%) ( $\chi^2=0.2699$ ;  $p=0.60$ ), and dyslipemia in 2 (22.2 %) and in 15 (20.8 %) respectively ( $\chi^2=0.0093$ ;  $p=0.92$ ). Conclusions: Functional, cognitive and nutritional status had been significantly related to mortality in the present study, but not cardiovascular risk factors. Barthel index at admission was not related to mortality, probably because of the recent acute illness.

**PB7 190 DELIRIUM IN ELDERLY PATIENTS TREATED AT HOME: A PROSPECTIVE STUDY**

G. ISAIA\* (Department of Medical and Surgical Disciplines, Geriatric Section, University of Torino, Torino, Ita, Torino, Italy)  
M. ASTENGO(1), V. TIBALDI(1), M. ZANOCCHI(1), B. BARDELLI(1), R. OBIALERO(1), A. TIZZANI(1), M. BO(1), C. MOIRAGHI(1), M. MOLASCHI(1), N. AIMONINO(1) - (1) Department of Medical and Surgical Disciplines, Geriatric Section, University of Torino, Torino, Italy (Torino, Italy)

Introduction: Delirium usually occurs during hospitalization. Aims of this study are to evaluate the incidence of delirium in hospital at home compared to traditional hospital ward and to assess mortality, hospital readmissions and institutional rates at 6-month follow-up in elderly patients with intermediate/high risk for delirium at baseline according to the criteria of Inouye. Methods and materials: We performed a prospective, non randomized, observational study with 6-month follow-up on 144 subjects aged 75 and older consecutively admitted to the hospital for an acute illness and followed in a Geriatric Hospital Ward (GHW) or in a Geriatric Home Hospitalization Service (GHHS). Baseline socio-demographic information, clinical data, functional, cognitive, nutritional status, mood, quality of life, caregiver's stress scores were collected. Results: Of 144 participants, 14 (9.7%) had delirium during hospitalization: 4 were treated by the GHHS and 10 by a GHW. Incidence of delirium was 16.6% in GHW and 4.7% in GHHS. All delirious patients were very old, with a high risk for delirium at baseline in 60%, according to the criteria of Inouye. In GHW the onset of delirium occurred significantly earlier and the mean duration of the episode was significantly longer. The severity of delirium tended to be higher in GHW compared to GHHS. At 6-month follow-up mortality was significantly higher among patients who suffered from an episode of delirium (42.9% versus 9.6%,  $p<.001$ ). Moreover, they showed a trend to a greater institutionalization rate. Conclusion: GHHS may represent a protective environment for delirium onset in acutely ill elderly patients.

**PB7 191 LONG-TERM USE OF PSYCHOTROPIC DRUGS IN COMMUNITY-DWELLING ELDERLY PERSONS – PREVALENCE AND PREDICTORS**

M. RIKALA\* (University of Kuopio, Kuopio, Finland)

S. HARTIKAINEN(2), R. SULKAVA (3), M. KORHONEN(3) - (2) Research Centre of Geriatric Care (Kuopio, Finland); (3) The School of Public Health and Clinical Nutrition (Kuopio, Finland)

**Background** In the elderly, use of psychotropic drugs is associated with serious adverse events, and therefore long-term use should generally be avoided. The present study aimed at assessing the prevalence and predictors of long-term psychotropic drug use in community-dwelling persons aged 75+. **Material and methods** The study is based on data from the GeMS study of a random sample of 1000 persons aged 75+ and living in Kuopio, Finland. The baseline interview was conducted in 2004, and follow-up interviews in 2005, 2006, and 2007. Baseline characteristics predicting long-term psychotropic use among 700 home-dwelling participants were identified using Cox proportional hazards regression. **Results** At baseline, 38 % (n=268) of the participants used at least one psychotropic drug. Of them, 60% (n=162) reported use at all follow-up interviews, while every fifth (22%, n=59) discontinued use during the study period. Multivariable analysis revealed that advanced age (HR for withdrawal 0.93 95% CI 0.86-0.99), use of at least two psychotropic drugs (HR 0.28 95% CI 0.11-0.75) and regular pattern of use (HR 0.49 95% CI 0.28-0.88) were predictors of long-term psychotropic use. On the other hand, living alone (HR 1.89 95% CI 1.01-3.60), and limitation in independent mobility (HR 2.12 95% CI 1.08-4.16) were associated with doubling of the likelihood of withdrawing from use. **Conclusions** The long-term use of psychotropics is common in community-dwelling elderly persons. However, patient characteristics seem to be only weakly associated with the long-term use; therefore, future studies need to include additional factors such as physician and health system characteristics.

**PB7 192 HOSPITAL CARE COSTS IN A CHILEAN ELDERLY DELIRIUM COHORT.**

M. CARRASCO\* (Pontificia Universidad Católica de Chile, Santiago , Chile)  
M. GONZÁLEZ(1), C. PALMA(1), L. VILLARROEL(1), J. CALDERÓN(1), G. MARTÍNEZ(2), P. MARÍN(1) - (1) Pontificia Universidad Católica de Chile (Santiago, Chile); (2) Hospital Antofagasta (Chile)

**Introduction:** delirium is one of the most common complications of ill older people, and considered a major burden to health care services. The objective of this study was to assess if delirium is associated to higher care costs during hospital stay in elderly medical patients. **Methods:** Data was obtained from a previous cohort study of consecutive patients 65 years and older admitted to a medical ward of a university affiliated hospital during 2006. A psychogeriatric team assessed patients during the first 48 hrs of admission, using Confusion Assessment Method (CAM), Barthel index, Charlson Comorbidity index and Acute Physiology and Chronic Health Evaluation II (APACHE II). Medical revaluation with CAM was performed every 48 hrs until discharge. Patients were included in delirium cohort if any CAM was positive during evaluation. Demographic data, length of stay (LOS), LOS in ICU or intermediate care units was recorded. Total cost of hospitalization was calculated including all laboratory and exams, pharmacy and medical care. **Results:** 542 inpatients were enrolled, data for cost analysis was obtained from 457 patients, and 34.4% of them developed delirium during hospitalization. The delirium cohort had a significantly longer LOS compared with non delirium cohort (mean (SD) 8.5 days (7.0) versus 5.4 (3.8)  $p<0.001$ ) and longer days in ICU or intermediate care units (mean (SD) 1.6 days (3.1) versus 0.6 (1.4)  $p<0.001$ ). Delirium cohort also had a higher total cost per day of hospitalization (mean (SD) US dollars 558.1 (513.1) versus 495.7 (555.5)  $p<0.001$ ). **Conclusions:** This study revealed a significant association between delirium and higher LOS, higher utilization of ICU/intermediate care units and higher total daily costs. These results emphasize the need to address this prevalent and costly problem.

**PB7 193 SOCIOECONOMIC PROFILE AND DEPRESSIVE SYMPTOMS AMONG OLDER ADULTS LIVING IN THE COMMUNITY**

A. MARTINS GRATÃO\* (Universidade de São Paulo, Ribeirão Preto, Brazil)  
C. MACHADO DE SOUZA(1), I. ROSSET CRUZ(1), V. JOSÉ HAAS(1), R. PARTEZANI RODRIGUES(1) - (1) Universidade de São Paulo (Ribeirão Preto, Brazil)

**INTRODUCTION:** the fast increase of the elderly population is worldly known, especially in developing countries, and it has consequences for society and individuals. Depression is considered the most frequent mental problem and it significantly affects negatively quality of life of elderly people. **OBJECTIVE:** to identify and relate demographic and socioeconomic profile and health problems to depressive symptoms in older adults. **METHODOLOGY:** cross-sectional, epidemiological study. Interviews were held with elderly people aged 65 years or older, living in the urban area in Ribeirão Preto, SP. The addresses were enrolled from a random draw of the census sectors and its squares. Data were collected using a questionnaire containing: identification; socioeconomic profile and Geriatric Scale Depression (GDS), shorter version, validated in Brazil. Double entry of data was performed using EXCEL and the analyses were carried out in SPSS (Statistical Package for the Social Sciences) for windows. **RESULTS:** In total, 515 older adults were interviewed, and prevalence of depression was 21,2% for the total sample. The variables that contributed the most for depression were: female sex, living alone, low educational level, low income, being older-elderly and having disabling morbidities. **CONCLUSION:** The prevalence of depression in elderly people in the studied sample was higher than many

national and international studies. Primary care health professionals should use assessment protocols in treatment.

**PB7 194 LEISURE TIME PHYSICAL ACTIVITY AND DEPRESSIVE SYMPTOMS**

I. PAKKALA\* (University of Jyväskylä, Jyväskylä, Finland)

S. READ(2), J. KAPRIO(3), M. KOSKENVUO(3), M. KAUPPINEN(1), T. RANTANEN(1) - (1) University of Jyväskylä (Finland); (2) London School of Hygiene and Tropical Medicine (United Kingdom); (3) University of Helsinki (Finland)

**Introduction:** The beneficial effects of physical activity on psychological well-being have been shown in earlier studies. However, the association between physical activity and mental health could also be explained by a third underlying variable, such as common genetic or environmental factors that predispose to a sedentary lifestyle as well as poor mental health. The purpose of this study was to examine if leisure time physical activity and depressive symptoms share a common genetic or common environmental factors. **Methods and materials:** This study is a part of the Finnish Twin Cohort. Data were available from two occasions: years 1981 (leisure time physical activity) and 1990 (depressive symptoms). We analyzed the leisure time physical activity in metabolic equivalent units (MET index) and depressive symptoms using the Beck Depression Inventory. The total numbers of twins analyzed were 1579 monozygotic (MZ) and 3515 dizygotic (DZ) males, 2081 MZ and 4046 DZ females. The mean (SD, range) age of this sample in the year 1990 was 43.9 (7.7, range 33-60) years. Quantitative genetic modeling was used for data analyses, with age as a covariate. **Results:** The phenotypic correlation between leisure time physical activity and depressive symptoms was small, but significant ( $r=-0.1$ ,  $p<.01$ ). In the leisure time physical activity additive genetic effects accounted for 35 % and in the depressive symptoms for 37 % of the total variance. The remaining variance was due to non-shared environmental effects. In the bivariate Cholesky decomposition model common genetic or environmental factors between these two traits were not found. **Conclusions:** Leisure time physical activity and depressive symptoms are both modestly heritable traits. However, in this study population, they don't share genetic or environmental factors. Further analysis is required to study potential mediating factors between physical activity and depressive symptoms.

**PB7 195 UNTERTREATMENT OF DEPRESSIVE SYMPTOMATOLOGY IN THE ELDERLY LIVING IN LONG STAY INSTITUTIONS AND IN THE COMMUNITY**

A. DORNELAS DE ANDRADE\* (Universidade Federal de Pernambuco, Jaboatão dos Guararapes, Brazil)

P. MARINHO(1), K. MELO(1), A. APOLINARIO(1), E. BEZERRA(1), J. FREITAS(1), D. MAGALHAES(1), R. GUERRA(2) - (1) Departamento de Fisioterapia - Universidade Federal de Pernambuco (Recife, Brazil); (2) Departamento de Fisioterapia- Universidade Federal do Rio Grande do Norte (Natal, Brazil)

The aim of the present study was to assess the presence of depressive symptomatology among elderly residents in long-stay institutions (LSI) and in the community of Recife, Brazil. In total, 81 long-stay elderly patients (mean age of  $75.55 \pm 9.18$  years) and 132 elderly (mean age of  $73.14 \pm 8.27$  years) individuals from the community were evaluated. Depressive symptomatology was assessed by the Geriatric Depression Scale (GDS-15), cognitive status by the Mini Mental State Examination (MMSE) and capacity to perform the activities of daily living (ADL) by the Katz Index. Comorbidities and the use of medication were recorded. The LSI elderly exhibited more depressive symptoms ( $p < 0.001$ ) and more dependency ( $p < 0.001$ ). We observed no differences in MMSE ( $p = 0.058$ ). The elderly in the community displayed more comorbidities and the LSI elderly consumed more medication ( $p < 0.001$  and  $p < 0.001$ , respectively). According to multivariate analysis (logistic regression), being male, having no spouse and having a low schooling level are risk factors for depressive symptoms. In conclusion, most elderly with depressive symptoms received no medication for depression.

**PB7 196 DESCRIPTIVE STUDY ON PSYCHIATRIC PATHOLOGY IN ELDERLY MEDICAL PATIENTS ADMITTED IN A GENERAL HOSPITAL**

L. PINTOR\* (Hospital Clinic Barcelona, Barcelona, Spain)

C. MONTIEL(1), E. BAILLES(1), S. MATRAI(1), A. BASTIDAS(1) - (1) Hospital Universitari Clinic Barcelona (Barcelona, Spain)

**INTRODUCTION** More than 60% of the beds of a general hospital are occupied by elderly people. It is known that psychiatric pathology has a negative impact on the prognosis of medical illnesses. However, we are lacking studies describing psychiatric pathology in elderly patients admitted in a general hospital due to complex medical pathology. **METHODS** The sample included 1119 patients aged over 65 years, referred to the Consultation-Liaison Psychiatry Unit of the Hospital Clinic of Barcelona from January 2005 to December 2008. A structured clinical interview was performed for DSM-IV Axis I diagnoses. Sociodemographic and clinical data were also collected. Data was loaded into a Microsoft Access Database and analysed using SPSS. **RESULTS** The characteristics of the 1119 patients were: mean age 75.7 years (ranging from 66 to 98); 50.5% were women; 47.1% had psychiatric history; 44.1% had physical disability. Main reason for referral (diagnosis established by physicians before psychiatric assessment) was depression (31.4%) followed by delirium (22.9%). Main diagnosis established by psychiatric assessment was delirium (30.9 %) followed by depressive adjustment disorder (10.9%) and depressive disorder (10.1%); 3.2% attempted suicide, and 4.7% had no psychiatric pathology. Drug treatment was prescribed in 76.5% of the patients: neuroleptics in 38.7%; antidepressants in 26.9%; and benzodiazepines in 6.1%. **CONCLUSIONS** Elderly patients referred to our Unit are a particularly complex group with severe medical pathology, high rates of psychiatric pathology and physical disability. In concordance with previous studies, delirium is often misdiagnosed as depression. Neuroleptics are the most frequently used drug treatments, followed by antidepressants. Benzodiazepines are hardly prescribed.

**PB7 197 IMPACT OF DEPRESSION AND COGNITIVE DEFICIT ON QUALITY OF LIFE OF ELDERLY PEOPLE WHO LIVE IN THE COMMUNITY**

R. PARTEZANI RODRIGUES\* (University of São Paulo, Ribeirão Preto, Brazil)

C. PERONI FREITAS(1), C. MACHADO DE SOUZA(1), L. DA SILVA TALMELLI(1), I. ROSSETI CRUZ(1), E. PEDRAZZI(1), F. VEIGA SCHIAVETO(1) - (1) University of São Paulo (Ribeirão Preto, São Paulo, Brazil)

**Introduction:** In a comprehensive assessment of elderly people, depression and cognitive deficit can strongly affect quality of life of this population. The present study aims to identify and relate demographic and socioeconomic profiles, depressive symptoms and cognitive deficit to quality of life of elderly people who live in the community. **Methods and Material:** A cross-sectional study was carried out, with sample of 515 older adults resident in Ribeirão Preto, São Paulo, Brazil. Data were collected through interviews held at their homes, using a questionnaire with demographic data, cognitive deficit according to the Mini Mental State Examination (MMSE), depression according to the Geriatric Scale Depression (GDS) and the WHOQOL-OLD. The last instrument was divided in six facets: sensory abilities; autonomy; past, current and future activities; social participation; death and dying; intimacy. Statistical analysis involved comparison of averages between groups and correlation measures among the variables of interest. **Results:** Most participants were women (66.6%) and widows (86.3 %), 55.5% had studied from one to four years; from those, 25% lived with partner and 19.2% in two or three-generation households. The increase in age imperils quality of life, and the sensory abilities ( $r=-0.127$ ;  $p=0.004$ ) facet was the most endangered. WHOQOL-OLD scores were higher for all facets when living with partner, the only facet which was not statistically significant was autonomy ( $p=0.69$ ). Presenting cognitive deficit implies in reduction of quality of life, and the facets social participation and autonomy presented statistically significant differences ( $p<0.001$ ). Older adults considered depressed, according to GDS, presented lower scores of quality of life in all facets of WHOQOL-OLD ( $p<0.001$ ). **Conclusion:** the presence of cognitive deficit, depression and lack of a partner affected the quality of life of older adults.

**PB7 198 PREVALENCE OF DEPRESSIVE SYMPTOMS AND ASSOCIATED FACTORS IN ELDERLY INSTITUTIONALIZED INDIVIDUALS**

I. CUNHA\* (Centro Universitário de Belo Horizonte, Belo Horizonte, Brazil)

M. TAÍS ALMEIDA(1) - (1) Centro Universitário de Belo Horizonte (Belo Horizonte, Brazil)

**INTRODUCTION/OBJETIVE:** to determine the prevalence of depressive symptoms among elderly individuals living in philanthropic nursing-homes of long stay (NHLS), in Belo Horizonte City, Brazil. **STUDY DESIGN:** no-experimental, descriptive and transversal study. **METHODS AND MATERIALS:** nine NHLS were randomly selected and a sample of 83 elderly individuals fulfilled the inclusion and exclusion criteria of the study. Demographics, clinical data and activity level were obtained by questionnaires. Cognitive integrity was evaluated by the MiniMental State Examination (MEEM). Presence of depressive symptoms was identified by the Geriatric Depression Scale (GDS) and by the Cornell Scale for depression in dementia. Functional capacity was assessed by incapacity dimension of Health Assessment Questionnaire (HAQ). **RESULTS:** the prevalence of depressive symptoms was 69.6%. The univariate analysis demonstrated that feminine gender and lack of participation in physical activity were independently associated to the presence of depressive symptoms ( $p\leq 0.05$ ). **CONCLUSION:** depressive symptoms are

highly prevalent among elderly individuals living in NHLS, and lack of physical activity is strongly associated with these symptoms. The results of this study grant the fostering of physical activity to elderly individuals living in NHLS.

**PB7 199 USE OF TISSUE PULSATILITY IMAGING (TPI) FOR CHARACTERIZING LATE LIFE DEPRESSION: A PILOT STUDY**

T. DESMIDT\* (Centre Hospitalier Universitaire de Tours, Tours, France)  
M. ELKATEB(2), J. REMENIÉRAS(2), F. PATAT(1), V. CAMUS(1) - (1) Centre Hospitalier Régional Universitaire de Tours (Tours, France); (2) UMR INSERM U-930 & CNRS FRE 2448 (Tours, France)

Rational: Late Life depression (LLD) is a very common geriatric condition. There are growing evidences that depression in the elderly is associated with cerebrovascular abnormalities. Recent advances in dynamic elastography techniques allowing characterizing the visco-elasticity of biological tissues have now made possible new developments in ultrasound techniques such as the Tissue Pulsatility Imaging (TPI). The main physical principle of TPI is to mechanically stimulate the tissue or use its natural movement while realizing an echographic sequence, and by correlation techniques of signal treatment, to estimate the displacement, velocity, strain or strain velocity of the biological tissue. In this pilot study, we used TPI to compare the Brain Tissue Pulsatility (BTP) of depressed and non depressed diabetic patients. Methods: 17 diabetics, non-cognitively impaired (MMSE > 25) and elderly subjects (50 years and older) were recruited and diagnosed as depressed (n=9) or non-depressed (n=8) according to the DSM-IV criteria for major depressive disorder and to a MADRS score higher than 15. Each subject underwent a clinical examination, cardiovascular risk factors assessment, neuropsychological testing (including executive functions), ultrasound protocol with measurement of Intima-media thickness (IMT) and TPI. Results: BTP was significantly decreased ( $p<0.015$ ) in depressed diabetic subjects (57,32 $\mu$ m ; SD=14.47) compared to non-depressed diabetic subjects (82,69 $\mu$ m ; SD=23.63). BTP was strongly correlated to the statin intake ( $p<0.000$ ). No significant difference was found concerning IMT. Discussion: this pilot study is the first to test TPI in clinical conditions including depressive patients older than fifty. Decreased BTP in depressive patients supports the involvement of specific cerebrovascular disorders in the pathophysiology of depression. We argue specific brain endothelial dysfunction caused by high blood level of cortisol is a key biological mechanism to explain reduced brain pulsatility in depression. Further and larger clinical and biological studies are needed to complete this hypothesis.

**PB7 200 INCIDENCE OF PSYCHIATRIC MORBIDITY IN SPOUSES OF DEMENTED PATIENTS, A NATURALISTIC COHORT STUDY WITH 6 YEARS FOLLOW-UP**

K. JOLING\* (VU University Medical Centre/ EMGO Institute, Amsterdam, The Netherlands)  
H. VAN HOUT(1), F. SCHELLEVIS(1), H. VAN DER HORST(1), P. SCHELTENS(2), H. VAN MARWIJK(1) - (1) VU University Medical Centre/Institute for Research in Extramural Medicine (Amsterdam, The Netherlands); (2) Alzheimer Centre VU University Medical Center (Amsterdam, The Netherlands)

Introduction: Family caregiving for dementia persons has been associated with increased levels of depressive symptoms and a higher prevalence of clinical depression and anxiety. However, only very few studies reported on the incidence of depression in caregivers. In this study we examined the incidence of depression and anxiety between spouses of dementia patients and matched controls. Methods: In a prospective cohort study during 2001 and 2007 data from 218 spouses of demented patients and 353 matched controls were analyzed. Data were extracted from 71 general practices in the Netherlands. Main outcome measures were incidence rates (per 1000 person years) of depression, anxiety, and psychosocial problems, prescription rates of antidepressants. Results: the incidence rate of depression was 17.0 for spouses of dementia patients and 4.2 for matched controls. The hazard ratio showed that spouses were 4 times more likely to get a depressive episode than controls. Incidence rates per 1000 person-years for anxiety were respectively 12.3 and 8.9 for spouses and controls. We did not find a higher risk for spouses to develop anxiety feelings or disorders than for matched controls. Conclusion: persons caring for their demented spouse have a higher risk to develop depression compared with persons who do not take care of a demented spouse. This higher risk was not found for anxiety. The absolute risk of depression and anxiety among caregivers was lower than expected.

**PB7 201 THE INFLUENCE OF ADMINISTERING METHOD ON DEPRESSION SCORES OF THE 15-ITEM GERIATRIC DEPRESSION SCALE IN OLD AGE.**

M. DE WAAL\* (Leiden University Medical Center, Leiden, The Netherlands)  
G. VAN DER WEELE(1), R. VAN DER MAST(1), J. GUSSEKLOO(1) - (1) Leiden University Medical Center (Leiden, The Netherlands)

Introduction. The Geriatric Depression rating Scale (GDS-15) is used frequently to screen for depressive symptoms among elderly. However, various studies used different administering methods and influence of the chosen method on depression scores is unclear. We studied the influence of administering method on the depression scores of the GDS-15 among persons aged 75 years and older in general practice. Methods. In two general

practices 276 elderly were asked to participate. Exclusion criteria were dementia and current treatment for depression. The GDS-15 was administered twice within one month: self-administered by mail, and interviewer-administered during home visits. The order of administering methods was different for both practices. Differences in item scores and total depression scores were analysed. Missing items were interpreted as 'not depressed'. Additionally, elderly (n=93) were asked to comment on changes in GDS-scores to get some understanding of discrepancies. Results. A total of 155 elderly participated (response rate 56%). Low cognitive functioning (MMSE < 25 points) was found in 12%. Many elderly (22.6%) left items unanswered when GDS-15 was self-administered: 2.5% left five or more items unanswered. There were no items unanswered when GDS-15 was interviewer-administered. Total depression scores were 0.74 points higher (CI 95% = 0.45-1.02) when self-administered than interviewer-administered. This difference was independent of order of administration. Some items were far more often scored positive when self-administered than interviewer-administered. Item-item comparison showed fair agreement (kappa range 0.21-0.53). Four items even showed poor agreement (kappa's < 0.21). Elderly mentioned different interpretation of questions (e.g. time frame), situation improvement, mood swings, inability to score nuances and rating by proxy as reasons for discrepancies. Conclusion. Total depression scores were higher when self-administered than interview-administered. This was independent of the order of administration. The method of administration should be taken into account when comparing studies or choosing a cut-off point.

**PB7 202 PREVALENCE AND CORRELATES OF DEPRESSIVE SYMPTOMS AMONG THE ELDERLY IN BRAZIL: THE SABE COMMUNITY STUDY**

C. MENDES-CHILOFF\* (BOTUCATU MEDICAL -SCHOOL - SÃO PAULO STATE UNIVERSITY-UNESP, BOTUCATU, Brazil)  
S. JAIR LÍCIO FERREIRA(2), T. ALBINA RODRIGUES(1), L. MARIA CRISTINA PEREIRA(1), L. MARIA LÚCIA(2), F. ANTÔNIA REGINA FERREIRA(2), D. YEDA A. DE OLIVEIRA(2), R. ANA TERESA DE ABREU(1) - (1) BOTUCATU MEDICAL SCHOOL - SÃO PAULO STATE UNIVERSITY - UNESP (BOTUCATU, Brazil); (2) SÃO PAULO UNIVERSITY (SÃO PAULO, Brazil)

INTRODUCTION: Depression is the most frequent mental disorder among the elderly worldwide; it is frequently associated with physical diseases and brings considerable burden to family members. This study aimed to estimate the current prevalence of depressive symptoms and associated factors among the elderly living in São Paulo city, the biggest Brazilian city, with approximately 10% of its 11 million inhabitants aged 60 years or more. METHODS AND MATERIALS: In 2006, 930 elderly were evaluated using the Geriatric Depression Scale-15, the Family APgar, and the same research protocol used in 2000 (first phase of the SABE Study, a population based survey to evaluate the determinants of health and well-being among the elderly). The results were analyzed by means of Relative Risk Ratios (RRR), obtained by fitting a multinomial logistic regression of depressive symptoms to independent variables: sex, age, ethnicity, educational level, income, satisfaction with income, family functioning and self-reported chronic diseases. RESULTS: The prevalence of depressive symptoms was 11.8% (mild: 8.9%; severe: 2.9%). The multivariate analysis indicated independent higher risk of mild depression for females (RRR= 2.5;  $p<0.001$ ), for those who considered their income insufficient (RRR=1.8;  $p< 0.02$ ) and for those living in highly dysfunctional families (RRR=2.93;  $p<0.02$ ). The risk was lower for those in the second quartile of income when compared to those in the first (RRR=0.49;  $p<0.03$ ) and for those not reporting chronic obstructive pulmonary disease (RRR=0.48;  $p<0.05$ ). Individuals living in highly dysfunctional families had an eight times higher risk of severe depression (RRR=8.11;  $p<0.001$ ). CONCLUSION: Depressive symptoms were frequent and independently associated with female gender, lower income, chronic pulmonary illness and dysfunctional families. Considering that these conditions are quite common in Brazil, social and public health policies must be promoted in order to minimize their negative effects on the rapid growing elderly population and on their families.

**PB7 203 THE USE OF PALLIATIVE SEDATION FOR ELDERLY PATIENTS NEARING DEATH**

J. RIETJENS\* (Erasmus MC, Rotterdam , The Netherlands)  
J. VAN DELDEN (2), B. ONWUTEAKA-PHILIPSEN(3), H. BUITING(1), P. VAN DER MAAS(1), A. VAN DER HEIDE(1) - (1) Erasmus MC (Rotterdam, The Netherlands); (2) University Medical Center Utrecht (Utrecht, The Netherlands); (3) VU University Medical Center (Amsterdam, The Netherlands)

Introduction: Palliative sedation concerns the use of sedating medications to relieve severe suffering of terminally ill patients. Its use is often heavily debated, due to its potential life-shortening effect when it is used without the administration of artificial nutrition/hydration. Little is known about whether it is used in similar frequencies and characteristics for elderly compared to younger patients. Methods: In the Netherlands in 2005, we mailed questionnaires to physicians attending deaths identified from death certificates. We studied non-sudden deaths in adult patients (n=3783). Response rate: 78%. Results: With increasing age, palliative sedation was less often used: in 18% of all deaths of patients aged 17-64 yrs, 14% for 65-79 yrs, and 9% for 80+;  $p=0.00$ . In 80% of the patients aged 80 or older, sedation was used without the administration of artificial nutrition/hydration, compared to 60% in younger patients. The proportion of the use of palliative sedation for

cancer patients decreased with increasing age: 19% of all patients with cancer aged 17-64 yrs, down to 14% for patients older than 80 years. When controlling for sex, cause and place of death, a significant effect of age on the use of palliative sedation remained: compared to the age-group 17-64 yrs, patients aged 65-79 yrs had an odds of 0.83 (0.66-1.04) to receive palliative sedation prior to death and patients aged 80 or older an odds of 0.62 (0.47-0.82). Conclusions: Physicians less often use palliative sedation for elderly patients, especially for those aged 80 years or older. It deserves further study whether elderly patients have less suffering that may necessitate palliative sedation, or whether there is a poorer recognition of suffering at the end of life of very old patients.

**PB7 204 THE COMMITTEE FOR PATIENTS UNDER TREATMENT FOR SEVERE BRAIN DAMAGE: ETHICAL SUPPORT IN THE MANAGEMENT OF THESE PATIENTS.**

P. FRIOCOURT\* (Centre Hospitalier de Blois, Blois, France)  
F. GAUQUELIN(1), F. KAZEMI(1), S. LEPAGE(1), N. GOBEZ(1), E. BEAUFILS(1), E. COIGNEAU(1) - (1) Centre Hospitalier de Blois (Blois, France)

Management of victims of severe brain damage is delicate, particularly in determining the programming of care. The choice must be made between high intensity technical care, and care tailored to the wills of the patient, or according to common sense, following recognized ethical rules. In 2006, we created a commission for reflection and support in decision making. We now report the results of the first 2 years of its activity. Method: the committee is composed of permanent members, physicians of various specialties (internal medicine, geriatrics, neurology, gastroenterology, palliative care) and with part-time members, who may be doctors or not (part of the medical team in charge of the patient), physicians in units of geriatric care and social workers. It intervenes at the request of a medical team. Its proposals are always written in the medical file of the patient in a document which indicates the history, the various options of care and the elements in the choice made. Results: 34 files were discussed: 16 women, 18 men, average age  $65 \pm 20$  years, resulting from 12 units (mainly intensive care 14, geriatric medicine-neurology 9, other geriatric services 4). The committee usually sits 3 days after the seizure. The average numbers of participation are: physicians  $5.1 \pm 1.2$ ; nurses  $2.5 \pm 1.1$ ; and social workers  $1.5 \pm 1$ . The pathologies were varied, mainly stroke (16 cases) and brain traumatism (4 cases). We never find living will or confidential persons appointment. The committee postponed its decision 5 times. It validated advice for end of life care 10 times, an invasive act (percutaneous endoscopic gastrostomy, tracheotomy) 9 times and rejected an invasive act in 8 cases. Conclusion: the committees support for patients diagnosed with severe brain damage seems valuable for the medical teams and the families.

**PB7 205 SPECIFIC ETHICAL ISSUES IN GERIATRIC PALLIATIVE CARE : STUDY OF INTERNATIONAL LITERATURE**

N. CHAOUI\* (Hôpital - université, Rennes, France)  
C. NATHALIE(1), D. CAROLINE(2), D. PATRICK(3) - (1) Hôpital (Auch, France); (2) université (Rennes, France); (3) hôpital (Auch, France)

Geriatric palliative care represents a challenge – an organizational, ethical, demographic and economic challenge - for years to come. The objective of the present study was to isolate the presence of specific ethical issues in gerontological palliative care. Methods and Materials The study consisted in examining international scientific literature devoted to this theme for the past twenty years. General works and articles (La Revue du Praticien, Site de la SFAP, La Revue du Généraliste et de la Gérontologie, Le Quotidien du Médecin, Gérontologie et Société, The New England Journal of Medicine) as well as articles from international and national specialized magazines (InfoKara, La Revue de Gériatrie, Jalmav, Médecine Palliative, La Revue Francophone de Gériatrie et de Gérontologie, American Geriatrics Society, Journal of Palliative Care, Palliative Medicine, European Journal of Palliative Care) went through critical reading. Results Common agreement in this literature indicates that the predominance of communication cognitive disorders - insanity in particular -, the presence of a polypharmacy and the strong dependency of older people, delay the decision for palliative care and worsen the risk of negligence or treatment abandonment. Absence of care demand, disability to express an opinion, restricted mobility to get to doctors' offices, mostly elderly family or friend circles as well as the aphorism of closeness to death among elderly subjects are all aggravating risk factors. Conclusion Those specificities and increased risks account for the palliative practices with older patients to imply an ethical attention based on a precise methodology. Nonetheless, this ethics requires first of all to ask about the place of old age in societies and the cares we intend to allow as far as it is concerned. The geriatric ethics also implies the training of medical workers practising in this particular field and in any unit

**PB7 206 DISCLOSING BAD NEWS TO PATIENTS WITH SEVERE / LIFE-THREATENING ILLNESSES – DIFFERENCES IN THE ATTITUDE BETWEEN PHYSICIANS AND NURSES IN ISRAEL**

D. GARFINKEL\* (SHOHAM GERIATRIC MEDICAL CENTER, PARDES HANA, Israel)  
I. SHAHAR(1), M. BEN NATAN(2) - (1) Shoham Geriatric Medical Center (Pardes Hana, Israel); (2) Pat Matthews Academic School of Nursing, Hillel Yaffe Medical Center (Hadera, Israel)

Scant attention has been paid to the decision making process of caregivers in disclosing bad news to patients. The purpose of this study was to describe factors influencing this process and to understand whether physicians and nurses behave differently, based on Ajzen and Fishbein's Theory of Reasoned Action. In this correlational quantitative research, using a convenience sample, a validated anonymous questionnaire was administered to 100 physicians and 200 nurses employed in several Israeli hospitals. The results indicate that only around 30% of physicians always disclosed bad news in the past, and that future decisions would be made on an individual basis. In contrast, a much greater proportion (over 76%) of nurses said that they would disclose bad news to their patients. Caregivers find it difficult to disclose terminal status information to all types of patients, although mostly find it relatively easier in the case of the elderly. The Theory of Reasoned Action may help predict disclosure of bad news by physicians and nurses. Behavioral beliefs, subjective attitudes and prior clinical experience with disclosure of bad news, represent the main factors influencing caregivers' disclosure. The main predictors among nurses are behavioral beliefs and prior experience, and among physicians - subjective norms and prior experience.

**PB7 207 GERIATRIC HOME HOSPICE: THE NEED OF OUR TIMES**

A. JAKRZEWSKA SAWIŃSKA\* (The Association of Palliative Care Volunteers in Wielkopolska , Poznan, Poland)  
K. SAWIŃSKI(1), M. FORYCKA(1) - (1) The Association of Palliative Care Volunteers in Wielkopolska (Poznan, Poland)

The majority of medical centers still lack the recognition of specificity of needs and ailments of senior citizens. In the last 10 years Geriatric Hospice in Poznań has taken care of ..... patients aged 65 and more. On the basis of our experience we have concluded that due to multitude of diseases and usually limited access to social services elderly people require specialized care. Our observations indicate that a large number of patients include individuals suffering from protracted diseases which cannot be the subject of causal treatment. Therefore, we have made an attempt to create an efficient system of palliative and hospice care. The task itself creates a huge challenge for our team since it requires knowledge and experience of such issues as occurrence of multiple illnesses, possibility of polipragnosia, high risk of drug interaction and likelihood of unpredictable side effects. Elder care requires the pragmatic treatment of many severe ailments such as pain, nausea, vomiting, urinary and fecal incontinence, dysphagia, anxiety state, dementia, bedsores. The treatment of pain is one of the most crucial issues in this context. We have noticed that in case of elderly people the pain is not soothed sufficiently in comparison with the patients of young and middle age. Our experience shows that the elder care requires caretakers not only to apply adequate procedures towards certain ailments but also to be flexible and focused on constant measuring the intensity of symptoms and effects of pharmacotherapy. Therefore, the hospice care of elderly requires specialized knowledge of geriatric medicine and psychogeriatry. Our experience indicates that offering holistic home care to our patients we provide them with professional care adequate for their needs in their private surroundings. The net result of the development of geriatric palliative care is possibility of dignified aging available for all people.

**PB7 208 AGE-BASED DISPARITIES IN MEDICAL END-OF-LIFE PRACTICES IN BELGIUM**

S. GORLÉ\* (Vrije Universiteit Brussel, Jette, Belgium)  
J. RIETJENS(1), R. DESCHEPPER(1), R. PASMAN(2), J. BILSEN(1), L. DELIENS(1) - (1) End-of-life Care Research, Vrije Universiteit Brussel (Jette, Belgium); (2) Department of Public and Occupational Health and the EMGO Institute for Health and Care Research, VU Medical Center, Amsterdam (Amsterdam, The Netherlands)

Introduction Medical end-of-life practices, defined as practices with a potential or certain life-shortening effect (non-treatment decisions, intensified alleviation of symptoms, euthanasia), are an important aspect of end-of-life care. Elderly patients have a different epidemiology of diseases and may have different attitudes towards health and healthcare, potentially resulting in differences in end-of-life decision-making. This study investigates possible age-based disparities and disentangles the relationship between age and medical end-of-life practices. Methods A sample was selected from all deaths in Belgium in 2007 and a questionnaire was mailed to the certifying physicians. We focus on adults and non-sudden deaths ( $N=2703$ ). Results The response rate was 58%. With increasing age, patients received less often euthanasia (8.2% for 18-64 yrs; 6.5% 65-84 yrs; 2.8% 85+;  $p=.0007$ ) and less often intensified alleviation of symptoms (46.3% for 18-64 yrs; 39.0% 65-84 yrs; 36.3% 85+;  $p =.0000$ ). There was a slight increase in the frequency of non-treatment decisions with increasing age. The effect of age on the incidence of intensified alleviation of symptoms ( $OR=0.985$ ,  $CI=.976-.995$ ) and non-treatment decisions ( $OR=1.018$ ,  $CI=1.004-1.032$ ) remained after controlling for confounding variables such as gender, education, marital status, place and cause of death. The covariance between age and the incidence of euthanasia could be explained by other confounders ( $OR=.998$ ,  $CI=.982-1.015$ ). Conclusion The observed differences in the incidences of end-of-life practices between younger and elderly patients in Belgium can only partly be explained by different

patterns in their cause of death. The potential risk of suboptimal end-of-life care for the elderly remains a concern for the medical practice and policymakers.

**PB7 209 END OF LIFE FOR INSTITUTIONALIZED ELDERLY PERSONS : EVALUATION OF THE TERMINAL PHASE CARE IN LONG-TERM CARE UNITS**  
A. LAHLOU\* (AP-HP Hôpital Charles Foix , Ivry sur Seine, France)  
M. MARZAIS(1), J. BEINIS(1), S. IKHEFOULMA(1), A. DE SAINT LEGER(1),  
Y. GAUDIN(1), L. KEROMNES(1), C. PETIT(1), P. GAUTHIER(1), A. AZEMARD(1),  
P. TOCHEPORT(1) - (1) AP-HP Hôpital Ch. Foix (Ivry sur Seine, France)

Introduction : As part of our ongoing evaluation of our professional practice, we have conducted an audit of terminal phase care in the long-term care units of our hospital. Methods and resources : We set up a multidisciplinary workgroup that reviewed the recommendations on palliative care published by ANAES in 2002. We reviewed patient records in order to identify those who died in 2008 and who were known to be in the terminal phase of their illness before death and requiring palliative care. From this group, 30 were randomly selected. Each set of records (both paper based and computerized records) was then reviewed in comparison with the audit criteria by one of the 6 teams each team was made up of a paramedic and a doctor. This was done in the presence of the project manager. Results : The multidisciplinary meeting decisions have been recorded in 50% of the files. In a large number of cases (19/28), the records reflected a specific mention that the patient was approaching the end of their life. In 7/30 cases, our Palliative Care Mobile Team provided assistance to the usual medical and nursing team in the care of the patients involved. The administration of analgesics of the 3rd category was frequent (21/30). Supporting close relatives of the dying patient was usually not discussed in the record only (6/28). The therapeutic or diagnostic interruption aimed at avoiding an unreasonable curative care was referred to in 17/30 of the cases. The medical and nursing teams tended to be poor at completing entire pain evaluation scores (11/30), in some cases did not consider pain management at all (9/21), and delivered poor mouth care (11/30). In addition, the respiratory symptoms of the agonizing phase are seldom anticipated (4/30 for polypnea, 13/

**PB7 210 CPR IN ELDERLY HOSPITALISED PATIENTS; ARE WE ACTING IN THEIR BEST INTERESTS?**  
M. MAC MAHON\* (University Hospitals Bristol, Bristol, United Kingdom)  
S. WHITE(1), A. PERSAUD(1), R. FACKRELL(1) - (1) University Hospitals Bristol (Bristol, United Kingdom)

Introduction: Delivering cardiopulmonary resuscitation (CPR) services places enormous pressure on hospital staff and their resources. Many healthcare systems will automatically provide this treatment for all inpatients unless senior medical staff have documented an advance directive stating that CPR is inappropriate. The recently updated UK Resuscitation Council guidelines (2007) advised healthcare staff to consider the burden of CPR as well as the benefits whilst acting in the patients best interests and recent published data have shown that certain comorbidities are associated with poor outcome. Materials and Methods: We reviewed the casenotes of 55 inpatients in a University hospital for whom the CPR team was called during two separate intervals in 2008 and 2009 respectively. Our objectives were to assess the survival rate and to document the clinical features and comorbidity of these patients in order to ascertain their prior likelihood of survival after CPR. Results; CPR was performed in 49 patients, 61% male. Overall survival, 2%. 90% >65yrs and 40% >80 yrs. Documented cardiac rhythms; pulseless electrical activity 53%, asystole 33% and ventricular fibrillation 12%. Monitored beds were used in 20%. Listed disabilities and comorbidities included prior dependency on carer support in 71%, chronic kidney disease level ≥3 in 38%, COPD 26%, cancer diagnosis 24% and left ventricular moderate/severe impairment in 18% respectively. Conclusions; Survival rate was extremely low. The majority of patients were elderly and a significant proportion had comorbidities which have previously been shown to be associated with poor outcome. In order to act in the patients best interests we need to consider a more rigorous approach in deciding which patients are suitable for CPR so as to permit improved care planning for those in the final stages of life.

**PB7 211 WHICH PALLIATIVE CARE OUTCOME MEASURES ARE SUITABLE FOR USE IN RESIDENTIAL AGED CARE FACILITIES?**  
D. PARKER\* (University of Queensland, Brisbane, Australia)  
B. HODGKINSON(2) - (2) Blue Care (Brisbane, Australia)

This poster will report on the results of a Joanna Briggs Institute systematic review conducted to assess the psychometric properties (reliability/validity) and feasibility of palliative outcome measures used to assess the quality of palliative care provided in residential aged care facilities. Articles were obtained from searching Medline, Cinahl, EMBASE, Psych Info, Psych Articles, DARE, Cochrane Reviews, TRIP and hand searching key palliative and aged journals published between 1/1/2000 and 1/9/2008. A total of 424 articles were identified of which 14 were included in the final review. These 14 articles discussed the psychometric properties of ten outcome measures. This poster

compares these ten outcome measures and provides recommendation for use of these in measures for clinical practice and research.

**PB7 212 ARTIFICIAL NUTRITION OR HYDRATION FOR ADVANCED DEMENTIA PATIENTS. PERSPECTIVES FROM DUTCH AND AUSTRALIAN DOCTORS**  
H. BUITING\* (Erasmus MC, Rotterdam, The Netherlands)  
P. BUTOW(2), J. CLAYTON(2), J. VAN DELDEN(3), A. VAN DER HEIDE(1) - (1) Erasmus MC (Rotterdam, The Netherlands); (2) University of Sydney (Sydney, Australia); (3) University Medical Center Utrecht (Utrecht, The Netherlands)

Background It is sometimes difficult to decide about the use of artificial nutrition or hydration (ANH) for patients suffering from advanced dementia. A study in 6 European countries showed that forgoing ANH in patients nearing death is a substantial practice that, however, significantly varies between countries. Medical practitioners may thus have different ideas about the appropriateness of making decisions about ANH. We explored how Dutch and Australian doctors decide about the use of ANH for advanced dementia patients. Methods and materials We performed semi-structured interviews with 15 Dutch and 15 Australian doctors. Interviews were transcribed, coded and analysed using constant comparative analysis. Results Both Dutch and Australian doctors are hesitant to provide ANH for patients with advanced dementia, which is a progressive deteriorating disease. However, they are willing to provide ANH for a short period of time as (1) temporary treatment to overcome an acute illness, as (2) a trial of recovery potential and / or (3) to keep other persons, such as the patient's relatives, comfortable. Most Dutch doctors speak openly about withholding and withdrawing ANH as an end-of-life decision; withdrawing ANH seems harder for them than withholding it. For Australian doctors, the difference between the two seems less relevant: they frequently do not recognize forgoing ANH as explicitly refraining from potentially life-prolonging treatment. Conclusion Dutch and Australian doctors to a great extent use similar considerations when administering ANH to patients with advanced dementia. Their decisions are largely based on medical grounds, but other factors, such as the comfort of relatives, play a role as well. Discussions about forgoing ANH seem to be more culturally determined. Open discussion may contribute to transparent and rational decision making.

**PB7 213 A PILOT STUDY OF A COMMUNITY BASED YOGA INTERVENTION AMONG THE ELDERLY AND ITS EFFECTS – A QUALITATIVE STUDY**  
N. PATEL\* (University of Texas Health Science Center San Antonio, Texas, USA, San Antonio, , United States)  
S. AKKIHEBBALU(1) - (1) Kaveri Natya Yoga (San Antonio, United States of America)

Scientific evidence indicates that physical activity can extend years of active independent life, reduce disability, and improve the quality of life for older persons. Yoga is an alternative to high impact aerobic exercises that can be strenuous on the body and discouraging to the elderly. Yoga may benefit the elderly by increasing longevity; increasing cognitive and perceptual flexibility; increasing behavioral flexibility; improving mental health and sense of well-being; prevention of osteoporosis; increasing strength and improving balance and gait; and reducing falls. Also, yoga activities can be varied to suit individual needs, and the benefits of yoga may be derived from even brief periods of activity. Therefore, any elder could participate and each would benefit. Although many benefits are described, research and scientific evidence of yoga are lacking. Objectives: To identify and explore the short- and long-term outcomes of a yoga intervention Methods: Cross sectional study - yoga intervention in a senior retirement community. Pre-post intervention qualitative assessment by focus groups and key informant interviews. Group classes conducted weekly. Residents of the community, both male and female age 65 – 89 years voluntarily participated. Intervention tailored to individual functional level. 60 minutes sessions included stretching, flexibility, endurance and balance, and relaxation. Effects were evaluated at, baseline, 3 months, and 1 year. Results: Demographic measures. Other outcomes measured based on themes identified by focus group discussions and key informant interviews. Participants reported improvements in gait and stability, decreased pain, decreased falls, improved self esteem, decreased medications, improved sleep, at one year participants felt peaceful and "connected with self." Conclusion: - Intervention appealing and available to the elderly. Can be tailored to suit individual needs, may serve as a viable alternative to more strenuous physical activities. This study formed the basis for designing intervention with objective measures and stronger study design

**PB7 214 CARDIAC AUTONOMIC MODULATION DURING ISOMETRIC EXERCISE DOES NOT CHANGE AFTER ECCENTRIC STRENGTH TRAINING.**  
A. TAKAHASHI\* (Universidade Federal de São Carlos, São Carlos, Brazil)  
R. MELO(1), R. QUITÉRIO(2), E. SILVA(3), E. TOBALDINI(4), A. PORTA(4),  
N. MONTANNO(4), A. CATAI(1) - (1) Universidade Federal de São Carlos (São Carlos, Brazil); (2) UNESP (Marilia, Brazil); (3) Universidade Metodista de Piracicaba (13565905, Brazil); (4) Università degli Studi di Milano (Milano, Italy)

Introduction: Isometric exercise is an autonomic test that allows studying interactions between the musculoskeletal and cardiovascular systems and can be useful to evaluate strength training. The effect of eccentric strength training (ET) on the cardiac autonomic

modulation is not clear. Methods and materials: Training group (TG) (9 men, 62±2 years) was submitted to ET (12 weeks, 2 days/week, 2-4 sets of 8-12 repetitions at 75-80% peak torque (PT) involving knee flexion and extension). Control group (CG) (8 men, 64±4 years) did not perform the ET. The cardiac autonomic modulation was evaluated by two symbolic indexes. The 0V% and 2UV% reflect changes in sympathetic and vagal modulations, respectively. Symbolic analysis was carried out over heart period variability series (around 200 cardiac beats) derived from ECG recordings during isometric contraction of knee extension muscle (15% of maximal voluntary contraction). The unpaired and paired t-test was used in the statistical analysis. Results: ET caused an increase on the eccentric PT only for TG (TG: 210±38 to 253±61 N.m and 118±25 to 133±27; CG: 203±33 to 215±40 N.m and 126±20 to 135±26 extensor and flexor, respectively). Isometric torque did not change for both groups (TG: 178±25 to 195±32 N.m; CG 172±27 to 176±26 N.m). The 0V% and 2UV% did not change in both groups (TG: 20±15 to 24±12 and 18±10 to 17±7, 0V% and 2V% respectively; CG: 23±10 to 17±9 and 15±5 to 19±7, 0V% and 2V% respectively). Conclusions: ET has improved only the eccentric force which can be explained by the specificity of training. The symbolic analysis has indicated that ET does not modify the cardiac autonomic control during the isometric exercise.

**PB7 215 CAN MEDICATION REVIEW USING THE DRUG BURDEN INDEX IMPROVE FUNCTION IN OLDER AUSTRALIANS LIVING IN RETIREMENT VILLAGES?**

D. GNJIDIC\* (University of Sydney, Faculty of Medicine, Sydney, Australia)  
S. HILMER(1), D. LE COUTEUR(1), D. ABERNETHY(2) - (1) The University of Sydney, Faculty of Medicine (Sydney, Australia); (2) United States Pharmacopeia (Washington DC, United States of America)

Introduction: The Drug Burden Index (DBI) uses the principles of dose-response and maximal effect to estimate an individual's exposure to anticholinergic and sedative medications. The association between higher DBI and impaired function has been validated in two populations of older people in the USA, and in a population of older Australian men. This study aims to assess the impact of information about DBI on prescribing in older people, and the association between change in DBI and function over 3 months. Methods: Study population includes older people living in self-care retirement villages, Sydney, Australia. Participants are randomised into intervention and control groups. The intervention involves a letter and phone call to General Practitioners, using DBI to prompt them to consider cessation or dose reduction of anticholinergic and sedative medications. Objective functional outcomes include the Short Physical Performance Battery (SPPB), maximum score 12. Results: To date, 91 (of 150) participants have been enrolled in the study (46 intervention, 45 control group). The mean age is 82.7 years. Approximately 23% are exposed to anticholinergic drugs and 22% to sedative drugs, with a mean DBI of 0.23±0.37. At baseline, after adjusting for confounders (sociodemographics, comorbidities, cognitive impairment), for every unit increase in DBI, the SPPB score decreased by 1.00 ( $p=0.16$ ). The average DBI at 3 months in the 71 participants who have been followed up is 0.23±0.40. At follow up, no change in DBI was observed in 63 participants. DBI decreased in 6 (2 intervention, 4 control group), and it increased in 2 (intervention) subjects. Conclusions: On preliminary analysis, there is a non significant trend between higher DBI and poorer physical function in older Australians living in retirement villages. The intervention has not resulted in decreased DBI at 3 months.

**PB7 216 A SUITABLE MODE OF RESISTANCE EXERCISE FOR COMMUNITY-DWELLING OLDER ADULTS WITH LOW MUSCULAR PERFORMANCE**

R. HASEGAWA\* (Seijoh University, Tokai Aichi, Japan)  
N. TOMIYAMA(1), M. ISLAM(2), N. TAKESHIMA(3) - (1) Seijoh University (Tokai Aichi, Japan); (2) Yonaha General Hospital (Kuwana Mie, Japan); (3) Nagoya City University (Nagoya, Japan)

Community-dwelling older adults with low muscular performance often avoid machine-based resistance exercises from fear of their inability to do that. In this study, we evaluated the influence of pre-intervention muscular performance score (PMPS) on the outcome of a community- and home-based resistance exercise (CHRE) program among older adults. Methods: 108 older adults (46 men and 62 women, 72 +/- 5 years) participated in a 10-wk CHRE program where they performed exercises at least twice a week at home. Simultaneously, they participated a weekly exercise session (warm-up, elastic band-based resistance and cool-down exercises) at a local community center provided by instructors. Muscular performance was assessed by 30-sec arm curl test (AC) and 30-sec chair stand test (CS) before and after intervention in all participants. Participants were divided into three groups [low-score group (LS), middle-score group (MS) and high-score group (HS)] based on their PMPS. One-way ANOVA with post hoc was done to examine the differences of pre-post intervention % changes among three groups. Results: In AC, 40 participants belonged to LS (<21 reps), 30 to MS (22-23 reps) and 38 to HS (>24 reps). After CHRE program, significant differences in changes among groups were only found when LS (34 +/- 22%) was compared with MS (13 +/- 11%) and HS (16 +/- 11%). In CS, 34 participants belonged to LS (<19 reps), 35 to MS (20-21 reps) and 39 to HS (>22 reps). After CHRE program, significant differences in changes among groups were only found when LS (31 +/- 23%) was compared with MS (16 +/- 16%) and HS (16 +/- 17%).

Conclusion: These results suggest that CHRE program is more effective for older adults with low muscular performance, and it could be a suitable mode of resistance exercises for these people.

**PB7 217 EXERCISE AND RISK OF INJURIOUS FALL IN HOME-DWELLING ELDERLY**

S. IINATTINIEMI\* (University of Oulu, Oulu, Finland, Oulu, Finland)  
J. JOKELAINEN(1), H. LUUKINEN(1) - (1) Institute of Health Sciences, University of Oulu, Oulu (FI-90014 University of Oulu , Finland)

Objectives. To examine the relationship between different types of physical exercise and the risk of subsequent fall-related injury. Study Design. A prospective study of the home-dwelling elderly. Methods. A population sample of home-dwelling subjects aged 85 years or older (n=512) in northern Finland participated in the study. Baseline data were collected by home-nursing staff through postal questionnaires and clinical tests. Frequency and times of physical exercise – that is, walking exercise and other exercise (home exercise, group exercise, gardening, cross-country skiing, dancing, swimming, bicycling) – and falls were recorded by a nurse examiner, who telephoned the participants 8 times during a 2-year follow-up period. Statistical analyses were based on Cox regressions and pooled logistic regressions. Results. The risk of injury-causing falls was reduced by other exercise taken at least 1 hour per week compared with corresponding non-exercise; adjusted odds ratio 0.37 (0.19–0.72) but not by walking exercise. The risk of injury-causing falls was not increased by any kind or amount of exercise taken. Female sex, a history of recent fall-related injury and poor baseline near-vision acuity were the other significant predictors of injury-causing falls. Conclusions. Habitual physical exercise proved to be safe and some of the exercises were associated with reduced risk of subsequent fall-related injury. Female sex, an injury-causing fall in the recent past and problems with near vision increased the risk.

**PB7 218 FRACTURES AFTER NURSING HOME ADMISSION: INCIDENCE AND POTENTIAL CONSEQUENCES**

K. RAPP\* (Robert Bosch Hospital , Stuttgart, Germany)  
S. LAMB(1), J. KLENK(2), A. KLEINER(2), S. HEINRICH(3), H. KÖNIG(3), T. NIKOLAUS(4), C. BECKER(5) - (1) Warwick Clinical Trials Unit, Warwick Medical School, University of Warwick (Coventry, United Kingdom); (2) Institute of Epidemiology, Ulm University (Ulm, Germany); (3) Health Economics Research Unit, Department of Psychiatry, University of Leipzig (Leipzig, Germany); (4) Bethesda Geriatric Clinic Ulm (Ulm, Germany); (5) Department of Clinical Gerontology, Robert-Bosch-Hospital (Germany)

Introduction: Residents of nursing homes are a high risk group for fractures. The aim of the study was to analyse fracture rates as a function of time from admission to nursing home, across a range of fracture sites, gender and functional abilities. Methods: Fractures of the upper limb, femur, pelvis and lower leg, time to first and subsequent fractures, age, gender and functional ability at admission were measured in 93,424 women and men aged 65 years and older and newly admitted to nursing homes in Bavaria between 2001 and 2006. Results: Fracture incidence was highest during the first months after admission to nursing homes and declined thereafter. This pattern was observed for all fracture sites, in women and men and in residents with different degrees of functional abilities. For example, fracture rates of the upper limb declined from 30.0 to 13.5/1000 person years in the first nine months after admission, and for all fracture sites from 135.3 to 69.4/1000 person-years in a corresponding time period. Conclusion: Newly admitted residents have the highest fracture risk. The pattern of risk is similar across all fractures suggesting a generic causal pathway. Implementation of effective fracture and fall prevention efforts should be a priority at the time of admission to nursing homes.

**PB7 219 FALL PREVENTION PROGRAM, FOR ELDERLY IN A PORTUGUESE HOSPITAL SETTING**

M. CALDEVILLA\* (Escola Superior de Enfermagem do Porto, Porto, Portugal)  
M. COSTA(1), M. MELO(2), J. RIBEIRO (2) - (1) Instituto Ciências Biomédicas Abel Salazar (ICBAS) (Porto, Portugal); (2) Hospital Valongo (Valongo, Portugal)

Preventing falls in hospitals or nursing homes, is today an important quality goal in health care. In Portugal is not nursing practice the use of falls assessments tools for elderly. So, a nurse lead fall prevention program was developed in a Portuguese hospital. The fall prevention program, purposes were: Nursing education; Fall team formation; And fall prevention protocols. With organizational support, nursing staff and a nursing school the "Falls Prevention Program" started in 2008, May. With this initiative, it was possible to involve more than 60% of the nurses into formation and practical orientation. A fall team nurse (FTN) approach was created. Team members included nurses and a nurse teacher. The FTN developed the "Falls Prevention Program", which includes: - Fall risk assessment of older inpatients. For this we chose de Hendrich II fall risk model; - Fall definition; - Availability of supplies and equipments such a bed alarms, low beds, fall prevention kit (red stickers, red socks, red arm bands and bed sign) and leaflet informative about falls education for patient and family; - Falls reports, which includes, time, date and history of falls. Location, injury results and fall witnessed. Hendrich II fall risk model score, fall cause, fall prevention kit in use and medical notice. Our fall prevention program, use

similar strategies as others studies. However the inexistent fall data publish in our country become this investigation important for findings. The innovation in a Portuguese hospital setting will prove that we must improve elderly care security and the results during the following months will support that.

**PB7 220** EFFECT OF PHYSICAL ACTIVITY ON COGNITIVE PERFORMANCE IN SENIOR PRACTICING INTERMITTENT WORK EXERCISE TRAINING.

O. RAMPHUL-DAUL\* (CHU de Strasbourg (Robertsau, France), Strasbourg, France)  
T. VOGEL(1), C. MARTIN-HUNYADI(1), J. LONSDORFER(1), M. BERTHEL(1),  
G. KALTENBACH(1) - (1) Chu Strasbourg.Hopital de la Robertsau (Strasbourg, France)

Introduction: Aging leads to a multiple of functional and intellectual disability, thus the concept of successful aging is the priority of senior citizens. In this aim a primary prevention approach have been developed especially for the promotion of regular physical activity among elderly. We evaluate the effect of Intermittent Work Exercise Training (IWET) program on cognitive functions. Methods and Materials: 23 healthy volunteers (13 males, mean age 71.5 years) performed a "tailor-made" IWET program during 1 year, 2 sessions per week. Each 30 min bicycling session consisted of 6 stages of 5 minutes, with 4 minutes, at a power output corresponding to the first ventilatory threshold (VT1), alternated with 1 minute of cycling at a power corresponding to a submaximal intensity. All subjects performed before and after 9-week of the IWET program an incremental exercise test which define their VT1, Peak Oxygen Uptake (VO2 peak) and Maximal Tolerated Power (MTP). At inclusion (T0) and after the 1-year IWET (T1), a cognitive evaluation was performed using the Rey auditory-verbal learning test (RAVLT) and verbal span, testing the working memory. Results: Training results in a significant increase of the MTP (+10.2%), the VO2 peak (+10.3%) and the VT1 (+33%). Compared with T0, the cognitive evaluation at T1 showed an improvement of short memory, with an average gain of 2 points on RAVLT ( $p=0.03$ ) and an increase of 3 points on the verbal span ( $p=0.001$ ). Conclusions: Regular physical exercise with IWET was significantly related to cognitive gain in the short memory especially in working memory. Thus, the promotion of physical activity may improve cognitive functions in senior and thus may enhance their life style. Further large-scale study should be plan to evaluate the effect of physical exercise on the other memories.

**PB7 221** UNDERTREATMENT OF OSTEOPOROSIS IN THE OLDEST OLD? A NATIONWIDE STUDY OF OVER 700 000 OLDER PEOPLE

K. JOHNELL\* (Karolinska Institutet, Stockholm, Sweden)  
J. FASTBOM(1) - (1) Aging Research Center, Karolinska Institutet (Stockholm, Sweden)

Introduction: The aim of this study was to investigate whether age is associated with use of osteoporosis drugs in a large population of older people. Methods: We analysed data on age, sex, type of residential area (urban/rural), and dispensed drugs for people aged >75 years registered in the Swedish Prescribed Drug Register from October to December 2005 (n=731 105). Multivariate logistic regression was used to analyse whether age was associated with use of osteoporosis drugs, after adjustment for type of residential area and number of other drugs (a proxy for comorbidity). Results: Osteoporosis drugs were used by 16.1% of the women and 3.4% of the men. The probability of use of bisphosphonates declined with increasing age [ORwomen=0.36 (95% CI 0.34-0.38) and ORmen=0.46 (95% CI 0.37-0.56) for age >90 years vs. 75-79 years]. Raloxifene was also negatively associated with age. Calcium + vitamin D supplements, however, showed a divergent pattern regarding age. In women, the lowest likelihood of use of calcium + vitamin D supplements occurred in the oldest old (>90 years). Conclusions: Our results indicate an undertreatment of osteoporosis, particularly with bisphosphonates, in the oldest old in Sweden. Future research is needed for understanding the mechanisms behind this age effect.

**PB7 222** THE CHAOS CLINIC - A RANDOMIZED CONTROLLED TRIAL OF A FALLS CLINIC FOR PREVENTION OF FALLS AND RELATED FRACTURES

M. PALVANEN\* (UKK Institute, Tampere, Finland)  
P. KANNUS(1), J. PARKKARI(1), J. RINTALA(2), M. JÄRVINEN(3),  
M. FOGLHOLM(4) - (1) UKK Institute (Finland); (2) Suomen Terveyystalo (Finland);  
(3) Tampere University (Finland); (4) Academy of Finland (Finland)

The purpose of this preliminary report of a falls clinic is to determine the number of falls and fall-related injuries (fractures) among Finnish Chaos Clinic participants. The Chaos Clinic is a falls clinic for prevention of falls and related injuries among elderly people. All persons aged 70 years or more with high-risk for falling and fractures are first interviewed and examined carefully at the Chaos Clinic to evaluate all individual intrinsic and extrinsic risk factors for falls and fall-induced injuries such as fractures. After the comprehensive and individual assessment of the risk factors for falling, the participants are randomized to the intervention or control group. Thereafter, the personnel of the Chaos Clinic decide, on individual basis, the falls prevention measures needed and supervise their execution in the intervention group (a multifactorial preventive approach). All the participants are followed-up for 12 months for falls and related injuries. Our hypothesis is that persons in the intervention group will have 30% less falls and related injuries. The trial started in January 2005 and is still in process. So far, 770 participants have been followed for 12 months. At the one-year follow-up, 392/770 (51%) of the participants had fallen at least once having

altogether 926 falls. These falls caused 489 injuries, 37 of them (8%) being fractures. The mean age of the participants was 77 years at baseline and 88% of them were women. The number of falls and related injuries have been at expected level. The coming years will show the true efficacy of the falls prevention intervention of the Clinic. (The contents of the abstract were submitted and accepted for WCO in Thailand 2008 but the congress was cancelled. This is an updated abstract.)

**PB7 223** RESPONSE OF TISSUE ON INTERMITTENT PRESSURE: INVESTIGATION USING AN IN VIVO RAT MODEL

E. TAM\* (The Hong Kong Polytechnic University, Kowloon, Hong Kong)  
J. NG(1), S. PARCO(1) - (1) The Hong Kong Polytechnic University (Kowloon, Hong Kong)

Introduction: Pressure ulcers are common and serious complications of tissue damage affecting many elderly with diminished pain sensation and/or diminished mobility. Although the cause of pressure ulcer remains to be unclear, it is generally believed that intermittent pressure relief can serve as a protective regime. In this work, we aim to examine the effects of intermittent pressure relief on tissue damage. Method: Sixteen adult Sprague-Dawley rats were randomly and equally assigned to static compression (SC,) or repetitive loading (RL) groups. Tissue compression (100mmHg) was performed over an area in the tibialis region of the right limb of the rats. For SC, the loading duration is 6 hours each day on two consecutive days. For RL, a 30 seconds release was given after each hour of loading. The left unloaded limb served as intra-animal control. All rats were sacrificed 20 hours after the last session of loading. Tissues directly underneath the loading region were collected and quickly frozen. Hematoxylin and eosin staining was used to demonstrate the histological changes. Result: Muscle tissue under went the compression procedure were characterized by rounding shape myofibers, increased number of nuclei in the interstitial space, and centralized nuclei were found at locations within the muscle overlying the tibia bony surface. When intermittent pressure relief regime was introduced, such damages were observed to be lessened. Moreover, muscle damages in those rats with intermittent pressure relief were not confined to the areas near the tibia bony surface, but also developed at localized area near the skin surface. Conclusion: These results demonstrated compression-release of only 30 seconds per hour can lessen cell damages to the muscle tissue overlying bony area. However, it is intriguing to observe that there were localized muscle cell damages initiated near the skin-muscle interface resulting from intermittent pressure relief.

**PB7 224** SELF-CARE FOR MEDICATION USE IN OLDER THAI PATIENTS WITH CHRONIC OBSTRUCTIVE PULMONARY DISEASE

P. MALATHUM\* (Mahidol University, Bangkok, Thailand)  
P. KRAINARA(1), S. NATHISUWAN(3), T. KAWAMATAWONG(4) - (1) Prachupkhirikhan Hospital (Prachupkhirikhan, Thailand); (3) Faculty of Pharmacy, Mahidol University (Bangkok, Thailand); (4) Faculty of Medicine, Ramathibodi Hospital, Mahidol University (Bangkok, Thailand)

Introduction & Objective To promote quality of life in patients with chronic obstructive pulmonary disease (COPD), medications play an important role to relieve distressing symptoms. However, older persons tend to have limited abilities to use medications appropriately. The purpose of this descriptive study was to describe self-care for medication use and basic conditioning factors for medication use (physical status, family support, and healthcare professionals' support) in older patients with COPD. Methods & Materials Purposive sampling was used to recruit 70 older patients with COPD at the Out-Patient Department at a general hospital in Thailand from February to April 2007. Results The majority of the sample took the right dose and time of oral medications, according to the physician's prescription. However, for inhaled bronchodilators, they used a higher number of puffs than the prescription, particularly, when acute exacerbation occurred. Analysis revealed that the number of incisors was positively related to the ability to cover the mouthpiece of the metered dose inhaler. A tremor hand was related to the low ability to press the canister, and the capacity of pulmonary function was positively related to the ability to breathe and hold their breath. Additionally, the family provided assistance for oral medication use of older patients including preparing the medications, reminding them to take the medications, and inquiring healthcare professionals about medication use. Regarding the inhaled bronchodilator, family members provided assistance when requested or when acute exacerbation occurred. Healthcare providers advised all older patients about the time and dose of oral medications and steps of using the inhaled bronchodilator, but they rarely explained the importance of each step. Conclusion To promote appropriate self-care for medication use in older patients with COPD, assistance from the family and healthcare professionals is needed. Physical function related to medication use should be assessed.

**PB7 225** NON INFERIORITY ANALYSIS OF A RANDOMISED TRIAL (RCT) OF HOME VERSUS DAY HOSPITAL REHABILITATION

S. PARKER\* (University of Sheffield, Barnsley, United Kingdom)  
J. BOND(2), C. JAGGER(3), E. PAMELA(1), K. FRYER(1), D. ROSS(1),  
R. CURLESS(4), P. OLIVER(1), C. COOPER(1) - (1) University of Sheffield (United

Kingdom); (2) Newcastle University (United Kingdom); (3) University of Leicester (United Kingdom); (4) Northumbria Health Care NHS Trust (United Kingdom)

**Introduction** The literature suggests that Day Hospitals are an effective setting for comprehensive services for older people. Previous trials have examined the Day Hospital as a setting for rehabilitation for stroke, inpatient, outpatient and nursing home care. Most previous RCTs have not compared Day Hospital Rehabilitation(DHR) to Home Based Rehabilitation(HBR). Methods We have conducted a four centre, two-arm randomised controlled trial which randomised patients to HBR or DHR. The primary outcome was change on the Nottingham Extended Activities of Daily Living Scale(NEADL) at six months. Secondary outcome measures included EQ-5D, Hospital Anxiety and Depression Scale (HADS), Therapy Outcome Measures(TOMs), hospital admissions and the General Health Questionnaire(GHQ-30) for carers. A 10% non-inferiority limit was applied to the confidence interval estimates for the outcome measures at the six-month follow-up. Results Estimated sample size of 460 was not achieved, 42 subjects received HBR and 42 DHR. The groups were well matched at baseline. At 6 months there was no significant difference in the primary outcome measure NEADL Total (DHR: mean=30.78, SD=15.01; HBR: mean=32.11, SD=16.89; P=0.37). EQ-5D, TOMs and GHQ for carers showed no significant differences between settings. Non-inferiority was demonstrated for the NEADL, EQ-5D, and HADS anxiety scale. The HADS depression scale suggested borderline advantage for HBR in some of the analyses. A similar pattern was seen at three and 12-months although a statistically significant difference in the mean EQ-5D index score was seen in favour of DHR at three months (P=0.047). Conclusion The trial was underpowered. Overall HBR does not appear to disadvantage older people or their carers compared to DHR. Patients receiving HBR may experience less psychological distress than those receiving DHR.

**PB7 226 UTILIZATION OF INPATIENT CARE BEFORE AND AFTER HIP FRACTURE: A POPULATION-BASED STUDY**

E. LÖNNROOS\* (University of Kuopio, Kuopio, Finland)

H. KAUTIAINEN(1), R. SUND(2), P. KARPPPI(3), S. HARTIKAINEN(4), I. KIVIRANTA(5), R. SULKAVA(6) - (1) Rheumatism Foundation Hospital (Finland); (2) National Research and Development Centre for Welfare and Health (Finland); (3) Central Finland Hospital (Finland); (4) Faculty of Pharmacy, University of Kuopio (Finland); (5) Department of Orthopaedics and Traumatology, University of Helsinki (Finland); (6) Department of Geriatrics, University of Kuopio (Finland)

**Introduction** Aim of this study was to evaluate effect of hip fracture (HF) on the inpatient care utilization by assessing use of hospital days in HF patients and general population. Number of and causes for hospital days were determined for the prefracture and two postfracture years. Methods The study covered 70-year-old and older HF patients and general population (26 000) living in Central Finland in 2002-03. Hospital registers and medical records were used to identify HF cases. Hospitalization data were obtained from the nationwide discharge register. Results 498 HF cases (age 82 SD 7 years, 75% women) were identified. Among them, there were 23, 107, and 52 hospital days per person-year in the prefracture, first and second postfracture year, respectively. In general population, the yearly number of hospital days was constantly 11. The age- and gender-adjusted rate ratio of hospital days between HF group and general population was 1.30 (95% CI: 1.27 to 1.32) in the prefracture year, 6.91 (95% CI: 6.85 to 7.00) in the first postfracture year, and 3.61 (95% CI: 3.55 to 3.67) in the second postfracture year. Before and after HF, hospital days due to injuries were more prevalent in HF group. In addition to injuries, excess hospital days were seen in six other ICD-10 classes in the first postfracture year and in four classes in the second year. Conclusions Evaluation of hospitalizations in 70+ population showed that HFs were associated with a substantial increase in the inpatient care utilization. Hospital days in several diagnostic classes increased and still exceeded both the prefracture and population levels in the second postfracture year. HF can far exceed older person's restricted reserve capacity and predispose to worsening of comorbidities and outbreak of new diseases.

**PB7 227 THE EFFECTS OF ANABOLIC AND CATABOLIC BIOMARKERS ON MUSCLE STRENGTH DECLINE: THE INCHIANTI STUDY**

S. STENHOLM\* (National Institute on Aging, Baltimore, United States)

M. MAGGIO(1), F. LAURETANI(2), S. BANDINELLI(3), G. CEDA(1), A. DI IORIO(4), F. GIALLAURIA(5), J. GURALNIK(6), L. FERRUCCI(5) - (1) University of Parma, Department of Internal Medicine and Biomedical Sciences (Parma, Italy); (2) University Hospital of Parma, Geriatric-Rehabilitation Department (Parma, Italy); (3) Geriatric Rehabilitation Unit, Azienda Sanitaria di Firenze (Florence, Italy); (4) University G. D'Annunzio Chieti, Department of Medicine and Sciences of Aging (Chieti, Italy); (5) National Institute on Aging, Clinical Research Branch (United States of America); (6) National Institute on Aging, Laboratory of Epidemiology, Demography, and Biometry (United States of America)

**Introduction:** Decreased muscle strength is a major public health concern in older persons predisposing to functional limitations, increased fall risk and higher mortality. Therefore, it is important to examine the related risk factors. The aim of this study was to examine whether high levels of multiple catabolic and low levels of multiple anabolic biomarkers predict accelerated decline of muscle strength over six year follow-up. Methods and

materials: In a representative sample of 312 men aged ≥ 65 years in the InCHIANTI study we measured interleukin-6 (IL-6), C-reactive protein, tumor necrosis factor alpha receptor 1 and resistin as well as bioavailable testosterone, insulin-like growth factor-1 and dehydroepiandrosterone sulphate (DHEA-S). Biomarker values were divided into tertiles and the numbers of catabolic / anabolic biomarkers in the highest / lowest tertile were calculated. Main outcome measure hand grip strength was measured at baseline, 3- and 6-year follow-up. Results: In adjusted linear mixed models higher concentration of IL-6 ( $p = 0.01$ ) and lower levels of DHEA-S ( $p = 0.01$ ) predicted muscle strength decline. Cumulated number of dysregulated catabolic and anabolic biomarkers showed greater decline in muscle strength. Subject who had increased values in more than 3 catabolic biomarkers had borderline significantly greater strength decline compared to those without any increased value ( $p = 0.07$ ). Having 1 or more decreased value in anabolic hormones was associated with greater strength decline ( $p < 0.05$ ). Increasing number of combined dysregulated catabolic and anabolic biomarkers was step-wisely associated with accelerated muscle strength decline ( $p < 0.05$ ). Conclusions: Having multiple dysregulated catabolic or anabolic biomarkers is a better predictor of muscle strength decline than single biomarker alone suggesting that a multisystem dysregulation is at the core of the mechanism leading to muscle strength decline with aging.

**PB7 228 A POPULATION-BASED STUDY ON FACTORS ASSOCIATED WITH FUNCTIONAL DISABILITY AMONG OLDER ADULTS IN THE GREAT METROPOLITAN BELO HORIZONTE, MINAS GERAIS STATE, BRAZIL**

K. GIACOMIN\* (FIOCRUZ, BELO HORIZONTE, Brazil)

S. PEIXOTO(1), E. UCHOA(1), M. LIMA-COSTA(1) - (1) FIOCRUZ (BELO HORIZONTE, Brazil)

**Introduction** - Preventing disability in a context of population ageing is one of the important roles of public health. The main objective of this study was to investigate disability among aged individuals living in community and to determine the prevalence and the associated factors to disability among elderly in the Metropolitan Area of Belo Horizonte, Minas Gerais, Brazil. Methods and materials - The theoretical model was based on predisposing (socio-demographic), extra-individual (social support, use of health services), and intraindividual factors (health conditions). The study was conducted in a probabilistic sample of 1,786 aged individuals (≥ 60 years). The dependent variable was disability, defined as mild (some difficulty) or severe (total dependence) in performing at least one basic activity of daily living. Results & conclusions - Prevalence of disability was 16% (8% mild; 8% severe). Age and worse self-rated health were independently and positively associated with mild and severe disability. Self-reported hypertension and arthritis were associated with mild disability, while diabetes and stroke were associated with severe disability. Severe disability was independently and negatively associated with number of visits by friends in the previous 30 days. According to the results, chronic conditions associated with disability in the study population are preventable, and severely disabled elderly had less extra-family social support.

**PB7 229 COMPREHENSIVE GERIATRIC ASSESSMENTS IN EMERGENCY DEPARTMENTS: REVIEW OF 3-YEAR-DATA FROM THE INPATIENT GERIATRIC TEAM OF GRENOBLE UNIVERSITY HOSPITAL**

P. COUTURIER\* (Centre Hospitalier Universitaire de Grenoble , Grenoble , France)

T. MORIN(1), C. MILLET(1), N. ZERHOUNI(1), A. GROMIER(1), C. SALA(1), B. LO(1), I. LANIECE(1) - (1) Clinique Universitaire de Médecine Gériatrique, Pôle Pluridisciplinaire de Médecine, Centre Hospitalier Universitaire de Grenoble (Grenoble, France)

**Introduction:** Geriatric assessment intervention in emergency units is expected to target frail elderly and to reinforce medical and social management. Methods and materials: Comprehensive geriatric assessments were conducted by a geriatric team in the emergency units during opening days from January 2005 to December 2007 among elderly patients targeted on medical and/or social frailty criteria. This study aimed to describe their socio-demographic and geriatric profile and their health outcomes, with a special focus on frail elderly. Results: 786 assessments were analyzed. Patients mean age was 85 years. 63% of patients were women, 85% lived at home and 56% lived alone. Acute functional decline was present among 83% of patients with a mean score in Katz's ADL scale falling from 3,5 points at home to 1,6 at admission. 67% of patients were frail, 23% had dementia, 8% had a mono-pathology and 2% were independent or in end of life. Main identified geriatric syndromes were: loss of autonomy (76%), dementia (44%), poor overall condition (40%), falls (39%). Mean prevalence of pressure sores was 33%, with a significant 3-year decrease as memory foam mattress became available. The median hospital stay duration was 14 days with a significant 3-year decrease of 5 days. It was significantly higher among frail patients (16 days versus 11 days). Global mortality was 13% and was more important among frail elderly (16% versus 5%). Following index admission, 68% of patients went back home, 14% to medical institutions, 13% deceased and 5% moved to another hospital. Conclusion: These results confirmed the efficiency in screening elderly with frailty or cognitive impairment early at admission, the complexity of frail elderly management and

the positive improvements in care management at the emergency unit level. Frail patients remain at higher risk for prolonged hospital stay and death.

**PB7 230 ABILITY TO RISE FROM THE FLOOR : PREDICTIVE VALUE OF FALL IN THE ELDERLY**

C. MARTIN-HUNYADI\* (Hôpital Saint-François, Strasbourg, France)  
S. GAUTHIER(1), I. MARTIN-PFITZENMEYER(1), F. MOUREY(2) - (1) Centre Gérontologique de Champmaillot, CHU de Dijon (Dijon, France); (2) INSERM/U887 Motricité-Plasticiité : Performance, Dysfonctionnement, Vieillissement et Technologies d'optimisation. Université de Bourgogne (Dijon, France)

Introduction: Falls are common events with serious consequences on quality of life for elderly people. Ability to get up alone after a fall is considered as a factor of better prognosis. We were wondering whether the inability to rise from the floor shows a predictive value of a subsequent fall. Methods: 128 patients aged 75 and older were tested by a physiotherapist about their ability to get up during a day hospitalization for geriatric evaluation. All the patients were followed-up during one year and falls were notified at 3, 6, 9 and 12 months. Results: Mean age was 82.7 years. 48.5% of the patients had a previous history of fall. After evaluation, 60.6% of the patients were able to rise from the floor alone; 11.8% needed help; 27.6% showed a complete inability to get up. The inability to rise from the floor was associated with falling at 3 (28.6% versus 9.9% in patients able to get up,  $p < 0.05$ ), at 6 (38.8% versus 14.5%,  $p < 0.01$ ), at 9 (47.9% versus 23.3%,  $p < 0.01$ ) and at 12 months (57.4% versus 34.7%,  $p < 0.05$ ). Conclusion: Our results showed that 39.4% of the frail population followed in geriatric day's hospital were exposed to a high risk of lying on the floor after falling. We can think that the inability to get up is linked to motor alterations which participate to postural abnormalities and to the risk of falling. In this way, it is very interesting to consider that risk of falling is increased in subjects who are unable to get up.

**PB7 231 COST OF SERIOUS INJURIOUS IN-HOSPITAL FALLS – A CANADIAN EXAMPLE**

A. ZECEVIC\* (The University of Western Ontario, London, Canada)  
D. MCAUSLAN(2), B. CHESWORTH(1), G. ZARIC(1), A. SALMON(1), C. HUANG(1), R. WELCH(2), D. BRUNTON(2), C. WRIGHT(2), J. HILL (2), J. KING(2) - (1) The University of Western Ontario (London, Canada); (2) London Health Sciences Centre (London, Canada)

Introduction: Falls represent 40% of all in-hospital accidents and the majority occurs among patients over 60 years of age. In-hospital falls rates vary from 2.9-13 falls/1000 patient days, and consequences range from no injury to serious injuries including fractures and head trauma. Although least common, multiple injuries are the most expensive at an average cost of US \$22,368 (\$9,969-\$64,382) per event, and length of stay (LOS) is 1-5 weeks longer. The purpose of this project was to estimate the cost and LOS related to serious injurious falls in a Canadian acute care hospital. Methods: This historical cohort study utilized data from Risk Management and Case Costing databases at an acute care teaching hospital and medical chart reviews of patients who sustained a fall-related serious injury during hospital stay. Between April 2004 and October 2007, 37 patients sustained a serious injury after an in-hospital fall. Their hospital cost was compared with 2,330 control subjects, non-fallers, who were matched by medical diagnosis, age and gender. Chart reviews identified services attributable to each fall. Total cost of inpatient stay and LOS were calculated for fallers and controls and compared using T-test and multivariate linear regression. Results: The average cost of hospital stay for seriously injured fallers and non-faller controls were CAD \$44,203 and \$13,507, while LOS was 45 and 11 days respectively. Surgery, surgery-related treatment, rehabilitation and radiology were the most frequent fall-related services provided. The cost to the health care system is underestimated as data did not include physician billings or care post-discharge. Conclusions: Prevention of serious injurious falls that occur during hospital stays have potential to reduce hospital costs by up to half a million dollars per year.

**PB7 232 PROMOTING ACTIVE LIVING (PAL): BEST PRACTICE GUIDELINES FOR FALL PREVENTION IN ASSISTED LIVING RESIDENCES**

V. SCOTT\* (British Columbia Injury Research & Prevention Unit and Ministry of Healthy Living and Sport, Victoria, Canada)  
H. BAWA(1), F. FELDMAN(2), J. SIMS GOULD(3), M. LEUNG(2), F. RAJABALI(1) - (1) BC Injury Research & Prevention Unit (Vancouver, Canada); (2) Fraser Health Authority (New Westminster, Canada); (3) Centre for Hip Health (Vancouver, Canada)

Introduction Assisted Living Residences (ALRs) are a priority setting for fall prevention due to the rapid growth among older persons that are at high risk and are choosing to remain living in the community. An action research methodology was employed to determine the feasibility of implementing evidence-based falls prevention strategies that are sustainable in the routine delivery of care. The one-year project consisted of a consultative planning process, six-month intervention study, and a collaborative process for the development of the Best Practice Guidelines. Methods The 6-month prospective, feasibility study was conducted at two ALR sites, where 161 of 188 residents consented to

participate. Measures included focus groups, surveys, and pre/post test measures of balance and gait assessments, and 6-month fall and fall-related injury surveillance. Interventions included staff and resident training on fall tracking, fall prevention education for staff and residents, and physical activity interventions. Results Over 6 months, 155 falls were recorded, with 38% (N=73) of residents identified as having at least one fall and 43% (N=72) of falls resulting in injury. There was a statistically significant reduction in the rate of falls per 1,000 resident days between the first and second three-month periods ( $X^2=11.98$ ;  $p=0.001$ ). A significant difference ( $t=3.16$ ,  $p=.002$ ) was noted in the Timed-Up-and-Go test findings pre and post PAL study, with fewer residents with scores above the high-risk cut-off for falling. Focus group findings revealed the need to tailor prevention to 'joiners' and 'non-joiners' of group intervention activities. Conclusion The PAL study demonstrated that fall prevention guidelines can be implemented within routine service delivery in ALRs. Further testing of these guidelines on a larger scale is planned for greater generalizability.

**PB7 233 ENABLING THE OLDEST OLD AGED 80 AND OVER TO REMAIN IN THEIR OWN HOMES**

V. HOLLIS\* (University of Alberta, Edmonton, Alberta, Canada)  
J. DARRAH, M. HELEN, E. PAT

Introduction. Many older adults live independently, adapting successfully to changing circumstances. However, when difficulties arise some have limited access to interventions that do not create health and social service dependency. This qualitative three-year multi-stage research, conducted in Canada, identified a breadth of factors concerning seniors (80+) ability to continue living in their own homes and ameliorating rehabilitation strategies. Method. (a) environmental service audit; (b) 30 interviews with community and facility-dwelling seniors from small, medium and large regions; (c) two 'consensus groups' of service providers and users for prioritization; (d) 10 validation interviews with facility dwelling seniors; (e) 10 interviews with rehabilitation staff to name essential interventions; (f) five public presentations to check credibility of findings. Results. Findings are presented using a Force Field Analysis. Facilitators to seniors remaining in their own homes were: the support of family/friends; access to health and social services; adequate finance; and personal motivation. Impediments included: poor/deteriorating health; lack of social contacts; safety concerns and the insidious erosion of independence that contributed to senior's belief that s/he was a burden. When impediments outweighed facilitators, seniors experienced Decreased Engagement in Roles. Unable to participate in the breadth of personally meaningful roles and/or to a satisfying degree, seniors relocated to supported environments. Conclusion. Some findings support results from other studies. New insights indicate the importance of interventions that promote or sustain continuing engagement in everyday roles and consequent positive mental and physical health. Engagement in everyday activities sometimes called 'occupations' and directed, not only towards self-care but targeted at individually preferred productivity and leisure roles, should be a central focus for those working with seniors wanting to remain in their own homes. This focus points to the congruence of health promotion and community-based rehabilitation strategies, delivered through the combined efforts of health professionals and communities for sustainability.

**PB7 234 HOME ACTIVITY MONITORING PROJECT (HAMP) FOR IMPROVING FUNCTIONAL PERFORMANCE AND REDUCING FALLS IN OLDER ADULTS**

R. PENHALL\* (Royal Adelaide Hospital, Adelaide, Australia)  
R. BARNARD(1) - (1) Centre for Physical Activity in Ageing, Hampstead Rehabilitation Centre (Northfield, Australia)

Introduction: Home-based activity allows individuals to participate in physical activity when limited options may be available. HAMP aimed to improve balance and coordination, build confidence and promote independence through information and education of participants. Methods and Materials: A HAMP project manager supervised other staff and volunteers. Program elements were development of resources, establishment of processes, widespread city and rural marketing, deployment of telephone coaching (the novel approach) and training of facilitators. Of 1,230 referrals, 412 completed the medical clearance, 169 remained active, while 98 had graduated. Activities focused on the individual being encouraged to undertake at least 150 minutes of physical activity per week, supported by an information booklet supplied by Active Ageing Australia. Support was regular telephone communication to encourage HAMP activity three times and walking at least twice a week. Participants kept records which were monitored. Results: From 122 participants surveyed, satisfaction was high - rated 9.1/10. Physical activity increased based on the change in number of days active - comparing the cumulative change from Week 1 at Week 8 and Week 32: participants with decreased physical activity 17% v 16%, retained activity 42% v 30%, increased activity 40% v 54%. In the previous six months, 108 of 384 participants fell (28%) having 319 falls, producing 0.83 falls per person - that number declined with participation: Week 1 0.26 to Week 40 0.07. Physical wellbeing assessed by six indicators had improved in at least three by 8 weeks; the greatest improvement in five occurred at 16 weeks. Greatest benefits in emotional wellbeing (2 indicators) were at 8 and 16 weeks. Conclusions: An enabling individual action plan with realistic achievable goals supported by a telephone coach had

tangible benefits with increased activity, less falls, and improved physical and emotional well-being with excellent client satisfaction.

**PB7 235 PREDICTORS OF RECURRENT FALLING IN HEALTHY OLDER ADULTS: THE IMPORTANCE OF BOTH EXECUTIVE FUNCTION AND GAIT**

J. HAUSDORFF\* (Laboratory for Gait and Neurodynamics, Tel Aviv Sourasky Medical Center, Tel Aviv, Israel)  
A. MIRELMAN(1), M. BROZGOL(1), N. GILADI(3) - (1) Laboratory for Gait and Neurodynamics, Tel Aviv Sourasky Medical Center (Israel); (3) Harvard Medical School (MA, United States of America)

**INTRODUCTION:** Cognitive domains, especially executive function (EF), may influence gait and fall risk, however, questions persist about the nature of this association. **METHODS:** From a cohort of 264 healthy elderly, 203 (76.0±4.7 yrs) who reported no falls during the year prior to the study were investigated. Subjects were evaluated at baseline and one-year-later. Participants reported falls using monthly calendars. At baseline, subjects were free of pathologies that affect gait. Subjects completed a computerized-cognitive-battery that generated age-and-education-normalized index of EF. Based on this index, subjects with the upper (better) and lower (worse) quartiles were compared (n=103). Clinical measures included the Timed-Up-and-Go (TUG), Dynamic-Gait-Index (DGI), Berg-Balance-Scale (BBS) and gait under single and dual task conditions. **RESULTS:** At baseline, subjects had normal MMSE with no group differences ( $p=0.15$ ). 26% had index EF in the upper-quartile (111.8±4.9) and 24% were in the lower-quartile (85±5.1). Significant differences between the groups were observed at baseline in DGI ( $p=0.002$ ), BBS ( $p<0.0001$ ), and in comfortable-gait-speed and speed during dual task. Gait variability (CV) was higher (worse) in the lower-quartile-group during gait under single task condition. In addition, 12% of subjects with lower EF had multiple-falls during follow-up, compared to none in the upper-quartile-group ( $p<0.0001$ ). Discriminant analysis demonstrated that TUG, gait speed and DGI explained 60.4% of the variance between the two EF groups. **CONCLUSIONS:** Challenging gait-assessment-tools such as DGI and TUG may predict future falls. Furthermore, these findings suggest that even in healthy elderly, EF plays an important role in the etiology and risk for multiple falls.

**PB7 236 THE EFFECTIVENESS OF INPATIENT GERIATRIC EVALUATION AND MANAGEMENT UNITS: REVIEW AND META-ANALYSIS**

K. MILISEN\* (Katholieke Universiteit Leuven, Leuven, Belgium)  
K. VAN CRAEN(1), T. BRAES(2), N. WELLENS(2), K. DENHAERYNCK(3), J. FLAMAING(4), S. BOONEN(4), C. GOSSET(5), J. PETERMANS(5), P. MOONS(2) - (1) Rehabilitation Hospital Hof ter Schelde (Belgium); (2) Katholieke Universiteit Leuven (Belgium); (3) University Hospital Basel (Switzerland); (4) University Hospitals Leuven (Belgium); (5) University of Liège (Belgium)

Introduction Comprehensive geriatric assessment (CGA) embedded within a geriatric evaluation and management unit (GEMU) may be one of the answers to achieve excellent care for frail older persons admitted to hospital. The objectives of this review are (1) to examine how GEMU's are organized, and (2) to examine the effectiveness of admission on a GEMU. Methods and materials Literature was searched by using different databases (Pubmed, Cinahl, Cochrane Library, Invert and Embase), references lists of included articles, and contacting authors. Thirteen RCT's met the inclusion criteria, describing the effectiveness of seven individual GEMU's. The outcome parameters are mortality, institutionalization, functional decline, readmission and length of stay at different follow-up points. Results The GEMU's are organized in a heterogeneous way and gave no thorough description about CGA. The involvement of a multidisciplinary team was a key element in all GEMU's. The individual trials showed that admission on a GEMU has one or more favorable effects on the outcomes of interest, with two significant effects in the meta-analysis: less functional decline at discharge from the GEMU (RR 0.87, CI 0.77-0.99;  $p=0.04$ ) and a lower rate of institutionalization one year after discharge (RR 0.78, CI 0.66-0.92;  $p=0.003$ ). For the three other outcomes in the meta-analysis, a GEMU did not induce significantly different outcomes compared to usual care. Conclusion There is heterogeneity between the studies, poor quality of some RCT's and shortage of information about CGA. Multidisciplinary CGA offered in a GEMU may be a surplus value in the care for frail older persons admitted to hospital. However, the limitations confirm the need for well designed studies using explicit CGA.

**PB7 237 A HIGH INCREASE IN THE CARE FOR OSTEOARTHRITIS IN THE NEAR FUTURE?**

H. PICAVET\* (National Institute Of Public health and The Environment, Bilthoven, The Netherlands)

Introduction Osteoarthritis of hip and knee is one of the most important old age diseases because its impact on pain and mobility. Joint replacement is the only treatment for severe affected hip or knee joints, which can improve function and mobility. In this study we quantify the expected increase in the need for osteoarthritis-related health care due to (1) the ageing of the population, (2) the epidemics of overweight and obesity, and (3) the changes in health care expectations among the elderly. Methods and materials We combine sex-age

specific data of the Netherlands on the prevalence of osteoarthritis, demographical trends, trends of overweight and obesity, trends in hospital admission on osteoarthritis, trends in hip and knee replacements due to osteoarthritis and opinions of experts in the osteoarthritis health care on the changing profile of patients, to quantify the need for hip and knee replacements in the coming one or two decades. Results Preliminary analyses show that: Between the years 1980 and 2000 the number of hospital admission due to osteoarthritis (mainly knee or hip replacements) doubled to a number of 28,838 (ICD 9-code 715) and increased to 50,123 in the year 2005, which is an increase of more than 70% in those last five years. Only demographical changes are expected to increase the prevalence of osteoarthritis between 2000 en 2020 with 38%. The prevalence of self-reported obesity (BMI>30) increase from 5.1% to 11.2% in the period 1981-2007. Conclusions The current trends will inevitable increase the need for health care for osteoarthritis and this should be taken into account for the planning of health services preventive interventions. In the presentation we will present the final expected numbers based on the combination of historical trends, forecasts and the opinions of medical experts.

**PB7 238 GERIATRICS SYNDROMES IN SPANISH NURSING HOMES. THE RESYDEM STUDY**

J. LOPEZ TRIGO\* (AYUNTAMIENTO DE MALAGA, MALAGA, Spain)  
R. LOPEZ MONGIL(2), J. CASTRODEZA SANZ(3), R. RCG(4) - (2) Diputacion Valladolid (VALLADOLID, Spain); (3) Universidad de Valladolid (29013, Spain); (4) Multicenter (Spain)

**INTRODUCTION** Geriatric syndromes reach high prevalence in elderly and cause functional disability. RESYDEM study analyzes these syndromes. **OBJECTIVES** To determine prevalence of GS (cognitive impairment, falls, immobility, incontinence, malnutrition, sensory disturbances, pressure ulcers, sleep disorders and depression). **METHODS AND MATERIALS.** Trasversal multicenter, observational study conducted in 54 nursing home representing all Spanish Communities. We analyze previous diagnoses, physical examination and complementary studies. Cognitive assessment by Folstein MMSE, AMT of Hodkinson and verbal fluency test. CM98 test used to assess functional capacity. Statistical analysis of contrast hypothesis test made with t-Student test and Fisher-Pearson chi-square. **RESULTS** Population of 1020 residents (852 study of cognitive impairment). Average 83.20y. (SD=7.90), 65% women (average 84.4y, SD=7.0), 35% men (average 80.7y, SD=8.4). Prevalences: cognitive impairment, 61.7% (CI95%, 58.4-65.1), sleep disturbances 41.7%, 36.6% visual disturbances, falls 34%, 30.9% depression, impaired hearing 27.3%, 10.3% malnutrition, pressure ulcers 7.6%, problems of any degree of urinary incontinence 57.20% (24.49% relative absolute 32.71%), fecal incontinence problems of any degree 37.41%. Mobility problems were detected in any of more than 60% (41.04% relative and absolute 19.34%). To make basic activities of daily living 18% were independent, 35.8% mild dependent, 11.2% moderate, 11% severe and 24% absolute. For instrumental activities of daily living 12.2% were independent, 22% mild dependent, 18.1% moderate, 9.2% severe and 38.5% absolute. **CONCLUSIONS** In RESYDEM study more prevalent GS have been cognitive impairment, mobility/autonomy, incontinence and sleep disturbances. Compared to other studies, the rate of malnutrition is significantly higher. GS show high prevalence in NH. Geriatric assessment is useful tool to provide early detection and prevention.

**PB7 239 CARDIAC ARRHYTHMIAS SEEN IN GERIATRIC PATIENTS REFERRED TO FALL CLINIK AND EXAMINED WITH EVENT RECORDER.**

A. ZEBO\* (Bispebjerg Hospital, Copenhagen, Denmark)  
A. CHRISTIANSEN(1) - (1) Bispebjerg Hospital (Copenhagen, Denmark)

Bispebjerg Hospital has a catchment area of 220.000 persons. Geriatric department is part of the medical field; there are 36 beds and several outpatient treatment centers where the fall clinic has approximately 350 new-referred patients pr year. The patients in the fall clinic are examined with vestibular investigations, orthostatic BT mode, Biotelemetry, para-clinical studies and, in cases of suspected cardiac syncope, with Event Recorder. We have chosen to study the amount of cardiac arrhythmias needing treatment, in patients studied with Event Recorder. Analysis of 50 patient records: The patients had all been investigated with Event Recorder for at least 72 hours in order to investigate fall-tendency. The patients were all +65yr, range 65-95yr. Of the 50 patients we studied had 23 changes in the conventional ECG, 11 patients equivalent to 48% had no arrhythmias on Event Recorder, while the other 12 had arrhythmias that lead to intervention. 5 patients, equivalent to 22% were treated with Pacemaker, 6 patients representing 26% were treated medically and 1 patient, equivalent to 4% were treated both medically and with pacemaker. In review of 50 patient records of patients referred for investigation of causes of fall. We found with Event Recorder cardiac arrhythmias in 24% (12 patients) who needed treatment and 50% of these needed Pacemakers. These findings indicate that Event Recorder is a valuable test applied to geriatric fall-patients. It could be of interest to examine a larger number of patients in order to validate the findings. It also would be interesting to review the indications for Event Recorder because there was a large proportion that had normal conventional ECG nor had arrhythmias at Event Recorder. One could compare changes in

the conventional ECG with arrhythmias on Event Recorder and thus using the Event Recorder survey more rationally.

**PB7 240 AN ATTEMPT AT MODELLING THE RISK FACTORS FOR FALLING AMONG THE ELDERLY**

A. COUGNAUD-PETIT\* (Hôpital Bretonneau, Centre Hospitalier Régional Universitaire, Tours, France)  
M. GAUBERT(2), J. BARRÉ(2), C. HOMMET(1), T. CONSTANS(1), G. BERRUT(3) - (1) Hôpital Bretonneau Centre Hospitalier Régional Universitaire (Tours, France); (2) Centre Hospitalier Universitaire (Angers, France); (3) Hôpital Bellier, Centre Hospitalier Universitaire (Nantes, France)

Introduction. Falls in the elderly are a frequent event which is caused by several factors. The prevalence of the risk factors for falling has not been often and extensively evaluated in a single study. The aim of this study was 1/ to evaluate the prevalence of chronic predisposing factors and intrinsic precipitating factors; 2/ to study the relationships between chronic predisposing factors within a population of elderly fallers. Materials and methods. A prospective study was conducted from 2000 to 2005 in an acute geriatric unit of the teaching hospital of Angers (France). Four hundred and seventy-one patients hospitalised for fall (mean age: 84±7) were included among 2299 patients. Results. The most frequent chronic predisposing factors were: intake of benzodiazepines or hypnotics (45.2%), cerebral and vascular diseases and Alzheimer disease (39.5%), hip problems (35.2%), rachis problems (32.3%), visual problems (33.1%), loss of adaptability to physical effort (29.1%) and depression (25.5%). The intrinsic precipitating factors were: orthostatic hypotension (17.2%), delirium (13.6%), atrial fibrillation (7.9%), impaired consciousness (6.8%) and stroke (6.4%). Finally, we described two profiles of fallers: depressive patients under psychotropic drugs and patients with bone or joints disorders and visual problems. Conclusion. This study highlighted risk factors for falling in elderly inpatients in accordance with previous data of the literature, evaluated the prevalence of each factor and identified two clinical profiles of fallers.

**PB7 241 STRONTIUM RANELATE REDUCES VERTEBRAL FRACTURES IN FRAIL OSTEOPOROTIC WOMEN**

Y. ROLLAND\* (CHU Toulouse , Toulouse, France)  
G. ABELLAN VAN-KAN(1), B. VELLAS(2) - (1) CHU Toulouse (Toulouse, France); (2) Inserm U558 (Toulouse, France)

Introduction Frailty exposes older people to increased vulnerability when confronted to a stressor. Frailty is associated to a decrease in strength, a feeling of tiredness, involuntary weight loss, slowness and inactivity. Anti-osteoporotic treatment is underused in frail patients despite of a higher fracture-risk, and poorer fracture outcomes. The aim of this study was to determine whether strontium ranelate was efficient to reduce the risk of vertebral and non-vertebral fractures in frail patients. Material and Methods Data were obtained from the SOTI (Spinal Osteoporosis Therapeutic Intervention) and TROPOS (Treatment Of Peripheral Osteoporosis) studies. During 3 years, participants were randomized to strontium ranelate 2 grams per day or placebo and supplemented with calcium plus vitamin D. Frailty was defined using adapted Fried's criteria (unintentional weight loss, exhaustion, weakness, slow walking speed and low physical activity). By intention-to-treat, and after 3 years of follow-up, the rate of vertebral and non-vertebral fractures of frail postmenopausal osteoporotic women was compared. Results 264 frail older women (125 patients from the strontium ranelate group, 139 patients from the placebo group) were identified. The risk for vertebral fractures was reduced by 58% (Relative Risk, RR = 0.41; 95% confidence interval, CI 0.23-0.73; p=0.002) and risk for all osteoporotic fractures (vertebral or non-vertebral) was reduced by 28% (RR, 0.72; 95%CI 0.49-1.04; p=0.08). Conclusion Strontium ranelate reduced significantly the risk of vertebral fracture over 3 years in postmenopausal frail women. Further studies involving a higher number of patients are necessary to assess the non-vertebral risk reduction in this population.

**PB7 242 PREVALENCE OF SARCOPENIA IN ELDERLY PEOPLE WITH HIP FRACTURE**

F. MASANES TORAN\* (Hospital Clinic, Barcelona , Spain)  
M. NAVARRO LOPEZ(1), M. NAVARRO GONZALEZ(2), A. CULLA GINESTA(1), E. SACANELLA MESEGUER(1), A. LOPEZ SOTO(1) - (1) Hospital Clínic (Barcelona, Spain); (2) CAPSE (Barcelona, Spain)

INTRODUCTION: To analize the prevalence of sarcopenia in a group of elderly patients with hip fracture (HF). METHODS: We evaluated 102 older patients (28m/74w) (HFG) with HF. We analyzed (<48 h admission): nutritional status (Mini Nutritional Assessment MNA), anthropometrical data, body mass index (BMI), functional capacity (Barthel index-IB) pre admission, comorbidity (Charlson index-Ch I), muscular mass (MM) and muscular mass index (MM/height<sup>2</sup>) (IMM). MM was determinate by electrical bioimpedance (RJL Systems). We compare the obtained results with 170 healthy old people (78m/92w) (HG). Sarcopenia was defined as a MMI < 2 SD under the mean for a young population (180 persons 20-40 y). RESULTS: men/women: HG: age 74,1/75,2 y, BMI 26,3/27,2 kg/m<sup>2</sup>, BI 99/99, ChI 0,6/0,4, MNA 28,7/28,4, MMI 9,9/7,1. HFG: age 82,8/82,9 y, BMI 24,9/25,7 kg/m<sup>2</sup>, BI 86,7/83,2, ChI 2,2/1,4, MNA 24,5/24,3, MMI 8,6/6,5. We

found that BMI was lower in men than women in both groups. The prevalence of sarcopenia was higher in HFG (43/60% vs 9/34%). Sarcopenia was related with BMI in HFG and HG p< 0,05. In the HFG sarcopenia was related with the age in both sexes and with BI in the men p< 0,05. CONCLUSIONS: 1. Patients with HF presents a high prevalence of sarcopenia. 2. Sarcopenia was related with age and BMI . 3. Presence of sarcopenia possibly increases the risk of HF. 4. The presence of sarcopenia evaluated by a non invasive and cheap method is a good frailty marker that keep us to do early preventive actions to improve the rehabilitation. Supported by grant FIS05/0098

**PB7 243 DIFFERENCES ON IN-HOSPITAL AND ONE-YEAR OUTCOME BETWEEN INTRA AND EXTRACAPSULAR HIP FRACTURES IN THE ELDERLY**

M. ÁLVAREZ-NEBREDA\* (Gregorio Marañón Hospital, Madrid, Spain)  
E. MARAÑÓN(1), S. NIETO(1), E. GALLEGOS(1), C. GONZÁLEZ DE VILLAUMBROSIA(1), R. BARRERA(1), Y. GRACIA(1), M. TOLEDANO(1), M. HERNÁNDEZ(1), J. SERRA(1) - (1) Gregorio Marañón Hospital (Madrid, Spain)

Introduction: It would be of interest to discover differences on in-hospital and one year outcome of elderly patients with intra and extracapsular hip fractures. Methods and materials: prospective longitudinal study including 1638 consecutive patients older than 64 years with a hip fracture, from 2004 to 2008. We compared Intracapsular Group (IG, N=722) and Extracapsular Group (EG, N=916). Variables analyzed were: social-demographic, functional status (Katz), ambulation (FAC) and complications. We analyzed mortality and functional recovery after in-hospital rehab and 3,6 and 12 months after discharge. Results: mean age: 83.5±7.2 years. 82% female. 20% living in nursing facilities. 33% independent on all B-ADL. 81% walking independently. 31% demented. Patients with extracapsular fractures (EG) were older (41vs29% of patients older than 80 years) but there were no differences on basal functional scores or number of comorbid conditions. EG developed more medical complications (77vs68%, p<0.001). A non-weight-bearing period of time was needed more frequently on EG. More patients in IG were eligible for in-hospital rehab (71vs63%, p=0.003). Patients of EG needed more public or private aids and new institutionalization at discharge. There were no differences neither in-hospital mortality nor at 3,6 or 12 months. Patients of IG recovered their previous independence for walking in more percent after in-hospital rehab than EG (45vs32%, p<0.001) and also after 3 months (61vs47%, p=0.003). There were differences of IG on functional recovery only at discharge of in-hospital rehab (49vs40%, p=0.008). Conclusions: Patients with extracapsular hip fractures are older, develop more medical complications and need more new nursing home placement. They recover later their walking ability and functional status but there is no difference on independence or mortality after one year.

**PB7 244 ELDERLY PATIENTS WITH A HIP FRACTURE AND A NON-WEIGHT-BEARING PERIOD OF TIME: DIFFERENCES ON IN-HOSPITAL AND ONE YEAR OUTCOME**

M. ÁLVAREZ-NEBREDA\* (Gregorio Marañón Hospital, Madrid, Spain)  
E. MARAÑÓN(1), F. COCA(1), A. MARTÍNEZ(1), Y. GRACIA(1), M. HERNÁNDEZ(1), J. SERRA(1) - (1) Gregorio Marañón Hospital (Madrid, Spain)

Introduction: Little is known about the outcome of patients with hip fracture who need a non-weight-bearing period of time after surgery. Methods and materials: prospective longitudinal study including 812 consecutive patients older than 64 years with a hip fracture, for 18 months. We analyzed: social-demographics, functional status (Katz), ambulation (FAC), comorbidities, type of fracture, complications, length of stay, mortality and placement after discharge. We compared 2 groups: non-weight-bearing group (NWBG, N=89) and patients with weight-bearing authorized (Control Group, CG, N=723). Results: mean age: 83.7±7.3 years. 83% female. 22% living in nursing facilities. 31% independent on all B-ADL. 81% walking independently. 11% needed a six-weeks non-weight-bearing time. On NWBG, 88% of patients had extracapsular fractures (34% perisubtrochanteric and 54% pecten trochanteric). NWBG had similar age, characteristics and functional status as CG. There were no differences between groups on medical complications or mortality but NWBG had more wound infections and blood transfusion requirements, as well as longer length of stay (12vs9 days). NWBG needed more social intervention (21vs11%, p=0.009) and different placement after discharge (to rehab-unit: 4.5vs75%, to their home: 67vs22%, new institutionalization needed: 28.4vs2.5%). There were differences on ambulation status only at 3 months (NWBGvsCG: independence on ambulation: 53vs65%). There were no differences on mortality, functional status, ambulation or placement after 6 and 12 months. Conclusions: 11% of patients with a hip fracture, the more frequent extracapsular fractures, need a period of non-weight-bearing. They don't have more complications or mortality but have longer length of stay and 28% need new nursing home placement after discharge. Although at 3 months they are more dependent on ambulation, after 1 year there are no differences on functional status, mortality or placement.

**PB7 245 ARE ELDERLY VOLUNTEER PARTICIPANTS IN EXERCISE TRIALS FITTER THAN NON-VOLUNTEERS?**

P. BARRETO\* (UMR 6578 – Unité d'Anthropologie Bioculturelle CNRS / Université de la Méditerranée / EFS, Marseille, France)  
A. FERRANDEZ(1), B. SALIBA-SERRE(1) - (1) UMR 6578 – Unité d'Anthropologie Bioculturelle (Marseille, France)

**Introduction.** Studies on exercise and functional fitness in the elderly are often subject to biases in selecting the study population: volunteers participants are thought to be in better physical shape than their same-age peers in the general population. The aim of this study was to look into whether volunteers to participate in an exercise trial are fitter than non-volunteers. **Methods and Materials.** A questionnaire about physical activity, functional limitations, state of health, bodily satisfaction, height, weight, and socio-demographic information was sent to 1000 individuals age 60 or over. Subjects were also asked whether or not they would be interested in participating in an exercise trial. Results. The questionnaire was answered by 535 individuals. Among them, 233 agreed to participate in the exercise trial and 270 did not. The volunteers were younger than the non-volunteers, but they did not differ in sex. Compared to non-volunteers, volunteers were more educated and more satisfied with their body, had higher health ratings and fewer chronic diseases, and took less medication. There was no difference between the levels of physical activity of the two groups. However, volunteers presented fewer functional limitations and higher weekly energy expenditure related to physical activity than non-volunteers did. **Conclusion.** Based on their functional abilities and physical-activity behavior, the volunteer participants in our study can be considered fitter than the non-volunteers. However, further analyses are needed to found out to what extent this bias can be interpreted in terms of the age difference between the two groups.

**PB7 246 PERSISTENT VERTIGO IN A PATIENT AT THE FALL CLINIC: KEEP BPPV IN MIND!**

M. HOOGSTEEN-OSSEWAARDE\* (UMC St Radboud, Dieren, The Netherlands)  
A. BOS(1), J. CLAASSEN(1) - (1) UMC St Radboud (Nijmegen, The Netherlands)

**INTRODUCTION:** Vertigo is a common problem in elderly patients presenting at a fall clinic. Diagnostics may be difficult, because of multiple potential causes of vertigo. We describe the case of a man with recurrent falling because of syncope and vertigo starting after a head trauma. **METHODS AND MATERIALS:** Case report: 78-year old man who fell more than 30 times in the previous year because of syncope and vertigo. Head rotation (particularly to the left), hyperextension of the neck, turning to the left side when lying in bed, bending over and coming upright provoked short attacks of vertigo. Attacks started a few seconds after moving the head, continued for less than 1 minute and were most prominent in the morning. No explanation for this vertigo was found during neurological examination. Orthostatic hypotension and possible hypersensitivity of the carotid sinus were determined. After discontinuing solifenacain, chlortalidone and non-pharmacological measures to prevent disorders in blood pressure regulation, syncope disappeared but vertigo with incidental falling continued. Therefore, additional diagnostic tests were performed. **RESULTS:** A holter registration occasionally showed bradycardia during daytime, however no association with vertigo could be demonstrated. Massage of the carotid sinus caused a significant fall in blood pressure confirming hypersensitivity of the carotid sinus, however asymptomatic. Finally, a Dix-Hallpike manoeuvre provoked symptomatic vertigo with nystagmus, suggesting benign paroxysmal positional vertigo (BPPV). An Epley manoeuvre was performed after which vertigo improved and no more falls occurred. **CONCLUSION:** In this patient, disorders in blood pressure regulation and BPPV both contributed to vertigo. BPPV should be considered when key symptoms and signs are present (short attacks, latency time, diurnal variation, nystagmus), particularly when there is a history of head trauma. The Epley manoeuvre is an easy and effective method to treat patients with BPPV.

**PB7 247 PREDICTIVE ABILITY OF COMMONLY IMPLEMENTED NUTRITION SCREENING INSTRUMENTS: WHAT DOES DATA FROM THE AUSTRALIAN LONGITUDINAL STUDY OF AGEING TELL US?**

M. MILLER\* (Flinders University, Adelaide, Australia)  
L. GILES(2), R. VISVANATHAN(2), L. COBIAC(1), M. LUSZCZ(1) - (1) Flinders University (Australia); (2) University of Adelaide (Australia)

**Introduction:** A variety of nutrition screening instruments have been developed for identifying risk of under-nutrition among community-dwelling older adults. These instruments vary in methodological quality creating confusion about which instrument to implement in practice. **Methods:** This study examines data from the Australian Longitudinal Study of Ageing to compare a range of nutrition screening instruments (Australian Nutrition Screening Initiative, Rapid Screen, Mini Nutritional Assessment – Short Form (MNA-SF), Malnutrition Universal Screening Tool, Malnutrition Screening Tool) for predictive ability in terms of outcomes including mortality and disability. **Results:** Preliminary analyses suggest that the Australian Nutrition Screening Initiative, Rapid Screen and MNA-SF were all significant risk factors for mortality (moderate to high nutritional risk resulting in 40 to 90% increased hazard of mortality) but none of the selected instruments were associated with an increased risk of disability. **Conclusion:** This work will be expanded upon to examine predictive ability of the range of nutrition screening instruments and outcomes including self rated health, positive affect, hospitalisations and change in accommodation. It is envisaged that this work will assist

health professionals to choose an evidence-based nutrition screening instrument for implementation in their setting.

**PB7 248 HIGHER C-REACTIVE PROTEIN AND SOLUBLE TUMOR NECROSIS FACTOR RECEPTOR LEVELS ARE ASSOCIATED WITH POOR PHYSICAL FUNCTION AND DISABILITY: A CROSS-SECTIONAL ANALYSIS OF A COHORT OF LATE MIDDLE-AGED AFRICAN AMERICANS**

M. HAREN\* (Saint Louis University, Saint Louis, United States)  
T. MALMSTROM(1), D. MILLER(2), P. PATRICK(1), H. PERRY(1), M. HERNING(1), W. BANKS(1), J. MORLEY(1) - (1) Saint Louis University (Saint Louis, United States of America); (2) Indiana University School of Medicine (Indianapolis, United States of America)

**Introduction:** This cohort of “late middle-age” African Americans has an excess of disability. We aimed to determine associations of circulating cytokine receptors (sTNFR1, sTNFR2, sIL-6R) and CRP with disability, physical function and body composition. **Methods:** Stratified sampling of two socio-economically diverse strata of Saint Louis, MO occurred in 2000-2001. Inclusion criteria were self-reported Black or African American race; born 1936 to 1950 inclusive and MMSE score ≥16. In-home evaluations of hand-grip strength, LBM%, physical performance, upper and lower body functional limitations (UBFLs and LBFLs) and basic and instrumental activities of daily living (BADLs and IADLs) were collected. Of the 998 participants, 368 had blood sampled at baseline. Serum was stored and assayed in 2006. **Results:** Absolute risks were: LBFLs ≥2, 46%; UBFLs ≥1, 23.5%; BADLs ≥2, 20.6% and IADLs ≥2, 22.5%. Independent of age, sex and underlying co-morbid conditions, higher CRP and sTNFR associated with poorer physical performance ( $\beta$  -1.462,  $P<0.001$  &  $\beta$  -0.618,  $P = 0.003$ ), UBFLs (OR 2.26 [95% CI 1.1 – 4.64] & OR 1.39 [0.96 – 2.02]), LBFLs (OR 2.30 [1.19 – 4.45] & OR 1.91 [1.26 – 2.91]), BADLs (OR 2.79 [1.03 – 5.96] & OR 1.66 [1.11 – 2.46]) and IADLs (OR 2.13 [1.03 – 4.41] & OR 1.43 [0.99 – 2.08]). Higher CRP ( $\beta$  -3.251,  $P<0.001$ ), sIL-6R ( $\beta$  -6.152,  $P = 0.013$ ) and lower adiponectin ( $\beta$  2.947,  $P = 0.052$ ) associated with lower LBM%. **Conclusions:** Higher CRP and sTNFR are independently associated with disability and physical dysfunction. Higher sIL-6R, CRP and lower adiponectin associate with lower LBM%.

**PB7 249 CHARACTERISTICS OF HEALTH PROBLEMS AMONG THE FRAIL HIGH-RISK ELDERLY IN A RURAL COMMUNITY IN JAPAN**

H. HONDA\* (Tohoku Bunka Gakuen University, Sendai, Japan)  
H. HAGA(2), S. UEKI(3), J. TAKATO(1), G. INUZUKA(1), T. KASAI(1), N. ARAYAMA(1), T. OKADA(3), S. EBATA(3) - (1) Tohoku Bunka Gakuen University (Japan); (2) Graduate School, J.F.Oberlin University (Japan); (3) Graduate School, Tohoku Bunka Gakuen University (Japan)

**Purpose** Individuals who may imminently become frail elderly people are called “Tokutei-Koreisha” in Japan. “Tokutei-Koreisha” are assessed using a check sheet consisting of 25 items, established by the Ministry of Health, Labour and Welfare. The present study was therefore conducted to clarify “Tokutei-Koreisha” characteristics among the elderly dwelling in a rural community in Japan. **Methods** The participants analyzed in the present study were 1,507 men and 2,341 women aged 65 to 104 years living in a rural community in Japan. Their health problems were (1) Motor function, (2) Malnutrition, (3) Oral cavity function, (4) Housebound, (5) Dementia, (6) Depression. **Results** Overall, 32.1 % of men and 38.9 % of women were classified as “Tokutei-Koreisha”. The rates of each health problem among “Tokutei-Koreisha” were 52.7 % dementia, 39.0 % depression, 32.6 % motor function, 27.3 % housebound, 24.5 % oral cavity function, and 1.5 % malnutrition, respectively. The results of multivariate logistic regression analysis to explore correlates showed that motor functions, malnutrition, oral cavity function, and depression in men, and motor function, malnutrition, oral cavity function in women, were significantly and independently related to functional decline. **Conclusion** These results suggest that support by a comprehensive program, considering the improvement of motor function, malnutrition, oral cavity function, and prevention of depression, is required to maintain the independent living of the frail high-risk elderly, so-called “Tokutei-Koreisha”, in a rural community in Japan.

**PB7 250 EFFECTS OF LOWER BODY RESISTANCE AND BALANCE EXERCISES IN HOME DWELLING JAPANESE OLDER WOMEN**

N. TOMIYAMA\* (Seijo University, Tokai, Aichi, Japan)  
R. HASEGAWA(1), M. ISLAM(2) - (1) Seijo University (Japan); (2) Yonaha General Hospital (Japan)

About 30% of Japanese over 65 years of age fall at least once per year, and 10% of falls result in fractures. Previous research indicates that there is strong association between leg muscle weakness and falls. In addition, decreased balance ability has been shown to increase falls in older adults. Balance ability is affected by vision, vestibular sensation, somatosensory function and muscular system. The purpose of this study was to determine the effect of lower body resistance exercises (RE) and balance exercises focusing on somatosensory function (BE) in home dwelling older women. Subjects were divided into a exercise group (EG, n = 14, mean age 71 ± 3 yr) and a control group (CG, n = 15, mean age 72 ± 5 yr). EG performed 10 weeks of supervised (1 d /wk, 60 - 90min/day) center-

based exercise (10min of warm-up, 30-40min of BE, 10-20min of RE and 10min of cool down). Elastic bands were used during RE, and unstable base of support (foam pads) was used during BE. Strength was evaluated using 30-sec chair stand (CS) tests and balance was measured using eye-closed one leg stance (EC), Functional Reach Test (FRT), Four Square Step Test (FSST), and Timed Up and Go test (TUG) in all participants before and after the intervention. EG showed significant improvements in CS (19 %) and TUG (- 8 %). No significant changes were noted in EC, FRT, and FSST. These results suggest that elastic band-based resistance exercises have beneficial effects on strength training, however, further study is needed to find out a suitable mode of balance exercises for home dwelling older women.

#### **PB7 251 LONG TERM BENEFITS OF EXERCISE ON BALANCE IN OLDER ADULTS**

M. BIRD\* (University of Tasmania, Launceston, Australia)  
K. HILL(1), K. HILL(3), . BALL (2), S. HETHERINGTON (2), A. WILLIAMS(2) - (1) National Aging Research Institute (Melbourne, Australia); (2) University of Tasmania (Melbourne, Australia); (3) La Trobe University and Northern Health (Melbourne, )

Aim: This study records ongoing participation in resistance training over a year after a formal exercise intervention ceased, and meets two aims: to report on the long term (12 months) benefits of participating in a resistance and flexibility training program compared to a non exercising control group; and to describe differences in balance and mobility between those participants who continue to exercise and those who do not. Results: Significant improvements in sit to stand, timed up and go and sway velocity were seen at one-year follow up with the exercising group, but not in the control group. Improvements in strength at the end of the intervention were not present a year later. Significant differences in the perception of benefits were seen between the control participants and exercisers. The only significant difference between the continuing exercisers and the ceased exercisers was a perception in the benefit of the program to participation in physical activity. Conclusion: Long-term benefits to some measures of balance and mobility persist one year after participation in a program that includes resistance and flexibility training. Motivation to continue resistance training may be supported by perceived benefits in physical activity.

#### **PB7 252 TRAINING FOR DYNAMIC BALANCE FUNCTION: IS IT POSSIBLE TO IMPROVE SENSE OF BALANCE IN THE ELDERLY?**

M. KANAMORI\* (Biwako Seikei Sport College, University, Otsu city, Shiga-ken, Japan)

For the elderly, the experience of falling down not only leads to decreasing the amount of physical exercise that is engaged in, such as walking outside, but also induces a fear of falling and causes deterioration of mental QOL. Physiological factors considered to induce falling in the elderly are a decline in leg strength, aging of the semicircular canal, failure of the sense of balance and aging of brain function. We report herewith the training effects such as improvement in balance function discovered using the new experience of riding a specially developed automated and controlled unicycle and by aerobic and anaerobic exercise. Method: Elderly case subjects aged 64- to 69-years old participated in either an exercise program involving the experience of riding the automated unicycle or a regular exercise plan (control group; n = 34) and the performance of each participant was compared before and 3 months after the start of training. Tests of physical strength such as standing on one leg with closed eyes (balance function), grip (strength), and running for 3 minutes (staying power) as well as blood tests for HDL-cholesterol and HbA1c and blood pressure measurements were conducted and training effects were observed. Statistical evaluation was carried out using matched pair t-test and stepwise multiple regression analysis. Results and discussion: Statistically significant differences between before and after exercise program were observed in grip, staying power and in HDL-cholesterol. All cases were able to ride the unicycle. Conclusions: From these findings it was understood that training by automated unicycle has a positive effect on the improvement of dynamic balance function in the elderly. We discussed that these training effects are due to get learning effect, formation of spinal reflex pathways, and ability to maintain posture through improvement in physical strength.

#### **PB7 253 FACTORS ASSOCIATED WITH CERTIFICATION FOR LONG-TERM CARE NEED IN COMMUNITY-DWELLING OLDER ADULTS: COMPARISON OF PARTICIPANTS WHO UNDERGO HEALTH CHECK-UPS AT A HEALTH CENTER WITH THOSE WHO UNDERGO CHECK-UPS AT HOME VISITS OVER A 3-YEAR FOLLOW-UP**

S. YASUMURA\* (Fukushima Medical University School of Medicine, Fukushima City, Japan)  
E. SAITO(1), H. YOKOKAWA(2), C. KANEKO(2), N. SUZUKI(2), K. MAKIGAMI(2), S. UEKI(3), S. WATANABE(4) - (1) Tokyo Metropolitan University (Arakawa, Japan); (2) Fukushima Medical University (Fukushima, Japan); (3) Tohoku Bunka Gakuen University (Sendai, Japan); (4) Otama Village (Otama, Japan)

We evaluated risk factors associated with long-term care certification among community-dwelling older adults aged 70 years and older over a 3-year period. Methods: Among 1,523 subjects in a village in Japan, 1,347 were eligible to participate; inpatients and

current recipients of long-term care were excluded. Interviews were conducted during a health check-up in a community health center in July 2004. Home visits were conducted for those who did not go to the health center. Results: Of the 838 subjects assessed, 443 underwent check-ups at a health center and 395 were seen during home visits. During the 3-year follow-up, 94 subjects (11.2%) were certified for long-term care, 48 (5.7%) died, and 3 (0.4%) were lost to follow-up. Significantly more subjects who underwent a home visit were certified for long-term care compared with subjects seen at the health center (16.0% vs 7.0%, respectively). Cox proportional hazards regression analysis showed that advancing age and standing time from a long sitting position on the 4sec/>floor (11/

#### **PB7 254 ASSOCIATION BETWEEN A HISTORY OF FALLS AND THE ABILITY TO MULTI-TASK IN COMMUNITY-DWELLING OLDER PEOPLE**

H. MAKIZAKO\* (Sapporo Medical University, Sapporo, Japan)  
H. IHIRA(1), H. SHIMADA(2), L. ODDSSON(3), M. KIMURA(4), E. UCHIYAMA(1), T. FURUNA(1) - (1) Sapporo Medical University (Sapporo, Japan); (2) Tokyo Metropolitan Institute of Gerontology (Sapporo, Japan); (3) Sister Kenny Rehabilitation Institute (Sapporo, United States of America); (4) International Life Sciences Institute JAPAN (Sapporo, Japan)

Introduction: Many older people experience falls when they perform tasks that require increased attention. The purpose of this study was to determine differences in reaction time during single-, dual- and triple-task conditions that required different levels of motor coordination, balance control and cognitive attention between a group of fallers and non-fallers in community-dwelling older individuals. Methods and materials: Eighty seven elderly individuals were recruited to participate in the study including 57 women and 30 men; aged 75 to 91 years (mean age 80.3 years). Reaction time, measured by pushing a handheld button as quickly as possible in response to a visual stimulus, was measured under four different conditions; 1) quiet standing (single-task); 2) counting backward during quiet standing (dual-task with cognitive demand); 3) stepping in place (dual-task with balance demand); 4) counting backward while stepping in place (triple-task). Results: Twenty nine (33.3%) participants experienced at least one fall during the past year. There were no statistically significant differences in reaction times between non-fallers and fallers during any of the tasks. Reaction times were significantly longer during dual- and triple-tasks as compared to single-task conditions in both groups. The ratio between reaction time during dual-task with balance demand (stepping in place) and reaction time in the single-task condition related significantly to a history of falls and showed the highest odds ratio (OR 3.16, 95% CI 1.06 - 9.45, P = 0.04). Conclusion: Relative changes in reaction time during a dual-task with balance demand related to a history of falls in community-dwelling Japanese older people. Reaction time under dual-task conditions with a balance demand was more sensitive to past falls than reaction time during a dual-task with cognitive demand.

#### **PB7 255 PREVENTION OF FALLS IN PERSONS WITH OSTEOPOROSIS: RESULTS OF A RANDOMIZED CLINICAL TRIAL**

E. SMULDERS\* (Sint Maartenskliniek, Nijmegen, The Netherlands)  
W. VAN LANKVELD (1), J. DUYSENS(2), R. LAAN(3), V. WEERDESTYEN(4) - (1) Sint Maartenskliniek, Department of Rheumatology (Nijmegen, The Netherlands); (2) K.U. Leuven, Department of Biomedical Kinesiology (FaBeR) (Leuven, Belgium); (3) Rheumatology, Radboud University Nijmegen Medical Centre (Nijmegen, The Netherlands); (4) Rehabilitation Medicine, Radboud University Nijmegen Medical Centre (Nijmegen, The Netherlands)

Introduction: Persons with osteoporosis are particularly at risk for fall-related fractures, because of decreased bone strength. Exercise programs can prevent falls and fall-related injuries in the elderly. The 'Nijmegen Falls Prevention Program' ('NFPP') has shown to be successful with a 46% reduction of the number of falls in community-dwelling elderly. However, patients with osteoporosis were excluded from this program, because of safety reasons. The benefits of a falls prevention program for patients with osteoporosis, however, are expected to be large. Therefore, the NFPP was adjusted for patients with osteoporosis and evaluated for its efficacy in a randomized clinical trial. Methods: A total of 92 persons with osteoporosis (mean age (SD): 71.0 (4.7), 86 female, 6 male; T-score < -2.5) participated. After a baseline measurement (M1), participants were randomly allocated to an exercise (n=47) and control group (n=45). Subsequently, the exercise group participated in the NFPP for persons with osteoporosis (5.5 weeks) whereas the control group received usual care. After the program had ended the second measurement took place (M2) followed by the third (M3) after one year. Primary outcome measure was fall incidence, measured for one year with monthly fall registration cards. At M1, M2 and M3 balance confidence (ABC-scale), quality of life (qualeffo-41) and activity level (pedometer) were assessed. Results: Fall incidence rates decreased by 35% in the exercise group compared to the control group (0.75 vs 1.16 falls/year). Balance confidence, QoL and activity levels remained the same in both groups for all three measurements. Conclusion: Since the results show that the program was effective in reducing the number of fall incidents it is

concluded that it is a valuable new alternative tool for the prevention of falls and fractures in elderly subjects with osteoporosis.

**PB7 256 THE SHORT PHYSICAL PERFORMANCE BATTERY (SPPB): CORRELATION WITH OTHER AREAS OF COMPREHENSIVE GERIATRIC ASSESSMENT**

A. CRUZ-JENTOFT\* (Hospital Universitario Ramón y Cajal, Madrid, Spain)  
J. DÁVILA-VALERO(1), B. MONTERO-ERRASQUIN(1), C. SÁNCHEZ-CASTELLANO(1), A. MACÍAS-OSUNA(2) - (1) Hospital Universitario Ramón y Cajal (Madrid, Spain); (2) Hospital San José Tec (Monterrey, Mexico)

**Introduction:** The Short Physical Performance Battery (SPPB) has been recommended as a standard measure of performance in older subjects. However, the correlations of the results of the SPPB with other measures obtained within a comprehensive geriatric assessment (CGA) have not been fully assessed. **Method:** The SPPB was performed in consecutive older subjects (>70 years) submitted by their primary care physicians to a hospital outpatient clinic for a CGA. All assessments were performed by the same geriatrician to reduce bias. Spearman correlation coefficients between the results of SPPB and other measures obtained with the CGA were calculated. **Results:** 51 subjects were included (mean age 80.4 years, 84.3% females). Mean SPPB was 5 (range 3 to 8). SPSS had a high correlation with Katz's ADL index ( $r=0.80$ ,  $p<0.001$ ) and a moderate correlation with Lawton's instrumental ADL ( $r=0.64$ ,  $p<0.001$ ) and age ( $r=0.59$ ,  $p<0.001$ ). A weaker correlation was found between SPPB and MMSE ( $r=0.42$ ,  $p=0.002$ ), and the number of drugs ( $r=0.42$ ,  $p=0.002$ ). No correlation was found with gender, BMI, number of falls, results of the Geriatric Depression Scale-15, and visual or hearing deficits. When the three components of the SPPB were studied separate, age, basic ADLs and MMSE had their strongest correlation with walking speed, instrumental ADLs with balance, and use of drugs with the chair stand test. **Conclusions:** The SPPB, a performance measure related with frailty and sarcopenia, was related, in this outpatient population, with age, ADL, cognitive function and number of drugs, but not with other areas of the CGA.

**PB7 257 INCIDENCE OF FALLS AMONG OLD PEOPLE RECEIVING HOME-HELP SERVICES IN A SWEDISH MUNICIPALITY**

I. VIKMAN\* (Department of Health Science, Luleå, Sweden)  
L. NYBERG(1), A. NORDLUND(2) - (1) Luleå University of Technology (Luleå, Sweden); (2) Stockholm University (Stockholm, Sweden)

Falls among old people are a well-mapped phenomenon, however, falls among people living in the community and receiving home-help services have been scarcely studied. Therefore, we investigated falls among community living home-help receivers in a Swedish municipality. This prospective cohort study included all 614 persons aged 65 and over, receiving municipality home help during one year from October 2005 in a particular community. Data on age, sex, and home help service use were collected from home-help services records, and falls were reported by staff on report forms specifically designed for the study. The overall fall incidence was 626 per 1000 PY, and incidence rate ratios were significantly correlated to total amount of services ( $p<0.001$ ), as well as to the amounts of help for I-ADL needs ( $p<0.001$ ), P-ADL needs ( $p<0.001$ ), meal distribution ( $p<0.001$ ) and escort service ( $p=0.004$ ). The proportion of falls reported as resulting in injury was 33 %. In conclusion, the fall incidence rate among home-help receivers aged 65 and over seems strongly correlated to the amount of services. This implies that fall prevention should be considered when planning the care for old people with ADL and mobility needs.

**PB7 258 CAN AN ACCELEROMETER ENHANCE TIMED-UP&GO TEST SENSITIVITY AMONG PATIENTS WITH PARKINSON DISEASE?**

J. HAUSDORFF\* (Tel Aviv Sourasky Medical Center, Tel Aviv, Israel)  
A. WEISS(1), T. HERMAN(1), M. PLOTNIK(1), M. BROZGOL(1), I. MEIDAN(1), N. BOROVSKY(1), N. GILADI(1) - (1) Laboratory for Gait & Neurodynamics & Movement Disorders Unit, Tel-Aviv Sourasky Medical Center (Tel-Aviv, Israel)

**Introduction:** Timed Up and Go (TUG) is a widely used mobility and fall-risk measure in older adults and Parkinsons disease (PD). We hypothesized that body-fixed-sensors can gain insight on TUG performance of PD patients. **Methods:** 17 PD patients (ON state) and 15 healthy controls (CO), (mean age  $66.8\pm5.9$ y;  $67.6\pm9.6$ y, respectively) wore a 3D Mobi8 (TMSI-International) trunk accelerometer while performing TUG. The sit-to-stand (Si-St) and stand-to-sit (St-Si) times were extracted from the 3-D signals. Measures included Si-St and St-Si durations, amplitude range and slopes (dt1, dt2, RNG1, RNG2, Slope1, Slope2, respectively), and were divided to 2 halves: a&b. Median (md) acceleration amplitude and the frequency-content of the signal in the 0.5-3hz low-locomotion-band (LFap) and 3-8hz high-FOG-band(HFap) were calculated.. **Results:** TUG duration was significantly ( $p<0.02$ ) higher in PD versus CO ( $10.2\pm2.85$ s,  $8.2\pm1.62$  s, respectively). AP RNG1, RNG2a, Slope1b, Slope2a and LFap were significantly lower in PD versus CO ( $p<0.02$ ). MDap was significantly higher ( $p=0.02$ ) in PD versus CO. A significant difference within the PD group (not found in CO) was found between RNG1a and RNG2b ( $p<0.004$ ). **Conclusions:** Accelerometer-derived-measures, especially AP, were more sensitive than duration to group differences, indicating that PD subjects have slower and decreased locomotion during Si-St and St-Si. These measures may potentially detect subtle mobility changes and

identify early markers of PD along with the documentation of disease progression and response to therapeutic interventions

**PB7 259 THE ASSOCIATION BETWEEN BIRTH WEIGHT AND GRIP STRENGTH: A REVIEW OF THE EVIDENCE FOR DEVELOPMENTAL INFLUENCES ON SARCOPENIA.**

A. AIHIE SAYER\* (University of Southampton, Southampton, United Kingdom)  
H. SYDDALL(1), H. MARTIN(1), H. PATEL(2), D. BAYLIS(2), C. COOPER(1) - (1) MRC ERC, University of Southampton (Southampton, United Kingdom); (2) Academic Geriatric Medicine, University of Southampton (Southampton, United Kingdom)

**Introduction** Sarcopenia, the loss of muscle mass and strength with age, has serious health consequences. Its adult determinants are well known but developmental influences may also contribute. We reviewed the evidence for an association between lower birth weight and reduced hand grip strength in later life. **Methods** Relevant articles were identified using Pubmed, OVID Medline and ISI Web of Knowledge. Study details were collated in tabular form. Stata 10 was used to produce a forest plot and to estimate the pooled coefficient for the relationship between birth weight and grip strength. The relative effect sizes of birth weight, age and height on grip strength were identified using the Hertfordshire Cohort Study (HCS). Results Ten studies of men and women considered the full range of birth weight; these varied from 316 to 1,562 participants, with follow-up ages 18 to 67 years. A forest plot showed homogeneity of association between birth weight and grip strength (Q-statistic 7.36,  $p=0.60$ ) with a pooled estimate of a 2.06kg decrease in grip strength per kilogram decrease in birth weight (95%CI 1.77, 2.35). Birth weight, age and adult height accounted for 2.2%, 3.6% and 16.2% of variance in grip strength in HCS. **Conclusions** The association between lower birth weight and reduced grip strength in later life is consistent across studies. Future studies need to elucidate the underlying molecular and cellular mechanisms of developmental influences on sarcopenia.

**PB7 260 UPPER EXTREMITY MUSCLE STRENGTH IN AN ELDERLY POPULATION - RELATION TO FUNCTIONING.**

B. SJÖLUND\* (Karolinska Institutet, Stockholm, Sweden)  
A. WIMO(2), A. SKÖLDUNGER(1), E. VON STRAUSS(1) - (1) Aging Research Center (ARC), KI (Stockholm, Sweden); (2) Alzheimer's Disease Research Center, KI (Stockholm , Sweden)

**Introduction.** Physical and mental impairments in old age have a considerable impact in daily life, but the needs for impaired elders are not well understood and measured. The aim of this study was to examine the upper extremity muscle strength (hand-grip) in an elderly population, and its relation to functioning. **Methods and materials.** Data derived from a population-based study ongoing in Sweden: The Swedish National study on Aging and Care. The study population was a random sample of 60+ year-old individuals living in the municipality of Nordanstig (SNAC-N). During 2001-2003 all participants were clinically examined, cognitively assessed, and socially interviewed. Hand-grip strength was measured with an electronic dynamometer, Grippit. Age- and gender-specific prevalence figures, and regression analyses adjusted for gender and education were calculated. **Results.** Of the 1016 subjects in the study population, 2 % died and 23 % denied participation. The majority of the 766 participants were living at home (89%), and 71% had less than 8 years education. Grip strength was higher in men at all ages ( $p<0.001$ ), and decreased dramatically with age for both genders. Before age 70, median strength for men was 432 Newton (range 132-629) and for women 231 (46-381). At age 80 this figure had decreased to 270 (72-537) and 148 (34-263), and at age 90 to 158 (94-358) and 126 (20-192) respectively. An association with lower grip strength and cognitive impairment (MMSE<24) was found in the younger elderly (60 to 77 years), and with lower grip strength and disability (assistance in 2+ ADL-activities) in the older elderly (81+). **Conclusion.** Our findings support the hypothesis that upper extremity muscle strength is associated with mental and physical functioning. Furthermore, differences in grip strength vary with gender and age.

**PB7 261 EXAMINATION FROM THE ACTUAL CONDITION AND THE ENVIRONMENTAL AGENT OF THE FALL ACCIDENT IN A CERTAIN HOSPITAL**

M. SHIROZU\* (St.Mry's College , Kurume city, Japan)

**Introduction:** In recent years, in the medical spot, safe environment was taken up more often. When the hospital and sickroom as space where a patient lives are considered, it is necessary to offer safe environment. One of the main causes of a medical accident has a fall, and it has been a pressing subject to take fall prevention and preventive measures. The present age serves as an aging society and is also carrying out the increase in the rate that elderly people occupy to an inpatient. A fall is one of the everyday occurrences which often encounter, and the many happen as a result of a fall person's active act. An environmental agent becomes entangled with a fall person's intentional act intricately, and a fall occurs. It is performing the survey of a fall accident for an inpatient and clarifying about the relation between a fall accident and environment in this research. **Methods and materials:** In the hospital of about 500 floors in the northern part in Fukuoka, investigation during nine months in April, Heisei 16 to December was conducted. There were 254 fall accidents in a consultation period. The protocol of this study was approved by the Ethics Review

Committee of this hospital. Results and conclusion? The number of fall accident occurrences in a consultation period was 254 affairs. Candidates were 167 men and 87 women and the average age was 74.8 years old. May was 35 fall accidents. Correlation was between the number of fall accident occurrences and average temperature in May. June was 35 fall accidents. Correlation was between the number of fall accident occurrences and the maximum temperature in June. When outside temperature falls, the influence on a body activity arises and a possibility that the fall has occurred cannot be denied.

**PB7 262 AN EXPLORATORY ANALYSIS OF VARIABLES ASSOCIATED WITH IMPAIRED PHYSICAL PERFORMANCE AMONG ELDERLY PEOPLE THROUGH DATA MINING OF INCHIANTI DATA BASE**

E. GROSSI\* (Bracco SpA, S. Donato Milanese - Milano, Italy)

A. CHERUBINI(1), C. RUGGIERO(1), E. CIRINEI(1), B. GASPERINI(1), S. BANDINELLI(3), L. FERRUCCI(4) - (1) Institute of Gerontology and Geriatrics, Dept. of Clinical and Experimental Medicine, University of Perugia (Perugia, Italy); (3) Geriatric Rehabilitation Unit, Azienda Sanitaria Firenze (ASF) (Florence, Italy); (4) Medstar Research Institute (Baltimore, Maryland, United States of America)

Introduction We applied a novel non linear data mining technique named Auto Contractive Map (Auto-CM), based on artificial neural networks, to explore the natural associations among 48 clinical and biological variables of elderly subjects randomly extracted from general population. Subjects and Methods Data come from InChianti, a longitudinal study of community-living persons >65years who were randomly selected from a population registry in two town of Tuscany, Italy. The main outcome measure was impaired physical performance, defined as Short Physical Performance Battery (SPPB) score between 0 and 9. Those subjects who had a SPPB score between 10 and 12 were considered to have unpaired lower extremity performance. The philosophy behind Auto-CM is to pick up affinities among variables related to their dynamical interaction rather than to their simple contingent spatial position. This approach seems to be more suitable to describe living systems context in which there is a continuous complex change in the variables values among time. Results SPPB 0'9 resulted to be a major hub in the semantic map, linked to knee arthrosis, CHF, age>75 years and >85years, female gender and fragility as nodes of first degree of separation. PCR and serum IL6 resulted to be linked to fragility together with Parkinson and femoral fracture. Other cytokines like TGFB1 and TNFA'E resulted confined far away from SPS 0'9 and fragility in the map. SPPB 10'12 was linked with male gender and high MMSE values through age 65-75. Low schooling linked with MMSE 20-25 while >10yrs schooling linked with MMSE>26. MMSE<20 linked with age>85years. Conclusions Auto-CM extends previous observations and confirms that physical performance impairment decline is an age associated complex phenomenon in which cognitive function, some immune factors and chronic inflammatory triggers play a major role.

**PB7 263 ROLLATOR USE AND FUNCTIONAL OUTCOME OF GERIATRIC REHABILITATION**

M. BACH\* (Goethe-University Frankfurt/Main, Frankfurt/Main, Germany)

L. VOGT(1), K. LUCKI(1), B. SCHULZE(2), W. BANZER(1) - (1) Goethe-University (Frankfurt/Main, Germany); (2) St Elisabethen-Krankenhaus (Frankfurt/Main, Germany)

Introduction: Ambulation assistive devices are frequently prescribed to increase stability, enhance mobility and independence or cope with fear of falling. Nevertheless, the regular use of walking aids may also predict decline in ADL function and could be associated with hospitalization. In a matched samples design the present study examined the effect of rollator use on functional rehabilitation outcome in geriatric patients. Methods: At the time of admission to a geriatric rehabilitation clinic 40 patients who agreed to receive a rollator (age 74–93 yrs) were classified into an experimental group and compared with a historic control group (n=40, no device) (age 67–91 yrs) matched for the admission functional status. Timed Up and Go test was used to characterize basic functional mobility. The time required to complete 5 repeated chair stands (5-chair Sit to Stand) was calculated as a measure of lower limb strength. Balance capacity in parallel stance (Romberg test) was rated on a 4-point ordinal scale. Measurements were repeated after the inpatient rehabilitation regimen (length of stay 20.6 ± 7.3 days). Performance-Oriented Mobility Assessment was used for predicting the admission risk of falling (cut-off <20). Results: Non-parametric testing did not reveal significant group differences between admission and discharge motor performance scores. Device users and controls demonstrated nearly comparable mobility (36 vs. 35), strength (29 vs. 37) and balance (7 vs. 10) improvements. Almost 20% of all patients showed functional gains in all three tests. Subgroup analysis with respect to the admission risk of falling indicated significant ( $p<.05$ ) performance differences between potential fallers and non-fallers independently of the rollator use. Conclusion: The study evidenced that rollator assistance does not interfere with functional rehabilitation outcome. Future studies should systematically evaluate the impact of wheeled walkers on fall prevention during geriatric rehabilitation.

**PB7 264 BIOLOGICAL DETERMINANTS OF OSTEOPOROSIS AND FRACTURE HISTORY IN AMBULATORY PATIENTS HOSPITALIZED FOR INTERCURRENT DISEASES IN AN ACUTE GERIATRICS DEPARTMENT**

R. OPRISIU-FOURNIER\* (University of Picardie, AMIENS CEDEX 1, France)

University Hospital of Picardie (AMIENS CEDEX 1, France); (3) Rhumatology University Hospital of Picardie (AMIENS CEDEX 1, France); (4) Nuclear medicine University Hospital of Picardie (AMIENS CEDEX 1, France); (5) University of Picardie - INSERM ERI12 (France); (6) Rhumatology University Hospital of Picardie (France); (7) Geriatric department University Hospital of Picardie (France); (8) Nephrology & internal medicine University Hospital of Picardie (France)

Introduction Osteoporosis prevalence is high in elderly patients. In order to implement preventive measures, we took the opportunity of hospitalisation for intercurrent disease of 55 ambulatory patients (27 men and 28 women, age 82 years) to measure bone mineral density (BMD), serum mineral, renal and nutritional parameters. Methods BMD, lean and fat body mass were measured by absorptiometry (DEXA). Results Densitometry osteoporosis (Tscore<-2.5) was more frequent in women than men (92 vs 76% at radius third; 62 vs 52% at ultradistal radius, 75 vs 33% at femoral neck). Nutritional parameters pointed out endogenous denutrition with albuminemia at 33 g/l, high CRP (36mg/dl), IGF 1=87ng/ml (NR 76-160), GFR (ml/min) by Cockcroft was moderately decreased (61 in men and 43 in women). Thyroid function was normal. 25OHvitD (ng/ml) was very low, both in men (6.6) and women (9). Intact PTH was normal at 47 and 63 pg/ml (normal<65pg/ml) as well as bone alkaline phosphatase (14 and 18 $\mu$ g/l; NR 4-21), in spite of renal insufficiency and D-depletion, presumably because of normal serum phosphate and corrected calcium. In contrast, crosslaps CTX were at twice the upper limit of normal (778pmol/l). BMD was positively correlated with height, weight, lean (but not fatty) body mass and IGF1, and negatively with CTX; no correlation of BMD with 25OH or PTH was observed because of the narrow ranges of low 25OHD and normal PTH. Conclusion 1-In our very elderly population with severe vit D deficiency, low BMD appears related more to increased resorption than to decreased bone formation. 2-Fracture risk is related directly to age and inversely to BMD, prealbumin and triglycerides ie to malnutrition. This stress the importance of preventing malnutrition in addition to vitamin D repletion.

**PB7 265 IDENTIFYING EARLY BALANCE DYSFUNCTION IN OLDER PEOPLE, AND EFFECTIVENESS OF A HOME EXERCISE BALANCE TRAINING PROGRAM.**

K. HILL\* (La Trobe University and Northern Health, Bundoora, Australia)

X. YANG(1), K. MOORE(1), S. WILLIAMS(1), L. DOWSON(1), K. BORSCHMANN(1), S. DHARMAGE(2) - (1) National Ageing Research Institute (Parkville, Australia); (2) The University of Melbourne (Parkville, Australia)

Aim: To evaluate a suite of force platform and clinical balance related measures in identifying early balance dysfunction, and to determine the effectiveness of a home based balance training program. Method: 225 community-dwelling older people (>65 years) were recruited, who remained community-ambulant but reported concerns about balance, loss of confidence, or near falls. A predetermined algorithm of performance comprising a suite of force platform (Neurocom Balance Master) and clinical balance related measures were used to identify participants with performance outside of normal performance range. Participants with identified balance dysfunction were randomised to an intervention group (6-month physiotherapist prescribed balance-training home exercise program, based on the Otago exercise program and the HPR Balance/Vestibular Exercise Set) or a control group. Participants in the control group continued with their usual activities. All participants were reassessed after 6 months by researchers blind to group assignment. Results: 165 participants (73%) had balance performance outside of normal range. 59 of the 83 participants in the intervention group (71.1%), and 62 of 82 in the control group (75.6%) returned for reassessment. Comparison of laboratory and clinical measures of balance, gait and strength between groups pre and post followup revealed significant improvement ( $p<.05$ ) in standing stability (mCTSIB composite score,  $p=.037$ ), Functional Reach ( $p<.000$ ), Step Test ( $p<.000$ ) and several other balance related measures for the intervention group relative to the control group. Fourteen (23.7%) of the intervention group improved to within normal limits at the end of the exercise program. Conclusion: Mild balance dysfunction is common and able to be identified using laboratory and clinical balance and related measures. An individualized physiotherapist prescribed home exercise program targeting balance performance is feasible and effective in improving balance in this group. Funding: Australian Government Department of Veterans' Affairs.

**PB7 266 DERIVATION AND VALIDATION OF A MORTALITY-RISK INDEX FROM A COHORT ELDERLY PATIENTS HOSPITALISED IN MEDICAL WARDS VIA EMERGENCY UNITS**

M. DRAMÉ\* (University of Reims Champagne-Ardenne, Reims, France)

J. NOVELLA(1), R. MAHMOUDI(2), P. COUTURIER(3), D. HEITZ(4), B. DE WAZIÈRES(5), R. GONTHIER(6), O. SAINT-JEAN(7), F. BLANCHARD(1), D. JOLLY(1), - (1) University of Reims Champagne-Ardenne, Faculty of Medicine, EA3797 (Reims, France); (2) Reims Teaching Hospitals (Reims, France); (3) Grenoble Teaching Hospitals (51092, France); (4) Strasbourg Teaching Hospitals (Strasbourg, ); (5) Nîmes Teaching Hospitals (France); (6) Saint-Etienne Teaching Hospitals (France); (7) Public Assistance, Hospitals of Paris (France)

Objectives: To identify predictive factors for 2-year mortality from a cohort of elderly patients after acute hospitalisation, and from these to derive and validate a Mortality Risk Index (MRI). Methods: A prospective cohort of elderly patients was set up in nine teaching hospitals. This cohort was randomly split up into a derivation cohort (DC) of 870 subjects

and a validation cohort (VC) of 436 subjects. Data obtained from Comprehensive Geriatric Assessment were used in a Cox model to predict 2-year mortality and to identify risk groups for mortality. A ROC analysis was performed to explore the validity of the MRI. Results: Five factors were identified and weighted using hazard ratios to construct the MRI: age 85 or over (1 point), dependence for the ADL (1 point), delirium (2 points), malnutrition risk (2 points), and co-morbidity level (2 points for medium level, 3 points for high level). Three risk groups were identified according to the MRI. Mortality rates increased significantly across risk groups in both cohorts. In the DC, mortality rates were: 20.8% in the low-risk group, 49.6% in the medium-risk group, and 62.1% in the high-risk group. In the VC, mortality rates were respectively 21.7, 48.5, and 65.4%. The area under the ROC curve for overall score was statistically the same in the DC (0.72) as in the VC (0.71). Conclusion: The proposed MRI appears as a simple and easy-to-use tool developed from relevant geriatric variables. Its accuracy is good and the validation procedure gives a good stability of results.

**PB7 267 DIETARY CALCIUM INTAKE HAS NEGATIVE EFFECTS ON BONE TURNOVER INDEPENDENT OF PARATHYROID HORMONE IN ELDERLY WOMEN**

M. YAMAUCHI\* (Shimane University Faculty of Medicine, Izumo, Japan)  
K. NAWATA(2), S. TAKAOKA(1), T. YAMAGUCHI(1), T. SUGIMOTO(1) -  
(1) Internal Medicine 1, Shimane University Faculty of Medicine (Izumo, Japan);  
(2) Health and Nutrition, The University of Shimane (Matsue, Japan)

Introduction: The calcium (Ca) intake of the elderly has been a fundamental and crucial issue for the prevention of osteoporosis. Ca supplements have a positive effect on bone mineral density (BMD). The aim of this study is to further clarify the effect of Ca intake on bone turnover, and whether the effect is influenced by PTH or BMD. Subjects and Methods: We enrolled 205 postmenopausal women who had examination of osteoporosis. We measured serum levels of N-terminal propeptide of type I collagen (PINP), C-terminal cross-linked telopeptide of type I collagen (CTX) and intact PTH, as well as BMD at femoral neck by dual-energy X-ray absorptiometry. Nutrient intakes (protein, fat, Ca, magnesium, phosphorus, sodium, vitamin D and vitamin K) were calculated using dietary records and a food frequency questionnaire. Results: Mean values of age and BMI were 63 years and 22.9kg/m<sup>2</sup>, respectively. Mean daily Ca intake was 655mg. Mean BMD value was 0.619g/cm<sup>2</sup>. Mean serum levels of PINP, CTX and PTH were 54.6ng/ml, 0.404ng/ml and 45.6ng/ml, respectively. Simple regression analysis showed that Ca intake was negatively correlated with PINP and CTX. PTH had positive correlation with PINP and CTX, but not with Ca intake. Ca intake had a positive association with BMD. Multiple regression analysis adjusted for age, BMI, years after menopause, and all nutrient intakes showed that Ca intake was negatively correlated with PINP and CTX, but not BMD. Moreover, Ca intake was still significantly correlated with PINP and CTX after additionally adjusted for PTH and BMD as independent variables. Conclusion: These findings suggest that low Ca intake is the major nutrient factor that could suppress bone turnover independent of PTH and BMD. Increasing Ca intake is important for the prevention of osteoporosis.

**PB7 268 INCIDENCE, MAIN DETERMINANTS AND PREDICTION OF THE RISK OF EARLY UNPLANNED READMISSION AMONG MEDICAL INPATIENTS AGED 75 AND OVER ADMITTED THROUGH EMERGENCY UNITS. THE FRENCH SAFES STUDY.**

I. LANIECE\* (Centre Hospitalier Universitaire de Grenoble, GRENOBLE, France)  
P. COUTURIER(1), M. DRAME(2), G. GAVAZZI(1), S. LEHMAN(1), D. JOLLY(3),  
P. LANG(4), J. NOVELLA(2), F. BLANCHARD(2), - (1) Clinique Universitaire de Médecine Gériatrique, Pôle Pluridisciplinaire de Médecine, Centre Hospitalier Universitaire de Grenoble, Hôpital Michallon (GRENOBLE, France); (2) Service de Médecine Interne et de Gérontologie Clinique, Centre Hospitalier Universitaire de Reims, Hôpital Maison Blanche (GRENOBLE, France); (3) Coordination de la Recherche Clinique, Centre Hospitalier Universitaire de Reims, Hôpital Maison Blanche (GRENOBLE, France); (4) Département de Réhabilitation et Gériatrie, Hôpital des Trois Chênes, Hôpitaux Universitaires de Genève (GRENOBLE, Switzerland)

Introduction Among elderly patients, readmission in the month following hospital discharge is a frequent occurrence which involves a risk of functional decline, particularly among frail subjects. While previous studies have identified risk factors of early readmission, geriatric syndromes, as markers of frailty have not been assessed as potential predictors. Methods and materials This prospective multi-center cohort study, belonging to the SAFES multicentre research programme conducted in nine French hospitals among medical inpatients aged 75 and older admitted through emergency departments, aimed to evaluate the risk of early unplanned readmission, and to identify predictors and risk groups. Data were collected through a comprehensive geriatric assessment conducted during the first week of hospital index stay. They were used in logistic regression to identify determinants of early unplanned re-hospitalization (defined as first unplanned readmission in the thirty days after discharge). A score constructed from the odd-ratios of these determinants identified three risk profiles. Results Data from a thousand out of 1,306 inpatients were analyzed. Early unplanned readmission occurred in 14.2% of inpatients and had no link with sociodemographic characteristics, comorbidity burden or cognitive impairment. Pressure sores (OR = 2.05, 95% CI = 1.0-3.9), poor overall condition (OR =

2.01, 95% CI = 1.3-3.0), recent loss of ability for self-feeding (OR = 1.9, 95% CI = 1.2-2.9), prior hospitalization during the last 3 months (OR = 1.6, 95% CI = 1.1-2.5) were found to be risk factors, while sight disorders appeared as negatively linked (OR = 0.5, 95% CI = 0.3-0.8). Three risk profiles significantly associated with increased readmission rates (6.5%, 12.6% and 23.2% respectively) were identified. Conclusion Markers of frailty (poor overall condition, pressure sores, prior hospitalization) or severe disability (for self-feeding) were the most important predictors of early readmission among elderly medical inpatients. Early screening could facilitate preventive strategies in risk groups.

**PB7 269 EFFECTS OF NUTRITIONAL STATUS IN FUNCTIONAL RECOVERY IN GERIATRIC PATIENTS AFTER HIP FRACTURE SURGERY**

I. ARTAZA\* (Centro Socio Sanitario Igurco Orue, Amorebieta, Spain)  
M. URKIZA(1), I. OLIVARES(1), N. LAUZIRIKA(1), I. AURRE(1), E. ELGEZUA(1),  
V. MARTINEZ(1), E. AGIRRE(1) - (1) Centro Socio Sanitario Igurco Orue (Amorebieta, Spain)

BACKGROUND: Malnutrition is common in elderly hip fracture patients and has been linked to poorer functional recovery. OBJECTIVE: This study investigates the relationships between nutritional status and functional recovery in patients with hip fracture admitted in rehabilitation unit of a geriatric nursing home. METHODS: This is a prospective study of 28 elderly hip fractured patients (22% of total unit patients) admitted in our unit since august 07 to December 08 to gait rehabilitation. We measured the nutritional status by Mini Nutritional Assessment (MNA) and functional recovery by the Barthel index, Heinemann index, Tinetti scale and the Functional Ambulation Classification of Holden (FAC). RESULTS: Mean of age was 83.2 y (71-100) and 93% women. Data we collected at admission were MNA mean: 18.66 (3.5% well-nourished, 14.2% malnourished, 82.3% at risk of malnutrition), Barthel index mean: 26.6 (0-65), Tinetti scale mean: 5.8 (0-21) and FAC mean: 0.5 (0-3). Outcome assessment: MNA mean: 21.5 (46.4% well-nourished, 14.2% malnourished, 34.2 % at risk of malnutrition), Barthel index mean: 55.71 (0-100), Heinemann index mean: 48.7 (0-100), Tinetti scale mean: 14.5 (0-26) and FAC mean: 2.82 (0-5). MNA scores at admission were significantly correlated to Heinemann index (p: 0.5665), to Barthel index (p: 0.5899), to FAC (p: 0.5731) and Tinetti (p: 0.533) at outcome. CONCLUSIONS 1) Nutritional assessment measured with standardized tools such as MNA has to be included in comprehensive geriatric assessment at admission in rehabilitations units to elderly patients. 2) In our unit the MNA total score is able to predict of functional and gait recovery in patients after hip fracture. 3) Moreover, additional studies are necessary to examine the nutritional status influence in functional

**PB7 270 MISMATCH OF PHYSICAL AND CLINICAL MEASUREMENTS OF DEDECUBITUS RISK**

T. MÜNZER\* (Geriatrische Klinik St. Gallen, St. Gallen, Switzerland)  
L. GERHARDT(1), D. SIEGFRIED(1), G. BISCHOFBERGER(2), C. HÜRNRY(2) -  
(1) Swiss Federal Laboratory of Materials Testing and Research (EMPA) (St. Gallen, Switzerland); (2) Geriatrische Klinik (St. Gallen, Switzerland)

Introduction: Aging and poor nutrition lead to increased risk of decubitus ulcers(DU). With age, skin elasticity decreases, skin hydration increases and skin friction properties remain unchanged. We investigated whether skin elasticity at different body sites, nutrition or measures of body composition (BC) can reliably predict a clinical score for DU risk (Braden Scale,BS). Methods and Materials: 32 patients(18f 14m)age 82±5.9 (±SD)y,without skin disease and measurements of skin elasticity(E)and hydration(H)at the forearm (VF), trochanter (TR) and sacrum (SA). We assessed nutrition(MNA), proteins (TP), creatinine (Crea), body water (TBW), lean body mass (LBM), %body fat (%F) by BIA, a blinded nurse applied the BS. Results: BMI (27±4.2 kg/m<sup>2</sup>), MNA (22.5±2.9), Crea (92.1±35.3 umol/l), TP (61.7.5±6.6g/l), BS (20±2.5), overall skin elasticity E (0.68±0.06) and VH (38.2±6.7) at any site did not significantly differ by sex. Men had more TBW (+12±1.5l), LBM (+9±2 kg) and less %F (-8.8±2.1), as well as increased HTR (+7.11±2.8) and HSA (+5.68±2.5). By simple regression, EVF correlated significantly with ETR ( $r^2=0.40$ , p<0.0001) and ESA ( $r^2=0.40$ , p<0.0001). In contrast, HVF did not correlate with HTR or HSA. None of the measures of BC, laboratory measures, MNA, skin elasticity or hydration at any site predicted BS scores. Conclusions: We found no correlation between objective biophysical/laboratory parameters and the subjective clinical BS assessment of DU risk. The predictive value of the BS in such patients seems low. If other measures or tools better predict DU risk is unclear.

**PB7 271 IMPACT OF DIFFERENT PARAMETERS IN LENGTH OF STAY AND FUNCTIONAL RECOVERY IN AN ELDERLY HIP FRACTURE PROGRAM**

A. PATRICIA\* (Hospital Infanta Leonor, Madrid, Spain)  
P. ALONSO-FERNÁNDEZ(1), F. BRAÑAS(1), R. DE DIOS(1), R. GARCÍA-BÓGALO(1), J. MONTTOYA(1), A. JUANES(1), B. IZQUIERDO(1), R. LARRAÍNZAR(1) - (1) Hospital Infanta Leonor (Madrid, Spain)

Introduction: Hip fracture is an important cause of mortality and disability in older people, with increasing frequency in the last years. We analyzed the impact of different parameters in length of stay and in functional recovery of patients included in an Elderly Hip Fracture Program (EHFP) in a recently opened hospital in Madrid (Spain). Material and Methods:

Participants were included in the EHFP (n=103) during hospitalization in the acute phase of hip fracture and were followed up during the next three months. Barthel Index (BI) and Functional Ambulation Classification (FAC) basal, at discharge, 1 and 3 months after discharge, time to surgery (TS) and social frailty were analyzed. Results: Age, mean 81.3 years. Female (%) 80.6. Median length of stay was 16.7+ 12.1 days. Basal BI 74.6 + 29.5. At discharge BI 29.9 + 21.6. One month BI 47.9 + 31.4. Three months BI 62.8 + 35.7. Basal FAC 4.2 + 1.2. At discharge FAC 1.9 + 1.3. One month FAC 2.9 + 1.4. Three months FAC 3.62 + 1.6. Medium TS 4.58 days. Social frailty was detected in 37% of patients. Parameters with influence in length of stay were TS (5,14 days of difference, p 0.031, if the patients were not operated in the first four days) and social frailty (4,94 days of difference, p 0.046). Prognostic factors in the functional recovery after the hip fracture were age and Basal IB (at discharge and follow up, p<0.001) and TS at three months follow up (p 0.044). Conclusion: Time to surgery is associated with a longer length of stay and a poorer functional recovery three months after surgical intervention. Social frailty is also associated with a longer length of stay.

#### **PB7 272 DOSE-RESPONSE RELATIONSHIP IN POST-ACUTE REHABILITATION CARE: MEASUREMENT OF ACTIVE TIME WITH 3D ACCELEROMETERS**

S. CHOQUETTE\* (Université de Sherbrooke, Sherbrooke, Canada)  
F. ALOR(1), C. LETENDRE(1), P. BOISSY(1) - (1) Université de Sherbrooke (Sherbrooke, Canada)

Introduction. The presence of a dose-response relationship between the volume of therapy in rehabilitation and functional outcomes has been suggested. Methodological and measurement challenges have limited the study of the determinants of this relationship to temporal aspect such as the total time of therapy received. However, other determinants such as "active time" (i.e. time when a patient is mobilized and engaged physically in therapeutic activities) may be even more important. In this study, an approach based on wearable sensors is used to estimate active time in real-life therapy sessions. Methods and materials. 21 patients (81.8±5.6 years) with four different admission diagnoses (stroke, lower limb fracture, amputation and immobilization syndrome) participated in this study. During their therapy sessions, they wore three 3D accelerometer modules positioned at the hip, wrist and ankle. Estimates of active time were computed based on the temporal density of a vector combining acceleration signals from the three modules. Concurrently, trained observers measured active time using a time motion approach. Measures from the time motion approach served as the gold standard to establish the measurement error of the accelerometers data. Results. A total of 141 therapy sessions and 755 therapeutic activities were observed. Strong associations were found between estimates of active time from both measurement approaches ( $r=0.95$ ,  $p<0.01$ ). The absolute error of WBAN estimates, for total active time during each patient's stay, was averaged to  $13.7\%\pm7.8\%$  (range= 5-30%). As for individual activities, important variations were observed. However, a low error of estimates ( $11.9\%\pm10.5\%$ ) was observed for "gait", which was also the most recurrent activity (28% of activities). Conclusion. Estimation of active time in therapy using 3D accelerometers is a good alternative to observation based time motion analysis. Longitudinal studies

#### **PB7 273 INTERVENTIONS TO IMPROVE OSTEOPOROSIS CARE AFTER FRAGILITY FRACTURE**

T. FANG\* (Division of General Internal Medicine, Department of Internal Medicine, Kaohsiung Medical University, Kaohsiung city, Taiwan)  
Y. LEE(1), D. CHAN(2) - (1) Division of family medicine, Cathay General Hospital (Taipei, Taiwan); (2) Department of Geriatrics and Gerontology, National Taiwan University Hospital (Taipei, Taiwan)

Objectives: The risk of future fracture increased 1.5- to 9.5-fold following a fragility fracture. Diagnosis and treatment of osteoporosis after fragility fractures may prevent future fractures. We tried to identify effective interventions improving osteoporosis care after fragility fracture. Methods: We searched the Pubmed, Psychoinfo and EMBase database before 2008 June with the MeSH terms: "fracture" and "osteoporosis/diagnosis or drug therapy or economics or mortality or prevention and control or therapy", and the limitations of humans, English, clinical trial or randomized controlled trial or controlled clinical trials. We found 924 articles. Twenty-two articles focusing on interventions to improve osteoporosis care after fragile fracture were selected for entire article review. Seven articles were excluded for no control, no patient level data, only observation study or methodology papers. Three articles were added by snow ball method. Finally, 18 articles were included. Results: The study designs and populations are so heterogeneous that meta-analysis for pooled findings are not possible. We reported the intervention effects on diagnosis rate and treatment rate. We divided intervention methods into five categories: (1) letters (2) letters + bone mineral density test offer (3) letter + face to face communication or consultation (4) coordinator (5) others. The effect of letters to primary care physicians was mixed. Letters to both primary care physicians and patients had more positive effects. Offering free bone mineral density test plus letter improved diagnoses, but had mixed results in improving treatments. Letter plus face to face communication and consultations were usually effective. Coordinator/special services were effective except the "Own the bone" project (A pilot study only). Conclusions: Many interventions were tried to improve osteoporosis care after fragile fractures but their effects were modest at best. Effective

osteoporosis care models for primary care physicians and orthopedic surgeons are urgently needed.

#### **PB7 274 LOSS OF INDEPENDENCE IN KATZ'S ADL ABILITY IN CONNECTION WITH AN ACUTE HOSPITALIZATION: EARLY CLINICAL MARKERS IN FRENCH ELDERLY PEOPLE**

P. LANG\* (University of Reims Champagne-Ardenne, Reims, France)  
D. HEITZ(1), M. DRAMÉ(2), J. ANKRI(3), D. SOMME(3), J. GAUVAIN(4), I. LANIÈCE(5), R. GONTHIER(6), C. JEANDEL(7), J. NOVELLA(2) - (1) Strasbourg Teaching Hospitals (Strasbourg, France); (2) University of Reims Champagne-Ardenne, Faculty of Medicine, EA 3797 (Reims, France); (3) Public Assistance, Hospitals of Paris (Paris, France); (4) Orleans Regional Hospital (Orleans, France); (5) Grenoble Teaching Hospitals (France); (6) Saint-Etienne Teaching Hospitals (France); (7) Montpellier Teaching Hospitals (France)

Objectives To identify early clinical markers associated with the loss of independence in elderly people in short-stay hospitals. Methods: Among the 1,306 subjects making up the prospective and multicenter SAFE cohort study, 619 medical inpatients, not disabled at baseline and hospitalized through an emergency department were considered. Data used in a multinomial logistic regression were obtained through a comprehensive geriatric assessment conducted in the first week of hospitalization. Dependency levels were assessed at baseline, at inclusion and at 30 days using Katz's ADL index. Baseline was defined as the dependence level before occurrence of the event motivating hospitalization. To limit the influence of rehabilitation on the level of dependence, only stays shorter than 30 days were considered. Results: About 514 patients were eligible, 15 died and 90 were still hospitalized at end point (n = 619). Two-thirds of subjects were women, with a mean age of 83. At day 30 162 patients (31%) were not disabled; 61 (12%) were moderately disabled and 291 severely disabled (57%). No socio-demographic variables seemed to influence the day 30 dependence level. Lack of autonomy (OR=1.9, 95% CI=1.2–3.6), walking difficulties (OR=2.7, 95% CI=1.3–5.6), fall risk (OR=2.1, 95% CI=1.3–6.8) and malnutrition risk (OR=2.2, 95% CI=1.5–7.6) were found in multifactorial analysis to be clinical markers for loss of independence. Conclusions Beyond considerations on the designing of preventive policies targeting the populations at risk that have been identified here, the identification of functional factors (lack of autonomy, walking difficulties, risk of falling) suggests above all that consideration needs to be given to the organization per se of the French geriatric hospital care system, and in particular to the relevance of maintaining sector-type segregation between wards for care of acute care and those involved in rehabilitation.

#### **PB7 275 CORRELATES OF LIFE-SPACE MOBILITY FOR MIDDLE-AGED AND OLDER POWER MOBILITY DEVICE USERS**

C. AUGER\* (Institut universitaire de gériatrie de Montréal (CRIUGM), Montreal, Canada)  
L. DEMERS(1), I. GÉLINAS(2), W. MILLER(3), J. JUTAI(4), M. DEPA(1) - (1) Research Center, Institut universitaire de gériatrie de Montréal (Montréal, Canada); (2) McGill University (Canada); (3) University of British Columbia (Canada); (4) University of Ottawa (Canada)

Limited information is available on the impact of power mobility devices (PMDs) on the lives of older adults, namely on how these devices modify their mobility in various environments depending on duration of use or device type. Objectives: 1) To describe the mobility of power wheelchair (PWC) and scooter users in successive environments from home to outside of town, and 2) To examine correlates of powered mobility. Methods: A random sample of PMD users, aged 50 and over, was stratified according to duration of PMD use: wait-list group (n=44); new users (n=35; 1-6 months), and long-term users (n=39; 12-18 months). Life-space mobility (Life space assessment) measured the mobility range and use of technical and human assistance in 5 successive environments. The associations between life-space mobility and 3 independent variables - duration of PMD use, age (50-64 vs >65 years) and device type (scooter vs PWC) - were examined with analyses of variance. Results: Environments were reached more frequently or more independently both for new and long-term users in comparison to the wait-list group. Frequency of PMD utilization peaked in the neighbourhood (92.3%) and was least at home (57.6% PWC; 2.4% scooters). Life-space mobility was significantly different depending on duration of use ( $p<.05$ ), age ( $p<.05$ ) and device type ( $p<.001$ ). An interaction was detected between age and device type. Life-space mobility was significantly lower for the older age group of PWC users, whereas no significant difference was found among younger users of both device types. Conclusion: Distinct frequencies of device utilization and levels of independence were observed for PMD users depending on the environment. Only older adults displayed different life-space mobility scores depending on the type of device used.

#### **PB7 276 WHICH THERAPY AFTER 18 MONTHS OF TREATMENT WITH TERIPARATIDE IN SEVERE SENILE OSTEOPOROSIS?**

D. MAUGERI\* (University of Catania, Catania, Italy)  
T. GIUSEPPE DAVIDE(1), M. GRAZIA(1), F. VALENTINA(1), Z. CARMELA(1), S. ANTONINO(1) - (1) University (Catania, Italy)

Severe osteoporosis is a form of osteoporosis that seems not to be responding to antiresorptives therapy. In fact, we have 10-25% of old aged patients defined "non responders" as they don't have any increase of BMD and moreover they continue to have new fracture at both vertebral and non vertebral site. In a previous publication by our working group, we observed that teriparatide administration for 18 months in postmenopausal osteoporotic patients was efficient in either increase new bone mass (+10%) or reduce new fractures risk (-96%). Teriparatide was efficient also in improving quality of life (+50%). At the end of these 18 months, we followed up patients every 6 months, monitoring BMD, fracture risk and quality of life. About 30% of patients (n=45) remained on Calcium + Vitamin D and followed up. After 1 year over the 18 months, we observed a gradual deterioration of quality of life while BMD reached a plateau with a trend towards a decrease of bone mineral density at both sites, vertebral and hip. So we decided to divide these 45 patients into 3 groups (A,B and C) of the same numerosity. We started a therapy with alendronate ( 70 mg/weekly) for group A, with Risedronate (35 mg/weekly) for group B and Strontium Ranelate (2g/die) for group C. We analyzed the effect of therapies after 6 months and after 1 year performing 1) a lumbar BMD 2) a hip BMD 3) administration of QUALEFFO with the 41 items questionnaire to evaluate the quality of life. Results are in Tab. 1: %±% Group C Δ ±% Group B Δ ±% Group A Δ Alendronate vs T0 Risedronate vs T0 SR Ranelate vs T0 BMD T0 L1-L4 640±60 L1-L4 656±70 L1-L4 648±66 mg/cm<sup>2</sup> Hip 710±90 Hip 724±84 Hip 718±76 BMD T6 L1-L4 648±60 + 1,2% L1-L4 670± + 2,2% L1-L4 700±78 + 8% mg/cm<sup>2</sup> Hip 712±94 + 0,28% Hip 730±88 + 0,83% Hip 740±78 + 3% BMD T12 L1-L4 660±62 + 3,12% L1-L4 680±84 + 3,6% L1-L4 710±76 + 9,6% mg/cm<sup>2</sup> Hip 720±80 + 1,4% Hip 742±80 + 2,5% Hip 768±82 + 6,9% Qualeffo T0 117±42 120±50 122±50 Qualeffo T6 122±46 - 4% 116±52 - 3% 100±54 - 18% Qualeffo T12 118±54 - 1% 112±54 - 6,6% 80±52 - 34% The BMD increase at hip level with strontium ranelate is of main importance as it was demonstrated (Bruyere et al, Curr Med Res 2007) a strong correlation between BMD increase (hip) and fracture risk reduction at vertebral and hip level (for each +1% of increase at hip there is a reduction of -4% for vertebral fracture risk and -7% for hip fracture risk respectively). Conclusion: in senile severe osteoporosis, consequential treatment with strontium ranelate (2 gr/daily) after 18 month of teriparatide seems to be better than consequential treatment with antiresorptives, with a significant increase of BMD and improvement of quality of life.

**PB7 277 CROSS-CULTURAL ADAPTATION AND VALIDATION OF THE "EDMONTON FRAIL SCALE (EFS)" – ELDERLY FRAILTY ASSESSMENT SCALE.**  
S. FABRÍCIO-WEHBE\* (Escola de Enfermagem de Ribeirão Preto - USP, Ribeirão Preto, Brazil)  
F. SCHIAVETO(1), T. VENDRUSCULO(1), V. HAAS(1), R. DANTAS(1), R. RODRIGUES(1) - (1) Escola de Enfermagem de Ribeirão Preto (Ribeirão Preto, Brazil)

Introduction: This research aimed at the cross-cultural adaptation of the Edmonton Frail Scale (EFS) to Brazilian Portuguese, as well as the analysis of its psychometric properties in a sample of elderly persons from a community in the interior of São Paulo State, Brazil. Methods and materials: The reference framework from literature was used: translation of the EFS to Portuguese; achievement of the first consensus version in Portuguese; item assessment by an expert committee; back-translation; achievement of a consensus version in English and comparison with the original version; semantic assessment of the EFS; pretest of the Portuguese version. Results: The adapted version was applied to 137 elderly aged 65 years or older who lived in the community, between August 2007 and June 2008. As to the assessed psychometric properties, in the known-groups validation of the diagnosis of frailty between gender, age and cognitive deficit, comparative analyses were made, using Mann-Whitney's non-parametrical test. It was found that elder elderly, women and with a cognitive deficit are more prone to the frailty diagnosis. All comparisons were statistically significant. The construct validity of the EFS with the Functional Independence Measure (FIM) and the Mini-Mental State Examination (MMSE), moderate and negative correlation levels were found, which were adequate and statistically significant ( $p < 0.001$ ). In the analysis of the interobserver frailty diagnosis data (on the same day), the Kappa index was 0.81 (CI 0.61-1.00), against 0.83 (CI 0.72-0.94) for intraobserver diagnosis (maximum period of 15 days). The intraclass correlation coefficient (CCI) of the gross frailty score was 0.87 for the interobserver (CI 0.82-0.91,  $p < 0.001$ ) and 0.87 for the intraobserver diagnosis (CI 0.81-1.00,  $p < 0.001$ ). Conclusion: Hence, it can be concluded that the EFS version adapted to Portuguese was valid and reliable in the study sample.

**PB7 278 AN EVALUATION OF THE FALLS EXERCISE SERVICE FOR 65S AND OVER WHO HAVE FALLEN IN GLASGOW, SCOTLAND.**  
D. SKELTON\* (Glasgow Caledonian University, Glasgow, United Kingdom)  
F. NEIL(1) - (1) Glasgow Caledonian University (Glasgow, United Kingdom)

Introduction: The Community Falls Prevention Programme (CFPP) is part of the referral pathway for community dwelling people aged 65 and older, living in the Greater Glasgow and Clyde, who have had a fall[1]. Referrals to the CFPP between Jan 2007-Jun 2008 averaged 177 patients/month. The CFPP runs strength and balance exercise sessions (in collaboration with Culture and Sport). All classes are evidence based[2,3] led by trained postural stability instructors[4]. There are three tiers of group class (to meet functional needs) offering between 10-28 weeks, reaching the required dose of balance exercise recently recommended[5]. During 2007, 277 patients attended classes every month.

Methods: 274 patients had baseline and follow-up functional tests following average 11.9 weeks of exercise sessions. All assessments by the same investigator. All data was normally distributed (Paired t-tests). Results: All outcome measures showed significant improvements. Tinetti balance score (TBS, n=274) improved from 23.1 to 24.8,  $p < 0.001$ ; 180 degree turn (n=112, 5.5 steps to 5 steps,  $p < 0.001$ ); functional reach (n=112, 19.2 to 20.9,  $p < 0.001$ ); timed up & go (TUAG) (n=137, 18.6 to 16.3 sec,  $p < 0.001$ ); Tinetti FES (n=43, 29.3 to 21.5,  $< 0.001$ ). Change in TBS was duration dependent, with the change in score in those attending <11 weeks (n=125, 1.2±2.7) being significantly lower than those attending for >12-16 weeks (n=91, 2.0±2.1,  $p < 0.01$ ), or those attending 16 weeks or more (n=58, 2.5±2.5,  $p < 0.01$ ). Conclusions: The TUAG post-exercise came close to the 16 second cut off for "low risk" of falls[6] and the falls efficacy scale changes suggest considerable improvements in self-efficacy to prevent falls. As duration of attendance was correlated with TBS balance outcomes, it is important to encourage long term adherence. References: [1]http://library.nhsogg.org.uk/mediaAssets/library/nhsogg/strategy/osteoporosis/falls/prevention/2006-2010.pdf [2]Skelton DA, et al. Age Ageing. 2005 [3]Robertson MC, et al. #### **PB7 279 FEMORAL FRACTURES IN OLD PATIENTS WITH AND WITHOUT COGNITIVE IMPAIRMENT: EFFICIENCY OF THE REHABILITATION PROCESS**

A. ESPERANZA\* (Hospital de la Esperanza, Centro Fórum, Hospital del Mar. Instituto de Atención Geriátrica y Socios. Barcelona, Spain)  
A. DIGÓN(1), B. FERNANDEZ-MATAMOROS(1), M. RIERA(1), M. ROBLES(1), C. ROQUETA(1), I. RIUS(1), E. DE JAIME(1), R. MIRALLES(1) - (1) Servicio de Geriatría del IMAS. Hospital de la Esperanza, Centro Fórum, Hospital del Mar. Instituto de Atención Geriátrica y Sociosanitaria (IAGS). (Barcelona, Spain)

Introduction: Cognitive impairment may be a poor prognostic indicator for functional recovery. Geriatric Convalescence Unit is an intermediate care hospitalization facility which offers an interdisciplinary geriatric intervention program. In these units specific geriatric care in addition to convencional rehabilitation programs are performed. Objetive: To evaluate functional improvement and the efficiency of the rehabilitation process, in old patients with femoral neck fractures, with and without cognitive impairment Patients and methods : A group of 200 patients was analyzed. Cognitive function was evaluated (Mini Mental State Examination of Folstein). Patients were divided : severe cognitive impairment ( $< 10$  points), moderate (11-21 points), and normal ( $> 21$  points). Variables: age, sex, functional status (Barthel index) before admission (BBA), at admisión (BA), and at discharge (BD). Efficiency index was calculated [functional improvement (BD-BA) divided by length of stay in the unit]. The corrected Heinemann index (CHI), was used to evaluate the percentage of recovered function at discharge, in relation to the previously lost functions at admisión [ $CHI = (BD-BA)/(BBA-BA) \times 100$ ]. Results : Of the 200 patients admitted, 18 were excluded of the rehabilitation program, because of acute medical complications or dead. Finally, 182 patients were analyzed (mean age 82.6±6.7) [135 women (74.1%)]. Mean value of CHI in patients without cognitive impairment was 73.8±24.0 %, in those with moderate cognitive impairment was 62.8±30.9 %, and in those with severe 33.6±32.5 % ( $p < 0.001$ ), and mean values of the efficiency index were 0.91±0.59, 0.55±0.44, and 0.27±0.35 respectively ( $p < 0.001$ ). Conclusions : 1. In spite de presence of moderate and severe cognitive impairment, old patients with neck femoral fracture, cannot be rejected from a rehabilitation program, because a high proportion of them may improve, if appropriate treatment and specific geriatric care is given. 2. Functional improvement expresed as CHI, and the efficiency index were lower in patients with cognitive impairment.

#### **PB7 280 BIOELECTRICAL IMPEDANCE VECTOR ANALYSIS IDENTIFIES SARCOMOPENIA IN NURSING HOME RESIDENTS**

J. KEHAYIAS\* (Tufts University, Boston, United States of America)  
A. SKAHAN(1), L. ITZKOWITZ(1), M. KHODIER(2) - (1) Tufts University, HNRCA (Boston, United States of America); (2) Edith Nourse Rogers Memorial Veterans Hospital (Bedford, United States of America)

Loss of muscle mass and water shifts between body compartments are contributing factors to frailty in the elderly. The body composition changes are especially pronounced in institutionalized elderly. We investigated the ability of single-frequency bioelectrical impedance analysis (BIA) to identify body composition deficiency in nursing home residents compared to free-living elderly Americans. Methods: Thirty-three nursing home residents (aged 72-93y) participated. Resistance (R) and reactance (Xc) values were measured at 50-kHz using the Xiton 4200 Hydra BIA instrument. Reference data for 2571 free-living adults aged 70-90 y were obtained from the NHANES III database (measured at 50-kHz using the Valhalla Scientific Body Composition Analyzer 1990B). The groups were compared using the method and bioelectrical impedance vector analysis (BIVA) software developed by Piccoli et al (Piccoli A, Pastori G: BIVA software, University of Padova, Italy, 2002). R and Xc values were standardized by the participant's height (H) in meters. The mean R/H and Xc/H values were calculated for each group by sex. The ratio of resistance to height (Ohm/m) was plotted on the major axis against the ratio of reactance to height (Ohm/m) on the minor axis. Bioelectrical impedance vector analysis software was used to plot the mean R/H and Xc/H values for each sex on a R-Xc graph with 95% confidence ellipses. Results: Comparison of the distribution of mean vectors in each

population illustrates a significant difference in the body composition of nursing home residents compared to the non-institutionalized American population. Nursing home vectors were outside the 75% tolerance ellipses of the reference population. Conclusion: Single frequency BIA successfully identifies the body composition deficiencies present in nursing home residents associated with sarcopenia and fluid redistribution. However, more detailed methods (such as stable isotopes) should be used for monitoring the status of individuals rather than groups.

**PB7 281 DEEP DISSECTING HEMATOMA IN HOSPITALIZED GERIATRIC PATIENTS: CONCEPT AND IMPORTANCE**

L. TOUTOUS TRELLU\* (University hospitals of Geneva, Thonex - Geneva, Switzerland)  
A. GKOMOUZAS(1), G. KAYA(1), F. HERRMANN(1), A. CHERETAKIS(1), R. RIZZOLI(1), J. SAURAT(1) - (1) University hospitals of Geneva (Geneva, Switzerland)

Introduction: Skin aging is associated with chronic cutaneous insufficiency or fragility syndrome, recently called dermatoporosis.<sup>1-3</sup> One major complication of this skin atrophy is the occurrence of deep dissecting hematoma (DDH) sometimes associated with skin necrosis and wound, resulting from minor trauma or falls. Objectives: Prevalence and description of DDH in a geriatric hospital in order to optimize an early detection and management by health care givers. Methods and materials: Retrospective analysis of all DDH diagnosed by the dermatologists in the Geriatric Hospital of Geneva from 2006 to 2008. A specialist nurse and a plastic surgeon participated in the management. The main outcome measures were sex, age, affected area, associated cutaneous wound, presence of steroids and/or anti-aggregant and/or anti-coagulant treatment. Results: 40 patients (mean age  $88.5 \pm 4.8$ , range 80 - 99) out of 1400 dermatology consultations had the diagnosis criteria. Women outnumbered men by a ratio of 7.0. The lower extremities were the most frequent affected part of the body. Other localizations were the face and arm. Incidence rate was significantly higher in women (57.8, 95% CI 40.3-80.3 vs 18.8, 95% CI 6.1-43.8) per 10000 patients discharged ( $p = 0.0134$ ). Conclusion: Falls and trauma in the elderly have serious skin consequences. The relation with the type of trauma and skin atrophy severity has been suggested but should be confirmed prospectively. Many of these patients were under steroids and/or antiaggregants - anti coagulants and we aim to show them as associated risk factors in our geriatric population. The consecutive skin necrosis and mobility impairment prolong the hospitalization or increase the cost of ambulatory care, which encourage us to better define the diagnosis and management criteria. **PB7 282 EFFECTS OF A PHYSICAL ACTIVITY PROGRAM ON COGNITIVE FUNCTION AND GAIT IN ELDERLY PERSONS SUFFERING FROM DEMENTIA**

P. CARETTE\* (University Hospital, Poitiers, France)  
G. KEMOUN(1), N. ROUMAGNE(1), G. LE CHARPENTIER(1), M. PACCALIN(2) - (1) EA 3813 and PMR department, University Hospital (Poitiers, France); (2) Geriatric Department, University Hospital (Poitiers, France)

Objectives: To study the effects of physical training based on exercises in walking, equilibrium and endurance on cognitive function and locomotion in institutionalized persons suffering from dementia. Materials et methods: A randomized prospective case control study on 31 subjects suffering from dementia with mean age of  $81.8 \pm 5.3$  (Mini Mental State Examination average  $12.44 \pm 3.8$ ). One group (GPA) benefited from a 15-week physical activity program involving three one-hour sessions a week. The other group (GC) served as the control group. Both before and after the physical activity program, all subjects took the following tests: ERFC (rapid evaluation of cognitive functions) and gait analysis through use of the Bessou locometer (SATEL®). Results: According to the ERFC, the GPA subjects improved their overall score ( $p < .001$ ), while we observed a reduction of this score in the control subjects ( $p < .001$ ). The program is thereby shown to have had a positive effect, ensuring maintenance, if not improvement, of cognitive capacities. As regards gait analysis, our study highlights the positive effects of the physical activity program on three spatio-temporal parameters: walking speed, length of stride and average double support time. Our results showcase both improvement in walking quality through heightened walking speed ( $p < .001$ ), and reduction of double support time ( $p < .001$ ). Lastly, after the 15 weeks of follow-up, the control group subjects presented a reduction in both walking speed ( $p < .001$ ) and stride length ( $p < .01$ ). Conclusion: This study shows that a physical activity program can improve the quality of walking and allow for the slowing of cognitive decline in elderly persons suffering from dementia.

**PB7 283 NEOVASCULAR AGE-RELATED MACULAR DEGENERATION (AMD) AND INJURIOUS FALLS: DOES DECREASED PHYSICAL ACTIVITY LIMIT RISK? A 12-MONTH PROSPECTIVE COHORT STUDY**

K. KHAN \* (University of British Columbia, Vancouver , Canada)  
S. SZABO(1), P. JANSEN(1), M. POTTER(1), S. LORD (2) - (1) Centre for Hip Health and Mobility, UBC/VCHA (Canada); (2) Centre for Hip Health and Mobility, UBC/VCHA (Canada)

Introduction: Impaired vision is a key risk factor for injurious falls, and neovascular age-related macular degeneration (AMD) is the leading cause of severely impaired vision among

older adults in Canada. However, clinicians observed that patients with AMD limited their physical activity and tended to remained indoors in familiar surroundings. The objective of this study was to use a robust study design to determine whether older women with AMD were at an increased risk of injurious falls compared with controls. Methods : We conducted a prospective cohort study enrolling 114 older (>70 years), community-dwelling women with AMD and 132 community-dwelling women without AMD. Subjects were recruited from a hospital-based ophthalmology clinic in Vancouver, Canada, and followed for a total of 12 months per person. The incidence of injurious falls was determined through monthly telephone follow-up. Physical activity was measured by PASE questionnaire. We compared the mean number of injurious falls per person year between groups using negative binomial regression models. Results: A mean of 0.37 injurious falls per person-year were experienced among participants from the AMD group, compared to 0.16 injurious falls per person-year among participants in the non-AMD group ( $p=0.006$ ). The AMD group reported less physical activity than their control counterparts. The relative risk of injurious falls, for an individual with AMD compared to those without AMD, adjusted for age, was 1.77 (1.07 – 3.02). Conclusions: Older women with age-related macular degeneration are at almost twice the risk of injurious falls compared to control counterparts. Clinicians caring for older adults should recognize AMD as an important risk factor for injurious falls, even though the visually impaired patients are less active.

**PB7 284 MUSCLE POWER AND FUNCTIONAL CAPACITY IN COMMUNITY-DWELLING OLDER PEOPLE WITH HIP FRACTURE HISTORY**

J. KOSKINEN\* (University of Jyväskylä, Jyväskylä, Finland)  
A. HEINONEN(2), E. PORTEGIJS(1), M. ALEN(3), I. KIVIRANTA(4), M. KALLINEN(5), S. SIPILA(1) - (1) Finnish Centre for Interdisciplinary Gerontology, University of Jyväskylä (Jyväskylä, Finland); (2) Department of Health Sciences, University of Jyväskylä (Jyväskylä, Finland); (3) Department of Medical Rehabilitation, Oulu University Hospital and Institute of Health Sciences, University of Oulu (Oulu, Finland); (4) Department of Orthopedics and Traumatology, University of Helsinki (Helsinki, Finland); (5) GeroCenter Foundation for Research and Development (Finland)

Hip fracture is a trauma affecting muscle power of the fractured side potentially increasing the risk for disability. This study aims to define the associations between leg extension power of the fractured leg (LEPm) and functional capacity (FC) in older people with hip fracture history (HFH). Population-based sample of 60-85-year-old community-dwelling persons 0.5-7 year after hip fracture (n=79) attended the study. FC was assessed by a validated questionnaire including 15 questions concerning ADL and IADL. Subjects were divided into two study groups: GoodFC (difficulties in less than three activities), ReducedFC (difficulties in three or more activities). LEPm was measured with the Power Rig. Time since fracture, number of chronic diseases and pain in the lower body were determined. Body height and weight were measured and BMI was calculated. 62% of the HFH subjects had reduced FC. The LEPm was 71 (41) W among those with ReducedFC and 101 (41) W among those with GoodFC ( $p=0.006$ ). The time since fracture was 1375 (585) days in the ReducedFC and 1819 (884) days in the GoodFC group ( $p=0.019$ ). Pain was reported by 53% of those with ReducedFC and by 27% of those with GoodFC ( $p<0.001$ ). The number of chronic diseases was 4 (2) in the ReducedFC and 3 (2) in the good FC ( $p=0.042$ ). Logistic regression analysis showed that LEPm was significantly associated with FC even after adjusted for time since fracture, pain and BMI (OR 0.982, CI95% 0.968-0.997). The association was, however, slightly weaker when number of chronic diseases was included in the model (OR 0.985, CI95% 0.970-1.001). This study shows that muscle power is an important determinant of functional capacity in older persons with HFH even years after fracture. Rehabilitation strategies targeting muscle power need to be developed to prevent disability after hip fracture.

**PB7 285 EFFECTS OF A STANDARDIZED PHYSICAL TRAINING ON MOTOR PERFORMANCES IN PATIENTS WITH DEMENTIA**

K. HAUER\* (Bethanien-Krankenhaus an der Universität Heidelberg, 69146, Germany)  
M. SCHWENK(1), T. ZIESCHANG(1), C. BECKER(2), P. OSTER(1) - (1) Bethanien-Krankenhaus (Heidelberg, Germany); (2) Robert Bosch Krankenhaus (Stuttgart, Germany)

Introduction: Randomised-controlled training interventions trials in patients with dementia show methodological limitations and controversial results (Hauer 2006). Political request to exclude patients with dementia from rehabilitation are hardly based on firm evidence or established guidelines. Target of study: To study the effects of a standardized physical training on maximal strength and functional performance (primary endpoints) in patients with mild to moderate dementia. Methods: Study design: Randomised-controlled Intervention Trial (RCT) Study participants: mixed sample of geriatric patients following geriatric rehabilitations and home-dwelling, multi-morbid patients with dementia (n=120: Intervention (I) n=61; Control (C) n=59, mean age, 82.5 Yrs.) (comprehensive Dementia diagnosis according to established diagnostic criteria). Intervention: 3 months, intensive, progressive strength, function, and attention-related group training.(2-hrs; 2 Times/week vs. unspecific stretching exercise while seated.(1 hour/2 Times/Week). Measurements before (T1), and after intervention (T2) and 3-months Follow-up (T3). Results: The Intervention group showed significant improvements in all measured parameters of maximal strength and functional performance compared to the control group at the end of training including the primary study endpoints: One-Repetition Maximum (IRM): C (T1):  $141.2 \pm 40.8$  kg; (T2):  $134.8 \pm 48.5$  vs. I (T1):  $154.8 \pm 59.4$  (T2):  $225.2 \pm 79.7$ ,

p<0,001; and 5-chair stand: C: (T1): 17,5±9,6; (T2): 19,7±15,9 vs. I (T1): 16,7±6,3; T2: 11,8±3,2; p<0,001. Differences remained significant during the follow-up period without training: in the primary< study endpoints and most other motor tests. IRM : C (T3) 153,4±53,6 vs. I (T3): 208,7±79,8; p<0,001 und 5-Chair-stand :C (T3): 19,9±15,9 vs. I (T3) 13,1±4,0; p<0,001) Conclusion: Study results confirm that significant, clinically relevant improvements in strength and function are feasible by a high intensive, standardised training in patients despite mild to moderate dementia. American Journal of Physical Medicine & Rehabilitation 2006 Oct;85(10):847-57.

**PB7 286 QTL ANALYSIS OF AGING MOUSE STRAINS TO DISCOVER GENES ASSOCIATED WITH DIFFERENCES IN LOCOMOTOR FUNCTION DURING AGING**

C. DWYER\* (University of Texas Health Science Center at San Antonio, San Antonio, United States of America)  
A. ROSSANO(1), E. FERNANDEZ(2), C. LIAO(2), S. PIEKE-DAHL(2), J. NELSON(2), R. STRONG(1) - (1) Department of Pharmacology - UTHSCSA (San Antonio, United States of America); (2) Department of Physiology - UTHSCSA (San Antonio, United States of America)

Loss of locomotor function is a universal manifestation of aging across species and is an important factor in frailty in aging humans. Quantitative trait loci (QTL) analysis is an unbiased approach to identify genes associated with complex traits such as age-related decline in locomotor function. A previous study from our lab found a highly significant QTL on chromosome related to strain differences in locomotor activity in older mice. The CLOCK gene was identified as a candidate gene of interest in the region identified. Mutation of this gene has been reported to increase rearing activity and expression of the gene coding for tyrosine hydroxylase, the rate-limiting enzyme in dopamine synthesis. We hypothesized that dopamine levels and locomotor activity in aging mice would be related to the QTL on chromosome 5 where CLOCK is located. We measured total locomotor activity in 33 recombinant inbred strains of mice using a Columbus Instruments Animal Activity Meter. Dopamine and its metabolites were measured by HPLCec in the brain of the same mice at 26 months of age. QTL analysis did not reveal a significant QTL for dopamine or its metabolites on chromosome 5. The levels of dopamine and its metabolites were not correlated with activity in the same mice. However, QTL analysis of dopamine and metabolites revealed almost significant QTLs associated with chromosomes 9 and X. These data provide evidence dopamine and metabolite levels are unrelated to strain differences in locomotor activity in old mice. Moreover, they show age-differences in dopamine and metabolites are not related to CLOCK. Future studies will focus on QTLs found on chromosome 9 and X and on other candidate genes found in our previous study. Studies like these may reveal genes underlying individual differences in vulnerability to frailty and may suggest new therapeutic targets for treatment of frailty.

**PB7 287 EXERCISE PRESCRIPTION AFTER OSTEOPOROTIC VERTEBRAL FRACTURES**

W. MILLER\* (University of British Columbia, Vancouver, Canada)  
S. HARRIS(1), L. LI(1), L. FEEHAN(1), D. MACINTYRE(1), C. MACDONALD(1), O. RESEARCH TEAM(1) - (1) University of British Columbia (Canada)

Introduction: To date no systematic reviews of the effect of exercise or physical activity for vertebral fractures have been published. Objectives: 1) to critically synthesize research on prescription of safe and effective exercises after osteoporotic vertebral fractures; 2) to identify the need for further research if insufficient evidence exists. Methods and materials: A systematic search of relevant medical and health sciences databases data bases, journals and gray literature was conducted. Only randomized controlled trials (RCTs) and controlled clinical trials (CCTs) that included adults >45 years who had sustained osteoporotic fracture(s) of vertebrae were included. Studies of post-fracture therapeutic exercise and regular physical activities in hospital or home settings were targeted. Separate analyses were undertaken for intervention against no treatment control or usual care, and against treatment control. Primary outcome measures were defined based on the International Classification of Functioning, Disability and Health. Adverse events were also analyzed. Results: Six unique studies were identified: 5 RCTs and 1 CCT. All had small sample sizes (range n=22 to n=185) and 5 targeted post-menopausal women. Interventions were home-based, community-based, or in out-patient clinics and included stretching, strength training, balance training and/or aerobics. Positive findings were reported in at least 1 study for the following outcomes: quality of life, gait speed, bed mobility, pain, balance, motor function and strength however analyses revealed that the studies were variable in terms of quality. One study reported an increased number of fractures among individuals who performed flexion (sit ups) compared to extension or combined extension/flexion exercise. Conclusion: There are few studies evaluating exercise or physical activity post vertebral fracture. The existing studies are of variable/limited quality. The results suggest that there is limited evidence to support or

refute the efficacy of exercise or physical activity intervention following spinal fracture in adults. Larger methodologically robust studies are needed.

**PB7 288 OSTEOPOROSIS IN TUBE FED (TF)BED-RIDDEN ELDERLY FEMALE PATIENTS.**

J. MENCZEL\* (Herzog Memorial Hospital, Jerusalem, Israel)  
E. JAUL(1), T. MALCOV(2) - (1) Herzog Hospital (Jerusalem, Israel); (2) Maccabi Health Services (Jerusalem, Israel)

Introduction: Elderly patients, bedridden and tube fed, despite being confined to bed, undergo fractures. These fractures occur not only due to falls, but even as a result of repositioning and transfers to and from bed. There is inadequate information about the bone density of these tube-fed patients. Methods: Twenty seven, bedridden and tube fed females patients, with a mean age of 85 (+/-7.56) years were evaluated. Bone mass density(BMD) was measured using Dexa, only for the lumbar spines due to contraction of the hip joints. The Kruskal-Wallis test or the Mantel-Haenszel chi-square test were used to compare between the osteoporotic, osteopenic and normal groups. Results: 19 subjects (70.4%) had osteoporosis, 3 (11.1%) had osteopenia, and 5 (18.5%) were normal. The nonosteoporotic subjects, had a mean age of 82.8 (+/-7.43) years, the osteopenic subjects were slightly older with mean age of 84.3(+/-4.16) years, and the osteoporotic subjects had a mean age of 86.1(+/-8.12); these differences were not statistically significant (Kruskal-Wallis test pvalue: 0.2968) The mean (+/-SD) hospitalisation time was 2.56 (+/-2.13), 1.15 (+/-1.16) and 2.31 (+/-1.37) for the osteoporotic, osteopenic and nonosteoporotic subjects respectively (Kruskal-Wallis test pvalue: 0.4573). There were no statistically significant differences found between the three groups in the functioning level as measured by Norton and Glasgow Coma scores either. No statistically significant differences in the prevalence of dementia, vegetative state, pressure ulcers and pelvic fractures were found before hospitalisation. Serum levels of calcium, phosphate, cholesterol, vitamin D and parathyroid hormone were normal, albumin and hemoglobin were low, there was no significant difference between the three groups. Conclusions: Tube feeding prepared formula containing calcium and vitamin D helps preserve bone mineral density among 30% of the subjects despite being bedridden for a long period of time.

**PB7 289 ACUTE CHANGES IN CIRCULATING BRANCHED CHAIN AMINO ACIDS, TRYPTOPHAN & PROLACTIN DURING SUSTAINED EXERCISE IN OLD MEN**

M. MÉLANÇON\* (University of Sherbrooke / Research center on aging, Sherbrooke, Canada)  
D. LORRAIN(2), I. DIONNE(3) - (2) University of Sherbrooke, Research center on aging/Laboratory of vigilance (Sherbrooke, Canada); (3) University of Sherbrooke, Research center on aging/Laboratory of body composition & metabolism (Sherbrooke, Canada)

Prolonged exercise can trigger a skeletal muscle uptake of branched-chain amino acids (BCAA) [valine, leucine, and isoleucine] that is out of proportion in comparison to other amino acids, including free tryptophan (TRPf). Since elevations in the TRPf:BCAA ratio are known to facilitate serotonin synthesis, the elderly may benefit from these exercise-related changes because previous work shows that they present a global decline in serotonergic function. OBJECTIVE: To quantify circulating levels in BCAA, TRPf and prolactin (PRL) during and after sustained exercise in older men. METHODS: Seventeen men (64±3 y) completed a maximal graded cardiopulmonary exercise test (CPET) and, at least 3 d later, a 60-min treadmill exercise bout at a heart rate representing 65-70% of VO<sub>2max</sub> measured during CPET. Mixed venous blood was collected from the antecubital vein into heparinized tubes as follows: immediately before exercise (BASELINE), after 30-min exercise (EXERC-30), after 60-min exercise (EXERC-60), and finally at 30 min post-exercise (POST-EX). Plasma was rapidly separated from red blood cells, then stored at -82°C until assayed using either LC/MS (amino acids) or immunoassay (PRL). RESULTS: Prolactinemia changed as follows: BASELINE: 6.6±1.7, EXERC-30: 7.7±3.2, EXERC-60: 10.1±6.3, and POST-EX: 8.9±4.9 mg/L (mean±SD). A repeated measure ANOVA revealed that prolactinemia increased from BASELINE to EXERC-30 (P<.05) and reached a peak at EXERC-60 (P<.01). On the other hand, baseline levels in BCAs [valine: 272±43, leucine: 147±27, isoleucine: 75±21 umol/L] and TRPf [62±14 umol/L] did not change significantly in response to exercise, leaving the TRPf:BCAA ratio unchanged at ~12%. CONCLUSION: Our results show that exercise BCAA levels and TRPf:BCAA do not change significantly despite increased prolactinemia. It is concluded that there are no acute changes in blood markers of serotonin synthesis in untrained elderly men in response to 60-min aerobic exercise, and that prolactin release by the pituitary gland is unrelated to these changes.

**PB7 290 THE RESULT OF MODERN THERAPY WITH VISCOELASTIC DEVICE IN THE ELDERLY PATIENTS WITH GONARTHROSIS**

C. KHAYAT\* (The National Institute of Geriatrics and Gerontology, Bucuresti, Romania)  
S. GHIORGHE(1), G. POPESCU(1), A. TEIXEIRA(2) - (1) The National Institute of Geriatrics and Gerontology (Otopeni, Romania); (2) (Brazil)

**Introduction:** Gonarthrosis is a very frequent disease in the elderly (almost 85% over 65 years old) which threatens the patients' quality of life (QOL), because of pain, immobility and dependence. The therapeutic options include conservatory measures to relieve the pain, to improve mobility and to delay the surgical procedures. The goal: The present paper analysed clinical and functional evolution of a group of patients with gonarthrosis submitted to an adequate rehabilitation program + NSAID + intra articular infiltrations with a sterile viscoelastic device, versus a group of patients treated only with a rehabilitation program + NSAID. **Method:** We selected 144 patients (69 males and 75 females), aged between 68-75 years old, who were admitted in a geriatric clinic for 15 days; they followed a rehabilitation treatment (electrotherapy, kinetotherapy and massage) + NSAID+ intra articular infiltration with hyaluronic acid, obtained by biofermentation, 1 dose/day in the 1st day, the 8th day, and the 15th day. For comparison we selected a control group of 160 patients (85 males and 75 females), aged between 65-74 years old, following only the rehabilitation treatment + NSAID. We noticed pain intensity, muscular force, the balance, step size, walking speed, use of cane, help need for daily activities, self-evaluation of well-being. **Results:** After 15 days of treatment we observed an obvious improvement of the followed parameters and QOL especially in the patients getting also infiltrations with viscoelastic solution compared with the control group. **Conclusion:** The modern intra articular treatment of gonarthrosis, together with the physical procedures and NSAID, determines superior benefits for patients comparative with those receiving only physiotherapy and NSAID, improving the functional performances, the subjective symptoms, and the QOL. \*The National Institute of Geriatrics and Gerontology "Ana Aslan" - Romania \*\* Fluminense University, Geriatrics, Rio de Janeiro, Brazil

**PB7 291 SNOEZELEN ROOM: A PRESCRIPTION FOR BALANCE IN INDIVIDUALS WITH DEMENTIA?**  
K. KLAGES\* (The University of Western Ontario, London, Canada)  
A. ZECEVIC(1) - (1) The University of Western Ontario (London, Canada)

**Introduction.** Few empirically tested falls prevention programs are available for individuals with dementia. Snoezelen rooms provide multisensory stimulation and are used to stimulate and to relax individuals. In this environment, touch, colour, sound, smell, and taste are used to rouse multiple sensations. This study investigated the capability of multisensory stimulation to improve balance and to reduce falling among institutionalized older adults with dementia. **Methods and Materials.** Twelve participants completed 30 minute sessions in the Snoezelen room twice a week for 6 weeks. Participants decided which senses to explore but were encouraged to engage in activities that can improve proprioception and balance such as swinging in hanging chairs, eye tracking exercises, or interacting with vibratory objects. Twelve participants comprised a control group and received volunteer visits. The Functional Reach Test, the Sharpened Romberg, and the Timed Up and Go Test with and without dual task were used to assess balance and function of all participants at baseline and after the 6-week intervention. Fall rates, as reported on institutional charts by the facility staff, were recorded before, during, and after the intervention. **Results.** A split-plot analysis confirmed that multi-sensory stimulation had no impact on the balance of participants in the intervention group. There were no statistically significant differences between the intervention and control groups on any test, nor was there any significant multivariate interaction effect of group by time. There were no statistically significant differences in falls rates for the intervention group before, during, and after the intervention. **Conclusion.** Results suggest that the regular practice of Snoezelen room does not alter the balance performance or falls occurrences of institutionalized individuals with dementia. The best use of Snoezelen room in dementia care lies in providing leisure activity and possibly improved mood and attention.

**PB7 292 ASSOCIATION OF OXYGEN CONSUMPTION WITH LOWER LIMBS MUSCLE PERFORMANCE IN COMMUNITY ELDERLY PEOPLE**  
R. BRITTO\* (Federal University of Minas Gerais, Belo Horizonte, Brazil)  
P. GARCIA(1), C. ZAMPA(1), J. DIAS(1), R. DIAS(1), V. PARREIRA(1) - (1) Federal University of Minas Gerais (Belo Horizonte, Brazil)

**Introduction:** The aging process is characterized by modifications in several systems including the cardiopulmonary and musculoskeletal. Characterizing the physical impairment may help optimizing training strategy. **Aim:** To investigate the association between oxygen peak consumption ( $\text{VO}_2$  peak  $\text{mL.Kg}^{-1}.\text{min}^{-1}$ ) and the lower limbs muscle performance (average power, peak torque and maximal torque-to-body weight ratio - MTBW) among 65 aged or older seniors. **Methods and Materials:** 28 volunteers living in the community (average age  $73.46 \pm 6.12$ ) were evaluated by incremental test with gas analysis using treadmill and ramp protocol and also by maximal strength test using an isokinetic dynamometer and concentric contractions of hip and knee. The study was approved by the Institutional Ethics Committee. After confirmation of normal data distribution, correlation test of Pearson was accomplished considering a significance level of 0.05. **Results:** There were found significant correlations between  $\text{VO}_2$  peak, the most accurate indicator on functional capacity with the average power of knee extensors ( $r=0.44$ ), peak torque (in the speed of 60%) of hip flexors ( $r=0.49$ ) and extensors ( $r=0.51$ ), peak torque of knee flexors ( $r=0.49$ ) and extensors ( $r=0.58$ ) and also with MTBW of hip flexors ( $r=0.47$ ) and extensors ( $r=0.48$ ) and MTBW of knee ( $r=0.40$  and  $r=0.54$ ). **Conclusion:** This results suggest that a decrease of the capacity to produce maximum and explosive lower limbs force is related to the decrease of oxygen consumption and

contribute to reduce the elderly physical performance. This study reinforces the need of global programs including aerobic and resistance training to improve the elderly physical fitness. Sponsored by: CNPq, FAPEMIG

**PB7 293 COMPARING CHARLSON AND ELIXHAUSER COMORBIDITY SCALES FOR MORTALITY PREDICTION IN OLDER BRAIN INJURY PATIENTS**  
J. VOSS\* (University of Washington, Seattle, United States)  
H. THOMPSON(1), N. TEMKIN(1), S. DIKMEN(1) - (1) University of Washington (Seattle, United States of America)

**Introduction:** Trauma patients with comorbid conditions are at higher risk for death. Comorbidities are common in older adults. Currently, the most widely used predictive tool for mortality is the Charlson comorbidity index (CCI), which does not account for prevalent chronic conditions in older adults such as hypertension and warfarin use, which may influence outcome following trauma. The goal of the present study was to compare the CCI to the Elixhauser score to predict mortality at discharge in a sample of older adults with traumatic brain injury (TBI) controlling for initial injury severity [injury severity score (ISS), Glasgow coma score (GCS)], age and gender. **Methods:** Secondary data analysis was conducted using the Harborview TBI dataset. Available clinical and outcome data were obtained for subjects aged 55 and older and medical records were reviewed for comorbidities (N=196). Logistic regression modeling was used to predict mortality at discharge. **Results:** Mean age of the sample was 69.3 years (SD 10), initial GCS in the ED was 9.9 (SD 4.1), mean ISS was 25.6 (SD 9.4), with an in-hospital mortality of 31%. Using the CCI, 58.5% of subjects scored 0, 26.5% scored 1, 9% scored 2 and 6% scored 3 or higher. In contrast, on the Elixhauser, 19.5% scored 0, while 35% had a score of 1, 37.5% had a score of 2, and 7.8% had a score of 4 or higher. Using logistic regression modeling, age and GCS were independently predictive of mortality at hospital discharge in both models. However, use of the Elixhauser score improved sensitivity from 75 to 79.5% over the CCI method for prediction of mortality. **Conclusion:** As the Elixhauser scale accounts for more prevalent conditions in older adults, it may be a more robust method for prediction of mortality. Further validation in other geriatric trauma populations is warranted.

**PB7 294 FREQUENCY OF AQUATIC EXERCISES IN RELATION TO MANAGEMENT OF KNEE AND HIP OSTEOARTHRITIS IN WOMEN**  
J. SAUVÉ\* (University of Calgary, Calgary, Canada)

**Introduction:** Hydrotherapy is frequently used with patients for the management of hip and knee osteoarthritis (OA). However, there is only a small quantity of research establishing the frequency of rehabilitation for this population. The purposes of this study were to determine if the frequency of attendance during a 6-week hydrotherapy intervention can affect measures of pain, stiffness, and overall physical function, and determine the efficacy of hydrotherapy on overall health and well-being for women with knee or hip OA. **Method:** Nineteen women with knee or hip OA were randomly assigned to participate in a 6-week deep water running intervention either 1-2 days a week (n=10 for Group A) or 3 or more days a week (n=9 for Group B). Participants were evaluated pre and post-training for changes in pain, stiffness and physical function, using the Western Ontario McMaster Universities Osteoarthritis Index (WOMAC), as well as overall health and well-being, using the Medical Outcomes Study Short Form 36 Version 2 (SF-36v2). **Results:** The intervention resulted in less pain and joint stiffness and greater physical function for both Groups A and B. Pain scores improved significantly for both groups ( $p < 0.05$  for each). Joint stiffness and physical function scores improved, but not significantly. There was no noted increase in physical or mental health component scores. **Conclusion:** Both programs of hydrotherapy in the 6-week period resulted in significantly less pain and lower levels of stiffness, and improved physical function. This study supports the notion that 1-2 days per week of hydrotherapy is an appropriate rehabilitation frequency for knee or hip OA. The findings demonstrate that if individuals who are diagnosed with mild to moderate hip or knee OA participate in 1-2 days of hydrotherapy per week, their pain scores will show significant improvements. It is recommended that the effects of hydrotherapy exercise programs be further investigated.

**PB7 295 DISABILITY MODERATES THE ASSOCIATION BETWEEN NEIGHBORHOOD ENVIRONMENT AND SOCIAL PARTICIPATION AMONG OLDER MEN BUT NOT WOMEN: THE NUAGE STUDY**  
M. LEVASSEUR\* (Université de Montréal, Montréal, Canada)  
L. GAUVIN(1), L. RICHARD(1), M. IBRAHIMA(1), H. PAYETTE(2) - (1) Interdisciplinary Research Group on Health, Université de Montréal (Montréal, Canada); (2) Centre de recherche sur le vieillissement, Université de Sherbrooke (Sherbrooke, Canada)

**Introduction:** Social participation, a key determinant of healthy aging, can be enhanced by a neighborhood with a wealth of community resources and services. The influence of neighborhood can differ according to disability, a frequent phenomenon among seniors. Unfortunately, few studies have examined this impact. This study examined the moderating effect of disabilities on the relationship between neighborhood environment and social participation among older women and men. **Method:** Embedded in the NuAge longitudinal study on nutrition and aging, this cross-sectional study used data from

268 women and 212 men collected three years into follow-up. At baseline, participants were healthy community-dwelling older adults from 6 equally distributed age/sex strata ( $70\pm2$ ;  $75\pm2$ ;  $80\pm2$ ). Data on frequency of participation in activities in the community, user-friendliness and accessibility of neighborhood resources, and ability of the person to perform activities of daily living were collected by interviewer-administered questionnaire. Results: A higher proportion of resources available within 5 minutes from home and a lower level of disabilities were associated with higher social participation ( $R^2 = 0.12$ ,  $p < 0.001$  and  $R^2 = 0.6$ ,  $p = 0.001$ , for men and women respectively). A significant moderating effect of disabilities was observed for men ( $p = 0.048$ ) but not for women ( $p = 0.45$ ). Disability level of women had the same effect on social participation regardless of availability of resource. For men, however, greater availability of neighborhood resources enhanced social participation, but only in men having a lower level of or no disabilities. Conclusion: These results show that disability moderates the association between neighborhood environment and social participation among older men but not women. Future work should investigate these specific effects using a longitudinal design. This study was supported by the Canadian Institutes of Health Research (MOP 62842 & IAP 66544).

**PB7 296 THE ASSOCIATION BETWEEN LIPID PROFILE, LIFE STYLE AND FRACTURES OF THE VERTEBRAE IN ELDERLY WOMEN**

L. SUSAN\* (University of Medicine and Pharmacy Victor Babes Timisoara, Timisoara, Romania)  
C. SERBAN(2), A. PACURARI(1), C. BANCIU(1), V. ANCUSA(3), G. SAVOIU(2), S. GOTIA(4), I. ROMOSAN(1) - (1) The IVth Medical Clinic of University of Medicine and Pharmacy Victor Babes Timisoara (Timisoara, Romania); (2) Pathophysiology Department of University of Medicine and Pharmacy Victor Babes Timisoara (Timisoara, Romania); (3) Politehnica University of Timisoara (Timisoara, Romania); (4) Physiology Department of University of Medicine and Pharmacy Victor Babes Timisoara (Timisoara, Romania)

Introduction: There are a lot of evidences that suggest that bone, fat metabolism and life style are related. The aim of the study was to investigate if the low levels of total cholesterol, triglycerides and LDL-cholesterol and life style factors (coffee and cigarette consumption, the type of physical activity) are associated with the fractures of the vertebrae in elderly women. Methods and materials: The study was carried out on a group of 86 elderly women, aged between 55-85 years, admitted in The IVth Medical Clinic of University of Medicine and Pharmacy Victor Babes Timisoara, Geriatric Department in a three year period. We noted in every patient the quantity of coffee and cigarette consumption per day and the type of physical activity. All the patients were clinically and paraclinically investigated (serum lipid levels, lumbar spine, hip and radius, bone mineral density measurements, lateral dorsal and lumbar spine radiographs). Results: We observed vertebrae fractures in 58 elderly women (67.44%) with low levels of total cholesterol, LDL-cholesterol and triglycerides. Total cholesterol level was most strongly associated with vertebral fractures. The BMD measurements (T-score) indicated osteoporosis in 31 women (36.04%). The lipid profile in osteoporosis women wasn't significantly different comparative with the lipid profile in women without osteoporosis. 35 women (40.69%) with over 20 cigarettes smoked per day, over 3 coffee cups per day and a sedentary life presented also vertebrae fractures. Conclusion: Our study showed that there is a connection between the lipid profiles, life style factors and vertebrae fractures in elderly women. Preventive measures include: antiresorptive drugs, controlling lipid profile every 3 months, regular exercise against gravity to make bone stronger accompanied by an adequate daily intake of calcium and vitamin D.

**PB7 297 COMPARISONS OF FALL RISK INDEX WITH ACTIVITIES OF DAILY LIVING, DEPRESSION, AND QUALITY OF LIFE, FOR COMMUNITY-DWELLING ELDERLY AMONG THREE TOWNS IN JAPAN**

Y. KASAHARA\* (Kyoto University, Kyoto, Japan)  
Y. ISHIMOTO(1), Y. KIMURA(1), M. HIROSAKI(1), T. WADA(1), M. ISHINE(2), R. SAKAMOTO(2), K. OKUMIYA(2), K. MATSUBAYASHI(1) - (1) Kyoto University (Kyoto, Japan); (2) Research Institute for Humanity and Nature (Kyoto, Japan)

Introduction: Falling in elderly people effect to decrease their quality of life (QOL). We reexamined the relation with falling and activities of daily living life (ADLs), depression, and QOL by using the "fall risk index" (FRI) in three towns in Japan. Methods and Materials: The study population consisted of 4383 people aged 65 and older (men 1871, women 2512, mean age  $75.4\pm6.7$ ) living in 3 towns in Japan. They were screened by the self-reported questionnaire contained FRI, ADLs, GDS, and QOL in 2006. FRI was validated by the Working Group for Fall Prevention in the Japanese Ministry of Health, Welfare and Labor. It consists of 21 questionnaire-based items on a yes/no basis. For the assessment of basic ADLs, the scores for seven items (walking, ascending and descending stairs, feeding, dressing, using the toilet, bathing, and grooming) were summed (0-21). For advanced ADLs, Tokyo Metropolitan Institute of Gerontology index of competence rating scale of 0 to 13 was used. Depression was assessed by the 15-item Geriatric Depression Scale (GDS: 0-15). QOL was rated on 100-mm visual analogue scale in five indicators (subjective health, relationship families, friends, financial satisfaction, and happiness). We separated two groups by FRI, who had over 10 points and others, and compared each groups scores of ADLs, GDS and QOL, used for calculating chi-square tests and unpaired t-test. Result: Response rates of the eligible population in each town were 79%, 90%, and

83%. The elderly who scored high in FRI had significantly lower scores for each item of the ADLs, GDS, and QOL in all three towns ( $p < .001$ ), and high scores for GDS ( $p < .001$ ). Conclusion: Fall risk index has significant correlation between ADLs, depression and QOL. We could use this index not only the screening of fall risk, but also fragility in community dwelling elderly.

**PB7 298 COST-EFFECTIVENESS ANALYSIS OF THE OTAGO HOME-BASED STRENGTH AND BALANCE RETRAINING IN SENIOR FALLERS**

J. DAVIS\* (University of British Columbia, Vancouver, Canada)  
P. GUY(1), T. LIU-AMBROSE(1), M. DONALDSON(2), M. ROBERTSON(3), K. KHAN(1), C. MARRA(1) - (1) Centre for Hip Health and Mobility (Vancouver, Canada); (2) San Francisco Coordinating Center (San Francisco, United States of America); (3) University of Otago (Dunedin, New Zealand)

Introduction: We sought to estimate the cost effectiveness of trained physiotherapists individually prescribing a home-based exercise programme aimed at reducing falls in older adults with a history of recent falls compared with guideline falls prevention care. Methods & materials: We conducted an economic evaluation based on a 12-month randomized controlled trial in 74 community dwelling women and men aged 70 years and older who presented to a healthcare professional after a fall. Participants were recruited from two dedicated referral-based falls clinics. The clinic provided falls risk factor assessment followed by a comprehensive geriatric assessment and treatment. Thirty-six participants received the intervention (Otago Exercise Programme; OEP) and 38 participants received guideline falls prevention care (CON). We recorded number of falls for each participant, cost of the falls clinic and the cost of delivering the Otago Exercise Programme by a trained physiotherapist. Results: Of the 74 participants enrolled in the trial, we have falls follow-up data for 52 participants. At 12-months, fewer falls (41%) occurred in the OEP group compared with the CON group. The total cost of delivering the Otago Exercise Programme for the study duration was \$CDN 14285 (\$US 11805, € 10720). The incremental cost of delivering the OEP compared with guideline care was \$CDN 247 (\$US 204, € 185) per fall prevented. Conclusions: An individually tailored exercise programme, delivered at home by trained physiotherapists was effective in reducing falls. Further, our results demonstrate that delivery of the Otago Exercise Programme in Canada yields an incremental cost-effectiveness ratio comparable with pioneering studies conducted in New Zealand.

**PB7 299 MAPPING FACTORS ASSOCIATED WITH FALLING TO THE INTERNATIONAL CLASSIFICATION OF FUNCTIONING**

L. MACKENZIE\* (University of Sydney, Lidcombe, Australia)  
A. HASSANI MEHRABAN(1), J. BYLES(2) - (1) Iran University of Medical Sciences and Health Services (Tehran, Islamic Republic of Iran); (2) University of Newcastle (Callaghan, Australia)

Falls risk is complex and the application of a holistic framework such as the International Classification of Functioning, Disability and Health (ICF) can account for the impact on falls of activity and participation, the environment and personal factors, in addition to body systems and structures. Aim: To map the factors associated with falls risk in the Australian Longitudinal study of Women's Health (ALSWH) cohort dataset. Method: First, items from five ALSWH surveys conducted between 1996-2005 were mapped to ALSWH survey categories and checked for accuracy across the surveys. Secondly, two occupational therapy researchers individually mapped these ALSWH survey items to the primary ICF components according to their interpretation of the meaning of the ICF components. Agreement between the raters was evaluated. The ten linking rules by Cieza et al and the 8 updated rules by Cieza et al were then used to link the ALSWH health status measures to the ICF. Scale items were allocated as a block rather than allocating individual items from scales to the ICF components. Results from both mapping exercises were compared and a consensus decision was made about the final linking of the items. Results: 410 items were mapped across the surveys. The OT raters differed on the placement of only 7 items. Differences were related to interpretations of activity and participation. Mapping using the 10 rules method allocated items differently due to personal factors not being classified and activity and participation being classified together. SF36 items were defined according to the rules method, but differently to the OT raters. Conclusion: The mapping exercise was challenging to accommodate both the professional interpretations of the OT raters and the rules published for this purpose. A review of the combination of activity and participation ICF components, and further definitions of personal factors and environmental factors are needed.

**PB7 300 THE RELATIONSHIP BETWEEN SUBJECTIVE & OBJECTIVE PHYSICAL FUNCTION & QUALITY OF LIFE IN PEOPLE LIVING TO ADVANCED AGE**

K. HAYMAN\* (University of Auckland, Auckland, New Zealand)  
N. KERSE (1), R. ELIZABETH(1), M. CONNOLLY(1), T. WILKINSON(2) - (1) University of Auckland (Auckland, New Zealand); (2) University of Otago (Christchurch, New Zealand)

Introduction Increasingly, longitudinal studies are being conducted to investigate the ways that older people age successfully. A major component of successful ageing is physical

function. This paper describes the variability of physical function and the relationship with frailty and quality of life in a cohort of older New Zealanders enrolled in a feasibility study. Methods and materials 112 people from 3 North Island locations in New Zealand (urban and rural) undertook a comprehensive questionnaire and physical assessments. Cross-sectional data were gathered on subjective and objective health status. Subjective measures included the Nottingham Extended Activities of Daily Living Scale (NEADL) and the SF36. The Short Physical Performance Battery (SPPB) generated an objective physical performance score from balance, gait speed and chair stand tests. We calculated a composite frailty score, based on Edmonton's frail scale. Results 64 women (57%) and 48 men (43%) were enrolled. 84% of people rated their health as good, very good or excellent. 77% scored >15 on the NEADL and 52% scored >7 on the SPPB, indicating good physical function. The correlation between self-reported (NEADL) and observed (SPPB) function was .55, and with frailty, -.59 and -.52 respectively. These variables were all independently associated with physical health-related quality of life (SF-36 PCS); frailty explained more of the variance than the others. In a regression analysis the three variables altogether accounted for 33% of the variance in SF-36 PCS score. This relationship was unaltered when mental health-related QOL was added to the model. Conclusion Although correlated, self-reported and observed function were both independently related to physical health-related QOL and may represent and measure different things. Frailty was closely related to QOL. These relationships will be examined longitudinally in a cohort of very old people and will add New Zealand data to the growing global understanding of the ageing process.

**PB7 301 EFFECTS OF JUMP TRAINING PLUS LOW-INTENSITY RESISTANCE TRAINING WITH MODERATE VASCULAR OCCLUSION (LIO) ON BONE MINERAL DENSITY OF HEALTHY ELDERLY AND MIDDLE-AGED FEMALES**  
Y. YOKOKAWA\* (Shinshu University, Matsumoto, Japan)  
I. KAI(1) - (1) University of Tokyo (Tokyo, Japan)

**INTRODUCTION:** Jump training has protective effects against the loss of bone mineral density (BMD) in elderly. Low-intensity resistance training with moderate vascular occlusion (LIO; Ishii 2002) is a resistance exercise wearing belt. It is not clear whether the combination of both trainings elevates BMD. The purpose of the present study is to examine the efficacy of jump training plus LIO on BMD of healthy elderly and middle-aged females. **METHODS:** Thirty-four healthy female subjects aged 50 and older were non-randomly allocated to the LIO plus jump training group ( $n = 23$ ) or control group ( $n = 11$ ). They did not have any identifiable medical problems. The training was conducted twice weekly for 6 months, using 6 sets of dynamic jump exercises. Each session of exercise included the 6 sets of 10 repetitions of the movements. At the end of jump training, LIO was performed. Control group maintained their usual daily activities. Various indicators of BMD, muscle strength, and endurance were used. BMD of femur, knee extensor muscle strength, reaction time, 10 m shuttle walking, and body mass index (BMI) were measured at pre- and post-intervention. **RESULTS:** Three subjects dropped out from the study because they were lost interest. In the follow-up study, thirty-one could be evaluated (91.2%). Among the analyzable subjects, average participation was 26.9 out of 48 sessions (range 2-45). Average age ( $\pm SD$ ) was 64.8( $\pm 5.9$ ) years in training group ( $n=21$ ) and 60.4( $\pm 4.4$ ) years in control group ( $n=10$ ). BMD did not change between pre- and post-intervention measurements. BMI was significantly decreased in the training group, but not in the control group. **CONCLUSION:** This intervention program might not have given enough stimulus to increase BMD of femur. We should consider how to provide mechanical strain to improve BMD in jump training plus LIO.

**PB7 302 AGE-FRIENDLY COMMUNITIES, WALKABILITY, AND HEALTH: A REVIEW OF EMPIRICAL STUDIES**  
G. GUTMAN \* (Simon Fraser University, Vancouver, Canada)  
E. HWANG(1), K. HACKETT(1), L. CUMMINGS(1), A. SIXSMITH(1) - (1) Simon Fraser University (Canada)

**o Introduction** This study reviews empirical research on the built environment, physical activity and health, including age-friendly communities, walkable neighborhoods, and health interventions. **o Methods and materials** To identify potential studies for review, several strategies were used. First, a key-word search was conducted using five major health databases and three planning databases. Second, potential studies were identified by reviewing all issues (1995 or later) of several major gerontology and planning journals. Finally, reference lists of studies identified from the first and second strategies were inspected. **o Results** Three main research areas exist. First, many studies investigated the effects of the built environment on obesity, almost universally measured using the Body Mass Index (BMI). Most found negative correlations between measures of walkability and levels of obesity; however, BMI and levels of physical activity (PA) were inconsistently related in studies examining both factors. Second is the wave of studies investigating environmental correlates of walking, which commonly differentiated between various forms of walking, including walking for recreation versus for transport, and travelling to public transportation stops. Different types of walking appear to be associated with different aspects of the built environment. A third area involves environmental effects on various physical and psychological outcomes, such as hypertension and depression. **o Conclusion** Many communities have experienced aging in place, but sample populations in studies reviewed were typically children, adolescents, and adults (usually all ages above 18); very few studies focused exclusively on older adults (i.e. 65 years and older). More

evidence-based research on older adults is needed. In addition, the built environment is considered as background or context in building conceptual models. This has limited efficient implementation of health interventions and policies for new urbanism that might translate into improved health.

**PB7 303 STAYING SAFE AT HOME: WHY AREN'T COMMUNITY DWELLING ELDERS ACCEPTING HOME MODIFICATIONS DESIGNED TO ASSIST THEM TO LIVE INDEPENDENTLY AT HOME?**

M. CURRIN\* (Flinders University, Brisbane, Australia)  
T. COMANS(2), C. ARCHER(1), J. PRYOR(1), M. CROTTY(1) - (1) Flinders University (Adelaide, Australia); (2) The University of Queensland (Brisbane, Australia)

**Background:** Previous research has demonstrated that home modifications prescribed by an occupational therapist are effective in reducing falls in the elderly<sup>1</sup>. This study draws on data collected from a randomised controlled trial of two different service delivery models for a falls prevention service located in Brisbane, Australia<sup>2</sup>. Clients are typically referred to the service for falls, declining mobility and/or difficulties with ADL's and receive an initial home visit including an environmental audit and recommendations made to improve safety and independence at home. **Results:** Clients presented to the service with a wide range of issues including being outside normal weight range, incontinence, no longer driving, abnormal cognition and anxiety/depression. Physical skills were significantly poorer than normal for age for walking, balance, strength, reaction times and hand function. Overall, 80 clients received an environmental recommendation. An average of 3.5 environmental changes was recommended at the initial home visit. At the 6 month follow-up an average of 50% of these had actually been completed. Recommended modifications were categorised into bathroom, toilet, bedroom, flooring, reducing obstacles, mobility aids and other. The majority of modifications were in the bathroom and toilet (grab rails and transfer benches) and flooring areas. Multivariate logistic regression analysis found that age, health status, the clients living arrangements, the number of falls they had experienced and their education level are all significant predictors of likelihood to comply with recommendations. **Discussion:** The uptake of recommendations by elderly community dwelling clients is poor. Clinicians need to develop an understanding of their clinical practice reasoning processes when undertaking home visits and their recommendations. This will assist with informing current and future practice and improving the uptake of any home visit recommendation. Further research into this area is required. 1. Cumming et al. Home Visits by an Occupational Therapist for Assessment and Modification of Environmental Hazards: A Randomized Trial of Falls Prevention. *Journal of the American Geriatrics Society* 1999;47((12)):1397-1402. 2. Comans TA, Brauer S, Haines T. Domiciliary vs Centre-Based Rehabilitation of Older Community Dwellers: Randomised Trial with Economic Evaluation *The Open Geriatric Medicine Journal* 2008;1:62-67 (6).

**PB7 304 EXERCISE FOR INDEPENDENT LIVING: RANDOMISED CONTROLLED TRIAL OF EXERCISE FOR MAINTAINING INDEPENDENCE DURING AGEING**

L. DAY\* (Monash University, Clayton, Melbourne, Australia)  
K. HILL(1), L. FLICKER(2), D. JOLLEY(3), L. SEGAL(4), F. CICUTTINI(3) - (1) Latrobe University and Northern Health (Australia); (2) University of Western Australia (Australia); (3) Monash University (Australia); (4) University of South Australia (Australia)

**Introduction:** Our aims were to: test the efficacy of tai-chi in delaying disability among older people, investigate the associated mechanisms, and to evaluate the economics of tai-chi. **Methods:** Community dwelling people ( $n=503$ ), 70+ years and screened for pre-clinical disability, were randomised into twice-weekly exercise groups for 48 weeks: tai-chi (TC), or a flexibility and stretching program (FS). The primary outcome measure was the Late-Life Function and Disability Instrument (LLFDI) score. Secondary outcomes included falls, joint pain, cardiac function, strength, balance, quality-of-life. The primary economic measure was incremental cost per change in Quality-Adjusted-Life-Years. The effect of TC on function and disability was estimated by weighted linear regression, adjusted for the baseline score and the clustering variable of site. **Results:** 68% of participants were women and 82% had at least one chronic medical condition. Ages were 70-74 (33%), 75-79 (32%) and 80-84 (24%) and 85+ (12%) yrs. Average baseline LLFDI function, disability-limitation, and disability-frequency mean scores ( $sd$ ) were 59.2 (8.0), 73.4 (12.0), and 52.8 (4.9) (max possible score 100). By 24 weeks, 53% of TC and 35% of FS participants had ceased attending classes. Average number of classes attended was 31 ( $sd$  14) for TC and 32 ( $sd$  10) for FS. At 24 weeks, the adjusted mean LLFDI basic, and advanced, lower limb function scores for the TC group were 0.36 units lower (95% CI -1.8 - +1.1,  $p=0.62$ ), and 0.18 units lower (95% CI -0.93 - +0.57,  $p=0.62$ ), than the FS group. The disability-limitation score was 0.86 units lower (95% CI -2.5 - +0.76,  $p=0.28$ ), and the disability-frequency score was 0.35 units lower (95% CI -1.4 - +0.67,  $p=0.49$ ). **Conclusions:** There was no evidence that TC reduced disability, relative to FS, among this

sample. The dose of tai-chi delivered may have been insufficient to impact on disability. Examination of secondary outcomes may assist in explaining this result.

**PB7 305 BEDSIDE ASSESSMENT OF VISUAL IMPAIRMENT IN OLDER FALLS PATIENTS**

J. LAYBOURNE\* (Manchester Royal Infirmary, Manchester, United Kingdom)

J. GOODCHILD(1), P. BANNISTER(2), R. HARPER(3), M. HANLEY(2) - (1) The University of Manchester (Manchester, United Kingdom); (2) Manchester Royal Infirmary (Manchester, United Kingdom); (3) Manchester Royal Eye Hospital (Manchester, United Kingdom)

Introduction 1/3 people >65 years fall annually. Treating falls in the UK due to visual impairment alone cost £128m in 2004. The National Institute of Clinical Excellence advises all falls patients should have vision assessed. After auditing, we found only 20% of falls patients received a full visual assessment. We therefore investigated bedside visual impairment screening tools in the falls in-patient population at a large UK teaching hospital. Methods and materials Non-confused falls patients aged ≥60 years were deemed eligible for the study. Confusion was assessed using the Abbreviated Mental Test Score (AMTS). Patients were asked our screening questions for visual impairment, particularly symptoms of cataract, age-related macular degeneration, glaucoma and diabetic retinopathy. They were then examined by a non-ophthalmic practitioner to assess for visual impairment: eyelids, pupils, eye movements, visual acuity (using LogMAR charts), visual fields (using Damato campimetry/confrontation, & Amsler Grid) and red reflexes (using ophthalmoscopy) were performed, and timed. Results 30/70 falls patients were not confused. Mean age: 81 years (63-94). Mean number of falls in last 12 months: 4.1 (1-12). 23% had not seen an optometrist for ≥24 months. 50% had a known ophthalmic diagnosis. 73% were visually impaired using their current spectacles, with 50% of them having no previously known ophthalmic history. Using pinhole testing, 32% improved to non-impairment standards and 50% of all patients showed improved visual acuity. 10% had ptosis, none had pupil abnormalities and 7% had abnormal eye movements. 27% of patients had visual field defects, 48% had an Amsler Grid abnormality and 7% had a new red reflex abnormality. Conclusion Our screening was quick and simple for a non-ophthalmologist to perform. It detected a high proportion of patients with visual impairment that was amenable to correction. This would improve patients' quality of life and reduce their risk of falls.

**PB7 306 ESTIMATION OF LEAN BODY WEIGHT IN ELDERLY PATIENTS**

S. MITCHELL\* (Royal North Shore Hospital and the University of Sydney, Sydney, Australia)

S. HILMER(1), C. KIRKPATRICK(3), B. GREEN(4), R. HANSEN(1), D. WILLIAMSON(5), N. SINGH (2), A. DIWAN(8), B. ALLEN(7), T. DIAMOND(7), M. FIATARONE-SINGH(5) - (1) Royal North Shore Hospital (Sydney, Australia); (2) University of Sydney (Sydney, Australia); (3) University of Queensland (Sydney, Australia); (4) Model Answers Pty Ltd (Sydney, Australia); (5) Exercise Health and Performance Faculty Research Group (Australia); (7) St George Hospital (Australia); (8) The University of New South Wales (Australia)

Introduction Lean Body Weight (LBW) decreases with age while total body fat increases, affecting drug pharmacokinetics. LBW increases non-linearly with total body mass and linearly with drug clearance. A semi-mechanistic model estimating LBW using height, weight and gender was recently developed in healthy adults. We investigated the transportability of this LBW model to predict Dual Energy X-ray Absorptiometry-derived fat free mass (FFMDEXA) in frail older patients. Methods Body composition data was obtained on 28 participants in the Sarcopenia and Hip Fracture study, a cohort study following 193 patients admitted for surgical repair of hip fracture. LBW was calculated using the LBW equation\*. Body composition was classified using Body Mass Index (BMI) and Bioelectrical Impedance Analysis (BIA)-sarcopenia data as: 'overweight/obese', 'sarcopenic', or 'sarcopenic obese'. The ability of the LBW equation to accurately predict FFM in this cohort was determined by agreement with FFMDEXA using Bland-Altman plots and statistics.. Results The mean±SD age of participants was 83±7 (females, n=23) and 81±9 years (males, n=5). Most were sarcopenic (65.2% female, 80% male). Mean±SD FFMDEXA was 48.7±8.26kg (males) and 36.7±6.69kg (females). Bland-Altman plots demonstrated modest agreement between LBW and FFMDEXA with limits of agreement of -10.1, 8.5 kg (females) and -4.1, 8.6 kg (males). Bias (95% Confidence Interval) was 0.77kg (-1.24, 2.78kg) for females and -2.26kg (-6.19, 1.68) for males. Precision was 4.60 (-11.29, 20.49) for females and 3.62 (-24.73, 31.97) for males. Agreement appeared similar for females who were sarcopenic, sarcopenic obese or overweight/obese. No baseline data was available for patients. Conclusion The LBW equation provides a reasonable estimate of FFMDEXA in women after hip fracture; insufficient data is available in men. However, individual variation in FFM prediction was large enough to be potentially clinically important for drug dose adjustment. \*LBWMALES (kg) = (9270 x WT (kg)) / (6680 +

$$(216 \times \text{BMI} (\text{kg}/\text{m}^2)) * \text{LBWFEMALES (kg)} = (9270 \times \text{WT (kg)}) / (8780 + (244 ? \text{BMI} (\text{kg}/\text{m}^2)))$$

**PB7 307 EFFECTS OF COMBINED AEROBIC WITH RESISTANCE EXERCISE MODEL ON PHYSICAL FITNESS AND ENDOTHELIAL FUNCTION IN THE ELDERLY**

D. SUKSOM\* (School of Sports Science, Chulalongkorn University, Bangkok, Thailand)

A. SIRIPATT(1), P. LAPO(2), S. PATUMRAJ(3) - (1) Faculty of Sports Science, Burapha University (Chonburi, Thailand); (2) School of Allied Health Science, Naresuan University Phayao (Phayao, Thailand); (3) Dept. of Physiology, Faculty of Medicine, Chulalongkorn University (Bangkok, Thailand)

Introduction: Aging is an independent risk factor for hypertension, atherosclerosis and coronary heart disease. It has been hypothesized that endothelial dysfunction precedes these pathological disease states. Regular aerobic and resistance exercise training are recommended for the prevention and treatment of cardiovascular disease associated with aging. However, studies that examined the effects of one performs aerobic and resistance training simultaneously were limited. Exercise with flexible stick (EF) , the innovation of aerobic exercise model which applied motion from Thai dance and Ram krabi-krabong movement compatible with Thai instrumental music and using the increasing resistance equipment, flexible stick should therefore be developed. This study was to investigate the effects of EF on physical fitness and endothelial function in the elderly. Methods and materials: Sixteen older women who practiced EF (OE), fourteen older sedentary women (OS) and fifteen younger sedentary women (YS) were recruited. OE group performed EF with intensity 70% of maximum heart rate (maxHR), 40 min/day, 4 days/wk for 12 wk. Physical fitness and biochemical data were determined in all participants. Postocclusive reactive hyperemia (PORH) was used to monitor endothelial function by using the laser-Doppler fluxmeter. Results: OE group had lower in resting HR, systolic blood pressure and %body fa ( $p<0.05$ ) when compared with OS group. Flexibility, muscular strength and maximal oxygen consumption of OE group were higher than OS group ( $p<0.05$ ) but lower than YS group ( $p<0.05$ ). PORHpeak/resting was higher in OE group than in OS group ( $p<0.05$ ). Plasma malondialdehyde, an indicator of free radical damaging, c-reactive protein, von Willebrand factor and cholesterol levels in OE group were lower than those of OS group ( $p<0.05$ ). Conclusion: Our results indicated that EF, a combination of aerobic and resistance training during their usual training regimen, had a favorable effects in promoting health related physical fitness and improving endothelial function in the elderly.

**PB7 308 INNOVATIVE STRATEGIES TO ASSIST FALLING ELDERLY (ISAFE): A COMMUNITY INITIATIVE FOR FALLS AND INJURY PREVENTION IN AUSTRALIA**

J. NITZ\* (The University of Queensland, Brisbane, Australia)

S. FU(1), V. CAITHNESS(2), M. TWEEDDALE(2) - (1) The University of Queensland (Brisbane, Australia); (2) DAART Mater Health Services (Brisbane, Australia)

Introduction Previous studies of community dwelling people have shown that falls rate is reduced through multidisciplinary team interventions. The purpose of this study was to evaluate reduction of fall risks in people 65 years and older living in the community through the implementation of a sustainable model of service delivery based on best practice falls prevention interventions. Method and Material 517 community dwelling people with a mean age of 81 were recruited from the community over 12 months period. They were individually screened and referred to allied health, medical practitioners and falls clinic as necessary. All participants undertook an exercise program that was delivered at their residential location or a senior's centre. Participants attended a 12 week twice weekly specific balance strategy training exercise program designed and delivered by physiotherapists. Assessment included balance and mobility measures, cardiovascular endurance and self-assessed functional level. Results: Post screening 30.6% were referred to allied health professionals, 48% to general practitioners and 31.4% were referred to falls clinic. All participants showed significant improvement in balance, mobility and endurance measures ( $p<0.001$ ). Frenchay activity index also improved ( $p=0.048$ ). A formal community infrastructure that manages falls risks was established in South-East Queensland between a falls clinic, existing allied health providers in the community, general practitioners and other stakeholders using a collaborative multi-sectoral fall prevention approach. Conclusions: The results provide evidence that this holistic approach to management including physiotherapist assessment and intervention reduced falls risks in this target group. Implementing a sustainable falls program through collaboration with other existing services should be considered to ensure the best outcome to reduce the possibility of a fall thus minimize demand on limited health resources.

**PB7 309 PREDICTORS FOR WALKING SPEED LOSS AMONG COMMUNITY-DWELLING OLDER ADULTS**

S. SHINKAI\* (Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan)

Y. FUJIWARA(1), H. YOSHIDA(1), H. AMANO(1), S. LEE(1), N. WATANABE(1), H. YOSHIDA(1), T. SUZUKI(1) - (1) Tokyo Metropolitan Institute of Gerontology (Tokyo, Japan)

**Introduction:** Walking speed is a good measure for lower extremity function of older person, and has been documented to be one of the best predictor for adverse health outcomes in older adults. However, knowledge is still limited regarding the predictor for change in walking speed. This study examined the predictor for walking speed loss among the elderly. **Methods and Materials:** Subjects comprised 656 community-dwelling older Japanese aged 65 years and over who were initially intact in walking speed (upper 75% by age and sex), and underwent again walking test 2 years later. We defined the walking speed loss as a person whose walking speed declined within lower 25% by age and sex. We compared socio-demographics, medical conditions, blood pressure, hematological parameters including markers for kidney function and inflammation, and walking speed at baseline between subjects who showed walking speed loss and those who did not. The multiple logistic models were used to examine predictors independent of other potential confounders. **Results:** Two years later, 84 persons (12.8%) were determined to have walking speed loss. They were characterized as having lower walking speed at baseline, poorer self-rated health, higher levels of serum measures of renal function (cystatin C and beta2-microglobulin) and inflammation (IL-6, TNF-alpha, and CRP). The factors which were independently associated with walking speed loss included baseline walking speed, self-rated health, and serum IL-6. The odds ratios (95% CI) of 2nd and 1st tertile relative to 3rd tertile were 3.05 (1.24-7.51) and 12.5 (5.38-29.2) for walking speed; that of fair/poor relative to excellent/good was 2.71 (1.51-4.87) for self-rated health; those of 2nd and 3rd relative to 1st tertile were 1.86 (0.94-3.68) and 2.15 (1.07-4.31) for IL-6, respectively. **Conclusions:** Lower walking speed, poorer self-rated health and higher level of serum IL-6 independently predict the future onset of walking speed loss in community-dwelling older adults.

**PB7 310 PREDICTIVE VALIDITY OF BIO-ELECTRICAL IMPEDANCE EQUATIONS IN PREDICTING FAT FREE MASS IN AN AUSTRALIAN POPULATION**

S. YU\* (The Queen Elizabeth Hospital, Adelaide, Australia)

R. ADAMS(2), D. WILSON(2), I. CHAPMAN(2), P. PHILLIPS(3), R. VISVANATHAN(1) - (1) The Queen Elizabeth Hospital (Australia); (2) The Department of Medicine, University of Adelaide (Australia); (3) Osteoporosis Centre, The Queen Elizabeth Hospital (Australia)

**Introduction:** Bioelectrical Impedance Analysis (BIA) is often used in community studies to estimate fat free mass (FFM). It is fast and convenient. The aim of this cross-sectional study was to evaluate the predictive validity of six previously published prediction equations in Australians. **Methods and Materials:** 195 healthy subjects (age 18-82 years, 40% men) underwent measurements of FFM using bio-electrical impedance analysis (BIA) and dual energy x-ray absorptiometry (DEXA). Reactance and Resistance values from BIA were entered into various prediction equations-Sun, Kyle, Lukaski, Segal, Deurenberg and Kushner. **Results:** Not surprisingly, the correlations between  $FFM_{DEXA}$  and the FFM estimates derived from the various prediction equations were strong ( $r = 0.85-0.93$ ). There was no difference between the mean FFM estimates using the Kyle ( $0.17 \pm SD 4.26$ ) and Deurenberg ( $-0.41 \pm 4.28$ ) equations. In men, a significant mean difference was seen only for the Kushner equation. In women, except for the Kyle equation, significant mean difference was seen for all other equations. For all predictive equations, wide limits of agreements ( $\pm 2SD$  of mean difference) were observed. **Conclusion:** This study suggests that for an Australian population, the Kyle equation is the most accurate predictive equation for estimating FFM. It would appear that all other equations performed poorly in women.

**PB7 311 A COMPARISON OF HUMAN PLASMA GLYCOPROTEOME BETWEEN PRE-FRAIL AND NON-FRAIL OLDER ADULTS**

K. SHAMSI\* (University of Texas Health Science Center San Antonio, San Antonio, United States)

A. PIERCE, PH.D.(1), D. HALADE(1), A. RICHARDSON, PH.D.(1), S. ESPINOZA, M.D.(1) - (1) The Barshop Institute for Longevity and Aging Studies (San Antonio, United States of America)

**Introduction:** Frailty is a clinical geriatric syndrome characterized by adverse health outcomes, vulnerability to decline, poor tolerance to stressors, and physiologic distinction from non-frail individuals. To date, physiologic alterations associated with frailty have almost exclusively demonstrated modifications in glycoproteins, such as interleukin-6 and C-reactive protein. Glycoproteins are a result of glycosylation, the most common type of post-translational modification. They are involved in various cellular processes thought to be altered with aging, particularly the regulation of cell-to-cell and cell-to-matrix interactions. The objective of this pilot study was to utilize proteomic biotechnology to analyze glycoprotein alterations between non-frail and pre-frail older adults. **Method:** Plasma was isolated from 4 pre-frail and 4 non-frail community-dwelling older adults, who were matched by age ( $\pm 9$  years) and sex. Pre-frailty was assessed using previously validated screening criteria (1 or 2 of weak grip, slow walk, weight loss, exhaustion, or low physical activity). Glycoproteins were isolated in Concanavalin A lectin columns and eluant was separated and quantified using 2-dimensional polyacrylamide gel electrophoresis. We measured differences in spot intensity using PDQuest software (Bio-Rad, Inc) to identify glycoproteins which differed in intensity (2-fold or greater) between pre-frail and non-frail individuals. Glycoproteins of interest were identified by matrix-assisted laser desorption/ionization time of flight spectrometry. **Results:** We studied 4 men

and 4 women (2 pre-frail and 2 non-frail for each gender) with an overall mean age of 81. Seven glycoproteins were upregulated in pre-frail individuals compared to non-frail (2 haptoglobin isoforms, 2 transferrin isoforms, 1 fibrinogen-G, and 2 unidentified). **Conclusion:** The up-regulation of several inflammatory glycoproteins in pre-frail vs. non-frail individuals indicates that this methodology may be useful in detecting alterations in glycoprotein expression between pre-frail and non-frail individuals. Moreover, differences in glycoproteins demonstrated at an intermediate stage, when frailty is not clinically apparent, may suggest feasibility for the identification of potential biomarkers for frailty and earlier identification of older adults at risk for adverse health outcomes.

**PB7 312 THE RELATIONSHIP BETWEEN ORAL FUNCTIONS AND MENTAL, AND PHYSICAL CONDITIONS ON THE OLDEST OLD**

T. IINUMA\* (Nihon University, Tokyo, Japan)

K. SAITO(1), M. FUKUMOTO (1), Y. ARAI(2), M. TAKAYAMA(2), K. ASAKURA(2), Y. NISHIWAKI(2), N. HIROSE(2), K. KOMIYAMA(1), N. GIONHAKU(1) - (1) Nihon university (Tokyo, Japan); (2) Keio university (Tokyo, Japan)

**Introduction:** Maintaining excellent oral function is important to achieve a healthy long life and to improve QOL. Therefore, there has been considerable research on the possible relationship between oral functions and general health. However, what studies on the oldest old (85 years old or more) are limited. This research examined whether oral functions affect nutritional state, physical performance, and cognitive function among the oldest old. **Material and methods:** The study involved 152 oldest old in Tokyo (65 men and 88 women, mean age 88.44±3.1). The number of remaining teeth, the condition of dental prosthesis and the bite force were examined as investigation items for oral functions. Body mass index (BMI), serum levels of albumin (Alb), total cholesterol (TC), and C-reactive protein (CRP) were measured for nutrient state. The grip, the chair standing in 30 seconds, and timed up and go test were investigated as physical performance. MMSE was investigated as cognitive function. Additionally, the correlation was examined between each of these items. **Results:** Mean values of the number of remaining teeth were 5.3, and did not differ by sex. The mean value of bite force was 8.44±4.5 kg. A significant correlation was found at the number of remaining teeth with bite force, Alb, chair standing, and walking time. A significant correlation was found at the condition of the dental prosthesis with chair standing, and walking time. In men, the chair standing and Instrumental ADL was associated with the bite force. In women, the grip was associated with the bite force, but not with I-ADL. **Conclusion:** Our results suggested there were significant relations between the oral function, the nutritional state, and physical performances in the oldest old. In addition, the cooperative relationships of oral muscles and the limb muscles were found.

**PB7 313 THE PREDICTIVE VALUE OF ASSESSMENT FOR FALLING RISK IN THE ELDERLY INPATIENTS**

M. ONISHI\* (Osaka University, Suita, Japan)

M. OHISHI(1), H. SAIDO(2), N. FUKUMOTO(2), Y. IKEDA(2), K. URANISHI(2), Y. SHIRAKAWA(2), H. RAKUGI(2), T. OGIHARA(3) - (1) Geriatric Medicine, Osaka University (Suita, Japan); (2) Osaka University Hospital (Suita, Japan); (3) Osaka General Medical Center (Osaka, Japan)

**Introduction:** Although the prediction and prevention about the falling incidence is quite important, it is very difficult to predict because the heterogeneity of the elderly patients, even if use well-known falling assessment score. Therefore, we designed a retrospective observational study to improve predictive value of assessment score. **Methods and Materials:** We recruited serial 215 cases with some kinds of incidences (mean age 69±12 y.o.) assessed by falling assessment score before incidence, and classified into two groups; falling group (n=59) and no-falling group (n=156). **Results and Conclusions:** The risk grade III was higher frequent in the falling group ( $p<0.0005$ ), and the score of history of falling and physical activity is higher ( $p<0.0001$ ). In the risk grade II, the history of falling ( $p<0.0001$ ), muscle weakness ( $p<0.0001$ ), necessary support for movement ( $p=0.0040$ ) and dizziness ( $p=0.0007$ ) is higher in the falling group. The additive effect of these four factors was found (50% for two, 66.7% for three and 100% for four in the falling group). In the risk grade III, only muscle weakness was the risk for falling ( $p=0.0212$ ). To improve the predictive value, if the risk grade II with more than one of history of falling, muscle weakness, necessary support for movement or dizziness, or the risk grade III with muscle weakness is considered as the risk for falling, the sensitivity (81.3%) and the specificity (75.6%) become much better than classical one. It would be quite important to clarify the important factors for falling, and to predict high-risk patients and to prevent the incidences of falling.

**PB7 314 REPRESENTATIONS OF OSTEOPOROSIS AT THE TIME OF ANNOUNCEMENT OF THE DIAGNOSIS -ROAD**

C. LAMBERT\* (IPSEN, Boulogne Billancourt, France)

L. CHARLES(1), L. ERIC(2), L. FLORENCE(3), L. SABINE(4), R. GÉRARD(5), B. GENEVIEËVE(6), T. THIERRY(7), F. FRANÇOISE(8) - (1) IPSEN (Boulogne , France); (2) CHU Orléans (Orléans, France); (3) CH Argenteuil (Argenteuil, France); (4)

Paris (Grennevilliers, France); (5) CHU Bobigny (France); (6) TNS Healthcare (France); (7) CHU St Etienne (France); (8) SFGG (France)

**Introduction** ROAD is the first cross-sectional psychobehavioural study conducted on representations of osteoporosis, perception of consequences in their future among newly diagnosed women and women in the general population. **Methodology** The first part of this study (ROAD 1) conducted throughout France among general practitioners (n=1,000) and private rheumatologists (n=200) is still ongoing. The second part (ROAD 2) was launched in the general population, evaluating unselected women of the same age-group (> 55 years) by means of a structured post-mail questionnaire. We present hereafter the results for the 1172 (53%) participants who were > 70 years, including 320 (27%) were osteoporotic women. First results When asked "Do you fear osteoporosis?", only one half of the women, whatever the age or presence of osteoporosis, agreed. Among women above 70, osteoporotic women perceived more negatively their disease and 70.9% perceived osteoporosis as a consequence of ageing (vs. 63.4% of osteoporosis-free women and 63.6% for all interviewed women). Only 45% of osteoporotic and osteoporosis-free women considered osteoporosis as a pain-free disease until the first fracture and almost 80% of these women considered osteoporosis as a painful disease after the first fracture (vs. 82%). When asked "Is there any recommended treatment?" 85% of osteoporotic and 81% of osteoporosis-free women agreed. The consequences of osteoporosis were judged severe by 98.1% and 95.5% and extremely severe by 39.4% and 38.5% respectively. 44.9% of the osteoporosis-free women believed that the consequences of osteoporosis could occur in the 5-10 years following the diagnosis. Conclusion: results expected for the 1st quarter 2009 Whether osteoporotic or not, French women appear to be informed of osteoporosis and aware of its consequences. However they don't seem worry about the diagnosis or its consequences. This may explain in part, the current poor adherence to treatment. Further analysis will compare the points of view of patients, doctors and osteoporosis-free women.

**PB7 315 THE FALL TELEPHONE: CAN FRAIL OLDER PEOPLE HANDLE IT?**

M. REELICK\* (Radboud University Nijmegen Medical Centre, Nijmegen, The Netherlands)  
A. LENFERINK(1), M. OLDE RIKKERT(1) - (1) Radboud University Nijmegen Medical Centre (Nijmegen, The Netherlands)

**Introduction:** Of different methods for falls registration in research in older people, the most commonly used is the fall calendar. These calendars must be filled in daily and sent to the researchers every two weeks. However, this method has several disadvantages in a frail population. The 'fall telephone' is an automatic computer system which phones participants once a week. Participants type in the amount of falls they experienced that week using a touch-tone telephone. It is unknown whether frail older people are able to handle such a system. **Methods:** Six frail older people with cognitive and physical limitations used both the fall telephone and fall calendars for four weeks to register falls, after receiving a personal instruction by one of the researchers. After four weeks, the researcher visited the participants again to conduct a semi-structured interview on their experiences with the two fall registration systems. Additionally, if caregivers aided the participants with the use of the system, the caregivers were also asked about their experiences with the systems. **Results:** Participants admitted they forgot to fill in the fall calendars daily and to mail them after two weeks. The fall telephone was easy in use and the greatest advantage was that participants could not forget to fill it in. Though, not every call was answered by the participants themselves. When asked directly, all participants preferred the fall telephone over the calendars. Conclusion: The fall telephone seems a feasible method to report falls data and is preferred over the use of fall calendars by frail older people. A larger study will be conducted and presented (N=30) in which we assess the validity of the fall phone to enable future research on falls in frail older people.

**PB7 316 ACUTE MEDICAL ILLNESSES OF ELDERLY MEDICAL INPATIENTS WITH SEVERE FUNCTIONAL DECLINE AND PREVALENCE OF IMMOBILIZATION COMPLICATIONS AMONG FRAIL ELDERLY ADMITTED IN MEDICALWARDS THROUGH EMERGENCY UNITS. THE FRENCH SAFES COHORT STUDY.**

A. DESBOIS\* (Centre Hospitalier Universitaire de Grenoble, GRENOBLE, France)  
I. LANIECE(1), C. MILLET(1), S. LEHMAN(1), G. GAVAZZI(1), M. DRAME(2),  
F. BLANCHARD(2), P. COUTURIER(1) - (1) Clinique Universitaire de Médecine Gériatrique, Hôpital Michallon, Centre Hospitalier Universitaire de Grenoble (GRENOBLE, France); (2) Service de Médecine Interne et de Gérontologie Clinique, Hôpital Maison Blanche, Centre Hospitalier Universitaire de Reims (REIMS, France)

**Introduction** Acute functional decline is frequent among elderly inpatients. This study focuses on the medical causes of admission and complications related to reduced mobility. **Methods and materials** An observational cohort study, belonging to the SAFES multicentre research programme was conducted in nine French hospitals among 1,306 medical inpatients aged 75 and older admitted through emergency departments. Data were collected through a comprehensive geriatric assessment conducted during the first week of admission. This descriptive study aimed to identify pathologies linked to severe acute functional decline, to estimate the prevalence of decubitus complications and the impact in terms of mortality. Four groups of patients regarding to mobility decline were defined with the item "mobility" from the Katz' ADL scale, measured 15 days before admission (baseline) and at admission. The group "severe functional deterioration" included patients

independent for mobility at base-line and becoming immobilized after admission. Results Data from 1,237 inpatients were considered. 37% of the patients had no mobility loss, 24% a previous reduced mobility, 30% a moderate functional decline and 9% a severe functional one. Acute medical illnesses significantly related to acute immobilization were: cerebro-vascular diseases, musculoskeletal pathologies, pulmonary embolism. Among patients independent before admission, those severely declining were significantly more affected than those keeping independent regarding to frailty criteria such as denutrition, cognitive impairment, loss of at least 2 IADLs and physiotherapy before admission. They had a significantly higher prevalence of immobilization complications: pressure sores (9%), venous thromboembolism (10%), digestive complications (9%) during the first week of admission. Hospital stay duration, mortality and institutionalization increased significantly with the severity of mobility loss. Conclusion 12% of previously independent patients became bedrest following admission. Cerebrovascular accidents and traumas were the main acute illnesses linked to immobilization. Early detection of mobility loss could facilitate prevention of decubitus complications and reinforce early rehabilitation care.

**PB7 317 INFLAMMATORY MARKERS AND FUNCTIONAL PERFORMANCE AMONG THE OLDEST-OLD**

K. TIAINEN\* (University of Tampere, Tampere, Finland)  
M. HURME(2), A. HERVONEN(1), M. JYLHÄ(1) - (1) Tampere School of Public Health, University of Tampere (Tampere, Finland); (2) Microbiology and Immunology, University of Tampere Medical School (Tampere, Finland)

**Introduction:** Recent studies have suggested that inflammation may play an essential role in the process of aging and the development of disabilities. However, the knowledge about the role of inflammation in the development of muscle weakness and disabilities among the oldest-old is limited. The purpose of this study was to examine the association between inflammatory markers and functional performance among the oldest-old men and women. **Methods and materials:** This study is part of The Vitality 90+ Study. The study population (n=285) consisted of 218 women and 67 men aged 90 years and older. Eighty-four % of the participants lived in the community and 16% in institutions. Hand grip strength was measured using dynamometer and functional performance was assessed with chair stand test. Plasma levels of interleukin-6 (IL-6), interleukin-1 receptor antagonist (IL-1Ra) and C-reactive protein (CRP) were determined. Logistic regression analyses were adjusted for sex. **Results:** The likelihood of belonging to the worst tertile in the hand grip strength was higher among those who belong to the highest tertile in IL-1Ra (Odds Ratio [OR] =2.15; 95% confidence interval [CI] 1.08-4.25) or in CRP (OR= 2.41; 95%CI 1.20-4.83), but not in those in the highest tertile of IL-6 (OR= 1.37; 95%CI 0.69-2.71). In chair stand no significant association with inflammatory markers were found. Odds and 95% CIs in the highest tertile: IL-1Ra OR=0.79, 95%CI 0.36-1.73; IL-6 OR= 1.42, 95%CI 0.64-3.15; CRP OR= 1.32, 95%CI 0.62-2.82. Conclusion: The association between high levels of inflammatory markers and poor hand grip strength was evident also among the oldest-old. However, the association with chair stands was not significant.

**PB7 318 ACCELERATED SARCOPENIA: THE ADVERSE EFFECT OF DIABETES, ADIPOSITY AND ATHEROSCLEROSIS IN 4000 OLDER MEN AND WOMEN**

J. LEE\* (The Chinese University of Hong Kong, Hong Kong, China)  
T. AUYEUNG(1), J. LEUNG(2), T. KWOK(3), P. LEUNG(2), J. WOO(3) - (1) Tuen Mun Hospital, Hong Kong, (China); (2) Jockey Club Centre of Osteoporosis, The Chinese University of Hong Kong, Hong Kong, (China); (3) Division of Geriatrics, Dept of Medicine & Therapeutics, The Chinese University of Hong Kong, Hong Kong, (China)

**Introduction** Sarcopenia contributes to frailty in old age, when metabolic diseases are prevalent. While sarcopenia is accelerated in renal replacement patients with diabetes, little is known about how it is affected by metabolic conditions in the elderly. We examined how metabolic diseases and adiposity affect rate of muscle loss in older adults. **Method** 4000 Chinese elderly 65 or over were followed for 4 years. Demographics, medical conditions, physical activity and muscle mass by DXA were recorded at baseline then 2-yearly. Appendicular skeletal muscle (ASM) was analyzed by general linear mixed models with repeated measures. In the first step, atherosclerosis (ankle-brachial index <0.9), diabetes, overweight (BMI >23), central adiposity (WHR >0.9 men, >0.85 women) were found to correlate with accelerated ASM loss in both genders, adjusted for age and physical activity. Multivariate analysis was then performed, including all conditions under study, age, physical activity, and interaction terms of conditions x time. Percentages of additional ASM loss were calculated by ASM loss due to conditions divided by background annual ASM loss. Results ASM declined at rate of 0.054 (0.009) and 0.044 (0.011)kg/year in men and women respectively. Compared with time effect solely, diabetes increased the rate of loss by a further 0.076 (0.016) and 0.049 (0.013)kg/year, atherosclerosis by 0.104 (0.030) and 0.038 (0.016)kg/year, and overweight by 0.033 (0.012) and 0.024 (0.009)kg/year, in men and women respectively. Physical activity was protective against muscle loss, while hypertension, stroke, heart disease and central adiposity was not significantly related. The additional ASM loss due to diabetes amounts to 140% (men) and 111% (women), to atherosclerosis, 193% (men) and 86% (women), and to overweight, 61% (men) and 55% (women), of the annual loss due to ageing.

Conclusion Diabetes, atherosclerosis and overweight in older adults significantly accelerate age-related sarcopenia.

**PB7 319 DAY-TO-DAY VARIABILITY OF PHYSICAL ACTIVITY OF OLDER PERSONS LIVING IN THE COMMUNITY**

C. BECKER\* (Robert-Bosch-Hospital, Stuttgart, Germany)

**INTRODUCTION:** The purpose of the study was to investigate by intra-individual comparison whether a 24h recording period is sufficient to describe PA of one week in older retired persons. Furthermore, we analyzed whether physical performance (PP) can be used as a surrogate marker of PA. **METHODS:** PA was captured on seven consecutive days in 44 community-dwelling older adults (80.75 ± 4.05 years) by a body fixed sensor which consists of triaxial accelerometers and single axis gyroscope. PP was measured by the SPPB. It contains unsupported standing, chair rise, and gait speed. **RESULTS:** Mean time of walking and mean "time on feet" of the group was 10.2 hours (+3.5 hours) and 35.1 hours (+9.43 hours), respectively, for the duration of seven consecutive days. The intra-individual variability of walking and of „time on feet“ of all participants was 31.9%+10.79 and 19.4%+8.76, respectively. The accumulated time of variables of PA of all participants showed no differences between weekdays with a variability of 3.8% and 1.8% for walking and „time on feet“, respectively. Association between the SPPB and different aspects of PA was limited (walking: r=0.397; „time on feet“: r=0.41). **CONCLUSIONS:** We could demonstrate that the measurement of PA of only one day could describe the mean time of activity (i.e. standing and walking) for the whole group, but not for a single person. A measurement of a single day cannot be used to compare results for medical interventions in a pre-post design for individual person. Measuring PA of a single day seems to be an efficient way to obtain comprehensive and objective data on PA on group level. The data show that PP is only a weak surrogate marker of PA.

**PB7 320 ALCOHOL CONSUMPTION AND THE FRAILTY PHENOTYPE IN COMMUNITY-DWELLING YOUNG-OLD PERSONS**

L. SEEMATTER-BAGNOUD\* (Institute of Social and Preventive Medicine, University of Lausanne, Lausanne, Switzerland)

J. SPAGNOLI(1), B. SANTOS-EGGIMANN(1) - (1) Institute of Social and Preventive Medicine, University of Lausanne (Lausanne, Switzerland)

**Introduction:** The association between alcohol use and frailty has not been extensively studied. The objective of this study was to examine the cross-sectional association between alcohol consumption and the frailty phenotype in young-old persons. **Methods:** In 2004, the Lausanne cohort 65+ enrolled 1564 randomly selected community-dwelling persons aged 65 to 70 years. Data collection included demographics, health and functional status and physical examination. Alcohol use was measured through the AUDIT-C. Frailty was assessed using Fried's frailty phenotype and participants were categorized into robust (0 criterion) and vulnerable (1+ criteria). **Results:** Overall, 92.9% of men and 83.4% of women reported any consumption of alcohol during the last 12 months, and 5% reported any previous alcohol-related problem. About half of these latter persons were current drinkers. Fifty percent of participants (men: 62.1%; women: 47.8%) were considered at risk drinkers using the AUDIT-C. Women who abstained from drinking were more frequently vulnerable than current alcohol drinkers (44.7% of non-drinking women, vs 27.4% of light/moderate drinkers and 34.5% of at risk drinkers, p=.001). A similar pattern was observed in men, although the differences were not significant (37.1% vs 23.3% vs 26.6%, p=.17). Although the proportion of vulnerable subjects was higher in at risk drinkers than in light/moderate ones, no significant association between the quantity of alcohol and frailty was observed. However, reporting any previous alcohol-related problem was associated with vulnerability (46.6% vs 27.7%, p<.001). **Conclusion:** In these relatively young-old persons, current abstinence from alcohol was associated with the frailty phenotype. Although the risk of vulnerability was lower for light/moderate drinking than for at risk drinking, no significant association with the quantity of alcohol could be shown. A possible explanation is that, in this age category, those who experienced alcohol-related problems or chronic health problems already stopped drinking.

**PB7 321 STRENGTH IN OLD AGE – HEALTH EXERCISE PROGRAMME 2005-2010 DEVELOPING EXERCISE ACTIVITIES THROUGH COORDINATION**

H. STARCK\* (Age Institute, Helsinki, Finland)

E. KARVINEN(1), P. KALMARI(1), M. SÄPYSKÄ-NORDBERG(1), E. VUORJOKI-ANDERSSON(1) - (1) Age Institute (Helsinki, Finland)

**Introduction** A national programme coordinated by the Age Institute promotes the autonomy and quality of life of independently living older adults (75+) with decreased functional capacity. This is achieved by increasing muscle strength and balance exercise services for the target group in 35 local third sector projects. **Methods and materials** The programme functions in local projects and produces good practices. General functions include communications, cooperation and training, which aim to increase awareness about strength and balance exercise for older adults. The Age Institute supports the local projects with interactive guidance including a written contract of cooperation, personal counselling, training, communication materials, and forums for cooperation. Peer support, evaluation and continuous feedback are encouraged in the projects. The projects are followed-up with

an annual questionnaire, mentoring diaries, client and training feedback, media monitoring, a description of good practices, and an external evaluation of the programme. Results According to the local actors, the network of local projects and the project guidance have improved the project activities and the instillation of good practices. Based on the reports from local projects, the first Good Practices Guide has been produced. According to external evaluation, the Age Institute and the local projects are committed to the common goal. The target group of older adults have received exercise services that otherwise would not have been available. Excellent training and learning materials have enabled good practices. The programme has created new networks and models of action. The success of the programme can be seen in the fact that the dissemination of its models of action has been set as a goal in several national documents of health and social policy. Conclusions Project guidance has proved to be a successful model of action. Cooperation between decisionmakers and various actors is essential for the instillation of action.

**PB7 322 FUNCTIONAL RECOVERY IN ELDERLY AFTER A STROKE, IN A REHABILITATION GERIATRIC HOSPITAL : A MULTI-PARAMETRIC ASSESSMENT**

A. MISME\* (Hopital bretonneau, Paris, France)

V. FOSSEY DIAZ(2), E. COTTO(3), M. BENBEKINA(4), K. TALEB(5), Y. WOLMARK(6) - (2) hopital bretonneau (paris, France); (3) hopital bretonneau (paris, France); (4) hopital bretonneau (paris, France); (5) hopital bretonneau (France); (6) hopital bretonneau (France)

Bretonneau's hospital (Paris) has 8 beds in post acute care units with geriatric orientation dedicated to the patients requiring reeducation. The prediction for outcome after a stroke in the elderly can be rather difficult. Firstly, we conducted a study to determine predictive factors of functional outcome after a stroke and predictive factors of discharge. Secondly, with an aim of standardizing the patients after a stroke, a multidisciplinary group was created for an evaluation of the professional practices. It's an observational cohort study of 41 patients, admitted to the rehabilitation unit after a stroke. In order to show the predictive factors of the functional evolution of the patient, and their orientation we performed a multi-parametric statistical test. The elements collected gathered demographic data, the presence of risk factors cardiovascular, the nutritional state, the place of life before and after the hospitalization, the scores of Functional Independence Measure (FIM) and National Institute Heath Stroke Scale (NIHSS) at admission and discharge. The average age of patients was 85 years. FIM score in particular admission FIM cognitive evaluate the extent of functional recovery. FIM score at discharge is a predictive discharge destination. The outcome of the patient can be explained by the final FIM mainly and partially by the age. There is an interest to collect the scores of FIM and NIHSS in geriatric rehabilitation unit at admission and discharge of the patient: both scales are predictive for the functional evolution and to outcome of those patients.

**PB7 323 USEFULNESS OF A DEDICATED TILT CLINIC IN OLDER PEOPLE WITH UNEXPLAINED SYNCOPE, FALLS OR DIZZINESS**

E. LAITHWAITE\* (Queens medical centre, Nottingham, United Kingdom)

M. SALEM(1), S. KAMATH(1), R. MORRIS(1), T. MASUD(1) - (1) Nottingham University Hospitals NHS Trust (Nottingham, United Kingdom)

**Introduction:** There is growing awareness that carotid sinus syndrome and vasovagal syndrome are important causes of unexplained syncope, falls or dizziness in older people. The aim of this study was to determine the positive yield of a tilt testing clinic in older subjects. **Methods:** Patients aged ≥70 years who had syncope, falls or dizziness where the cause remained unexplained after routine clinical assessment and investigations were consecutively referred to the tilt clinic. Bilateral carotid sinus massage (CSM) was performed for 10 seconds separately and in the supine and upright (70 degrees) positions. Prolonged (40 minutes) upright stress, including sublingual Glyceryl Trinitrate (400mcg) provocation after 20 minutes, was performed. Carotid Sinus Syndrome (CSS) was diagnosed if, after CSM, either there was an asystolic pause on the cardiac monitor of >3seconds (cardioinhibitory CSS) or a 50mmHg systolic blood pressure drop (SBP) with symptoms (Vasodepressor CSS). Vasovagal syndrome (VVS) was diagnosed if SBP fell >50mmHg associated with symptoms of presyncope or syncope. **Results:** 177 subjects (age 70-94 yrs, 110 women) were studied (respectively; syncope, falls, dizziness; 123, 28, 26). Overall the positive diagnostic yield (95%CI) in the syncope, falls and dizziness groups were 66.7% (58.4-75.0), 64.3% (46.6-82.0) and 38.5% (19.8-57.2) respectively [Chi<sup>2</sup>=7.3;df2; p=0.026]. In the syncope group 42.3% (33.6-51.0) were diagnosed with VVS and 35.0% (26.6-43.4) with CSS. In the falls group 39.3% (21.2-57.4) had VVS and 28.6% (12.9-44.3) CSS and in the dizziness group 23.1% (6.9-39.3) had VVS and 19.2% (4.1-34.3) had CSS. **Conclusion:** The diagnostic yield of a dedicated clinic incorporating carotid sinus massage and a prolonged head up tilt test is high in older patients with unexplained syncope, falls or dizziness. The positive yield in syncope and falls patients was significantly higher than those with dizziness alone, although even then it was worth performing the test in the latter group.

**PB7 324 THE IMPACT OF A MECHANICAL THERAPY FOR OSTEOPOROSIS ON HEALTH-RELATED QUALITY OF LIFE**

I. LASKIBAR\* (Fundación Ingema , San sebastian, Spain)

N. GALDONA(1), J. YANGUAS(1), A. ORBEGOZO (2), M. VECINO(2), M. GENUA(2), J. LARRETA(3), I. ALAVA(4), M. DÍAZ-CURIEL(5), E. URDANETA(1) - (1) Fundacion Ingema (San Sebastian, Spain); (2) Fundación Matia (San Sebastian, Spain); (3) Osetech (San Sebastian, Spain); (4) Inasmet (San Sebastian, Spain); (5) Fundación Jimenez Diaz (Spain)

**INTRODUCTION** Approximately 2 million women are affected by osteoporosis in Spain (Diaz Curiel, Garcia, Carrasco, Honorato, Perez, Rapado & Alvarez, 2001). Osteoporosis, or porous bone, is a disease characterized by low bone mass and structural deterioration of bone tissue, leading to bone fragility and an increased risk of fractures of the hip, spine, and wrist. This pain can impact in the activities of daily living, social relationship and emotional state due to the low back pain resulting from vertebral fractures (Cook, Guyatt, Adachi, Epstein & Juniper, 1999). **METHODS AND MATERIALS** A sample of 194 subjects was recruited and femur and spine densitometry was made in order to establish whether they had osteopenia or osteoporosis. 126 of the 194 subjects had osteopenia or osteoporosis. Two equivalent groups were matched for osteopenia, osteoporosis, quality of life, age and gender. 69 took part in the experimental group and 56 in the control group. Those in the experimental group attended three weekly sessions of half an hour to a mechanical therapy for 18 months, subjects in the control group continued to lead an active life. Health-related quality of life was measured by the SF-36 questionnaire. **RESULTS** At the end of the experiment statistically significant differences were found in Physical Function ( $p=0.024$ ), Mental Health ( $p=0.015$ ) and General Health ( $p=0.030$ ). **CONCLUSIONS** This mechanical therapy increases significantly some aspects of the quality of live such us Physical Function related to the capacity to carry out the activities of daily living, Mental Health related to emotional states like depression and anxiety symptoms, and General Health related to the way they perceive their own health. Further research is needed in order to improve osteoporosis therapies and the quality of life of people affected by this pain, but this mechanical therapy could be one of the treatments for these patients.

**PB7 325 THE EFFECTS OF TAI CHI ON FALL PREVENTION, FEAR OF FALLING, AND BALANCE IN ELDERLY PEOPLE: A SYSTEMATIC REVIEW AND META-ANALYSIS.**

I. LOGGHE\* (Avans University of Applied Sciences/ ErasmusMC, Breda/Rotterdam, The Netherlands)

A. VERHAGEN(2), A. RADEMAKER(1), S. BIERMA-ZEINSTRA(2), E. VAN ROSSUM(3), M. FABER(4), R. WIJNEN-SPONSELEE(1), B. KOES(2) - (1) Avans University of Applied Sciences (Breda, The Netherlands); (2) ErasmusMC (Rotterdam, The Netherlands); (3) Department of Health Care Studies, Faculty of Health , Medicine and Life Sciences, Maastricht University (Maastricht, The Netherlands); (4) Center for Quality of Care Research, Radboud University Nijmegen Medical Centre (Nijmegen, The Netherlands)

Falls are a common problem among older people. Tai Chi Chuan is a promising exercise intervention to prevent falls, but its effectiveness on fall prevention is inconclusive. Besides reported beneficial influences on fall risk Tai Chi may also influence risk factors for and consequences of falls like impaired balance and fear of falling. We performed a systematic review according to the Cochrane standards to assess the effect of Tai Chi (TC) on fall prevention, fear of falling and balance in healthy elderly people. We used a broad computerised literature search on Tai Chi interventions, covering Medline, Cinahl and Psyclit and used a highly sensitive search strategy for RCT's. References in relevant reviews and identified RCTs were also screened. We assessed the risk of bias with the Delphi criteria list and used a standardised form to extract the data. Whenever studies were clinically homogeneous concerning intervention, study population and outcome measures we performed statistical pooling with random effect models. In case of heterogeneity we performed a qualitative analysis and used a rating system for "levels of evidence". We included 14 trials in this systematic review with a total of 2658 elderly people of 50 years and older. Most trials in community setting used fall calendars, the measurement instruments used in facility setting trials were more divers. We will calculate a pooled incidence rate ratio in homogenous study populations and intervention groups, when complementary data arrive. Because of heterogeneity in the balance measurements and study population in fear of falling we refrained from statistical pooling for these outcomes. Preliminary results show conflicting evidence for the effect of Tai chi on both static and dynamic balance and fear on falling. The effects of Tai Chi on fall prevention will be presented on the Congress.

**PB7 326 IS THE USE OF AN ALGORITHM EFFECTIVE IN THE DIAGNOSIS OF ORTHOSTATIC HYPOTENSION?**

M. MODREKER\* (Albertinen-Haus, , Hamburg, Germany)

N. VAN DER VELDE(1), F. MATTACE RASO(1), W. VON RENTELN-KRUSE(2), T. VAN DER CAMMEN(1) - (1) Erasmus MC (Rotterdam, The Netherlands); (2) Albertinen Haus (Hamburg, Germany)

**Background:** Orthostatic hypotension (OH) is a major healthcare problem in older persons, leading to dizziness, falls and increased (cardiovascular) mortality. It is underdiagnosed and therefore undertreated. As it is a multifactorial problem, the diagnostic process can be problematic, especially in busy daily practice. Therefore, correct diagnosis and treatment are important. We designed a diagnostic algorithm to facilitate the diagnostic process and the consequent clinical care (ref. 1). **Methods:** The algorithm consists of a stepwise approach, starting with measurement of blood pressure and heart rate supine and standing at 1, 3, 5 minutes and recording of symptoms; followed by an inventory of drug use and of underlying conditions. This will lead to a systematic hierarchical differential diagnosis of the most likely underlying cause(s). This is followed by a checklist of treatment options. In-hospital patients on a geriatric ward were included, if mobilisation was possible. **Results:** Twenty-two patients were tested with the algorithm and a further 20 will serve as controls. At baseline 20/22 experienced OH, 15 were symptomatic. The main diagnoses were OH-inducing drugs (18/20), cardiovascular diseases (12/20) and dehydration (4/20). According to the diagnosis all patients were given the required treatment. In 5 patients medication was withdrawn, 4 patients received IV-fluids, elastic stockings were prescribed for 1 patient. Average duration of the work-up with the diagnostic algorithm was 15 minutes. Results of the control group will be presented at the meeting. **Discussion:** The algorithm appears to be time-saving and comprehensive, because it presents a clear pathway for recognizing possible underlying conditions and for establishing treatment options for OH. Especially for young doctors on the ward the algorithm is an effective tool for optimizing care for the elderly with OH. Supported by a Forschungskolleg Geriatrie Grant from the Robert Bosch Foundation, Stuttgart, Germany.

**PB7 327 MOBILITY, FUNCTIONAL ABILITY AND QUALITY-OF-LIFE AMONG PEOPLE OF 60 YEARS OR OLDER**

C. FAGERSTRÖM\* (Blekinge Institute of Technology, Karlskrona, Sweden)

G. BORGLIN(1) - (1) Blekinge Institute fo Technology (Karlskrona, Sweden)

**Introduction:** It is well known that reduced ability to perform activities of daily living (ADL) and declining mobility are both related to advanced age. This relation is also valid for low quality-of-life. It is not, however, the advanced age per se that causes the low quality-of-life. Rather, it seems that it is the declining mobility that unable people to manage their daily lives satisfactory - a circumstance that is often overlooked, since the most frequently used measuring method, the ADL-scale, is mainly focusing on people's functional ability and not their mobility. Hence, the assumption and aim for this study has been to investigate to which extent mobility factors, in comparison to the control factors age, gender and ability to perform ADL, may explain low (physical) quality-of-life (SF-12, PCS-12). **Methods:** The study includes people (n=1402) aged 60-96, who participated in a baseline survey in one (Blekinge) of four included centres of the longitudinal and multi-centre cohort study, The Swedish National study on Ageing and Care (SNAC), in 2001, a study with a 61% response rate. **Results:** Collected data indicated that mobility factors such as reduced ability either to walk a distance of 200 metres or less without stopping, or walking in stairs, or rising from a chair or opening a bottle played a crucial part when developing conditions of low (physical) quality-of-life (PCS-12), while control factors such as gender, age and ability to perform ADL, did not. **Conclusion:** The results suggest that multiple factors of reduced mobility, rather than impairment in ability to perform ADL, appear to increase the risk for low (physical) quality-of-life, and that targeting these phenomena in health care interventions, are essential.

**PB7 328 ARE FALLS OCCURRING DURING POST-ACUTE CARE ASSOCIATED WITH REHABILITATION OUTCOMES?**

S. ROCHAT\* (CHUV/ CUTR Sylvana, Epalinges, Switzerland)

E. MARTIN(1), R. DREHER(1), P. GUILLEMIN(1), C. HOSKOVEC(1), C. BULA(1) - (1) CHUV/ CUTR Sylvana, Service of Geriatric Medicine & Rehabilitation (Epalinges, Switzerland)

**Introduction:** The objective of this study was to investigate the association between falls occurring during post-acute care and rehabilitation outcomes. **Methods and materials:** Over a 5-year period (2003-2007), all falls (n=1217) were prospectively recorded among 4026 patients consecutively admitted to post-acute rehabilitation. Patients' characteristics, including health, functional, cognitive and affective status were systematically collected using standardised instruments. Rehabilitation outcomes considered were length of stay, discharge destination, and rehabilitation success, defined as at least 50% gain in the possible improvement in Barthel score (difference between maximal and admission Barthel score). **Results:** Overall, 11.4% patients fell once and 6.3% were multiple fallers. The fall incidence rate was 12.6/1000 bed-days. Compared with non fallers, one time fallers and multiple fallers, respectively, were older ( $80.5\pm7.9$  vs  $82.1\pm7.8$  vs  $82.7\pm7.4$  years;  $p<.001$ ), more often cognitively impaired (MMSE<24: 26.1 vs 46.2 vs 55.0%;  $p<.001$ ), and had more frequently depressive symptoms (GDS $\geq$ 5: 16.7 vs 24.4 vs 25.1%;  $p<.001$ ). They also had lower Barthel score at admission ( $63.8\pm20.4$  vs  $54.0\pm19.3$  vs  $47.0\pm18.3$ ;  $p<.001$ ). Compared to non fallers, one-time and multiple fallers had prolonged lengths of stay by an average of 4.1 days (95%CI 3.2-5.0;  $p<.001$ ) and 7.7 days (95%CI 6.5-9.0;  $p<.001$ ), respectively, independent of demographics, comorbidities, affective, cognitive and functional status. One-time (adjOR 0.68, 95%CI 0.53-0.87;  $p=.003$ ) and multiple fallers (adjOR 0.47, 95%CI 0.35-0.64;  $p<.001$ ) were also less likely to be discharged home after rehab compared to non fallers in multivariate analysis. However, only multiple fallers had

significantly decreased odds to achieve rehab success (adjOR 0.65, 95%CI 0.47-0.90; p=.009). Conclusion: In this population of frail older patients admitted to post-acute rehabilitation, fallers had longer length of stay and were less likely to be discharged home. Interestingly, only multiple fallers were less likely to achieve rehab success. These results suggest that falls prevention programs in similar setting should primarily target these high risk patients.

#### **PB7 329 EMBEDDING BALANCE AND STRENGTH TRAINING IN DAILY ROUTINES (LiFE): AN RCT OF FALL PREVENTION INTERVENTIONS**

L. CLEMSON\* (University of Sydney, Lidcombe, Australia)

M. FIATARONE-SINGH(1), A. BUNDY(1), B. CUMMING(1), K. MANOLLARIS(1), P. O'LOUGHLAN(1), E. WEISSEL(2) - (1) University of Sydney (Lidcombe, Australia); (2) Department of Veteran Affairs (sydney , Australia)

Introduction Improved balance, and to a lesser degree strength, are major contributors to reducing falls. However, population studies have shown that, outside of studies, there is a very low regular participation rate by older people for strength exercises (<6%) and even less for balance activities. Thus, what is needed are viable and sustainable choices for older people. In the innovative LiFE approach balance and strength exercises are individually tailored for the older person and embedded within their daily routines. Methods A 3-arm randomized controlled trial was conducted to establish the efficacy of both the new LiFE approach and a structured balance and strength exercise program compared to a control flexibility gentle exercise program in reducing falls with community residing older people. Results 317 people were followed for 12 months with data collection completed December 2008. The major outcome is the reduction of falls measured by a Negative Binomial Regression Model. Secondary measures examined differences in static and dynamic balance, strength and gait stability, self-efficacy for activities of daily living , habitual physical activity and functional independence. Analysis was by intention-to-treat. In our initial pilot-feasibility study we had significant results for LiFE with a 79% reduction of falls (RR=0.21 (0.06-0.67), n=34). In this paper we will present the final results of our major trial, comparing differences in outcomes between the exercise interventions. Conclusion There are many opportunities in everyday life to challenge your balance and to load your muscles and make them work harder. This project has rigorously examined the efficacy of such a novel approach for older at-risk elders. It will advance our knowledge about the role of balance and strength in falls prevention, challenge our thinking about balance and strength training and physical activity and has the potential to impact on practice across a number of health professions.

#### **PB7 330 : PHYSICAL AND MENTAL ACTIVITY: ASKING OLDER ADULTS ABOUT THEIR EXPERIENCES, BELIEFS AND PREFERENCES.**

S. DOMENECH\* (Institute on Aging UAB, Barcelona, Spain)

X. ROJANO(1), A. MIGUEZ(2), L. COLL(1), J. ROMERO(2), A. SALVA(1) - (1) Institute on Aging UAB (Barcelona, Spain); (2) Mutuaum (Barcelona, Spain)

**INTRODUCTION:** Physical and mental activity are well-known to prevent disability and dementia, respectively. Furthermore, they contribute to an active aging as defined by the WHO. However, the regular engagement of older adults in these activities is difficult. Therefore, our aim was to study experiences, beliefs and preferences of community-dwelling older adults in Catalonia with respect to these activities. **METHODS AND MATERIALS:** Cross-sectional study with a consecutive sampling of patients from 7 primary care centres in Catalonia. Study population consisted of persons above 65 years old who lived at home, were independent for the activities of daily living and had no cognitive impairment. 281 subjects fulfilled the inclusion criteria (187 women, mean age 78.4 y). Socio-demographic data were recorded and specific questions on beliefs and preferences on physical and mental activities were asked. Nurses conducted the interviews. **RESULTS:** 70.1% of the participants had practiced physical exercise at least once, while only 28.4% exercise currently. Nevertheless 82.2% considered exercise important to aging well. 56.6% pointed out that physical activity helps to prevent diseases, 53.4% to improve mood and 14.6% to prevent falls. Concerning mental activity, 93.6% considered it important, while only 8.5% had participated in at least one memory training. 80.4% agreed that memory training would improve cognitive functions and 36.3% that it would ameliorate mood. 45.9% would participate in a physical activity program, while 57.7% in a memory training. **CONCLUSION:** Although there is high knowledge on the benefits of physical and mental activity for healthy aging and a high willingness participate, only a low proportion currently practice these activities. Remarkably, there is very low knowledge on the effect of physical exercise on fall prevention and a high agreement on the positive effect of both activities on mood.

#### **PB7 331 EFFECTS OF A NETWORK REHABILITATION PROGRAMME IN FRAIL OLDER PERSONS**

K. HINKKA\* (The Social Insurance Instituion of Finland, Turku, Finland)

S. KARPPI

Introduction. A new network-based rehabilitation program was developed in Finland for frail older persons with progressive disability and unspecific morbidity to support their living at home as long as possible. A nation-wide multi-center trial was designed to

evaluate, whether the programme could postpone institutionalization. The programme was based on the networking of institutional rehabilitation providers and the local social and health services. Methods and materials. Subjects were 708 home-dwelling persons, aged 65+, without severe cognitive impairment (MMSE <18), but with progressively decreasing functioning and need of assistance. The setting included 41 municipalities and 7 rehabilitation centres in Finland. Within 8 months the intervention group (IG, n=343) received a multidisciplinary network-based rehabilitation in three inpatient periods (totalling 21 days) and a home visit. At a rehabilitation centre, a comprehensive geriatric assessment was followed by an activating programme aiming to maintain or improve person's functional ability and support independent living at home. The controls (CG, n=365) received standard social and health services. Measures applied at baseline and at 12 months: health, pain, living conditions, functional ability (FIM 5.0), mood (GDS), ADLs, IADLs, mobility (walking speed, chair rise test, balance), handgrip strength. Results. The subjects' mean age was 78 years (65 -94 yrs). There were no differences between the groups at baseline. By one year, beneficial effects in measures of health, mood and functional capacity were seen in IG as compared to CG. By five years, 46 % of persons in IG and 43 % in CG were still living at home, mortality was 30% and 34%, respectively. There were no differences in the institutionalization rate. Conclusion. Although multidisciplinary network-based rehabilitation programme delayed deterioration of functional capacity and disability development in frail elderly persons compared to the controls, it did not result in differences in institutionalization in a 5-year follow-up..

#### **PB7 332 QUALITY OF LIFE BEFORE AND AFTER AN EXERCISE INTERVENTION TARGETED TO PREVENT FALLS AND FRACTURES IN ELDERLY WOMEN**

S. KARINKANTA\* (The UKK Institute for Health Promotion Research, Tampere, Finland)

R. NUPPONEN(1), A. HEINONEN(2), H. SIEVÄNEN(1), K. UUSI-RASI(1), P. KANNUS(1) - (1) The UKK Institute for Health Promotion Research (Tampere, Finland); (2) Department of Health Sciences, University of Jyväskylä (Finland)

Introduction: Our previous 12-month RCT\* in home-dwelling, elderly women indicated that the supervised exercise training could prevent functional decline and bone loss – risk factors of falls and related fractures. Here the effects of participation in training on health-related quality of life (HRQoL) are reported. Methods and materials: Relatively healthy, independent-living women (n=149) were randomly assigned to three intervention groups and the control group. The intervention groups participated either in resistance, balance-jumping or their combination (COMB) supervised training three times a week. HRQoL was assessed by the RAND-36 Questionnaire at the baseline and after the intervention. The scores were analysed with paired sample t-test and Wilcoxon Signed-Rank test. Results: In each of the RAND-36 scales at baseline, the scores were higher compared to the age-equivalent reference group of Finnish population, and heavily accumulated to the favourable values. Accordingly, the scale reliability values were slightly lower (Cronbach's alphas .60 to .83) than in the reference population. Comparisons by group indicated that the scores at baseline and after the intervention were significantly ( $p < .05$ ) different only in the General health scale (GH) in the COMB group. No differences were found in the control group. When the scores of the intervention groups were pooled, significant differences emerged between values obtained at baseline and after the intervention for the Physical functioning, Role limitations/emotional and GH scales. All observed changes favoured the exercise intervention, but the absolute differences were minimal. Conclusion: Considering that the participants were more favourably positioned in the RAND-36 than their age-mates at baseline, increases in the scale values were less likely. Within the limits of the moderate sensitivity and reliability of the scales we conclude that the intervention neither improved nor reduced the HRQoL of these women. \*Karinanta et al. Osteoporos Int 2007;18:453-462.

#### **PB7 333 MUSCLE STRENGTH IN THE KOREAN LONGITUDINAL STUDY OF AGEING(KLoSA) PARTICIPANTS: AGE AND GENDER PATTERNS OF CORRELATES**

S. CHO\* (Seoul National University, Seoul, Republic of Korea)

J. CHANG(1), H. PHANG(1), H. SHIN(1), K. BOO(1), H. LEE(1) - (1) KLoSA team, Korea Labor Institute (Seoul, Republic of Korea)

Introduction: Muscle strength is a robust predictor of functional decline, fractures, and mortality among the elders. Good muscle strength and its maintenance seem to be important to achieve successful aging for individual, and to relieve care burden for aging society. We compared gender and age differences of muscle strength measured by grip strength, and its different correlates by age and gender among Korean adults. Methods and Materials: The Korean Longitudinal Study of Ageing(KLoSA) 2006 baseline survey was used in this study. Two-stage stratified random sampling was conducted to select a nationally representative sample of Korean adults aged 45 or older . Study subjects were derived from 8424 persons(aged 45~105) in the KLoSA participants who underwent a hand grip strength test. Handgrip strength was measured 2 times for both left and right hands in a standing position using a dynamometer in units of kilograms. The average of all measurement was used for the analyses. Socioeconomic variables, health behaviors, ADL, IADL, fall experience, weight, height, Mini-Mental Status Examination(MMSE) and Center for Epidemiological Studies-Depression were measured by trained interviewers.

**Results:** Bivariate and multiple regression analyses showed that grip strength were lower in women, older persons, and low educated persons. Throughout the age range, gender difference was the largest (standardized coefficients of women= -8.0 ~ -14.0), and Body Mass Index, MMSE, CES-D score were significantly associated with grip strength in all subgroups of gender and age. Employed, higher physical functions, and regular exercise were associated with higher grip strength only for men, not for women. Similarly, for elders aged 85 years or older, physical functions, exercise were not associated with grip strength. **Conclusion:** The patterning of grip strength and its correlates by age and gender may reflect the common factors and unique factors for improving muscle strength between age group and gender.

**PB7 334 PREVALENCE AND RISK FACTOR FOR FALLS IN DEMENTIA PATIENTS LIVING IN THE COMMUNITY. RESULTS FROM THE NUTRIALZ STUDY.**

A. SALVA\* (Institute on Aging UAB, Barcelona, Spain)  
 M. ROQUE(1), M. INZITARI(1), E. FERNANDEZ(1), S. ANDRIEUX(2), Y. GUIGOZ(3), B. VELLAS(4) - (1) Institute on Aging UAB (Barcelona, Spain); (2) Service d'épidémiologie et de santé publique (Toulouse, France); (3) Nestlé Nutrition (Konolfingen, Switzerland); (4) Hôpitaux de Toulouse (Toulouse, France)

**Introduction** The incidence of falls in Alzheimer patients is higher than in elderly without dementia. It is not clear the mechanisms by which dementia increases the risk of falling. **Objectives** To estimate the incidence and risk factors of falls in a cohort of non-institutionalized people with dementia. **Methods** A total of 926 outpatients from 11 Alzheimer centres where controlled after 6 and 12 months of the first visit. The question of interest was 'Has the individual fallen in the previous 6 months?'. Those variables significant in the univariate analysis were included in a logistic regression analysis. **Results** 626 patients completed all assessments, while 320 dropped-out or had missing assessments (institutionalized (31%), death (24.8%), contact lost (4.1%), medical complications (9.0%), refuse (9.7%), other 21.4%). Mean Age was 78.6 (50-96), 68 % were female. 63 % had Alzheimer disease. 223 (35.62%) individuals felt. Age, mmse, CDR score, severity dimension of npiq scale, stress dimension of npiq scale, Cornell scale, MNA, B and I ADL, weakness, cerebrovascular disease, previous fall, mixed dementia and participant centre where significant at the univariate level. The final model only kept age, ADL, cerebrovascular disease and previous fall as significant independent risk factors for falls. **Conclusions** Falls are frequent in patients with dementia. For each 5 year increase in age, the odds of falling increases in a 10%. The two main risk factors are presence of cerebrovascular disease and the occurrence of a fall during the previous year, whose presence respectively increase the odds of falling in a 50% and a 100 %.

**PB7 335 THE IMPACT OF UNDERNUTRITION ON THE STRENGTH IN OLDER PEOPLE.**

J. MORIGUTI\* (School of Medicine of Ribeirão Preto - São Paulo University, Ribeirão Preto - SP, Brazil)  
 K. VILAÇA(1), F. PAULA(1), E. FERRIOLLI(1), J. MARCHINI(1), N. LIMA(1) - (1) School of Medicine of Ribeirão Preto - São Paulo University (Ribeirão Preto - SP, Brazil)

**Introduction:** the elderly population is increasing fast, especially in countries of the Third World, and this is associated with an increasing incidence of chronic and degenerative diseases. Lean body mass decreases with normal aging and, as lean mass is directly related to muscle strength, there is a reduction of strength with aging. Undernutrition is also associated with the reduction of lean body mass, but there is a lack of studies about strength in the undernourished elderly. This research aimed to investigate if there is correlation between reduction of strength and lean body mass in the undernourished elderly. **Methods and materials:** forty one male volunteers aged 62 to 87 years participated in this study. The subjects were submitted to evaluation of body composition by dual energy X-ray absorptiometry and strength by hand dynamometer (Jamar). **Results:** the results showed that strength and lean mass are reduced in undernourished older persons as compared with eutrophic ones {23.07±6.9 and 30.27±8.4 (Kg), p=0.005; 40.18±4.5 and 48.6±5.1 (Kg), p<0.001, respectively} and that there is correlation between age and lean mass of the right arm in the eutrophic group ( $r=0.515$ ,  $p=0.02$ ), but not in the undernourished group ( $r=-0.344$ ,  $p=0.13$ ). Also, strength and age are associated in the undernourished group ( $r=-0.38$ ,  $p=0.10$ ). **Conclusions:** it can be supposed, then that strength is related to lean mass of the right arm in eutrophic and undernourished older persons but, the aging process could be more important on the strength in undernourished ones, when compared with eutrophic older people.

**PB7 336 PREDICTING FALLS DURING REHABILITATION UNIT STAYS: A PROSPECTIVE COHORT STUDY**

C. SHERRINGTON\* (The George Institute for International Health, SYDNEY , Australia)  
 S. LORD(1), J. CLOSE(1), E. BARRACLOUGH (1), M. TAYLOR (1), S. O'ROURKE(1), S. KURRLE (2), A. TIEDEMANN (1), R. CUMMING (3) - (1) Prince

of Wales Medical Research Institute (Sydney, Australia); (2) Hornsby Ku-ring-gai Hospital (Sydney, Australia); (3) University of Sydney (Sydney, Australia)

**Introduction:** Falls present an important challenge for those delivering clinical services for older people as well as for health policy. Falls in aged care rehabilitation units have not previously been well investigated. This study aimed to establish the frequency of falls during rehabilitation unit stays and develop a predictive model for these falls. **Methods and materials:** This prospective cohort study included 533 rehabilitation inpatients in two large public hospitals. All people aged 50 years and older admitted to the participating wards during this time period were considered for inclusion in the study unless they were unable to safely complete the assessments due to medical conditions, did not speak conversational English or have an available interpreter. Data were collected from medical records, interviews with staff and participants and from physical assessments conducted in the 48 hours following admission to the ward. **Results:** Seventy five (14%) participants fell during their rehabilitation ward stays. A multivariate model to predict falls included: male gender (OR 2.76, 95% CI 1.59 to 4.79), prescription of Central Nervous System (CNS) medications (OR 2.28, 95% CI 1.33 to 3.90), a fall in the previous 12 months (OR 2.07, 95% CI 1.00 to 4.30), frequent toileting (OR 1.86, 95%CI 1.09 to 3.17), Mini-Mental Status Examination (MMSE) score <28 (OR 1.88, 95% CI 1.03 to 3.45), and standing balance time in 5 positions (OR 0.96, 95% 0.94 to 0.99). The area under the ROC curve (AUC) for this model was 0.77 (95% CI 0.71 to 0.82) and the bootstrap-corrected AUC was 0.76. **Conclusion:** We propose a tool to assist in the prediction of falls during rehabilitation unit admission. This tool can predict falls with sufficient accuracy to assist in clinical decision making and therefore may assist wards to implement intervention strategies to prevent falls.

**PB7 337 VITAMIN D STATUS AND FUNCTIONAL EFFICIENCY, BALANCE AND FALL HISTORY IN ELDERLY PEOPLE**

A. SKALSKA\* (Jagiellonian University Medical College, Krakow, Poland)  
 B. GRYGLEWSKA(1), T. GRODZICKI(1) - (1) Department of Internal Medicine and Gerontology Jagiellonian University Medical College (Krakow, Poland)

Vitamin D is essential for many processes including calcium homeostasis, bone turnover, muscle function. The aim of the study was to evaluate the relationship between 25(OH)D plasma level and functional status, balance & falls in elderly people. **Methods:** The medical and falls history was obtained. Functional status was assessed with basic (ADL) and instrumental (IADL) activity of daily living and Timed up&go test. Balance was evaluated with 1leg and tandem stance tests scored 0 (unable) – 4 (able to stand for 10 or 30 seconds respectively), and by measurement of center of feet pressure (COP) movement on balance platform (mean and maximal lateral and antero-posterior COP displacement (mm), COP movement velocity (mm/s), COP path length (mm) in eyes open-EO and closed- EC tests. **Results:** Mean age of 89 subjects (59 female) was 79.3±7.3 years. Fall in the last year was reported by 51 persons (42.7%). Mean 25(OH)D level was 40.69±27.5 nmol/L. Fallers had lower 25(OH)D level than non-fallers (35.01±19.4 vs 49.74±35.6 nmol/L,  $p=0.03$ ). People efficient in ADL had higher 25(OH)D than ADL dependent (54.04±33.6 vs 30.67±16.1 nmol/L,  $p=0.0003$ ). Subjects with 25(OH)D below median value (34.19 nmol/L) had poorer functional and balance parameters than those with 25(OH)D above 34.19 nmol/L: ADL 5.08±1.5 vs 4.33±1.5\*, IADL 20.4±7.3 vs 16.8±6.4\*, tandem stance 1.68±1.6 vs 0.71±1.1\*, EO'1lateral mean 3.9±2.9 vs 5.6±3.0\*\*, EO'lateral-max 18.7±13.8 vs 31.7±22.3\*\*\*, EO'anteroanterior'max 15.9±10.3 vs 21.2±10.1\*, EO'path'area 10.7±12.5 vs 5.9±8.6\*\*\*, EO'path length 317.5±204.4 vs 452.7±258.6\*\*, EO'velocity'mean 10.6±6.7 vs 15.1±8.6\*\*, EO'velocity'lat 6.3±4.1 vs 10.2±5.8\*\*\*, EC'lateralmax 32.4±24.3 vs 44.5±23.5\*, EC'velocity'lateral 11.5±9.2 vs 16.5±9.2\*\*, EC'path length 739.5±377.7 vs 581.4±397.1\* (\* $p<0.05$ , \*\* $p<0.01$ , \*\*\* $p<0.001$ ) Plasma 25(OH)D level correlated with IADL ( $r=0.3$ ,  $p=0.03$ ), 1leg stance ( $r=0.3$ ,  $p=0.03$ ), tandem stance ( $r=0.34$ ,  $p<0.005$ ) and Timed up&go test ( $r=-0.3$ ,  $p=0.03$ ). **Conclusions:** Low 25(OH)D level may be a marker of functional decline and risk for balance deterioration and for falling in older people.

**PB7 338 HEALTH STATUS, FUNCTIONAL ABILITIES, AND OUTCOMES OF HOSPITALIZED OLDER PATIENTS**

C. YAMVONG\* (Mahidol University, Bangkok, Thailand)  
 P. INTARASOMBAT(1), W. PRASANATIKOM(1), N. KIJJANON(1), J. CHONTICHACHALALAUK(1), Y. JUNTOURN(2) - (1) Faculty of Medicine, Ramathibodi Hospital, Mahidol University (Bangkok, Thailand); (2) Golden Jubilee Medical Center, Mahidol University (Thailand)

**Introduction:** Hospitalization has a significant impact on health status and functional ability of older patients. This study aimed to describe health status, functional ability, and outcomes of hospitalized older patients. **Methods & Materials:** The sample consisted of 349 patients aged 60 years and older who were admitted to medical and surgical wards during October to December 2004 at Ramathibodi Hospital, Bangkok, Thailand. **Results:** The analysis showed that two-thirds of the sample were female. The age ranged from 60 to 97 years with a mean of 72.48 years. Most older patients (83.7%) had at least one underlying disease. The most common underlying diseases were hypertension, diabetes mellitus, and heart disease. The major health problems were poor eyesight, alteration of bowel elimination, difficulty in chewing, and sleep disturbance. The functional ability

scores on the Barthel Activity of Daily Living Index were not normally distributed. Using the Friedman test, the researchers found that functional abilities before admission, at admission, and at discharge significantly differed. In a post hoc investigation using the Wilcoxon matched-pairs signed-ranks test, the score of functional ability before admission was highest, followed by that at discharge and at admission, respectively. Regarding outcomes of hospitalization, almost all older patients were discharged home. Almost two-thirds of the sample went back to their own home after discharge, while the rest moved to their relatives' house. The average length of hospital stay was 12 days. The readmission rate was 7.8 % and the mortality rate was 7.7%. Complications during hospitalization included acute confusion (5.1%), pressure sore (1.8%), and accident/fall (1.5%). Conclusion Functional abilities tend to decline over time in hospitalized older patients. Also, complications during hospitalization are preventable; thus, health care providers should find strategies to prevent functional decline and complications for preventing adverse health outcomes.

#### **PB7 339 INPATIENT'S HEALTH SUBJECTIVE PERCEPTION VERSUS COMPREHENSIVE GERIATRIC VALORATION**

A. LOZANO\* (Hospital Universitario Sagrat Cor, Barcelona, Spain)  
C. ENRIC(1), P. NURIA(1), A. MARGARITA(1), L. CRISTINA(1), F. FRANCES(1) - (1) hospital universitario sagrat cor (Spain)

Introduction Inpatient's own health perception isn't always valued as it should. Practitioners tend to consider it a part of the adaptive disorder that goes with the illness, especially when talking about old people. Material and Methods Medical histories of 371 inpatients admitted to hospital were analyzed. Various items were evaluated: socio-demographic information, own health's subjective perception, and the result of the different scales that were used for making the comprehensive valuation of these patients. The statistical analysis was realized with SPSS for Windows. Results There were analyzed 371 inpatients, their mean age was 85.5 (SD 6.8) and 66.3% of them were women. 72% of the patients were firstly admitted to emergency service. 21.6% of the inpatients evaluated their own health as very good or good, 36.9% as medium and 41.5% as bad. Emotional alteration was observed in 83 inpatients (22.4%). The rest of the patients (77.6%) had a stable emotional situation. There weren't important differences between emotional situation and inpatient's own health perception. On the other hand, differences between dependent variable and the Barthel scale were found. Mean Barthel punctuation was: 36.25 (SD 29.51) for inpatients with bad health punctuation, 63.57 (SD 25.55) for medium, and 88.61 (SD 14.29) for good health perception ( $p=0.000$ ). Bad health perception matched up with a Charlson average rate of 2.68; medium health perception, with 2.11; and very good health perception with 1.76. ( $p=0.002$ ). For the screening of cognitive deterioration, test Pfeiffer was used. The average of errors obtained with this test was: 5.62, 3.74 and 1.76 for bad, medium and good health perception, respectively. Albumin levels were lower as worst health perception had the inpatient. Albumin average levels were 33.46g/L, 36.43g/L and 37.50g/L for bad, medium and good/very good health perception groups, respectively. ( $p=0.009$ ) When talking about advance directive or patients discharge, we also observe significant differences. Conclusions • Inpatients' own health perception is correlated with the objective data that practitioner obtains with the patient's valuation. • This is an opinion that might be borne in mind when making decisions. • It would be necessary to study in depth this data correlation when having to interpret the results of the comprehensive valuation.

#### **PB7 340 STRENGTH AND FLEXIBILITY RISE DURING FITNESS PROGRAM**

A. BÓS\* (Pontifical Catholic University of RS, Porto Alegre RS, Brazil)  
J. SOUZA(1), R. OPPERMANN(1) - (1) Pontifical Catholic University of RS (Porto Alegre, Brazil)

Introduction: Strength and flexibility are two main fitness components that suffer aging effects. Losses in both components are associated with sedentary life pattern and muscle movements decay. Ten female participants, 65.8 7.6 years, part of the General Program of Physical Activities for Older Adults, of PUCRS – Physical Education Faculty, were measured after and before a four months fitness and flexibility program. Once a week, the group did muscle fitness associate with flexibility exercises and on the other day, team adapted sports as volleyball, basketball and handball, as part of the main objectives of the program; social integration and physical wellness. Methods and materials: A random sample was selected over a group of 30 participants freely subscribe for the program. The group had 50 minutes of physical activities twice a week. Sit and Reach test was used to measure flexibility and five kilogram dumbbell lateral raise fitness exercise was used to measure strength. Wilcoxon Test non parametric statistical analysis was used due to sample size to verify significant differences. Results: Flexibility increased from  $25.6 \pm 3.36$  to  $29.4 \pm 2.93$  ( $p=0.047$ ), and strength increased from  $5.8 \pm 0.95$  to  $8.7 \pm 1.86$  repetitions ( $p=0.091$ ), indicating an increase of 15% for flexibility and 50%, for strength. Statistical analysis was significant for flexibility but not for strength at a 95% probability level. Conclusion: It was seen that fitness associate with an sport activity at least once a week should be enough to breakdown sedentary life pattern and rise fitness components for an increase in quality life. Nonetheless, there were several difficulties on the prescription of

physical activity, because of the heterogeneity of the group. Social integration as part of the physical activity goal for each participant is important as an emotive variable.

#### **PB7 341 THE RELATIONSHIP BETWEEN GOING OUTDOORS AND FUNCTIONAL IMPAIRMENT**

M. SUZUKAWA\* (Tokyo Metropolitan University, Tokyo, Japan)  
H. SHIMADA(2), K. KOBAYASHI(3), T. SUZUKI(2) - (2) Tokyo Metropolitan Institute of Gerontology (Tokyo, Japan); (3) Tsukui Corporation (Yokohama, Japan)

Introduction: Restrictions in physical activity such as being homebound are associated with deterioration of health and functional impairment in older adults. The purpose of this study was to determine the relationship between going outdoors and functional impairment in community-living frail older people who utilized day-care service. Methods and Materials: Participants were 535 (mean age,  $82.3 \pm 7.0$  years) older people enrolled in the Tsukui Ordered Useful Care for Health (TOUCH) program. Going outdoors in the participants during a month period was investigated retrospectively by family members. We selected two demographic variables (age and sex), three physiological or functional variables chair stand test (CST), timed up-and-go test (TUG), and independence of the stair climbing/descending), and a mental status variables (mental status questionnaire (MSQ)) as possible correlates of going outdoors. Results: Multiple logistic regression analysis revealed that only TUG was significantly associated with going into the town [OR 1.05 (95% CI 1.02-1.07)]. On the other hand, only independent of the stair climbing/descending was significantly associated with going into the outside the town [OR 1.77 (95% CI 1.17-2.66)]. Conclusions: The stair climbing/descending had key role to perform going into the outside the town which is required to adopt complex circumstance.

#### **PB7 342 POSTURAL CONTROL IN YOUNG OLD AND OLDEST OLD WITH HISTORY OF RECURRENT FALLS**

C. ROMANI UHLER\* (Universidade Cidade de São Paulo, São Paulo, Brazil)  
M. PERRACINI(1) - (1) Universidade Cidade de São Paulo (São Paulo, Brazil)

Evidences suggests that there is a decline in postural control mechanisms with advanced of age, increasing the risk of falls in oldest old. However is unknown the impact of age on the body sway in the elderly with history of recurrent falls. Objective: To compare the body sway of young old (GIJC) and oldest old (GIMIC) with history of recurrent falls (2 or more falls in the last year). METHODS: 16 elderly people were recruited, of which 10 belong to GIJC ( $70.5 \pm 3.2$ ) and 6 to GIMIC ( $82.8 \pm 4.9$ ), submitted the assessment stabilometric, muscular strength, acuity of proprioception and the functional tests timed up and go test (TUG), time in one leg support (TAU) and Short Physical Performance Battery (SPPB). Secondary data related dimensions: sociodemographic, clinical, mental health (Mini-Mental State Examination, MMSE, Geriatric Depression Scale - GDS), level of activity (Profile of human activity-PHA), fear of falling (Falls Efficacy Scale - International FES-I) and functional capacity (Brazilian OARS Multidimensional Functional BOMFAQAssessment Questionnaire) were collected. RESULTS: The GIMIC showed higher average speed of sway of the pressure center (COP) ( $p = 0.01$ ), total displacement of the COP ( $p = 0.01$ ) and average anterior-posterior sway of the COP ( $p = 0.03$ ) compared with GIJC in condition soft surface eyes closed. The total work for the extension of the knee and ankle dorsiflexion was lower in GIMIC ( $p = 0.03$ ,  $p = 0.02$ ). With regard to functional tests and proprioception no significant difference was found between groups. It was found in the group GIMIC linear correlation between the displacement of the COP, the TUG ( $r = 0.84$ ) and TAU ( $r = -0.94$ ) in GIJC the correlation was observed between the displacement of the COP and the TAU ( $r = -0.89$ ;  $r = -0.86$ ). The age did not distinguish the performance of the elderly in the multivariate analysis. CONCLUSION: The performance of GIMIC was worse than in GIJC in relation to the parameters of stabilometry and muscle strength. The age did not distinguish the GIMIC of GIJC.

#### **PB7 343 THE EFFECT OF FUNCTIONAL STATUS ON THE NUMBER AND LENGTH OF HOSPITALIZATIONS AMONG OLDER ADULTS**

E. MARCUS\* (Herzog Hospital , Jerusalem, Israel)  
D. CIPEL (1), Z. SHAPIRA(2), S. VINKER(1), P. ZIMMERMAN (1), A. ELHAYANY (3) - (1) Clalit Health Services, Central District (Israel); (2) Israel College (Ramat Gan, Israel); (3) Meir Hospital (Kfar Saba, Israel)

Introduction: The elderly population is characterized by a high prevalence of functional deterioration, chronic disease and hospitalization. The aim of this study was to evaluate the effect of the functional status and chronic disease on the number and length of hospital stays among community-dwelling adults aged 65 years and above and to evaluate the effect of socio-demographic factors on the functional status and on the number and length of hospitalizations. Methods and materials: The sample included 93 community-dwelling older adults who are insured by Clalit Health Services. Functional status was assessed by nurses using the FIM - Functional Independence Measure scale. Data regarding chronic diseases and the number and length of hospitalizations in the previous year were retrieved from computerized databases. Results: No statistically significant effect was found of the functional status on the number and length of hospitalizations. Diabetes was associated with a greater number of hospital stays ( $p<0.05$ ) and hypertension with a greater length of hospital stays ( $p<0.06$ ). Among those who suffer from vascular disease there was no

statistically significant effect of the functional status on the number of hospitalizations, whereas among those without vascular disease, the lower their functional status, the greater the number of hospitalization ( $p<0.06$ ). Similar findings were found regarding hypertension. Among those with diabetes, the lower their functional status, the greater the number of hospitalizations ( $p<0.07$ ). No statistically significant effect was found among all the socio-demographic factors tested on the number and length of hospitalizations. Factors associated with high functional status were higher education, high self-assessment of health status and living alone. Conclusion: Among community-dwelling older adults the effect of the functional status on the number and length of hospitalizations is complex because of various confounding variables. Community health services for the frail elderly may have prevented hospitalization in this population.

**PB7 344 IMPACT OF AGE, ANTHROPOMETRIC DATA AND BODY COMPOSITION ON CALCANEAL QUANTITATIVE ULTRASOUND**

M. NEUHÄUSER-BERTHOLD\* (Institute of Nutritional Sciences, Giessen, Germany)  
C. BRUNNER(1), B. EDELMANN-SCHÄFER(1) - (1) Institute of Nutritional Science, Justus-Liebig-University (Giessen, Germany)

Introduction. This study investigates the impact of age (A), body height (H) and body mass (BM), body mass index (BMI), fat-free mass (FFM), and fat mass (FM) on quantitative ultrasound (QUS) of bone within the longitudinal study on nutrition and health status in an aging population in Giessen (GISELA), Germany. Methods. Speed of sound (SOS) and broadband ultrasound attenuation (BUA) of the left heel were measured as variables for QUS (Achilles+ Solo, Lunar) in 229 women (age:  $73.5 \pm 5.8$  y, BMI:  $27.6 \pm 4.6$  kg/m $^2$ ) and 95 men (age:  $73.8 \pm 5.1$  y, BMI:  $26.9 \pm 3.3$  kg/m $^2$ ) and stiffness index (SI), which is a combination of SOS and BUA, was calculated. FFM (kg) and FM (kg) were measured by bioelectrical impedance analysis (Akern-RJL BIA 101/S, Data Input) using the formula of Kyle et al (2001). All measurements including body mass (kg) and body height (cm) were carried out in the morning after an overnight fast. Stepwise multiple regression analysis was applied to investigate the impact of the various parameters on SI in female and male subjects. Results. SI was significantly lower in women than in the men ( $78.1 \pm 17.4$  vs.  $94.3 \pm 13.5$ ,  $p < 0.001$ ). Stepwise multiple regression analysis revealed that in women age (12.4 %) and FFM (4.9 %) and in men FFM (6.9 %) and H (4.6 %) had the greatest impact on SI while BM, BMI, and FM had no impact on SI. Respective regression equations were for the women:  $SI = 103 - 0.78 A + 0.73 FFM$  ( $p: 0.000$ ,  $r: 0.42$ ,  $r^2: 0.17$ , SEE: 15.9) and for the men:  $SI = 127 + 0.97 FFM - 0.51 H$  ( $p: 0.000$ ,  $r: 0.34$ ,  $r^2: 0.12$ , SEE: 12.8). Conclusion. Results show that in both female and male elderly FFM is a significant predictor of the QUS parameter SI.

**PB7 345 LDL-CHOLESTEROL LOWERING EFFECT OF BISPHOSPHONATE IN THE ELDERLY PATIENTS WITH OSTEOPOROSIS**

A. MATSUO\* (Osaka University, Suita, Japan)  
M. OHISHI(1), M. ONISHI(1), T. HATA(3), T. OGIHARA(2), H. RAKUGI(1) - (1) Department of Geriatric Medicine, Osaka University Graduate School of Medicine (Suita, Japan); (2) 3. Osaka General Medical Center (Suita, Japan); (3) 1. Department of Cardiology, Higashi-Osaka General Hospital (Suita, Japan)

Introduction: Bisphosphonate is very effective therapy for osteoporosis and bisphosphonate with nitrogen (N) directly prevents apoptosis of osteoclasts via blockade of farnesyl 2-phosphatase, which one of the members of mevalonic acid pathway. On the other hand, "statin" inhibits HMG-CoA, which consists in up-stream of the pathway and strongly lowers LDL-cholesterol levels. As we speculated bisphosphonate with N lowers LDL-cholesterol levels via suppression of mevalonic acid pathway, we designed a retrospective observational study in the elderly outpatients with osteoporosis. Methods and Material: We recruited 62 patients with osteoporosis (male/female=10/52, mean age= $71 \pm 10$  y.o.) whose lipid profile was evaluated before and after starting of administration with bisphosphonate with N (alendronate; n=49 and risedronate; n=13). A 48% of participants were given lipid-lowering therapy, however, none of them was changed that therapy during this study. Results and Conclusion: Total cholesterol ( $210 \pm 25 \rightarrow 208 \pm 29$  mg/dL), triglyceride ( $111 \pm 47 \rightarrow 117 \pm 59$  mg/dL) and HDL-cholesterol ( $63 \pm 18 \rightarrow 64 \pm 19$  mg/dL) were not changed before and after bisphosphonate administration, however, LDL-cholesterol ( $121 \pm 20 \rightarrow 116 \pm 24$  mg/dL) was significantly reduced with bisphosphonate administration ( $p=0.0337$ ). Moreover, LDL-cholesterol with alendronate was not significantly changed ( $120 \pm 19 \rightarrow 118 \pm 24$  mg/dL;  $p=0.2355$ ), however, it with risedronate was significantly reduced ( $123 \pm 25 \rightarrow 112 \pm 25$  mg/dL;  $p=0.0254$ ). Although a large scale cohort trial is necessary to confirm this result, bisphosphonate with N, especially risedronate, might reduce LDL-cholesterol levels in the elderly patients with osteoporosis.

**PB7 346 HEALTH, SOCIAL AND BEHAVIORAL CHARACTERISTICS ASSOCIATED WITH PARTICIPATION OF COMMUNITY-DWELLING ELDERLY WOMEN IN A FALLS PREVENTION TRIAL: RESULTS FROM THE 'OSSÉBO' STUDY**

L. JOUBIN\* (Inserm Unit 953, Villejuif, France)  
B. CASSOU(1), J. NOVELLA(2), M. DRAME(2), F. PUISIEUX(3), P. DEJARDIN(4), Y. WOLMARK(5), P. DARGENT-MOLINA(6) - (1) Laboratoire Santé-Vieillissement EA2056, UVSQ - Centre de gérontologie, hôpital Ste Périne, AP-HP (Paris, France); (2) Pôle Neurologie gériatrie, Hôpital maison blanche (Reims, France); (3) CHRU-Lille

Hôpital gériatrique les Bateliers (Lille, France); (4) Centre MEDERIC - Observatoire de l'âge (Paris, France); (5) Service de gériatrie, Hôpital Bretonneau (France); (6) Inserm Unit 953 (France)

Introduction : Our aim was to identify individual factors associated with participation in a falls prevention study among community-living elderly women. Methods and materials : The 'Ossébo' study is an on-going 2-year randomized controlled trial aimed at assessing the effectiveness of an exercise program for the prevention of falls and fall-related trauma. We used electoral rolls to invite women aged 75 years or older to a balance examination that included a clinical examination (standardized neuromuscular functional tests, visual acuity, weight/height) and a questionnaire on physical and social activity, quality of life (SF36), previous falls and fractures, fear of falling (FES-I), socio-demographic characteristics and prevention-related behaviors (systematic screening examinations, medical follow-up, vaccinations, use of dietary supplements). Women with diminished physical capacities (slow gait speed or inability to do 4 tandem steps) who had no medical contra-indication to physical exercise and did not already take gymnastic classes were invited to participate in the intervention study. Among eligible women, we compared characteristics of those who accepted to participate and of those who declined. Results : A total of 1222 women aged  $79.4 \pm 3.0$  years were examined, and 479 (39%) of those were eligible for the intervention trial. Among eligible women, 279 (58%) accepted to participate in the trial and 141 (29%) declined (59 were excluded because of anticipated move, repeated absences from home, etc). Compared to women who declined participation in this falls prevention trial, women who accepted were more likely to live alone and to take part in a physical or social leisure activity, but did not differ in terms of age, falls history, fear of falling, and other health or prevention-related characteristics. Conclusion: Our results suggest that social rather than health-related considerations motivate participation of community-dwelling elderly women in a falls prevention study.

**PB7 347 GENETIC ANDROGEN RECEPTOR POLYMORPHISM, TESTOSTERONE AND PSYCHOPATHOLOGY IN >50 YEARS OLD MALES**

G. SCHNEIDER\* (University of Muenster, Muenster, Germany)  
K. NIENHAUS(1), J. GROMOLL(2), G. HEUFT (1), E. NIESCHLAG(2), M. ZITZMANN(2) - (1) Department of Psychosomatics and Psychotherapy, University of Münster (Muenster, Germany); (2) Department of Reproductive Medicine, University of Münster (Muenster, Germany)

Introduction: Population means for serum testosterone (T) levels in men decrease with ageing and the effects of T are markedly modulated by the androgen receptor (AR) CAG repeat polymorphism (CAGn). We investigated how T and the AR polymorphism relate to psychopathology in aging men in clinical and nonclinical samples. Methods: 120 male patients of the Department of Psychosomatics and Psychotherapy (PP), 76 male patients of the Andrologic Clinic of the Department of Reproductive Medicine (AP) and 100 healthy male volunteers (HC) (all aged >50 years) were examined by means of the German versions of the Brief Symptom Inventory (BSI), the Patient Health Questionnaire (PHQ-9), the Screening for Somatoform Disorders (SOMS), and blood sample analyses for sex hormones and the CAGn polymorphism. Results: CAGn was significantly and positively correlated to all scales measuring psychopathology. In the subgroup defined by the longest CAGn and low T (i.e. the lowest androgenicity), psychopathology on all scales was significantly more pronounced than in the groups with short or intermediate CAGn, and clinically relevant "cases" of psychopathology were most frequent. T significantly contributed to overall psychopathology, depression, obsessive-compulsive symptomatology, hostility and psychoticism only in the upper quartile of CAGn. Conclusions: Results indicate that genetically determined long CAGn of the AR are an independent risk factor for global psychopathology in aging men, not only for depressive disorders. In the upper quartile of CAGn length, T levels could be protective. Our results could lead to new diagnostic and therapeutic options for psychic symptoms in aging males.

**PB7 348 EFFECTS OF LEAN AND FAT MASS ON BONE MINERAL DENSITY AND ARTERIAL STIFFNESS IN ELDERLY WOMEN**

A. BENETOS\* (Geriatrics University Hospital of Nancy, Vandoeuvre lés Nancy, France)  
A. KEARNEY-SCHWARTZ (1), C. PERRET-GUILLAUME (1), C. LABAT (2), A. ZERVOUDAKI (1), V. PASCAL-VIGNERON (4), P. LACOLLEY (2), G. WERYHA (4), A. BENETOS (1) - (1) Department of Medicine and Geriatrics, University Hospital of Nancy (France); (2) INSERM U684, University of Nancy (France); (4) Department of Endocrinology, University Hospital of Nancy (France)

Introduction: The aim of this study was to evaluate the influence of fat and lean mass on both arterial stiffness and bone mass density (BMD) in elderly women. Methods: This study was performed in 138 French women over 60 years. Aortic stiffness was assessed by carotid/femoral pulse wave velocity (PWV). BMD and body composition were determined with a DEXA device in lumbar spine L1-L4, femoral neck and total body. Results: Lean mass was positively correlated with the three T-scores accounting for 13-16% of their variability. Fat mass had no effect on BMD but was positively correlated with aortic PWV accounting for 9.8% of its variability. This association was still significant in multivariate analysis ( $p < 0.003$ ) after adjusting for age, MAP, and heart rate. Lean mass was not a determinant of PWV. The multivariate analysis showed that regular physical activity was also associated with lower PWV. Conclusions: In women over 60 years of age, presence of

low lean and high fat mass is associated with the highest arterial stiffness and the lowest bone mineral density. Decreasing fat mass and increasing lean mass by means including regular physical activity could protect elderly women from accelerated arterial and bone aging.

**PB7 349 SEXUAL RELATIONSHIPS IN MEN OVER THE AGE OF 75 YEARS**

L. FLICKER\* (University of Western Australia, Perth, Australia)  
J. CALVER(1), K. MCCAUL(1), Z. HYDE(1), K. JAMROZIK(2), G. HANKEY(3),  
O. ALMEIDA(1) - (1) WACHA University of Western Australia (Australia); (2) School of  
Population Health & Clinical Practice, University of Adelaide (Australia); (3) Stroke Unit,  
Department of Neurology, Royal Perth Hospital (Australia)

**Introduction** Older people are often considered asexual and there are scant data regarding the participation of older people in sexual relationships. **Methods** We used an established population-based cohort of older men, the Health in Men Study. Initially, 12,216 men, resident in Perth, Australia, aged 65 years or older were recruited via random sampling from the Electoral Roll between 1996 and 1998. In 2008, a questionnaire was mailed to the men, and 3201 responded representing a 42.6% response fraction of the surviving men. **Results** Over the previous five years, 57% reported being sexually active with one partner, 1.6% with two partners and 2.8% with three or more partners. Over the previous 12 months, 31.6% had been sexually active, with 6.3% at least once per week, 9.3% two to three times per month and 16.0% once per month or less. The proportion reporting sexual activity over the previous 12 months ranged from 39.7% in the age group 75-79 years to 10.6% in the group 90-93 years. For those men who had been sexually active, 55.5% considered this was as often as they would like and 44.1% considered this less often than they would like. Common reasons for the absence of sexual activity was lack of interest of the men and their partners, and physical limitations of the men and their partners. Self-reported health conditions which were associated with a markedly increased odds ratio (OR) of no sexual activity included heart failure, OR 1.84 (95%CI: 1.20-2.81), carcinoma of the prostate, OR 2.41 (1.78-3.27) and depression OR 1.58 (1.14-2.19). **Conclusions** Contrary to popular belief, many men continue to engage in sexual activity until advanced old age.

**PB7 350 CORYNEBACTERIUM UREALYTICUM INDUCED MASSIVE HEMATURIA IN AN ELDERLY FEMALE PATIENT**

F. BELLARBRE\* (Amiens Hospital, Amiens, France)  
H. SANAA(1), S. SALIHA(2), S. JEAN-MARIE(3) - (1) Amiens Hospital (Amiens, France); (2) Amiens Hospital (Amiens, France); (3) Amiens Hospital (Amiens, France)

Encrusted cystitis was the first identified in 1914, but the fact that it is caused by Corynebacterium urealyticum was highlighted recently. One of the symptoms of the disease was hematuria. We report the case of a 86 year-old woman with a history of hypertension and dementia who presented anorexia, weight loss and a massive hematuria. Ultrasonography and computerized tomography showed an irregular thickening of the bladder wall. Cystoscopy showed a marked inflammatory of the bladder mucosa with plaques corresponding to multiple encrusted calcifications. Even if the first urine culture revealed a sterile leucocyturia, the second urine culture was performed in enriched media proved positive. Medical treatment by Vancomycin and oral acidification of the urine allowed the regression of the disease. Corynebacterium urealyticum, has been a commensal microorganism of the skin. Its development involved many factors including a preexisting urological procedure, a prolonged antibiotic therapy, a preexisting lesion of the mucosa and immunosuppression. It produced an urease which modified the urine and it became alkaline and saturated with struvite and calcium phosphate. Thus, struvite and calcium phosphate can precipitate. Symptoms of the disease consisted of dysuria, massive hematuria, pollakiuria. The patient can expel abundant mucopurulent debris. Demonstration of the bacteria required prolonged cultures in enriched media. Computerized tomography showed calcification associated with an edema of the bladder wall. Treatment consisted of acidification of the urine and antibiotics, mainly glycopeptides, with positive results. Sometimes the deterioration of the bladder wall can reduce the bladder volume. Massive hematuria is a frequent urinary symptom in elderly patient, which may suggest at first a bladder neoplasm. This report show that this particular infectious disease can produce the same symptoms with a best prognosis.

**PB7 351 EFFECTIVENESS OF A URINARY CONTINENCE PHYSIOTHERAPY PROGRAM FOR CHINESE ELDERLY WOMEN IN COMMUNITY**

B. LEONG\* (Elderly Health Service, Department of Health, HKSAR, Hong Kong, Hong Kong)  
W. MOK(1) - (1) Dept of RS, Hong Kong Polytechnic University, HKSAR (Hong Kong)

**Introduction:** Urinary incontinence (UI) is prevalent among elderly women globally. In Hong Kong, the reported prevalence rate of UI ranges from 13% to 40.8%. Few studies investigated the effect of a structural combination exercise therapy for Chinese elderly women with stress (SUI), urge (UUI) or mixed urinary incontinence (MUI). A standardized Urinary Continence Physiotherapy Program (UCPP) was formulated and evaluated using a randomised control trial design. **Methods and Materials:** Fifty-five elderly women with UI of mild to moderate severity were recruited from various community settings in Hong Kong, aged over 65 years. The subjects in the treatment group

received 8 sessions of UCPP in 12 weeks, whereas an educational pamphlet on management of UI was given to the subjects in the control group. **Results:** There was significant improvement in the treatment group after the intervention. A significant reduction of the UI episodes per 7 days (UI7) was observed in the treatment group compared with the control group (Control = 7.43 ± 6.19, treatment = 1.00 ± 1.88, p < 0.001), with no significant difference among the three types of incontinence [F(2,25) = 0.92, p = 0.51]. A significant improvement in quality of life in the treatment group was demonstrated through the scores of the Incontinence Impact Questionnaire (Control = 5.00 ± 2.74, treatment = 1.07 ± 1.24, p < 0.001). The subjective perception of improvement in the treatment group was markedly better than those in the control group (Control = 1.42 ± 0.65, treatment = 8.70 ± 0.92, p < 0.001). The mean treatment satisfaction in the treatment group was 9.52 ± 0.74 as measured in a 10-point Visual Analogue Scale. **Conclusion:** This study demonstrated that a standardised UCPP was effective in the management of various types of UI for Chinese elderly women.

**PB7 352 EXPLORING ANDROPAUSE IN MEN AS A MEANS OF REDUCING SEXUAL DYSFUNCTION IN AGEING MALES IN EDO STATE, NIGERIA**

A. IGBAFE\* (UNIVERSITY OF BENIN, BENIN CITY, BENIN, EDO STATE., Nigeria)

**BACKGROUND** Andropause heralds a period of transition in the reproductive life of men and is commonly associated with features that may compromise the health of men. It has implications for the reproductive health and quality of life of older males. **OBJECTIVE** To explore andropause in men as a means of reducing sexual dysfunction in ageing males in Edo State, Nigeria. **METHODS** This was a descriptive cross-sectional study carried out among 350 older males in Benin City, Nigeria. Sexual function Questionnaire (SFQ) and international index of erectile function (IEF) questionnaire were administered. **RESULTS** Many of the respondents (94%) had no knowledge of andropause; however most of them feel their sexual dysfunctions is as a result of witchcraft attack. The most prevalent symptoms were loss of libido (64.8%) poor memory (42.7%), erectile dysfunction (37.5%). Most of the men (78.2%) said they had to marry another younger wife, but 32.5% sought treatment to relief symptoms from traditional medicine man. **CONCLUSION**. Our findings indicate very poor knowledge about andropause in older males in Edo State, Nigeria compared with other developing countries. There is therefore the need for massive health education about andropause in Edo State, Nigeria and other related male reproductive health. **Keywords:** Andropause, sexual dysfunction, witchcraft, divorce.

**PB7 353 STUDY OF GAIT DISORDERS IN COMMUNITY-RESIDING OLDER MEN: RESULTS FROM THE CHAMP STUDY**

V. SRINONPRASERT\* (Siriraj hospital, Bangkok, Thailand)

H. CREASEY(2), L. WAITE(2), R. CUMMING(2) - (2) Centre for Education and Research on Ageing (CERA) Concord RG Hospital (sydney, Australia)

**Introduction:** Abnormal gaits have been found to be predictive of subsequent adverse clinical events. We aimed to study the prevalence and impact of gait disorders in a representative group of older men. **Method and Materials:** CHAMP study recruited 1705 community-residing men aged 70 and over for the baseline assessment. Gait diagnosis, Tinetti gait subscale and other clinical gait parameters were obtained in 1387 subjects (81%). **Results:** Of 1387 subjects, 1087 (78.4%) had abnormal gaits. Gait abnormalities were classified into pure neurological (73.0%), pure non-neurological (6.8%) and mixed gait (20.2%). Prevalence of abnormal gait increased with age. Abnormal gait was associated with increased risk of falls, functional limitation (any limitation in performing physical measures) and physical disability (any limitations in performing activities of daily living). All categories of abnormal gait were associated with increased risk of falls compared to normal gait. Non-neurological gait had the strongest relationship with functional limitation (OR 8.59; 95%CI 4.19-17.58, p <0.0001). Mixed gait had the strongest relationship with physical disability (OR 4.58; 95%CI 2.70-7.77, p<0.0001). Among neurological gaits, gait slowing had the strongest relationships with functional limitation (OR 4.34; 95% CI 2.74-6.86, p < 0.0001) and physical disability (OR 5.02; 95%CI 3.29 – 7.66, p < 0.0001) **Conclusion:** Prevalence of abnormal gaits is high in community-residing older men. Neurological gait was the most common type of abnormal gait. However, mixed gait and non-neurological appeared to have more impact on function. Gait slowing was also associated with poorer functional performances. Appropriate medical management and rehabilitation programs should be considered for these gait disorders in order to improve function and independence among older men.

**PB7 354 SEX DRIVE, SEXUAL FUNCTIONING AND SEXUAL STRATEGIES THROUGHOUT LIFE AND INTO VERY OLD AGE**

S. VAN HOOREN\* (Open University of the Netherlands, Heerlen, The Netherlands)

W. WATERINK(1), J. ESHUIS(1) - (1) Open University of the Netherlands (Heerlen, The Netherlands)

**Introduction:** Nowadays, people have longer and healthier lives and sexuality plays a more vital role in old age than in the past. The recent more realistic and open perspectives on sexuality in later life value the important role of sexuality across the entire lifespan. Unfortunately, limited information and few high quality studies are available regarding sexuality among older adults. **Methods and materials:** This study consisted of two

independent cross sectional surveys. The first survey on sex drive and sexual functioning included 798 men and women in the age range of 16 to 81 years. The second focused on short- and long term sexual strategies and consisted of 489 men and women aged between 19 and 95 years. Results Into old age, participants reported sexual activities and preferences for short- and long term sexual strategies. Hierarchical regression analyses revealed that age and gender were significantly associated with sex drive, sexual functioning and strategies. The older a person, the lower the sex drive, the frequency of orgasms and masturbation, and the preference for sexual strategies. Compared to women, men reported a higher sex drive, more sexual activities and a more pronounced preference for sexual strategies. Educational level was not related to the dependent variables. Conclusion Because of the differences in sex drive and sexual functioning between men and women it is important to account for these differences in gerontological research and in sexological counseling and treatment. As predicted by evolutionary theory, sexuality decreases in old age. However, this decrease is not as strong as would be expected. Thus, despite the decrease in sex drive in late life, older people do report a substantial initial drive for sex and sexual activities.

**PB7 355 EVALUATING NOCTURNAL MOTOR ACTIVITY OF DEMENTED INPATIENTS BY A SHORT SEMI-QUANTITATIVE SCALE**

G. CORTE FRANCO\* (CHU Grenoble, La Tronche, France)

C. PASCAL(1), S. FRANÇOIS(2), M. PHILIPPE(1), B. SOUTRIK(2) - (1) \* Clinique Universitaire de Médecine Gériatrique, CHU de Grenoble (La tronche, France); (2) INSERM U558, Toulouse (France)

**INTRODUCTION** Evaluating nocturnal activity is crucial during follow up of behavioural problems in severe dementia patients. Even in specialized units, their follow up is tiring, time consuming and nocturnal activity is usually based on subjective scales that depend on the staff appreciation. Our goal was to evaluate a semi quantitative scale for inpatients with high nocturnal activity. **METHODS AND MATERIAL** We used two patient bedrooms equipped with the GARDIEN® system that uses passive infrared sensors to monitor activity. We analyzed the nocturnal activity between midnight and 6 o'clock from patients hospitalized for 7 days. The patient or their legal person gave an informed consent. The night staff used the assessment scale. This scale has 4 scores : 0 = no observation of any mobility or getting up from bed. 1 = getting up from bed once or two times. 2 = getting up from bed > 2 times and less than 5 and 3 = getting up from the bed more than 5 times. The scale was then full filled by experts using the reports from the GARDIEN ® System as a Gold standard. **RESULTS** We registered a total of 352 nights gathered from 27 patients, 11 men and 16 women. Mean age was 82 years. All patients were hospitalized for medical reasons; including 19 with dementia of different types. The mean MMSE for these patients was 13 / 30. For the group with dementia (295 nights observed) the kappa was 0.45 (95%CI 0.38-0.52) and 0.27 (95%CI 0.08-0.46) for the cognitively normal group (57 nights). This difference between the populations is related to under evaluation by staff for low activity, especially in normal patients. **CONCLUSION** This scale can be useful to quantify nocturnal activity in elderly with severe dementia and can contribute to the follow up.

**PB7 356 ASSESSING COMPUTER SYSTEMS FOR THE REAL TIME MONITORING OF ELDERLY PEOPLE LIVING AT HOME**

F. BREMOND\* (INRIA, Sophia-Antipolis, France)

N. ZOUBA(1), M. THONNAT(2), A. ANFOSSO(2), É. PASCUAL(2), P. MALLEA(3), V. MAILLAND(3), O. GUERIN(3) - (1) INRIA (Sophia-Antipolis, France); (2) CSTB (Sophia-Antipolis, France); (3) centre hospitalier universitaire (Sophia-Antipolis, France)

The elderly population is expected to grow dramatically over the next 20 years. The number of people requiring care will grow accordingly, while the number of people able to provide this care will decrease. Without receiving sufficient care, elderly are at risk of losing their independence. Thus a system permitting elderly to live safely at home is more than needed. In this context, we propose an automatic monitoring system which consists in analysing human behaviours and looking for changes in their activities. The system includes detecting people, tracking people as they move, recognizing events of interest and identifying a profile of a person - its usual and average behaviour - based on multi-sensor analysis, and human activity recognition. The proposed monitoring system is real time and takes, three types of input: video stream(s) acquired by video camera(s), data resulting from environmental sensors (e.g. contact sensors, pressure sensors, water consumption sensors) embedded in the home infrastructure, and a priori knowledge concerning event models and the 3D geometric and semantic information of the static environment. The output of the system is the set of recognized events at each instant. The laboratory GERHOME equipped with many sensors and composed of four rooms has been build to design the monitoring system and to explore the ADLs (Activities of Daily Living) that can be recognized by a computer system. While evolving in the laboratory, fourteen volunteers (aged from 60 to 85 years) have been observed during 4 hours to measure the quality of the detected events recognized by the monitoring system. This paper describes the experimentation and tries to highlight what are the capabilities of a computer system to

assess automatically the frailty of elderly people in order for them to have a better and more secure life at home.

**PB7 357 CELLULAR, METABOLIC, NANOMOLECULAR AND SOCIAL COMPONENTS OF HUMAN LIFE EXPECTANCY**

V. MESHCHANINOV\* (Institute of medical cellular technologies, Yekaterinburg, Russian Federation)

E. TKACHENKO(1) - (1) Institute of medical cellular technologies (Yekaterinburg, Russian Federation)

**Introduction.** For the Sverdlovsk region of Russia low life expectancy of the population is characteristic, but discover to 14 % of long living individuals. We have conducted the research for disclosing of the possible reasons of it. Excitation of human body cells by oxygen, pro- and antioxidants can influence on ageing processes. The influence of a cellular lipid metabolism on ageing processes, life expectancy and the biological age are not clear. **Methods and materials.** The research lipid peroxidation in plasma and blood cells was carried out during 10 years (Chem Well Combi, the USA; Lucy 3 Anthos Labtec Instruments, Austria; Spineact, Spain). 1800 patients with a polyopathy of mature, elderly and senile age received hypoxitherapy, hyperbaric oxygenation, ozonotherapy, dry carbonic baths, L-arginin ("Vazoton", The Russian Federation, Altajvitaminy). These patients were measured the biological age and was registered the death rate indicator. **Results.** Hypoxitherapy and hyperbaric oxygenation activated lipid peroxidation in erythrocytes and plasma of human blood elderly and senile age persons, reduced a life of erythrocytes, increased a biological age and did not influence duration of a calendar life. Nanoparticles of ferric oxide did not render influences on this process. After carrying out of dry carbonic baths courses in all age groups and hypoxitherapy in group of mature age patients lipid peroxidation and the biological age decreased, and antioxidant activity and life time of erythrocytes increased. Ozonotherapy in all human groups normalized the studied indicators. We have created the mathematical model connecting lipid peroxidation in erythrocytes and blood plasma, the biological age, real life expectancy of blood cells and of a human organism. **Conclusions.** The correction lipid peroxidation in erythrocytes, blood plasma and a human organism by means of gas therapy is effective like a geroprophylactic remedy depending on age of patients.

**PB7 358 UNATTENDED AUTONOMOUS SURVEILLANCE IN COMMUNITY-DWELLING OLDER ADULTS**

J. VAN HOOF\* (Hogeschool Utrecht, Utrecht, The Netherlands)

H. KORT

The Unattended Autonomous Surveillance (UAS) system, an integrated system that combines many technological functionalities, was placed among 18 older adults, who are entitled to receiving nursing home care at home, as a means to support ageing-in-place by providing a sense of safety and security. This paper presents the results of a second round of interviews (1 year follow-up) among 10 remaining participants in the cohort, with both somatic and psychogeriatric health problems. The paper particularly focuses on the changing user attitudes towards implemented technology, the integration and perception of technology in the home environment, and the efficacy of the system within the care processes. In order to investigate whether the expectations and needs at baseline were met by the UAS system, qualitative research was carried out at the homes of the participants using semi-structured interviews based on the WHO's ICF. The interviews were tape-recorded and transcribed verbatim. A phenomenological approach was used for analysis using the MAXQDA 2 program. First, each transcript was read in its entirety. Then, they were read a second time to develop codes that were grouped into themes consistent with the interviews, which emerged from the narratives and the interview guides. Third, quotes that summarised the essence of each person's subjective experience were recorded. Results showed a mix of positive and critical attitudes of the older adults, and of their informal carers in particular, towards the system, which is to take away a part of the burden of care. Some of these attitudes have changed over the year. Apart from the UAS-system, additional home modifications may be needed to support ageing-in-place. Results of the study are used to further improve the system and its implementation.

**PB7 359 VIDEOCONFERENCE BETWEEN ESTABLISHMENTS - EXPERIENCES OF HOSPITALS AT EMBRUN AND AIGUILLES IN THE HAUTES ALPES - FRANCE**

P. LUTZLER\* (Embrun Hospital , Embrun, France)

L. PIERRE(1), C. VÉRONIQUE(1), E. NORIA(1), G. EMMANUEL(1), V. RAPHAEL(2) - (1) Embrun Hospital (Embrun, France); (2) Aiguilles Hospital (Embrun, France)

Situated in the Hautes Alpes is a population base comprised of four districts: the Queyras Valley, the Guillestrois region, and the towns of Embrun and Savines le Lac. These districts have a significant geriatric contingent; of the 19,000 residents, 20% are older than 65 in age, and 10% exceed the age of 75. This is a vast mountainous area, with the effect of isolating communities and resources. This population base is served by four medical establishments with a combined total of 450 beds. In order to be able to provide a rapid response adapted to the needs, we have opted for a gerontologic telemedicine network, joining the hospitals at Embrun and Aiguilles. The equipment employed consists of a

portable miniaturized videophone system which is stationed at the patient's bedside. The local hospital at Aiguilles (caller) is equipped with a patient station which includes a large screen and a video camera on a mobile cart. The central hospital in Embrun (respondent) is equipped with a fixed-in-place system comprised of two screens, a camera, and a PC which permits access to computerized medical records. In our experience over the last two years, this system addresses the challenges of isolation and lack of direct access to care by geriatric patients. Consequently, medical professionals are able to communicate easily without need for significant travel. The use of this tool by these teams has been well received, and improves patient comfort by obviating transport to other establishments. Also improved are working conditions, diagnostics, and decision making. Furthermore, the tool has provided a structural improvement of the medical activities.

**PB7 360 IMPROVING HEALTH AND SAFETY FOR ELDERLY PEOPLE THROUGH AN ETHIC-OF-APPRECIATION.**

T. GHAYE\* (Luleå University of Technology, Luleå, Sweden)

A. MELANDER WIKMAN(1), B. BERGVALL KÅREBORN(3) - (1) Dept. of Health Science, Luleå University of Technology (Luleå, Sweden); (3) Dept. of Business Administration and Social Sciences (Luleå, Sweden)

Introduction: This paper uses data from MyHealth&Age (2008-2010), an EU, Northern Periphery funded project. Its aim is to offer the rapidly ageing population in the northern periphery regions of Europe, improved health, safety and well-being through the use of new services and new mobile ICT products. The project methodology is informed by the values and processes of participatory design, Form-IT and appreciative action research. The project's aim and its approach raise a fundamental ethical question namely, "In what ways do ICT solutions for improving the quality of life for older people (over 65 years), have an ethical dimension?" Methods: Our developing ethical awareness uses data from focus group meetings and storyboarding activities conducted with a group of 20 elderly persons, with/without functional limitations, in Norrbotten, Sweden. Using conversational analysis, thematic elucidation, semiotic and iconographic analysis, we present our efforts to do the 'right thing' and the 'best thing' to enhance the well-being of elderly people. Results: This paper illustrates ethical conflicts and dilemmas associated with trying to balance user needs (e.g. elderly people, healthcare professionals) with technological (product) design requirements and commercial or market opportunities. Four ethical themes have emerged which, collectively, form an ethic-of-appreciation. They are the need to clearly demonstrate an; Ethic of respect : Where the lived experiences of older people are actively listened to. Ethic of empowerment : Where older people feel they have a voice in decisions about their well-being. Ethic of critique : Where power differentials that often constrain and marginalise older adults, are confronted. Ethic of concern : Where ICT solutions enable older people to feel dignified and treated with kindness. Conclusion: ICT and ethics need to be creatively synthesised into an ethic-of-appreciation. This is imperative for projects based upon participatory design principles.

**PB7 361 A PRELIMINARY STUDY ON VIDEO GAME PLAYING AMONG THE KOREAN ELDERLY IN KOREA**

J. AHN\* (Hoseo University, Cheonan, Republic of Korea)

Previous research has supported that playing video games has positive effects on the various functions (i.e. improving cognitive skills) of the elderly. Despite these results, few research efforts have been made on the use of video games among the elderly. Therefore, this preliminary research has investigated the appeal and interest of video games among elderly population in Korea. Data were collected from a survey of approximately 67 community-dwelling cognitively competent Koreans between ages of 55 and 89 years of age. Participants were asked to play an assortment of video games (baseball game, rhythm and beat game, drumming game) and complete a questionnaire pre- and post- game play. Results showed the participants showed a considerable degree of interest in video game; 26.9% of participants who have not experienced playing video games in the past expressed their interest in playing video games again. 46.3% of participants stated that they were satisfied with the video games played. In particular, those who evaluated the speed of the game slow and comfortable were more satisfied with the games. Based on these findings, the following conclusions were posited. There exists a potential market within this demographic group for the use of video games for fun as well as for improving various skills. Game developers should take into account a preference for slow speed of the screen, user friendly tools, and familiar content. In order to better serve the need of this population, a greater degree of instruction must also be accompanied. The knowledge obtained from this preliminary analysis will provide a point toward more specific investigations of the elderly population's use of video games and their effects on various functions of the elderly.

**PB7 362 SOCIO-CULTURAL FACTORS AND I-ADL DEPENDENCE AMONG VERY OLD EUROPEAN WOMEN**

V. HORSTMANN\* (Department of Health Sciences, Lund, Sweden)

H. WAHL(2), F. OSWALD(2), S. IWARSSON(1) - (1) Department of Health Sciences (Lund, Sweden); (2) Department of Psychological Ageing Research (Heidelberg, Germany)

Introduction: Assessments of activity of daily living (ADL) can be defined in terms of dependence upon another person. Thus dependence could be a result of functional capacity, and also of the economy and social welfare. The present objective is to explore sociocultural impact on ADL-assessments. Methods and materials: The ADL Staircase assessments, with dependence/independence defined in terms of receiving personal assistance was collected in 1,448 very old single living women in Sweden, Germany, the United Kingdom, Hungary, and Latvia. Differences among the five national samples were studied with regard to health and socio-cultural factors and their possible influence upon dependence in four instrumental ADL; hereby univariate analyses as well as regression analyses were used. Results: There were highly significant differences between the samples with regard to health and economic factors, with regard to provided medical and domestic services and with regard to use of mobility devices. Health and income were generally higher in Sweden, Germany and the UK. Nonprofessional support was common although less in Sweden and Germany, where rather professional services as home health care, domestic service and special transport service (STS) were common. Canes were common in the five samples, while rollators were mostly seen in Sweden. Most participants were dependent in cleaning, especially so in the wealthier German sample. Dependence in shopping and transportation was high, the latter especially in Sweden where STS is often provided; the variations between the five national samples were highly significant. Particularly in Sweden and Latvia, the ADL dependent received significantly less non-professional support. Mobility devices were generally related to dependence of all types. Conclusion: Besides assessing functional capacity, the ADL assessment can be influenced of availability of support and ability to pay for services. This knowledge is important for valid interpretations, particularly in cross-national studies.

**PB7 363 DEVELOPING A NEW SMART DISTRESS MONITOR WITH OLDER AND DISABLED PEOPLE: WORKING WITHIN USER CENTRED, PARTICIPATORY FRAMEWORKS TOWARDS ASSISTIVE TECHNOLOGY SOLUTIONS.**

S. JUDITH \* (Manchester Metropolitan University (MMU), Manchester, United Kingdom)

J. SIXSMITH(1), A. PRATESI(1), R. WOOLRYCH(1), A. SIXSMITH(2) - (1) MMU - Division of Psychology and Social Change (United Kingdom); (2) Gerontology Research Centre - SFU.CA (Canada)

Current literature on new assistive technology tends to assume that technology can improve the quality of life and independence of older and disabled people. However, there is little substantive, systematic evidence for this. To ensure that technological development is relevant to the lives of older and disabled people, the user centred research presented in this poster brings together technologists, social scientists and older/disabled people to develop a Smart Distress Monitor based on evolving sensor equipment. The purpose of the project is to develop, implement and evaluate an intelligent and reliable front end inactivity/fall sensor to detect vulnerable people when in need of assistance. The project has the following objectives: to identify the technological, psychological and social needs of older and disabled people; to explore the ways in which an activity monitoring system impacts on the everyday lives of older/disabled people in different settings; to ensure that older and disabled users are central to the development of the monitoring system and the research. A multi-methods approach includes: in-depth interviews, focus groups with older/disabled people and health/social care professionals, laboratory-based simulations, field trials in private home, residential home and hospital settings, and stakeholder workshops. Preliminary findings from the project highlight: concerns of the impact of technology on the relationship between the 'carer' and 'cared for'; the concern that the equipment installed could be intrusive and detrimental to privacy; the necessity to assess separately the various environments where the equipment is installed; and the need to understand people's experiential understandings of the home as a restorative environment which embraces social, emotional and symbolic components. Only when these latter components are incorporated into system design and implementation, assistive technology can become an important instrument to improve people's well-being and quality of life.

**PB7 364 CAN POSTUROGRAPHY PREDICT THE RECURRENCE OF FALLS?**

G. KEMOUN\* (University Hospital of Poitiers, Poitiers, France)

E. WATELAIN(2) - (2) UMR CNRS 8530 University of Valenciennes (Valenciennes, France)

As one of a number of multifactorial mechanisms, weakened posture control heightens the risk of falls. In a population having fallen, does posturographic assessment in the framework of an original form of home-based prevention of falls in the elderly (PADCHUTE®) effectively facilitate prediction of possible recurrence? Materials and method A cross-sectional prospective study of a population of elderly persons having fallen and who follow an activity program (PADCHUTE®) designed to counteract the tendency to fall. Clinical tests and posturographic assessments are performed on D0 and D+1 year. Taking into account the results after one year determining constitution of the two groups (n=16 « no longer falls » and n=4 « still falls »), statistical analysis (ANOVA and Post Hoc Tukey) allows for differentiation at D0 of the discriminative parameters of the future repeat fallers. Results As regards clinical tests, only the « Stop walking when talking test » and « finger-ground distance » effectively differentiate the two groups. "Eyes open" posturographic parameters (oscillation area, amplitude of the antero-posterior oscillations and mean pressure center displacement speed) characterize the « still falling » groups. In the "eyes closed"

condition, the two groups are significantly different as regards most of the posturographic parameters. Discussion Home-based posturography efficaciously rounds out the existing clinical approach. It objectifies the globally increased pressure center oscillations associated with the heightening of speed and amplitude, especially from a medio-lateral standpoint. While clinical tests alone cannot predict the future evolution of the elderly person having fallen, posturographic assessment appears to contain specific and sensitive predictive parameters for posture deterioration, especially in the « eyes closed » condition. Conclusion To a greater extent than classical clinical examinations, posturographic assessment appears to foster the emergence of relevant infra-clinical elements that are directly connected with the risk of recurrence in the elderly person having fallen.

**PB7 365 INFLUENCE OF THE AQUATIC EXERCISE CONCERNING THE INDEX OF RESISTIVITY CAROTID AND THE QUALITY OF LIFE IN ELDERLY WOMEN.**  
Y. MENESES\* (State University of Piauí, Teresina, Brazil)  
R. VALE, T. CAMPOS, A. ANDRADE

**Introduction:** Improvements in life expectancy have prompted developments in science, attempting to appraise functional and structural deficits into the issue of human aging. At this stage in life, large arteries are affected, being responsible for cardiovascular diseases. The practice of physical exercise is a protecting factor against arteriocalanarian diseases. The purpose of this study was to assess the influence of physical exercise on the resistivity index of carotid, the quality of life, and the functional autonomy in elderly women. **Methods and Materials:** The sample was composed of 30 women aged (67,79±4,48), body weight (55,66±8,33), blood pressure systolic (129,3 ± 11,83) and diastolic (87,5 ± 3,2). The index of resistivity carotid internal artery (RCIA) has been analysed by ultrasound with Doppler, the quality of life (QL) by the Questionnaire WHOQOL-100 and the functional autonomy (FA) by the results of five tests of the GDLAM protocol. The sample was divided into group control (GC) and intervention group, (GH) being submitted within twelve weeks of exercise in water of medium intensity, controlled by perception of the effort of Borg. For intergroups comparison, the Student's t-test not paired was used to verify the differences between the groups ANOVA and for the correlation the Pearson test. **Results:** The RCIA In pre-test and post-test was maintained  $p = 0,537$ . The QL in pre-test and post-tests respectively was: GH = 14,9 and 13,9 and GC = 12,8 and 12,9 and  $p = 0,183$ . The data showed positive correlation between RCIA and FA  $p = 0,0039$  in pre-test; between one of FA in post-test and the domains psychological  $p = 0,044$  and personal belief  $p = 0,032$  in WHOQOL-100. **Conclusion:** The practice of 12 weeks of hydrogymnastics was not sufficient to alter the RCIA. All in all, the modifications in physical domain and personal beliefs in pre and post-tests were significant, suggesting gains in controlling risk factors that provoke carotid resistance and functional dependence. **Keywords:** Carotid artery, Elderly, Autonomy, Hydrogymnastic.

**PB7 366 USING A WEARABLE ASSISTIVE TECHNOLOGY SYSTEM—OPPORTUNITIES AND THREATS**  
V. WILLIAMS\* (University of Reading, Reading, United Kingdom)  
C. VICTOR(1), R. MCCRINDLE(1), P. LEVENE(2) - (1) University of Reading (Reading, United Kingdom); (2) Docobo Limited (Bookham, United Kingdom)

**Introduction** Population ageing poses one of the greatest social, economic and health challenges for Europe in the 21st century. Increased life expectancy does not necessarily translate into healthier lives; with age the prevalence of chronic illness increases, often compromising older peoples' independence and well-being. The introduction of assistive technology (AT) may support older people to live independently in their own homes. This paper explores the perceptions and needs of older people and their carers with regard to a wrist worn AT device. **Methods** A mixed method approach (focus groups/ survey) was chosen to explore the responses of older people and their carers with regard to using a wrist worn AT device. Focus group interviews were tape recorded and transcribed verbatim. Data were analysed using thematic analysis to explore themes of importance to participants and identify similarities and differences across data. Survey data were analysed using descriptive statistics. Results Nine focus groups with 47 participants (aged 58 to 91 years) were conducted from a diverse range of socio-economic and health backgrounds. Two main themes were identified: threats and opportunities such a device would offer. Two issues characterised the perceived threats: design and operational complexity and confidentiality/privacy concerns. Opportunities related to increased independence, reassurance and well-being. Older people described both threats and opportunities inherent in the device whilst carers placed greater emphasis on opportunities than threats. These findings were supported by questionnaire data from 121 respondents. **Conclusion** Assistive technology can have clear benefits for older people and their carers in terms of well-being and independence. However, such technology also raises concerns amongst older people, which need to be considered in order to ensure that the objectives of AT, increasing the well-being and independence of older people and their carers, can be achieved.

**PB7 367 USE OF TELEMEDICINE TO STRENGTHEN A PROGRAM OF BEST PRACTICES IN NURSING HOMES**  
D. PRINCIAUX\* (Grenoble, Grenoble, France)  
D. PRINCIAUX (1), G. HEBRARD (1), JM. BUONO (2), A. LECLERC (2), M. BENBADIS (1), O. MAGNILLAT (1), I. AWADA(1), V. RIALLE (1),

J. DESAINDES (2), A. FRANCO (1) - (1) Clinique Vieillissement & Handicap (Pr Alain FRANCO), CHU Grenoble, France (2) Association Marc SIMIAN

The quality of the care implies a continuous improvement of practices within geriatrics institutions, particularly in establishments hosting dependent old persons (named EHPAD in France). MobiQual ([www.mobiQual.fr](http://www.mobiQual.fr)) is a French national program of Quality in Nursing homes promoted by the French Ministry of Health and the Société Française de Gérontologie et Gérontologie. It promotes the Best practices in the palliative care, the pain's care, the depression's care and emphasizes the principles of "bientraitance", French neologism meaning "benevolence in taking care". The aim of the study is to promote Best practices ([www.HAS.fr](http://www.HAS.fr)) through video-meetings (video-consultation's recommendation of SFTAG 2009) of gerontology professional's multidisciplinary teams. Institutions are not able to facilitate the exchanges of practices between each others due to limited workforces. The video conference within the framework of a program of Telemedicine allows working on-line, deleting travelling and saving strongly the time necessary for meetings between several institutions. The study designs a regular link (a meeting each month) between a University Hospital geriatric team and a Nursing home's multidisciplinary team by video conferencing meeting, managed with supervision by a clinical psychologist. An evaluation of this program will be presented during the Paris 2009 IAGG World Congress. **Keywords:** Telemedicine, MobiQual (professional practices), Best practices, EHPAD (establishment hosting dependent old persons), Geriatric multidisciplinary team, University Hospital.

**PB7 368 THE REALAGE® ALGORITHM: A NEW MATHEMATICAL APPROACH TO BIOLOGICAL AGE ASSESSMENT BASED ON ROUTINE LABORATORY TESTS**  
G. ENZO\* (Bracco SpA, San Donato Milanese - Milano, Italy)  
E. GROSSI(1), S. CAVUTO(1), V. GRAZIOLI(1) - (1) Centro Diagnostico Italiano (Milan, Italy)

**Introduction** The availability of large cohort data regarding physiological functions measured with specific tests or general laboratory biomarkers has allowed the proposal of algorithms for biological age assessment based on regression models. Most of available literature, however, is based on limited sized cohorts of subjects, lacks real world derivation and rigorous external validation. **Methods** The statistical basis of our algorithm is represented by REALAB data base, a project aimed to redefine reference intervals for routine clinical laboratory quantities using a very large set of current data instead of small focused trials, gaining in statistical precision and describing the real quantity distributions in the population of interest. The data have been collected during 3 years of daily activity of CDI, one of the largest Italian laboratory located in Milano and concern over 15.000.000 electronic records in 197 350 individuals. On the working hypothesis that biological age is equal to real age for healthy subjects, we modeled the relationship between biological age and laboratory quantities for these subjects, extrapolating the predictive models to non-healthy subjects with a proper best-choice algorithm. **Results** In absence of gold standard for biological age, the validation of the algorithm has been based on the distribution of predicted age in healthy and not-healthy subgroups separately. The obtained results are consistent with the working hypotheses and show a close correlation between health status and predicted biological age. **Conclusions** REALAGE appears to be an interesting tool for the study of healthy aging in public health context.

**PB7 369 THE EUROPEAN PROJECT SMILING: SELF MOBILITY IMPROVEMENT IN THE ELDERLY BY COUNTERACTING FALLS**  
F. MARCELLINI\* (INRCA, Ancona, Italy)  
M. BULGHERONI(1), S. BAR-HAIM(2) - (1) Ab.Acus Srl (Milano, Italy); (2) Step of Mind Ltd (Beer-yaakov, Israel)

**Introduction.** The European project SMILING (FP7, ICT, GA 215493, EC contribution € 2.250.000) has begun its activity on 1st January 2008. Eleven research centers, universities and companies of 5 European countries (IT, CH, UK, NL, SK, IL) are involved in it. The main objective of the project is to improve the elderly mobility and counteract falls with a new rehabilitation process, inducing variable environments that need active response and problem solving. The SMILING intent is to solve the motor problems of older people in real time, with the use of a new and innovative device. **Methods and Materials.** The SMILING system, a wearable computer-controlled device, is aimed to implement a systemic solution for facilitating or ameliorating walking schemas. Prototypes of the system will be built and tested on the end-users in four validation sites (IT, IL, CH, SK), using a protocol of training and questionnaires to evaluate psychosocial aspects, acceptance and safety of the new technology. For the validation phase, a randomized controlled cross-over trial will be conducted on 96 subjects. **Results.** A preliminary study on the end-users and professionals needs has shown that the maintenance of independence is the most expected outcome (97%), considering that 50% of interviewed subjects experience fear of falling sometimes or always (25%). For the professionals, SMILING fall-related program could be very useful (mean ± SD; 7.2 ± 2.1; range 1-10). The main results are expected from the future validation of the system. **Conclusion.** Elderly at risk of falling can be considered to be suffering from an involuntary motor behaviour that restricts their participation in society. The SMILING system, according to elderly needs, could increase the quality of life with improving their mobility. The elderly technology

acceptance represents an open issue to detect for the future development of gerontechnology solutions.

**PB7 370 QUALITY OF LIFE (QOL) OF ELDERLY SURVIVORS 12 MONTHS AFTER DISCHARGE FROM A MEDICAL ICU.**

E. SACANELLA\* (Hospital Clinic, Barcelona, Spain)  
M. NAVARRO(1), J. NICOLAS(1), F. MASANES(1), A. LÓPEZ-SOTO(1) - (1) Hospital Clinic (Barcelona, Spain)

INTRODUCTION: QOL of medical ICU survivors  $\geq$  65 years 12 months after discharge is not well known. METHODS: ICU elderly patients who were alive 12 months after discharge from hospital were evaluated. Main diagnosis at ICU admission (APACHE III) and a comprehensive geriatric assessment were performed. EuroQOL-5D (EQ-5D) was used to assess QOL and evaluates five domains (mobility, anxiety, self-care, daily activity and pain) and global health status by means of a visual analogical scale (EQ-VAS). Main geriatric syndromes before and after ICU stay were also collected. RESULTS: From 193 patients aged 65 or more admitted to our medical ICU, 75 (age  $72.9 \pm 5.4$  years) were alive 12 months after discharge from hospital (survival rate: 38.9%). Main diagnosis at admission were: acute exacerbation of COPD, heart failure, sepsis and lung infections. EQ-VAS was decreased at discharge and 3 months later ( $p<0.01$  both), however, it was similar 12 months after discharge compared to baseline ( $69.6 \pm 17.0$  vs  $73.0 \pm 16.3$  points;  $P=0.3$ ). A higher percentage of patients referred difficulties in EQ-5D domains at 12-month evaluation compared to baseline: pain (58% vs 40%), anxiety (50 vs 34%), daily activity (50 vs 31%), mobility (33 vs 11%) and self-care (27 vs 13%). Most of these difficulties were classified as mild. The prevalence of  $\geq$  2 geriatric syndromes was 19% at baseline and was significantly higher (37%) at 12 months after discharge ( $P < 0.01$ ) those more were polypharmacy (72%), depression (21%) and urinary incontinence (21%). Most of the survivors (81%) would accept a readmission to the ICU. CONCLUSIONS: Elderly patients alive 12 months after discharge have a relatively good perceived quality of quality of life similar to baseline, although, there is a significant decrease in some domains.

**PB7 371 HYPOTHALAMIC-PITUITARY-ADRENAL AXIS REACTIVITY AND DEHYDROEPIANDROSTERONE SULFATE PLASMATIC CONCENTRATIONS IN CRITICALLY ILL ELDERLY**

E. FERREIRA DA MOTA\* (Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1 , Montpellier, France)  
K. KLOUCHE(2), L. AMIGUES(2), P. CORNE(3), R. DURANT(1) - (1) Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1 (Montpellier, France); (2) Réanimation Métabolique, Lapeyronie, CHU Montpellier (Montpellier, France); (3) Réanimation médicale et assistance respiratoire, Gui de Chauliac, CHU Montpellier (Montpellier, France)

Introduction : The aim of this study was to investigate the activity of Hypothalamic-pituitary-adrenal axis and basal dehydroepiandrosterone sulfate in the elderly in comparison with non-elderly critically ill patients. Methods and materials : This is a prospective observational study in two multidisciplinary Intensive Care Unit (ICU) of a university-affiliated teaching hospital. Two groups of 18 severely acutely ill patients were admitted in ICU: elderly 75 years or older and non-elderly aged 65 years or younger. Patients with a hypothalamo-pituitary-adrenal (HPA) axis disease, previously treated with corticoids, etomidate, fluconazole or ketoconazole, were excluded. Basal ACTH, cortisol, DHEAs, stimulated cortisol 30 and 60 minutes after intravenous injection of 250 $\mu$ g of ACTH. Relative adrenocortical insufficiency was defined as a basal cortisol level  $>10\mu$ g/dl and a maximal rise in cortisol after stimulation (delta max) less than 9 $\mu$ g/dl. Results : Both groups were similar for the following parameters: sex ratio, SAPS II, diagnosis of acute illness, and the need of mechanical ventilation, hemodialysis or vasoconstrictive agents. Basal cortisol and ACTH measurements were similar between the two groups. Although mean delta max was lower in the elderly, the difference did not reach statistical significance. Relative adrenocortical insufficiency was diagnosed in four patients of each group, with an incidence of 22.2% in both groups. Basal DHEAs levels were however significantly decreased in the elderly patients. Conclusion : According to the definition criteria, incidence of adrenocortical insufficiency in ICU patients is not age-dependent. The significant decrease of DHEAs and the lower cortisol increment in elderly suggest however that ageing slightly alter the reactivity of HPA axis reactivity. In critically ill elderly, the diagnosis of relative adrenocortical insufficiency should be redefined in order to better identify patients who may benefit from stress doses of hydrocortisone.

**PB7 372 CHARACTERISTICS OF HOME CARE CLIENTS IN POLAND AND THE PROFILE OF DELIVERED NURSING SERVICES**

S. CHLABICZ\* (Medical University of Bialystok, Bialystok, Poland)  
W. MOJSA(1), L. MARCINOWICZ(1), Z. STOJAK(1) - (1) Medical University of Bialystok (Bialystok, Poland)

Introduction A new form of services provided by nurses – long-term home care has been recently introduced in Poland. The purpose of the study was to provide descriptive data about the characteristics of today's home care clients in Poland and to describe the profile of delivered nursing services. Methods and Materials This study examined 577 home

health clients served by one of agencies in Podlaskie region in Poland in years 2004-2008. Demographic, health history, and clinical data were analyzed. The Barthel Index consisting of 10 items was used to measure a person's daily functioning specifically the activities of daily living and mobility. The scores for each of the items were summed to create a total score with potential maximum of 100. In addition nursing services provided to individual clients were recorded. Results The median age of home health clients was 76.8 years. Majority (n=376; 66.2%) were females and were older than 80 years (299; 51.8%). For 259 (44.9%) clients the total Barthel score was 0 indicating very high level of dependency. The nursing services delivered most frequently were: pressure ulcers management (69.3%) and urethral catheterization (56.5%). As many as 135 (23%) patients died during observed time of up to 180 days. Conclusions Majority of home care clients in Poland tend to be very old, sick and with very high level of dependency. This requires from nurses both provision of nursing services as well as good technical skills to operate medical equipment in home environment. The important task of home care nurses is also to support a patient's family, especially while caring of terminally ill. Our data suggest that education of home care nurses should take place in the context of comprehensive geriatric care.

**PB7 373 CARE HOME RESIDENTS' ENJOYMENT OF STRUCTURED ACTIVITY CLASSES: AN OBSERVATIONAL STUDY.**

G. FOX\* (Leeds General Infirmary, Leeds, United Kingdom)  
J. MCCREANOR(1), L. GOMEZ(2), M. CATTAN(2) - (1) Leeds General Infirmary (Leeds, United Kingdom); (2) Centre for Health Promotion Research, Leeds Metropolitan University (Leeds, United Kingdom)

Introduction The provision of recreational and therapeutic activities for care home residents has been the subject of much discussion. One company, Motivation & Co, offers structured recreational classes to care homes on a commercial basis. We conducted a service evaluation of these classes and investigated the short term effects on the participants, and the views of residents and staff about the classes. Method We observed the participants at two care homes on seven occasions for levels of participation, sleep, and the need for physical assistance or verbal encouragement. We noted indicators of wellbeing and ill-being before, during and after activities. We conducted semi structured interviews to assess the views of staff, participants and activities coordinators about the classes. Results 58 residents were observed in total. 50 showed increased levels of wellbeing during the activities, 2 showed a decline in wellbeing, 3 showed no change, 3 were excluded due to not being present for either the before or after section of the class. Overall residents participated in 172/236 activities. Skittles and Music and Beanbag/Hoopla were the activities with the highest participation (participation of 100% and 92.9% respectively). During these two activities most people were awake and during skittles and music the highest levels of wellbeing were recorded. Only 50% participation was recorded during the sayings and proverbs activity. Key benefits noted from the interviews were enjoyment, variety of activities, choice for residents and participation in activities. Conclusions The increased wellbeing indicators during the activities indicate enjoyment of the classes which is backed up by the interview results. Preferences for certain activities were demonstrated. These could possibly be explained by the presence of hearing or visual impairments. Further research is necessary to help direct provision of the best activities for elderly people living in care homes.

**PB7 374 EFFECT OF ANTIBIOTICS ON MORTALITY IN NURSING HOME RESIDENTS WITH PNEUMONIA AND DEMENTIA**

J. VAN DER STEEN\* (VU University Medical Center, EMGO Institute, Amsterdam, The Netherlands)  
P. LANE(2), N. KOWALL(3), D. KNOL(4), L. VOLICER(5) - (2) E.N. Rogers Memorial Veterans Hospital, Geriatric Research Education Clinical Center (Amsterdam, United States of America); (3) E.N. Rogers Memorial Veterans Hospital, Geriatric Research Education Clinical Center, Bedford, MA, USA, and Boston University School of Medicine, and Boston University Alzheimer's Disease Center, and (Amsterdam, United States of America); (4) VU University Medical Center, Department of Epidemiology and Biostatistics (Amsterdam, The Netherlands); (5) University of South Florida, School of Aging Studies, Tampa, FL, USA and Charles University Medical School, Prague, Czech Republic (United States of America)

Previous observational studies on effect of antibiotics on mortality in patients with pneumonia and dementia are inconclusive. Treated and untreated patients were very different, thereby complicating adjustment for confounding patient characteristics when examining associations between antibiotics and outcome. Further, effectiveness may be decreased with more severe dementia or limited fluid intake. Methods We enrolled 110 nursing home residents with a new episode of pneumonia between February 2004 and November 2008 in US Veterans Affairs nursing home. We selected 94 first episodes. Follow-up was up to almost 5 years. Severe dementia was assessed as 6 on the Cognitive Performance Scale (CPS) pre-illness, which implies full eating dependency. Mortality risk was calculated with a validated risk score. Associations of any antibiotic use with 10-day mortality were calculated using logistic regression. Odds ratios (OR) and 95% confidence intervals (CI) were calculated. Results The large majority of residents (97%) were male and 71% were treated with antibiotics. Six-month mortality was 71% for treated, and 88% for untreated residents (n=92; p=0.08), and 10-day mortality was 37% and 74%, respectively (p=0.001). The groups did not differ by mortality risk, severe dementia, fluid

intake, or age. Use of antibiotics was strongly associated with decreased 10-day mortality (OR 0.21, CI, 0.08-0.56). The association remained after adjustment for mortality risk, CPS and age (OR 0.22, CI 0.07-0.70), and differed neither by dementia severity nor by fluid intake. Conclusion In our sample of male nursing home residents with dementia and pneumonia, antibiotics were associated with decreased 10-day mortality. Antibiotics are likely effective in reducing short-term mortality in nursing home residents, including those with severe dementia and limited fluid intake. Nevertheless, long-term mortality was substantial despite antibiotic treatment.

**PB7 375** SPECIFIC TRAINING IN GERONTOLOGY : A CHALLENGE FOR THE XXITH CENTURY

P. MICHOT AND MARZAIS\* (SFGG, Paris 16, France)  
M. PATRICIA(1), M. MARTINE(1) - (1) SFGG (Paris, France)

The ageing of the populations in the next years implicates the necessity of reinforcing the qualification of the paramedical staffs and the development of specific competences to take care of the old persons in institution or at home. The training responds to permanent evolutions in : legal, scientific, professional and societal matters. The training process undertakes changes in the way of thinking and in professional acting. The training will adapt the competences of the staff in there knowledge, as well in there know-how, and there know how to behave. The training answers to the confusion of the nursing in front of patients affected by heavy pathologies, in front of the suffering and of the death. It acts like a prevention of the burnout, reinforces the motivation and the pleasure to work with the old persons and allows valuation of the individual professional project. The training must be a part of the establishment's project (Hospital, EPHAD – Geriatrics Hospital-, Home Care Service). The acceptability for giving financial ressources and suffisant time remains with the Director. Establishing adequate training programs supposes a good capacity of listening, efficiency in the expression of needs and more over it imposes the importance of the manager's supervision for the new trainee. The specific training in gerontology is a necessity in the taking care of the elderly people and his acquaintances (helping). This will be the challenge of the XXIth century in gerontology. Keywords: gerontology - training - competence - care - ethics.

**PB7 376** 26TH ANNUAL DAYS OF THE S F G G 5-6 OCTOBER 2005 VALIDATION A METHOD FOR COMMUNICATING WITH ELDERLY DEMENTIA PATIENTS  
M. DAURIAC\* (SFGG, Paris, France)  
D. MARIE CHRISTINE(1) - (1) SFGG (Paris, France)

Communication is a vital need for humans. One of the characteristics of Alzheimer type dementia is the forgetting of words, the disruption in the conception of words and the loss of the capacity to speak. A verbal and non-verbal method of communication, "Validation" can be used with persons afflicted with dementia. Naomi Feil's theory of validation is based on principles developed by behavioral, analytical, and humanistic psychologies. "Validation" allows persons afflicted with Alzheimer type dementia to become aware of themselves and to keep their identity. "Validation" gives meaning to the acts of care administered. A description of the Validation methodology This method is situated in an approach of improving the care of elderly dementia patients who have trouble communicating. This approach has the benefit of producing positive effects on the speech of elderly persons, of giving care techniques to caregivers, and of combating the feeling of powerlessness on the part of caregivers.

**PB7 377** CARE PLAN LIFE PLAN  
T. GRESSIER\* (SFGG, Paris, France)  
G. THIERRY

Elderly people move into institutions not because of their age, but because of health reasons (handicaps linked to progressive or chronic illnesses,) because of security issues (related to behavior and judgment,) and because of a disrupted quality of life which no longer allows them to live on their own or with their family. Their state of physical and mental health necessitates - A care plan, to safeguard, to foresee, to treat, to improve, to support, to serve the needs of the elderly person throughout the rest of their life. - A life plan, so as to improve the quality of life in institutions, to respond to cultural and social needs of the residents, and to improve their quality of life by combating isolation, withdrawal, denarcissism phenomenon, and boredom. But can we talk about a care plan without a life plan? Instituting a care plan without considering a life plan could have serious consequences for the well-being of the residents; the result could actually work against their positive treatment. There must be a correlation between a care plan and a life plan. In reality, both plans are one and the same, an individualized life plan. It replaces the care phase in the resident's life history, and from this point of view give meaning to care—it motivates and energizes health professionals and/or home health aids. The involvement of the multidisciplinary team in the development, implementation, evaluation and readjustment of the individualized life plan is a source of coherence in the care of the

elderly patient and centralizes the team around a common project. Without care, no quality of life Without a life plan, no desire to live

**PB7 378** CONCEPT OF MULTIDISCIPLINARY OR RATHER OF PLURAL PROFESSIONALISM

A. ENGELSTEIN\* (SFGG, Paris, France)

Interdisciplinary or multidisciplinary, you should not rather speak of plural professionalism in the professionals' community of care that is the Nurses, Nurse's aide, Assistant Medical Psychological, physiotherapists, psychologists, doctors, social workers. Professional being it is to share values, to know and to recognize the missions, the competences and the role of each. It is indeed a question of caring together and also a question of thinking that the global care is a plural business where every professional approaches the situation of the person been looked after by a different angle. The principles of global care and continuity of care live in all these angles and allow a coherent meshing. The notion of team plural professional is a reality in the sectors of elderly people. We are not still many but really motivated to promote care, life and sense in the shared actions with the well-kept person and his entourage. To stay on the alert about this fundamental cohesion of all the professionals, it is advisable to ask some questions to « make care » or « to take care », about the postulate that the well-kept person is an actor of his care, about the place and the role of every professional actor. The new hospital's organizations with the governance and the departments of care's activities are going to ask us for a particular attentiveness to maintain our requirements and assert our competences. Beside the medical units of care, the sectors of old persons have difficulty in demonstrating a gain. It will be necessary to aim towards control of the expenses in human's resources, in material equipment, in logistics by organizing us better and by being creative and keeping this will to optimize care with plural professional's team. Our strength is our competences, our formations and our

**PB7 379** NURSING COMPETENCIES IN GERIATRICS.

M. AUGER\* (SFGG, Paris, France)  
A. MARIE CLAIRE

The development of nursing competencies in the area of prevention will lower the cost of health care insofar as it will help avoid the sometimes irremediable consequences linked to a lack of intervention. The care pertaining to a "fragile" population, especially an elderly one susceptible to Alzheimer type dementia, underscores the advantage of developing a specific expertise in the care of this population. Care that is limited to actions does not respond to the needs of the elderly person, since care is constituted by a group of "little things." These "little things" are important ones and lie at the heart of quality of life issues. Care approach involves the team in a global supportive environment. It focuses on the person, on the life situation, on specific human reactions and on the medical situation. This approach is operational in diverse settings (at home, EHPAD, SLD, SSR, short stay,) which requires on the part of the nurse a knowledge of how to adapt life plan objectives to the elderly person. This approach occurs at a period in life that requires specific competences relating to physical and psychological help for the elderly person. The approach helps the elderly person adapt to aging, to loss, to end of life handicaps. It is an approach that involves nurses developing an ethical reflection in a multidisciplinary framework. It is clear that the acquisition of levels of competence rests on continuing education: a university degree, a clinical specialty in order to acquire different levels of expertise that allow nurses to exercise managerial tasks, strategize projects, analyze complex care situations. In this perspective, exchanges in nursing training schools foster the development of competencies through focus groups and the sharing of experiences, but also by participation in work groups on the practice recommendations and research that are currently underdeveloped.

**PB7 380** DEVELOPMENT OF AN INCLUSIVE INDEX OF HEALTH ASSESSMENT FOR ELDERLY

H. MASAKI\* (Chiba University School of Nursing, Chiba, Japan)  
K. KURODA(1), M. TANIMOTO(2), Y. TAKAHASHI(2), M. TORITA(2), T. KITA(3) -  
(1) The Center for Education and Research in Nursing Practice, Chiba University School of Nursing (Chiba, Japan); (2) School of Nursing, Chiba University (Chiba, Japan);  
(3) School of Medicine, Chiba University (Chiba, Japan)

Introduction: Currently most Japanese nurses use health indexes that lack a view of the elderly. We need specific measure of health for the elderly to empower the elderly and nurses because the elderly population is increasing in Japan. Objective: To develop inclusive index of health assessment for professional nurses to use to increase the capacity of the elderly in holistic health. Methods: A hybrid model of the concept development method (Schwartz-Barcott D. & Kim H. S., 1993) was applied. In the theoretical phase, to grasp the essential characteristics of health of the aging, all the available literature on health was widely reviewed. In the fieldwork phase, the assessment items and the method of creating the elderly's health index were investigated by the focus group interview among 6 CNS's in gerontological nursing and the participation observation with 2 doctors of specialty of geriatric medicine in Japan. In final analysis phase, the theoretical phase and the fieldwork phase were integrated. Results: Three domains were found as an inclusive index that illuminated the holistic views of health of the elderly by health professionals.

These are, health as stability, health as actualization, and health as wholeness (holism). Health as stability shows the stability of life base according to environment, the tenability of the baseline to which the individual of a physiological function is stabilized, and the maintenance of daily living. Health as actualization shows the achievement of one's possibility, creating purpose and meaning in one's life, and the maintenance integrity and pride. Health as wholeness shows a sense of wholeness including a sense of coherence, social interactions, belonging in the community, continuity, and enjoying inner peace and well-being. Conclusions: Future plans include creating and piloting a health assessment guideline for the elderly based on these three domains.

**PB7 381 PREVENTION OF THE RISKS RELATED TO A BAD INSTALLATION IN THE ARMCHAIR OF ELDERLY BEDRIDDEN PATIENTS IN LONG TERM CARE UNIT**

M. MANCIAUX\* (CHU Nancy, Nancy, France)  
M. GODART(1), I. CROCI(2), R. LEROY(1) - (1) usld chu Nancy (Nancy, France);  
(2) Institut régional de réadaptation (Nancy, France)

**INTRODUCTION** An inadequate position of elderly bedridden patients in the arm chair is frequently observed and may have important consequences: pains, wounds of pressure, falls, disorders of swallowing...and bad quality of life. **METHODS** Professional practices evaluation gives us a method to improve the way in which the personnel installs the patients in their arm chair. One audit on practical aspects of installation according to 10 definite criteria and an investigation of knowledge of the medical staff concerning the risks and consequences of a bad installation are carried out initially. A plan of improvement is set up: purchase of positioning material (cushions of varied forms), staff training to the prevention of the risks, criteria of good installation, and use of positioning material. Posters showing the criteria for optimal sitting position and pointing the risks are posted up in the wards. A second audit of practices is realised six months later. **RESULTS** The first audit of practices highlighted a low number of patients answering the 10 criteria (11%) and a bad knowledge of the whole of the risks by the staff. The second audit six months later showed a clear improvement of the installation (60% answered the 10 criteria) and the knowledge of the risks among the personnel of the department. **CONCLUSION** An information of medical staff, a renewal or investment in material adapted to the patient conditions, a collaboration between various professionals (medical and physiotherapists, nurses...) show a great effectiveness to improve professional practices in the targeted field and especially the quality of life in institutionalized frail patients and the satisfaction of their entourage.

**PB7 382 IMPACT OF A TRAINING PROGRAM FOR NURSING STAFF ON CHRONIC PAIN IN RESIDENTS WITH DEMENTIA IN LONG TERM CARE INSTITUTIONS**

L. MISSON\* (Université Laval, Québec, Canada)  
R. VERREAULT(1), M. AUBIN(1), M. SAVOIE(2), T. HADJISTAVROPOULOS(3),  
S. LE MAY(4), M. BEAULIEU(5), P. VOYER(1), S. KAASALAINEN(6),  
P. CARMICHAEL(1) - (1) Centre d'excellence sur le vieillissement de Québec (Québec, Canada); (2) Hôpital Ste-Anne (Québec, Canada); (3) Dept. Psychologie, University of Regina (Québec, Canada); (4) Faculty of Nursing, University of Montreal (Montreal, Canada); (5) Centre de recherche sur le vieillissement, CSSS-IUGS (Canada); (6) Faculty of Nursing, McMaster University (Canada)

**Introduction :** Chronic pain is highly prevalent in older persons, but frequently under-diagnosed and under-treated, particularly in seniors with severe dementia and serious limitations in ability to communicate. **Methods:** This study is part of a larger project about evaluation of a multifaceted pain management program for seniors with dementia living in long-term care institutions. The objective of the present study is to assess the impact of a training program to all staff members in a publicly funded long-term care (LTC) institution in Quebec City, Canada. The 10-hour training program focuses on knowledge, attitudes and beliefs regarding pain and its treatment in the elderly, as well as on the use of a pain observational instrument (PACSLAC) and implementation of individualized care plans for residents showing increased pain scores. Training sessions were given in groups of 6 to 10 participants. Outcome measures include impacts of the program on residents (pain, agitation and sleep) and on staff (knowledge, attitudes and beliefs about pain in older people). Knowledge of staff about pain was assessed using a validated questionnaire including 15 true/false items (score range 0-15). Attitudes and beliefs were assessed using the Family Pain Questionnaire, including 12 items on a Likert scale (score range 8-21). Questionnaires were administered before and after completion of the training program. **Results:** A total of 136 staff members received the training program. Average global scores increased by 30% post intervention for knowledge ( $p<0.0001$ ), and 11% for attitudes/beliefs ( $p<0.0001$ ). Specific areas of improvement will be presented and discussed. Follow-up regarding the impact of the training on residents is still on-going and will be published later. Average scores on knowledge improved from on Conclusion: A standardized training program on pain detection and management in LTC is effective in improving knowledge, attitudes and beliefs about chronic pain in residents with dementia.

**PB7 383 DETERMINING FACTORS OF PHYSICAL RESTRAINT IN ELDERLY POPULATION IN A LONG STAY WARD.**

M. MICHEL\* (University Hospital, Rennes, France)  
A. BEAUMANOIR-LAMBOTTE(1), O. MICHEL(1), F. JEGO(1), A. LANNOU(1),  
P. JOUANNY(1) - (1) University Hospital (Rennes, France)

Physical restraint is still a common practice in elderly people admitted in long stay wards to prevent falls or manage behaviour troubles, despite its well-known harmful consequences on autonomy and dignity respect. The aim of the study was to evaluate the prevalence of physical restraint, as bed rails and belts, in a long stay ward in the University Hospital and to analyse some determining factors that lead to restrain people. In the same time, the second aim was to educate the nursing team to find alternatives, as recommended by the international guidelines. In case of no alternative to restraint was found, the team was asked to improve its practice as recommended by the French Health Authority (H.A.S.). The method was a clinical practices assessment driven by the care-givers themselves in 5 geriatric units involving 165 elderly individuals over a six-month period, from November 2007 to May 2008. In addition to the prevalence of the restraint practice, the authors also analysed the main pathology of the patients, age, gender, history of previous falls, disability level (scored by the French AGGIR scale), MMSE status, use of psychotropic drugs. Guidelines were reminded during several educational sessions. Results: at the first round of the practice appraisal, prevalence of restraint was bed rails: 67% and belts: 36%. At the second round, the prevalence declined respectively to 13% and 5%. In the same time, the prescription of bed rails and belts by a doctor rose from 41% to 76%. Alternatives were the acceptance of fall risk, the prescription of hips protectors, mattresses on the floor, without any increase of falls rate in the study period. The main pathologies were Alzheimer's dementia (85%) and stroke (13%). Main determining factors of physical restraint were significantly a low score of MMSE (score 6/30 in restrained patients versus 12 in non-restrained), a worst disability rate in restrained (GIR 1.3 versus 2), especially concerning orientation, judgement and mobility. Severe balance trouble was found in 80% of restrained people versus 38%. Conclusion: the improvement of a non restraining care-strategy has been effective during a six-month period as guidelines were reminded to geriatric teams. This improvement should persist in the future despite the increasing prevalence of severe demented people with high risk of falls

**PB7 384 TECHNOLOGY AND LONG-TERM CARE (TLC)**

S. REDER\* (VA Puget Sound Health Care Systems, Seattle, WA, United States)  
G. AMBLER(1), M. PHILIPPOSE(2), S. HEDRICK(1) - (1) HSR&D VA PSHCS (Seattle, United States of America); (2) Intel Corporation (Seattle, United States of America)

**Introduction:** Research has found that most recipients of long-term care (LTC) want to live in the least constrained manner possible. One approach to supporting the independence of elders is the use of new sensor technologies. The purpose of this study was to determine if the sensor technology, developed by Intel, could assist community-dwelling elders who need LTC in maintaining independence. **Methods:** We conducted a one year longitudinal pilot study in Seattle, Washington. For three months the technology was installed in the homes of 12 elders, used to monitor four activities (eating, physical activity, vitamin use, personal care) and to convey summary information to the elders, a family caregiver and/or a paid caregiver, on a picture frame monitor. The study design was a single group pre and post-intervention evaluation. Data collection consisted of interviews with all subjects at baseline, one-month and three-months post installation of the technology. Qualitative and quantitative analyses were conducted. **Results:** All subjects would recommend the technology and found it useful in at least one of the following ways: increased peace of mind while living alone, reminders for elders' daily tasks, helping structure an elders' daily routine, and enhanced communication between elders and caregivers. Communication patterns did not change much between elders and paid caregivers; however, all six family caregivers in the study noted a positive change in their communication with the elder. The family caregivers with the highest baseline caregiver burden benefitted the most from the technology. **Conclusions:** Elders and caregivers enjoyed using the technology and found it easy to incorporate into their lives. The technology has promise for supporting elders in independent living situations. A study with a larger sample size, including a cost analysis, needs to be conducted prior to broad implementation of this technology.

**PB7 385 THE "HARD TO PLACE" OR "DIFFICULT TO PLACE" PATIENT**  
D. MAHER\* (Lions Gate Hospital, North Vancouver, Canada)

**Introduction** There is no clear definition in the literature of the "hard to place" or the "difficult to place" patient. Most clinicians and administrators have a nebulous idea of what they mean when referring to a hard to place patient, and there is no consistent approach to address service gaps identified in the health care delivery system. **Methods and Materials** A literature review was conducted using PubMed, Ovid and Google Scholar and the few articles that reference this topic are primarily related to the psychiatry literature and refer to a mainly schizophrenic population. There are no specific references to Geriatric Medicine patients. As a consequence, some preliminary data related to discharges from Lions Gate Hospital, North Vancouver, Canada, were reviewed to identify patterns that lead to the timely placement of patients deemed to require nursing home level of care in a long term care facility. **Results** Although the majority of patients were placed in a long term care facility, a small but significant minority in each reporting period required

intensive resources, both human and financial to identify an appropriate type of housing and care. The patient profile that emerges is one in which the majority are often young (<75 years of age), may have advanced dementia with aggression and/or sexually inappropriate behaviour, concomitant psychiatric illness, an uncertain prognosis, requiring ventilation and finally, non-adherence with medications or substance abuse. These patients do not respond to conventional intervention such as behaviour logs, care plans, increased staffing levels (1:1 care) and medications for the treatment of BPSD. Conclusion The definition of the difficult to place patient needs to be clarified and more consistently identified early on in during hospitalization. An interdisciplinary approach is one of the guiding principles required to address equally the myriad of clinical and social issues in this challenging patient population.

**PB7 386 LIFE CONDITIONS OF KOREAN CENTENARIANS LIVING IN BUSAN AREA, SOUTH KOREA: IN THE CONTEXT OF FAMILY**

Y. SON\* (Department of Care Management, Busan, Republic of Korea)  
Y. KIM(1), H. PARK(2), D. KIM(2), J. LEE(1), J. LIM(1), E. KIM(3) - (1) Pusan National University Yangsan Hospital (Yang-San, Republic of Korea); (2) College of Nursing, Pusan National University (Yang-San, Republic of Korea); (3) Department of Care Management (Pusan, Republic of Korea)

Introduction: The purpose of this study is to examine living conditions of community-dwelling Korean centenarians in the context of family systems. Since the oldest population (85 and older) is known as the fastest growing population, people aged 100 and more are likely to increase in a near future. Methods & Materials: All subjects were drawn from Busan metropolitan city, the second largest city in South Korea. The second(2006) and third(2007) wave of the BCS were used to study the relationships of physical and mental health conditions, life satisfactions, family relations, economic conditions and other areas. How to maintain physical autonomy appeared to be an important factor of increasing quality of life satisfaction. Those coresiding in multigenerational households were better in being helped from daily activities. Questionnaires developed by the BCS researchers were administered to a number of centenarians. Several methods were employed to identify their real age. Results: The current study showed that overall health and life conditions were relatively in good states, and most were well-connected to both family and community. Cohorts effects such as low level of socioeconomic conditions were observed and appeared to have an influence on their performance. Since co-residing family members played a gatekeeping role, making initial contacts with centenarians found to be difficult. Although results of the study reflected the changing trends of attitudes toward the elders, most centenarians were engaged in positive interactions such as companionship, mutual supports, and personal welfare. Most of them resided with their older sons family and received social and emotional supports. Conclusion: The Busan Centenarian Study(BCS) established in 2006 has conducted life conditions of Korean centenarians about socio-psychological aspects of aging processes. In times of medical and economic needs, resources were drawn from family members and thus the importance of social support from family members cannot be overemphasized.

**PB7 387 STABILIZING FACTORS OF HOME CARE AFTER HOSPITAL DISCHARGE: A LATENT PROFILE ANALYSIS**

W. WIEDERMANN\* (University of Klagenfurt, Klagenfurt, Austria)  
B. JENULL(1) - (1) University of Klagenfurt, Department of Psychology; Applied Psychology and Methods Research Unit (Klagenfurt, Austria)

Introduction: The study investigates factors which promote an efficient home care of patients after an inpatient stay in a geriatric ward in Austria. Since April 2008 the institution implemented a Geriatric Basic Assessment (GBA) as a standardized instrument to evaluate the physical, mental, and social health status of patients. On the basis of these data the primary purpose was to explore different health profiles of patients. To determine stabilizing factors of home care practice, follow-up interviews were conducted to evaluate the health status 90 days after hospital discharge. Method: Latent profile analysis (LPA) was used to develop a typology of patient's health status at the beginning of an inpatient stay ( $N = 295$ ). Beside the latent class membership, demographic variables such as gender (66 % female), place of residence (52 % urban), family status (56 % living alone), and age (mean = 82,  $sd = 7.5$ ) were used to predict the health status after discharge by means of logistic regression. Results: LPA revealed three distinct profiles, showing serious impairments on all geriatric scales in 29 % of all patients, moderate in 32 % and low impairments in 39 % of all cases. Results demonstrated that even those who showed little impairments had clinically noticeable test scores. The logistic regression analysis showed no significant associations between covariates and patient's health status 90 days after discharge. Conclusion: The study identified three different types of hospitalized patients. Currently, there is no evidence that a certain latent class membership promotes an efficient home care practice. This may be attributable to power issues concerning the logistic regression, due to a low mortality rate. Further studies are needed to investigate the predictive value of latent class memberships within a longer time period after discharge.

**PB7 388 HEALTH PROMOTION IN LONG-TERM CARE**

A. HORN\* (University of Bielefeld, Bielefeld, Germany)  
M. BRAUSE(1), D. SCHAEFFER(1), A. BÜSCHER(1) - (1) University of Bielefeld (Bielefeld, Germany)

Introduction: The demographic trend in Germany shows that the number of frail elderly has risen during the last years and will rise further. Because of this trend the situation in institutions of long-term care (LTC) has changed enormously. The average age of nursing home residents has risen to 82 years. About 70% of these people suffer from dementia and a lot of them require a high level of care. The average length of stay in nursing homes decreases while the need of care increases. Rising strain causes impairment of health for all parties concerned – patients and employees. Methods and materials: The LBIHPR in Vienna (Austria) and the University of Bielefeld (Germany) have entered into cooperation for the next seven years of research in health promotion as a strategy to deal with the problems in the field of LTC. A Survey is planned to analyse the health status of residents and employees in LTC. On the basis of this data set interventions for both groups will be planned, carried out and evaluated. Results: At first we carried out a systematic literature review to explore the concept of health promotion in LTC with an extensive search for practice examples in the Setting "nursing home" in Germany. Afterwards we looked for interventions and their evaluation for residents as well as for employees in the field of international LTC. Conclusion: "Health promotion" is a central theme for the carers but what this means for the care receivers is rather unclear. There are a lot of examples for workplace health promotion, but not for the residents. It does not mean, that there are no activities in German nursing homes. The results suggest that health promotional activities for frail elderly living in nursing homes are not called health promotion, especially not, if these people are in need of care.

**PB7 389 IMPLEMENTING A NATIONAL LONG TERM CARE SYSTEM ON A UNIVERSAL BASIS: EXPERIENCE OF SPAIN.**

A. SALVA\* (Institute on Aging UAB, Barcelona, Spain)  
T. RIVERO(1), J. FERNANDEZ(2), X. ROJANO(1), A. CALLE(2) - (1) Institute on Aging UAB (Barcelona, Spain); (2) IMSERSO Ministry of Education, social policy and sport (Madrid, Spain)

Introduction: In 2007, a new long-term care system (LTCS) was implemented in Spain. This represents a major policy change to largely replace its regional means-tested systems for a national system with universal coverage for all population. Objective: We examine the Spanish LTCS, focusing on issues of eligibility and assessment, benefits, availability of services, and profile of recipients. Methodology: This study used ministerial data for 2007-2008 period collected from applicants to analyze the evolution of the system, and to compare gender, age, disabilities and diagnostics patterns of recipients. Results: The proportion of elders in applicants is 78.7%. Women elders represent the 53.7%. Dementia is the main diagnostic reported (7.9%) as a primary cause of chronic disabilities. There are six eligibility categories, which vary mostly by the number of problems with ADLs or IADLs. The proportion of eligible persons at any level of disability and at the highest level of disability is higher in the applicants with mental disabilities (98.6%; 48.6%) than physical disabilities (90.1%; 12.1%). Conclusion: Two years after implementation there remain controversial issues, including area variations on eligibility, difficulty of the assessment on people with mental disabilities, and encouraging further development on home care services. Future challenges include the promotion of functional independence on older people and early detection of dementia.

**PB7 390 THE INSTITUTIONALIZED PEOPLE HEALTH SURVEY OF CATALONIA: COMORBIDITY AND DISABILITY IN NURSING HOMES AND LONG TERM CARE HOSPITAL UNITS**

X. ROJANO\* (Institut de l'Enveliment de la Universitat Autònoma de Barcelona, Barcelona, Spain)  
P. BRUGULAT(2), L. COLL(1), E. SÉCULI(2), A. SALVÀ(1) - (1) Institut de l'Enveliment de la UAB (Barcelona, Spain); (2) Generalitat de Catalunya. Departament de Salut. (Barcelona, Spain)

INTRODUCTION: In Catalonia Health surveys exclude the 5% elderly people which are in long term care units (LTC) or in nursing homes (NH). The aim of this study is to describe and compare comorbidity and disability in these settings. METHODOLOGY: Population survey of elderly people (65 or older) hospitalized in LTC or living in NH in Catalonia. Stratified two-stage sampling, centre as primary sample unit. When the selected person had either cognitive or communication impairment, the information was gathered from a proxy worker. Morbidity was assessed with a list of diseases and the Charlson index. Disability was assessed with questions asking for degree of difficulty to perform activities and need of help, summarized in a Katz-like 6 activities scale, considering a person dependent for an activity when he was unable to do it or had high difficulties and needed help. RESULTS: 1379 participants (1042 NH and 337 LTC) with a mean age of 84.0years (84.3 and 82.2), 72% were women (73% and 64%). There were no differences between each type of centre on the average number of diseases (7.3), Charlson index (2.4), medications (5.6) and dementia (46.7%). MMS scores are worse in LTC among people with dementia (3.7 vs. 6.3) but also without (16.7 vs. 19.2). Once adjusted by age, sex does not affect the average number of disabilities, which increases with age, being greater in

LTC (4.0 vs. 2.8) for all age groups. Only 14% in LTC and 23% in NH are autonomous for all activities. Increasing of number of diseases affected disability both in NH and LTC, whereas Chalson index only did it in NH. CONCLUSIONS: The prevalence of disability is greater in LTC and NH than in the community. Number (and kind) of diseases explain better than the Chalson index the degree of disability.

**PB7 391 BODY MASS INDEX AND FUNCTIONAL IMPAIRMENT IN THE AGED WOMEN**

Y. SHEN\* (Kaohsiung Medical University, Kaohsiung, Taiwan)  
C. HSU(1), Y. CHEN(1), K. HUANG(2) - (1) Yuan's General Hospital (Kaohsiung, Taiwan); (2) National Taiwan University Hospital (Taipei, Taiwan)

**OBJECTIVES:** The main purpose of this study was to determine whether the degree of functional impairment related to body mass index (BMI) among the aged women. **METHODS AND MATERIALS:** A total of 62 apparently healthy Taiwanese women, aged 65-75 (mean age= 69.4±2.5) years, were recruited in 2008. Body mass index (BMI)(mean=27.5±3.4 kg/m<sup>2</sup>), waist circumference (WC)(84.3±3.7 cm), and body fat (32.1±1.7%) were measured. The participants were divided into 4 groups: Group I with normal BMI (<=23.99 kg/m<sup>2</sup>, n=15), Group II with overweight ( 24-26.99 kg/m<sup>2</sup>, n=15), Group III with first degree of obesity (27-29.99 kg/m<sup>2</sup>, n=16), and Group IV with second degree of obesity (BMI >=30 kg/m<sup>2</sup>, n=16). Activities of daily living (ADL) were measured with Barthel index. Functional impairment was defined when Barthel index was less than 80. The relationship between BMI, body fat, WC and ADL was examined using multivariate logistic regression analyses. **RESULTS:** The prevalence of abnormal BMI (BMI >=24 kg/m<sup>2</sup>) was 75.8% and the prevalence of ADL impairment was 61.29%, respectively. There was a strong association between levels of BMI and ADL impairment ( $P<0.001$ ). With increasing age, the ORs of having ADL impairment increased significantly (OR=1.35, CI=1.06-1.72). With increasing BMI (OR=3.04-4.51), the ORs of ADL impairment increased significantly. After adjustment for age, the ORs (2.59-17.78) of ADL impairment were significantly higher in subjects with abnormal BMI (BMI >=24 kg/m<sup>2</sup>). **CONCLUSIONS:** The present study revealed that overweight and obesity were related to ADL impairment in the female elderly. Therefore, weight reduction may alleviate the functional impairment in the obese elderly.

**PB7 392 CAUSES OF DECREASED ACTIVITY OF DAILY LIFE IN ELDERLY PATIENTS WHO NEED CARE OF DAILY LIVING**

H. YOSHINO\* (Kobe-university Graduate School of medicine, Kobe, Japan)  
T. SAKURAI(1), K. HASEGAWA(2), K. YOKONO(1) - (1) Department of Internal and Geriatric Medicine,Kobe University Graduate School of Medicine (Kobe, Japan); (2) Inamino hospital (Kobe, Japan)

**Introduction** The causes of decreased activity of daily life (ADL) in elderly patients include cerebrovascular disease, bone fracture by fall and dementia, all of which result from complicated or overlapped lifestyle diseases. Investigation on the risk factors of lifestyle diseases, therefore, would be helpful in reducing mortality and morbidity in this age group. Thus, the present study was conducted among elderly patients with decreased ADL who were hospitalized in nursing wards in order to investigate the causes of decreased ADL, and to determine precautionary measures against decreased ADL. **Patients and Methods** The study subjects were 224 elderly hospitalized patients with decreased ADL and 49 elderly outpatients with favorable ADL. According to medical record information provided by the families, the causes of decreased ADL, current age, age at the start of ADL decrease, medical history, BMI, and blood pressure were investigated. History of cigarette smoking was also taken. Data were expressed as mean±SE. Factors affecting age at the start of ADL decrease were analyzed by both simple and multiple linear regression analyses using StatView. ANOVA was used for analysis between groups. Results In the two groups with decreased ADL, the mean age of bedridden status of the diabetic group was significantly younger than that of non-diabetic group (77.6±5.9 vs 82.8±8.7 years,  $p<0.05$ ). In the diabetic group, cerebrovascular diseases were the major causes of becoming bedridden at a younger age. Multiple linear regression analysis revealed that sex, presence of diabetes mellitus and history of smoking were the factors determining the age of becoming bedridden. **Conclusions** This study showed that diabetes mellitus and smoking habit are independent risk factors of becoming earlier bedridden. Therefore, the major targets of medical care to prevent from decreased activity of daily life among elderly are the male.

**PB7 393 ASSESSMENT OF BODY COMPOSITION BY BIOELECTRICAL IMPEDANCE AND ANTHROPOMETRY IN ELDERLY IN-PATIENTS: EFFECT OF OEDEMA.**

D. LEBOIN\* (Hôpital Charles Foix, Saint Maurice, France)  
G. GOLMARD(2), R. RAYNAUD-SIMON(3) - (2) hôpital la pitié Salpêtrière (paris, France); (3) hôpital Bichat (paris, France)

**Objective.** To compare body composition assessment by bioelectrical impedance and anthropometry in elderly in-patients and to determine the effect of oedema on the correlations. **Methods.** Prospective study in a geriatric sub-acute care ward in a university-based hospital. In 80 consecutively admitted elderly patients, we recorded within 48 hours of admission: 1) age, body mass index (BMI) and plasma levels of albumin 2) clinical

evaluation of oedema 3) percentage of fat mass (%FM) by Multi-Frequency Bioelectrical Impedance Analysis (BI) 4) %FM by anthropometry using the SIRI formula including body density as assessed by the Durnin and Womersley equation relying on four skinfold measurements. Concordance was analyzed by the Bland and Altman test. **Results.** Patients were 83.7 ± 8.1 years old. Oedema was present in 15 patients (19 %) and was associated with higher BMI (27.9 ± 4.7 vs 23.4 ± 5.0 kg for patients with vs patients without oedema respectively;  $p = 0.003$ ) and slightly lower albuminemia (29.8 ± 3.9 vs 31.6 ± 5.1 g/L;  $p = 0.4$ ). Bland and Altman analysis showed a good concordance between BI and anthropometry in the 65 patients with no oedema. In opposition, concordance was poor in the 15 patients with oedema, with an error increasing with %FM. Conclusion. Body composition would be important to monitor in elderly malnourished patients undergoing renutrition. However, reliable and easily available techniques need to be validated in those populations. We show that %FM measurements by BI and anthropometry were concordant in elderly patients with no oedema but not in patients with oedema, representing 19 % of this population. Coupled measurements with different body composition assessment techniques may allow a more precise evaluation.

**PB7 394 WEIGHT LOSS AS AN INDEPENDENT PREDICTOR OF 3-MONTH MORTALITY IN HOSPITALIZED SUB-ACUTE CARE ELDERLY PATIENTS**

C. FORASASSI\* (Hôpital Charles Foix, Ivry/seine, France)  
A. NUYTTENS(1), J. GOLMARD(2), I. MYARA(1), A. RAYNAUD-SIMON(3) - (1) hôpital charles foix (ivry/seine, France); (2) hôpital pitié-salpêtrière (paris, France); (3) hôpital bichat (paris, France)

**Objective.** To determine the predictive value of weight loss for mortality in hospitalized sub-acute care elderly patients. **Methods.** Prospective study including 97 elderly patients consecutively admitted in three sub-acute care wards in a university-based geriatric hospital. Recorded data were: 1) At admission : age, sex, functional status (ADL), primary medical diagnosis, comorbidity (Charlson comorbidity index), Mini Nutritional Assessment (MNA), body mass index (BMI), and plasma levels of albumin, transthyretin, C-Reactive Protein (CRP) and orosomucoid. 2) Weight variation 14 days after admission 3) Death at 3 months. **Results.** Mortality at 3 months was 11%. Univariate analysis revealed that weight loss during 14 days after admission, transthyretin < 200 mg/L and MNA < 17 were significantly associated with an increase in the risk of death at 3 months. The logistic regression model retained only weight loss during 14 days after admission (HR = 1.512, [IC 95% 1.089 – 2.100];  $p= 0.0136$ ) as an independent risk factor for death. **Conclusion.** Weight loss during 14 days after admission is an independent risk factor of death in hospitalized sub-acute care elderly patients. This study shows the importance of immediate nutritional support at admission in sub-acute care.

**PB7 395 DIETITIANS SHOW MORE RESPECT TO THE ELDERLY- A QUALITATIVE RESEARCH**

P. WERNER\* (Haifa University, Haifa, Israel)  
O. STONE(1) - (1) Haifa University (Haifa, Israel)

**Introduction:** Obesity treatment in old age is a matter of dispute both physiologically (the weakening correlation between BMI, morbidity, and mortality as one ages) and behaviorally. On one hand there are claims about the difficulty of changing ones habits during old age, yet on the other hand the elderly person has more spare time to dedicate for changing his lifestyles. The aim of the study was therefore to explore and compare dietitians attitudes towards obesity treatment of the young vs. the elderly. In order to develop a research questionnaire a primary qualitative study was conducted. **Method:** Four focus groups were conducted, two in each of the two largest HMO's in Israel. The number of participants in each group was six on average (23 dietitians in total). One of the research questions (explored only in two groups) dealt with the dietitians attitude and interaction with a young vs. elderly obese patient. **Results:** Dietitians were unanimous that their treatment style was different between the young and the elderly obese individual. The difference is the result of the dietitians acknowledgement of the different needs of the elderly individual, and the sense of feeling that there is less pressure for immediate dietary results. Dietitians mentioned that they address the elderly patient more gently, with patience, huggingly, cheerfully, and respectfully. Moreover, dietitians brought up the importance of both personal and professional exposure to the world of ageing as something that influenced their way of treating the elderly patient. **Conclusion:** patients age influences the public dietitians practice skills while treating obesity. Dietitians have more respect to the elderly patient and therefore feel obliged to address him in the most proper way and in accordance with his needs.

**PB7 396 HOW HEALTHY IS THE DIET OF LONESOME PORTUGUESE ELDERLY?**

D. SANTOS\* (Rio de Janeiro State University , Nutrition Institute, Rio de Janeiro, Brazil)  
S. RODRIGUES(1), A. TRICHOPOULOU(2), M. DE ALMEIDA(1) - (1) Faculty of Nutrition and Food Sciences, Porto University (Porto, Portugal); (2) Department of Hygiene and Epidemiology, School of Medicine,University of Athens (Athens, Greece)

Diet assessment is a complex issue although crucial considering its relation to the wellbeing and health status of populations, especially elderly ones. The use of diet quality

indices may be helpful to understand determinants of food consumption and also serve as a surveillance tool. We used the revised Healthy Diet Indicator (HDIr), evaluating compliance to the WHO goals to assess the diet quality of Portuguese elderly living alone. Data was obtained from the Portuguese Household Budget Survey carried out by the National Statistic Institute to provide the data on food availability within the DAFNE Project. Elderly living alone (N=902 and 1161 in 1990 and 2000, respectively) were compared with adults and the entire sample. The HDI<sub>r</sub> was measured in those two time periods, in order to assess changes in the quality of the diet. Data will be presented as median, 10th and 90th percentile as well as the percentage of elderly with a low (<=4), intermediate (5-6) and high (>=7) HDI<sub>r</sub>. The differences between lonely elderly with a low HDI<sub>r</sub> (if their scoring were below national median) and the remaining households were analyzed by means of logistic regression. HDI<sub>r</sub> median of lonely elders was higher than the national average. The percentage of elders with low HDI<sub>r</sub> score decreased in time with a corresponding increase in intermediate and high scores. The proportion of elderly in the high score increased (8.8 vs. 9.0 across time) compared to adults living alone and to the entire population in both periods. The reverse occurred in adults and in the total sample. Our results show that the compliance to WHO recommendations was low in the general population. Elderly seem to be more aware of healthy eating as we observed an increase in the HDI<sub>r</sub> median compared with adults living in similar circumstances.

**PB7 397 BODY MASS INDEX AND WAIST CIRCUMFERENCE ARE ASSOCIATED WITH INCREASED PREVALENCE AND INCIDENCE OF LOWER BACK PAIN.**

M. KUMARI\* (UCL, LONDON, United Kingdom)

P. ZANINOTTO(1), C. DE OLIVEIRA(1) - (1) UCL (LONDON, United Kingdom)

**Introduction:** Obesity is positively associated with lower back pain in cross sectional analyses, however there is a lack of longitudinal studies that examine the association of anthropometry and lower back pain. Here we assess whether body mass index (BMI) and waist circumference predict lower back pain reporting in a national study of older men and women. **Methods and materials:** A prospective national cohort study of older English adults (the English Longitudinal Study of Ageing, ELSA). Body mass index and waist circumference were measured by a nurse at baseline in 1998, 1999 or 2001 (wave 0) and at follow-up in 2004 (wave 2) an average follow-up of 5 years. Assessments of lower back pain were made in 2002 (wave 1), 2004 and 2006 (wave 3). The number of participants varied between 5135 and 5806 (mean age 64 years, 55% women) depending on the analysis. **Results:** Women had a higher prevalence of lower back pain than men at wave 1. In both sexes the prevalence rates of severe and moderate back pain increased over time (between waves 1 and 2, waves 2 and 3 and waves 1 and 3) among those who were overweight and obese. Women also reported increased lower back pain at a lower threshold of BMI or waist circumference than men. Regression results show that in women, but not men, increased BMI and waist circumference (at baseline) is associated with higher odds of reporting lower back pain (at follow-up), after controlling for age. **Conclusions:** These findings suggest that increased BMI and waist circumference is associated with increased prevalence and incidence of reporting of lower back pain in older men and women.

**PB7 398 DOES NUTRITIONAL GUIDELINES ENSURE GOOD ROUTINES IN NUTRITIONAL CARE OF ELDERLY SUBJECTS WITH COMMUNITY SUPPORT?**

J. TÖRMÄ\* (Department of Public Health and Caring Sciences, Uppsala, Sweden)

M. SELLGREN(1), Y. MATTSSON SYDNER(2), B. KARLSTRÖM(2), M. CARLSSON(3), T. CEDERHOLM(4), A. SALETTI(4) - (1) Senior Citizens Office, Community of Uppsala (Sweden); (2) Department of Food, Nutrition and Dietetics (Sweden); (3) Department of Public Health and Caring Sciences (Sweden); (4) Clinical Nutrition and Metabolism (Sweden)

**Introduction:** Malnutrition and inadequate nutritional routines in elderly care are common. To develop guidelines is one option to achieve improvements in this area. The Community of Uppsala, the 4th largest city of Sweden, adopted nutritional guidelines in 2000 for elderly receiving community support. The aim was to investigate the knowledge and practical use of those guidelines. **Methods and materials:** All directors of department (n = 68), community chief nurses (n = 6), nurses (n = 155) and a number of the care staff (n = 266) were asked to answer a questionnaire about the guidelines. The questionnaire contained 13 questions. **Results:** Altogether 340 persons (69 %) answered the questionnaire. About half of the responders (52 %) were aware of the nutritional guidelines. Directors knew the guidelines to a greater extent than nurses and care staff. Barely half of the responders (45 %) answered that the guidelines were used in practice. Again, directors answered more frequently that the guidelines were used than the nurses and the care staff. Forty-four percent (44 %) knew about the sheet form, that is advocated for screening of nutritional problems, and 38 % answered that they had documented routines for nutritional care. Around 70 % had knowledge about 7 of the 15 different diets that should be available for the elderly. According to the guideline every care giver should have a dietician for nutritional support. Fifty-seven percent (57 %) of the directors, one third (33 %) of the nurses and 17 % of the care staff knew of this. About two thirds (62 %) of the responders wanted additional knowledge about nutrition in the elderly. **Conclusion:** The knowledge about the nutritional guidelines in community elderly care was scarce and

was seldom used in practice. More research is needed about how guidelines can best be implemented into practical use to achieve a substantial improvement in this area.

**PB7 399 COMMUNITY BASED PREVALENCE OF DIABETES MELLITUS 2 AMONG ELDERLY AND ASSOCIATION WITH HEALTH STATUS COMMUNITY BASED PREVALENCE OF DIABETES MELLITUS 2 AMONG ELDERLY AND ASSOCIATION WITH HEALTH STATUS**

K. VIEGAS\* (PUCRS, Porto Alegre, Brazil)

P. ENGROFF(1), G. DECARLI(1), C. SCHWANKE(1), I. DA SILVA FILHO(1) - (1) PUCRS (Porto Alegre, Brazil)

**INTRODUCTION:** Once Diabetes mellitus 2 (DM) became an important public health concern in the elderly, the aim of this study was to assess the prevalence of DM in the elderly population and its association with health status, and sociodemographic characteristics. **METHODS AND MATERIALS:** Prospective cross-sectional study of 424 elderly ( $\geq 60$  years) from a population-based sample (second phase of the Multidimensional Study of the Elderly in Porto Alegre/RS/Brazil - EMIPONA - that enrolled 1078 older persons). We considered health self-perception, physical activity, body mass index, depressive symptoms, and hospitalization at the last year to determine the health status. Individuals were classified for the presence of DM according to the criteria of the Sociedade Brasileira de Diabetes. Odds ratio (OR) with 95% confidence intervals were calculated to test the influence of different variables and logistic regression were also done. **RESULTS:** The sample mean-age was 71.7±7.8 years; 69.8% females; 83.4% Caucasian, 17.5% African-Brazilian; 39.1% widowers, 36.5% married; 56.9% had incomplete elementary education. The prevalence of DM was 25.7% (CI95: 21.8-30.1) 23.4% (CI95: 16.9-26.7) in males and 26.7% (CI95: 22-32) in females. Twenty percent of 108 elderly with DM did not know that they were diabetic. When health characteristics were compared between elderly with and without DM there were significant differences. DM group showed higher prevalence of hospitalizations ( $P=0.006$ ), depressive symptoms ( $P=0.011$ ) and regular health self-perception ( $P<0.001$ ). There was an inverse relation of the prevalence of DM and the level of education and a direct relation with the body mass index. **CONCLUSION:** We document a high prevalence of DM in the elderly population of Porto Alegre, one of the highest prevalences in Brazil.

**PB7 400 PREVALENCE OF METABOLIC SYNDROME IN THE ELDERLY**

C. LOPEZ\* (INCOR, Sao Paulo, Brazil)

**Introduction –** Currently, cardiovascular diseases are the leading cause of death worldwide, with high morbidity and low quality of life. Metabolic syndrome (MS) is represented by the joint occurrence of multiple risk factors of such diseases. Few data are known about its magnitude in the health of the elderly and the validity of diagnostic criteria used to measure its presence in this population. The objective of this review was to assess the prevalence of MS in the elderly population worldwide, according most widely used diagnostic criteria, as the National Cholesterol Education Program - Adult Treatment Panel III (NCEP-ATPIII), International Diabetes Federation (IDF) and the Organization World Health (WHO), identifying their differences. **Methods and materials –** Using the databases MEDLINE, LILACS-BIREME and SCIELO, the literature search included original articles, review articles and guidelines addressing the prevalence of MS in elderly published in the last ten years; was selected 50 articles. **Results –** The results suggest that MS increase its prevalence with age and tend to be more prevalent in women than in men of similar age. The IDF criteria suggests higher prevalence of values regardless of ethnicity, age or gender, probably by taking into account the lower values of waist circumference and blood glucose. Values were found between 10 and 39% prevalence of MS by NCEP-ATPIII criteria and between 14 and 69% with the IDF, new criteria that may be leading to an excess of individuals classified as carriers of MS. **Conclusions -** The diagnostic criteria for metabolic syndrome used until now can generate values very discrepant about the prevalence of SM in the elderly population. Specific criteria for this population should be considered by elucidative studies that can to improve the care of this population, the correct diagnosis of MS and the prevention of CVD, seeking longevity with quality of life.

**PB7 401 RELATION BETWEEN AGING AND SUPPRESSIVE EFFECT OF CANDESARTAN ON NEW-ONSET DIABETES : CASE-J TRIAL SUBANALYSIS**

T. OGIHARA\* (Osaka General Medical Center, Osaka, Japan)

A. FUJIMOTO(1), K. NAKAO(2), T. SARUTA(3) - (1) EBM Research Center, Kyoto University Graduate School of Medicine (Kyoto, Japan); (2) Department of Medicine and Clinical Science, Kyoto University Graduate School of Medicine (Kyoto, Japan); (3) Keio University School of Medicine (Tokyo, Japan)

**Introduction:** Since diabetes is a crucial risk factor for cardiovascular events, its prevention is very important in hypertensive patients. Candesartan was reported to significantly suppress the new-onset of diabetes compared with amlodipine in the CASE-J study. The incidence of new-onset diabetes was compared between the treatment groups after stratification according to age in this subanalysis. **Methods and Materials:** The relation between suppression of new-onset diabetes and aging was examined in high-risk hypertensive patients without diabetes who were registered in the CASE-J study (mean age: 63.7 years). **Results:** Of 2,685 high-risk hypertensive patients without diabetes, 1,343

patients were assigned to candesartan group and 1,342 patients were to Amlodipine group. In patients under 65 years old, the incidence of new-onset of diabetes was significantly lower in the candesartan group (5.7/1,000 patients years) compared with those in the amlodipine group (12.6/1,000 patients years). In patients aged over 65 years old, the incidence of new-onset diabetes was also lower in the candesartan group (11.5/1,000 patients years) compared with the amlodipine group (14.5/1,000 patients years), although the difference was not significant. Conclusions: Candesartan reduced the incidence of new-onset diabetes compared with amlodipine in high-risk Japanese hypertensive patients, but a significant difference was only observed in the patients aged under 65 years and not in those aged over 65 years.

**PB7 402 RELATIONSHIP BETWEEN POLYPHARMACY STATUS AND NUTRITIONAL STATUS IN ELDERLY PERSONS**

J. JYRKKÄ\* (University of Kuopio, Kuopio, Finland)

H. ENLUND(2), P. LAVIKAINEN(3), A. TUOVINEN(3), R. SULKAVA(4), S. HARTIKAINEN(3) - (2) Department of Pharmacy Practice, Kuwait University (Kuopio, Kuwait); (3) Kuopio Research Centre of Geriatric Care, University of Kuopio (Kuopio, Finland); (4) School of Public Health and Clinical Nutrition, University of Kuopio (Kuopio, Finland)

Introduction The impairments in physical health make elderly persons vulnerable to altered drug responses and changes in nutritional status. The aim of this study was to assess the relationship between the number of drugs in use and nutritional status. Methods and materials For the GeMS Study (2004-2007), a random sample of 1000 persons was drawn from the population of aged 75 years and older living in the city of Kuopio, Finland. They were allocated to two same-sized groups: intervention and control groups. A trained nurse and a physician collected the data on sosiodemographics, drug use, and nutritional status annually. This article included only home-dwelling elderly persons from control group. The analysis covered years 2005 (n=313), 2006 (n=293), and 2007 (n=274). The MiniNutritional Assessment (MNA) test was used to evaluate the nutritional status. Drugs were categorized in non-polyparmacy (0-5 drugs), polyparmacy (6-9 drugs), and excessive polyparmacy (10+ drugs) groups. Results In 2005, the non-polyparmacy group included 42% (n=132), polyparmacy group 37% (n=116), and excessive polyparmacy group 21% (n=65) of the participants. Nutritional status was the lowest in excessive polyparmacy group (mean MNA 23.2) compared with polyparmacy (24.1) and non-polyparmacy (25.6) groups ( $p<0.001$ ). At the end of follow-up, the respective scores were 22.7, 23.4, and 25.0 ( $p<0.001$ ). By using mixed model analysis, polyparmacy status ( $p<0.001$ ) was found to be a significant factor associated with decrease in nutritional status after adjusting for age, living alone, self-report health, IADL scores, and Barthel Index. Conclusion Polyparmacy status is a predictor of decline in nutritional status over a three-year period in elderly persons. Clinicians should pay more attention to maintaining adequate nutritional status in elderly persons with polyparmacy or excessive polyparmacy.

**PB7 403 AGE, BODY MASS INDEX AND MORTALITY A 42 YEAR FOLLOW-UP STUDY IN A GENERAL POPULATION.**

A. GULSVIK\* (University of Oslo, Oslo, Norway)

D. THELLE, M. MOWÉ, T. WYLLEN

**INTRODUCTION:** In the elderly a low body mass seems to be a strong predictor of death. Preclinical disease prior to baseline may confound the associations. We wanted to explore the association between body mass index (BMI ( $\text{kg}/\text{m}^2$ )) and total mortality when adjusting for possible confounders and sources of bias. **METHODS AND MATERIALS:** A random sample of 6811 Norwegians was invited to a longitudinal study in 1964. 5653 (84%) attended. The mean age was 47.5 years; range 22-75 years. 788 of these were 65-75 years. Mean follow-up time was 28 years. BMI was calculated from standardized measurements of body height and weight. Findings from complete clinical- and supplementary examinations were also recorded and information on time and cause of death was obtained after 42 years of follow up. **RESULTS:** In the elderly (age 65-75 yrs) the relative risk of death related to BMI was U-shaped, whereas in the youngest age group (20-44 yrs) the pattern was more linear. The highest mortality in the elderly was in the lower BMI category (<22.0) (adjusted Cox proportional Hazard Ratio (HR) 1.46, 95% Confidence Interval (CI) (1.08-1.72) compared to the BMI reference group (22.0-24.9). The pattern persisted after eliminating 72 months of early follow-up deaths. The unadjusted relative risk associated with the two upper BMI-groups (BMI 25-28  $\text{kg}/\text{m}^2$  and BMI  $\geq 28 \text{ kg}/\text{m}^2$ ) was 1.05 (95% CI 0.87-1.27) and 1.28 (95% CI 1.05-1.56) respectively. **CONCLUSION:** Obesity related risk of death diminishes with increasing age. BMI below 22.0 was a considerable risk factor of all cause mortality in the elderly in this population. More focus might be addressed towards the thinnest elderly.

**PB7 404 A NEW ENTERAL FORMULA SPECIFICALLY DESIGNED FOR THE ELDERLY: AN EXPERIMENTAL STUDY IN THE AGED RAT**

A. RAYNAUD-SIMON\* (Hôpital Bichat APHP, Paris, France)

M. KUHN(1), J. MARC(1), J. MOULIS(1), L. CYNOBER(1), C. LOI(1) - (1) Biological Nutrition Laboratory, EA 2498, Faculty of Pharmacy, Paris – Descartes University (Paris, France)

Introduction. A new formula was designed specifically for the nutritional support of tube-fed elderly patients (elderly-specific formula, ESF, Nestlé Clinical Nutrition). This formula is slightly hyperproteic, the proteins employed are mainly whey proteins. For glycemic control, it is supplemented with fructose, chromium and fiber. We tested it against a standard formula (Sondalis® Iso, SI, Nestlé Clinical Nutrition) in sixteen 22-month-old Sprague Dawley rats fed by total continuous enteral infusion via gastrostomy for 7 days. Methods. Body weight, stool weight and nitrogen balance were measured daily. After sacrifice, we also measured muscle weight, plasma levels of amino acids, glucose, insulin, albumin and fibrinogen, and tissue protein and amino acid content. Results. The ESF limited weight loss ( $-7 \pm 8 \text{ g}$  vs  $-30 \pm 7 \text{ g}$ ;  $p = 0.04$ ), improved cumulative nitrogen balance ( $556 \pm 102$  vs  $251 \pm 64 \text{ mg}$ ,  $p = 0.02$ ), and increased jejunum protein content ( $79 \pm 3$  vs  $54 \pm 5 \text{ mg}/10 \text{ cm}$ ,  $p = 0.0008$ ). Plasma levels of threonine, leucine, isoleucine and the sum of total amino acids were higher in ESF-fed than SF-fed rats ( $p < 0.05$ ). Threonine and isoleucine content in the soleus and gastrocnemius were also higher in ESF-fed than SF-fed rats ( $p < 0.05$ ). The ESF improved intestinal transit (7 days stool weight  $25 \pm 2 \text{ g}$  vs  $9 \pm 1 \text{ g}$ ,  $p = 0.0001$ ). Conclusions. The new formula benefited nutritional status of old rats more than a standard formula. Clinical studies are now required to test this formula in elderly patients.

**PB7 405 METABOLIC SYNDROME IN OLDER SUBJECTS: COINCIDENCE OR CLUSTERING?**

M. BO\* (SCDU Geriatria, ASO San Giovanni Battista, Molinette, Torino, Italy)

A. SONA(1), M. ASTENGO(1), A. BRESCIANINI(1), M. COMBA(1), G. FONTE(1) - (1) SCDU Geriatria, Dipartimento Discipline Medico-Chirurgiche, ASO San Giovanni Battista, Molinette (Torino, Italy)

**INTRODUCTION** The prevalence of the metabolic syndrome (MS) increases with aging. Aging per se is associated with increased prevalence of most of the abnormalities contributing to the MS. Whether MS in older people consistently identifies a true pathophysiological entity or a casual aggregation of aging-associated metabolic abnormalities, remains to be elucidated. We aimed to evaluate whether in older subjects the aggregation of metabolic components of the MS, as defined by the National Cholesterol Education Program Adult Treatment Panel III (NCEP-ATP III), is consistent with a single latent variable. **METHODS AND MATERIALS** Age, waist circumference, systolic and diastolic blood pressure, metabolic variables were determined in 152 older (>70 years), non-diabetic, healthy men. Cronbach alpha was used to assess the internal consistency of the components of the MS. Structural equation modeling, using the Normed Fit Index (NFI), the Root Mean Square Error of Approximation (RMSEA), the Comparative Fit Index (CFI), and the Tucker-Lewis Index (TLI) was used to assess the fit to a model with a single latent variable. **RESULTS** The Cronbach alpha test showed low internal consistency among the metabolic variables ( $\alpha = 0.31$ ). The calculated X<sub>2</sub> values were 28.31 and 32.52 for model entering hypertension as dichotomous variable and for model entering blood pressure values, respectively, both expressing low fit to a model with a single latent variable. In both models, CFI (0.41 and 0.55), NFI (0.59 and 0.55), RMSEA (0.25 and 0.22) and TLI (0.31 and 0.12) scores showed a low fit of the metabolic alterations to a single latent variable. **CONCLUSION** These findings suggest caution in making diagnosis of MS at older ages, since metabolic and cardiovascular abnormalities being extremely common in elderly people, do not appear to cluster together under a single common factor.

**PB7 406 SYMPTOMATIC HYponatremia SECONDARY TO UNKNOWN HYPOPItuitaRISM**

V. CURIALE\* (E.O. Ospedali Galliera, Genova, Italy)

A. RUELLE(1), C. PRETE(2) - (1) E.O. Ospedali Galliera, Neurosurgery (Genova, Italy); (2) E.O. Ospedali Galliera, Geriatrics (Genova, Italy)

Introduction: Hypopituitarism is often overlooked in the elderly. Its symptoms are protean and overlapping with those of aging. Methods and materials: A 78-year-old man came to observation for the incidental finding of a pituitary mass on contrast-enhanced CT performed for psychomotor and gait impairment, and hypoxemia. Anamnesis was remarkable for an ischemic stroke and he was currently on warfarin and flecainide for atrial fibrillation. The neurosurgeon judged the pituitary lesion as an intrasellar macroadenoma (diameter 14 mm) and advised morphological follow-up. The patient looked pale and had hypotension. Results: Pituitary function assessment revealed a global anterior hypopituitarism: reduced LH: 0.88 IU/L and FSH: 1.1 IU/L levels with markedly reduced testosterone levels: 0.2 ng/ml, normal PRL levels, low-normal FT4 levels: 0.9 ng/dl (0.89-1.76) and reduced FT3 levels: 1.97 pg/ml (2.3-4.2) with appropriately normal TSH levels: 1.4 microIU/ml, and reduced cortisol levels: 3.8 microg/dl (8-25). Severe hyponatremia (119 mEq/L) coexisted. Replacement therapy was started with cortisone acetate 37.5 mg/day with significant overall clinical improvement, and normalization of sodium levels (141 mEq/L). Subsequently, L-tiroxine (50 microg/day) was started. Conclusion: The patient showed pituitary macroadenoma and cerebrovascular disease, both possibly able to induce hypopituitarism. A cohort of multifaceted symptoms usually related to aging, may, although rarely, be secondary to hypopituitarism. Hyponatremia due to cortisol deficiency and hence to hypersecretion of vasopressin, is quite a common biochemical finding, able to cause severe neurological symptoms. An early and appropriate hormonal replacement therapy of hypopituitarism is able, also in

the elderly, to improve significantly the clinical condition and to normalize the electrolytic abnormalities.

**PB7 407 SENILE LOCAL EYE AMYLOIDOSIS ASSOCIATED WITH AGE-RELATED MACULAR DEGENERATION**

V. ERMILOV\* (Volgograd Medical University, Volgograd, Russian Federation)

Age-related macular degeneration (AMD) is the leading cause of blindness and the pathogenesis of the condition is largely unknown. AMD is characterized by the accumulation of extracellular deposits, termed drusen, between the retinal pigmented epithelium (RPE) and the choroid. Widespread drusen deposition is associated with retinal pigmented epithelial cell dysfunction and degeneration of the photoreceptor cells of the neural retina. The appearance of amyloid in eye tissues is related with development of some gerontoophthalmological diseases. They make it possible to see in a new light the problem of eye amyloidosis, as well as its place among different forms of amyloidosis known to us as of now. Histological, histochemical, and electron microscopic studies of the fundus oculi tissues in 111 eyes with AMD revealed amyloid in the drusen Bruch's membrane, and between the basal membrane of the RPE and the internal collagen layer of Bruch's membrane in the center of the fundus oculi. The detected amyloid incorporations are referred to senile amyloidosis and reliably differ from amyloid in generalized amyloidosis. Comparative analysis of morphologic changes in tissues of the macular and paramacular areas of the fundus oculi and of the incidence of amyloid incorporations in them permit us to propose that accumulation of local senile amyloid is conducive to development and aggravation of AMD. A relationship between the degree of RPE degeneration and accumulation of amyloid in the fundus oculi was revealed. Ultrastructural studies of Bruch's membrane in the macular region have shown that amyloid fibrils are localized in inner collagenous zones of Bruch's membrane with fragments of degrading RPE cells closely attached to them. The authors put forward a hypothesis of the pathogenesis of some stages of AMD, in which the principal role in the formation and deposition of abnormal protein, amyloid, is played by

**PB7 408 THE INFLUENCE OF RACE AND INCOME ON HEALTH-RELATED QUALITY OF LIFE AMONG OLDER DIABETICS AND NON-DIABETICS**

J. MCDONALD\* (University of the District of Columbia, Washington, DC 2008, United States)

Y. WANG(2) - (2) Montclair State University (Montclair, NJ, United States of America)

Racial/ethnic differences and socioeconomic status are often associated with health disparities (Crimmins, Hayward and Seeman, 2004). Type 2 diabetes is more prevalent among persons in lower economic groups (Connolly, Unwin, Bilois , and Kelly 2004) and among various ethnic minorities (Winkleby and Cubbin, 2004). A secondary analysis of the Behavioral Risk Factor Surveillance System 2007 (BRFSS) was conducted in order to determine the influence of race and income on health-related quality-of-life among older diabetics and non-diabetics. Respondents selected for this study were 65 years old and above and diagnosed with diabetes by doctors (N=604). A contrast group were older non-diabetics (N=2,116). Three variables were used to test HRQOL, namely, general health self-reported by older adults, and the number of days that respondents' physical or mental health was not good during the past 30 days. Data analysis included descriptive statistics and regression models were tested for the impact of physical exercise on the QOL among older diabetics. The Statistical Analysis System (SAS 9.1) software was utilized to analyze data in this study. The results of chi-square showed no significant difference of the racial components between older diabetics and non-diabetics ( $p=0.06$ ), while the household income was found significantly different between two groups ( $p<.001$ ). A series of regression models revealed that the level of household income had significant positive impact on older adults' HRQOL variables and their general life satisfaction ( $p<.01$ ). The race variable had no significant influence any of the HRQOL variables and life satisfaction among older diabetics ( $p>.05$ ). Additional research is needed to understand the influence of socioeconomic status on health behaviors and outcomes and concomitant health promotion strategies for minimizing health disparities.

**PB7 409 ASSOCIATION OF NUTRITIONAL STATUS AND HEALTH RELATED QUALITY OF LIFE AMONG OLDER INPATIENTS WITH DELIRIUM**

M. LAAKKONEN\* (University of Helsinki and City of Helsinki, Health Center, Laakso Hospital, City of Helsinki, Finland)

J. LAURILA(2), T. STRANDBERG(3), R. TILVIS(4), K. PITKÄLÄ(5) - (2) Clinics of Internal Medicine and Geriatrics, Helsinki University Hospital (Finland); (3) University of Oulu, Institute of Health Sciences/Geriatrics, (Finland); (4) University of Helsinki, Department of General Internal Medicine and Geriatrics (Finland); (5) University of Helsinki, Department of General Practice, Finland (Finland)

Introduction: The association of older patients' nutritional status and health-related quality of life (HRQoL) has as yet received limited attention in scientific literature. We studied the relationship between nutritional status and HRQoL among old inpatients with delirium. Material and methods: Our cohort consisted of inpatients (N=170). All participants were diagnosed with delirium according to the DMS-IV, and all underwent baseline assessment for their nutritional status with the Mini-Nutritional Assessment (MNA) and for their

HRQoL with the 15D index including 15 dimensions for HRQoL (mobility, vision, hearing, breathing, sleeping, eating, speech, elimination, ADL, mental function, discomfort and symptoms, depression, distress, vitality and sexual activity). In 15D a difference of 0.02-0.03 is considered clinically meaningful. In the analyses sexual activity was omitted because frequent lack of responses, and HRQoL index was compared between the MNA groups. Results: The mean age of the patients was 83 years, and 31% were diagnosed with prior dementia. Patients were classified into three groups according to their MNA- score: 1) malnourished <17 (N=49), 2) at risk for malnutrition 17-23.5 (N=101) and 3) well-nourished > 23.5 (N=20). Well-nourished patients showed significantly better HRQoL (mean 15D index 0.789) compared with those at risk for malnutrition (mean 0.697) or with those malnourished (mean 0.653) ( $p<0.001$  for both). There were significant differences between the MNA groups in several 15D dimensions: mobility ( $p<0.001$ ), vision ( $p=0.013$ ), sleeping ( $p=0.003$ ), and ADL ( $p<0.001$ ). Even omitting the items measuring similar 15D dimensions (mobility, eating), the difference between MNA groups was significant. Conclusions: Nutritional status assessed with the MNA is significantly associated with HRQoL among older inpatients with delirium. The results emphasize adequate nutritional care also from the HRQoL viewpoint.

**PB7 410 PROSPECTIVE EVALUATION OF TOLERANCE OF UPPER GASTROINTESTINAL ENDOSCOPY IN 70+ YEAR OLD PATIENTS**

C. COLLIARD\* (CHU Nantes, Nantes, France)

L. DE DECKER(1), M. BERLIOZ-THIBAL(1), V. OULD AOUDIA(1), G. BERRUT(1) - (1) CHU (Nantes, France)

Introduction In recent years, there is a increase in the use of upper gastrointestinal endoscopy. For elderly population, the comfort of this investigation is significant. The tolerance of esophagogastrroduodenoscopy in the 70+ year old elderly was evaluated in a prospective study of patients undergoing endoscopic examination. Methods This study took place in 2008 in a geriatric unit of Nantes teaching hospital. Each patient was asked if they agreed to repeat the examination under the same conditions: it was our main criterion of tolerance. Tolerance was assessed with a 100mm visual analogue scale (VAS) too. Five specific items (secondary criteria) were assessed: pain, anxiety, nausea, discomfort, sensation of choking. Results 30 patients were included, 19 women and 11 men. The medium age of the patients, was 84.3 years old. The main indications for endoscopy were anorexia and/or weight loss and iron deficiency anemia. The tolerance was good since 20 patients (60%) would have agreed to repeat the procedure. No complication occurred related to endoscopy. 16 out of 30 patients (53.3%) did not suffer any pain (medium VAS: 2.36/10). 20 patients (66.7%) did not feel any sensation of choking (medium VAS: 1.44/10) 18 patients (60%) did not feel nausea (medium VAS: 2/10). 16 patients (53.3%) were not anxious (medium VAS: 2.7/10). This study showed that there tolerance was significantly linked to each secondary criteria ( $p<0.05$ ), i.e. when patients refused to repeat the procedure, it was linked to strong pain, high level of anxiety, important feeling of nausea or suffocation. Conclusion The present study showed that uppergastrointestinal endoscopy in the elderly is well tolerated. There tolerance was significantly linked to pain, anxiety, nausea and suffocation. However, a reflexion ethic remains necessary for every old patient for these investigations.

**PB7 411 ASSOCIATION OF WAIST-TO-HEIGHT RATIO WITH INDICATORS OF OBESITY AND METABOLIC RISK FACTORS AMONG MIDDLE-AGED AND OLDER ADULTS IN RURAL AREAS**

Z. YASSIN\* (Universiti Putra Malaysia, Serdang, Malaysia)

F. ARSHAD(1), N. A. KARIM(2), R. MOHD YUSOF(3), N. ABDUL GHANI(3), H. ABU SAAD(3), A. ABDUL RAHMAN(4) - (1) International Medical University (Kuala Lumpur, Malaysia); (2) Universiti Kebangsaan Malaysia (Kuala Lumpur, Malaysia); (3) Universiti Putra Malaysia (Malaysia); (4) Cyperjaya University College of Medical Sciences (Malaysia)

Obesity is a growing global problem and is increasingly recognized as an important risk factor for cardiovascular diseases (CVD) and other metabolic risks. Waist-to-height ratio (WHtR) can be used to assess central fat distribution and to identify those at increased risk for metabolic disorders. This paper will present the association of waist-to-height ratio with indicators of obesity and metabolic risk factors among older adults (40+ years) from selected rural areas in Malaysia. The sample consisted of 3747 subjects (men=1378; women=2369). Information on demographics and health characteristics were collected using a questionnaire during face-to-face interviews. Height, weight, waist circumference (WC) and hip circumference (HC) were measured using standard procedures and appropriate instruments. Blood samples were collected after 8 to 10 hours of overnight fasting and analysed using the Chemical Analyser (Hitachi 902). WHtR>0.5 was the cut-off value to indicate increased risk for central obesity. The results showed that 80.3% of the subjects were classified with central obesity, representing 75.2% of men, 83.3% of women, 81.4% of older adults (>60 years) and 61.6% of those in the normal BMI range. Based on five metabolic risk factors, 27.8% were without any risk factors while 11.9% had three or more risk factors. The prevalence of metabolic risks were significantly higher among those with WHtR>0.5. Height and weight correlated negatively with age, while WHtR correlated positively with age. WHtR successfully identified 98.4% and 96.8% of overweight men and women, respectively. WHtR can provide a simple and practical indicator to identify metabolic risks among middle-aged and older adults. The usefulness

of this indicator needs to be confirmed among the Malaysian population through future studies among different age and ethnic groups, gender and strata.

**PB7 412 CHRONIC DISEASE AND CONDITIONS ASSOCIATED WITH BMI IN A POPULATION OF OLDER ADULTS LIVING IN THE AUSTRALIAN COMMUNITY.**

J. KELLETT\* (University of Sydney, Lidcombe, Australia)

J. PYUN(1), K. BROCK(1), M. FIATARONE-SINGH(1), A. BUNDY(1), R. CUMMING(2), R. CANT(1), L. CLEMSON(1) - (1) University of Sydney (Lidcombe, Australia); (2) University of Sydney (Concord, Australia)

Introduction: People with malnutrition can be overweight as well as underweight and may have serious chronic diseases and conditions irrespective of their weight status. We investigated predictors of malnutrition in a free living community of elderly (mean age  $83 \pm 4.3$ ) living in Sydney, Australia. Methods: In 2006-8 a falls prevention randomized controlled trial was conducted in a volunteer sample of 317 community-dwelling elderly. Anthropometric data were individually measured including height and weight. Self-reported baseline data included demography (age, gender, marriage status, socio-economic status), medical conditions (including hip fracture, falls, diabetes, coronary heart disease (CHD), arthritis, current medications). Respondents were classified into BMI categories slightly deviating from the international standards because of the age of the population. Results: In this population 15 % were underweight 40% overweight 18% obese and 10 % very-obese. High-BMI was associated with younger age, less education and being female. The very obese group had a significantly higher risk of having diabetes ( $OR=3.5$  CI=1.4-8.4), knee arthritis ( $OR=3.6$  CI=1.6-8.2) and CHD ( $OR=2.7$  CI=1.2-6.3) compared with the other groups. In contrast, those who were underweight had a significantly higher risk of having a hip fracture ( $OR=3.7$  CI=1.2-11.3). Contrary to expectations there was no association with the chronic diseases and conditions in the overweight group. Conclusion: In conclusion, these data pinpoint a need to further evaluate the real and important risks of being overweight or obese in the elderly.

**PB7 413 IS STATIN THERAPY REALLY FAVORABLE FOR THE HOSPITALIZED VERY OLD SUBJECTS?**

C. LAGUILLIER\* (Hôpital Charles Foix, Ivry-Sur-Seine, France)

I. PEYRON(2), C. DICHAMP(1), A. LAHLOU(3), C. COTTART(1), J. BEAUDEUX(1), V. NIVET(1) - (1) Department of Clinical Biochemistry (Ivry-Sur-Seine, France); (2) Department of Pharmacy (Ivry-Sur-Seine, France); (3) Department of Gerontology 2 (Ivry-Sur-Seine, France)

Objectives: cardiovascular diseases are the first cause of mortality in the world and hypercholesterolemia is mainly implicated. A preventive treatment with statins is recommended in France to control plasma cholesterol level in subjects under 80. The aim of our study was to analyze blood lipid levels in old hospitalized patients receiving a statin therapy in a geriatric hospital. Methods: during a one day survey, the lipid status was established in 136 hospitalized patients taking a statin (48M, 88F, age:  $81 \pm 10$  years), by measuring total cholesterol, triglycerides, low- and high-density lipoprotein cholesterol (LDL-C, HDL-C). The serum albumin informed about the nutritional status. Results: 44% presented a hypocholesterolemia and 2% a hypercholesterolemia. Among the hypocholesterolemic patients, indications of the statin treatment were: cerebral vascular complications (35%), cardiac and/or vascular disease (29%), complicated diabetes (18%), other (history of hypercholesterolemia, not found indication: 17%). On these patients, 47% were malnourished, 100% had a LDL-C <2.6mmol/L (1g/L) and 67% had a HDL-C <1.0mmol/L (0.4g/L). Discussion/Conclusion: the benefit of a cardiovascular prevention has been demonstrated for the subjects from 70 to 80 years but not for the subjects after 80. Taking account of histories and risk factors of this population, therapeutic objectives in term of LDL-C lowering are reached. However more than half of the hypocholesterolemic patients presented a weak concentration of HDL-C which has been reported as a vascular risk factor in the under 80 years-old patients and may then modify the benefit/risk balance of the therapy. Since published data concerning comorbidity and mortality of hypocholesterolemia in the elderly are controversial, our study asks the question of the relevance of a statin prescription to the subjects more than 80 with multiple medication, especially in case of malnutrition.

**PB7 414 PREVALENCE OF GASTROINTESTINAL SYMPTOMS AND ASSOCIATION WITH CLINICAL AND FUNCTIONAL CHARACTERISTICS IN ELDERLY**

G. CREPALDI\* (National Research Council, Padova, Italy)

M. NOALE(1), A. PILOTTO(2), M. FRANCESCHI(2), G. PARISI(3), S. MAGGI(1) - (1) CNR, Institute of Neuroscience, Padua Section (Padova, Italy); (2) Department of Medical Sciences, Geriatric Unit, IRCCS (San Giovanni Rotondo (FG), Italy); (3) Internal Medicine Department, General Hospital (Feltre (BL), Italy)

Introduction The aim of the study was to evaluate the prevalence of the upper gastrointestinal symptoms and their association with functional and clinical characteristics in elderly outpatients in Italy. Methods and materials: The study was carried out by general practitioners in elderly outpatients. By using a structured interview, data on age, gender, education, Body Mass Index (BMI), smoking-alcohol-coffe use, functional status

according to Barthel-ADL, concomitant diseases and therapies were recorded. The UGISQUE (Upper GastroIntestinal Symptom Questionnaire for the Elderly), a validated tool including 15 items divided into five symptom clusters: A)abdominal pain; B)reflux syndrome; C)indigestion syndrome; D) bleeding; E)nonspecific symptoms (anemia, anorexia, weight loss, vomiting, dysphagia), was used. Chi-square and Fisher test, GLM procedure, Cochrane-Armitage test for trend and logistic regression were considered. Results: 3,100 subjects (M=1,547, F=1,553, mean age=72.2+6.2) were included in the analysis. The overall prevalence of upper gastrointestinal symptoms was 43.0%, cluster A)=13.8%, B)=21.8%, C)=30.2%, D)=0.3%, E)=5.7%. Patients with symptoms were significantly older ( $p=0.05$ ) and disable ( $p<0.0001$ ) than subjects without symptoms. Significantly higher BMI ( $p=0.0005$ ) and more concomitant diseases ( $p<0.0001$ ) and therapies ( $p<0.0001$ ) were observed in symptomatic vs non-symptomatic subjects. Logistic regression analysis demonstrated that female sex ( $OR=1.78$ ), disability ( $OR=2.13$ ), BMI ( $OR=1.07$ ), upper and lower gastroenterological ( $OR=8.44$ ;  $OR=2.93$ ,respectively), psychiatric ( $OR=1.80$ ),respiratory ( $OR=1.57$ ) and heart diseases ( $OR=1.54$ ) were significantly associated with upper gastrointestinal symptoms. Conclusions: Female sex, disability and obesity are significantly associated with upper gastrointestinal symptoms. Other than gastroenterological diseases, psychiatric, respiratory and heart disorders were also associated with symptoms.

**PB7 415 FRUIT INTAKE INFLUENCES BONE MINERAL DENSITY (BMD) AMONG JAPANESE MIDDLE-AGED AND ELDERLY**

F. ANDO\* (Aichi Shukutoku University, Nagoya, Japan)

T. IMAI(1), R. OTSUKA(2), Y. KATO(2), Y. MATSUI(3), M. TAKEMURA (3), H. SHIMOKATA(2) - (1) Tokaiagaku University (Nagoya, Japan); (2) National Institute for Longevity Sciences, National Center for Geriatrics and Gerontology (Obu, Japan); (3) National Center for Geriatrics and Gerontology (Japan)

Introduction: The purpose of the present study was to evaluate the effects of fruit and/or carotenoid intakes on BMD among the middle-aged and elderly. Methods and materials: The subjects were the participants in the NILS-LSA (National Institute for Longevity Sciences-Longitudinal Study of Aging), a population-based study for aging and age-related changes. The participants were examined biannually. The cumulative number of the participants from the first to the fourth wave examination was 7203, aged from 40 to 79 at the first visit. Fruits and carotenoid intakes were estimated by 3 day weighed dietary records based on the Standard Tables of Food Composition in Japan (the 5th revised and enlarged edition). BMD was measured at 8 sites of the body using dual energy X-ray (DXA) and peripheral quantitative computed tomography (pQCT). The relationships of fruit and carotenoid intakes with BMD were evaluated by sex using mixed effect model controlled for age, BMI and auto-regression (SAS 9.1.3). The statistical significance was set of  $p<0.01$ . All procedure was approved by the Committee of the Ethics at the NCGG. Results: As fruit intake increased, BMD at site of total body ( $p=0.0001$ ), lumbar spine ( $p=0.030$ ), femoral trochanter ( $p=0.0002$ ) by DXA, as well as D100 ( $p<0.0001$ ) and P100 ( $p=0.0005$ ) by pQCT increased significantly among females. As for males, fruit intake influenced positively BMD at site of total body, lumbar spine, femoral trochanter by DXA and D50, D100 and P100 by pQCT. Carotenoid intakes showed no significant relationship with BMD among both of males and females. Conclusion: Fruit intake, or life-style related fruit intake, may have some benefits on maintaining BMD among the middle-aged and elderly.

**PB7 416 OBESITY AND PHYSICAL FUNCTIONING IN THE ENGLISH LONGITUDINAL STUDY OF AGEING (ELSA)**

C. DE OLIVEIRA\* (University College London, London, United Kingdom)

M. KUMARI(1), P. ZANINOTTO(1) - (1) University College London (London, United Kingdom)

Introduction: The prevalence of obesity is increasing across the age spectrum even in the oldest age groups. In England, more than half of all adults are currently classified as overweight or obese. The aim of this longitudinal study was to assess whether excess body weight and raised waist circumference affected physical functioning in older persons living in England. Methods and materials: The study population consisted of 3681 participants aged 60 and older (mean age 71 years) who took part in three waves (2002, 2004 and 2006) of the English Longitudinal Study of Ageing (ELSA), a prospective national cohort study of people aged 50 years and over. The outcome measures included a self-reported physical function measure namely activities of daily living (ADLs) and an objective physical function test namely gait speed which involved timing how long it took to walk a distance of eight feet. Measurements were collected during the three waves. The main independent variables were body mass index (BMI) and waist circumference. Multiple regression analyses were used to investigate the effects of both BMI and waist circumference on physical functioning. Results: Among overweight men and women and obese women, mean walking speed decreased significantly from Wave 1 to Wave 3 (i.e. poorer mobility functioning). Similarly, regression results show that both men and women in higher BMI ( $OR=1.50$ ; 95% CI = 1.30-1.70;  $p<0.001$ ) and waist circumference ( $OR=1.06$ ; 95% CI = 1.00-1.12;  $p<0.040$ ) categories were more likely to report poorer physical function according to the ADL measure. Conclusions: The findings suggest that excess body weight and raised waist circumference were associated with a decline in

physical functioning in older men and women. The increasing numbers of overweight and obese older people is likely to create a strain

**PB7 417 FRUIT AND VEGETABLES AND COGNITIVE FUNCTION: PRELIMINARY RESULTS FROM THE SU.VI.MAX2 STUDY**

S. PÉNEAU\* (Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1, Montpellier, France)  
P. GALAN(2), C. JEANDEL(1), S. HERCBERG(2), M. FERRY(2), E. KESSE-GUYOT(2) - (1) Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1 (Montpellier, France); (2) INSERM, U557 ; INRA, U1125 ; CNAM ; Univ Paris13 ; CRNH IdF (Montpellier, France)

**Introduction** Hypotheses suggest that intake of fruit and vegetables (FV) may protect from age-related cognitive impairment. We aimed to study the association between these dietary factors and cognition assessed 13y later, in a preliminary analysis of the on-going Supplementation with Antioxidant Vitamins and Minerals 2 (SU.VI.MAX2) study. **Methods** The SU.VI.MAX study (1994-2002) included 12,741 middle-aged adults and aimed at testing the impact of antioxidant nutrients on chronic diseases risk. Subjects were invited to complete 24-hour dietary records. After the intervention, about 7,200 participants accepted to take part in the SU.VI.MAX2 study launched in 2007. Subjects participated in a clinical examination including several cognitive tests: Mini Mental State Examination (MMSE), "5 words test" and self-reported Cognitive Difficulties Scale (CDS). The relation between cognitive impairment and food intake was assessed by logistic regression analysis. Results Preliminary analyses included 1,462 men and 1,204 women, aged 64±5 years at the time of cognitive evaluation. After adjustment for covariates, MMSE impairment was associated with a low intake of FV ( $OR=Q4versusQ1=0.71[0.49-1.01]$ ), of vegetables ( $OR=0.69[0.49-0.97]$ ), of FV folate ( $OR=0.63[0.44-0.89]$ ) and of FV vitamin C ( $OR=0.60[0.43-0.85]$ ), in men. "Five word" test impairment was associated with FV folate ( $OR=0.64[0.44-0.93]$ ), in women. **Conclusion** According to these preliminary results, cognitive impairment was less frequent among elderly having a high fruit and vegetable intake assessed 13 years earlier. We thank the volunteers and the clinicians who carried out the clinical examination. This work was granted by ANR (n° 05-PNRA-010), DGS (Ministry of health) and supported by Mederic, Ipsen and Pierre Fabre.

**PB7 418 GLYCEMIC CIRCADIAN RHYTHMICITY IN ELDERLY WITH DIABETES**

A. TERMINET\* (Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1, Montpellier, France)  
R. DURANT(1), J. COURREGE(2), J. LAFAILLIE(3), A. AVIGNON(4), C. JEANDEL(1) - (1) Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1 (Montpellier, France); (2) Centre Hospitalier Narbonne (Montpellier, France); (3) Biostatistics Department, Arnaud de Villeneuve Hospital, CHU Montpellier (Montpellier, France); (4) Service de médecine métabolique, CHU Montpellier (Montpellier, France)

**Introduction:** Diabetes in the elderly is characterized by a lack of increase in hepatic glucose output during the dawn period. Glucose profiles in the elderly are therefore likely to be different from those described in younger subjects. The objective of this preliminary study was to determine glucose profile in a diabetic population of elderly treated with oral antidiabetic medication only. **Research design and methods :** We selected 16 type 2 diabetic subjects over 70 years old treated with antidiabetic medication only. Glucose profiles were obtained using a continuous glucose monitoring system (Guardian RT™, Minimed) during 12 to 72 hours. Drug therapy and nutrition were stable during monitoring. Increase in preprandial glycemia was estimated using linear mixed model. **Results :** Subjects were  $80.5\pm4$  years old, with a mean diabetes duration of  $9.4\pm7.7$  years, a BMI of  $27.5\pm6.5\text{kg/m}^2$  and a HbA1c of  $7.3\pm1.4\%$ . An increase in preprandial glycemia during daytime (7h:  $1.31\pm0.36\text{g/l}$ ; 12h:  $1.46\pm0.52\text{g/l}$ ; and 19h:  $1.47\pm0.57\text{g/l}$ ) with a maximum attained at midnight ( $1.48\pm0.45\text{g/l}$ ,  $p=0.018$ ) was observed. During nighttime (0h-7h), glycemia decreased continuously ( $0.047\text{g/l/h}$ ,  $p=0.001$ ), without dawn phenomena, independent of sex, BMI, diabetes duration, antidiabetic medication and HbA1c level. **Conclusion:** Glucose profiles in patients over 70 years old and treated with oral antidiabetic medications are different than those from younger subjects. We observed in the elderly an increase in glycemia during daytime and a decrease during nighttime without dawn phenomena. Our results suggest a preferential use of basal insulin in the morning, in this age group. Other studies including a larger number of patients with a greater diabetic imbalance are needed to confirm our results.

**PB7 419 GENDER DIFFERENCE REGARDING DYSLIPIDEMIA AND GLUCOSE SERUM LEVELS AS PREDICTIVE FACTORS FOR COGNITIVE DYSFUNCTION IN ELDERLY**

O. TOANA\* (Medcenter, Bucharest, Romania)  
H. FLORENTINA (1), R. DRAGHICI(2), D. STATE(2), C. GLAVCE(3) - (1) Medcenter (Romania); (2) INGG Ana Aslan (Romania); (3) Fr. Rainer Institute (Romania)

Cardiovascular risk factors have a major and well-known role in ethiopathogenesis and evolution of cardiovascular and cerebrovascular disease with great impact on cognitive function. This study aims to evaluate some of the cardiovascular risk factors especially lipidic and glycemic profile on elderly people. There were 121 patients included, age 60-95 years, men and women diagnosed with mild cognitive impairment. A comprehensive geriatric and psychogeriatric examination was done to all patients. Exclusion criteria comprises acute or severe diseases, neurological or psychiatric diseases, severe cardiovascular disease or diabetes mellitus. We have evaluated anthropometrical, social, biochemical and hematological parameters. Statistically significant correlations were observed between some cardiovascular risk factors and cognitive dysfunction with interesting correlations and differentiations by gender.

**PB7 420 FRAIL ELDERLY OUT-PATIENTS: PREDICTORS OF OUTCOME AFTER ONE YEAR**

A. MOIZIARD\* (Hopital charles foix, Ivry/seine, France)  
J. GOLMARD(2), A. RAYNAUD-SIMON(3) - (2) hopital pitié-salpêtrière (paris, France); (3) hopital bichat (paris, France)

**Objective.** Frail community-dwelling outpatients represent an important population for preventive actions. Nutrition and inflammation markers have consistently shown to be associated with mortality in hospitalized or community-dwelling non selected elderly populations, but little data is available for frail outpatients. Also, other outcomes (hospitalisation, admission to nursing home) have been little studied. **Methods.** 192 outpatients aged  $80.6\pm7.6$  years with loss of autonomy and cognitive disorders referred to the hospital outclinic for comprehensive geriatric evaluation. Data concerning nutrition and inflammation were collected on the initial visit: BMI, arm and calf circumference, Mini Nutritional Assessment, and plasma concentrations of albumin, transthyretin, CRP, orosomucoid, Iron, ferritin, vitamin B9 and B12, calcium, and creatinin were also noted. A questionnaire was sent to the general practitioner so as to collect information for outcome one year after the visit to the hospital (death, hospitalisation, nursing home admission). **Results.** We received information about outcome for 123 (69 %) of our patients. Eighteen had died, 18 had been hospitalised at least once and 10 were in nursing homes one year after the initial visit. In multivariate analysis, significant risk factors for death were age ( $RR=1.079 [1.001 - 1.163]$ ), CRP ( $RR = 1.037 [1.010 - 1.063]$ ), creatinin ( $RR=1.023 [1.005 - 1.042]$ ) and ferritin ( $RR=1.002 [1.001 - 1.004]$ ). The higher the BMI, the higher the risk for hospitalisation in the year following the visit ( $RR=1.111 [1.033 - 1.194]$ ). Multivariate analysis showed that only serum creatinin was predictive for admission in a nursing home ( $RR=1.031 [1.006 - 1.056]$ ). **Conclusions.** Predictive factors differed when considering the different outcomes such as death, hospitalisation or admission in a nursing home. This shows the difficulty for predicting outcome in these frail elderly outpatients.

**PB7 421 INCREASED WAIST CIRCUMFERENCE THE MOST IMPORTANT CRITERIA FOR DETECTING METABOLIC SYNDROME IN THE ELDERLY.**

A. BÓS\* (Institute of Geriatrics and Gerontology of PUCRS, Porto Alegre , Brazil)  
J. SILVA(1), N. TERRA(1), I. SILVA-FILHO(1) - (1) Institute of Geriatrics and Gerontology of Pontifical Catholic University of Rio Grande do Sul (Porto Alegre, Brazil)

**Introduction:** Cardiovascular diseases are the leading causes of death in both developed and developing countries, and affect the quality of live of the elderly patients. Researchers have stressed the importance of simultaneously controlling risk factors as a way to prevent cardiovascular diseases. Metabolic Syndrome (MS) is an important and prevalent risk factor for cardiovascular diseases in the elderly. This study aims to quantify the most important criteria for diagnosing MS in Brazilian elderly (60 years and older) and in octogenarian (80 years and older) subjects. **Methods and materials:** We analyzed data from 226 elderly community dwelling subjects who participated in a general health evaluation in Porto Alegre, Brazil between January and July 2006. Using the International Diabetes Federation criteria for MS, participants were classified as having Waist-circumference (WC) criteria (80 cm or over for women and 94 cm for men), Blood Pressure (BP) criteria (135 mmHg for systolic or 80 mmHg for diastolic, or treatment), HDL cholesterol (HDL) criteria (less than 50mg/dL for women and 40 for men), triglycerides criteria (150mg/dL of higher) and glycemic criteria (100mg/dL or higher). **Results:** mean age was  $72.8 \pm 7.7$  yo, 35 were octogenarians, SM diagnosed in 156 (69%). Waist Circumference showed the highest positive predictive value (91%), followed by PA (88), HDL (79) triglycerides (70) and glicemic (59). In contrast WC was the lowest negative predictive value with 39%. Among the 14 participants with no WC criteria all had positive PA and HDL criterias. Octogenarians showed the same pattern of MS criteria frequency, similar results were found using NCEP-ATP III classification. **Conclusion:** increased WC is the most important factor in the assessment of cardiovascular risk for both elderly and octogenarian patients. In normal waist subjects PA or HDL cholesterol measurements may be important tools to detect MS.

**PB7 422 FACTORS ASSOCIATED TO OVERWEIGHT AGED INDIVIDUALS ASSISTED BY THE FAMILY HEALTH PROGRAM IN VITÓRIA, ESPIRITO SANTO, BRAZIL**

G. CAMPOS\* (Escola Nacional de Saúde Pública / FIOCRUZ, Rio de Janeiro, Brazil)  
G. MONTEIRO(2) - (2) Escola Nacional de Saúde Pública / FIOCRUZ (Rio de Janeiro, Brazil)

**Introduction:** To verify the possible association of overweight and socio-demographic variables (sex, age, conjugal status and income source), self-reported Hypertension and Diabetes and physical activity in aged individuals. **Methods and Materials:** This was a sectional study with a sample of individuals with 60 years or more, users of the Family Health Program in Vitória, Brazil. Bedridden and institutionalized elders were excluded. Interviews were carried out at their homes and information relative to socio-economic, demographic and anthropometric variables was collected, along with health conditions, social support network, physical activity and self-reported morbidity. Univariate and bivariate analysis were performed and prevalence ratios with 95% confidence intervals were calculated, for the outcome overweight. Multivariate analysis was carried out through Poisson regression and only variables with statistical significance ( $p > 0.20$ ) were tested in the models. **Results:** The study population had 995 elders, with a predominance of women (69.4%). Analysis of nutritional state showed that 46.6% of the participants were overweighted. Comparing both genders, women presented a higher percent of overweight (49.1%) than men. More than half of the sample (53.4%) presented waist circumference compatible with high risk for metabolic diseases. Variables statistically associated with overweight were years of schooling, hypertension, do not take walks and to be a pensioner. To be a woman was directly associated with overweight, but without statistical significance. The following variables remained in the final adjusted model: hypertension (PR=1.30; CI 1.13-1.40), to be a pensioner (PR=1.44; CI 1.14-1.84) and do not take walks (PR=1.23; CI 1.07-1.43). **Conclusions:** The factors associated to overweight who remained in the model are likely to be modifiable through policies directed towards a good quality of life for aged people.

#### PB7 423 UNDERNUTRITION AND NOSOCOMIAL INFECTIONS IN ELDERLY PATIENTS.

F. TAHMASEBI\* (Albert Chenevier's Hospital, Créteil, France)

P. BORIES(1), K. LE DUDAL(2), O. MONTAGNE(2), C. MILLOT(3), S. HERBAUD(3), A. MEZIERE(3), E. PAUILLAUD(3) - (1) Hotel Dieu Hospital, Dpt. of Biology (Paris, France); (2) Henri Mondor's Hospital, Centre d'Investigation Clinique (Créteil, France); (3) Albert Chenevier's Hospital (Créteil, France)

**Introduction:** hospital-acquired infections and malnutrition are two problems in public health in elderly patients. They are a frequent complication of hospitalisation and are associated with high morbidity, mortality rate and costs. This study aims to determine the incidence of nosocomial infections (NI) and its association with malnutrition. **Methods and materials:** 252 inpatients aged 85.2 ± 6 years old admitted in acute geriatric unit or rehabilitation unit during two years were included consecutively in the study. The nutritional assessment was based on evaluation of dietary intake, several anthropometric indices, MiniNutritionalAssessment (MNA), NutritionalRiskIndex-Geriatrics (NRI-G), and biological markers (serum nutritional proteins, CRP, vitamins A, E, C, Zinc, Selenium). The definition of malnutrition from the HAS (French high authority on health care) includes: weight loss > 10% in 6 months, BodyMassIndex (BMI)<21, MNA<17, serum Albumin<35g/l. During hospitalisation patients' progress was closely monitored, particularly for the detection of nosocomial infections. **Results:** the incidence rate of NI was 38.4%. One hundred and thirty six infections were recorded. The most frequent infection sites were pulmonary (n=64; 47%) and urinary tracts (n=54; 40%). The nutritional status of the population, the comorbid conditions [MiniMentalStatusExamination(MMSE), ActivitiesDailyLiving(ADL), CumulativeIllnessRatingScale(CIRS-G)] and the risk factors were studied by comparing two groups defined according to the absence (group I, n=155) or presence of one or more NI (group II, n= 97). The patients of group II versus group I were older with higher morbidity rate (CIRS-Ger p = 0.0001) and more discharge placement. They showed an altered nutritional status with a higher proportion of patients with deficit in vitamin C ( p= 0.005), zinc ( p= 0.02), selenium ( p= 0.01), also a greater loss of autonomy (ADL p =0.0002) and cognitive decline (MMSE p=0.03). **Conclusion:** The malnutrition, the deficit in Vitamin C, Zinc, Selenium are associated with high infectious risk in the elderly inpatients.

#### PB7 424 TASTE PERCEPTION AND NUTRITIONAL STATUS IN GERIATRIC PATIENTS – IS THERE AN ASSOCIATION WITH MEDICATION?

S. MALUCK\* (Klinikum St. Georg gGmbH, Wolmirstedt, Germany)

K. KUCZ(1), D. HANRIEDER(2), M. WIESE(3), A. WEIMANN(1) - (1) Abteilung Klinische Ernährung der Klinik für Allgemein und Visceralchirurgie, Klinikum St. Georg gGmbH (Leipzig, Germany); (2) Fachbereich Landwirtschaft/ Ökotrophologie/ Landschaftsentwicklung, Hochschule Anhalt (Bernburg, Germany); (3) Fachbereich Akutgeriatrie, Klinikum St. Georg gGmbH, Leipzig (Leipzig, Germany)

**Introduction:** Sarcopenia and disease-associated malnutrition are typical phenomena in the elderly. In a prospective study we analyzed the nutritional status as well as the sensitivity of taste perception of geriatric patients in comparison to healthy controls; furthermore a potential association between disease related medication and sensitivity of taste. **Methods:** 265 (81 men) patients of a geriatric hospital, average age 83 (range 60-100) years, were evaluated. 169 of them (group 1: average age 82; range 61-100 years) have been treated with drugs which can potentially cause alterations of taste perception. The other 96 patients (mean: 84 years; range 60-95) with no taste affecting medication were taken as group 2. A series of three-alternative-forced-choice procedures was used to determine the detection thresholds for the five basic taste qualities: sweet, salty, sour, bitter

and umami. Additionally, the nutritional status was measured using the Mini Nutritional Assessment (MNA™) protocol. Data were statistically compared to those of 150 (61 men) healthy controls aged from 49 to 71 (mean: 60) years. (Mann Whitney U-Test;  $p < 0.01$ ) **Results:** In the nutritional assessment, the geriatric patients scored with a median index of 17 (3-26) points. The prevalence of severe malnutrition (MNA™ < 17) was 49.1 %. The controls reached a significantly higher median index of 25.5 (17-29) points. In comparison with the controls, the geriatric patients of both groups showed significantly increased detection thresholds for all basic taste qualities. Between groups 1 and 2 no difference in taste perception was observed. **Discussion:** The nutritional status of geriatric patients was significantly lower than that of controls. The patients also showed impaired taste perception for all five basic qualities. These alterations have to be more attributed to age and disease per se, than to the intake of drugs considered to have taste affecting side effects.

#### PB7 425 INTERVENTIONS TO MAINTAIN OR IMPROVE THE NUTRITIONAL STATUS OF MALNOURISHED ELDERLY IN-PATIENTS

P. YOON\* (Changi General Hospital, Singapore, Singapore , Singapore)

C. LIEN(1), M. CHEONG(1), S. INDARANI(1), H. CHONG(1), M. CHIANG(1) - (1) Changi General Hospital (Singapore , Singapore)

**Introduction:** Many elderly patients refuse food or eat very little in the peri-hospitalisation period. Whilst a nutritional screen in the integrated nursing record provides a quick assessment of nutritional risk, malnutrition remains poorly diagnosed, and treatment interventions are inconsistent, and poorly sustained. **Methods and Materials:** Using clinical practice improvement programme (CPIP) and Deming's plan-do-check-act (PDCA) methodology, a multidisciplinary team was configured, comprising doctors, nurses, dieticians and speech therapists, to review the nutritional issues of orally fed malnourished elderly patients admitted to a 38 bed geriatric ward in Changi General Hospital. Over a 9 month period a ward survey was carried out, work processes and documentation reviewed, and issues discussed using cause-effect (fish-bone) structure and charting, embracing the Pareto principle. Small interventions were introduced and systematically fine tuned to implement sustainable changes. **Results:** Initial screening found that the nutritional trigger in nursing documentation was inaccurate. Using the improved form, 24/31 patients (77%) on oral feeding were reviewed: 8/24 (33%) were found to be screen positive, of which 3/8 (38%) were not referred to the dietician, and 4/8 (50%) were not weighed. Among all patients, only 11/31 (29%) were weighed (the rest considered unfit). Among the cause-and effect discussions, the most important factors were in nursing screening, with poor appetite and dislike of hospital food not being documented and communicated. Nutrition alert triggers and colour codes were introduced and food palatability, charting of consumed food portions and supplements improved. Nutritional issues were highlighted at weekly team meetings and interventions reviewed through repeated PDCA cycles. Weighing of patients, referral to dieticians, nutrition alert charting and counselling on admission and discharge improved from initial rates of 0-30% to rates of 80-100%. **Conclusion:** CPIP methodology can successfully change the unstructured interventions for elderly malnourished patients, resulting in better measurements, documentation, communication and improved feeding interventions.

#### PB7 426 RELATIONSHIP BETWEEN THE CONSUMPTION OF DIETARY PHOTOPROTECTIVE FOODS WITH THE SKIN REACTION TO UV RADIATION DUE TO SUN EXPOSURE OF A VACATIONING POPULATION OF THE SOUTHERN COASTLINE OF BRAZIL

L. ROCHA\* (Instituto de Pesquisas, Ensino e Gestão em Saúde, Porto Alegre, Brazil)

L. M. ROCHA(1), S. FERNANDES(1), G. BELLO(1), A. SCHNEIDER(1) - (1) Instituto de Pesquisas, Ensino e Gestão em Saúde (Porto Alegre, Brazil)

**Introduction:** Skin aging is a continuous process that affects skin functioning as well as its appearance. Intrinsic and life style related factors contribute to cutaneous aging. The hazardous effects of chronic exposure to ultra-violet (UV) radiation can be responsible for some of these effects (Chung et al, 2001). Certain micronutrients commonly found in the diet, such as carotenoids, tocopherols, ascorbic acid, flavonoids and some fatty acids have protective capacities against UV radiation. **Methods.** Transversal study. The population consisted of adults vacationing in Xangrilá beach (southern Brazil). The Fitzpatrick Classification Scale was used to evaluate the skin photo type (Kawada, 2000). The nutritional status was classified through the Body Mass Index (BMI) (WHO, 1995). To determine the consumption of photoprotective nutrients a food frequency questionnaire was used (Fisberg, 2008). The statistics analysis was performed using SPSS Software. The T of Student Test was applied for the association analysis. **Results.** 86 individuals were studied. Among them, n=48 (55.8%) presented a normal BMI and n=34 (39.5%) were overweight ( $BMI > 25 \text{ kg/m}^2$ ). N=61 (70.9 %) were among photo types I to III; and n=25 (29.1%) between photo types IV and V. The frequency of regular dietary intake (consumption > 5 times/ week) of photoprotective nutrients was respectively: Vitamin E n= 73 (84.9%); Vitamin C n=42 (48.8%); Carotenoids n=68 (79.1%); Polyphenols n=35 (40.7%) e; Selenium n=16 (18.6%). The relationship between the regular intake of dietary sources of photoprotective nutrients with the skin photo type presented a positive association for Vitamin E ( $p=0.017$ ) and Selenium ( $p=0.049$ ). There was no significant association between regular consumption of photo protective nutrients with the gender, age and BMI variables. **Conclusion:** There was a high prevalence of individuals with a skin

photo type more sensitive to UV radiation that did not present a regular adequate consumption of photoprotective nutrients.

**PB7 427 SENSORY CHANGES AFFECT APPETITE IN THE OLD**

L. PALARIERU-ABRAMOVICH\* (Maccabi Health Services, Modeein, Israel)  
H. BAREL(2), V. GREEN(2), A. SHAHAR(3) - (2) Bayit Balev Maccabi Health Care Services Group (Herzelia, Israel); (3) Ministry of Health, South District (70700, Israel)

Introduction Aging is associated with decreased appetite and food intake. This study examines risk factors for impaired appetite in the old age. Including, a detailed taste and smell measurement. Methods: Subjects: Independent living elders aged 70+ years were recruited. We collected data on nutritional and medical status, sociodemographics and functional abilities. Tests for taste and smell sensitivity were performed. Impaired appetite was defined by the SNAQ questionnaire. Results: Seventy elderly people with mean age of 80 participated in the study; 20% had impaired appetite. Participants with impaired appetite had lower BMI [24.7 vs. 28, p=0.05] and Mini Nutritional Assessment (MNA) score [28 vs. 30, p=0.03] compared to participants with normal appetite. Among participants with impaired appetite 36% consumed meat, fish or poultry daily compared with 79% among participants with normal appetite [p=0.002], 36% had lower fruits and vegetables intake compare with 5% among the normal appetite group [p=0.001]. No difference was detected between the groups in medical status, family-status, smoking, eating-habits, oral health and the number of full meals. A decrease in the sensitivity to the smell of coffee was associated with impaired appetite [p=0.007]. All the participants with impaired appetite were highly sensitive to the bitter taste, compared with 50% among participants with normal appetite [p=0.048]. Conclusions: Impaired appetite increases the risk for nutritional and health deterioration as well as for lower diet quality. Regarding the impact of gustatory and olfactory alterations on appetite, we show that impaired appetite is associated with changes in the senses of taste and smell. Follow up researches are needed to investigate the temporal sequence between the time at which a change in the senses of taste and smell occurs, and the observed decrease in appetite.

**PB7 428 EFFECT OF AGE ON GLUCOSE AND CHOLESTEROL CONCENTRATION DIABETES DISEASE**

H. KARIMI\* (Medical university, Dezful , Islamic Republic of Iran)  
S. MOHAMMADZADEH(1) - (1) education ministry (Khorram abad, Islamic Republic of Iran)

Introduction: It has shown that receptor of glucose slowly change in cell membrane and its concentration be increased in ECF (extra cellular fluid). Age is important factor affected in glucose concentration. Methods of materials: Thirty patient (women) diabetes were selected and divided into two groups of its age: first group <50 year and second >50year. Samples of blood were analyzed for Fasting blood sugar (FBS) and Total cholesterol (TC). Result: In first group FBS and TC were  $200.25 \pm 69.66$  mg/ml and  $203 \pm 55.7$  mmol/ml respectively. In second group FBS and TC were  $179.61 \pm 38.97$  mg/ml and  $211.5 \pm 63.7$  mmol/ml respectively. Result: In young group, concentration of FBS and TC was greater than of old group. Conclusion: Unfortunately, the younger group doesn't keep to the roles of ration but them organisms could be suffer high concentration on cholesterol and glucose. In old group tolerance threshold is low and it seems that receptor of glucose were decrease, so in second group sugar concentration in ECF is very dangerous. Key word: Diabetes, FBS, TC.

**PB7 429 NORMAL BODY MASS INDEX RATHER THEN OBESITY PREDICTS INCREASED MORTALITY IN THE ELDERLY**

J. STESSMAN\* (Hadassah-Hebrew University Medical Center, Mount-Scopus, Jerusalem , Israel)  
M. BURSZTYN(1), J. JACOBS(1) - (1) Hadassah-Hebrew University Medical Center, Mount-Scopus (Jerusalem PO BOX 24035, Israel)

Introduction: To examine the impact of body mass index (BMI) on all cause mortality in the elderly. Methods and materials: Data was drawn from the Jerusalem Longitudinal Cohort study (1990-2008) which has followed a randomly chosen, representative sample of Jerusalem dwelling older people, drawn from the cohort born 1920-1921. Comprehensive assessment was performed in 1990, 1998, and 2005, with subjects aged 70 (n=450), age 78 (n=877), and age 85 (n=1096) respectively. The study sample was augmented at follow up with additional randomly chosen subjects from the original birth cohort. All cause mortality was collected from the National death registry during the period 1990-2008. Results: An adjusted Cox proportional hazard analysis in women found that a unit increase in BMI resulted in a mortality hazard ratio(HR) at age 70 of 0.95, 95% confidence interval (CI) 0.90-0.99; at age 78 the HR was 0.95, 95%CI 0.91-0.98, and at age 85 the HR was 0.91, 95%CI 0.85-0.97. Similarly, among men at age 70 the HR was 1.002 95%CI 0.95-1.05, at age 78, HR 0.94 95%CI 0.9-0.99, and at age 85 (HR 0.92 95%CI 0.85-1.0). A time dependent analysis of the 450 subjects followed up for 18 years confirmed the above findings: among women a unit increase in BMI resulted in a mortality HR of 0.93, 95% CI 0.87-0.99, and among men the HR was 0.94, 95% CI 0.89-0.98. Dependence in activities of daily living, diagnoses of cancer and diabetes mellitus were predictive in most models. Elimination of the first third of follow-up mortality to account for possibility of reverse

causality did not change the results. Conclusions: In the elderly higher BMI appears to protect from mortality.

**PB7 430 THE MEANING OF QUALITY OF LIFE ACCORDING TO THE EXPERIENCES OF ELDERLY INDIVIDUALS WITH TYPE-II DIABETES MELLITUS**

R. POPIM\* (Faculty at the School of Medicine, Botucatu, Brazil)  
R. JANE(1) - (1) Faculty at the Botucatu School of Medicine (Botucatu, Brazil)

INTRODUCTION: Type-II diabetes mellitus (DM-II), is a very important clinical condition for the elderly population due to the frequency of its occurrence and to the fact that it causes micro and macrovascular complications that may lead to dependence and disability. In addition to possible complications, continuous treatment may significantly affect these individuals' lifestyle. OBJECTIVES: To evaluate the effects of DM-II on the quality of life of elderly individuals. METHODOLOGY: This is a qualitative study with a phenomenological approach. Twelve elderly individuals with DM-II, age ranged from 60 to 90 years, ( $X=75$  years old). The period of development of the disease ranged from one to 40 years, ( $X=10$  years). The patients were attended to at the Geriatrics and Gerontology Outpatient Unit of the Botucatu School of Medicine. A taped interview was conducted during which the following guiding question was answered: "What does quality of life mean to you?" RESULTS AND DISCUSSION: Quality of life was essentially related to physical, emotional and financial independence. Affective relationships with relatives and friends as well as affection for household pets were highly valued. Another relevant aspect was mental and spiritual well-being. Living well, not doing harm to others, not having debts, not being disturbed and being in peace with God were requirements for good quality of life. They reported to live well and that diabetes was a limiting aspect, as it restricted diet and other good things. They classified the disease as being silent and difficult to control over time. CONCLUSION: Independence, affective relationships constructed over one's lifetime and spiritual belief were reported as factors that can promote quality of life. Diet restriction was the major negative aspect in such quality. They classified diabetes as a silent disease, and indicated that it was difficult to control over time, which requires, from health care professionals, continuing and accessible orientation concerning the disease. Key words: Elderly, Diabetes Mellitus, Quality of Life

**PB7 431 NUTRITION RISK AND LIVING TO ADVANCED AGE**

C. WHAM\* (Institute of Food Nutrition and Human Health, Massey University, Auckland, New Zealand)  
R. TEH(2), N. KERSE(2) - (2) Auckland University (Auckland, New Zealand)

Introduction Poor nutrition in older people may hasten or amplify poor health. The population of very old people is growing rapidly in New Zealand and is expected to increase by 50% between 2006 and 2051. Data on the nutrition risk profile of older New Zealanders remains scarce. This study investigated the association between living arrangement and nutrition risk among a purposive sample of those in advanced aged. Methods and materials A cross-sectional feasibility study was conducted among 112 participants (57% women and 43% men) aged 85 years (75- 79 for Maori) living in three North Island locations (urban and rural). Nutrition risk was assessed by questionnaire items from Seniors in the Community: Risk Evaluation for Eating and Nutrition (SCREEN II) validated for use in the community. Results Half (52%) of the participants in this study were found to be at nutrition risk (SCREEN II score <50; range 29-58; out of maximum score 64). The mean score for SCREEN II was higher for older people who lived with others ( $50.3 \pm 5.1$ ) compared to those who lived alone ( $46.4 \pm 5.8$ ) p=0.001. Those in a shared living situation tended to eat foods from the meat group more often (70%) (i.e. at least two or more times a day) versus those living alone (30%) p=0.006. Consumption of the recommended five serves of fruit and vegetables per day did not differ by living arrangement. Conclusion In this sample those who live alone and do not have the opportunity to share meals with others appear to be at higher nutrition risk. Health and well being may be compromised as eating alone is known to lead to altered food procurement, preparation, cooking and eating of meals. Factors affecting nutritional well being will be investigated in a longitudinal cohort study of the top 1% of the older population.

**PB7 432 BODY MASS INDEX AND PERCEIVED BARRIERS TO PHYSICAL ACTIVITY AMONG OLDER PEOPLE**

T. LYRYA \* (University of Jyvaskyla, Jyvaskyla, Finland)  
J. SALLINEN (2), R. LEINONEN(1), M. HIRVENSALO(2), T. LYRYA(2),  
E. HEIKKINEN(2), T. RANTANEN(2) - (1) GeroCenter Foundation for Research and Development, Jyvaskyla, Finland; (2) The Finnish Centre for Interdisciplinary Gerontology, Department of Health Sciences, University of Jyvaskyla, (Finland)

Introduction: Older people with higher body weight are often more sedentary than those with normal weight. This study examined factors underlying the association between body mass index and physical activity among older people. Material and methods: 619 community living people aged 75-81 years who had their weight and height measured, took part in face-to-face interviews and filled in a questionnaire about physical activity and barriers to physical activity. Based on body mass index, participants were categorized as non-obese (BMI 20-29.9; n=436), moderately obese (BMI 30-34.9; n=127) or severely obese (BMI 35 or more; n=56). Results: Compared to the non-obese group, moderate

obesity associated with two times (OR 1.97, 95%CI 1.26-3.09) and severe obesity over four times greater odds of physical inactivity (OR 4.59, 95%CI 2.55-8.26). Higher prevalence of pain, chronic diseases, tiredness, fear of falling and injuries, feelings of insecurity when exercising outdoors, feeling uncomfortable when exercising and having no interest to exercise was observed among those categorized as obese as well as among those categorized as physically inactive. In the multivariate regression model, higher prevalence of tiredness explained 22%, fear of falling 18%, pain 15%, feelings of insecurity when exercising outdoors 8%, chronic diseases 7% and fear of injuries 7% of the increased risk of inactivity among severely obese people. However, even after including all the potential barriers to physical activity in the model, the excess risk of physical inactivity among those with severe or moderate obesity was not fully accounted for. Conclusions: Part of the increased inactivity among severely obese people was explained by their higher prevalence of known barriers to physical activity. The complexity of obesity-related inactivity should be taken into account when planning physical activity programs for older obese individuals.

#### **PB7 433 SOY FOOD AND ISOFLAVONE INTAKE AND PHYSICAL DISABILITY IN OLDER WOMEN**

J. KIM\* (Ajou University School of Medicine, Suwon, Republic of Korea)  
Y. LEE(1), J. BACK(1) - (1) Ajou University School of Medicine (Suwon, Republic of Korea)

Introduction: Soy food and its constituents may protect against functional disability, but previous reports on the association between soy intake and decreased level of disability have been inconsistent. We evaluated the relationship between disability and the dietary intake of soy food and isoflavone in older women. Methods and materials: Data are from the 2005 Korean National Health and Nutrition Examination Survey (KNHANES). Subjects were women aged 65 and older (n=432) living in the community. Information on soy food intake was obtained using a 24-hour dietary recall, and physical disability was assessed using the activities of daily living (ADLs) and instrumental ADLs (IADLs) scales. Logistic regression analyses were used to ascertain the association of soy food and isoflavone intake with ADLs and IADLs, adjusting for potential confounders, including sociodemographics, health behaviors, chronic diseases, and other nutrient intake. Results: The dietary intake of soy food and isoflavone tended to be higher among those not impaired compared with the impaired in physical function, with significant difference observed for soy isoflavone (mean [SD]: 25.5 [27.4] mg/day vs. 19.8 [22.5] mg/day, p=0.02). Adjusting for covariates, an inverse association between quartiles of soy food and isoflavone intake and physical disability was observed (P for trend<0.05). Respondents with the highest soy food intake had the lowest odds of having IADL disability (OR [95% CI]=0.40 [0.20-0.79]). Persons in the highest quartile of soy isoflavone had 52% lower odds of having IADL disability, than those in the lowest quartile. Soy food and isoflavone intake also tended to correlate inversely with impaired ADLs, but were not statistically significant. Conclusion: Increased soy food and isoflavone intake may be protective against functional limitations and disability in older women. Further research is needed to ascertain the effect of diet on functional limitations and disability in older persons.

#### **PB7 434 UNIVERSAL PROVISION OF DIABETIC DIET IN A CARE HOME: DOES IT HELP IN DIABETES CARE?**

C. HUANG\* (Taipei Veterans General Hospital , Taipei city, Taiwan)  
M. LIN(1), L. CHEN(1), S. HWANG(1), C. LAN(2) - (1) Center for Geriatrics and Gerontology, Department of Family Medicine, Taipei Veterans General Hospital, and National Yang Ming University School of Medicine Taipei (Taiwan); (2) Institute of Health Welfare and Policy (Taiwan)

Introduction: Diet control in diabetes care is of great importance. Systemic implementation of diabetes diet in the care homes may improve diabetes control for diabetic residents. The main purpose of this study was to evaluate the clinical effectiveness of systemic implementation of diabetic diet in the long-term care settings. Methods and materials: All residents living in Banciao Veterans Care Home who participated in the annual health examination in 2008 were invited for study and they were enrolled after they were fully consented. Serial anthropometric and laboratory examinations were performed for each participant. Results: In total, 957 residents participated in this study and 225 of them (23.5%) were diabetic by medical records. Among the 225 diabetic residents (mean age=81.2±4.8 years, all males), 44 were provided universal diabetic diet (case group) and remaining 181 participants were provided conventional diet (control group) in the care home. Overall, subjects provided with universal diabetic diet were not better in hemoglobin A1c (7.6±1.5 vs. 7.3±1.5 %, P=0.32), but fasting plasma glucose (128.4±39.9 vs. 139.2±59.9 mg/dl, P=0.26), total cholesterol (168.4±34.2 vs. 176.0±37.3 mg/dl, P=0.22), triglycerides (140.5±74.2 vs. 150.5±107.3 mg/dl, P=0.56), and BMI (24.7±3.3 vs. 24.9±3.4 kg/m<sup>2</sup>, P=0.73) were slightly better, but not statistically significant. However, the serum levels of creatinine (1.8±1.6 vs. 1.5±0.5 mg/dl, P=0.02) were significantly higher in case group and the mean systolic pressure was significantly lower in case group (132.5±17.2 vs. 139.2±20.3 mmHg, P=0.03). Conclusion: The benefit of universal provision of diabetic diet was marginal. However, the possible benefit of universal diabetic diet provision in assisting blood pressure control was significant (possibly related to low

salt intake). Further study is needed to clarify the role of universal diet provision in diabetic control in long-term care settings.

#### **PB7 435 TOTAL ENERGY EXPENDITURE OF INDEPENDENT OLDER BRAZILIANS LIVING IN AN URBAN COMMUNITY: A DOUBLY LABELED WATER STUDY.**

K. PFRIMER\* (University of Sao Paulo, Ribeirao Preto, Brazil)  
MARCHINI(1), J. MORIGUTI(1), N. LIMA(1), P. FORMIGHIERI(1), E. FERRIOLLI(1) - (1) University of Sao Paulo (Ribeirao Preto, Brazil)

Introduction: Data on the energy expenditure of older populations in developing countries is scarce and usually the energy needs are derived from studies in younger adults. It is well known that aging is related to a reduction in total energy expenditure, partially explained by the loss of lean body mass but also related to changes in physical activity, diet and other factors, some of which could be different in developing countries. The objective of this study was to assess the total energy expenditure of healthy older people free-living in an urban community. Methods and material: Thirty-one subjects aged from 60 to 75 years participated in this study, 19 women. Most of the participants were sedentary. Total energy expenditure (TEE) was measured through the doubly labeled water technique, two points method (Schoeller and colleagues). Resting energy expenditure (REE) of 24 volunteers was also assessed by indirect calorimetry and the physical activity level (PAL) was calculated as TEE/REE. Results: The mean total energy expenditure 770 kcal in± 653 kcal in men and 2004 ± 752 kcal, 2576 ± was 2186 160 kcal in women. The± 156 kcal in men and 1415±women. REE was 1607 mean physical activity level was 1.6 in men and 1.4 in women. Conclusions: In this study, the total energy expenditure of sedentary independent older volunteers was close to the present estimated energy requirements (EER) for the ages of 51 to 70 years, although the EER of men is 370 kcal below the measured expenditure. PAL showed the same levels as described in other studies for sedentary older adults.

#### **PB7 436 PATIENT EDUCATION IN AN ACUTE CARE SETTING. FEASABILITY AND MEDIUM-TIME EFFECTS OF A SHORT PARTICIPATORY PATIENT-EDUCATION FOCUSING ON HYPERTENSION IN ELDERLY PATIENTS WITH NON-INSULIN-DEPENDENT DIABETES**

H. BURKHARDT\* (Universitätsmedizin Mannheim, Mannheim, Germany)  
A. KOFFNER(1), R. GLADISCH(1) - (1) Universitätsmedizin Mannheim, Geriatric Center (Mannheim, Germany)

Patient education is crucial in preventive medicine to achieve and maintain a healthy and appropriate lifestyle and hereby minimize the burden of morbidity due to chronic disease. The framework concept of shared decision making encourage health care professionals to apply a participatory approach in patient education. Feasability and effects of such an approach has already been described in ambulatory settings but little is known about implementation in acute care. Also participatory approaches are often referred as less appropriate in the elderly. To examine the feasability and medium-time effects of a participatory educational session offered in an acute care setting a pilot-study was done in elderly patients with diabetes and hypertension. Patients were recruited from a ward for general internal medicine and geriatric wards. They were eligible if acute illness was controlled or partially recovered. Exclusion criteria were dementia, delirium, instable clinical condition and remaining prognosis below 1 year. Patients were randomized to an intervention group consisting of a short (30 minutes) participatory education session focussing on self-management of hypertension. Reassessment of participants by telephone took place 3 months thereafter. 44 patients (29 women and 15 men, age 57-88) took part in the study. After three months in the intervention group (N=20) significantly more participants showed reduced blood pressure values, both systolic (120-160mmHg) and diastolic (70-90mmHg), body weight (50-121kg) and HbA1c (5.8-11.3%). However, only 4 patients in the intervention group achieved blood pressure values of 130/80mmHG or below. Also median weight reduction was limited (2kg). Participatory patient education when applied in an acute care setting is feasible and provides beneficial effects on blood pressure control, weight reduction and metabolic control in elderly but well-functioning patients with diabetes. Therefore this approach may effectively supplement usual ambulatory patient education.

#### **PB7 437 STUDY OF DIABETES AS A RISK FACTOR FOR STROKE FOR ELDERLY PATIENTS IN THE THREE-CITY STUDY**

I. BOURDEL-MARCHASSON\* (Service de médecine gérontologique, CHU de Bordeaux, Pessac, France)  
E. PUGET(4), C. HELMER(1), J. DARTIGUES(1), K. RITCHIE(2), C. TZOURIO(3) - (1) INSERM U593 (Bordeaux, France); (2) INSERM U888 (Bordeaux, France); (3) INSERM U708 (Bordeaux, France); (4) Service de médecine gérontologique, CHU de Bordeaux (Bordeaux, France)

Background: Strokes and diabetes are two major public health issues regarding mortality and morbidity associated with them. Numerous studies have shown an association between diabetes and the occurrence of stroke among young subject. Objective: To study whether diabetes is a risk factor for stroke in the elderly over 65 years and if a strict blood sugar control reduces the risk of stroke for this population. Materials and Method: The studied

population was from the Three-City Study. It is a longitudinal cohort study of individuals over 65 years, undertaken to study the relationship between vascular disease and vascular dementia. The individuals whose diabetes status was known were included in our population. The event studied was a stroke. A survival analysis was conducted to study the risk of stroke over time. Results: In our sample population of 8721 people, 897 subjects were diabetic; the number of incident cases of stroke was 137 during the follow-up of 4 years. The diabetes among the elderly over 65 years did not appear as an independent risk factor for stroke in the studied population. The relative risk was 0.21 IC95% [0.03-1.51], p = 0.27 after adjustment on risk factors for stroke. The rise in glycated hemoglobin of 1% in the diabetic is also not associated with the occurrence of stroke with a relative risk of 1.77 IC95% [0.59-5.33], p = 0.3. Age, male, a body mass index greater than 27 and the existence of atrial fibrillation were independent risk factors for stroke. Conclusion: Our study showed no association between diabetes and the occurrence of stroke among the elderly over 65 years within the study of the Three-City study. These preliminary results have to be confirmed after the validation of the follow-up period of 6 and 8 years of the cohort.

**PB7 438 WATER INTAKE IN ELDERLY PATIENTS ON A GERIATRIC WARD**  
 M. YEUNG\* (Queen Elizabeth Hospital, Woolwich, London, United Kingdom)  
 D. ALSHEIKH ALI(1), E. EKPO(1) - (1) Queen Elizabeth Hospital (London, United Kingdom)

Introduction: Dehydration is common amongst elderly people. Adequate hydration is essential to ensure normal physiological function and electrolyte and fluid balance is maintained. The amount of fluid an elderly person needs varies according to underlying diseases, medications and physical activity. The recommended amount of fluid an elderly person should consume in 24 hours should not be less than 1600 millilitres. Methods: Over a 24 hour period, all patients on a geriatric ward had the volume of water consumed from their bedside jugs measured and recorded just prior to the time of refilling. Water jugs were refilled twice daily, in the morning and late afternoon. Basic demographics, medical comorbidities, presence of diuretic medications, mobility status, use of parenteral fluids, fluid balance charts and cognitive impairments were recorded. Results: Water consumption was measured on a total of 26 patients. All were over 70 years old. More than half (58%) had no fluid balance chart. No patients consumed the recommended minimum of 1600 millilitres of water, and more than 80% consumed less than 1000 millilitres the 24 hour period. More than 60% did not manage half the daily recommended amount. Conclusion: Elderly patients on a geriatric ward appear not to be consuming enough water to meet their daily recommended amount of water intake. Only a small proportion of patients were monitored for fluid balance, despite all patients having inadequate intake. Further studies would be required to assess what possible measures can be instigated in both the community and hospital to improve fluid intake in this population.

**PB7 439 THE COMPARISON IN THE MOTIVATIONS OF FOOD CHOICES BETWEEN ELDERLY JAPANESE LIVING IN THE COMMUNITY AND UNIVERSITY STUDENT**  
 S. KATO\* (Kyoto Notre Dame University, Kyoto, Japan)  
 H. OSADA(1) - (1) J. F. Oberlin University (Tokyo, Japan)

Introduction: The great deal was known about what the elderly people eat and the demographic and life style factors associated with food habits. And there were also known about what foods impacted to the health and about what dietary intakes improved the disease, but little is known about why elderly people choice the foods, especially, effects of the motivations for food choice by elderly Japanese people living in community. We investigated the comparison in the motivations of food choices between elderly Japanese and University student. Methods and materials: A Food Frequency Questionnaire was used to measure the dietary variety and intake. The motivations (Nutrition and Health, Sensory Appeal, Weight Control, Convenience) for food choice were assessed with the Food Choice Questionnaire New Version by 249 elderly (males; n=108, females; n=141) and 424 University students (males; n=136, females; n=288). Multiple logistic regressions were used to examine how the motivations predicted the choice of the foods. Result: The "Nutrition and Health" predicted higher choice of the eggs in young males, sea vegetable in elderly males, and the soybeans products in young females. The "Convenience" predicted higher choice of the noodles in elderly females and young males and the instant products in elderly females. The "Weight Control" predicted lower choice of the rice in young females and the eggs in the elderly. The "Sensory Appeal" predicted higher choice of the milk and the green vegetables in young males. The effects of the motivations for food choice were difference between the elderly and University students. Conclusion: The results of this study suggested that we should understand the perceived individual motivation for food choices by the elderly when developing health promotion programs. And it is necessary to develop a new criterion of motivation for food choice for the elderly.

**PB7 440 USING QUALITATIVE AND QUANTITATIVE RESEARCH METHODS TO UNDERSTAND HEALTHY OLDER CONSUMERS LIKING OF ORAL NUTRITIONAL SUPPLEMENTS (ONS).**  
 O. KENNEDY\* (University of Reading, Reading, United Kingdom)  
 L. METHVEN(1), K. RAHEL(1), N. ECONMOU(1), M. GOSNEY(1) - (1) University of Reading (Reading, United Kingdom)

Introduction: Oral nutritional supplements (ONS) are frequently wasted; documented reasons for wastage include not liking sip feeds, disliking the taste, texture or sweetness and feeling sick or bloated after drinking them (Gosney, 2003). The aim of this study was to gather both qualitative and quantitative data regarding the acceptability of ONS from healthy older volunteers. Methods and materials: The liking of four commercial vanilla ONS products (Abbott Ensure Plus, Nestle Clinutrin, Nestle Resource and Nutricia Fortisip) was quantified by older consumers (n=32; age range 66-88) using a 9-point hedonic scale. The perceived sweetness of the products was quantified using a 100 mm unstructured line scale. For qualitative data, three focus groups of six to eight volunteers were conducted. A topic list devised from previous literature was used to guide the discussions and various commercial and trial ONS were presented as stimuli. The dialogue was tape-recorded, transcribed verbatim and thematically content analysed. Results: There was a significant difference in perceived sweetness of the four commercial products (p=0.013), with mean sweetness varying from 56 to 79 (0-100 scale) between products. Mean liking also significantly differed between samples (p=0.009), values ranging from 3.8 to 5.2 (1=dislike extremely, 9 = like extremely). Liking and perceived sweetness were not correlated. Themes arising from the focus groups, implied that sensory attributes such as sweetness, mouth-feel & aftertaste negatively impacted on consumers acceptability and willingness to consumer the products. Conclusions: The liking scores of commercial vanilla ONS, by the healthy older volunteers, were considered low although not directly related to perception of sweetness. The focus group discussion corroborated previous studies, where consumers thought that the taste of the products was the most important factor affecting consumption. The affect of flavour and mouth-feel attributes that lingered after consumption was a problem highlighted by a number of volunteers.

**PB7 441 FUNCTIONAL CAPACITY IN POLYMYALGIA RHEUMATICA; BASELINE DATA OF A CLINICAL TRIAL**  
 M. BJÖRKMAN\* (Helsinki University Central Hospital, HUS, Finland)  
 H. HYVÄRINEN(1), R. TILVIS(1) - (1) Helsinki University Central Hospital, Clinics of Internal Medicine and Geriatrics (HUS, Finland)

Introduction: Polymyalgia rheumatica (PMR) is an inflammatory joint disease of the elderly characterized by pain and morning stiffness in the neck and limb girdles often leading to difficulties in activities of daily living (ADL). Long-term corticosteroid therapy has been the corner stone in treatment of PMR. A disease activity score (PMR-AS) based on physician's global assessment (0-10), pain intensity (0-10), C-reactive protein concentration (mg/l), duration of morning stiffness (minutes) and ability to elevate the upper limbs (0-3) has been recently introduced for monitoring PMR activity and managing glucocorticoid tapering. In order to find out whether and to what extent PMR-AS is related to functional capacity 41 PMR patients participating in a blinded 16-week protein supplementation cross-over (with a 4-week wash-out) trial were investigated. Methods and materials: Baseline examinations included among others an evaluation of nutritional status (Mini Nutritional Assessment = MNA), body composition (Body Mass Index = BMI), and functional capacity (Activities of Daily Living = ADL using Health Assessment Questionnaire). PMR-AS was calculated without global assessment. Medical history and current medication were also collected. Results: A total of 41 voluntary PMR patients were recruited ( $70.1 \pm 6.5$  years, 88% women). Patients reporting some difficulties in at least two out of the eight different categories of ADL had higher PMR-AS ( $27 \pm 17$  vs.  $14 \pm 15$ , p=0.013) and BMI ( $29.0 \pm 4.5$  vs.  $25.4 \pm 2.3$  kg/m<sup>2</sup>, p=0.004). However, no significant differences were found in age, MNA, duration of symptoms or use of continuous corticosteroid medication. In linear regression models PMR-AS ( $\beta=0.396$ , 95% CIs 0.038-0.157) and BMI ( $\beta=0.470$ , 95% CIs 0.221-0.683) emerged as significant predictors of ADL-score explaining 36% (adjusted R-square = 0.363) of its variation. Conclusions: Disease activity and body composition have a major impact on functional capacity in PMR patients, whereas age, nutritional status, duration of symptoms and use of continuous corticosteroid medication seem to be less important.

**PB7 442 THE USE OF ICE CREAM AS A NUTRITIONAL SUPPLEMENT FORMAT FOR OLDER PEOPLE**  
 L. METHVEN\* (University of Reading, Reading, United Kingdom)  
 O. KENNEDY(1), A. WILBEY(1), L. LABDROOKE-DAVIS(1), L. KINNEAVEY(1), M. GOSNEY(2) - (1) University of Reading (Reading, United Kingdom); (2) University of Reading (Reading, United Kingdom)

Introduction: Compliance issues with consumption of oral nutritional supplements (ONS) are known to be a problem (1). Previous studies found serving temperature to affect the acceptability of ONS. However, air incorporated into ONS in order to produce ice cream, unacceptably increased consumption volume (2). This study aimed to manufacture ice cream of higher calorie, mineral and vitamin composition by weight, in order to achieve the same calorie content by volume as an ONS drink (typically 150 kcal/100 ml). Methods and materials: Ice cream was manufactured to contain 20 % fat ( 233 kcal/100 ml), 10 % fat (169 kcal/100 ml) or 95% commercial ONS (125 kcal/100ml) The sensory profile of ice cream was evaluated by a trained analytical sensory panel (n= 12) and by patients in the hospital setting at the Royal Berkshire NHS Foundation Trust, who scored liking using a 9-point hedonic scale (1=dislike extremely, 9=like extremely). Results: Thirty attributes differed significantly (p<0.05) between the samples. High fat ice creams were lower in many odours, tastes (except sweet), flavours, mouthfeel attributes and aftertastes compared

to ONS ice cream. Patients (mean age 82) mean liking differed significantly ( $p=0.009$ ); ONS ice cream was liked least (mean 4.2), the 20 % and 10 % fat ice creams were preferred (mean 5.3 and 6.4 respectively). Conclusions: Test ice creams had higher calorific density than ONS ice cream, ensuring a more acceptable consumption volume. They had less negative sensory attributes and were preferred by patients to the ONS ice cream. A high fat, mineral and vitamin supplemented, ice cream should be manufactured commercially. (2) Methven, L., Kennedy, O.B., Mottram, D.S., Grimble, G.K., Bushell, M., Gray, L. and Gosney, M.A. (2008). Can changing the serving temperature improve the palatability of Oral Nutritional Supplements in older people? *Proceedings of the Nutrition Society*, in press

**PB7 443 NUTRITIONAL STATUS, ENERGY AND NUTRIENT INTAKE OF ELDERLY SERVICE HOUSING CLIENTS**

M. SUOMINEN\* (University of Helsinki, Helsinki, Finland)

A. JOKI(1), S. MUURINEN(2), H. SOINI(3), K. PITKALA(4) - (1) Finnish Heart Association (Finland); (2) National Research and Development Centre for Welfare and Health (Finland); (3) Health Centre, Social Services, City of Helsinki (Finland); (4) Department of General Practice and Primary Health Care, University of Helsinki (Finland)

Introduction: Nutritional problems are common among elderly individuals in institutions. Adequate energy, protein and nutrient intakes are a part of the good care of the elderly. The aim of this study was to examine nutritional status and energy and nutrient intakes of service housing clients aged 65+ in the metropolitan region of Finland. Methods: In this cross-sectional study we assessed nutritional status of all service housing clients aged 65+ years. Of all the clients, 67% ( $n=1475$ ) participated. In addition, 398 (27% of participated) clients' energy and nutrient intake for one day were calculated from food diaries. Results: The mean age of participants was 83 years, 78% were females. 70% of clients had impaired cognitive function. The nutritional status according to the MNA was good in 22% of the clients, 65% were at risk of malnutrition and 13% malnourished. Body mass index (BMI) was less than 24 in 43%, 24-29.9 in 37% and 30 or more in 20% of clients. The mean energy intake of women was 1681 kcal and men 1927 kcal, protein intake of women 61.3 g and men 69.4 g. Oldest men (age>84 y), not women, had lower ( $p=0.003$ ) energy (1675 kcal) and protein (59 g) intakes than younger men (60-74 y), 2266 kcal/79 g respectively. Ca, Fe and Mg intakes were also lowest in the oldest group of men, but not in women. Only 3% of clients received nutritional supplements. Conclusions: Although many of the studied service housing clients seemed to receive enough energy and nutrients from their food, particularly the oldest men were in the risk of getting not enough energy and protein. Considering that 78% of the elderly clients were at risk of malnutrition or had nutritional problems, the possibilities of nutritional care were underused in the care of clients.

**PB7 444 IMPACT OF THE PRESENCE OF A CLINICAL PHARMACIST IN UNIVERSITY HOSPITAL WARDS ON THE ELDERLY OR POLYMEDICATED PATIENTS CARE**

J. PETERMANS\* (CHU Liège (Sart-Tilman), Liège, Belgium)

T. VAN HEES(1), J. DELPORTE(2) - (1) CHU Liège (Sart-Tilman) (Liège, Belgium); (2) University of Liège (Liège, Belgium)

Introduction: The recent development of Clinical Pharmacy in Belgium fits into the strategic and organizational objectives established by the University Hospital of Liège in order to increase the quality and efficiency of patient care. The objective of this project was to investigate if a clinical pharmacist could contribute to optimize the medical care of the patient in different wards. Methods and Materials: A pharmaceutical care program has been developed in geriatric, neurologic and emergency units, in the environment of a university hospital, where the objectives of education and training of health personnel (doctors, nurses, pharmacists ...) add to the concern of an optimum quality of care. For 15 months, a clinical pharmacist, or pharmacy students in their final year under the supervision of clinical pharmacist, has participated to the round, carried out medication history and monitored treatment during and after hospitalization. Patients were selected according to age ( $\geq 75$  years) and number of drugs mentioned in the medical record ( $\geq 4$ ). The clinical pharmacist interventions were recorded on standard sheets, and evaluated by a doctor of the medical team who judged the clinical importance of the intervention. Results: 349 interventions were recorded, mainly initiated by the pharmacist (75%). The most important reasons for intervention were: no indication for the drug or not treated indication (23%); changes in route, form, technique or moment of administration (15%); detection of adverse drug effect, interactions ... (16%) and information to the staff (17%). The interventions were generally well accepted by the medical team ( $>90\%$  of full or partial acceptance) and evaluated as of major (37%) or moderate (47%) clinical importance. Conclusion: The added value of the presence of clinical pharmacist in the various services has been demonstrated. The pharmaceutical care program in place is highly valued and claimed by both the medical staff and nursing.

**PB7 445 THE FIRST SYSTEM OF REFERENCE FOR THE MEDICAL PRACTICE OF HOMEOPATHY IN FRANCE**

J. BILLOT\* (AP-HP Hôpital Corentin-Celton, Issy-les-Moulineaux, France)

Introduction At least 30% of the French population has recourse to homeopathy, with a large proportion of elderly persons. Some 25000 practitioners prescribe homeopathic treatments.

Object: Development of a system of reference for the medical practice of homeopathy in order to meet with the legal obligations of evaluation and training of homeopaths. Method : 1- Creation by the Société Française d'Homéopathie of a working group of expert specialists representative of the medical practice of homeopathy to determine: - a basic methodology: self-evaluation according to the method of practice groups; - the subject: « the homeopathic medical file»; - the aims and requirements of quality; - the standards of evaluation; - the number and content of items or inquiries 2- Verification of the text's form by a reader's group; 3- Verification of acceptability and feasibility by a group test; 4- New meeting of the working group to register the modifications shown necessary by the feasibility study; 5- Presentation of the text to the methodologists approved by the Haute Autorité de la Santé (Health Department); 6- Finalization of the project and transmission to the Haute Autorité de la Santé for validation. Results: Elaboration of a system of analysis with reference to the «homeopathic medical file», according to the method of practice groups. This system of reference includes a questionnaire concerning the symptoms noted in the patient's file: in order to be of homeopathic value, the symptoms must be precisely characterized and organized according to their relative importance. Conclusion This system of reference was validated by the Haute Autorité de la Santé in February 2007. Several practice groups have already used this system of reference to validate the legal obligations of their professional practice. The complete text of this system of reference can be downloaded on web-site: WWW.homeopathie-francaise.fr

**PB7 446 CHALLENGES IN DEVELOPING AN ON-LINE MSC GERONTOLOGY PROGRAMME : AN EU PARTNERSHIP PERSPECTIVE**

K. HORTON\* (University of Surrey, Guildford, United Kingdom)

P. SMITH(1) - (1) University of Surrey (Guildford, United Kingdom)

Introduction Demographic changes, advances in technologies and increasing pressure from professional bodies have led higher education institutions to review programme structures and delivery, in particular, developing an innovative curriculum to meet the needs of local, national and European society. This three-year study involving six EU partner countries aims to develop an on-line programme on Gerontology. Methods and materials The study uses a multi-site participatory case study approach. The principles of participatory research have the goal of addressing an innovation with partners; in this case, the development of an on-line programme which underpins its development. A structured questionnaire was designed to scope existing information relating to each of the six partner countries. This information included structures and processes that are in place in order to identify any potential problem(s) relating to the development of the on-line programme. Key foci within the questionnaire included programme structure, modes of delivery, module organisation, number of credits at Master's level, funding and fee structure, marketing and recruitment, entry requirements and the framework for managing the programme and the political and philosophical context of each partner country. Results A descriptive analysis was undertaken. Key themes emerged in relation to both structures and processes which included leadership and management; marketing and recruitment, programme entry requirement, validation processes, resources and assessment and feedback. Conclusion Developing an on-line MSc programme involving six EU countries has its challenges and rewards. It is argued that cross cultural learning within EU partner countries has the potential to enrich learning through innovation and interprofessional learning and working. Important factors such as leadership and management and assessment and feedback are key to ensuring the delivery of an online programme that would meet students' needs.

**PB7 447 TEACHING,SERVICES IN LATIN AMERICA:COSTA RICA CASE**

F. MORALES-MARTINEZ\* (Hospital Nacional de Geriatría y Gerontología, San José, Costa Rica)

Introduction The evolution of Geriatric Medicine in Latin America Brazil has only 20 hospitals with geriatric services and Mexico has a total of 12. The lack of organized services targeting the care of older people means that medical education continues to ignore the training of physicians in geriatric medicine. Costa Rica, Chile, Cuba and Panama are the only countries that have a specialized geriatric hospital; these hospitals vary in the number of services provided and in the degree of complexity that they are able to handle. Costa Rica appears to offer the most comprehensive program Other regional countries do have Geriatric Medicine Units. A survey was carried out through the region: Country Formal University training in Geriatrics Geriatric Unit Geriatric Medicine Department Geriatric Hospital Day Hospital Home care Argentina Yes Yes Yes No Yes Yes Brazil Yes Yes Yes No Yes Yes Costa Rica Yes Yes Yes Yes Yes Yes Colombia Yes Yes Yes No Yes Yes Cuba Yes Yes Yes Yes Yes Yes Chile Yes Yes Yes Yes No Yes Ecuador Yes Yes No No No Yes El Salvador Yes Yes No No No Yes México Yes Yes Yes No Yes Yes Panama Yes Yes Yes Yes No Yes Peru Yes Yes Yes No Yes Yes Uruguay Yes Yes Yes No No Venezuela Yes Yes No No Yes Yes Survey done: Dr. Fernando Morales-Martínez. The Costa Rican Experience The University of Costa Rica offers the Specialty in Geriatrics Medicine and Gerontology after graduating a medical doctor, with a 5 years duration. At present there are 60 geriatricians and 48 medical residents. The program graduates 10 geriatricians every year and admitted 10 new medical

residents every year. Conclusion: The teaching of geriatrics has to be included as an integral part of the training of general physicians.

**PB7 448 THE PATIENT'S PERSPECTIVE OF QUALITY IN AN AGED HEALTHCARE PROGRAM**

I. CAMERON\* (The University of Sydney, Sydney, Australia)  
L. WHITE(1) - (1) The University of Sydney (Sydney, Australia)

Introduction: Including the patient's perspectives in defining and measuring aged healthcare quality is emerging as an important factor to understanding the service outcome. Yet there is comparatively little work investigating patient perceptions of the quality of their service. Aged healthcare services continue to develop in type and complexity, and hence the need for a specific validated tool to assess the patient's perspective. Methods: A synthesis of the patient and health service quality literature was undertaken to examine: the existing measurement of quality in healthcare; the patient's role and impact on the quality of the service and its outcome; and the documented problems associated with employing satisfaction as an indicator of the patient's view of quality. A validated approach to measuring the patient's perception of the quality of their service is identified. To understand the factors influencing a patient's assessment of service quality, an exploratory qualitative study of patients aged over 80 receiving publicly funded community-based aged healthcare services was conducted. Results: The investigations established that Patient Orientation; Patient Involvement; and Service Provider and Patient Empowerment influenced a patient's perception of the quality of their service. The resultant conceptual model depicts: these four antecedents to perceived service quality; the global, dimensional and sub-dimensional components of perceived service quality, where each influences perceptions of the component above; and that this summated perception then triggers the health related behaviour adopted by the patient. An argument for the holistic measurement of healthcare quality to include the use of a validated and reliable patient specific instrument is made and a multi-dimensional hierarchical tool and measurement scale is presented. Conclusion: Evaluating the determinants of the aged patient's perception of the quality of their service will provide key information for service improvement and an understanding of the health behaviours that are subsequently adopted.

**PB7 449 THE ANALYSIS OF THE ARTICLES PUBLISHED IN JOURNAL OF THE KOREAN GERIATRICS SOCIETY**

Y. ROH\* (Kangnam Sacred Heart Hospital, Hallym University Medical Centre, Seoul, Republic of Korea)  
M. CHOI

Introduction: We thought that it is needed to look over the past issues in The Korean Geriatrics Society Articles, in order to assure that it is proper as an academic journal of geriatrics. We scrutinized the articles published in the Journal of The Korean Geriatrics Society. Methods: We analyzed 28 volumes of Journal of The Korean Geriatrics Society, published from 2001 to 2007. We counted the number of review articles, original articles and case reports by year. We classified articles as geriatric principles, basic sciences, and clinical studies, which were classified again by subjects as understanding of geriatric and elderly patients, problem common in elderly people, and clinical trial. We stratified original articles by the research methods, such as descriptive, analytical (cross-sectional, case-control, and cohort study), and investigational study. Results: Journal of The Korean Geriatrics Society was published in every three months. For 7 years, 275 articles were published, which included 32 review articles (11.6%), 182 original articles (66.2%), and 61 case reports (22.2%). They were dealing with the geriatric principles in 68, basic science in 19, and clinical study in 127 articles respectively. By subjects, 86 articles (32.0%) worked on understanding of geriatric and elderly patients, and many original articles were related with the cardiovascular and neurological system. Neurological diseases were most common in case reports. There were 50 descriptive (27.5%), 118 analytical (64.8%; cross-sectional 45.0%, case-control 18.7%, cohort 1.1%), and 14 investigational studies (7.7%). Conclusions: The proportion of original articles was highest in Journal of The Korean Geriatrics Society. A third of all articles were relevant to geriatric principles, and two thirds were analytical, which were thought to be proper as an academic journal of geriatrics.

**PB7 450 GERIATRIC CARES IN NORTH WESTERN EUROPE : WHAT ARE THE REGIONAL DIFFERENCES ?**

N. BLETTNER\* (CHU Liège, Liège, Belgium)  
J. PETERMANS(1), M. BERTHEL(2), N. N. BLETTNER, J. DANION, V. HANSMANN(3), A. SANCHEZ, M. VAN DER LINDEN, M. PETER, I. PIFFER, C. ORTOLEVA - (1) CHU Liège (Belgium); (2) CHU Strasbourg (France) ; (3) Conseil général du bas Rhin (France)

Background : a health and demography project is supported by European regional fund in INTERREG IVb Northern West Europe. Seven regions taking part in this cooperation are all faced with the same demographic problem. After evaluating and comparing their experience, the participants have to propose medium and long term solutions to answer to crucial human medical and social problems and their economic impact on territorial development, arising from the ageing of the population. Material and methods: to compare

different types of care given to old ill persons in accordance with different health politics and legislation and to verify appropriateness between the patients need and the qualification of caregivers. Five geriatric situations (Delirium, psychological handicap, somatic dependency, poly pathologies, social complexity) were described, at home, in resting home or in hospital, both within or outside geriatric wards. A standardised questionnaire was completed by each region and a glossary was created to standardize definitions. Results: each northern west European region have developed their own specific approach in order with the detection of geriatric profiles, health channels, geriatric interventions, and cares in or outside health institutions. However, there are no clear definitions of the aged person, the geriatric profile, caregivers and place of care; institution and organization are quite different in term of their type of financing health systems; usefulness of geriatric validated scales is well known but there is no consensus on which scales should be used. Conclusion: the creation of a transnational center of excellence in northern west Europe is necessary to respond to the demographic changes due to aging; but a lot of barriers should be eliminated, especially in the definition, financing and organization of health care, in the training of the caregivers and in the assessment tools used for the geriatric population.

**PB7 451 INCREASING THE PERCENTAGE OF APPROPRIATE REFERRALS BY A GERIATRIC MOBILE TEAM, AS A MARKER OF IT EFFICIENCY.**

T. JOUCDAR\* (Hopital Broca , Paris, France)  
F. BLOCH(1), Y. SPIVAC(1), A. LE BELLER(1), A. RIGAUD(1), N. CHARASZ(1) - (1) Hopital Broca (Paris, France)

Introduction Geriatric Mobile Teams (GMT) are emerging in recent years in emergency, medical and surgical units. Their aim is to improve the care of elderly patients, to optimize their referral to appropriate units and to encourage their return home with adequate aid. GMT have difficulties to define the criteria enabling them to reflect their activity. Our objective was to make a retrospective study of the activity of a GMT in an urban hospital, to evaluate the percentage of appropriate referrals. Methods and materials We analysed the 1044 records of the patients seen in 2007 and identified the initial reasons for the intervention of the GMT. The various reasons were: to define an adequate orientation, to transfer the patient in geriatric acute or sub acute cares, to evaluate the opportunities to return home, to make a cognitive evaluation or a counselling support. When the reason for the intervention was a request to transfer the patient in geriatric units, we analyzed the adequacy of the solution proposed by the GMT. Results The main reason to call the GMT was a request to transfer the patient in geriatric units (34%). Only 60% of these initial requests led to an effective transfer. Twenty per cent of patients whose initial request was a transfer in geriatric units were able to directly return home after the intervention of the GMT, 2% were admitted in an institution rather than a geriatric ward and 8% were hospitalized in private clinics. Conclusion The GMT seems to prevent a large number of non appropriate geriatric hospitalizations by promoting the home return or by shifting towards a more appropriate project. This is a way to improve, with a GMT, the fluidity of elderly patients' flow in spite of a limited access to beds in a tertiary university hospital.

**PB7 452 MEDICATION RECONCILIATION: IDENTIFYING MEDICATION DISCREPANCIES IN ACUTELY ILL HOSPITALIZED OLDER ADULTS**

D. VILLANYI\* (University of British Columbia, Vancouver, Canada)  
M. FOK(1), R. WONG(1), J. DELEMOS(2), F. PATAKY(2) - (1) University of British Columbia-Geriatric Medicine (V5Z 1M9, Canada); (2) Vancouver General Hospital Pharmaceutical Sciences (Vancouver, Canada)

Introduction: Medication discrepancies are prone to occur during transitions from community to acute care hospitals. The elderly are at risk for such discrepancies due to multiple co-morbidities and complex medication regimens. Medication reconciliation involves verifying medication use, identifying discrepancies, and rectifying them. Our objective was to describe the prevalence and type of medication discrepancies in acutely ill older patients. Methods: We prospectively enrolled patients 70 years or older, admitted to 3 acute care for elders units (ACE) over two months in 2008. Medication discrepancies were classified as intentional, undocumented intentional and unintentional. Unintentional medication discrepancies were graded by a blinded rater for potential to harm. Results: Sixty-seven subjects (42 women; mean [SD] age 84.0 [6.5] years) were enrolled. There were 37 unintentional prescription medication discrepancies in 27 (40%) subjects and 43 unintentional over-the-counter (OTC) medication discrepancies in 19 (28%) subjects. This translates to Medication Reconciliation Success Index (MRSI) of 89% for prescription medications and 59% for OTC medications. The overall MRSI was 83%. Over half of the prescription medication discrepancies (57%) could potentially cause moderate/severe discomfort or clinical deterioration. Conclusion: Despite a fairly high overall MRSI in ACE patients, a substantial proportion of the prescription medication discrepancies were associated with potential harm. Future studies are needed to investigate the effectiveness of a robust medication reconciliation program in acutely ill older adults.

**PB7 453 THE GERONTONET FEASIBILITY STUDY. A DESCRIPTION OF 414 EUROPEAN OLDER PEOPLE.**

G. ABELLAN\* (Toulouse University Hospital, Toulouse, France)

G. GAMBASSI(1), C. RAJKUMAR (2), A. CRUZ-GENTOFTE (3), A. SINCLAIR (4), B. VELLAS (5) - (1) Centro Medicina Invecchiamento, Universita Cattolica Sacro Cuore (Italy); (2) Brighton and Sussex Medical School, Royal Sussex County Hospital (United Kingdom); (3) Department of Geriatric Medicine, Hospital Ramon y Cajal (Spain); (4) University of Bedfordshire (United Kingdom); (5) Inserm U558, University of Toulouse III (France)

**Introduction:** The aim of GerontoNet (expert panel of 40 European Academic Medical Centres) is to enhance European research and overcome under-representation of older people in RCTs. The present study reports the feasibility of a Geriatric Minimum Data Set (GMDS). This dataset is a composite tool of different validated scales used in usual Comprehensive Geriatric Assessment and has been developed with the aim of standardisation of assessment tools. **Methods and materials:** The feasibility criteria were established prior to the study: • Each centres had to include > 10 participants during a 4-months inclusion period • At least 80% of the centres had to participate • For each assessment tool, no more than 20% of missing values were permitted • Respect of inclusion and exclusion criteria **Results:** Results of the feasibility were discussed in the annual GerontoNet meeting. Of the 40 centres, 27 participated at the study (67.5%), 24 centres (60%) fulfilled the criteria of including at least 10 participants. Ten assessment tools presented more than 20% of missing values and were rejected in the final composite GMDS. 414 older persons were included mainly from the outpatient consultation (19.3%) and the day hospital (28.7%). The mean age of the sample was  $80.7 \pm 6.8$ ; 252 (61.3%) were female; 168 were living with spouse (40.6%); 300 (72.5%) presented mild or no degree of ADL impairment; 233 (57.4%) presented no cognitive impairment; the mean number of comorbidities were  $4.1 \pm 1.7$ ; 216 (55.1%) had a good nutritional status; and finally 247 (62.2%) had no depressive symptoms. 75 of the included participants (18.1%) met exclusion criteria (MMSE <16 and ADL <3). **Conclusion:** The GerontoNet meeting concluded on the acceptance of the GMDS in a broad range of older people and countries and obtained a preliminary database in order to scope future European research.

**PB7 454 TRIGGER TOOL METHODOLOGY TO ASSESS ADVERSE DRUG EVENT MEASUREMENT IN A GERIATRIC HOSPITAL.**

D. VILLANEAU\* (Hôpitaux universitaire de Genève, Thônex-Genève, Switzerland)

N. VOGT-FERRIER(1) - (1) Hôp Univ de Genève- Hôp Trois-Chêne (Thônex-Genève, Switzerland)

**Introduction** Monitoring the quality of medication care is important. We adapted the IHI (Institute for Healthcare Improvement) Medication Trigger Tool to identify adverse drug events (ADE) in a Swiss geriatric hospital and to quantify the harm they cause. **Methods** In 200 medical records, the last 30 days of hospitalization were retrospectively reviewed for the presence of 38 « triggers » or « clues » that an ADE may have happened. All triggers and ADE were defined explicitly, to ensure inter-investigators consistency. Example: Trigger is INR>6, ADE is bleeding in an anticoagulated patient. The severity of each ADE was also recorded. **Results** Mean review time per record was 25 minutes. Patients were on average 84 years-old, were exposed to a mean of 14 different drugs per stay, and took on average 11 drug doses/day. Median length of stay was 29 days. 207 ADE were identified and 14% of these were related to a drug interaction. 13% of the identified ADE led to prolongation of the hospital stay. Three were life-threatening and one lethal. The 12 triggers with the best “power” to detect an ADE were: Abrupt stop of drug therapy, “lethargy-somnolence or falls”, INR>6, digoxinemia  $> 2.6 \text{ nmol/l}$ , hyponatremia, hyperkalemia, white blood cells  $< 3 \text{ G/l}$ , hypoglycemia, sodium polystyrene (for hyperkalemia), antiemetics or anti diarrheal agents, and more than 4 psychotropic agents. **Conclusion** Potentially, 7.7 ADE per 100 drug doses and about 9 ADE per day may occur amongst the heavily medicated elderly patients in our 300 beds geriatric acute care center. Regular chart reviews using the 12 best performing triggers may suggest ways to improve medication care. It provides a means of monitoring the effects of corrective measures implemented on the basis of previous results. Automated data collection using our integrated hospital information system may speed the review process, but has not yet been studied.

**PB7 455 PERCEPTIONS OF ORAL HEALTH ADEQUACY IN LONG-TERM CARE FACILITIES IN TOKYO**

K. SHIMOMYAMA\* (Tokyo Medical and Dental University, Tokyo, Japan)

A. HAGIMOTO(1) - (1) Tokyo Medical and Dental University (Tokyo, Japan)

**Introduction:** Literature has described the oral health needs of nursing home residents. Oral health in long-term care facilities has been repeatedly documented as less than ideal. The purpose of this study was to determine perceptions of oral health care and practices related to oral health care by surveying administrator of long-term care facilities in Tokyo. **Methods and materials:** A 17-item questionnaire exploring oral health care was mailed to all 389 long-term care facilities in Tokyo. The questionnaire consisted of closed-ended questions and Likert-type scales. **Results:** Facility response rate was 39.3% (n=153). Dentists as part-time staff served in 18 per cent of nursing facilities. Staff dental hygienists, full-time or part-time, served in 14 per cent of nursing facilities. Three per cent of

respondents strongly satisfied with oral health care for residents and 40 per cent satisfied with oral health care for residents. Nineteen per cent reported dissatisfaction and five per cent reported strong dissatisfaction. Thirty-three per cent were undecided. Twenty-seven per cent stated an examination by a dentist was provided to new residents. Forty-two per cent stated regular dental check-ups were provided to residents. Sixty-one per cent stated an oral observation by nursing staff was provided to new residents. Sixty-eight per cent of facilities had an oral health care manual for nursing staff. Sixty-two per cent made an assessment of oral hygiene by nursing staff. Administrators' satisfaction with oral health care for nursing home residents significantly related to factors, such as staff dental hygienists, regular dental check-ups, a dental observation by nursing staff, an oral health care manual and an assessment of oral hygiene. **Conclusion:** Participation by dental staff within care teams in nursing homes may help to promote oral health care

**PB7 456 INFECTION AND ITS CONTROL IN GROUP HOMES FOR THE ELDERLY IN JAPAN**

S. EBIHARA\* (Institute of Development, Aging and Cancer, Tohoku University, Sendai, Japan)

T. EBIHARA(1), K. OSAKA(2), H. ARAI(1) - (1) Institute of Development, Aging and Cancer, Tohoku University (Sendai, Japan); (2) Tohoku University School of Dentistry (Sendai, Japan)

Group homes, which are small-scale facilities as the alternative to traditional larger-scale long-term care facilities for elderly demented people, are rapidly proliferating across Japan. Recently, spreading and mass outbreaks of influenza and norovirus in senior care facilities have been reported in many regions. Small-scale facilities paid less attention to infection control than large-scale ones. Therefore, we examined the actual conditions of infection and the systems of infection control in small-scale care facilities in Japan. Questionnaires were sent to 1,899 care facilities registered with the National Association of Dementia Group Homes throughout Japan to investigate infection control measures at each facility. 684 facilities (36%) completed the questionnaires. 26% of facilities had residents who had been infected with influenza, 14.5% with scabies, 12% with norovirus and 8.2% with MRSA. The mass outbreaks reported in these facilities were norovirus (9.8%), influenza (7.9%) and scabies (4.7%). Regarding the response following norovirus infection, 90.1% of facilities used gloves but only 60.1% used masks when disposing of vomit. 26.9% of facilities kept pets, 11.6% kept dogs, 4.7% kept cats and 0.3% kept reptiles that are considered carriers of salmonella bacteria. Although most facilities had policies addressing the collection of bodily fluids, blood, and feces for disposal, they did not have any standardized policies outlining final disposal methods. 60% of facilities disposed of them as general refuse. We conclude that improvement in the actual conditions of infectious disease control in small-scale facilities for elderly people in Japan is needed. The problems highlighted in this research show the need for developing standardized infectious disease control strategies and creating a manual, outlining detailed measures designed to specifically meet the needs of small-scale group homes in Japan.

**PB7 457 ASSESSING QUALITY IN AUSTRALIAN RESIDENTIAL CARE FACILITIES MADE EASY: THE RESCAREQA.**

M. O'REILLY\* (Queensland University of Technology (QUT), KELVIN GROVE, Australia)

M. COURTNEY(1), H. EDWARDS(1), S. HASSALL(2) - (1) Queensland University of Technology, Institute of Health & Biomedical Innovation (KELVIN GROVE, Australia); (2) Blue Care (MILTON BC, Australia)

**INTRODUCTION** Residential aged care in Australia does not have a standardised system of quality assessment related to clinical outcomes. Consequently, an assessment based on resident outcomes was developed and evaluated in collaboration with care providers. This paper will present an overview of the instrument - the ResCareQA (Residential Care Quality Assessment). As criteria and standards are necessary for making judgements about quality, preliminary benchmarks developed for use with the ResCareQA will also be discussed. **METHODS & MATERIALS** Nominal Groups allowed extensive consultation with industry experts, who identified clinical areas necessary for inclusion in an Australian quality assessment. A Delphi study and quantitative survey collected data from 498 residents in 9 residential facilities to confirm face and content validity, as well as reliability, user-friendliness, and concurrent and discriminative validity. An expert panel then participated in a further Delphi survey to deliberate on preliminary benchmarks of quality. **RESULTS** The ResCareQA examines 24 clinical areas within four domains; reflecting care domains from the Australian Residential Accreditation Standards (Resident Health, Personal Care, Resident Lifestyle, Care Environment). It is holistic, providing rich data concerning resident outcomes, while being relatively quick and easy to administer. The ResCareQA consistently demonstrates a mean completion time of 30 minutes/resident, while informal feedback indicates increased familiarity with assessment and residents allows for shorter completion times. Psychometric analyses demonstrated that it has sound reliability and validity, and benchmarks provide tangible measures to allow judgements of quality to be made. **CONCLUSION** Australian residential facilities require a valid and reliable means of monitoring care quality and informing quality improvement. However, rather than adopting another instrument, the ResCareQA was specifically developed for the Australian context, providing a sound and comprehensive approach to quality monitoring.

Its process of development could be readily adopted by anyone wishing to create a quality assessment specific to their needs.

**PB7 458 PRESERVATIVE CARE. ON GOOD DAILY, CONCRETE NURSING CARE FOR VULNERABLE ELDERLY IN NURSING HOMES**

J. JUKEMA\* (Windesheim University of Applied Sciences, Zwolle, The Netherlands)

M. GRYPDONCK(1), M. VERKERK(2) - (1) University of Utrecht (Utrecht, The Netherlands); (2) University of Groningen (Groningen, The Netherlands)

Introduction Elderly in nursing homes describe their situation often as difficult and hopeless. They face an all-encompassing care dependency, lack of control in daily routines of clothing, washing, eating and socializing, and loneliness. More than that, cases have been reported of residents actually being harmed by a lack of caring by nurses. The aim of this research is to articulate good nursing care in nursing homes. The research question is: 'what is morally good daily nursing care of vulnerable elderly in nursing homes? Methods Within an iterative research process theoretical work (by nurses, philosophers, care ethicists) aided the interpretation of empirical data (participative observations (515 hours) and interviews (n=35) with both elderly and nurses in 9 nursing homes), whereas empirical data helped us to discuss and clarify theoretical insights. Results Personal daily, concrete care is both an expression of personhood and a mean to constitute and continu someone's personhood. Elderly nursing home residents are not longer able to care for themselves. So, they depend to a large extent on nurses in maintaining and continuing their personhood. A nursing home is a moral practice aiming at holding elderly, amongst others, as unique persons within the community. Nurses are morally responsible to provide daily, concrete care which preserves an elder in such a way that he or she is shown to full advantage within a changing context of progressive dependency and permanent stay in a nursing home. Such a quality of care is preservative care. Nurses who are able to care in this particular way are recognised by their attentiveness, modesty, and competence. Conclusion In practices of preservative care, elderly persons remain worthy members of society at large. Preservative care is a relational practice. So, in practices of preservative care nurses are also valued and held as valuable unique persons.

**PB7 459 QUALITY IMPROVEMENT PLAN FOR THREE AGED HOMES IN THE SPECIAL ADMINISTRATIVE REGION OF MACAO, CHINA ("MACAO") IN 2008-2009**

A. CHIU\* (Hong Kong Association of Gerontology, Hong Kong, Hong Kong)

Introduction Similar to many cities and regions over the globe, Macao is experiencing an era of aging population, when the society becomes acutely concerned of the care of the aged. In 2008, upon the invitation of Macao SAR, the Hong Kong Association of Gerontology ("HKAG") has begun to assist three Aged Homes to implement the Quality Improvement Plan ("Plan") to meet the requisite standard of competence care of residential homes in Macao ("Standard"). Methods and materials By holding Training Workshop, Professional Consultation Sessions, this comprehensive Plan aims to revamp the Human Resources Management System, the Documentation System, and the Care and Management System of the Aged Homes. In the first and second phases of the Plan from August 2008 to January 2009, the HKAG Consultation Team visited the Aged Homes bi-weekly to assist three homes to establish quality management system. Review visits assessing the effectiveness of the Plan are scheduled in April 2009. According to the results of the review visits, the Aged Homes will then have to prepare further improvement plans to reach the mandated Standard for the consultant team to approve. After that, the Aged Homes have to improve the homes according to their resolutions drawn. Results Since the Plan is still running currently, final results will be announced in mid 2009. In the interim, it has been observed that the caring services of the Aged Homes have undergone prominent changes. Conclusion It is important to help the aged home establish an effective system to run the services to care for the elderly. With emphasis on personal coaching and on-site supervision during the whole process, all staff, including the front line carers, the professionals and the management level, appreciate the change and have demonstrated great efforts to contribute to the success of the improvement.

**PB7 460 PHYSICAL ACTIVITY AND RELATED FACTORS AMONG ELDERLY WOMEN**

N. SARAFRAZ\* (Medical university, Kashan, Islamic Republic of Iran)

A. BAGHERI(1), F. ABASZADE(1), M. KAFIAIE(1) - (1) Kashan, Islamic Republic of Iran)

Objectives: The purpose of this study was to examine physical activity among the elderly women with Barthel Index (BI) that has been recommended for the functional assessment of older people. Methods: The sample was obtained every women from the entire nursing home population (n = 190) in the city of Kashan, in 2008. Information was eventually collected by interview from persons and nurses. Activity was assessed using the Barthel Index(BI) test . Data analysis was performed with SPSS. Results: The results indicated the following: The More than 30% of the women reported decreased physical activity during their stay in the nursing home. Barthel Index score was>75 in 15%, 51-75 in 24% and < 50 in 61% of women. Age, total number of medical conditions, and presence of cardiovascular were significant with low Barthel Index score( $p < 0.001$ ). Conclusions: The

results suggest that living conditions and factors related to health and functional capacity affect the level of physical activity among nursing home residents. In order to encourage this population to be physically active, attention should be paid not only to physical exercise but also to associated factors, such as satisfaction with everyday life and health

Keywords: Barthel Index, physical activity, elderly women

**PB7 461 THE STANDARD FOR THE PROVISION OF RESIDENTS OF INPATIENT NURSING INSTITUTIONS OF MARSEILLE-KLINIKEN AG WITH NUTRITION AND LIQUIDS**

U. OLSCHEWSKI\* (Eqs.-Institut, Hamburg, Germany)

C. LÖSCHMANN(1), S. DIETSCH(1), U. ARENS-AZEV DO(2) - (1) eqs.-Institut (Hamburg, Germany); (2) HAW (Hamburg, Germany)

Introduction Malnutrition represents a frequent problem in inpatient nursing institutions (Tannen et al. 2008). A standard for the nutrition and supply of liquids has been created for the residents of Marseille-Kliniken AG. The aims were to reduce the incidence of malnutrition, to recognise a risk of malnutrition at an early stage and to initiate specific measures for treating malnutrition. Methods and materials The actual status was recorded in order to create the standard. To this end the nursing documentation was analysed (BMI and other data) and family members, nurses of residential groups for residents with dementia and nursing services were questioned. Almost every tenth resident had a BMI < 18.5 kg/m<sup>2</sup> (Olschewski et al. 2009). Moreover, research was conducted into evidence-based measures for the treatment of malnutrition and dehydration in the care of the elderly. The standard is composed of four main parts: Measures for prophylaxis, a screening in order to identify residents with a risk of malnutrition, an assessment in order to identify the causes of malnutrition and special measures for certain nursing problems and clinical pictures (e.g. nutrition for residents with dementia). Results The evaluation of the standard began in three pilot institutions of Marseille-Kliniken AG in November 2008. The tools (screening, assessment) will be tested, the nutritional status of the residents recorded (pre-post comparisons by analysing the nursing documentation) and the benefit of the standard evaluated (questioning of the residents, nurses, employees of the kitchen, family members and nursing services). Conclusion The evaluation will take until the end of June 2009. The first feedback from the nurses and the nursing services is positive. The standard will be implemented in all inpatient nursing institutions of Marseille-Kliniken AG in July 2009. Nurses and employees of the kitchens will be trained accordingly.

**PB7 462 IMPROVED QUALITY OF CARE USING THE RAI-MDS INSTRUMENT IN AN ITALIAN NURSING HOME BETWEEN 1999-2007**

G. MENCULINI\* (Residenza Protetta "Creusa Brizi Bittoni, Perugia, Italy)

M. FATICHENTI(1), N. POPA(1), S. SIMONCINI(1), G. SORBINO(1), M. MARCACCI(1), A. OCHESSALU(1), A. PECYNA (1), G. DELL'AQUILA(2), U. SENIN(2), A. CHERUBINI(2) - (1) Residenza Protetta "Creusa Brizi Bittoni (perugia, Italy); (2) Institute of Gerontology and Geriatrics, University of Perugia (perugia, Italy)

AIM To present the benefits of introducing Comprehensive Geriatric Assessment based on the Resident Assessment Instrument- Minimum Data Set (RAI-MDS) instrument in an Italian nursing home (Residenza Protetta "Creusa Brizi Bittoni" di Città della Pieve - Perugia) during a 8 year period. METHODS The use of RAI-MDS was implemented in this nursing home since 1999. The multidisciplinary team evaluates every resident using this instrument on admission and every 6 months afterwards. The data obtained through the assessment are discussed during team meetings and used to produce individualized health care plans. RESULTS The nursing home has a total of 50 beds for disabled older people. Although during these years the nursing home residents became sicker and more disabled, by using the RAI-MDS several measures of the quality of care improved, such as hospitalization rate, falls and fractures incidence, pressure sore prevalence, use of physical restraints and of psychotropic drugs. The main results are reported in table 1. Tab. 1 Main results of the implementation of the RAI-MDS instrument in the period between 1999 and 2007 1999 2007 Death rate 26% 26% Hospitalization rate (based on the local population) 0,09/00 0,014/00 Falls 162% 28% Hip fractures 4% 0% Pressure sores 24% 12% Physical restraints 35,3% 14% Use of psychotropic drugs 90% 62% DISCUSSION The use of comprehensive geriatric assessment based on the RAI-MDS instrument determined a significant improvement of the quality of care.

**PB7 463 PRACTICE GUIDELINE ON PHYSICAL RESTRAINTS - THE GUIDELINE GROUP MEMBERS' PERSPECTIVE**

A. HAUT\* (University of Witten/Herdecke, Witten, Germany)

W. SCHNEPP(1), G. MEYER(1) - (1) University of Witten/Herdecke, Institute of Nursing Science (Witten, Germany)

Introduction: Currently, we are developing the first evidence-based guideline on physical restraints in nursing homes in Germany. The multidisciplinary guideline group, including representatives from nursing science/practice/advisory boards and quality assurance, insurance companies, medicine, law, ethics and patients' representatives, held five meetings. Evaluation of the group process during guideline development remains a challenge, though it is widely acknowledged that participation and interaction of patients, their representatives and professionals is of major concern for successful guideline

development and implementation. Therefore the development process was evaluated from the group members' perspective. Methods and materials: Standardised instruments for the evaluation of guideline development processes are not available yet. Thus, a methodologically open approach with qualitative methods was chosen. Process data of the five guideline meetings were collected through unstructured observation and written documentation. Based on the observation protocols problem-centred individual interviews with the multidisciplinary representatives (n=11) were conducted (11/2008). The data analysis according to the method of Grounded Theory relies on interview transcripts, postscripts, memos and observation protocols. Results: From a review of the observation protocols and of the interviews the following sensitizing concepts emerge: role/behaviour of group members/moderator/group leader, understanding of concepts of evidence based medicine, methodological procedure of guideline development, group dynamic and interdisciplinarity. Preliminary results point out the decisive role of a skilled moderator. Also, the group members' understanding of evidence-based medicine and methodological procedures seems to be a critical point as well as a successful integration of an interdisciplinary group. Analysis of the interviews is ongoing. Conclusion: Conclusions can be drawn for future guideline development group processes regarding decisive elements of optimal group process facilitation, like moderation instructions or methodological training of group members.

**PB7 464 WHICH APPLICATION AND WHICH EFFECT OF "SNOEZELEN" FOR DEMENTED PEOPLE LIVING IN NURSING HOME?**

V. DUBOST\* (Groupe Korian, Paris, France)  
C. RIGAUD-PERCHEY(1), P. DENORMANDIE(1) - (1) Groupe Korian (Paris, France)

Introduction Snoezelen, also referred to a multi-sensory stimulation, is an approach which actively stimulates the sense of hearing, touch, vision and smell in a resident-oriented, non threatening environment (Kok et al. 2000). Although Snoezelen has become a popular clinical intervention for people with dementia, its application often varies in form, principles, duration, and subject groups. Such variations in application make the assessment of the therapeutic value of Snoezelen difficult, which in turn undermines the clinical development of this approach. This observational study aimed to specify the application of Snoezelen for demented people living in nursing home and investigate the short-term effects of Snoezelen on physiological and behavioural changes. Methods and materials The Snoezelen sessions were characterized using their duration, frequency, objectives, and sort of stimulation used. During the session, the proposals which hold resident's attention, as well as the posture and the behaviour of resident were documented. Heart rate was recorded just before and just after each session. Results The mean duration of each session is 44 min, and usual frequency is one session / week. Snoezelen sessions are intended to residents who present moderate stage of dementia (CDR = 2.1). The three main objectives of sessions are: relaxation (40%), decrease of agitation (22%), and mood improvement (15%). The first results show that heart rate after the session tends to decrease for each subject, as compared to before the session. Conclusions Until now, most studies used conventional behaviour assessment tools, and there has been limited evidence for the effectiveness of Snoezelen. This study is in process, but our results concerning short-term effects of Snoezelen are promising, they must be verified by a larger sample of subjects.

**PB7 465 ANALYSIS OF INTERNATIONAL GUIDELINES AND STANDARDS ON PHYSICAL RESTRAINT USE IN NURSING HOMES**

R. MOEHLER\* (University of Witten/Herdecke, Witten, Germany)  
A. HAUT(1), G. BARTOSZEK(1), G. MEYER(1) - (1) University of Witten/Herdecke, Institute of Nursing Sciences (Witten, Germany)

Introduction: An evidence-based practice guideline can be a powerful tool to overcome unnecessary variations in nursing practice and to enhance the quality of care. Currently, a guideline on physical restraints in nursing homes in Germany is developed. Therefore, internationally available guidelines, standards and other recommendations were systematically collected and analysed concerning their content and use of evidence-based guideline development methods. Methods and Materials: The systematic search covered electronic databases (PubMed, CINAHL, Gerotlit, Carelit) and an internet search (google.de/ch/at, metager.de, metacrawler.com), including 34 international health care organisations. It was restricted to German and English documents of the last ten years. According to the AGREE instrument a criteria catalogue was developed and pre-tested in six documents. Two independent researchers analysed the documents applying the 33 criteria addressing formal criteria, scope and purpose, stakeholder involvement, editorial independence, definition and application of physical restraint, development process, recommendations for avoidance of physical restraints and implementation. Results are interpreted according to frequencies and content-analysed categories. Results: The search revealed 29 international (mainly Anglo-American) and 14 German documents, published by professional, national accreditation, nursing, political and educational organisations and ministries. Transparency of the development process was limited: Stakeholder involvement and external review were rarely mentioned (n=4 and n=2) and only two documents base their recommendations on external evidence. Almost all documents advocate for a rather restraint-free policy with a variety of recommendations. Conclusion: Transparency of international guidelines, standards and recommendations on physical restraints in nursing homes is inadequate, lacking rigorous methodological procedures. Therefore, their

recommendations on physical restraints in nursing homes are not suitable to enhance evidence-based nursing practice.

**PB7 466 PREDICTORS OF WHEELED MOBILITY IN INDIVIDUALS IN RESIDENTIAL CARE**

W. MORTENSON\* (University of British Columbia, Vancouver, BC, Canada)  
W. MILLER(1), C. BACKMAN(1), J. OLIFFE(2) - (1) University of British Columbia, Department of Occupational Science and Occupational Therapy (V6T 2B5, Canada); (2) University of British Columbia, School of Nursing (V6T 2B5, Canada)

Introduction: Wheelchairs are the primary means of mobility for the majority of older adults living in North American residential care facilities. Regrettably, the wheelchairs that many residents receive are uncomfortable and difficult to propel. Residents in need of seating intervention have been found to have reduced mobility, but little is known about how other factors influence wheelchair mobility in this population. Methods and materials: To identify predictors of wheelchair mobility among individuals living in residential care a cross-sectional study was undertaken with 268 residents from 11 facilities including 149 competent individuals and 119 residents who required proxy respondents. Standardized personal, wheelchair-related and environmental measures were administered and socio-demographic and wheelchair data were collected. Mobility was measured using the Nursing Home Life Space Diameter measure, which quantifies the frequency, extent, and independence of residents' mobility inside and outside of their facilities. Results: Subjects had a mean age of 84 years (SD=8.6) and 69% were women. Most participants (91%) had manual wheelchairs; 63% of subjects were independently mobile on their units, 40% were independently mobile off their units within the facilities and 20% were independently mobile outdoors. A linear regression model accounted for 48% of variance in mobility scores. In descending order of importance, the significant predictors of mobility were wheelchair skills (including the capacity to engage brakes and manoeuvre), functional independence in activities of daily living, having 4 or more visits per week from friends or family and use of a power wheelchair. Conclusion: Limited independent mobility, especially outdoors, is a common problem among facility residents. To improve mobility residents may benefit from wheelchair skills training, provision of powered mobility or increased visits from others, but the effectiveness of these interventions would need to be evaluated in future experimental research.

**PB7 467 CONSTRUCTIVE STAFF-FAMILY RELATIONSHIPS IN RESIDENTIAL AGED CARE**

L. MCAULIFFE\* (La Trobe University, Melbourne Victoria, Australia)  
R. NAY(1), T. BATHGATE(1), M. BAUER(1), M. O'DONNELL(1),  
D. FETHERSTONHAUGH(1), M. WINBOLT(1), E. HAESLER(1), B. KOCH(1) - (1) Australian Centre for Evidence Based Aged Care (ACEBAC) (Melbourne Victoria, Australia)

INTRODUCTION Research evidence shows that residents' experience of care is better when staff and family have positive relationships. The objective of this project was to identify and address challenges to the development and maintenance of constructive staff/family relationships in residential aged care by developing, implementing and evaluating an interdisciplinary evidence based guideline for use by staff and families of residents. MATERIALS & METHODS This project used an action research approach to increase the likelihood that staff would 'own' the outcomes and that change would be embedded in practice. The project consisted of a systematic review of the evidence; a survey of staff and families' perceptions of their relationship; development of the guideline incorporating stakeholder feedback and facility staff education; and implementation of the guideline and clinical audit tool. A second survey of staff and families was then conducted to determine any change. Three residential aged care sites in Melbourne, Australia completed the survey. RESULTS Major recommendations from the systematic review included: increase education for both staff and families on relationship development, power and control issues, communication skills, and negotiation techniques. Strong support from administration and management staff was identified as being vital to the success of any interventions. Analyses of survey findings using Mann Whitney revealed significant differences between: staff and family perceptions for both survey 1 and 2; staff perceptions at each site between survey 1 and 2; and family perceptions at each site between survey 1 and 2. CONCLUSION Although staff-family relationships generally improved after the implementation of the guideline, several site specific issues and areas for improvement were identified. These will be further elaborated upon and the implications of these findings discussed.

**PB7 468 PATTERNS OF CHOLINESTERASE-INHIBITOR AND MEMANTINE USE IN NURSING HOMES: A CROSS-SECTIONAL STUDY OF 1975 RESIDENTS.**

N. BARRO-BELAYGUES\* (Service de Médecine Interne et Gérontologie clinique; Hôpital La Grave Casselardit, Toulouse, France)  
S. GÉRARD(1), G. ABELLAN VAN KAN(1), S. GUYONNET-GILLETTE(2), Y. ROLLAND(2), B. VELLAS(1) - (1) Service de Médecine Interne et gérontologie

clinique, Hôpital La Grave Casselardit (Toulouse, France); (2) INSERM U558, Université Toulouse 3, Département d'épidémiologie et de santé publique (Toulouse, France)

**Introduction:** Dementia is frequently reported in nursing home (NH) residents but only few data are available assessing the factors associated with the use of the treatment of Alzheimer's disease in this population. The aim of this study was to report the factors associated to cholinesterase-inhibitor and memantine use in demented residents. Methods and materials: The "réseau de Recherche en Etablissement d'Hébergement pour Personnes Agées" (REHPA) is a functional network established, between the Geriatric Department of the Toulouse University Hospital and 240 NH, to overcome weak evidence-based recommendations and enhance research. Data presented are part of a cross-sectional observational study that was set up to identify major health problems in NH. Demography, disabilities, comorbidities and specific treatment and diagnosis of dementia in 4896 residents (randomly selected by birth date) was evaluated. Multivariate linear regression models were performed. Results: Among the 1975 dementia affected residents (40.3% of the all sample) 49.11% were specifically treated. The associated non-treatment factors were: an institutional stay over 3 years [OR=0.60 95% CI: 0.48-0.75], a concomitant antipsychotic treatment [OR=0.60 95% CI: 0.55-0.90], an hospitalization before admission [OR=0.70 95% CI: 0.48-0.76], a transfer from another institution [OR=0.49 95% CI: 0.34-0.70], and the presence of polypharmacy [OR=0.95 95% CI: 0.92-0.99]. The associated treatment-factors were: the presence of behavioral disturbances [OR=1.46 95% CI: 1.10-1.94], low disability [OR=2.20 95% CI: 1.62-3.00], and diagnosed by a specialist other than the GP (mainly geriatrician [OR=2.81 95% CI: 1.89-4.18] and neurologist [OR=4.05 95% CI: 2.66-6.16]). Conclusion: The treatment of dementia in NH relies on the number of years in the institution, antipsychotic treatment, hospitalization before admission, transfer from another institution, polypharmacy, presence of behavioural disturbances, level of disability, and specialist involved in the diagnose.

**PB7 469 THE PRACTICE OF SPUTUM ASPIRATION AND TUBE FEEDING BY NURSES AND CAREGIVERS AT SPECIAL NURSING HOMES FOR THE ELDERLY**

T. MIZUNO\* (Tokyo women's Medical University, Tokyo, Japan)  
M. KONAGAYA(1), T. KAMEI(2), S. SAKAI(1), Y. LAU(1), R. IZAWA(1),  
M. NISIDA(3), K. KANAGAWA(4), K. OTA(5), K. ISHIGAKI(6), K. NAKAJIMA(7) -  
(1) Tokyo Women'S Medical University (Tokyo, Japan); (2) St. Luke's College of Nursing (Tokyo, Japan); (3) Okayama University (Okayama, Japan); (4) Ishikawa Prefectural Nursing University (Ishikawa-ken, Japan); (5) Keio University (Japan); (6) Chiba University (Japan); (7) JNA Nursing Education and Research Center (Japan)

In Japan, it has been hard to place elders who need supervised medical care into special nursing homes for the elderly, but in 2006 these institutions were given directives to cope with seriously ill patients. Providing safe medical care in nursing homes without full-time doctors or night-shift nurses became an urgent topic. Objectives: This study examines the medical care that nurses and caregivers give elderly nursing home patients. Results will be used for materials on care programs. Methodology: We randomly selected 30 of Japan's special nursing homes for the elderly (with 100 or more patients) that perform aspirations and tube feeding. Full-time nurses and caregivers were interviewed using a structured, open-ended format. Survey Topics: Nurse and caregiver demographics; individual implementation and reason for sputum aspiration and feeding tubes; performance levels; and implementation systems. Subjects were respondents at institutions that gave their informed consent. Results: Caregivers usually performed the medical care of sputum aspiration at night when nurses were not on duty. Aspiration was limited to the mouth and was considered to be oral care rather than medical action. Nurses usually performed tube feeding, but some institutions allowed caregivers to perform this under nurse supervision. Nurses made assessments, chose and modified methods, and instructed caregivers. Many institutions trained caregivers for the implementation of aspirations and tube feeding, and by ascertaining nurse and caregiver competence, worked with the capable caregivers. Discussion: Caregivers often perform medical care without fully understanding their actions and responsibilities. Nursing care should be the responsibility of nurses, instructions and information, the conditions and methods of delegation, and what duties may be delegated should be clear. There should be continued assessments. These findings will be incorporated into our care program.

**PB7 470 LEADERSHIP AND ORGANIZATION IN NURSING HOMES: IMPACT ON QUALITY, JOB SATISFACTION AND COST**

A. HAVIG\* (NOVA, Oslo, Norway)

**INTRODUCTION** The purpose of this study is to assess quality, job satisfaction and cost in light of different types of leadership and different types of organization in nursing homes. Are some types of leadership and organization more efficient and effective in creating quality to the patients, job satisfaction and low cost? Although studies have examined both leadership and types of organization in nursing homes, few studies have examined both aspects simultaneously. **METHODS AND MATERIAL** 40 units in 22 nursing homes participate in the study. The nursing homes are randomly selected and are located in large and medium-sized councils in five areas throughout Norway. Leadership (task related, relation related, transformation and laissez faire) is measured by a questionnaire among the staff, organization is measured by interviews and field observations, quality is measured by a questionnaire among the staff, a questionnaire among primary caregivers to the nursing home patients and participation observations, job satisfaction is measured by a questionnaire

among the staff and cost is measured by auditing accounts. **RESULTS** Preliminary results indicate a significant correlation between leadership and quality. The correlation between job satisfaction and leadership, job satisfaction and quality and cost and quality is weaker. Cost varies significantly between the institutions under study. The differences between the two most extreme nursing homes were more than 50 %. **CONCLUSION** The results indicate that some kind of organization and leadership is more suitable in creating quality in care. In order to improve quality, leadership and organization should be in focus.

**PB7 471 ATTITUDES OF NURSING HOME RESIDENTS**

G. BARTOSZEK\* (University of Witten/Herdecke, Institute of Nursing Science, Witten, Germany)  
N. KOLBE(1), S. STRUPEIT(1), A. HAUT(1) - (1) University of Witten/Herdecke (Witten, Germany)

**Introduction:** Attitudes of nursing home staff, residents and their relatives determine the decision making process about the use of physical restraints. Knowledge on staffs' attitude towards physical restraints is sparse. Even less is known about relatives' attitudes. We conducted a survey on relatives' attitudes and compared the results with a recent survey on nurses' attitudes. **Methods and materials:** The German version of the validated "Maastricht Attitude Questionnaire" was used. Part I contains 22 items of three subscales (reasons, consequences, and appropriateness of restraints), part II contains 14 items evaluating restrictiveness and discomfort of restraint measures. For the survey in relatives the instrument's wording was slightly adapted and piloted with 7 relatives. Data were collected by trained nurses in 13 nursing homes in 2008. The comparison group consists of nurses of 25 homes surveyed in 2007. Mean values and SD were calculated. **Results:** A total of 195 questionnaires were distributed to relatives, 177 answered (91%). Mean age was 62 yrs (SD 12.6); 71% were female; 11% were partners, 71% son/daughter; 59% visited their relative 2-3 times a week. A total of 274 questionnaires were distributed to nurses, 258 (94%) answered. Mean age was 44 yrs (11.4); 82% were female; 54% were registered or practical nurses, 8% charge nurses. Relatives assess restraints slightly more positive compared to nurses with an average of 3.4 (0.6) vs. 3.1 (0.5) on a 5-point scale (5=strongly positive attitude). Relatives and staff both assess restrictiveness with 2.1 (0.3) points and discomfort of restraints with 2.1 (0.4) and 2.1 (0.3) on a 3-point scale (3=very restrictive/discomforting). Both groups consider wrist and ankle belts as measure with highest and sensor mats, infrared systems, and unilateral bedrails with lowest restrictiveness and discomfort. **Conclusion:** Attitudes of nursing home residents' relatives towards restraints are rather positive and comparable to nursing staffs' attitudes.

**PB7 472 PRESSURE ULCER GUIDELINE DEVELOPMENT AND DISSEMINATION IN EUROPE**

E. MEESTERBERENDS\* (Maastricht University, Maastricht, The Netherlands)  
R. HALFENS(1), C. LOHRMANN(2), R. DE WIT(3) - (1) Maastricht University (Maastricht, The Netherlands); (2) Medical University of Graz (Graz, Austria); (3) Maastricht University (Maastricht, The Netherlands)

**Introduction:** Pressure ulcers are a persistent problem in nursing homes in Europe with reported prevalence rates varying from 7.9 % up to 83.6 %. Pressure ulcer prevalence rates can be influenced by several factors, which can be divided in structural, process and outcome factors. One of the structural factors is the development and dissemination of pressure ulcer guidelines. These are difficult and complex processes, of which it is not clear whether they differ between European countries. Therefore, the aim of this study is to explore the current state of pressure ulcer guideline development and dissemination, from national to local level (i.e. nursing homes) in six European countries: England, Germany, Italy, the Netherlands, Portugal and Sweden. **Methods and materials:** A literature search and semi-structured interviews, conducted in six countries at national and nursing home level. **Results:** Four countries had national pressure ulcer prevention and treatment guidelines. Portugal had no national guidelines and Sweden had shifted the responsibility to regional level. All participating nursing homes had pressure ulcer guidelines except those in Portugal. Control and monitoring of guideline dissemination was carried out only in Sweden and England. The literature search revealed that attention for pressure ulcer care, like developing a pressure ulcer guideline decreases pressure ulcer prevalence and that nurses' knowledge regarding pressure ulcer prevention and treatment is lacking in some countries. **Conclusions:** All countries studied have national or regional pressure ulcer prevention and treatment guidelines, except Portugal. Portugal is also the only country where none of the nursing homes included had pressure ulcer guidelines. Because the dissemination of such guidelines does not imply actual implementation, further research should focus on the implementation process.

**PB7 473 COMPATIBILITY STUDY OF EFFERVESCENT ANALGESIC TRAMADOL 37.5MG/ PARACETAMOL 325 MG ZALDIAR®) AND AN INSTANT THICKENER (RESOURCE®)**

M. SERRANO\* (Grünenthal Spain, Madrid, Spain)  
F. MENÉNDEZ(1), L. IGNACIO(1) - (1) MEDINSA (Torrejón de Ardoz, Madrid, Spain)

**Introduction:** Patients with dysphagia may have problems when taking pills, effervescent or liquid analgesic. In medical treatment, instant thickening agents are used quite

frequently to make it easier to swallow medications. Objective: The objective of this study was to demonstrate that there is no incompatibility between effervescent Zaldiar® and the instant thickening agent (Resource®). Methodology: The test design simulates the use of the product in the practice. Three different types of preparations were used: dissolve 2 effervescent tablets in a glass of water (100 ml), and add 8.5 g of thickening agent (pudding), or 6.4 g of thickening agent (honey) or 4.5 g of thickening agent (nectar). Thermal analysis can be used to study and predict physicochemical alterations. Samples of the medication and the instant thickening agent are analyzed by DSC (Differential scanning calorimetry). To demonstrate the compatibility, an ANOVA test using the actives assay results obtained by HPLC was applied between each of the types of preparations and reference product (for Paracetamol ANOVA and Tramadol ANOVA). Bonferroni's multiple comparison test has been carried out between each type of preparation and reference product. Results: The results of DSC show quite clearly that Zaldiar® effervescent tablets have a melting peak at approximately 240°C. It can, also, be observed that this peak appears at around 220°C in the thickener Resource®. In relation to the binary mixtures (1:1 actual conc.) of Product: Instant thickening agent, it can be observed that the peak always occurs between 220°C and 240 °C (for the 1:1 actual conc. Product : excipient), and the same for (1:10 Product : Instant thickening agent) Regarding to ANOVA analysis, no differences were found between Zaldiar® with and without thickening agent in different concentrations. Conclusion: There is no incompatibility between tramadol 37.5mg/ paracetamol 325 mg (Zaldiar® effervescent tablets) and the thickening agent (Resource®)

**PB7 474 HERPES ZOSTER AND POST-HERPETIC NEURALGIA SERIOUSLY IMPACT PATIENTS' QUALITY OF DAILY LIFE**

S. SCHMITT\* (Klinikum Ernst von Bergmann, Postdam, Germany)  
T. WEINKE(1), A. EDTE(2), K. LUKAS(3) - (1) Klinikum Ernst von Bergmann (Postdam, Germany); (2) Sanofi Pasteur MSD (Munich, Germany); (3) Sanofi Pasteur MSD (Munich, France)

Introduction: Herpes zoster (HZ) and the long-term complication post-herpetic neuralgia (PHN) show increased prevalence with age due to decline in specific immunity against the latent varicella zoster virus. This survey assessed the impact of HZ and PHN on quality of life (QoL), an outcome that remains poorly documented. Methods: In March–May 2008, telephone interviews were conducted in Germany. Patients >=50 years old with painful HZ diagnosed during the last 5 years were identified. Questions adapted to enable evaluation of previous HZ episodes from standard QoL questionnaires assessed pain characteristics and impact of HZ/PHN on QoL. Patients rated pain from 0 ("no pain") to 10 ("pain as bad as you can imagine") and interference from 0 ("does not interfere") to 10 ("completely interferes"). Results: Of >11,000 respondents, 280 met screening criteria, of whom 32 (11%) developed PHN. Mean pain scores were 6.3 on average and 7.2 at worst (compared with 7.1 and 8.2, respectively, for PHN). Three-quarters of patients experienced problems performing daily activities including work, studies, housework, family and leisure activities. Approximately 60% of employed interviewees had to stop work at some time during the disease. Mean pain interference was highest for sleep (5.1), mood (4.6) and normal work (4.6). Pain and QoL outcomes were similar for all patients versus those diagnosed within the last 12 months (n=102) and for patients aged 50–59 years (n=130) versus >=60 years (n=150). By contrast, patients with PHN had considerably worse outcomes on every measure than those with HZ. Conclusion: HZ causes substantial pain, which seriously interferes with many aspects of daily life, particularly sleep, mood and work. The negative impact of HZ on QoL is particularly evident in patients whose pain persists as PHN.

**PB7 475 EFFICACY AND SAFETY OF OXYCODONE AND NALOXONE IN A PROLONGED RELEASE (PR) FIXED COMBINATION TABLET IN ELDERLY (> 65 YEARS) PATIENTS WITH MODERATE TO SEVERE CHRONIC PAIN**

W. KREMERS\* (Mundipharma Research GmbH & Co. KG, Limburg, Germany)  
E. LUX(1), P. LEYENDECKER(2), B. BOSSE(2), M. HOPP(2), K. REIMER(2), K. REIMER(3) - (1) Klinikum St.-Marien-Hospital Lünen (Lünen, Germany); (2) Mundipharma Research GmbH & Co. KG (Limburg, Germany); (3) University Witten/Herdecke (Witten, Germany)

Introduction: Oxycodone is highly effective for the treatment of severe chronic pain. Opioid-induced constipation is an adverse event that limits the continuous treatment of pain patients. Orally administered naloxone can reduce opioid-induced constipation due to its local opioid antagonistic effect in the gastro-intestine. As elderly are prone for constipation it is of relevance to assess the efficacy and safety of the combination oxycodone/naloxone PR (OXN PR) in elderly patients. Methods: A post-hoc subgroup-analysis of elderly patients (> 65 years) of three pivotal, randomised, double-blind Phase 3 studies (OXN3401, OXN3001, OXN3006) was performed on the primary endpoints pain (OXN3401) using pain intensity (NRS), analgesic rescue intake and bowel function (OXN3001, OXN3006) using the Bowel Function Index (BFI) and laxative intake. Results: In the subgroup analysis of study OXN3401 it could be demonstrated that there was no significant treatment by age effect with respect to pain values ( $p=0.9207$ ) and to the frequency of rescue medication intake ( $p=0.8079$ ) as indicated by the ANOVA. Based on studies OXN3001 and OXN3006 the subgroup analysis showed that treatment with OXN PR leads to a significant improvement in bowel function compared to OxyPR and that the

number of subjects taking laxatives (oral bisacodyl) was lower in the OXN PR group compared to subjects receiving OxyPR alone in elderly patients. There was no statistical significant difference ( $p=0.2668$ ) between elderly and younger subjects in the OXN PR treatment group with respect to the BFI values. OXN PR has no different safety profile in elderly patients. Conclusions: OXN PR has a comparable analgesic efficacy to OxyPR, leads to an improvement in bowel function compared with OxyPR and is well tolerated in both age groups. Acknowledgments: Supported by Mundipharma Research GmbH & Co. KG, Limburg (Lahn), Germany.

**PB7 476 SLEEP APNEA AND PAIN IN THE ELDERLY**

S. ONEN\* (Hospices Civils de Lyon, Francheville, France)  
F. ONEN(2), G. ALBRAND(1), E. DECULLIER(3), F. CHAPUIS(3), C. DUBRAY(4) - (1) Hospices Civils de Lyon, Hôpital Geriatrique A. Charial (Francheville, France); (2) CHU Bichat, Service de Geriatrie (Paris, France); (3) Hospices Civils de Lyon, Pôle Information Médicale Evaluation Recherche (69340, France); (4) CHU de Clermont-Ferrand, Inserm CIC-501 (Clermont-Ferrand, France)

Introduction: Patients with painful conditions often suffer from sleep disturbances. However, changes in sleep pattern could also influence pain tolerance. We assessed whether continuous positive airway pressure (CPAP) treatment in elderly patients with obstructive sleep apnea (OSA) would result in improved pain tolerance. Methods: Randomized, double blind crossover study. A total of 13 consecutive OSA patients aged 70 and over randomly assigned CPAP treatment (low-CPAP versus high-CPAP pressure). Eleven patients completed the study. Overnight polygraphy for respiratory parameters, electrical pain tolerance assessment, visual analogic scale for sleep quality were performed. Results: Both low and high-CPAP treatment significantly improved respiratory parameters. However, compared to baseline, the electrical pain tolerance score was significantly enhanced (analgesic effect) only under high-CPAP treatment ( $21.1 \pm 10.9$  versus  $28.3 \pm 15.9$ ;  $p=0.03$ ). Conclusion: The treatment of OSA with CPAP would have an analgesic effect. Our findings suggest that appropriate management of OSA in the elderly may be an important treatment objective with possible benefits beyond the improvement in sleep.

**PB7 477 EVALUATION OF A MULTIFACETED PAIN MANAGEMENT PROGRAM FOR SENIORS WITH DEMENTIA LIVING IN LONG-TERM CARE INSTITUTIONS**

R. VERREAULT\* (Université Laval, Québec, Canada)  
M. AUBIN(1), M. SAVOIE(2), T. HADJISTAVROPOULOS(3), S. LE MAY(4), M. BEAULIEU(5), P. VOYER(1), S. KAASALAINEN(6), L. MISSON(1) - (1) Centre d'excellence sur le vieillissement de Québec (Québec, Canada); (2) Hôpital Ste-Anne (Ste-Anne de Bellevue, Canada); (3) Dept. of Psychology, University of Regina (Québec, Canada); (4) Faculty of Nursing, University of Montreal (Montreal, Canada); (5) Dept. Service social, Université de Sherbrooke (Canada); (6) Faculty of Nursing, McMaster University (Canada)

Introduction : Chronic pain is highly prevalent in older persons, but frequently under-diagnosed and under-treated, particularly in seniors with severe dementia and serious limitations in ability to communicate. Methods: The objective of the study was to assess the effectiveness of a multifaceted pain management program for seniors with dementia in two publicly funded long-term care (LTC) institutions in Quebec City, Canada. All residents with dementia unable to communicate and all personnel directly involved in their daily care in the 2 participating institutions (approximately 80 staff members and 75 seniors in each institution) participated in the study. The intervention program included awareness sessions for administrators, directors and care teams focusing on the importance of the problem of pain in LTC, involvement of a pain resource nurse to act as a change agent and a role model for the care teams, a 10-hour training program for all staff members on knowledge, attitudes and beliefs regarding pain and its treatment in the elderly; daily monitoring of pain using a pain observational instrument (PACSLAC) and implementation of an individualized care plan for residents showing increased pain scores. Outcome measures include: (1) compliance with the program by staff; (2) for residents: pain, agitation and sleep; (3) for staff: knowledge, attitudes, beliefs, satisfaction regarding the program, impact on work organization on care units; (4) for families: satisfaction with the program. The program has been implemented and a one-year follow-up is underway. Anticipated results: Results will provide information on the feasibility to implement, in long-term care institutions, a pain management program for seniors with dementia, and its impact on patients and their family, as well as on the care team and their work environment. Conclusion: There is a need to improve pain management in long-term care.

**PB7 478 TREATMENT OF CARPAL TUNNEL SYNDROME IN ELDERLY PATIENTS**

K. SAWIŃSKI\* (The Association of Palliative Care Volunteers in Wielkopolska , Poznan, Poland)  
P. NAWROT(1), A. JAKRZEWSKA-SAWIŃSKA(2), A. NOWAKOWSKI(1) - (1) University of Medical Sciences (Poznan, Poland); (2) The Association of Palliative Care Volunteers in Wielkopolska (Poznan, Poland)

Review article. Authors show actual opinions on treatment of carpal tunnel syndrome in elderly patients. Authors show enormous meaning of the clinical examination and verify indications for the auxiliary investigations. In modern orthopedic approach, for elderly patients minimal invasive technics is preferred. This allows swift postoperative mobilization. Minimally invasive methods in treatment of carpal tunnel syndrome allows the achievement of good results especially in subjective perspective relieving the symptoms.

**PB7 479 PAIN AND INTERVENTIONS IN GERMAN NURSING HOMES**

K. KOPKE\* (Charité - Universitätsmedizin Berlin, Berlin, Germany)  
D. DRÄGER(1) - (1) Charité - Universitätsmedizin Berlin, Institut für Medizinische Soziologie (Berlin, Germany)

Introduction Pain is the most common complaint in old age. Nevertheless in 45% to 80% of nursing home (NH) residents pain therapy is assumed to be inappropriate. Despite its significance knowledge is lacking on the quality of analgesic drug therapy and appropriateness of prescribing practices for pain management in NH. The main objective of this study is to determine the factors influencing the pain prevalence and pain therapy in German nursing home residents and to clarify how pain is associated with resident's autonomy. The ultimate goal is to identify therapeutic interventions and structural measures likely to increase or maintain autonomy despite pain. Methods and Materials In a representative survey design, different data sources will be used. To gain a thorough insight into pain and pain related factors primary data will be collected for a cluster randomized sample of 1000 NH residents in two German states. The primary data source is a structured resident interview, supplemented by psychological and physical assessments as well as an analysis of resident records, using well established instruments. Since a large number of residents with cognitive deficits are expected, assessment instruments are adjusted accordingly. Results As a result of the study a comprehensive characterization of pain in residents of German NHs is expected. First data will be presented about pain prevalence, etiological factors, pain related interventions, analgesics and associations with other diseases, subjective health, and personal and social factors. Methodological issues concerning empirical studies and pain assessment in nursing home populations with cognitively impaired individuals will be discussed. Conclusion Pain is a very relevant health problem in Nursing Homes that impacts resident's autonomy. Recommendations for physicians and nurses will be given to improve pain management practice.

**PB7 480 INTEREST OF A PROCEDURE FOR HELPING PRACTITIONERS IN PRESCRIPTION OF MORPHINE WITH PATIENT CONTROLLED ANALGESIA PUMP IN ELDERLY**

F. ESCOUROLLE-PELTIER\* (Bretonneau, PARIS, France)  
B. BAUNE(1), S. GALLERON(1), O. DHELIN-LIENHARD(1), K. TALEB(1),  
C. NATIVEL(2), Y. WOLMARK(1) - (1) Bretonneau (Paris, France); (2) Bichat (Paris, France)

Introduction: The "Patient Controlled Analgesia" (PCA) concept was first used to control acute post-surgery pains. Currently the PCA pump is recommended in prevention of pains during nursing, for chronic pains and in palliative care. It can be used in geriatrics centers, even if patients are unable to understand or control by themselves the pump. In this case, the nurse realizes the intermediate injections. Methods: It's an observational study of professional practices concerning prescription of morphine's PCA. Results: In the geriatric center, we observed that the PCA pump was usually used in the palliative care unit. From July 2001 to August 2004, the hospital's "Committee against pain" observed that among 105 patients have been treated with PCA pump: 84% were in palliative care unit, 6% in acute units, 8% in rehabilitation units and 2% in home care units. Morphine was used in 62% cases. From January 2007 to June 2008, the committee realised a new study, and observed the same results. The hospital's "Mobile unit against pain", observed how difficult it was for their colleague to realize the appropriate prescription of morphine, such as the adaptation and setting of the pump. In order to initiate the prescription of a PCA pump, the committee has elaborated a procedure for help prescription. Initial dose of morphine per day, intermediate doses, quantity of morphine necessary in syringe, refractory period have been tabulated. Procedure and boards will be explained. Conclusion: Medical staff training has been organised in the hospital. The mobile unit is on charge to teach the nurses and improve the use of the PCA pump: boards, pump's programmation and monitoring. An internal audit will be realized in 2009 among the nurses, in order to evaluate the using of PCA pump in their daily use.

**PB7 481 VALIDITY AND CLINICAL USEFULNESS OF A PAIN ASSESSMENT INSTRUMENT FOR SENIORS WITH DEMENTIA AND INABILITY TO COMMUNICATE**

M. AUBIN\* (University Laval, Québec, Canada)  
R. VERREAULT(1), M. SAVOIE(2), T. HADJISTAVROPOULOS(3), S. LE MAY(4),  
M. BEAULIEU(5), P. VOYER(1), S. KAASALAINEN(6), L. MISSON(1),  
P. CARMICHAEL(1) - (1) Centre d'excellence sur le vieillissement de Québec (Québec, Canada); (2) Hôpital Ste-Anne (Québec, Canada); (3) Dept Psychology, University of Regina (Québec, Canada); (4) Faculty of nursing, University of Montreal (H3T 3J7,

Canada); (5) Dep. Service social, Université de Sherbrooke (Canada); (6) Faculty of Nursing, McMaster University (Canada)

Introduction : Chronic pain is highly prevalent in older persons, but frequently under-diagnosed and under-treated. This situation is even more problematic for seniors with severe dementia because self-report pain scales cannot be used due to serious limitations in ability to communicate. Methods: The objective of the present study was to assess the validity and clinical usefulness of the French version of the Pain Assessment Checklist for Seniors with Limited Ability to Communicate (PACSLAC-F). The PACSLAC-F is an observational 60-item checklist used by the LTC staff to provide a pain score in residents with severe dementia. First, a pilot study was conducted with 86 older residents in two long-term care (LTC) settings to assess test-retest reproducibility, inter-observer variability and internal consistency of the PACSLAC-F. The PACSLAC-F was then used in a (still on-going) larger longitudinal project about the evaluation of a multifaceted pain management program for seniors with dementia living in LTC institutions. For this study, the PACSLAC-F is being used twice daily for 12 months in 80 residents with severe dementia and unable to communicate. Results: The pilot study showed excellent test-retest ( $r=.80$ ;  $p<.0001$ ) and inter-observer ( $r=.94$ ;  $p<.0001$ ) reliability for the PACSLAC-F. Correlation between the PACSLAC-F and Doloplus-2 scores was .80 ( $p<.0001$ ). In the longitudinal study, 9,928 PACSLAC-F global scores have been recorded so far among 80 residents, with an mean ( $\pm S.D.$ ) of 4.74 ( $\pm 3.85$ ) and a median of 4. Distributions of scores by domains of pain manifestations will be discussed. The PACSLAC-F was found easy to use by the staff and useful for the daily monitoring of pain using a pain diary readily available in the medical chart. Conclusion: The PACSLAC-F has shown good psychometric properties and was found by the staff easy to use and clinically useful in LTC settings.

**PB7 482 COMPARISON OF ALGOPLUS PAIN EVALUATIONS IN DIFFERENT SETTINGS**

S. BONIN-GUILLAUME\* (Service de Médecine Interne et Gériatrie, CHU Nord, AP-HM, Marseille, France)  
P. RAT(1), E. JOUVE(2), L. DONNAREL(4), M. MICHEL(5), F. CAPRIZ-RIBIERE(6),

C. DOLOPLUS(10) - (1) Service de Médecine Interne et Gériatrie, CHU Nord, AP-HM (Marseille, France); (2) Unité de Pharmacologie Clinique et d'Evaluations Thérapeutiques, Antenne CIC Timone (Marseille, France); (4) Service d'Accueil aux Urgences, CHU Nord, AP-HM (Marseille, France); (5) Service de Médecine des Personnes Âgées, CH Rennes (France); (6) Service de Médecine Gériatrique, Hôpital de Cimiez, CHU Nice (France); (7) Service de Gérontologie, Hôpital Paul-Brousse, AP-HP (France); (8) Service d'Accueil aux Urgences, CH Béziers (France); (9) Equipe Mobile de Soins Palliatifs, CH Blois (France); (10) Centre de Soins Palliatifs, CHR Metz-Thionville (France)

Introduction The elderly often experience Acute Pain (AP). Patients with limited ability to communicate verbally (LAC) are unfortunately under treated because of lack of assessment. Thus, the Doloplus Collectif developed and validated in different settings an easy-to-use behavioral scale Algoplus® specifically designed to assess AP in elderly with LAC. Method A multicentre cross-sectional study examined Algoplus pain evaluations in emergency departments, acute settings and long term care facilities. The mean Algoplus score was compared between elderly patients (65 years old and over) in pain (based on a composite criteria) or not in pain. Same comparisons were done between LAC (MMSE < 15, delirium, aphasia...) and non LAC patients. Interrater reliability was also tested. Results Algoplus score (mean  $\pm$  SD) differed significantly between patients in pain or not in pain: respectively, in emergency departments:  $2.8 \pm 1.1$ ,  $1.0 \pm 1.0$  ( $p < 0.001$ ), in acute settings  $3.2 \pm 1.2$ ,  $0.6 \pm 0.7$  ( $p < 0.001$ ) and in long term care facilities  $2.6 \pm 1.7$ ,  $0.5 \pm 0.7$  ( $p < 0.001$ ). An excellent correlation was established in each setting between the total Algoplus mean score and the total self-report or behavioral assessment scales mean score. The interrater reliability was in acute care settings: 0.86 and in long term care facilities: 0.76. At last, an Algoplus ROC analysis at a threshold of 2 showed that Algoplus specificity to discriminate AP situations was excellent respectively 0.71 in ED, 0.93 in acute care settings and 0.86 in long term care facilities. Sensitivity was respectively 0.88, 0.92 and 0.67. Conclusion Algoplus exhibited good discriminant and convergent properties and an excellent interrater reliability. At a threshold of 2, the best sensitivity and specificity were found in emergency departments and acute care settings which corresponds fully to the care-givers' request for an easy tool to assess AP in elderly patients.

**PB7 483 GOODMOOD - PROMOTION OF MENTAL WELLBEING IN OLDER PEOPLE**

R. LEINONEN\* (GeroCenter Foundation for Research and Development, Kinkomaa, Finland)  
M. KALLINEN(1), P. TIIKKAINEN(2) - (1) GeroCenter Foundation for Research and Development (Kinkomaa, Finland); (2) JAMK University of Applied Sciences (Jyväskylä, Finland)

The aim of the 3-year GoodMood-project is to develop and to evaluate the impact of early intervention on mood, loneliness and participation in older people who are at increased risk of decline in mental wellbeing. The object of this report is to describe the design and the general methodology of the study, the screening process of the study group, and selected

baseline results concerning need for intervention. The project started in September 2008 and consists of two parts: the screening and the intervention parts. First, an information letter was sent to all the 75-79-year-old community-living residents in the City of Jyväskylä, central Finland (N=1167). Of these people 985 persons participated in the phone interview with the aim of finding the subjects who reported feeling, loneliness, melancholy or depressive mood. Of the 475 subjects regarded suitable for the study 296 persons agreed to participate in a face-to-face interview. After that additional 4 persons were excluded due to memory impairment (MMSE < 22) and 22 persons refused further examinations. Thus, 270 persons took part in the personal counseling in health centre. The final study group included 257 persons who were randomized into intervention (n=129) and control (n=128) groups. The intervention group members participated in a 6-month intervention including either a physical activity group, social activity group, or face-to-face counseling sessions. The study outcomes include loneliness, depressive mood, quality of life, and participation. The intervention continued until May 2009 when the follow-up interviews at home were arranged for both the intervention and control groups. The surveillance of changes in feelings of loneliness, melancholy or depressive mood and participation is carried out through telephone interviews at 3, 6 and 12 months in both the intervention and control group.

**PB7 484 PREVENTION OF ASPIRATION PNEUMONIA IN THE ELDERLY BY CELL-SENSING**

T. EBIHARA\* (Tohoku University Institute of Development, Aging and Cancer, Sendai, Japan)  
S. EBIHARA(1), M. YAMAZAKI(1), H. ARAI(1) - (1) Tohoku University Institute of Development, Aging and Cancer (Sendai, Japan)

[Introduction]Dysphagia is a crucial problem in the elderly. The current study in Japan reported that 86.7% of hospital-acquired pneumonia was induced by aspiration. Heretofore, we showed the relationship between the transient receptor potential on the sensory nerve and the swallowing reflex that was responsible important factor for aspiration pneumonia. Concretely, thermal stimulation, the application of capsaicin (TRPV1 agonist) or menthol (TRPM8 agonist)can improve the deteriorated swallowing reflex. We also showed the improvement of sensory- and motor swallowing movement via insular cortex by olfactory stimulation. Therefore, we attempted to devise a safe remedial strategy by cell-sensing for oral feeding in dysphagic patients which would enable them to eat or feed orally without or with muchless aspiration before the start of tube feeding. [Methods] During these 2 years,17 elderly inpatients with pneumonia, were cross-over applied 2 type protocols after the recovery from pneumonia in each admission phase. The 1st phase was provided the standard low- or high-intensity swallowing treatment(appropriate dietary modification). The 2nd phase was provided the cell-sensing stimulated low- or high-intensity treatment. Both were provided oral care and specific swallowing exercise by speech pathologist. The incidence of pneumonia, the number of fibril days, the ability of eating or oral-feeding, and the ability of intaking necessary calorie were examined. [Result]The cell-sensing stimulated diet inhibited the incidence of pneumonia, the fibril days ( $P<0.01$ ). The number of patients in the 2nd phase who were able to eat or be orally fed were greater than those in the 1st phase( $p=0.2$ ). Patients in both phase did not take enough calorie.[Conclusion]Our remedy for eating or orally feeding using cell-sensing may be effective to prevention for aspiration pneumonia.

**PB7 485 RISK FACTORS FOR ADVERSE DRUG EVENTS IN ELDERLY HOSPITALIZED PATIENTS: A GERIATRIC SCORE**

C. TRIVALLE\* (Hopital Paul Brousse, Villejuif, France)  
A. BURLAUD(1), P. DUCIMETIERE(2) - (1) Hopital Paul Brousse, APHP (Villejuif, France); (2) INSERM U 780 (Villejuif, France)

Introduction: Adverse drug events (ADEs) are common in the elderly and a major public health issue. As strategies for reducing ADEs in the elderly are developed (i.e Beers criteria), an important component will be the identification of patients at special risk. We proposed a specific score to evaluate the risk of ADEs in the elderly. Methods and materials: The score was elaborated on the base of the IMEPAG study (article submits for publication). This study was conducted in France, around Paris, in 16 rehabilitation geriatrics centres of APHP. Possible drug-related incidents were detected using a standardized check list and by week review of all charts by investigators. Cases included all individuals aged of 65 years or older who experienced an ADE during the 4 weeks of the study period. Separate multivariable models were constructed using all ADEs as the outcome with stepwise logistic regression using SAS. Variables that were significantly associated with a P value < 0.05 and with prevalence at least 5% were considered for inclusion. Results: During the 4 weeks of observation, 152 patients with at minimum one imputable ADE over 576 patients in the study (26%) were included for the elaboration of the score. The risk factors included in the final score were: age  $\geq$  85 years, weight  $\geq$  76 kg for male or  $\geq$  65 kg for female, number of medication (if  $\geq$  7), and the presence of anticoagulant treatment. The final score was between zero and 34, with a risk of ADE at 10% for a score < 7, at 19% for a score of 7-13, at 31% for a score of 14-21 and at 48% for

a score  $\geq$  21. Conclusion: This score is simple and practice to detect risk of ADEs in elderly hospitalized patients and to propose prevention.

**PB7 486 ASSESSMENT OF QUALITY OF LIFE AMONG ELDERLY INCLUDED IN ORGANIZED RECREATIONAL ACTIVITIES: A CASE-CONTROL STUDY**

V. ILAKOVAC\* (J.J.Strossmayer University of Osijek, School of Medicine, Osijek, Croatia)  
J. PLUZARIC(1), N. PRLIC(1) - (1) J.J.Strossmayer University of Osijek, School of Medicine (Osijek, Croatia)

Introduction. With a view to promote and implement active, productive and healthy aging, a senior club was established within institution for home nursing care in Osijek, Croatia. Club offers wide variety of recreational activities tailored to elderly, from exercise programs to arts and crafts activities. The aim of this study was to investigate difference in perceived health status and quality of life between club members and elderly members of general population from the same geographic region. Methods and subjects. The final sample comprises 104 club members and 104 age and gender matched controls. Controls were drafted from the Croatian Adult Health Survey, which included approximately 1700 examinees from the same geographic region. Health related quality of life was measured using the Short Form Health Status Questionnaire (SF-36). Self-perception of quality of life in general was measured on a visual analogue scale. All scores were recoded and transformed into a scale ranging from 0 (poor health) to 100 percent (excellent health). Results. More than a half club members (61.5%) are included in more than one activity. Club members scored significantly higher than control on 6 out of 8 health dimensions ( $P<0.001$  for all). Median score was over 60 in all eight health dimensions in a club members group, while controls exceed score of 60 only in two, role emotional and social functioning. Club members rated their quality of life in general higher than controls (median 80 vs 50,  $P<0.001$ ). Conclusion. Club members in general showed better health-related functioning than general elderly population on almost all health dimensions. Self-perception of quality of life in general was also much better among club members than in general population of elderly people. Recreational activities for the elderly are essential for maintaining good physical and mental health.

**PB7 487 PHYSICAL ACTIVITY, AT THE AGE OF 65, AS A PREDICTIVE FACTOR OF WELL BEING 7 YEARS LATER. THE PROOF STUDY**

E. CRAWFORD-ACHOUR\* (CHU DE SAINT-ETIENNE, SAINT-ETIENNE, France)  
M. GARET, K. CASTRO-LIONARD, B. TROMBERT, J. LACOUR, C. THOMAS-ANTERION, J. BARTHELEMY, F. ROCHE, R. GONTHIER

Background: Physical activity has a pleiotropic effect and is a significant factor of successful aging. This study aims to quantify the relationship between physical activity of a 65 years old cohort and the level of well-being and self-estimated health status seven years later. Methods: 988 questionnaires were sent by mail to a representative sample of healthy pensioner (Proof cohort, Neuroepidemiology, 2007). Well-being and health status were estimated on two analogical scales (graded from 0 to 10), using answers from the following questions: 1) how do you estimate your health status? 2) are you basically satisfied with your life? The level of physical activity was estimated with the POPAQ questionnaire (Garet et al. Eur J Heart Failure. 2004) enabling us to calculate: 1) daily Energy Expenditure(DEE), 2) Physical activity energy expenditure (PAEE), 3) DEE higher than 5 METs (DEQ>5METs), 4) activity index (PAEE/DEE), and 5) VO2peak. Results: 686 responses were validated. The average age was 72.9+/-1.2 years old for 279 men (40.7%) and 407 women (59.3%). Amongst the sample, 98% (n=672) lived at home and 24.7% (n=168) lived alone. Mean DEE was 10365+/-1964 kJ/24h, mean PAEE was 44794+/-1170 kJ/24h, mean activity index was 0.42+/-0.05 and mean estimated VO2peak was 22.5+/-1.6mL/min/kg. Individuals with a DEQ>5MET represented 57.6% (n=395). Activity index and VO2peak were the variables the more significantly correlated with self-estimated health status ( $p=0.0032$  and  $p=0.0011$ ) and perception of well-being ( $p=0.0117$  and  $p=0.0053$ ). Conclusion: Energy spent in activity and VO2peak estimated on DEE, measured at the age of 65, appear to be strong predictors of well-being, seven years later.

**PB7 488 RISK FACTORS ASSOCIATED WITH MORTALITY IN HOSPITALIZED PATIENTS WITH PRESSURE ULCERS**

A. CHANDRA\* (Mayo Clinic, Rochester MN, United States)  
P. TAKAHASHI(1), S. CHA(1), P. TARGONSKI(1) - (1) Mayo Clinic (Rochester , United States of America)

Introduction Pressure ulcers (PU) are common in elderly hospitalized patients and associated with prolonged stays, increased costs and adverse outcomes. Many studies have addressed PU prevention and management. This study examines patient, ulcer and treatment characteristics associated with mortality among patients with established PU. Methods This was a retrospective cohort study of Olmsted County, Minnesota adult residents hospitalized at Mayo Clinic with a diagnosis of PU from January 2000 through December 2005. The outcome was all cause mortality within 6 months post-hospitalization. Logistic regression analysis was conducted to estimate the magnitude of association between patient demographics, functional status, medical comorbidity, Braden score, wound characteristics and treatment and 6 month post-hospitalization mortality. Results 317 hospitalized PU patients met inclusion criteria. Mean age was 70.7 years and

52% were male. 117 (36.9%) patients died within 6 months post-hospitalization. On univariate analysis, increasing age, Braden score <18, elevated creatinine, Charlson comorbidity index (CCI)>5, ulcer stage >2, presence of wound odor and being married were significant mortality risk factors. On multivariable testing, increasing age, CCI > 5, and Braden score <18 were associated with higher post-hospitalization mortality. Conclusions Hospitalized PU patients are at high risk of death within 6 months following discharge. Higher staged ulcers and wound odor as univariate risks likely reflect severe disease and infection. A low Braden score, indicating functional/nutritional impairment and suboptimal skin environment, advanced age and higher comorbidity were associated with high mortality risk in multivariable analysis. An aging population and increasing PU prevalence among hospitalized patients herald the need to proactively detect patients at high risk for complications and mortality. These results identify potential patient and ulcer factors that should be further explored for utility in stratifying prophylactic and therapeutic interventions towards avoidance of mortality in the hospitalized patient with PU.

**PB7 489** FACTORS OF RISK ASSOCIATED WITH FALLS IN THE MAJOR HOSPITALIZED ADULT K. DONOSO, C. SALAZAR, S.CASTRO.

K. DONOSO\* (National Institute of Geriatrics, Santiago, Chile, SANTIAGO, Chile)

D. KAREN(1), S. CAROLINA(1), C. SERGIO(1) - (1) National Institute of Geriatrics (SANTIAGO, Chile)

The fall of the major hospitalized adult is a multifactorial problem, which physical, psychological and socioeconomic consequences compromise his or her quality of life, increasing the demand in hospitals. A multidisciplinary intervention can prevent these falls. Objective: to identify frequent parameters associated with falls in the major hospitalized adult, which can be used to elaborate a preventive program. Materials and methods: a guideline was applied to 97 60-year-old major patients who suffered falls of a whole of 1089 hospitalized patients in the year 2008. Results: Age  $78.6 \pm 8.0$  years. In the admission 78.3 % presented neurological diagnosis, 65.9 % had sustained previous falls, 89.7 % presented unstable walking. During the hospitalization in 69.1 % the fall was diurnal, 60.8 % was in treatment with psychoactive drugs. The 78.4 % presented alteration in the scale of Yessavage and 83.5 % in the Barthel's scale. Conclusions: A complete anamnesis of the patient in the hospital admission allows finding out the risk of falling down. Many of them have a history of previous falls and unstable walking; for this reason it is necessary to provide a safe environment to avoid maladjustment to environmental factors, especially when he or she develops activities during the day. Due to the high frequency of falls in the major adult with neurological pathology and with deterioration of his or her self-valency according to Barthel's scale, the precocious rehabilitation is necessary to favor his or her level of independence and to minimize the risk of falling down. There is a relevant relationship between those that present falls and those that have some characteristics that guide the diagnosis of depression according to Yessavage's scale. It is also very important the valuation of the pharmacological treatment, especially in elderly treated with psychoactive drugs.

**PB7 490** IS SUBOPTIMAL PRESCRIBING A RISK FACTOR FOR POOR HEALTH OUTCOMES IN UNSELECTED ELTERS? THE ICARE DICOMANO STUDY

M. DI BARI \* (University of Florence, Florence, Italy)

C. POZZI(1), F. LAPI(2), G. MAZZAGLIA(3), M. INZITARI(1), D. CHIARANTINI(1),

P. GEPPETTI(2), A. MUGELLI(2), N. MARCHIONNI(1), M. DI BARI(1) - (1)

Department of Critical Care Medicine and Surgery, Unit of Gerontology and Geriatric Medicine, University of Florence (Italy); (2) Department of Pharmacology, University of

Florence (Italy); (3) Regional Health Authority of Tuscany (Italy)

Introduction. Mostly because of comorbidity, drugs consumption increases with advancing age. Older persons are often exposed to an increased risk of sub-optimal prescribing, defined as use of an excessive number of drugs (polypharmacy), prescription of inappropriate drugs, or of potentially interacting drugs. At present, no such studies have investigated the association between sub-optimal prescription and long-term health outcomes in Italy. We aimed at investigating the relation between suboptimal prescribing (SP) and the risk of mortality and hospitalization in Italian older community-dwellers. Methods. In a cohort study enrolling the entire population aged >65 years living in Dicomano, Italy, use of >5 drugs (polypharmacy), prescription of inappropriate drugs (ID), defined according to Beers' criteria, and of potentially interacting drugs (PID), based on Drug Reax-Micromedex, were evaluated in 1995 and 1999 and considered as forms of SP. Vital status and hospital admissions through 2003 were recorded. The three forms of SP were entered as time-dependent exposures into Cox regression analysis model, adjusting for age, sex, and comorbidity and disability as time-dependent covariates. Results. Of 1022 participants (mean age  $73.0 \pm 6.8$ , 57% women), 220 were evaluated in 1995, 234 in 1999 and 568 in both waves. In univariate analysis, mortality was twofold higher in participants with polypharmacy (73.4 per 1000 person-years, 95% CI 58.2-92.4 vs. 34.1, 95% CI 29.7-39.2;  $p < 0.001$ ) or PID (72.7 per 1000 person-years, 95% CI 46.3-113.9 vs. 38.0, 95% CI 33.5-43.1;  $p < 0.001$ ), whereas it was unrelated to the presence of ID. Hospitalization rates

were independent of any form of SP. In multivariable models, ID and PID were no longer associated with an increased risk of death, and ID predicted a

**PB7 491** CHANGES IN LEVELS OF DINAMIC STRENGTH IN WOMEN ABOVE THE AGE OF 55 SEDENTARY AND PHYSICALLY ACTIVE SUBMITTED TO A PROGRAM OF RESISTANCE EXERCISES

M. MARCON\* (Faculdade da Serra Gaúcha, Caxias do Sul, Brazil)

D. GARIBALDI(1) - (1) Faculdade da Serra Gaúcha (Caxias do Sul, Brazil)

The aim of this study was to determine the dynamic changes of maximum strength in women aged over 55 years, undergo a training program resisted. We evaluated 16 women with a mean age of  $59.11 \pm 5.42$  years, the women were divided into 2 groups according to level of physical activity prior to the study (group of sedentary=GS and group of Physically Active=GFA). The participants in the study were subjected to maximum dynamic strength evaluation using the protocol for prediction of maximum strength of 2 to 10 repetitions to fatigue, the exercises were the supine and Leg Press. The assessed the exercises done with the maximum possible charge, in addition to causing a state of fatigue prior to the tenth execution, if the estimated 1reps make the attempt is ignored and the test reapplied after 5 minutes of recovery. To check the difference between the groups using the Test "T" of Student for independent samples, assuming a rate of less than 0.05 significance ( $p < 0.05$ ). The intervention program was comprised of 3 sessions per week, with duration of 60 minutes, for 16 weeks. There were significant changes in both groups both in the financial year as in the supine leg press, in general the average in the supine position rose from  $23.84 \pm 6.30$ kg to  $31.88 \pm 4.69$ kg, now in the leg press results changed from  $69.97 \pm 12.10$ kg to  $94.00 \pm 14.97$ kg, however no differences were observed when comparing the groups in any of the tests. It was concluded that a program of resistance exercises training can promote the gain of strength in women aged over 55 years regardless of the level of physical activity prior to the period of intervention.

**PB7 492** SOCIO-ECONOMIC STATUS AND HEALTH BEHAVIOUR OF ACCIDENT AND FALL VICTIMS: RESULTS FROM A SAMPLE STUDY IN FRANCE

A. SITBON\* (National Institute for Prevention and Health Education, Saint-Denis, France)

H. BOURDESSOL(1), S. PIN(1) - (1) National Institute for Prevention and Health Education (Saint-Denis, France)

Introduction: Although the prevalence of accidental injury and trauma caused by falls is relatively well-documented in France, the process of identifying the profiles of victims of these accidents is still in its very early stages. This work describes the socio-economic characteristics and health behaviours of people who reported having suffered from a fall within the last year. Method: The study was based on the use of data from the Baromètre Santé 2005, an on-going transversal national survey which focuses on various health behaviours of the French population. The sample is composed of more than 30,000 people aged from 12 to 75 years old of which 14,790 individuals responded to a series of questions related to falls and accidents. Exploratory and inferential analyses were used to investigate the socio-economic characteristics (sex, age, profession, level of education) and health behaviours (Body Mass Index, alcohol consumption, psychotropic drug use, chronic disease) of fall victims. Results: Nearly one in four people (23.1%) aged 40 to 75 reported having fallen within the past year; half of them had several accidents. Women are more susceptible to falls than men. The frequency of falls decreases in men with age, while it increases in women. Obesity, psychotropic drug use and the existence of a chronic disease are risk factors for falls among women. The consequences resulting from falls (such as doctor's visits, fear of falling, problems with equilibrium) are more distinctive in the older-aged group of the sample. Discussion: These self-reported data on falls are valuable for the adaptation and implementation of injury prevention programmes. They provide an image which contrasts that of the current analysis of accident victims according to age and sex, and therefore they imply the need for the development of targeted prevention strategies.

**PB7 493** DIABETICS PREVALENCE AND HEALTH FACTORS IN ELDERLY THAT LIVES IN MANAUS, AMAZONAS-BRASIL

A. SOUZA\* (Universidade do Estado do Amazonas, Manaus, Brazil)

J. SILVA(1), A. ANDRADE(1), M. ROCHA(2), E. MAIA-RIBEIRO(1),

A. SILVEIRA(2), I. CRUZ(2), E. RIBEIRO(1) - (1) Universidade do Estado do Amazonas (Manaus, Brazil); (2) Universidade Federal de Santa Maria (Santa Maria, Brazil)

Introduction: diabetes mellitus (DM2) is a large problem of crescent importance to public health of several countries of the world. Based in DM higher epidemiologic impact the objective of the present study was to analyze the DM2 prevalence and socioeconomic, life style, health and quality of life indicators associated with this disease. Methods and materials: a cross-seccional, observational study was performed associated to Programa de Pesquisa Idoso da Floresta started in 2007, October that included 1509 elderly subjects and its associated with sex, age and life style, health and life quality variables. Results: DM2 prevalence was estimated in 25, 5% (377). Multivariate analysis showed association between DM2 and obesity in males (odds ratio 1,919 (1,243-2,964) and DM2 and hypertrigliceridemia (>150 mg/dL) in women [odds ratio 1,704 (1,203-2,412)]. DM2 and co-morbidities association was observed in both genera. The number of diabetics without

controlled glycemia was higher and Macro region Health associated. Conclusion: the study confirm the higher prevalence of DM2 in Manaus and suggest that health policies related to primary prevention, diagnosis and glycemic control of diabetic patients need to be designed and implanted in the ESF-SUS, Manaus-AM.

**PB7 494 MASTICATORY PROBLEMS IN ELDERLY THA LIVES IN MANAUS, AMAZONAS-BRASIL: PREVALENCE AND MORBIDITIES ASSOCIATION**  
J. SILVA\* (Universidade do Estado do Amazonas, Manaus, Brazil)  
A. SOUZA(1), F. CASTRO(1), K. MOTA(1), A. BRITO(1), J. MENEZES(1), E. RIBEIRO(1), E. MARIA-RIBEIRO(1), I. JUNG(2), I. CRUZ(2) - (1) Universidade do Estado do Amazonas (Manaus, Brazil); (2) Universidade Federal de Santa Maria (Santa Maria, Brazil)

Introduction: clinical studies suggest that masticatory dysfunctions are related to dietary intake with malnutrition and morbidities. In elderly this conditions could be dramatic to maintain your health conditions. However, few studies were performed in Brazil about the epidemiological impact of this condition in elderly population. For this reason we performed here an exploratory study to evaluate the association between self-report of masticatory problems, health and life quality factors in an elderly population that lives in a urban Brazilian tropical region. Methods and materials: a cross-seccional study was performed associated to Elderly's Amazon Forest Region Research Project that included 1482 elderly subjects. Self-report of masticatory difficulty to eating was asked to elderly. The prevalence of this conditions and its association between health and life quality variables were compared and described here. Results: From subjects analyzed, 364 (24.6%) self-reported masticatory problems (MP) whereas 1118 (75.4%) did not report this problem. We did no find association between MP, age and genera. However, we found a significant association between MP, sarcopenia ( $p=0.05$ ), multiple morbidities ( $> 4$ ) ( $p=0.0001$ ), elderly dependence using Barthel index ( $p=0.001$ ) and hospitalization in the last year ( $p=0.001$ ). Life quality factors (self-report of health and life conditions) were poorest in MP. Conclusion: several investigations reported association between masticatory conditions and diseases such as hypertension, stroke, sarcopenia in elderly population. Our results corroborate these previous studies and suggest the importance of elderly's oral care programs as a prevention mechanism of diseases that increase the mortality and morbidity risk.

**PB7 495 NEW POLITICS FOR GLOBAL HEALTH AND LONGEVITY: COMPLEMENTARITY OF ANTI-AGING MEDICINE WITH MENTAL HEALTH**  
S. RIGA\* (Al Obregia Clinical Hospital of Psychiatry, Bucharest 8, Romania)  
D. RIGA(1), L. DANAILA(2), A. MIHAILESCU(3), D. MOTOC(4), L. MOS(4), F. SCHNEIDER(4) - (1) Dept Stress Res & Prophylaxis, Al Obregia Clin Hosp Psychiatry (Romania); (2) Dept Vasc Neurosurg, Natl Inst Neurol & Neurovase Dis (Romania); (3) Dept Med Psychol, C Davila Univ Med Pharm (Romania); (4) Center Appl Physiol & Mol Biol, V. Goldis Western University (Romania)

Introduction "The common trunk" of anti-aging medicine (AAM) and mental health (MH) is represented by sanogenesis (at individual level) and public health (at societal level). Methods Both are branches of preventive medicine (prophylaxis and hygiene) and also of integrative medicine (bio-psycho-social human concept). Therefore, AAM and MH have common principles and methods: cognitive construction-development and continuity-permanence at individual level, and health assessment programmes and improvement strategies at societal level. Results Cognitive construction-development (1st stage of sanogenesis pattern implementation) comprises the processes of knowledge, understanding, acceptance, learning, programing and education. Continuity-permanence (2nd stage of maintaining and improvement of sanogenesis pattern) includes the processes of practicing, progressiveness, activation, training, perfecting and performance. Programmes of health assessment and improvement must become national planes and a permanent concern of society. Studies of AAM-MH strategies at individual-societal levels emphasize useful data and facts: - AAM-MH complementarity is evident as binomial: the construction of one of them meaning the development of the other one and vice versa; - AAM-MH superposition is total in the last life cycles: mature adult  $\rightarrow$  old adult  $\rightarrow$  3rd age (65-85 years)  $\rightarrow$  4th age (over 85 years); - dependence of AAM-MH couple from (human and social) ecology manifests antagonistically: •in negative register: etio-pathogenic and morbiogenesis factors, ways and processes; •in positive register: resources, strategies and therapies for longevity and mental health. In prophylactic and medical practice, the phenomenologic tetrads/cascades must be known and respectively applied: •etio-pathogenic, entropic tetrad: distress/stress-dependent disorders  $\rightarrow$  wear and tear/impairment  $\rightarrow$  premature/accelerated aging  $\rightarrow$  polypathology; •therapeutic, anti-entropic tetrad: anti-stress/eu-stress/adaptation  $\rightarrow$  anti-impairment/vitality/ resistance  $\rightarrow$  anti-aging/healty longevity  $\rightarrow$  anti-illnesses/anti-diseases. Conclusion AAM and MH represent medicine of the future and will be included into common health politics of globalization.

**PB7 496 HEALTH IN ELDERLY PEOPLE WHO LIVE IN SITUATION OF POVERTY**  
M. MARGARITA\* (ITESO - Universidad Jesuita de Guadalajara, Mexico, Tlaquepaque, Jalisco, Mexico)

In 2000, the elderly population in Mexico was 7.1 %, but for the year 2050 the percentage will increases to 21 % (National Institute of Statistics, Geography and Computer, 2002). Wong (2002), found that men report a better health than women; in self-evaluation on health, 32 % of women consider her health is good, unlike 42 % than men. This study has as aim knows as the elderly population perceives his health. Method: Subjects 201 elderly, 47.8 % men and 52.2 % women, average of age 77.6 years. Instruments: Health and Well-being and Aging in Latin America and the Caribbean - Survey and National Study of the Health and Aging in Mexico - Survey. Results: The major percentages that it reports this population as for her perception of the health is "regular", so much in men (21.9 %) as women (23.4 %). As for the levels of "very good" health the percentages are very low in groups, men (5.5 %) and women (3.3 %). If we consider the levels of "bad health" and "very bad health", it shows that women has a percentage (9.5 %) lightly higher than men (6.5 %). Differences of gender exist in the diseases that reported. The women shows significantly more problems of memory and attention (57.3 %) than men (37.2 %) ( $\chi^2 = 9.0$ ;  $p < .01$ ). Also, the arterial pressure was higher in women (62.5 %) than men (43.6 %) ( $\chi^2 = 7.8$ ;  $p < .01$ ). Conclusions: This study reported that men have better perception of his health than women. The diseases that the elderly reported were: problems of arterial pressure, problems of bones, problems of vision, problems of the stomach, but especially problems of memory and attention.

**PB7 497 A SIX YEAR FOLLOW-UP STUDY ON MORTALITY: DEPRESSION AND SELF REPORTED HEALTH AS RISK FACTORS**

J. FERREIRA SANTOS\* (School of Medicine at Ribeirão Preto, Ribeirão Preto, Brazil)  
A. CERQUEIRA(1), M. LEBRÃO(2), Y. DUARTE(3), A. FUREGATO(4) - (1) Faculdade de Medicina de Botucatu-UNESP (Botucatu, Brazil); (2) Faculdade de Saúde Pública - USP (Botucatu, Brazil); (3) Escola de Enfermagem da USP (Botucatu, Brazil); (4) Escola de Enfermagem de Ribeirão Preto - USP (Botucatu, Brazil)

INTRODUCTION. Self reported health (SRH), a subjective assessment of health, is known as a predictive variable for mortality. Gender differences in SRH are also documented, as well as its association with depressive symptoms. Researches on SRH and mortality in old ages are important to bring better understanding of the issues involved, and to the designing of policies focused in preventive medicine. OBJECTIVES: To study the association of SRH with mortality, controlling for depression, age and sex. METHODS AND MATERIALS. Data came from two rounds of a longitudinal survey : ESTUDO SABE – São Paulo (Brazil). The 2000 sample included population aged 60+, living in São Paulo, Brasil (n= 2143). To these data was added the information on survival at the 2006 round: Found living (59.1%), Dead (22.2%), Institutionalized (0.3%), Other (Moved, not found, refused to answer – 18.4%). Independent variables: SRH(Good, Fair, Poor), Depressive symptoms in 2000 (GDS-15 scale: Normal, Mild, Severe), Sex and Age (taken as continuous). Dependent variable: Survival at 2006. Analysis: A multinomial logistic regression was fitted with robust estimates of errors, Relative Risk Ratios (RRR) taken as elements of comparison. Found living was the reference for the dependent variable. RESULTS- DEATHS: SRH "fair" increases death Risk Ratio by a factor of 1.4 and "poor" by 3.34. Males have a Risk Ratio increased by 2.2 and each year of age increases RRR by 9%. INSTITUTIONALIZATION: Severe depression multiplies the Risk Ratio by a factor of 6.7, each year of age raises the Risk Ratio by 14%. CONCLUSIONS: SRH predicted death, when controlled by age and sex. Moving out, not being found or refusing to answer were not associated with the independent variables. Severe depression and age are associated with the risk of being in an institution 6 years after the first interview.

**PB7 498 A NOVEL PROGRAM FOR IMPROVING FUNCTIONAL BALANCE AND LIFESTYLE PARTICIPATION IN ADULTS AS THEY AGE.**

J. NITZ\* (The University of Queensland, Brisbane, Australia)  
S. FU(1) - (1) The University of Queensland (Brisbane, Australia)

Introduction: Decline in balance and functional mobility has been demonstrated by our research team to become significant between the ages of 40 and 60 in both men and women. In many older adults particularly those who are sedentary, obese or who have arthritis this decline limits lifestyle options. Empowering older people with these problems to sustain participation in physical activity after completion of a program to prolong beneficial effects is of major importance. Therefore the intervention needs to be attractive to these non-physically active people. This study will evaluate the effect of an attractive exercise program that targets the impairments underpinning balance and functional decline in men and women aged over 40. Methods and materials: Study design is a clinical trial. Participants aged 40 and over are volunteers from the community who were required to be sedentary, have self-perceived poor balance, osteoarthritis or be obese or overweight. Intervention involves a one hour exercise session each week for 10 weeks. The exercises can be translated to home practice and are adaptable to all ages and abilities. They include specific balance strategy training, multiple tasking and functional strengthening. Pre and post-intervention measurements include strength, power, proprioception, functional balance and the patient specific functional scale [PSFS]. Results: 60 subjects (with a 1:8 ratio of men to women), have been enrolled to date with 20 completions [more imminent]. Ages ranged from 40 to 78. Preliminary analyses show improvements across all measurements with significance reached at  $p < 0.05$  in functional balance and mobility measures, proprioception, muscle power, quadriceps strength and two PSFS activities.

**Conclusion:** This approach to exercise shows a positive response in sensorimotor and central processing aspects of balance that are reflected in improved functional balance and mobility which has translated to activities identified by subjects as problematic.

**PB7 499 THYROID SELF- EXAMINATION IN THE ELDERLY: THE IMPORTANCE OF HEALTH EDUCATION**

V. CAMARA\* (Universidade Federal Fluminense, Niterói, Brazil)  
M. LEOPOLDINO(1), A. VIDON(1), E. AFONSO(1), M. RODRIGUES(1) - (1) UFF (Niterói, Brazil)

**Introduction:** Thyroid cancer is the more prevalent endocrine cancer in the world, although only represents nearly 1 % of total malignant cancers. Usually occurs in women around fourth to sixty and has good evolution. Unfortunately, poor prognosis with non-differentiated cancer tends to increase with age, specially on elderly persons with previously thyroid nodules. Sistematic thyroid self-examination helps early detection of thyroid abnormalities, including cancer, which increases cure possibilities and reduces related mortality, increasing life expectancy and quality. The objective of this study was verify in one elderly group the knowlegdment on thyroid self-examination. Methods and materials: For thyroid cancer screening we evaluated 51 patients (50 women and 1 men, mean age: 69.53 years ± 9.77) of the Geriatric and Gerontology Service of Universidade Federal Fluminense- Campus Mequinho- Brazil. They were questioned about thyroid diseases (hypothyroidism, hyperthyroidism, nodules or previous surgery), neck radiation exposition and familiar thyroid cancer. Thyroid self-examination was explained. We asked if they have listen about it before and if they have this self-practice. Neck evaluation includes inspection and palpation of thyroid topography and lymph nodes. Results: Nobody had listen before about thyroid self-examination, consequently none had this self-practice. Although we detected in this group nearly 10 % (5/51) with thyroid diseases, 23.5% (12/51) with neck radiation exposition historical and one case with familiar cancer history. By the screening, one patient had suspicious thyroid cancer (the one with familiar history) and was submitted an additional investigation and follow-up. Conclusions: Thyroid self-examination seems to be negletable by the health professionals. It is useful for screening cancer and certainly stimulate elderly self-care. The lack of knowlegdment from this elderly group on thyroid self-examination shows the importance of conscious geriatrics and gerontology professionals on thyroid self-examination education.

**PB7 500 INTRADERMAL INFLUENZA VACCINE FOR OLDER ADULTS: IMMUNOGENICITY OF CONSECUTIVE ANNUAL VACCINATIONS**

P. VAN DAMME\* (Sanofi Pasteur, Lyon, France)  
R. ARNOU(1), G. ICARDI(2), A. AMBROZAITIS(3), F. WEBER(4) - (1) Private practice (Angers, France); (2) Department of Health Sciences, University of Genova (Genova, Italy); (3) Dept. Infectious Diseases and Microbiology, Vilnius University (Vilnius, Lithuania); (4) Sanofi Pasteur (Lyon, France)

**Introduction:** Older adults are at greatest risk from influenza, yet conventional influenza vaccines are less effective in this population than in younger individuals. Intradermal vaccination is a promising, immunogenic alternative to the intramuscular route. A trivalent inactivated intradermal influenza vaccine has been designed specifically for adults older than 60yrs using a new intradermal microinjection system. Methods: Multicentre, randomized, controlled phase 3 trial: adults (60–94yrs) were vaccinated in three consecutive years with investigational intradermal vaccine (Intanza®) or licensed intramuscular control (Vaxigrip®). Both contained 15mcg of haemagglutinin per influenza strain. Primary objective: to demonstrate whether intradermal vaccination was more immunogenic than the control based on seroprotection rate (SPR: % with haemagglutination inhibition titre >=40) 21 days after vaccination in year 1. Immunogenicity of vaccination in years 2 and 3 was described in a random subset of participants. Results: Primary analyses on all subjects in year 1 (intradermal: N=2612; intramuscular: N=1089), confirmed that intradermal vaccination was more immunogenic: SPR in the intradermal and intramuscular groups were, respectively: 77 and 71 (p=0.0003) for influenza A/H1N1, 93 and 88 (p<0.0001) for A/H3N2, and 56 and 49 (p=0.0003) for B. SPR after year-2 vaccination (intradermal: N=262, intramuscular: N=143) followed the same pattern: 93 and 82 for H1N1, 98 and 96 for H3N2 and 60 and 53 for B. Geometric mean titres were also consistently higher after intradermal vaccination: 82 vs 69, 298 vs 181, and 40 vs 35 in year 1, and 204 vs 137, 382 vs 293, and 46 vs 37 in year 2. Year-3 results are under analysis. Conclusion: This intradermal influenza elicited significantly and consistently higher immune responses than the reference intramuscular vaccine in older adults. Higher immune responses are expected to result in increased protection for this population.

**PB7 501 LABORIOUS PHYSICAL ACTIVITY AND HEALTH-RELATED QUALITY OF LIFE IN OLDER JAPANESE ADULTS**

F. TOGO\* (Japan National Institute of Occupational Safety and Health, Kawasaki, Japan)  
T. MITANI(1), T. KOMATSU(2) - (1) Watanabe Hospital (Kamisu, Japan); (2) The University of Tokyo (Bunkyo-ku, Japan)

**Introduction:** The purpose of this study was to determine whether laborious physical activity is associated with health-related quality of life (HRQOL) in older adults. Methods

and materials: Subjects were a sample of 734 male and 906 female healthy Japanese adults, aged 65–85 years. The Physical Activity Questionnaire for Elderly Japanese (PAQ-EJ) was used to assess total and four domains of habitual physical activity: personal transportation, exercise/sports, housework, and labor. HRQOL was assessed using the Japanese version of the Medical Outcome Study 36-Item Short-Form Health Survey (SF-36). We dichotomized data based on the PAQ-EJ score for labor. We labeled those who did laborious activity as "worker" and those who did not any laborious activities as "nonworker". Results: Total and all subtotal PAQ-EJ scores were significantly ( $P < 0.05$ ) greater in subjects in the worker group than subjects in the nonworker group for both men and women. In both men and women, subjects in the worker group also showed significantly ( $P < 0.05$ ) greater physical component summary score (PCS) and mental component summary score (MCS) from the SF-36 and significantly ( $P < 0.05$ ) greater scores in eight SF-36 categories: physical function (PF), role physical (RP), bodily pain (BP), social functioning (SF), general health (GH), vitality (VT), role emotional (RE), and mental health (MH). Subjects in the worker group had statistically significant ( $P < 0.05$ ) and positive correlations between PAQ-EJ score for labor and RP, SF, RE, and MH in men and RP and GH in women after controlling for age. Conclusion: Our results suggest that working may associate with physical and mental health in elderly people. Working may contribute to prevent a decline in physical and mental health status.

**PB7 502 BEHAVIOURAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA (BPSD) : DO YOU THINK THERE MAY BE A RELATED BIPOLAR SPECTRUM?**

J. DOREY\* (CHU DE SAINT-ETIENNE, SAINT-ETIENNE, France)  
C. BORG, D. FEDERICI, T. CELARIER, C. GIRTANNER, A. SAGNE, R. GONTIER

We report the case of a 84-year old patient hospitalized for psychomotor restlessness with excitation, irritability, escape of ideas, mood exaltation, logorrhea, sleep disorders in a context of Alzheimer's disease at a moderate stage. Clinical and paraclinical valuations: In admission, somatic exam was without specificity. All biological exams were normal, notably TSH and calcemia. No previous psychiatric history was found. But, the exploration of the pre-morbid personality showed a probable cyclothymic personality according to the criteria by Akiskal [J Affect Disord 1998]. A treatment by FLUOXETINE had newly been introduced for a depressive syndrome. Medical management and evolution: The stopping of FLUOXETINE and the introduction of OXACARBAZEPINE allowed the disappearing of the behavioural and psychological symptoms. Discussion: The management of BPSD is often complex. Here, the introduction of a mood stabilizer treatment, OXAZEPINE, proved to be effective on symptoms. Although without known previous psychiatric history, a diagnosis of bipolar spectrum disorders occurring in co-morbidity with the Alzheimer's disease was suggested for several reasons: symptomatic maniac syndrome, worsening of symptoms under SSRI, existence of a probable premorbid cyclothymic temperament. BPSD find a multifactorial origin and the research of a psychiatric component can allow to orient the therapeutic strategies, even for patients without known previous psychiatric history. The bipolar spectrum disorders are frequent, with a prevalence going up to 8,4% in the general population, but most are no diagnosed [J Affect Disord 1998]. Under the influence of cognitive decline, the disorders of bipolar spectrum can appear and be mistaken for the behavioural and psychological symptoms. The systematic research of marker of thymic vulnerability, as affective temperaments described by Akiskal, could help to identify the bipolar spectrum disorders and to better target the management of the behavioural and psychological symptoms.

**PB7 503 SCREENING TOOL OF OLDER PERSON'S PRESCRIPTIONS (STOPP) AND SCREENING TOOL TO ALERT DOCTORS TO RIGHT TREATMENT (START): APPLICATION TO HOSPITALIZED GERIATRIC PATIENTS.**

O. GUTIERREZ-DUQUE\* (Hospital Xeral-Calde, Lugo, Spain)  
O. GUTIÉRREZ DUQUE(1), E. GONZÁLEZ COLOMINAS(2), F. VEIGA FERNANDEZ(1) - (1) Geriatric Department. Complexo Hospitalario Xeral-Calde (Lugo, Spain); (2) Pharmacology Department. Complexo Hospitalario Xeral-Calde (Lugo, Spain)

**Introduction:** Older people often experience multiple co-morbidities for which they are prescribed multiple medications. Prescription of such drugs is potentially inappropriate where safer alternatives exist (STOPP criteria) and they are often denied clinically indicated medications without a valid reason (START criteria). We aimed to apply the STOPP and START valid screening tool to detect inappropriate treatments in geriatrics hospitalized patients. Methods and Materials: A prospective, observational study of 100 consecutive admissions to the Geriatric Department was performed. Demographic data; comorbidity; geriatric syndromes; mental, functional and social status; laboratory test and concurrent medications were recorded. STOPP and START criteria were applied. Results: Mean patient age was 85.1 years, 50% female, 87% comorbidity and 73% ADL dependent. Most common geriatrics syndromes were polypharmacy (more 6 drugs) 93%, sensory loss 69% and dementia 57%. Length hospital stay was 14.7 days. Average medications during hospitalization were 10.6 drugs/patient, reduce to 6.6 at discharge. According to STOPP criteria, inappropriate drugs were prescribed in 67 patients, 28 of them had related side effects. Potential beneficial drugs were denied in 48 patients based on START criteria. Most frequent STOPP criteria were drugs that adversely affect fallers (30%). Most common START criteria were avoiding statin therapy in diabetes mellitus coexisting with other major cardiovascular risk factors (14%). Variables statistically associated with inappropriate drugs prescriptions were length hospital stay ( $P < 0.04$ ) and polypharmacy at

admission ( $P<0.01$ ). Underuse potential beneficial drugs were associated with renal failure ( $P<0.01$ ), delirium ( $P<0.01$ ), dementia ( $P<0.03$ ), immobility ( $P<0.01$ ), insomnia ( $P<0.01$ ) and comorbidity ( $P<0.05$ ). Conclusion: This study identifies high rates of inappropriate treatments in hospitalized elderly frail patients. It's necessary to adjust both STOPP and START criteria and clinical practice to specific geriatrics features.

**PB7 504 SENIORS HEALTH EDUCATION PROGRAM IMPROVES POSITIVE BEHAVIOR AND MODIFIES MEDICAL RESOURCES CONSUMPTION**

B. CORMAN\* (Successful Aging Database, Boulogne Billancourt, France)  
S. LAUQUE(1), S. JOVIC(2), V. VANBOCKSTAEL(3), P. AEGERTER(2),  
L. TEILLET(2) - (1) Successful Aging Database (Boulogne Billancourt, France);  
(2) Hôpital Ambroise Paré (Boulogne-Billancourt, France); (3) Mutualité Sociale Agricole (Bagnole, France)

Introduction. The aim of most health promotion programs for elderly is to maintain or improve autonomy, quality of life, physical condition and social interaction. We wondered if such health promotion program does improve health behavior and changes medical resource consumption of men and women over 55. Methods. Eight hundred and twelve subjects mostly living in rural areas of France participated to the health program. From those, 306 affiliated to the Mutualité Sociale Agricole (MSA), a health insurance for the rural population, were matched to 244 control subjects for life area, age and sex. The program, entitled « Les Ateliers du Bien Vieillir », was sponsored by the MSA. It was provided to groups of 10 to 15 individuals in six weekly half-day meetings. The main topics covered were aging processes, nutrition, physical activity and falls, sleep, sight and hearing, bone and calcium, medical resource consumption and its alternatives. Health behavior was recorded at the beginning of the program, 3 and 12 months later, with questionnaires. Medical resource consumption was compared the year before and the year after the program, from the health insurance electronic database. Results. Participants and controls were comparable at inclusion for demographic and socioeconomic characteristics, retirement status, body mass index, living arrangement subjective health and food habits. Mean age was 70 years and women represented 82% of the cohort. Mean body mass index was rather high, close to 26 for both genders. Time devoted to physical activity was larger than 30 minutes per day for 2/3 of this population. Fruits and vegetable consumption was less than 4 per day for 74%. Conclusion. Preliminary results showed that participation in the program resulted in increased consumption of fruits and vegetables, calcium intake and physical activity. Medical resource consumption was also modified, depending on individual baseline levels.

**PB7 505 APPROPRIATE PRESCRIBING IN OLDER PEOPLE**

J. WOODARD\* (Nottingham University Hospitals, Leicester, United Kingdom)  
G. ROWELL(1), S. CONROY(1), R. VARTHA(1), C. WHITTINGHAM(1),  
N. VADHER(1) - (1) University Hospitals of Leicester (Leicester, United Kingdom)

Introduction: Older people tend to be prescribed more medications and are at higher risk of adverse drug events, drug-drug interactions and drug-disease interactions. We audited an acute medical unit to identify inappropriate prescribing in older people using the STOPP/START tool (Gallagher P RC, et al). Method: We performed a retrospective case note review of patients aged 70+ admitted to the AMU. 74 sets of notes were examined between June-July 2008. Gold Standards were set at 3% for inappropriate prescriptions, 27% for the proportion of patients with one inappropriate prescription and 15% for underuse of appropriate medication. These gold standards were derived from a RCT of pharmacist led optimisation of prescribing for hospitalised older people (Spinewine A SC, Dhillon S et al). Results: The mean age of the participants was 80.6 (95% CI, 79.1-82.0) years, 58% were female. The mean number of drugs per patient was 6.8 (6.0-7.5), with 55/74 (73%) taking four or more medications. On admission 34/74 (46%) of individuals had at least one inappropriate medication, this increased to 49% at discharge. Of all individual prescriptions, 64/500 (13%) were inappropriate at admission, falling to 5% at discharge. Omissions were high on admission (34%) and at discharge (30%), with omissions being mostly related to secondary prevention of fractures and cardiovascular disease. Conclusion: This audit suggests inappropriate prescriptions pre-admission and at discharge are below published gold standards, although the total number of inappropriate prescriptions were reduced. Under prescribing of appropriate medications was common, with rates twice that seen in published gold standards. There maybe a number of reasons why prescribing did not reach target levels including; no medication review taking place, missing medical history and a lack of awareness of prescribing in older people. We suggest making STOPP/START criteria readily available and educating health professionals in its use.

**PB7 506 ASSESSMENT OF A NURSE EDUCATION COURSE FOR THE ORAL HEALTH OF THE INSTITUTIONALISED ELDERLY PEOPLE.**

G. SAVARD\* (Faculty of dentistry, Orleans, France)  
J. BARANES(1), F. LORENTZ(2), C. BOISSEL(2), A. BARTHAS(1), M. PIRLET(3),  
E. BAILLON-JAVON(4), C. NABET(5) - (1) Faculty of dentistry - Paris Descartes University (Montrouge, France); (2) Reseau Gerontologique Inter Etablissement du Val-d'Oise (Marines, France); (3) Caisse Primaire d'Assurance Maladie du Val-d'Oise

(France); (4) Service medical de l'assurance maladie Ile de France (France); (5) Faculty of dentistry, Paul Sabatier - Toulouse University (France)

**INTRODUCTION.** Oral health of elderly people is altered with age and medical conditions especially among institutionalised elderly. The reasons reported in the literature are poor oral hygiene, poor medical conditions or complicated access to dental care. Another important point is the inadequate care-givers practice and knowledges. The aim of the study was to assess the clinical impact of a continuous training of nursing staff on institutionalised elderly's oral health. We pay a special attention to the pedagogical structure of the course. **METHODS AND MATERIALS.** We conducted a baseline ( $n=333$ ), 6 months ( $n=304$ ) and 1 year ( $n=297$ ) clinical assessment on two groups of institutionalised aged 65 and over. We have randomly ascribe the 11 settings to the education (6) and control group (5). In each place, elderly people were randomly selected on the basis of 40% of the setting's population. We had, at baseline, 133 valid observations for the education group and 159 for the control group. The observations included : medical, cognitive and social conditions, interview on hygiene practices, nutritional assessment, an oral health related quality of life scale, and a clinical examination. **RESULTS.** At 6 months, we observed less dental plaque and calculus, a lower progress in caries, less severity of periodontal diseases, cleaner and better tolerated prosthodontics. At 1 year, we only observed less progress in dental caries and a better prosthodontics hygiene. **CONCLUSIONS.** The educational program has partially improved the oral health of elderly institutionalised people. The effect are better at 6 months than at 1 year. The educational program should be supported and established in a long term and continuous perspective. Education relay are needed to widespread this program. Beside, our study revealed important treatment needs. We argue for the settlement of dental care units under the responsibility of medical staff including a trained dentist.

**PB7 507 EVALUATION OF OVERLOAD AND QUALITY OF LIFE: CAREGIVERS OF INSTITUTIONALIZED ELDERLY WITH FUNCTIONAL LOSS**  
J. BIANCO\* (Centro Universitário São Camilo, São Paulo-SP, Brazil)  
A. ODA(1), V. SILVA(1), M. PEREZ(1) - (1) Recanto São Camilo (Brazil)

Introduction: The demographic and epidemiological transition in Brazil and also the aging of the population has caused a higher prevalence and incidence of chronic diseases, which demand continuous monitoring, emphasizing therefore the role of the caregiver. It is known that the caregivers emotional overload can interfere directly to the assisted elderly. The identification of predictors of stress situations is crucial for effective approaches that are taken to prevent, diagnose and treat this condition. The objective is to assess the quality of life on formal caregivers of the elderly with functional loss and dependency that are residents in long-stay institutions and related it to a degree of burden and level of functional independence. Material and method: 25 were female formal caregivers (100%), with an average age of 35.12 years, average schooling of 9.45 years and time average of professional activity with the elderly assessed in 32.35 months. Instruments used: Quality of Life Questionnaire of WHOQOL-brief, Burden Scale (Zarit Burden Interview) and Functional Independence Measure. Results: We found that older people that are fully dependant do not overload the caregivers (Zarit total = 32), as much as those with a modified dependency in need of supervision of their daily activities (Zarit total = 40). The scale of overload was shown to be related to the overall quality of life. Conclusion: Taking care of a modified dependency of the elderly which requires assistance to up to 50% of their tasks creates a greater burden than cases in which the dependence is total. And the noticed burden related to quality of life of caregivers indicated that the lower the scores in the areas of WHOQOL-brief, the higher the burden. These findings emphasize the need to adopt measures to promote health among these professionals ensuring a consequent improvement of assistance to the elderly.

**PB7 508 MEDICINAL DISTRIBUTED IN POSTS OF INDIGENOUS HEALTH BONFIM/ RR THAT CAN CAUSE IATROGENY**  
E. MARTINS BATISTA\* (Uea, Manaus - AM, Brazil)

Introduction: In Brazil live around 460 thousand Indians, in 225 societies indigenous, representing 0.25% of the brazilian population. In the state of Roraima concentrates the second largest indigenous population of Brazil: 30,715 Indians divided into nine ethnies: ingaricô, macuxi, patamona, taurepang, waimiri-atroari, wapixana, waiwai, yanomami and ye'kuana (IBGE, 2002). In the municipality of Bonfim are ethnic macuxi and wapixana, with 2.200 Indians and 243 elderly. The current study presents an overview of drugs available in health centers indigenous Bonfim - RR provided by Family Health Program Indigenous / Brazil, and that can cause iatrogenia in the elderly. Methods and materials: It was used for research of this paper books, magazines, newspapers and specific sites, which helped to identify the indigenous population and the incidence of iatrogenic causes. This is a cross-sectional study, observational, based on literature reviews. Conducting the medical activities in indigenous communities in the municipality of Bonfim, it was possible to observe a number of elderly people seeking medical attention. The greatest interest was to discuss how these drugs work and what are its advantages over the side effects that can cause iatrogenia in elderly patients and avoid undesirable reactions that can bring or cause more suffering to our patients. Results: According to this review, the drug less suitable for the elderly that are available are: acetylsalicylic acid, amiodarone, cinnarizine, dexchlorpheniramine, diazepam, diclofenac sodium and potassium, scopolamine,

aluminum hydroxide, methyldopa, metoclopramide, nifedipine, nimesulide, propranolol and promethazine, which, in general, in certain diseases or conditions, may cause iatrogenia. Conclusion: We should always be careful when prescribing the medication, especially for our elderly, with a basic knowledge of both (drug/patient), because none of the drugs that were mentioned is completely free to cause reactions mild, moderate or severe, with her, putting at risk the very life of the patient.

**PB7 509 PROFILE OF OLDER PATIENTS IN A SINGAPORE HOSPITAL, IMPACT OF AGEING-IMPLICATIONS ON PROVISION, ORGANISATION OF CARE**  
S. ANG\* (KK Women's and Children's Hospital, Singapore, Singapore)  
C. TAN(1), M. CHUA(1), E. CHAN(1), C. TEO(1), C. LIM(1) - (1) KK Women's and Children's Hospital (Singapore, Singapore)

Introduction KK Women's and Children's Hospital is Singapore's only dedicated Women-Maternal and Children Hospital. The care for adult women was primarily geared towards the provision of Obstetrics and Gynaecology services. Singapore is one of the fastest ageing populations in the world. By 2030, 1 in 5 Singaporeans will be 65 years and above. In tandem with the ageing of our population, the average age our patients has also increased and hence, the co-morbidity profile of our patients has also changed with chronic diseases e.g. hypertension, diabetes common. Methods and Materials To achieve holistic patient centred care, a pilot project was conducted whereby all women above 70 years old who were admitted to the hospital were assessed by the geriatric resource nurse with the support of the geriatricians, family medicine disciplines. Patients were assessed not just for the primary reason for admission, but also for co-morbidity, functional, social and post discharge care needs. Results A total of 191 patients out of the total 213 admissions (70 years and above) were assessed. Results: Hypertension- 64%, Diabetes Mellitus-30% , Hyperlipidaemia-38%. Impaired Abbreviated Mental Test-7%, Moderate to High risk for osteoporosis (based on OSTA- Osteoporosis Self-Assessment Tool)-97%, ADL ( Activities of Daily Living- Modified Barthel) Impairment, moderate to severe- 20%, Moderate to High Fall Risks (Berg Balance Scale)-61%. The prevalence of the cohort assessed having 3 comorbidities was 47%. Conclusion As a result of this pilot, KKH has embarked on a hospital wide programme to holistically assess and manage all older inpatients. A collaborative patient centred model of care is in place with the medical disciplines working together with the primary surgical team to optimize patient care, proactively identify health and care issues and integrate with the community services. Capability building of all staff including doctors, nurses and allied health e.g. physiotherapists, occupational therapists, and social workers through lectures, teaching ward rounds and specialty consults is also underway.

**PB7 510 EFFECTS OF &ALPHA;-CYCLODEXTRIN ON BLOOD PRESSURE, GASTRIC EMPTYING AND GLYCAEMIA IN THE ELDERLY**  
D. GENTILCORE\* (University of Adelaide, Adelaide, Australia)  
L. VANIS(1), C. RAYNER(1), M. HOROWITZ(1), K. JONES(1) - (1) University of Adelaide, Discipline of Medicine, Royal Adelaide Hospital and NHMRC Centre of Clinical Research Excellence in Nutritional Physiology, Interventions and Outcomes (Adelaide, Australia)

Introduction: In healthy older subjects the hypotensive and glycaemic responses to carbohydrate-containing meals are dependent on gastric emptying (GE) and intestinal absorption-when the latter are slowed, the magnitude of the fall in blood pressure (BP) and rise in glucose are attenuated. The oligosaccharide,  $\alpha$ -cyclodextrin, is inexpensive, and diminishes the glycaemic response to starch in young adults, possibly by slowing GE and/or carbohydrate absorption. Accordingly,  $\alpha$ -cyclodextrin may prove useful in the management of postprandial hypotension and type 2 diabetes, which occur frequently in the elderly. The aims of this study were to determine the effects of  $\alpha$ -cyclodextrin on BP, GE and glycaemic responses to oral sucrose in older subjects. Methods and Materials: Eight healthy subjects (6M, 2F; age 68-76 yr) were studied on two separate days, after an overnight fast. BP (automated), GE (scintigraphy) and blood glucose (glucometer) were measured between t=0-300min following a 300ml drink containing 100g sucrose labelled with 20MBq  $^{99m}$ Tc-sulphur colloid, with or without 10g  $\alpha$ -cyclodextrin. Results:  $\alpha$ -cyclodextrin had no effect on GE initially, but caused slowing after ~120min (eg intragastric retention at t=180min; control: 11 $\pm$ 2.2% vs  $\alpha$ -cyclodextrin: 18 $\pm$ 2.3%; P=0.04). Blood glucose concentrations between t=60-75min were slightly less (eg at t=60min; control: 9.9 $\pm$ 0.9mmol/L vs  $\alpha$ -cyclodextrin: 8.7 $\pm$ 0.8mmol/L; P<0.001), and between t=180-240min slightly greater (eg at t=180min; control: 5.0 $\pm$ 0.2mmol/L vs  $\alpha$ -cyclodextrin: 6.3 $\pm$ 0.6mmol/L; P<0.05), with  $\alpha$ -cyclodextrin.  $\alpha$ -cyclodextrin had no effect on systolic or diastolic BP. Conclusion: In a dose of 10g,  $\alpha$ -cyclodextrin has no effect on the BP response to oral sucrose in healthy older subjects, but attenuates the initial rise in glycaemia and slows GE. The latter effects are modest and attributable to delayed intestinal carbohydrate absorption, so that glucose is absorbed more distally. These observations argue against a therapeutic role for  $\alpha$ -cyclodextrin in patients with postprandial hypotension and/or type 2 diabetes.

**PB7 511 EFFECTS OF GLUCOSE LOAD ON BLOOD PRESSURE, HEART RATE AND SPLANCHNIC BLOOD FLOW IN HEALTHY ELDERLY**  
L. VANIS\* (University of Adelaide, Adelaide, Australia)  
D. GENTILCORE(1), C. RAYNER(1), M. HOROWITZ(1), C. FEINLE-BISSET(1), K. JONES(1) - (1) University of Adelaide, Discipline of Medicine, Royal Adelaide

Hospital and Centre of Clinical Research Excellence in Nutritional Physiology, Interventions and Outcomes (Adelaide, Australia)

Introduction: Postprandial hypotension, defined as a fall in systolic blood pressure (BP) of  $\geq$ 20mmHg, sustained for at least 30min within two hours of a meal is an important clinical problem, particularly in the elderly. The magnitude of the fall in BP is related to the rate of small intestinal nutrient delivery. We aimed to determine whether the fall in BP and rises in heart rate (HR) and superior mesenteric artery (SMA) flow, in response to intraduodenal (ID) glucose are load-dependent in the healthy elderly. Methods and materials: Nine subjects (5M,4F; age 65-76yr) had simultaneous measurements of BP, HR (DINAMAP) and SMA flow (ultrasound), on four separate occasion, in a double-blind, randomised order. On each day, subjects were intubated via an anaesthetised nostril into the stomach, with a nasoduodenal catheter, incorporating a duodenal infusion port. Following a recovery period (30min), subjects received an ID infusion (5ml/min) of either saline (S) (0.9%) or glucose at a rate of 1, 2 or 3 kcal/min (G1, G2, G3, respectively), for 60min (t=0-60 min), followed by ID saline for a further 60min (t=60-120min). Results: Between t=0-60min, there was a significant fall in BP and rise in HR following G2 and G3 compared to S (P<0.05 for all) but not during G1; there was no significant difference between G2 and G3. Between t=0-120 min, there was a significant increase in SMA flow following G2 and G3 compared to S (P<0.01 for all) but not during G1; the magnitude of increase in SMA flow was greater after G3 than G2 (P<0.05). Conclusion: The cardiovascular response to ID glucose reaches a maximum between 2-3kcal/min, however, the rise in SMA flow appears to be a load-dependent phenomenon.

**PB7 512 DEFINING PROFILES OF FUNCTIONAL LIMITATIONS IN GROUPS OF OLDER PERSONS: HOW AND WHY?**  
B. SLAUG\* (Lund University, Lund, Sweden)  
O. SCHILLING(2), S. IWARSSON(1), G. CARLSSON(1) - (1) Lund University, Department of Health Sciences (SE-221 00, Sweden); (2) University of Heidelberg, Institute of Psychology (Heidelberg, Germany)

Introduction Accessibility to the society at large is a prioritized political goal. For older people, who often have more than one functional limitation, it is crucial that the environment is designed to meet demands posed by reduced functional capacity, as manifested in combinations of limitations. This study aimed at identifying specific combinations of functional limitations as type profiles, in order to support physical planning procedures and decisions. Methods and materials We utilized a database comprising data from older persons (75-89 years) in four European countries (N=1,542), both on their functional limitations and the environmental barriers in their housings. Data were collected using the Housing Enabler instrument. We tested which combinations of functional limitations that occurred more or less often than by chance, by means of Configuration Frequency Analyses. Combinations that came out as significant were identified as type profiles and used in simulations in order to predict accessibility problems. The type profiles were checked with regard to all environmental barriers listed by the Housing Enabler. Barriers were ranked according to severity of predicted accessibility problems. Results Out of 64 theoretically possible combinations of functional limitations, eleven occurred more often than expected by chance and eight occurred less often than expected (p<0.05). For further analyses we selected the five positively significant profiles with highest observed frequencies and the five negatively significant profiles with highest observed frequencies. The occurrence of these ten profiles ranged from 2.0% to 26.7%. Simulations of accessibility problems showed varied patterns of barrier ranking between the type profiles. Conclusion By means of Configuration Frequency Analyses we were able to identify combinations of functional limitations as type profiles, representing groups of older people. With such type profiles defined, simulations can be used in order to improve planning procedures and different sets of priorities can be identified for different groups.

**PB7 513 EVALUATION OF NON-INFERIORITY OF INTRADERMAL VERSUS ADJUVANTED INFLUENZA VACCINE WITH TWO SEROLOGICAL TECHNIQUES**  
A. FIQUET\* (Sanofi Pasteur MSD, Lyon, France)  
P. VAN DAMME(1), R. ARNOU(2), J. WOOD(3), P. RICHARD(4), S. THOMAS(4), G. MEGHLAOIU(4), S. SAMSON(4), E. LEDESMA(4) - (1) Vaccine & Infectious Disease Institute (Belgium); (2) Reseau ALTI (France); (3) National Institute for Biological Standards and Control (United Kingdom); (4) Sanofi Pasteur MSD (France)

Introduction: INTANZA® 15 $\mu$ g is the first licensed intradermal influenza vaccine for elderly subjects containing 15 $\mu$ g of haemagglutinin (HA) of each of the seasons three strains. We report the results from the first comparison of the intradermal vaccine with an adjuvanted vaccine. The primary objective of this study was to demonstrate that INTANZA 15 $\mu$ g is at least as immunogenic as an intramuscular adjuvanted influenza vaccine (FLUAD®/ADDIGRIP® 15 $\mu$ g) for the three strains. Methods and materials: 795 adults aged at least 65 years old were randomised to receive either INTANZA or ADDIGRIP during the 2007-2008 influenza season. Antibody titres were measured 21 $\pm$ 3 days post-vaccination using the haemagglutination inhibition (HI) method (primary endpoint) and the single-radial haemolysis (SRH) method (secondary endpoint). Both techniques are recognised by the European Medicines Agency (EMEA). Non-inferiority was demonstrated if the upper bound of the 95% confidence interval (CI) of the

ADDIGRIP/INTANZA ratio for the post-vaccination GMT was less than 1.5. Safety was assessed throughout the study. Results: Non-inferiority of INTANZA was demonstrated with the SRH method for the 3 strains and with the HI method for the H1N1 and B strains. For the H3N2 strain with the HI method the upper bound of the 95% CI was 1.53. Both vaccine groups complied with the same EMEA criteria (seroprotection, post-/pre-vaccination titres ratio and seroconversion) with each assay. Injection-site reactions were generally mild and transient; erythema, but not pain, were more frequent in the INTANZA group as could be expected with the intradermal route of administration. The systemic safety profile was comparable between groups. Conclusion: The results obtained for both vaccine groups were consistent for each assay. The non-inferiority of INTANZA when compared with ADDIGRIP was demonstrated with the SRH method for the 3 strains and for 2 strains with the HI method. Both vaccines were well-tolerated.

#### **PB7 514 COLLECTIVE AND PRODUCTIVE SOCIAL ACTIVITIES REDUCE MORTALITY RISK IN OLDER PEOPLE**

K. PYNNÖNEN\* (University of Jyväskylä, Jyväskylä, Finland)

T. LYYRA(1), T. RANTANEN(1), R. HEIKKINEN(1) - (1) Department of Health Sciences and The Finnish Centre for Interdisciplinary Gerontology (Jyväskylä, Finland)

Introduction: Although earlier studies have shown an association between social inactivity and mortality, less is known about how different dimensions of social activity affect health in old age. The purpose of this study was to investigate how collective and productive social activity effect on mortality risk in old age. Material and methods: As part of the Evergreen project 1224 people aged 64-84 years at the baseline were interviewed face-to-face in 1988. Mortality was followed up for 17 years. Collective social activity was based on questions concerning cultural hobbies, travelling and other hobbies pursued in groups, and productive social activity on questions concerning paid work, participation in organisations and helping relatives, friends and neighbours. Results: After follow-up 871 persons (71 %) had died. Results of Cox regression models indicated that those with two or more collective social activities had a 39 % (HR = 0.72; CI = 0.59 - 0.87) lower risk for mortality compared to those with no social activities even when controlled for sociodemographics, physical health and functioning, memory, and intensity of physical exercise. Subjects with at least one productive social activity, had a 31 % (HR = 0.76; CI = 0.66 - 0.89) lower risk for mortality than those with no social activities when controlled for similar confounders. Conclusion: The results show that both collective and productive social activity are protective for the health of older people. On a societal level, promoting social activity can maintain and enhance the health and autonomy in old age.

#### **PB7 515 LEGITIMACY OF A REMINISCENCE THERAPY GROUP CALLED "HISTOIRE DE VIE" FEELING OF IDENTITY AND SELF-AWARENESS IN ALZHEIMER'S DISEASE**

A. SAGNE\* (CHU DE SAINT-ETIENNE, SAINT-ETIENNE, France)

C. THOMAS-ANTERION, A. GUYENET, J. COLLIGNON, J. DOREY, R. GONTIER

Even if identity and self-awareness in patients suffering from Alzheimer's disease seem to be called into question, quest of the self has been always led. OBJECTIVES We wish 1/ know cognitive and emotional processes mobilized by a therapy based on reminiscence about experimentation of an original group 2/ show that the specific group "Histoire de vie" ameliorates patient's capacity for maintain their autonomy of thinking and update their self-awareness, vital for their identity; 3/ acknowledge relevance of a quantitative and qualitative valuation tool. METHOD It's a retrospective study falls on two hundred patients' files diagnosed suffering from Alzheimer's disease 'their results from MMS vary between sixteen and twenty-five points' hospitalized in neuro-psychogeriatric department. All subjects took part in reminiscence therapy group; each group made up five to six patients who participated in two or four sessions during their hospitalization. Findings of this study are based on use of a specific scale developed from an original mediation (a family tree leant on memories) and which studies some components like chapters of life, episodic or semantic components... RESULTS Subjects are able to speak about themselves. They told on more of personal semantic data than events and more of generic events than episodic events. We notice a Ribot's gradient with a peak of reminiscence when subjects were between ten and thirty years old. Some subjects can give data about their current life, especially emotional data. At the moment, the most part of our data hasn't been processed. Thanks to these objective data supported by twenty years of practice, we can say that feeling of identity and self-awareness continue in Alzheimer's disease and can be explored in reminiscence therapy group based on story of life.

#### **PB7 516 FACTOR ANALYSIS OF COMPLICATIONS FOLLOWING VITREOUS SURGERY AND CONSIDERATION OF PREDICTIVE NURSING**

N. AIDA\* (Nagoya University, Nagoya city, Japan)

Y. MIYAHARA(1) - (1) Tokyo Women's Medical University Hospital (Shinjuku-ku, Japan)

INTRODUCTION: Vitreous surgery is conducted on many elderly patients who are often affected by not only ophthalmic disease but also concomitant complications such as heart disease or cerebral infarction. Therefore, the role of nurses is paramount in providing predictive nursing care to prevent postoperative retinal break or vitreous hemorrhage. To

accomplish this, an accurate needs assessment including information regarding postoperative rest and physical restrictions is essential in addition to pre- and intraoperative reports. This study focused on elucidating the causes of postoperative retinal break and vitreous hemorrhage, complications often leading to serious conditions such as visual degradation. METHODS AND MATERIALS: Subjects comprised 64 patients admitted to the ophthalmology ward of a university hospital in Tokyo for vitreous surgery and who had suffered no intraoperative complications. Medical and nursing records obtained during their hospitalization were grouped into those with and without postoperative complications. These were retrospectively studied using multiple logistic regression analysis of variables shown by univariate analysis to have a significant difference. RESULTS: The complication group comprised 7 patients (10.9%) while the non-complication group comprised 57 patients (89.1%). Differences in background factors between the two groups comprised a significantly higher value for "period of hospitalization" and "serum creatinine" in the complication group along with significant differences in "intraocular pressure abnormalities" and the use of the operative procedures "air tamponade or scleral buckling". The three factors related to the onset of postoperative complications (multiple logistic regression analysis,  $p < 0.05$ ) were intraocular pressure (odds ratio, 14.4; 95% confidence interval, 1.38 – 238.02), serum creatinine (odds ratio, 1.4; 95% confidence interval 1.03 – 8.33) and vitreous surgery involving air tamponade or scleral buckling (odds ratio 10.1, 95% confidence interval 2.12 – 103.95). CONCLUSION: These findings suggest that when intraocular pressure is abnormal and serum creatinine levels high, patients who additionally undergo vitreous surgery using air tamponade or scleral buckling are more likely to develop postoperative complications.

#### **PB7 517 COLONOSCOPY IN THE OVER 80'S IS SAFE AND AN EFFECTIVE USE OF RESOURCES**

B. MCCALL\* (Queen Elizabeth Hospital NHS trust, London, United Kingdom)

M. BLOOMFIELD(1), C. SOLOMONIDES(1), A. ENGLEDOW(2) - (1) Queen Elizabeth Hospital NHS trust (United Kingdom); (2) University College Hospital foundation trust (United Kingdom)

Introduction: Colonoscopy is still the gold standard investigation for investigation of lower gastrointestinal symptoms allowing high resolution views of the colonic mucosa and the potential for therapeutic intervention. However concerns have been raised over the safety of colonoscopy in the elderly, both in terms of the procedure itself and the sedation required. We assess the safety and efficacy of colonoscopy in patients aged 80years and over Methods: 51 consecutive patients over 80years of age referred for colonoscopy were recruited. Data recorded prospectively into a database included age, sex, indication, ASA grade, grade of colonoscopist, sedation, caecal intubation rates, reasons for failure to intubate, pathology and complications. Results: 51 procedures were performed. 29 patients were female. Median age 84 years (range 80-92). All endoscopists were senior trainees, associate specialists or consultants. Patients were ASA grade 2 (22) and 3 (29). Sedation with midazolam (median dose 2mg (range 500mcg-3mg)) was given in all. No reversal agents were required. The caecum was intubated in 41 patients (80%). Reasons for failure were pathology encountered (5), poor prep (1) and procedure not tolerated (4). 38 patients (75%) had pathology with 17 (33%) requiring biopsy or polypectomy. There were no major complications. One mucosal tear resolved with conservative management. Conclusions: Colonoscopy with sedation is safe and well tolerated in this age group. The diagnostic yield and intervention rate is high with no significant complications.

#### **PB7 518 ARE JUNIOR DOCTORS AWARE OF THE CATHETER STATUS OF THEIR ELDERLY PATIENTS**

B. MCCALL\* (Queen Elizabeth Hospital NHS trust, London, United Kingdom)

E. IDEDEVBO(1) - (1) Queen Elizabeth Hospital NHS trust (United Kingdom)

Aims: The urinary tract is the commonest site for hospital acquired infection. Indwelling catheters are a well known risk for urinary sepsis which can cause considerable morbidity and even mortality, especially in the elderly. We aim to assess junior doctor's awareness of the catheterization status of elderly patients. Methods: 10 junior doctors at FY1 to ST2 level were asked "does patient x currently have an indwelling urinary catheter?" with respect to their current inpatients aged 65 and over. A ward round of patients was then conducted and all were checked for the presence of an indwelling urinary catheter. Data including patient age, sex, catheterisation status, junior doctor's response and accuracy were recorded prospectively into a database. Results: There were 87doctor-patient contacts. 51 patients were female. Median age was 83 years (range 65-97). 22 (25%) patients had indwelling urinary catheters (10 female). Junior Doctors only answered correctly in 11 (50%) of these patients. Overall 35 (40%) of answers given were incorrect including 28 (32%) were the catheterisation status was unknown and 2 (2%) false positives and 5 (6%) false negatives. Conclusions: Junior Doctors have poor knowledge concerning the catheterisation status of their patients. This may lead to unnecessarily prolonged periods of catheterisation with the concomitant increase in morbidity and mortality. This may also have adverse financial implications

#### **PB7 519 ISAR FOR OLDER HOSPITALIZED PATIENTS, A BRIEF INSTRUMENT TO PREDICT FUNCTIONAL DECLINE**

J. HOOGERDUIJN\* (Hogeschool Utrecht, University of Applied Sciences, Utrecht, The Netherlands)

B. BUURMAN (2), J. KOREVAAR(2), S. DE ROOIJ(2), D. GROBEE(3), M. SCHUURMANS(1) - (1) Hogeschool Utrecht, University of Applied Sciences (Utrecht,); (2) Academic Medical Centre (Amsterdam,); (3) University Medical Centre Utrecht (Utrecht,)

**Introduction** Post hospitalisation loss of function is seen in 30-60% of older patients resulting in increased length of stay, decreased quality of life and autonomy, increased risk for nursing home admission and increased need for homecare. The first step in preventing functional decline is to identify patients at risk. The Identification Seniors At Risk (ISAR) was developed as a prognostic tool for morbidity in ER patients. We studied this instrument in a cohort of acute admissions in general medicine with promising results, however modification is needed. The aim of this study is to improve the ISAR for use in a hospital setting. **Methods and materials** In a multicenter prospective cohort study data were collected of 639 patients, acutely admitted to the internal wards. Within 48 hours after admission demographic data, physical, psychological and functional status was measured by trained research nurses. Three months after admission outcome data were collected by telephone interview. The Katz index (6 activities) was used to measure functional status. Functional decline was defined as at least one point decline. Single imputation was done to derive an optimal dataset. The ISAR was improved by excluding some and including new predictors, based on univariate analysis and logistic regression. Discrimination and calibration of the new model were assessed and internal validity was assessed by bootstrapping. Results Mean age was 77.8 years and 44.3% were male, 33.8% showed functional decline. Mortality rate was 20.0%. The AUC of the unmodified ISAR was .627 (95% CI .576-.678). After modification the AUC was .708 (95% CI .661-.755) Best predictors: Need of help on a regular basis before admission, using a walking device, ability to travel independently, and numbers of years of education. Conclusion The discriminative ability of this ISAR for Hospitalized Patients is promising and it will be easy to use in clinical practice.

**PB7 520 HIV IN ELDERLY: IS THERE ANY DIFFERENCE BETWEEN MEN AND WOMEN ?**

A. CARMO\* (Universidade Federal do Estado do Rio de Janeiro, Rio de Janeiro, Brazil)  
M. FAKOURY(1), E. GROSS(1), A. CASARSA(1), F. FERRY(1) - (1) Universidade Federal do Estado do Rio de Janeiro (Rio de Janeiro, Brazil)

**Background:** The acquired immunodeficiency syndrome in recent decades showed an increase in the number of notifications among patients over 60 years. Recently in Brazil, the number of reported cases among men and women is 9x and 18x greater than the 80s respectively. **Objectives:** Compare the epidemiological profile of elderly HIV+ men and women, in a reference hospital in Rio de Janeiro, Brazil. **Methods:** Prospective study with patients aged 60 or more being treated at HIV Clinics of the Hospital Universitário Gaffrée e Guinle, until January 2008. Split the sample into 2 groups according to sex (male = G.I and female = G.II). **Results:** Our sample comprised 140 patients, 64 women. The age (65.04 ± 5.07 x 63.40 ± 5.28 years), age at diagnosis and education level were similar between groups. Among the categories of possible HIV infection in G.I 31.58% of the patients were bisexual, 21.05% gay, 15.79% heterosexuals with multiple partners (MP), 7.89% heterosexual partner with known HIV + (KHP) and 19.74% unknown. In G. II, 23.44% KHP , 25% were partners with risk behavior, 12.5% MP and 25% unknown. There were significant difference between the frequency of lipodystrophy (19.72% vs. 35.48%, p = 0.0031), past history of syphilis (39.66% vs. 9.80%, p = 0.0009) and dyslipidemia (25.00% x 55.88%, p = 0.0016). No difference in the frequency of hepatitis B, hepatitis C, smoking, hypertension, diabetes and obesity were observed. **Conclusions:** HIV+ elderly showed important differences. Men had higher risk of infection because of their own behavior while the older women showed greater risk because of sexual behavior / HIV status of their partners. Women showed higher prevalence of lipodystrophy and dyslipidemia while men showed higher frequency of sexually transmitted diseases, especially syphilis.

**PB7 521 INCIDENCE AND RISK FACTORS FOR EARLY READMISSION OF PATIENTS DISCHARGED FROM AN ACUTE GERIATRIC UNIT**

V. REVEL DA ROCHA\* (Hôpital de Pau, Pau, France)  
J. MAHE(1), M. SARASIBAR(1), P. BIGOT(1), D. ALBERT(1), V. REVEL(1) - (1) CH Pau-pôle de gérontologie (Pau, France)

**Introduction:** Geriatric care network is faced with the increase in the elderly population and with it, the increase in the needs of hospital care. Thus, emergency departments must take care of a growing number of elderly patients. In this context, post-acute geriatric units have been created in France since 2003. The one of the hospital of Pau, in the South-West of France opened in June 2006. It offers to patients a global management, on a short length of stay ; its aim is the return at home. The main purpose of this study was to identify factors influencing early readmissions in patients discharged from a post-acute geriatric unit. **Methods and materials:** This prospective study conducted in 2007, measured the incidence of unplanned readmissions within thirty days of discharge and the factors likely to have an effect on them. We studied the following factors : age, length of stay, principal diagnosis, cognitive state, autonomy, comorbidities, mode of discharge, presence of a caregiver at home. A monovariate followed by a multivariate analysis using a logistic regression model was carried out. **Results :** 822 patients had been hospitalised during one year. The rate of

unplanned early readmission was 11.5 %. In multivariate analysis the two identified risk factors were an age older than 90 (OR=3.90[1.39-10.90], p<0.01) and living alone at home (OR=2.17[1.10-4.26], p<0.05). Conclusion : the rate of readmission is similar to those found in the literature for acute geriatric units. Patients who are very old and living alone must be particularly surrounded after their discharge. A global assessment of the elderly patient is essential to identify patients at risk of early readmission.

**PB7 522 PREVALENCE OF BACTERIOLOGICAL SAMPLES AND PATHOGENS IN A GERIATRIC INSTITUTION**

J. LLOVERAS\* (Hopitaux de Luchon, Luchon, France)  
C. COSTES(1), M. SHUKR(1), A. LINDOULSI(1), S. BEDECARRATS(1), C. PINOS(1), M. BLAISOT(1), P. GRIMA(1) - (1) Hopitaux de Luchon (Luchon, France)

The aim of this study was the prevalence of bacteriological samples during a one-year period in a primary care unit. The different microorganisms were characterized by type, site of infection and antibiotic resistance. The results were adjusted for bed-occupancy. We retrospectively studied the bacteriological samples sent to the laboratory from January 1 st to December 31 2007 in hospitalized patients in a geriatric 26-beds unit (mean-age : 79 years ; mean hospitalization time : 31 days). We expressed the positive samples as percentages ,adjusting them for hospital-days and admitted patients and we studied the microorganisms following antibiotic resistance. During the year 2007, 235 admissions and 7999 patient-days were notified : 175 bacteriological isolates were studied from urine (101 ; 58%), sputum (13 ; 8%), stool (19 ; 11%), blood (4 ; 3%), skin (16 ; 9%), and others (19 ; 11%), corresponding to 22 samples/1000 patient-days and 74 /100 admissions ; 109 samples (62%) showed a predominant morphotype, 20 (11%) many organisms and 46 (27%) were negative. The prevalence of MRSA was 0.5 /1000 patient-days. Among staphylococci, 17% were methicillin-resistant. BLSE was found in two samples. In urine isolates ,bacteria Gram positive were found in 27% cases mainly enterococcus (59%). Escherichia Coli exhibited a resistant phenotype in 2/3 cases (Ampicillin-resistance: 60%, Quinolone-resistance : 40%) which is the usual feature for geriatric inpatients. Sputum culture was positive in 92% cases (12/13) confirming in this study its value, which is controversial. Stool culture revealed Clostridium difficile in 1 case (5%), yeasts in 6 cases (32%) ; blood cultures were positive twice (50%), among operative wounds, ulcers or sore, staphylococcus was predominant with 23% This study confirms the high prevalence of infection in geriatric inpatient population ; adjustment for bed-occupancy could improve the cost-efficacy of bacteriological diagnosis.

**PB7 523 DISTRIBUTION OF HOME CARE PERSONNEL'S WORKING HOURS**  
P. TIIKKAINEN\* (JAMK University of Applied Sciences, Jyväskylä, Finland)

The goal of elderly services is that aged people can live in their own homes. In order to make the home care services correspond to the needs of the population we need continuous development of work processes. The aim of this study was to describe the distribution of the nursing personnel's working hours in home care services. The target group consisted of registered nurses (RN) and licensed practical nurses (LPN) (N=110) of one Finnish municipality. The data, consisting of two sub-data, were collected during two weeks in 2008. Firstly, five nursing students observed home care personnel's work activities during five days. They collected data by filling a structured data collection instrument, which divided the work into two major categories: direct and indirect care. The observers followed one nurse in a day reporting work activities in minutes. Secondly, home care personnel self-assessed the distribution of their work hours by web based questionnaire. The results of the observation showed that the nursing personnel's working hours consisted of average 40 % direct care and 60 % indirect care activities of the total one day working time. According to the self-assessment the percentage of direct care activities was 51 %. However, there were differences between RNs and LPNs, whose proportion of direct care was higher (52 %) than RNs' (38%). The most time-consuming direct care activities were taking care of the clients' daily activities and medication care. Respectively, the most time-consuming indirect care consisted of documentation and work planning and meetings. The proportion of personal time was 11% and periods of transition between clients took 12% of the total working time. More attention should be paid to deliver direct care in order to improve client-oriented care and to make services more efficient. Key words: Work sampling, home care

**PB7 524 SERTRALINE-INDUCED RHABDOMYOLYSIS IN AN ELDERLY PATIENT WITH DEMENTIA AND COMORBIDITIES: A CASE REPORT**

P. GARERI\* (Operative Unit Elderly Health Care - ASP Catanzaro, Catanzaro, Italy)  
C. SEGURA GARCIA(3), P. DE FAZIO(3), S. DE FAZIO(1), R. LACAVA(2), A. CASTAGNA(2), D. COSTANTINO(2), G. DE SARRO(1) - (1) Chair of Pharmacology Department of Experimental and Clinical Medicine, Faculty of Medicine and Surgery, University Magna Graecia (Catanzaro, Italy); (2) Operative Unit Elderly Health Care, ASP Catanzaro (Catanzaro, Italy); (3) Chair of Psychiatry, Department of Experimental and Clinical Medicine, Faculty of Medicine and Surgery, University Magna Graecia (Italy)

Rhabdomyolysis is a life-threatening event often caused by drugs; we describe a case of sertraline-induced rhabdomyolysis in an elderly demented patient with comorbidities. A 71-year-old woman performed a psychiatric visit for her depressed mood in September

2007; she was affected with senile dementia, depression, arterial hypertension, heart failure. She had started amysulpride 50 mg/day six months earlier with poor relief. After a psychiatric consultation, sertraline 50 mg/day was added for depression treatment. A geriatric visit in October confirmed the same treatment. Her mood improved significantly. From 18-24th December 2007 she was admitted to a Cardiologic Unit to undergo cardiac pacemaker substitution. Laboratory evaluations showed elevated serum markers of rhabdomyolysis. Treatment with amysulpride and sertraline was interrupted. On December 24th serum levels of CPK and myoglobin were decreased and she was discharged. On January 22nd, laboratory tests showed normal values of CPK, CPK-MB, myoglobin. Sertraline was prescribed again for persistent depressed mood. Fifteen days later, she performed blood tests showing increased CPK and myoglobin. Therefore, the drug was interrupted and blood tests normalized a week later. Two months later escitalopram was started. Until today, no increase in rhabdomyolysis markers was found. This is a case report of sertraline-induced rhabdomyolysis. The Naranjo probability scale indicated a probable relationship between sertraline treatment and the onset of rhabdomyolysis. In fact, it is supposed no relationship between amysulpride and rhabdomyolysis because it was started six months earlier without causing any changes in serum markers of rhabdomyolysis. Furthermore, rechallenge with sertraline caused a new increase in CPK and myoglobin, which was reversed following sertraline interruption. No significant interactions were described between sertraline and drugs administered to our patient. Genetic defects of sertraline demethylation and/or to P-gp binding or concurrent circumstances might explain the onset of rhabdomyolysis.

#### **PB7 525 SURGICAL TREATMENT OF PRESSURE SORES IN ELDERLY PATIENTS**

P. ZICCARDI\* (S.Maugeri Foundation I.R.C.C.S, Telesse, Italy)  
F. CACCIATORE(1), F. MAZZELLA(1), G. DI CAPRIO(1), M. SCIOLI(1), N. FERRARA(1), V. NUNZIATA(1) - (1) S.Maugeri Foundation I.R.C.C.S (Telesse, Italy)

The plastic surgeon knows that the pressure treatment needs two actions: resection and reconstruction. The surgical treatment concerns the pressure sores with a minimal height of 5cm for the diameter, located in area with bone protrusion, essentially pressure sores of the pelvic area. The surgical treatment requires three stages: 1) preparation stage with information of the patient for the surgical imperatives and wound bed preparation 2) surgery stage with the choice of a secure technique which needs to preserve the maximum of skin and muscle, useful in case of recurrence; 3) post-operative stage requiring cooperation and responsibility of the patient and rehabilitative treatment. The techniques are multiple from the most simple such as grafts , local plasty, to the most sophisticated such as distal flaps cutaneous, muscular, mainly musculo cutaneous or expanded flaps. An imperative condition: thick tissue cover, well vascularised, occasionally sensitive, overall bringing a durable mattress on the bone protrusion area. Elderly patients frequently are affected by pressure sores if long term bedded . Quality of life ,costs of treatments and bad prediction of life , associated to comorbidity ,could orientate the choice of surgical treatment to obtain a faster healing of sores and reduce the delay of hospitalisation. Conclusion: Surgery is the solution which can heals the most rapidly possible to the elderly patient with pressure sores to avoid the worsening of general conditions that can be cause of death. In every patient with some expectative of life surgery is imperative. the reduction of plasmatic and blood loss from sores is extremely effectiveness to improve the conditions of patients. in many cases if the pathologic state allows, patients can recovery orthostatism and deambulation after surgery. and this means an effective improvement of quality of life.

#### **PB7 526 THE EFFECTS COMPREHENSIVE GERIATRIC ASSESSMENT ON MORTALITY OF PATIENTS IN PRIMARY CARE SETTING SIRPA HARTIKAINEN, HANNU KAUTIAINEN, RAIMO SULKAVA KUOPIO UNIVERSITY, FINLAND**

S. HARTIKAINEN\* (University of Kuopio, Kuopio, Finland)  
H. KAUTIAINEN(2), R. SULKAVA(1) - (1) University of Kuopio (Kuopio, Finland); (2) Medcare (Finland)

Introduction The effects comprehensive geriatric assessment (CGA) on mortality vary depending on the setting and expertise of CGA team members. The aim of this study was to evaluate effects of CGA in primary health care setting on mortality of elderly persons. Methods and material The GeMS Study is a population-based geriatric health intervention study in people aged 75 years or more. A random sample of 1000 persons aged 75+ was drawn from the census data of the city of Kuopio in eastern Finland on November 1, 2003. The subjects were randomized into intervention (n=500) and control (n=500) groups. Participation rate was 78.1% in whole study population, 81% (n=404) in the intervention and 75.2% (n=377) in the control group. CGA was performed to the subjects in the intervention group yearly during years 2004-2006, whereas only limited activities took place in the control group. Results Mean age of participants at the date of first examination was 81.7 years and two in three (70%, n=584) were female. At baseline the intervention and control group were alike in age, sex, residential status as well in ADL and IADL capabilities and in cognitive functioning. From the date of first examination in 2004 to the end of 2007 one in five (n=179, 22.9%) participant died, 96 persons (23.8%) in intervention group and 83 (22.0%) in control group. Four year survival did not differ between groups and standardized mortality rate was for all men 0.83 (95% CI 0.62 to 1.07)

and for all women 1.00 (95%CI 0.83 to 1.19). Conclusion Comprehensive geriatric assessment in primary health care setting did not effect on mortality of patients.

#### **PB7 527 GERIATRIC MULTIDIMENSIONAL APPROACH IN THE EMERGENCY DEPARTMENT**

M. STASI\* (Department of Medical and Surgical Disciplines, Geriatric Section, University of Torino, Torino, Italy)  
G. ISAIA(1), V. TIBALDI(1), E. QUAGLIOTTI(1), M. BOSCARINO(1), L. FISSORE(1), N. AIMONINO(1) - (1) Department of Medical and Surgical Disciplines, Geriatric Section, University of Torino (Torino, Italy)

Introduction. The use of hospital care increases significantly with age. Older people visiting the emergency department have three to seven times higher rate of hospitalization than younger people. The multidimensional geriatric approach could represent a valid help for elderly people even in the emergency department. Methods and materials. Randomized controlled trial evaluating over eighty five patients visiting the Emergency Department of San Giovanni Battista Hospital for acute illnesses not requiring hospital admission. All patients underwent a multidimensional evaluation including demographic characteristics, clinical data, quality of life, functional, nutritional and cognitive status at baseline and at 6-month follow up. The control group was discharged normally while a specific protocol was activated for the study group, aimed to reduce clinical and social problems and indirectly to reduce hospital accesses. The protocol was made with the aim of characterize clinical and social problems often misunderstood. A dedicated phone line was activated for patients and their caregivers. Results. Thirty four patients gave the consensus to participate: 17 for each group. One third of patients was married and was living with the consort. Main admission's diagnoses were: cardiovascular illnesses (29.4%), urinary infections (14.7%), respiratory infections (11.7%) and pain (8.8%). There were not differences in demographic characteristics, comorbidity, functional and cognitive impairment, nutritional status and quality of life between two groups. The multidimensional approach showed many social problems: loneliness (61.7%), old caregiver (20.6%) and hard relationships with relatives (5.8%). At 3-month follow up there were not differences in terms of hospital readmissions nor mortality. Only caregiver's stress was significantly reduced in the study group ( $p=0.05$ ). Conclusion. The geriatric multidimensional approach could be considered a strategy for optimising the needs of old people and reducing caregivers stress.

#### **PB7 528 OLDER PEOPLE**

C. ABLEY\* (Newcastle Primary Care Trust, Newcastle University (PhD Student), Tynemouth, United Kingdom)

Introduction Research was carried out to explore and therefore increase understanding of the social construction of patient centred health and social care for vulnerable older people in the community. The National Service Framework (NSF) for Older People (Department of Health, 2001) provided the background for this study, as although it placed person centred care at the heart of care for older people, it failed to provide adequate detail for its application in every day practice, apart from in relation to assessment. Research on person centred care has focused on dementia care (Kitwood, 1997) and hospital settings (McCormack, 2003), with some studies relating to general practice (Mead and Bower, 2000). None relate specifically to health and social care in the community and incorporate the views of older people. Methods Data collection was via focus groups and individual interviews with older people and health and social care professionals. Purposive sampling was used. Data analysis was based on the constant comparative method described originally by Glaser (1965), but also informed by the approaches of Wolcott (1994) and Dey (1993). A qualitative data analysis software package (NVIVO) was used to assist with data management. Results and conclusions A key finding was that older people who feel vulnerable do not consider their care to be patient centred and those that view their care as patient centred do not feel vulnerable. These apparent links between feelings of vulnerability and patient centred care highlight the importance of asking older people whether they feel vulnerable and intervening in ways that aim to reduce these feelings. The research suggests that asking older people whether they feel vulnerable should be integral to the work of community health and social care teams. Decisions should not be based solely on professional perspectives of vulnerability.

#### **PB7 529 OBESITY IN ELDERLY WOMEN AND ASSOCIATED FACTORS**

A. OLIVEIRA MARQUES \* (Federal University Of Pernambuco, Pernambuco, Brazil)  
A. DE OLIVEIRA MARQUES(1), I. GRANDE DE ARRUDA(1), M. CARRÉRA CAMPOS LEAL(1), A. GOMES DO ESPÍRITO SANTO(1) - (1) Federal University of Pernambuco (Brazil)

Epidemiological, demographic, and nutritional transitions are taking place in Brazil in the last decades. The elderly population is already the fastest growing group and the concomitance of malnutrition and obesity has been reported in a very low-income population in Northeast Brazil. Obesity is now recognized as a major risk factor for coronary heart disease. It also harms more than just the heart and blood vessels system. It is a major cause of gall stones and can worse degenerative joint disease. Obesity is associated with significant morbidity including hypertension, type 2 diabetes and some forms of cancer, diseases with high prevalence in elderly. The aim of this study is to

analyses the prevalence of obesity in elderly women and its association with socio-demographic, biochemical and hypertension variables. Methods and Material: By means of a cross sectional study, 188 women outpatients, 60 to 89 years-old were assessed. Obesity was defined by the Body Mass Index  $\geq 30 \text{ Kg/m}^2$  (WHO, 1998). The parameters examined were: age, education, marital status, fasting glycemia, total cholesterol, high and low density cholesterol lipoproteins, triglycerides and presence or absence of blood hypertension. Data analysis was performed by Pearson's Chi-square or ExactTest of Fisher and Multivariate Analysis of Logistic Regression, estimating the probability of obesity. Results /conclusions: Among elderly women, 25,6% were obese. Obesity was present in the first age ranges (60 to 69 and 70 to 79 years old), and positively associated ( $p=0.050$ ) to fasting glycemia  $\geq 126 \text{ mg/dL}$ , with increased risk (Odds =1,76) for elder diabetic, compared to non-diabetics women. The highest probability of obesity, around 18%, was observed in women younger than 70 years-old, triglycerides  $\geq 200 \text{ m/dL}$ , diabetic and hypertensive, emphasizing the role of associated morbidity.

#### **PB7 530 GENERAL PRACTITIONER ATTITUDES TO DEMENTIA: A RURAL/URBAN COMPARISON**

A. GREENWAY-CROMBIE\* (Bendigo Health, Bendigo, Australia)  
 S. DAVIS(1), P. DISLER(2), D. POND(3), J. SWAIN(3) - (1) Monash University (Bendigo, Australia); (2) Bendigo Health (Bendigo, Australia); (3) University of Newcastle (3550, Australia)

**INTRODUCTION** The ageing of the population has led to a significant increase in the prevalence of dementia in Australia and indeed worldwide. Our current inability to prevent dementia from occurring and the lack of a cure for dementia makes it essential that the disease is detected as early in its course as possible. General Practitioners (GPs) are often the first point of contact for people with memory problems or symptoms of cognitive impairment and they are responsible for diagnosing the cause of the problem or impairment. A study is currently being undertaken in Australia to explore the detection and management of dementia by GPs compared to established best practice. This presentation will focus on GPs confidence and attitudes towards the detection and management of dementia and will explore the differences between rural and urban GP perception. **METHODS** GPs participating in the study were asked to complete a "GP Attitudes and Confidence Survey". The 24-item questionnaire was based on a 49-item self administered questionnaire developed by a team of German researchers and used with their permission. GPs from four urban centres in three different Australian States and one regional centre (that includes three rural towns) participated in the survey. **RESULTS** Results from the preliminary analysis of the questionnaires will highlight differences in attitudes and confidence of rural and urban GPs in relation to dementia detection and management. **CONCLUSION** The relevance of results will be discussed in relation to the impact of GP attitudes and confidence in making a dementia diagnosis and in disclosing this diagnosis to the patient and/or their carer. GP attitudes toward management guidelines for dementia are also examined. The discussion will consider these issues from a rural versus urban perspective.

#### **PB7 531 AGE PATTERNS IN ALCOHOL-RELATED CARE IN STOCKHOLM 1997-2007**

K. AHACIC\* (Karolinska Institutet, Stockholm, Sweden)

**Introduction.** This study describes age patterns in alcohol and drug related health care. **Methods.** Based on Stockholm County registers covering inpatient and outpatient care, the proportion of people with at least one care episode during a year was estimated by age. Included inpatients were people with an alcohol or drug related first, second, and third diagnosis, and outpatients in two clinics (Beroendecentrum Stockholm and Maria Beroendecentrum AB) where it was not possible to separate alcohol from drug related care. **Results.** The distribution over age could be described as curvilinear with two peaks. There is a first peak for age group 15-24, which is followed by a lower percentage for age group 25-34. The percentage then increases until next peak in middle age, for age group 45-54, where after the percentage decreases with age. This pattern was similar for inpatient and outpatient care. The age distribution was also similar among men and women, but women's estimates were about half compared to men's. The distribution varied by diagnosis. Alcohol intoxication was the most common diagnosis in age group 15-24, while alcohol dependence was the most common diagnosis among older ages. Alcohol dependence, harmful use, alcoholic liver disease all showed a peak in middle age and a following decrease with increasing age. When the age distribution in 2007 for all inpatient care was compared to the corresponding distribution in 1997, it peaked in an older age group than before – in age group 55-64 rather than in age group 45-54. While the percentage in younger age groups decreased, the percentage in older age groups had increased. **Conclusion.** This change in age patterns suggests inpatient care may be cohort dependent. If so, alcohol related care may increase among older people when later born cohorts reach older ages.

#### **PB7 532 MAJOR DIGESTIVE SURGERY IN ELDERLY PATIENTS. RISK FACTORS OF MORTALITY. A FRENCH MULTICENTER PROSPECTIVE STUDY.**

E. DURON\* (Hopital de la Pitié, Paris, France)  
 J. DURON(1), H. LEVARD(3), D. COLLET(4), B. SUC(5), J. HAY(6) - (1) Hopital de la Pitié (Paris, France); (3) IMM (Paris, France); (4) Maison du Haut Leveque (Pessac, France); (5) CHU Rangeuil (France); (6) Hopital Louis Mourier (France)

The aging population in France results in an increasing number of major digestive surgical operations. The purpose of the present study was to highlight the specific risk factors of mortality following this type of surgery in elderly patients. Patients and methods. From January 1, 2002 to December 31, 2004, 3,322 patients undergoing a major digestive operation were prospectively enrolled. 1,796 (54%) were  $\geq 65$  years old (mean age 75 $\pm$ 6.5). The end point was the postoperative 30 days mortality. Twenty-six items (16 preoperative conditions, 6 intraoperative observations or procedures and 4 postoperative outcomes) were considered through a prevalence report, a univariate as well as a multivariate analysis. Results. The global mortality of the  $\geq 65$ -year-old patients was 10.6% and significantly increased with age from the 65-75 years group. Age 65 was an independent factor of mortality (OR 2.21 CI95% 1.36-3.59 p<0.001). In the  $\geq 65$ -year-olds, the other specific independent factors of mortality were: emergency (OR 5.18 CI95% 3.13-8.56 p<0.001), anemia (OR 1.92 CI95% 1.19-3.10 p<0.001), ASA III class (American Society of Anesthesiologists) (OR 1.85 CI95% 1.12-3.04 p<0.001) and a palliative cancer operation (OR 4.05 CI95% 2.31-7.09 p<0.001). Conclusion. Even if age itself remains a risk factor of mortality in elderly patients, this study reveals opportunities for improving the results of major digestive operations in  $\geq 65$ -year-old patients: preoperative geriatric assessment to optimize preoperative conditions (e.g. anemia) and screening of preoperative diseases (e.g. colon cancer) to increase rate of elective and curative operations.

#### **PB7 533 AN ALGORITHM TO DIAGNOSIS EPILEPTIC SEIZURES IN THE ELDERLY**

M. VERNY\* (Hôpital de la Salpêtrière, Paris, France)  
 S. DUPONT(1), S. HARSTON(2), C. MARCHAL(2), F. PUISIEUX(3), A. BENETOS(4), H. VESPIGNANI(4), L. CARTZ-PIVER(5), S. SCHUCK(6), P. DERAMBURE(3) - (1) Hôpital de la Salpêtrière (Paris, France); (2) CHU de Bordeaux (Bordeaux, France); (3) CHU de Lille (Lille, France); (4) CHU de Nancy (Nancy, France); (5) CHU de Limoges (France); (6) Kappa Santé (France)

**Introduction:** Epidemiological studies have demonstrated high frequency of seizures and epilepsy in the elderly. However, diagnosis remains difficult. A panel of experts (neurologists and geriatricians) elaborated an algorithm based on 29 clinical, electroencephalographical or radiological criteria to facilitate the diagnosis of seizures. The objective of this study was to validate this algorithm. **Methods and materials:** The algorithm was applied to the data of patients ( $> 65$  years) referred for various symptoms evoking epilepsy (delirium, falls, weakness...) in a multicentric retrospective study. All patients underwent EEG and brain CT scan or MRI. The diagnosis of the experts participating in this study was considered as the gold standard. **Results:** Data of 269 patients (mean age: 79.3  $\pm$  7.2) were analyzed: 138 epileptic (E+) versus 131 non epileptic (E-). Patients were mainly referred for neurological deficit (40%), delirium (38%), loss of consciousness (27%), impaired consciousness (26%), falls (23%). The results of the algorithm for classification of certain and probable epileptic seizures versus possible and improbable epileptic seizures were: specificity 67% and sensitivity 86%; PPV 74% and NPV 82%. With a logistic regression, 2 new models are proposed: the first with 13 criteria (Sp 90%, Se 86% and PPV 90% and NPV 86%; prediction by roc curve 0.94) and the second with 8 criteria (Sp 82%, Se 84% and PPV 83% and NPV 83%; prediction by roc curve 0.87). **Conclusion:** The present study validates the use of the algorithm to facilitate the diagnosis of epileptic seizures in the elderly. We plan to test the different models of algorithm in a prospective study.

#### **PB7 534 POLYPHARMACY AND DRUG INTERACTIONS IN ELDERLY IN- AND OUTPATIENTS**

D. BAUMGARTNER\* (Medical University of Graz, Graz, Austria)  
 R. OTTO(1), E. TAFEIT(2), S. WALLNER- LIEBMANN(3), A. LUEGER(1), R. ROLLER- WIRNSBERGER(1) - (1) Medical University of Graz, Department of Internal Medicine (Graz, Austria); (2) Medical University of Graz, Institute of Physiological Chemistry, Center for Physiological Medicine (Graz, Austria); (3) Medical University of Graz, Institute of Pathophysiology, Centre of Molecular Medicine (Graz, Austria)

**Introduction** Polypharmacy is a major risk factor for functional decline and secondary morbidity in elderly patients. Little data are available about prescription routine of doctors treating elderly patients in the setting of a department of internal medicine not especially trained in geriatric medicine. **Methods** Data were collected from patients older than 65 yrs attending the Emergency Clinic of the Department of Internal Medicine at the Medical University Graz for 2-months (n= 723). Collection of data focused on drug therapy at time of admission and at the end of ambulatory (n= 323, age 76.7 $\pm$ 8.0 yr) or inpatient (n= 400, age 79.8 $\pm$ 7.5 yr) treatment. Potential drug interactions were evaluated electronically. **Results** The mean number of drugs on admission was significantly lower in patients further treated on outpatient (OP) basis (6.50 $\pm$ 4.17) compared to the inpatient (IP) group (7.64 $\pm$ 3.61) (p<0.001). On discharge the mean number of drugs was significantly increased to 7.00 $\pm$ 4.12 in OP group (p<0.001). Overall change in mean number of drugs in IP group to 7.78 $\pm$ 3.17 was not statistically significant. Significant increase was found in the age group between 65-74 years (p<0.005), while significant decrease was found only in the oldest old above 85 years (p<0.05) in IP group. Significant decrease of drug groups was only found in IP group for benzodiazepines, NSAIDs and tricyclic antidepressants. The mean number of potential drug interactions increased significantly in OP group, while change in IP group was not significant. **Conclusions** Short term visits at emergency clinics

not employing doctors trained in the special needs of elderly patients may contribute to polypharmacy. An increase of number of drugs prescribed per patient also raises the potential for drug interactions.

**PB7 535 BARRIERS TO ASSESSING FITNESS TO DRIVE IN DEMENTIA IN NOVA SCOTIA: INFORMING STRATEGIES FOR KNOWLEDGE TRANSLATION**

P. MOORHOUSE\* (Dalhousie University, Halifax, Nova Scotia, Canada)  
L. HAMILTON(1), T. FISHER(1) - (1) Dalhousie University (Halifax, NS, Canada)

**Introduction:** Information regarding provincial barriers to assessing driving safety in dementia is scarce. Information regarding primary care physicians' (PCPs) attitudes and practices regarding driving and dementia will assist in the design a novel online resource for Nova Scotian PCPs to aid in the discussion of fitness to drive in dementia. **Methods and Results:** We randomly surveyed 64 Nova Scotian PCPs who currently care for older adults with dementia, 38.3% of whom practice in rural areas. 63.8% of respondents indicated that they sometimes avoid discussions about driving cessation, most commonly due to lack of comfort in decision making. 55.3% of respondents indicated that discussions about driving cessation had a negative impact upon the therapeutic relationship. 78.7% of respondents indicated that concerns about personal/corporate liability factored in their decision to report unsafe drivers to provincial authorities. 87.2 % of respondents used the MMSE, 53.2% used the clock drawing test, 14.9% used the MoCA, and 12.8% used the TrailsB test. 40.0% of respondents use the current national guidelines assessing fitness to drive in dementia. Approximately 57.4% of patients assessed in primary care are referred on for on-road assessment of driving while 59.6% are referred to specialists, most commonly geriatricians (46.8%). 89.4% of respondents indicated that they would be interested using an online resource for assessing fitness to drive in dementia. **Conclusions:** Barriers to the assessment of fitness to drive in dementia in primary care include lack of comfort with decision making, incomplete use of national guidelines, lack of consistency in assessment tools between physicians, and concern regarding negative impact to the physician patient relationship. These barriers will be used to design an online resource for knowledge translation.

**PB7 536 A GERIATRIC MEDICINE CURRICULUM IN AN INTERNAL MEDICINE RESIDENCY PROGRAM: DEVELOPMENT AND EVALUATION**

H. KUSZ\* (McLaren Regional Medical Center - Michigan State University Residency Program in Internal Medicine, Flint, United States)  
S. SMITH(1) - (1) McLaren Regional Medical Center - Michigan State University Residency Program in Internal Medicine (FLINT, United States of America)

**Introduction:** The number of older Americans will nearly double when the youngest baby boomers reach retirement age. Geriatric expertise in primary care physicians is desperately needed, but inadequately addressed by training programs. The American Geriatric Society (AGS) has developed guidelines for geriatric training in internal medicine (IM) and the Review Committee-IM (RC-IM) of the Accreditation Council for Graduate Medical Education (ACGME) has had a requirement for geriatric training for many years, most recently stating that IM training programs must have "formal instruction and assigned clinical experience in geriatric medicine." **Methods:** We are a university-affiliated, community-based, teaching program with 36 resident physicians, twelve at each postgraduate level. Based upon a widely recognized need for geriatric training, and a survey of our trainees in October 2000, we increased our geriatric content, both in clinical experience and in didactic instruction. We added a one-month geriatric block rotation for second year residents and a first year experience in residential hospice to a long-standing longitudinal, nursing home rotation for PGY-2 and PGY-3 residents. The written curriculum is organized around the six ACGME competency-based goals with learning objectives. Clinical experiences include direct patient care and bedside teaching rounds, all supervised by a board certified geriatrician, with multidisciplinary input. Didactic teaching includes monthly core conferences and assigned articles. Faculty evaluate residents in the longitudinal and block experiences. Residents evaluate their rotations and faculty. **Results:** Eight of our residents in the past nine years have pursued a geriatric fellowship, four staying in academic medicine and four pursuing primary care. Evaluation comments reflect their appreciation for their geriatric training. **Conclusion:** The culture of our small program is one of continuous quality improvement with continuing modifications of our curricula. We look forward to on-going feedback from our graduates on their preparedness to meet the needs of our aging population.

**PB7 537 COLONIC PSEUDO-OBSTRUCTION ASSOCIATED WITH EMPHYSEMATOUS CYSTITIS IN AN ELDERLY PATIENT**

S. MATTIONI\* (APHP, UPMC Paris 6, Paris, France)  
M. GODARD(1), A. REBILLAT(1), M. BRIHIER(1), J. BODDAERT(1), M. VERNY(1) - (1) Geriatric department, Pitié-Salpêtrière hospital, APHP, UPMC Paris 6 (Paris, France)

**Introduction:** Emphysematous cystitis is an uncommon and life threatening entity, requiring early diagnosis and treatment to improve outcome. We report a case of colonic pseudo-obstruction complicated with emphysematous cystitis. Case report A 84-year-old diabetic woman, with diabetes mellitus, unexplored cognitive impairment and repeated cystitis past history, presented to the emergency department with a bowel obstruction. She

described a three weeks diarrhea, alternating with constipation and vomiting. Biological analysis revealed a severe hypokalemia (2.1 mmol/l), leading to ED admission. Abdominopelvic X rays and CT scan reported a colonic pseudo obstruction and air in the bladder wall, suggesting an emphysematous cystitis, confirmed by the bacteriological analysis revealing a E.Coli urinary infection. The patient received a 6 weeks treatment with ceftriaxone for E.Coli and metronidazole for possible anaerobic bacteria. Outcome was favorable and an abdominal CT scan confirmed the regression of the air in the bladder. Patient went back home after 10 days. **Discussion:** Emphysematous cystitis is an uncommon and life threatening entity, with a 9.4 % mortality rate. Several factors are associated with, such as diabetes mellitus, female, urinary stase conditions, recurrent urinary tract infections and immunosuppressive comorbidities. The gas formation could be related to bacterial fermentation mainly associated with E. coli (50 – 80 %) and Klebsiella pneumonia. Diagnosis is often made incidentally on abdominal radiographs. Treatment consists of broad spectrum antibiotics, bladder drainage and glycaemic control, with a length of treatment varying from 7 days to 6 weeks according to the literature. Outcome can be characterized by emphysematous pyelitis or pyelonephritis, requiring percutaneous drainage, partial or total nephrectomy or cystectomy even hyperbaric oxygen. Conclusion Emphysematous cystitis is an uncommon potential life threatening infection, requiring early diagnosis and treatment.

**PB7 538 WEIGHT LOSS IN THE ELDERLY: A 10 YEAR RETROSPECTIVE ANALYSIS.**

J. MENA-MADRAZO\* (Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán, Mexico City, Mexico)  
R. SOTO-SOLIS(1), F. ALVAREZ-MONTERO(1), M. VAZQUEZ-HERNANDEZ(1) - (1) Instituto Nacional de Ciencias Médicas y Nutrición Salvador Zubirán (Mexico City, Mexico)

**Introduction:** Weight loss is a common complaint in elderly people. While in some patients these may be a normal consequence of the aging process, many of them have an underlying disease. Diseases that cause weight loss can be organic, psychiatric or social. There is no consensus on a definition of abnormal weight loss, and little information is available on how these patients should be evaluated. **Methods:** A retrospective analysis was done with patients seen at our institution from January 1999 to December 2008. All patients aged 60 or more with unintentional weight loss were included. Patients who did not complete the follow-up or with insufficient data for analysis were excluded. Logistic regression model was used to evaluate the predictors of organic, psychiatric and malignant disease. **Results:** Of the 248 patients with unintentional weight loss, 220 were included in the study, 121(56%) were men, with a mean (SD) age of 72.5 (8.1) years. Mean weight loss in kilograms was 12.1 (5.9), representing a percentage of 17.1 (8.5), with a median of 6 months of evolution. The first cause of weight loss was organic (57.4%), followed by psychiatric diseases (17.2%). No diagnostic was found after a complete evaluation in 15%. From the organic disease group, the most common diagnostic was benign gastrointestinal pathology (35% of all patients), followed by cancer (22%); 5% of patients had the coexistence of organic and psychiatric disease. Only female gender was found to be related to a diagnostic of psychiatric disease with an OR (95%CI): 2.57 (1.021-6.47). The final diagnostic was coincident with the initial presumptive diagnostic in 30%. **Conclusions:** Most elderly patients that present with weight loss have an identifiable disease. Only female gender was associated with psychiatric disease. All elderly patients complaining of weight loss, even when small, should undergo a diagnostic evaluation.

**PB7 539 RARE PRESENTATION OF STREPTOCOCCUS PNEUMONIAE PNEUMONIA WITH BACTEREMIA AND MULTIPLE SUBCUTANEOUS ABSCESSSES.**

E. TAILLANDIER-HÉRICHE\* (Henri Mondor's Hospital, Créteil, France)  
E. ALONSO(1), S. KRYPCIAK(1), P. LESPRIT(2), S. HERBAUD(3), E. PAILLAUD(3) - (1) Henri Mondor's Hospital, Dpt. of Internal and Geriatric Medicine (Créteil, France); (2) Henri Mondor's Hospital, Infection Control Unit (Créteil, France); (3) Albert Chenevier's Hospital, Dpt. of Internal and Geriatric Medicine (Créteil, France)

**Introduction:** Streptococcus pneumoniae remains the principal bacterial cause of pneumonia in adults. Although bacteremia can lead to suppurative complications such as meningitis, pericarditis, arthritis, and osteomyelitis, metastatic infections in soft tissue are fairly uncommon. **Methods:** We report a case of streptococcus pneumoniae pneumonia who presented with abscesses in multiple soft tissue sites in a patient of 83 years with a review of the literature. **Results:** An 83 year old woman, was admitted to hospital for weakness and fever. On admission, the patient was febrile to 39° with multiple erythematous, warm, fluctuant swellings over left leg. On pulmonary examination, the breath sounds were diminished at the left lung base. Blood culture and aspiration of a subcutaneous abscess were identified as S pneumoniae susceptible to penicillin. To our knowledge, most reported cases of S pneumoniae soft tissue infection have involved cellulitis with 40 cases reported in the literature and 8 cases of subcutaneous pneumococcal abscesses. In these series the majority of patients had underlying chronic illnesses or were immunocompromised by alcohol abuse. Descriptions range from localized erythema to violaceous or brawny skin discoloration and bullae formation. Pneumococcal cellulitis was universally associated with bacteremia. Penicillin G was typically the drug of choice. Suppurative complications were common and surgical drainage was required in many

cases. Mortality was ~ 15 %. Conclusion: Streptococcus pneumoniae is an unfrequent cause of skin infection in adults and suppurative complications are common.

**PB7 540 USING THE MODIFICATION OF DIET IN RENAL DISEASE (MDRD) AND COCKCROFT AND GAULT (CG) EQUATIONS TO ESTIMATE GLOMERULAR FILTRATION RATE IN HEALTHY PEOPLE AGED 75 OR OLDER.**  
C. GALVEZ\* (Hospital Central de la Cruz Roja, Madrid-España, Madrid, Spain)  
J. GOMEZ-PAVON(1), J. RODRIGUEZ-SALAZAR(1), J. BAZTAN(1), I. RUIPEREZ(1)- (1) Hospital Central de la Cruz Roja (Madrid, Spain)

Objectives: To compare the glomerular filtration rate (GFR) of patients aged 75 or older healthy people obtained by urine 24 h creatinine clearance (24 h-CC), these is estimated by using the CG and the MDRD1-2 formulas. Methods: Prospective observational study. There were included all patients aged 75 years or older healthy people (Barthel index 90-100 and Charlson index 1-2) from geriatric team consultation of a Geriatric Service from Madrid, into the period between 1-11-2007 and 1-11-2008 discarding patients without euvolement clinic condition or with kidney renal disease, urinary incontinence, dementia or another disorder that hinder to take urine 24 h. We compared CG (corrected to a body surface area (BSA) of 1.73 m<sup>2</sup>) , MDRD1 and MDRD2 against the 24 h-CG - corrected with BSA of 1.73 m<sup>2</sup> - using least squares linear regression. Differences from 24 h-CC were tested using the paired t-test. p value <0,05 and 95% interval confidence. Results: We studied 70 persons (44 females, mean age 82,87 +/- 5,8 years old). The mean of 24 h-CC was 56,6 +/- 22,79 ml/min and GFR estimated using the CG, MDRD1 and MDRD2 formulas was 54,27 +/- 15,25 ml/min, 71,48 +/- 18,65 ml/min, 69,78 +/- 18,53 ml/min, respectively. There was evidence of a relationship between 24 h-CC and the three GFR estimated (MDRD1: Beta standardized coefficients= 0,48; p<0,001; MDRD2: Beta= 0,50, p<0,001; CG: Beta: 0,53, p<0,001). There was differences significantly between the mean of 24h-CC , MDRD1 (mean -14,88 (-19,85 to -9,909, p<0,001), and MDRD2 (-13,186 (-18,253 to -8,120, p<0,001). However, not significantly differences between 24 h-CC and CG (2,328 (-2,312, 6,969, p: 0,32) was found. Conclusions: The CG and MDRD formulas compared with urine 24h creatinine clearance have a weak average relationship in healthy people aged 75 or older, but this formulas showed relevant differences between them.

**PB7 541 ARE GENERAL PRACTITIONER CHARACTERISTICS RELATED TO RECRUITMENT OF THEIR OLDER PATIENTS: THE BRIGHT TRIAL**  
K. NGAIRE\* (The University of Auckland, Auckland, New Zealand)  
M. SIMON(1), N. KERSE(1), S. LIN(1), C. MCLEAN(1) - (1) The University of Auckland (Auckland, New Zealand)

Introduction. High response rates are needed to ensure generalisability of information from research conducted in the community. The BRIGHT trial recruited 3700 older people in New Zealand to test a primary care disability prevention strategy. Do characteristics of the GP (age and gender) influence the success of recruitment of their patients? Methods and materials General practitioners in three regions of NZ were recruited by personal invitation. Eligible patients: 75 years or greater (65+ for Maori); lived in the community; and could communicate in English, were identified from the GP list of enrolled patients and sent a letter of invitation from their GP. Research staff completed consenting processes. GPs and practices were surveyed to ascertain demographic and practice characteristics. GP and practice characteristics associated with recruitment rate of patients were examined using generalized linear multiple regression. Results 132 GPs in 60 practices (1-9 GPs per practice) contributed 3751 patient participants aged 75 years and over (65+ for Maori). 43% of GP were women, 65% had been trained in New Zealand and 25% worked less than half time. On average the GPs had been in general practice for 17.7 years (8.8) and had been at the current practice for 12.7 yrs (sd 9.6). On average 46.8% of eligible patients were recruited (sd 9.2). 25% of GPs contributed less than 8 participants. Using multiple regression, the longer the GP had been practicing the more patients were recruited (p = 0.004) controlling for practice size, gender, sessions per week and country of graduation. Conclusion Patients from more experienced GPs were easier to recruit to research. Efficiency in recruitment may be increased by foreknowledge of likely high or low yield practices.

**PB7 542 THE DEVELOPMENT OF HEALTH CARE SERVICES MODEL FOR THE DEPENDENT ELTERS IN THAILAND**  
V. WIROJRATANA\* (Faculty of Nursing, Mahidol University, Bangkok, Thailand)  
A. OUMNARTSATSE(1), A. SASAT(2), A. MALATHUM(3), J. NARONGSAK(1) - (1) Faculty of Public Health, Mahidol University (Bangkok, Thailand); (2) Faculty of nursing, Chulalongkorn University (Bangkok, Thailand); (3) Faculty of Nursing, Mahidol University (Bangkok, Thailand);

Introduction: The objectives of the study were to (a) explore the needs of the Thai dependent elders and their caregivers (b) identify existing support systems including that assist the dependent elder (c) develop a health care service model for the dependent elders. Method: Applied participatory action research (PRA) was used. Purposive sample were drawn from Chaugnutnet area in Bangkok, Thailand including the dependent elders, families caregivers, lay persons in the community and health care professionals in the

Health Care Centre 29. In the first phase, a focus group was conducted for each group (8-10 persons) to identify need and problems caring for the dependent elders, support system and health care services available. The second phase another round of focus group was conducted to develop a health care services model. Data analysis was done within and across groups to interpret and reach consensus of health care services model. Results: The findings revealed that the Thai dependent elders and their families faced to stress, lack of sufficient economic and health care support. Lay persons also identified needs to enhance community networks which have existed in community and cooperate with religion institutions to assist the dependent elders and their family. Health care professions reported workload and limited budget. The finding suggested that a health care services model have to integrate social and health care services. The cooperation among the community networks, health care center and local government enhance satisfaction of services. Conclusion: This study was implemented in Urban area in Thailand may not apply in the rural area. The further study needs to explore the effectiveness of the model.

**PB7 543 COMPARISON OF HEALTH PROMOTING BEHAVIORS BETWEEN THE HEALTHY AND THE DIAGNOSED ELDER PARTICIPANTS IN SOUTH KOREA**

E. CHOI\* (Inje University, Busan, Republic of Korea)  
S. HONG(1), I. LEE(2), H. HYUN(3), C. CHUN(4), D. HAN(5) - (1) Seoul National University (Seoul, Republic of Korea); (2) Kangbuk-gu Community Health Center (Seoul, Republic of Korea); (3) Kangwon National University (Chuncheon, Republic of Korea); (4) Research Institute of Geriatric Health, Inje University (Busan, Republic of Korea); (5) Research Institute of Science for the Better living of the Elderly (Republic of Korea)

Introduction The aim of this study is: To investigate the relationship between the relevance of disease and health promoting behaviors such as non-smoking, non alcohol drinking, regular exercise, and the levels of stresses which are measured by Brief Encounter Psychosocial Instrument (BEPSI), in the community setting (such as lower income for senior citizens); and to investigate the impacts of demographic factors and social economic status on the prevalence of diseases for the older population, in a community-based setting. Methods Three hundred sixty-five older adults were recruited and interviewed by public health nurses. The participants were in a lower income bracket, located in special government housing complex in Seoul. 114 of 365 respondents were 65 years or older. Results The mean age of the population was 73.68 year old (the range from 65 year old to 87 year old). Gender proportion of the subjects was 28.9% male and 71.1% of female. Twenty seven participants were healthy and 87 had one more diagnosed disease. There were no significant correlations between age, BEPSI, and the number of diagnosed diseases in elder. No significant associations between gender and the prevalence of disease; between health promoting behaviors (regular exercise or none smoking) and the disease. But a significant association between no alcohol drinking and the incidence of disease was noted. No-alcohol drinker had higher incidence of disease than alcohol drinker. Conclusion It is concluded that the impacts of health promoting behaviors and stresses on the prevalence of disease in elder are important. So comprehensive assessment of environment including reversal causal effects of the health promoting behavior, diagnosis of risk factors and early detection of disease, and planning of public health services are emphasized for frail older adults' health promotion.

**PB7 544 MEDICATION ADHERENCE AMONG GERIATRIC OUTPATIENTS WITH HIGH RISK OF POLYPHARMACY**

K. TSAI\* (National Taiwan University Hospital, Taipei, Taiwan)  
D. CHAN(3), C. WEN(1), S. WU(2) - (1) Department of Geriatrics and Gerontology, National Taiwan University Hospital (Taipei, Taiwan); (2) Institute of Health Policy and Management, College of Public Health, National Taiwan University (Taipei, Taiwan); (3) Taiwan Society of Gerontology and Geriatrics (Taipei, Taiwan)

Introduction: The study assesses the medication adherence among geriatric outpatients with high risk of polypharmacy. Method and Material: Baseline data from 193 outpatients enrolled in the "Medication Safety Review Clinic in Taiwanese Elders" study were analyzed. Enrollment criteria were 1) 65 years or older, 2) at least one prescribing physician belonged to the "core physician" group, and 3) either prescription with minimum of 8 chronic medications (a drug prescribed for at least 28 days) or visited at least 3 different physicians at the 2 participating hospitals from Aug. to Oct., 2007. Demographic, health-related, medication-related, and healthcare-related characteristics were collected for analysis. Poor medication adherence (PMA) for each drug was defined as taking fewer than 80% or greater than 120% of the prescribed doses over a 7- day period. Poor personal medical adherence (PPMA) was defined as at least 25% of medications prescribed for a person reached PMA. Result: The mean age was 76.2±6.2 years and 53% were male. Participants had on average 9.0±2.6 co-morbid chronic conditions and prescribed with 8.9±3.1 medications. Among the 1689 medications assessed, 314 (19%) reached PMA. Two-thirds (66%) of the subjects had at least one drug with PMA, and each subject had on average 1.7±1.8 drugs reached PMA. One-third (34%) had PPMA. Having higher number of drug-related problems (DRPs) from assessments, and having dizziness in 6 months prior to assessment were associated with higher risk of PMA. Having higher number of DRPs from assessments, having higher number of self-reported DRPs, and having higher Mini-Mental Status Exam scores increased the likelihood of PPMA. Conclusion: Poor medication adherence is common among geriatric outpatients with high risk of polypharmacy. Several drug and patient characteristics were associated with developing PMA and PPMA. Physicians should routinely ask about

medication adherence at each clinical encounter especially when unexpected clinical outcomes were presented.

**PB7 545 TRAUMATIC BRAIN INJURY IN OLDER ADULTS: COGNITIVE CONSEQUENCES**

G. KINSELLA\* (La Trobe University, Melbourne, Australia)  
B. ONG(1), J. OLVER(2), E. MARCH(1) - (1) La Trobe University (Melbourne, Australia); (2) La Trobe University (Melbourne, Australia)

Introduction : Traumatic Brain Injury is frequently associated with young adults involved in motor vehicle incidents. However, a further important demographic group presenting to emergency and trauma services are older adults who have experienced both falls and motor vehicle incidents resulting in traumatic brain injury. This group represents a rapidly increasing public health challenge in our aging community. In young adults, mild traumatic brain injury (mTBI) is typically associated with neuropsychological recovery by three months post-injury and yet only a few studies have explored outcome for older adults, and more persisting deficits maybe expected. Our objective is to examine the three-month cognitive outcome of mTBI in a sample of older adults. Methods and Materials: A prospective cohort study was conducted in patients aged over 65 years and admitted to a hospital trauma service in Melbourne. After exclusions for co-morbidities and evidence of pre-injury cognitive decline, 29 mTBI patients were compared with two control groups - 29 patients with orthopaedic-only injuries and 29 healthy community adults. Participants were evaluated on a range of neuropsychological measures, including prospective memory, at three months post-trauma. Results: Analyses revealed that on many of the neuropsychological measures (including speed of information processing and memory) the mTBI group performed at an equivalent level as the two control groups indicating a recovery of neuropsychological status. However, on measures of prospective memory, or remembering to perform delayed intentions, the mTBI demonstrated significantly impaired performance as compared to the two control groups. Conclusion: These findings indicate a generally positive cognitive recovery pattern by three months post-trauma for older adults with mTBI. Nevertheless, persisting difficulties in prospective memory, such as taking medication or attending appointments, are common. These results will be discussed in the context of increased risk of everyday memory failures for older adults in the early stages following mTBI.

**PB7 546 DEPRESSIVE SYMPTOMS AND PHYSICAL ACTIVITY IN A POPULATION BASED STUDY IN ELDERLY RESIDENTS OF PORTO ALEGRE - BRAZIL**

A. BÓS\* (Pontifical Catholic University of RS, Porto Alegre, Brazil)  
A. SOUZA(1), E. YEE-LOPES(1), F. SILVEIRA(1), R. OPPERMANN(1),  
A. FLORES(1), C. LUFTI(1), I. SILVA-FILHO(1), N. TERRA(1) - (1) Pontifical Catholic University of RS (Porto Alegre RS, Brazil)

Introduction: Depressive symptoms are common in elderly subjects and may be associated with regular physical activity (PA). In order to understand the association between PA and different symptoms that could be related with depression we proposed this study. Material and methods: a population based study involving 1078 elderly from Porto Alegre - Brazil, questioned 12 symptoms related to depression and about regular physical activity. The depressive questions were: "Do you wake up well and rested most mornings?" (Q01), "Is your life full of interesting events?" (Q02), "Do you feel, sometimes craving of run-away?" (Q03), "Do you feel as no body understand you?" (Q04), "Have you ever feel like you are loosing the control over everything?" (Q05), "Is your sleep agitated?" (Q06), "Are you happy most of the time?" (Q07), "Do you feel worthless sometimes?" (Q08), "Do you feel good most of the time?" (Q09), "Do you have headache?" (Q10), "Do you feel week most of the time?" (Q11), "Do you feel like everybody is against you?" (Q12). Frequency of depressive answers were compared among three different levels of PA (no PA, 1 to 2 times a week of PA, 3 or more times a week of PA) and tested by Chi-square test. Results: Only the question about the quality of sleep (Q01) was not statistically associated with PA ( $p=0.451$ ). Subjects who exercise 3 or more times a week reported lower frequency for questions Q02, Q04 and Q12. Subjects exercising 1 or 2 times a week reported lower frequencies for questions Q02, Q04, Q05 and Q08. The no activity group reported higher frequency for questions Q11, Q12, and Q09. Conclusions: Elderly engaged in regular physical activities reported less depressive symptoms. It is not clear, however, if physical activity is the cause of the mood wellness or depressive symptoms are to blame for the lack of physical activity.

## Track C - Behavioural and Psychological Sciences

**PC7 547 LONG-TERM EFFECT OF PSYCHOLOGICAL TRAUMA ON MENTAL HEALTH OF AGED PEOPLE DISPLACED AFTER WORLD WAR II.**

K. STRAUB\* (University of Hamburg, Hamburg, Germany)  
S. SCHMIDT(2) - (2) University of Greifswald (Greifswald, Germany)

Introduction What are the long-term effects of mass trauma on the psychological wellbeing of displaced persons in late-life? Most epidemiological data are for short-to-medium term

effects, leaving the possibility that early reactions could reduce naturally over time as well as trauma that occurred decades ago could resurface in frail elderly suffering from cognitive dysfunctions or emotional problems. Specifically, we aimed to assess the long-term effect of forced migration after World War II on mental health and disability in aged displaced people resettled in Hamburg, Germany. Methods and materials Within a population-based cohort-study (LUCAS, Longitudinal Urban Cohort Aging Study), we identified a community sample of 414 people, displaced after World War II. We sampled a control group without displacement, matched by gender and age. Participants were asked to fill in a postal survey which was composed by questionnaires assessing psychiatric symptoms, such as depression, anxiety and post-traumatic stress; exposure to psychological traumatic events; disability and use of health services as well as current social, economic and integration factors. Multivariate analysis with adjustment for stressors since migration to establish the risk factors for mental wellbeing has been done. Results The postal survey was completed by 466 (53%) adults. Mean length of resettlement was 52.7 years (SD 13.2) and mean time since the most severe traumatic event was 58.8 years (SD 18.3). Displaced persons showed a significantly higher frequency of traumatic symptoms and depression but not anxiety. Further, displaced persons reported significantly lower subjective physical health but no significant amount of medical consultations. Certain interaction between trauma exposure and time since trauma were associated with a higher risk of symptomatology. Conclusion These findings demonstrate that there are long-term psychological problems in people who are forced to migrate. In further analysis we aim to examine resilience factors and utilisation of primary health care.

**PC7 548 PREDICTORS OF POST-TRAUMATIC STRESS DISORDER AMONG ELDERLY VICTIMS OF FLOOD DISASTER IN KOREA**

S. CHUNG\* (Ewha Womans University, Seoul, Republic of Korea)  
E. KIM(1) - (1) Ewha Womans University (Seoul, Republic of Korea)

The purposes of this study were to examine post-traumatic stress disorder among elderly victims of flood disaster and to explore factors influencing post-traumatic stress disorder of those people. A total of 155 elderly people aged 65 and over who were directly or indirectly damaged by flood disasters in Gangwon province, Korea which is mainly devastated by flood disasters were selected for this study. Post-traumatic stress disorder was measured and determined using Post-traumatic Diagnostic Scale (PDS) Korean version, with scores of 15 or higher to indicate possible PTSD. A total of 34.8% of the sample in the elderly flood victims showed symptoms of PTSD. The mean (standard deviation) scale score for the subjects was 11.8 (10.3). As a result of multiple regression analysis, the variables affecting PTSD among the elderly included knowledge of disaster, coping strategy, damage rate, depression, level of education, with knowledge of disaster having a greater impact on PTSD than other variables. These findings suggest that there is a need to provide education programs of flood disaster and disaster preparedness for the elderly people in the damaged areas or potential risk areas. A number of implications for the recovery strategies of PTSD for the elderly flood victims are also presented.

**PC7 549 SOCIAL PARTICIPATION AND SOCIAL EXCLUSION IN THE CASE OF MULTIMORBIDITY**

M. ZIMMERMANN\* (University of Vechta, Vechta, Germany)  
G. BACKES(1) - (1) University of Vechta (Vechta, Germany)

Social exclusion is mostly related to poverty and the loss of social participation. In the concept of societal differentiation exclusion (and inclusion) is directly regulated by the different functional systems like politics, economy or religion. This approach analyses participation and role engagement in different societal spheres. The paper asks for health-related exclusion risks focussing particularly on multimorbidity which will be defined as more than one chronic illness. In this case exclusion risks are concentrated on the question of exclusion processes from organisations (political, religious) and activities like charity work, support to family, friends or neighbours, participation in clubs, educational programs or religious communities. For the statistical analysis the database of the Survey of Health, Ageing, and Retirement in Europe (SHARE) was used comparing the social situation of aging people from the age of 50 until 100 years in relation to good and poor health conditions and multimorbidity. The results show as expected a significant correlation of exclusion or retreat tendencies related to multimorbidity in all mentioned activities without the exception of the participation in religious communities. These tendencies are diminished among young elderly people (younger than 70 years) and increase with higher age groups and the number of chronic diseases. Gender differences exist, but not in relation to multimorbidity. Even taking into account that only the cross sectional SHARE database was used, the morbidity and age related exclusion and retreat phenomena remember to the classical theory of disengagement. Though the concepts of "diversity of ageing" and "active ageing" contradict the general assumptions of the disengagement theory, the theory seems (still) to be relevant in the case of age and (multi)morbidity. Further analysis will test cultural differences.

**PC7 550 BEHAVIOURAL AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA (BPSD) DIFFERENCES AMONGST A SAMPLE OF EARLY AND LATE ONSET PATIENTS**

P. GIL\* (Hospital clinico san carlos de madrid, Madrid, Spain)  
C. MASSEGUA(1), R. M(1), Y. R(1), S. F(1), G. P(1), R. JM(1) - (1) hospital clinico san carlos madrid (madrid, Spain)

Aims: to determine the prevalence of BPSD in patients with an Early Onset (EOAD) compared with those with a Late Onset (LOAD) Alzheimer's Disease. Methods: prospective study of eighty one patients diagnosed of Alzheimer's Disease (NINCDS-ADRDA criteria) at Unidad de Memoria HCSC. The sample was divided into two groups according to the patient's age at the diagnosis. Hence, patients were classified as EOAD (< 70 years) or LOAD (> 75 years). Demographic (age, gender and educational level) and functional outcome data (Lawton, Katz) as well as the results on neuropsychological measures were collected. BPSD were assessed with the 12 item version of the Neuropsychiatric Inventory (Cummings et al.). Statistical software used: SPSS v14.0. A Pearson Chi Square test and a median comparison were performed. Results: 81 patients divided into two groups EOAD (n= 37) and LOAD (n= 44). The mean age was 66 years for the EOAD group and 82 years for the LOAD group. Gender was distributed as follows, 18.5% were men while women represented the 81.5% of the sample. No significant differences were found on any of the demographic variables (age, gender and educational level). The statistical analysis of the total and the item per item score on the Neuropsychiatric Inventory did not find any significant difference between the groups. Conclusion: 1) There are no differences on the prevalence of BPSD between an Early Onset and a Late Onset Alzheimer's Disease sample. 2) Age does not seem to increase the frequency of Behavioural and Psychological Symptoms in Alzheimer's Disease

#### **PC7 551 CAREGIVER BURDEN AND GLOBAL DETERIORATION SCALE**

P. GIL\* (Hospital clinico san carlos madrid, Madrid, Spain)  
S. F(1), Y. R(1), V. J(1), G. T(1), G. P(1), R. JM(1) - (1) hospital clinico san carlos madrid (madrid, Spain)

Introduction: To describe the relationship between caregiver burden and stage of dementia. Methods and Materials: Retrospective transversal study including 200 patients. We registered demographic data and the results of Zarit scale and GDS. Statistical analysis performed by SPSS 14.0 program. Results: N = 200. 61,5% females, ages between 67 and 90 years (mean: 79,20 years  $\pm$  5,9). Mean Zarit punctuation was 24,14 for patients with 79 years or older compared with 20,73 for younger ( $p = 0,8$ ). No statistical relationship was found between Zarit punctuation and gender (23,17 for males and 21,78 for females,  $p = 0,2$ ). Patients with GDS 3 had mean Zarit punctuation of 21,47 (26,81 for 79 years or older, and 18,12 for younger,  $p = 0,9$ ); with GDS 4 had mean Zarit punctuation of 22,37 (23,04 for 79 years or older, and 21,83 for younger,  $p = 0,29$ ); with GDS 5 had mean Zarit of 21,75 (25,27 for 79 years or older, and 18 for younger,  $p = 0,18$ )and 34,33 with GDS 6. No statistical relationship ( $p = 0,72$ ) between early (1-3) and advanced levels of deterioration (4-6). Conclusions: 1.- The importance of the application of instruments to evaluate caregiver burden in patients in order to estimate the magnitude of the illness leading to ways of helping both patients and caregivers. 2.- In our study, there is a relationship between Zarit and the Global Deterioration Scale. Caregiver burden keeps on stable or even decreases during moderate or mild stages of the disease and increases in advanced stages

#### **PC7 552 THE ROLE OF THE PSYCHIATRIC CONSULTANT IN THE DIAGNOSIS AND TREATMENT OF DEMENTING DISORDERS**

L. ILIOPOULOU\* (Counselling Center for Combating Drug Abuse, Ioannina, Greece)  
A. FOTIADOU(1), V. KOUTRAS(2) - (1) General Hospital of Ioannina (Ioannina, Greece); (2) Counseling Center for Combating Drug Abuse (Ioannina, Greece)

Introduction: People with dementing disorders increase dramatically: most have dementia of Alzheimer's type (DAT) or vascular dementia. The role of the psychiatric consultant in liaison consultation psychiatry is important for the diagnosis and identification of treatable psychiatric and behavioral findings. Methods and materials: A psychiatric section operates in the General Hospital of Ioannina, providing services of liaison psychiatry. Specialists from other clinics can call a psychiatrist for patients with psychiatric symptoms. Requests concerning old patients are usually related to dementia. Psychiatrist responds directly and continues with the diagnostic process and the administration of therapy. Results: A medical or a surgical clinic's request for a patient with suspected dementia is usually made because of behavioral symptoms related to delirium. This patient can often have a non-diagnosed dementing disorder. He displays acute confusion as a result of a disease, more frequently than a cognitively intact elderly patient. Depression symptoms, which are also related to dementia, are another reason for psychiatric examination. Many times elderly patients don't have appropriate psychiatric observation, because relatives focus on physical symptoms and their pharmaceutical handling. They neglect cognitive decline, because they attribute it to old age and believe there is no therapy. They complain more often about behavioral problems, but usually symptoms medication is administered, which causes side effects or more arousal. Nursing in the general hospital facilitates correct diagnostic approach by appropriate laboratory tests. The specialist administers proper medication, sets behavioral management (such as frequent time and space re-orientation), and informs family members about diagnosis and anticipated progress. Conclusions: Hospitalization for physical disorders in a general hospital of patients with dementia allows specialist to make

correct diagnosis and set the process of patient's observation after leaving hospital. This results in the relief of the patient and the family members, the secret victims of dementia.

#### **PC7 553 EVALUATION OF A PART-TIME CARE FACILITY FOR PEOPLE WITH DEMENTIA**

S. OPPIKOFER\* (University of Zurich, Zurich, Switzerland)

Introduction: With the effort of providing good homecare to family members with dementia, many caregivers reach or even go beyond their personal limits. To date, a range of possibilities exist to alleviate caregivers' physical and psychological strain, e.g. patients' regular short stays at an institution or nursing home. However, the effect of this procedure upon the persons involved has not yet been evaluated in Switzerland. Methods and Materials: A process-oriented evaluation investigated the effects of visiting the part-time care centre of a specialized institution for dementia near Zurich upon part-time patients, their family caregivers, permanent patients, and staff members. 17 family caregivers and their patients underwent standardized interviews and were observed at their homes and during their stay at the institution. The main themes were quality of life, health, care burden and amount of relief experienced. In addition, 17 staff members were interviewed on job satisfaction and care burden, and 6 permanent patients were asked about the effects of having temporary guests at their ward. Results and Conclusions: Family caregivers showed slightly improved health since using part-time care in 80% of the cases, and depressive mood was reduced. About 70% of the respondents believed that by using part-time care in an institution, they would be able to keep their family members with dementia at home for longer, and 60% reported positive changes in their social activities. However, the results of this evaluation indicate benefits not only for caregivers, but also for patients: for example, aggressive behaviour was reduced in a quarter of the cases. In conclusion, utilizing a part-time care facility has a positive effect on family caregivers' physical and social resources and helps them cope independently with their daily routine for a longer time.

#### **PC7 554 REPETITIVE PRACTICE OF SHORT-TERM MEMORY TASKS FOR PEOPLE WITH ALZHEIMER'S DISEASE**

T. WANG\* (National Cheng Kung University, Tainan, Taiwan)  
Y. KUO

Introduction The aim of this study is to measure the learning capacity after a short and repetitive practice of verbal and object memory tasks in people with and without Alzheimer's disease (AD). Method Thirty-nine patients with AD( $72.79 \text{ y} \pm 7.13$ ) and 35 normal controls ( $73.46 \text{ y} \pm 6.30$ ) participated in this study. All participants completed two subtests of the Wechsler Memory Scale (Wechsler, 1997)—the logical memory and word-paired associates tasks, and the Fuld Object-Memory Evaluation (Fuld, 1982). The scores of each trial, the summations of all trials in each task, delay recall, and the retention percentage were collected besides the demographic data. Between-group differences were analyzed by MANOVA, and repeated measures ANOVA was used to examine between-trial differences for each group individually. Result There was no difference between the AD and normal groups regarding demographic factors of sex, age, education, and depression. The controls outperformed the AD group significantly in terms of the total scores, delay recalls, and the retention percentages among three memory tasks ( $p < .002$ ). Significant trial effect was found within each group. Post hoc analysis with Bonferroni procedures showed that normal controls made ongoing progresses until they reached the ceiling scores. Although significant progress from the first to the last trial was noticed in the AD group, the learning outcome was limited and much poorer than the first recall performance of the controls. Conclusion Memory deficits in encoding and retention of information, as well as the limited learning effect in the AD group were evident. The findings provide clinical implication for the therapists and caregivers: when giving instructions or trainings to the patients, even with repetitive learning provided, one should be aware of patient's limitation to avoid frustrations of both parties.

#### **PC7 555 PILOT STUDY OF THE REVISED FUNCTIONAL BEHAVIOUR PROFILE (FBP): AN ASSESSMENT TOOL FOR IDENTIFYING PRODUCTIVE BEHAVIOUR IN DAILY LIFE IN DEMENTIA**

J. OCHS\* (Laboratoire inter-universitaire de Psychologie (LIP/PC2S EA4145), Grenoble, France)  
B. JULIE(1), C. PASCAL(2), T. JEANNE(1) - (1) Laboratoire inter-universitaire de psychologie (LIP/PC2S(EA4145)) (Grenoble, France); (2) Centre d'Evaluation Gériatrique, UMAGE, Clinique Universitaire de Médecine Gériatrique (Grenoble, France)

Keywords: Dementia - FBP - functional assessment – residual abilities – revised French translation. Background: The effects of dementia on performances of routine daily activities are sometimes difficult to understand ; family caregivers may overestimate or underestimate the residual abilities or emerging deficits. The Functional Behaviour Profile (FBP) (Baum, Edwards and Morrow-Howell, 1993.) is a functional assessment tool which helps caregivers to identify and describe patient's abilities in three domains (problem solving, performance on tasks and social interaction). This information can improve communication between the caregiver and the clinician so they can jointly plan strategies to maximize and maintain patient's function. Our pilot study (2007) established the clinical feasibility of a FBP French translation and its impact on caregivers' abilities to describe patient performance in daily

living. However, some item modifications were necessary to improve the tool's sensibility and the caregiver's understanding of questions. Aims: The objectives of this study were : (1) to identify item modifications required to improve caregivers' abilities to describe patient performance ; (2) to evaluate the impact of those modifications on the assessment of patient's abilities in daily life. Methods: We recruited patients from people with dementia attending a memory consultation clinic in Grenoble University Hospital. We interviewed primary caregivers (n=50) accompanying a patient ; they participated in a semi-structured interview and completed a revised French translation of the FBP. Results: Data from the 50 first interviews will be presented. This revised version of the FBP seems to be better understood by caregivers. It enabled them to distinguish between (a) performances in complex tasks versus simple tasks ; (b) performances in familiar versus non-familiar tasks. They can identify the modifications between past and current behaviours. Conclusion: The revised FBP French translation helped caregivers to better identify productive behaviours of their relatives. This version improves the assessment of the patient's abilities and performances of activities of daily living.

**PC7 556 HOW PATIENTS WITH ALZHEIMER DISEASE EXPERIMENTS AND MAKE SENSE TO CHANGE ? DEVELOPING A PERSON-CENTRED APPROACH.**  
 C. BILLIET\* (Université Lille 3, Villeneuve d'Ascq, France)  
 P. ANTOINE(1), J. NANDRINO(1), C. COUSIN(1), C. ROGER(1), C. SZAFRANIEC(1) - (1) Université Lille 3 - EA 1059, Laboratoire URECA-FASE (Villeneuve d'Ascq, France)

**INTRODUCTION :** Anosognosia among people with Alzheimer Type Dementia has been widely studied and has been operationally defined in a variety of ways including observation of the discrepancy between the patient self-report and the report of a natural caregiver, clinical ratings of a health-care professional or performance during neuropsychological tests. However, limited attention has been given to the way patients experiment and make sense to their situations. The present explanatory study aimed (1) at exploring how differing degrees and manifestations of awareness are manifested in the conversation and interaction of people with AD and (2) at identifying theoretical and practical implications. **METHODS :** Themes such as evaluations and representations of change, perception of self, adjusting to loss and impairments, were explored in semi-structured interviews with 46 people who had a diagnosis of mild to severe AD. Transcripts were analysed using a grounded theory approach. **RESULTS :** Despite the deficits, people with AD stay able to produce an intelligible discourse concerning the subjective experience of living with dementia. Moreover, the data tended to show that, despite certain perceptions are impaired, the system coordinating them remains. A preliminary model is presented that support the view of constructing awareness as a process including cognitive, affective and social dimensions. **CONCLUSION :** Because it maintains a view of the person with dementia as an active agent in constructing his/her own sense of identity and emphasises that this process necessarily occurs within a social context, data provides foundation for developing care interventions. This subject deserves to be deeply explored as it gives bases for clinical assessment of awareness. It also states ethical issues. In further research, we hope that understanding the way older people cope with dementia could improve their psychological well-being and quality of life. This work was supported by a grant from the Fondation Médéric Alzheimer (30 rue de Prony, 75017 PARIS)

**PC7 557 USE OF THE HOUSE DRAWING TEST(HDT) IN THE DIAGNOSIS OF EARLY STAGES OF ALZHEIMER**  
 H. LESNIEWSKA\* (Centre Hospitalier d'Arpajon, Arpajon, France)  
 P. BARBOUX(1), H. ANDRIATISIFERANA(2), L. MEYER(3), V. HOCREITERE(4), J. SUDRES(5), C. BULLIONNET(6) - (1) Centre hospitalier d'Arpajon (Arpajon, France); (2) C.H.d'Arpajon (Arpajon, France); (3) C.H d'Arpajon (France); (4) C.H d'Arpajon (Arpajon, France); (5) Université de Toulouse (France); (6) INSERM /Hôpital St Antoine (France)

Introduction The aim of this study was to test the hypothesis that freehand house drawing can be used as a complementary screening instrument to differentiate between patients in early stages of Alzheimer's disease (AD) and elderly controls(NS). Methods and materials Twenty six NS (MMSE=28.4+-1,10) and twenty four AD (MMSE=25.4+-2,41) matched for age (mean: 73.62 +-6,46), gender and education were included. The cognitive status of AD was established through clinical and neuropsychological assessment in the Memory Clinic at the Hospital of Arpajon (France). Graphic competence was compared with cognitive functioning by means of the MMSE. A 25 items evaluation of scale drawing, ranged from 1 to 25 is presented. The system of evaluation takes account of the presence of house details, their space organization, the proportion and form of features. Results A significant difference appears between the drawings of the AD and those of NS. The drawings executed by AD are simplified, impoverished, and spatial disorganized compared to the NS. The mean total score of AD was 11.29+-3,26 while the mean score of NS was 20.15+-2,09 (p<0,0001). The mean score of details supplementary of AD was 1.33+-1.24 and 8.69+-5,10 of the NS (p<0,0001). A high significant correlation (0.62) appeared between MMSE and HDT level. Receiver-operator curve (ROC) demonstrated that HDT score<17 detected early stage of AD with specificity of 96.2%, and sensibility of 95.8%. The test classified 96% of the patients correctly. Conclusions The HDT is a valid tool, easy to conduct. Drawing deficiencies are significant in the early stages of AD and this test may

improve the early detection of dementia. HDT may be used in combination with overlapping pentagon drawing task included in the MMSE, which remains correct over a long time even at the moderate stages of AD.

**PC7 558 SELF-REPORTED ANXIETY IN AUSTRALIAN MEMORY CLINIC ATTENDEES.**

G. BYRNE\* (University of Queensland, Herston, Australia)  
 N. PACHANA(2), E. ARNOLD(1), K. APPADURAI(3) - (1) School of Medicine, University of Queensland (Herston, Australia); (2) School of Psychology, University of Queensland (St Lucia, Australia); (3) Geriatric Medicine, Royal Brisbane & Women's Hospital (Australia)

**Introduction:** Although anxiety is highly prevalent among people with dementia, more work is required to define its nature and significance in this context. Accordingly, we investigated anxiety symptoms in memory clinic patients. **Methods:** We recruited 203 consecutive memory clinic attendees and their caregivers and measured generalised anxiety symptoms on the Geriatric Anxiety Inventory (GAI), a 20-item self-report scale. In addition, we rated the patients on a standardised battery of measures, including the Neuropsychiatric Inventory (NPI). We compared our GAI findings with results from normal volunteers and psychogeriatric patients. **Results:** There were 117 female and 86 male patients with a mean age of 76.5. One hundred and forty-one (69.5%) had dementia (39.4% AD; 6.9% VaD; 12.8% mixed; 3.5% FTD; 1.5% DLB; 1.97% other), with an additional 6.4% CIND or MCI. Mean sMMSE score was 22.0. Mean GAI score was 5.4 (SD 5.8; range 0-20) with a Kuder-Richardson coefficient of 0.93. Fifty-two patients (25.9%) reported a history of anxiety disorder. There was a strong relationship between GAI score and history of anxiety disorder ( $KW \chi^2 = 25.6$ , df = 1,  $p < 0.001$ ). GAI score was correlated with NPI anxiety severity ( $r_s = 0.20$ ;  $p < 0.05$ ) and NPI anxiety distress ( $r_s = 0.20$ ;  $p < 0.05$ ). Mean GAI score was significantly higher in memory clinic attendees without dementia than in those with dementia (mean 7.0; SD 6.2 vs mean 4.7; SD 5.4;  $KW \chi^2 = 6.8$ ,  $p < 0.01$ ). In comparison, a separate population-based cohort of 205 women aged 65+ years (mean 74.4; SD 5.5; range 65-86) had a mean GAI score of 2.32; and a separate clinical sample of 46 male and female psychogeriatric patients (mean age 78.8 years) had a mean GAI score of 5.22. **Conclusions:** Anxiety symptoms are highly prevalent in memory clinic attendees, particularly those without dementia.

**PC7 559 ROAD SIGN RECOGNITION IN MINOR DEMENTIA OF THE ALZHEIMER TYPE**

H. PITTI FERRANDI\* (CLINIQUE MEDICALE DE LA PORTE VERTE, VERSAILLES, France)  
 E. CHAMPEAUX(1), F. MARQUIS(2) - (1) Clinique Medical de la Porte Verte (Versailles, France); (2) Hopital Charles Foix, Ivry sur Seine. (Versailles, France)

Today, Alzheimer disease and driving are the object of numerous governmental policies. According to Road Security, the risk of an accident is multiplied by five when a driver suffers from Dementia of the Alzheimer Type (DAT). Indeed, early on it affects the essential capacities to drive; executive functions being mainly studied. On the other hand, road sign recognition has not been analyzed much. As no consensus exists on the precocity of problems reading road signs (RRS), we have assessed the impact of minor DAT on sign recognition. To do this, we compared the abilities of test subjects between the ages of 74 and 89; 20 people affected by DAT (Mini Mental State between 21 and 28) and 20 people in good health. We also wanted to know if a standardized test could predict driving capacities. We therefore compared the results from the Evaluation Protocol of Visual Gnosis (EPVG) to those of the RRS protocol. We created a protocol that assesses the semantic knowledge of real signs, categories of signs, as well as the reasoning on the structure of the rules. A questionnaire on driving habits was also proposed to test the subjects in order to assess a possible change in driving behavior. At the end of our survey, we noted a change in the recognition of road signs in minor DAT. Difficulties increased with the progression of dementia. Results in the EPVG are not predictive of performances in RRS. Even more than a semantic deficit, our work revealed a very precocious change (at 28 in the MMS) in thinking capacities. Also, the recognition of road signs and the judgment on the construction of the rules can be supplementary tools for precocious evaluation of road reasoning capacities.

**PC7 560 NON-PHARMACOLOGICAL MANAGEMENT OF BEHAVIOURAL SYMPTOMS IN NURSING HOMES: THE TNM STUDY**

A. DEUDON\* (Centre Mémoire de Ressources et de Recherche, France, Nice, France)  
 J. PIANO(1), N. MAUBOURGUET(2), X. GERVAIS(2), E. LEONE(1), P. BROCKER(1), L. CARCAILLON(3), P. ROBERT(1) - (1) CMRR CHU UNSA - Nice (France); (2) FFAMCO (France); (3) INSERM U 697 (France)

Behavioural and psychological symptoms of dementia (BPSD) are often reported in institutions for the elderly. Objective: To evaluate the effectiveness of a staff education intervention to manage BPSD in older people with a diagnosis of dementia. Methods: The trial was conducted in 16 nursing homes; 306 patients with a diagnosis of dementia and presenting BPSD were selected. Nursing homes were randomly allocated to an intervention group or a control group. An eight-week staff education and training programme was conducted in the nursing homes from the intervention group. The main outcome measures

were the Cohen-Mansfield Agitation Inventory (CMAI) and an observation scale score. Assessments were done at baseline (W0), at the end of the 'intervention' period (W8) and 12 weeks after (W20). Results: There was a significant decrease in the global CMAI score between baseline and W8 (-7.8; p > 0.01) and between baseline and W20 (-6.5; p > 0.01) in the intervention group but not in the control group. Results of mixed linear models showed that the CMAI global score, the CMAI physically non-aggressive behaviours subscale score and verbally non-aggressive behaviours subscale score significantly decreased in the intervention group ( $p < 0.001$ ) although there was no significant evolution in the control group. Direct assessment with the observation scale produced the same pattern of results, with a significant decrease only in the intervention group. Conclusion: The intervention reduced BPSD in severely demented nursing home residents and this effect was still present 3 months after the end of the programme.

**PC7 561 RELATIONSHIP QUALITY AND QUALITY OF LIFE IN DEMENTIA**  
R. WOODS\* (Bangor University, Bangor, United Kingdom)

Introduction: It is well-established that ratings of relationship quality made by family caregivers predict care-giver strain, but people with dementia have rarely been asked for their perspective, and the association of relationship quality with quality of life has not been evaluated. Methods: 77 people with dementia and their care-givers living in the community participated; 74% had mild dementia; 90% were co-resident; 78% were spouses; mean duration of memory problems 3.1 years (range 1-10). All completed the 5-item Positive Affect Index (PAI; Bengtson, 1973) and the 14-item Quality of Care-giving Relationship Scale (QCPR; Spruytte, 2002) and each couple was video-taped carrying out a verbal and a non-verbal task together. Trained assessors rated the video-tapes for emotional attunement, positive and negative affect and depersonalisation. Quality of life was assessed using the QoL-AD (Logsdon et al., 2002). Results: The ratings of relationship quality made by people with dementia showed good internal consistency (0.81 for PAI) and re-test reliability (over 12 weeks,  $r=0.66$  for PAI). There was reasonable agreement with care-givers' rating ( $ICC=0.58$  for PAI), with the degree of stress reported by the care-giver being the main predictor of discrepancies. Ratings made by the person with dementia correlated significantly with ratings of the video-taped interactions (e.g. QCPR and emotional attunement,  $r=0.30$ ,  $p<.05$ ). Self-reported quality of life (the QoL-AD) was predicted by QCPR, but not by depression, anxiety, care-giver stress or depression, MMSE scores, age, gender or dementia severity ( $R^2=0.14$ ;  $p<0.002$ ). Conclusions: Many people with dementia are able to reliably and accurately rate the quality of the current relationship, which may also be evaluated through observation of structured tasks. The quality of life of the person with dementia, as well as the stress experienced by the care-giver, are associated with the quality of the current relationship. Interventions should aim to sustain relationship quality.

**PC7 562 ADVANTAGES OF A SHARP PSYCHogeriatric UNIT FOR PATIENTS WITH BEHAVIOURS AND PSYCHOLOGICAL SYMPTOMS OF DEMENTIA (BPSD)**

S. BELQADI\* (Hopital Bretonneau, Paris, France)  
P. KOSKAS, S. GALLERON, S. SAAD, L. PETIT, J. DARAUZ, G. ROCHEDE DES LEMPDES, F. PLOSKAS, E. WEYL, A. POISSONNET, O. DRUNAT

BPSD are very common in the evolution of dementia. Psychogeriatric units offer a specialized pluri professional taking care. Objective: Determining the typology of the inpatients in a sharp specialized psychogeriatric unit. Estimating the advantages brought by this kind of taking care. Method: An over 9 months retrospective study, based on the collect of medical and social informations of the BSPI in-patients. All the in-patients have been evaluated by the NPI scale. 4 points have been used to estimate the taking care : The improvements of the BPSD. The analysis of the activating factors. The modification of the psychotropic treatments. The in-patient evolution. Result: On the 160 in-patients of this study, 126 were presenting symptoms of behaviour disorders and 84 of them were diagnosed for BPSD and were kept for our analysis. The average age was 83, 13 (+/- 7.63 [61; 98]). 37 % came from their domicile, 29 % from another hospital and 18 % from nursing home. MMS was 17,59 ( +/- 5.3 [7;27]). The BPSD appraised by NPI were controlled by behaviours of positive disorders (80, %), anxious disorders (32, %) and depressive disorders (30, %) productive disorders (44, %). The main symptom has been improved on 86 % patients, the average psychotropic figure have been limited, a diagnosis of dementia has been detected on 29 subjects. A sharp pathology has been discovered and treated on 55 patients and 63% patients were able to back home. Conclusion: From the results of this study, we can precise the interest of a specialized unit for the present BPSD's in-patients and we propose a discussion about their place in a geriatric service.

**PC7 563 EARLY IDENTIFICATION OF COGNITIVE CHANGE IN PRECLINICAL DEMENTIA**

S. MACDONALD\* (University of Victoria, Victoria, BC, Canada)  
V. THORVALDSSON(2), B. JOHANSSON(2), L. BÄCKMAN(3) - (2) Gothenburg University (Gothenburg, Sweden); (3) Karolinska Institutet, Aging Research Center (Stockholm, Sweden)

Preclinical cognitive deficits in AD are characterized by large episodic and executive impairments. Despite sizeable mean differences between preclinical cases vs. non-cases,

considerable overlap (> 40%) remains across performance distributions. Improving classification requires moving beyond the examination of static mean differences to consideration of relative timing and magnitude of decline. In the present study, we examined whether onset and rate of preclinical decline differed across cognitive outcomes. Participants (n=417 dementia cases and n=249 non-cases, aged 75+) from the Kungsholmen Project completed up to 5 measurement waves. We fit a series of change-point models in 1-month increments to identify the average transition point that best characterized acceleration of decline prior to dementia onset (compared to normative age changes). Protracted change points (> 7 years) were observed for cognitive correlates of dementia pathology (episodic memory), but faster rates of decline were observed for tasks that incorporate both fluid and crystallized abilities (category fluency). This distinction supports claims that well-preserved abilities may be most discriminative, but only in close proximity to incident diagnosis.

**PC7 564 NARRATIVES OF THE LIVED EXPERIENCE OF A DEMENTIA INTERVENTION: AN ANTHROPOLOGICAL STUDY**  
M. PERKINSON\* (Saint Louis University, St. Louis, United States)

Rigorous research design and standardized measures are necessary, but not sufficient to assess the impact of gerontological interventions and develop valid evidence-based practice. The social and physical contexts of an intervention and the meaning that participants ascribe to the experience of that intervention can impact the way a program is carried out in unanticipated and, using traditional methods of assessment, unnoticed ways. Narratives of participants' lived experiences of an intervention can provide critical insight into the process of implementation of that intervention and should be included as an essential component of program evaluation. Thirty older adults with dementia and their primary family caregivers participated in a three-month home-based, family-supervised physical activity program designed for persons with mild dementia. Participants were randomly assigned to one of two exercise groups and given baseline and follow-up standardized assessments of balance, flexibility, strength, and endurance. The majority showed clinically significant improvement at follow-up compared to baseline performance. This "pre-post-only 'black-box' design" (Patton 2005), focusing solely on the end result or impact of the intervention, was supplemented by ethnographic process evaluation (Butler 2005). Implementation of the program was not assumed as a given, but as a process to be examined. Follow-up focus groups and in-depth interviews with the family exercise supervisors elicited ways participants translated their training into action and the ways they negotiated that translation within specific social and physical contexts. Rather than passively replicating the program, family members took active measures to change and adapt it to fit their individual needs. Family members identified barriers and facilitators to implementing the program and criteria they used to determine successful implementation. An anthropological focus on context, meaning, and process provides insights into ways interventions are operationalized, complementing traditional assessments of outcomes and contributing to enhanced validity of evaluation research. (Funded by Alzheimer's Association)

**PC7 565 READING SYMBOLS AND ROAD SIGNS IN ALZHEIMER DISEASE**  
F. MARQUIS\* (Hospital Charles Foix, Paris, France)  
E. CHAMPEAUX

Actually, there are many interesting studies on driving with AD. We understand this because AD multiplies by five the risk of a road accident (by road safety in France). The patients are not always aware of their problems and don't make any effort to help the disability (like adapted speed, getting lost, cutting the road and not respecting the road signs...). We would like to know if AD with mild dementia defects reading symbols and road signs. The question is: are these problems perceived or associated? Methods and materials The population is: 20 patients with mild dementia (mms: 21-28) and 20 elderly persons (control population); the age is more 65. We propose: - A perceptive test: putting together two same road signs among other distractions - An associated test: recognizing the signification of real signs different categories and wrong or faulty signs. Results - The perceptive test doesn't show any perceptive trouble in recognizing signs in patients with very mild dementia. - In associated test, we find a significant remark impact in patients AD. AD with mild dementia have more difficulties with signs of different categories and faulty signs because they need to think about the Highway Code. Patients with Alzheimer mild dementia don't have the necessary reflexions to evaluate the sign because their cognitive abilities don't function correctly. - The capacity of reading road signs is more difficult as the illness progresses. Conclusion All these tests obliged the patients to think about the road signs and understand the form of the road signs, and it's difficult for them because they have limited capacities of judging and reasoning. Even if elderly people have not a good knowledge of the Highway Code, they always can reason and understand the meaning of the signs which are unknown, Alzheimer are not able to.

**PC7 566 THE 'ROUND TABLE SCIENCE ET CITÉ ON DEMENTIA': RESEARCH BASED ON THE COLLABORATION OF CAREGIVERS, HEALTH PROFESSIONALS, AND SCIENTISTS**

M. CAROLINE\* (University of Zürich, Zurich, Switzerland)  
H. SCHELLING(1), M. MARTIN(1) - (1) University of Zürich, Center for Gerontology (Switzerland)

**Introduction:** In Switzerland, roughly two thirds of the people with dementia are being cared for by family members, who in turn face a high risk for physical and psychological illness. Twenty-five lay and expert members of the Round Table Science et Cité on Dementia designed and evaluated a research project to address some of the most urgent questions regarding dementia homecare in the region of Zürich. Methods and Materials: 67 family caregivers and their patients were interviewed at their homes. The interviews were largely standardized and the main topics covered were quality of life, health, coping with caregiving and dementia symptoms, and assessing the amount and kind of help received from other helpers. Caregivers also kept a standardized diary to assess the patients' affect over a range of activities. Results and Conclusions: Quality of life of caregivers does not necessarily diminish with time, reflecting a great effort to adjust to and master their situation. However, quality of life was highly predicted by depression and changes in the relationship between caregiver and patient. Although most caregivers have other helpers, half of them are not satisfied with the amount or quality of help received. Most caregivers feel they have too little time for themselves. Based on these and further study results, the Round Table is currently developing a range of recommendations and measures to improve the well-being of those caring for a family member with dementia.

**PC7 567 COST-EFFECTIVENESS OF A GROUP PROGRAMME REDUCING FEAR OF FALLING: RANDOMISED CONTROLLED TRIAL**

J. VAN HAASTREGT\* (Maastricht University, Maastricht, The Netherlands)  
G. ZIJLSTRA(1), M. HENDRIKS(1), M. GOOSSENS(1), J. VAN EIJK(1), G. KEMPEN(1) - (1) Maastricht University (Maastricht, The Netherlands)

**Introduction:** Fear of falling and associated avoidance of activity are common among older people and have negative consequences for daily functioning, quality of life, healthcare utilization and associated costs. This underlines the need for cost-effective interventions to reduce fear of falling and associated avoidance of activity. In the current study we evaluated the cost-effectiveness of a cognitive behavioural group intervention that reduced fear of falling and associated avoidance of activity. **Methods and materials:** This cost-effectiveness study was embedded in a two-group randomised controlled trial. We compared the costs and effects of an 8-week cognitive behavioural group intervention conducted by trained nurses, with those of usual care. A total of 540 persons were included in the study. Clinical outcomes were fear of falling and associated avoidance of activity. Direct healthcare costs included costs related to general practitioner consultations, specialist care, days in hospital, physiotherapist' consultations, hours of professional domestic help, hours of professional home care, home adaptations, aids, and assistive devices. Outcome measures were assessed at 2, 8 and 14 months by means of structured telephone interviews and self-administered questionnaires. **Results:** The costs for the program were on average €276 per person in the intervention group. The total direct healthcare costs per person (including intervention costs) were somewhat higher in the intervention group (€4,925) compared to the control group (€4,828). This difference of €97 was not statistically significant ( $p=.899$ ). Only the costs for physiotherapy were significantly lower in the intervention group, compared to the control group (€295 versus €509,  $p=.007$ ). **Conclusion:** This trial showed that the programme significantly reduced fear of falling and associated avoidance of activity while at the same time not significantly increasing direct healthcare costs. The programme is currently being implemented in regular care in the Netherlands.

**PC7 568 BEYOND SOCIOECONOMIC STATUS: THE INFLUENCE OF EARLY LIFE CIRCUMSTANCES AND MIDLIFE ASSETS ON OLD AGE FUNCTION. FINDINGS FROM THE AGES REYKJAVIK STUDY**

D. GROFFEN\* (School for Public Health and Primary Care (Caphri), Maastricht, The Netherlands)  
A. KOSTER(2), H. BOSMA(1), T. ASPELUND(3), M. JONSDOTTIR(4), G. KEMPEN(1), J. VAN EIJK(1), G. EIRIKSDOTTIR(3), L. LAUNER(2), V. GUDNASON(3), T. HARRIS(2) - (1) School for Public Health and Primary Care (Caphri) (Maastricht, The Netherlands); (2) Laboratory of Epidemiology, Demography and Biometry, National Institute on Aging, National Institutes of Health (Bethesda, United States of America); (3) Icelandic Heart Association (Kópavogur, Iceland); (4) Landspítali-University Hospital and University of Iceland (Reykjavík, Iceland)

**Introduction** While it is well-established that education and occupation are important in predicting function in old age, it is unclear whether other aspects of socioeconomic status could be important as well. This study focuses on the impact of early life circumstances and midlife assets on daily function in old age next to classical socioeconomic risk factors. **Methods and materials** We used data obtained in midlife to assess the effects of early life circumstances and midlife assets on physical dysfunction (i.e. mobility limitation and walking speed) and depressive symptoms three decades later. Data were obtained from 4,809 Icelandic men and women, aged 33-65 years who, in midlife, participated in the Reykjavik Study (1967-1994) and who were re-examined in old age in the Age, Gene/Environment Susceptibility (AGES)-Reykjavik Study (mean follow-up=29 years). **Results** Three decades later, men and women from lower educational and occupational levels had the highest risk of self-reported mobility limitation, depressive symptoms (GDS) and low walking speed (adjusted OR's ranging from 1.59 for mobility limitations to 2.20 for depressive symptoms) . Additionally, a physically straining occupation or owning fewer assets of house or car, living in older or poor quality housing, were also important

determinants of dysfunction in old age, independent of the classical socioeconomic risk factors (adjusted OR's ranging from 1.22 for a lack of  $\geq 1$  housing assets to 1.80 for a physically straining job). In addition, a recalled shortage of food in childhood was similarly related to negative health outcomes (e.g. OR=1.86 for depressive symptoms in women). **Conclusion** These findings support the hypothesis that even accounting for the classic socioeconomic risk factors, other aspects of life circumstances contribute to physical and mental dysfunction in old age. Whether these differences will diminish with improved socioeconomic status in subsequent generations should be investigated.

**PC7 569 SAFETY AT HOME OF PEOPLE WITH DEMENTIA: CONTRIBUTIONS OF AN EVALUATION OF RISK SITUATIONS IN A GERIATRIC CONSULTATION CLINIC**

J. BOURGEOIS\* (Laboratoire Interuniversitaire de Psychologie, Grenoble, France)  
J. OCHS(1), P. COUTURIER(2), J. TYRRELL(1) - (1) Laboratoire Interuniversitaire de Psychologie (Grenoble, France); (2) Unité d'Evaluation Gériatrique, UMAGE, Clinique de Médecine Gériatrique (Grenoble, France)

**Introduction:** The growing number of people with Alzheimer's disease living at home raises questions about their safety and quality of life. Cognitive deficits from dementia include impaired memory, lapses in attention, and judgment difficulties; patients are sometimes injured following domestic accidents. Families often express their concerns about the safety of their relatives and their vulnerability to danger. Few studies have measured the frequency of situations-of-risk, although a tool (Safety Assessment Scale) has been proposed recently (Poulin et al. 2006) to help evaluate community-dwelling patients. The purpose of this study was to describe the prevalence of safety problems among community-dwelling patients, and also to identify factors associated with potential situations-at-risk in the home. **Methods and material:** We studied patients who were living at home, and evaluated in a memory consultation clinic (with a caregiver-relative). Their relatives took part in a semi-structured psychological interview about security issues (based on a French version of the Safety Assessment Scale (SAS). Psychometric indicators of current patient functioning (ADL, IADL and MMSE) were also administered. **Results:** Results show that all of the people with dementia (n=103) were exposed to risks at home. Patients living alone (31%) were judged to be more at risk at home than those living with someone (69%). The most common risks reported concerned fires, food and polymedication. Home safety scores (SAS) are not related in a linear manner to cognitive level (MMSE) and dependency (ADL/IADL). **Conclusion:** The safety evaluation interview is an innovative opportunity to assess perception of risk and carers' preoccupations about patient well-being. The Safety Assessment Scale is useful in the context of memory consultation to (a) determine the risks at home and (b) to focus the interview with the caregiver towards preventing accidents and improving quality of life in the home settings.

**PC7 570 INDIRECT EFFECT OF SCHOOL VOLUNTEERING BY SENIOR CITIZENS ON PARENTS THROUGH INTERGENERATIONAL PROGRAM THE "REPRINTS".**

Y. FUJIWARA\* (Tokyo Metropolitan Institute of Gerontology, Itabashi-ku, Tokyo, Japan)  
N. WATANABE(1), M. NISHI(1), S. LEE(1), H. OHBA(1), Y. KOUSA(1), S. YAJIMA(1), H. YOSHIDA(1), T. FUKAYA(1), N. SAKUMA(1), S. SHINKAI(1) - (1) Tokyo Metropolitan Institute of Gerontology (Itabashi-ku Tokyo, Japan)

**Background and Purpose** • We have launched a new intervention study, called "REPRINTS" (Research of productivity by intergenerational sympathy) in which senior volunteers aged 60 years and over engage in reading picture books to school children, regularly visiting public elementary schools since 2004. The purpose of this study was to examine the changes of evaluation of "REPRINTS" program by parents of school children during the 2 years. • **Methods** • 4-6 volunteers as a group have visited an elementary school in suburb Kawasaki city twice a week to read picture books. Baseline survey was conducted one month after launching volunteer activity. 1st –4th follow-up surveys were conducted every 6 months after baseline survey. Of 368 parents, 230 whose children were in 1-4th grades were analyzed. **Measurements:** School grade of children, gender, emotional image scale of older adults by SD (Semantic Differential) method (13 items), evaluation of activity of "REPRINTS" volunteers such as promotion of reading for children, or children's respect, thanks, familiarity with "REPRINTS" volunteers, indirect effect on promotion of safety community, reducing parent's physical and psychological burdens of volunteer service for school. Repeated cross-sectional analyses by ANCOVA were conducted to compare change of response between parents of 1-2nd grade children and those of 3-4th grade-children. • **Result** • In terms of children's familiarity with "REPRINTS" volunteers, two-way factorial analysis of variance demonstrated significant main effect of number of surveys and interaction between the grade and number of surveys adjusted for confounding factors. Also, main effect of grade and number of surveys was found to be significant among reducing parents' physical burdens of volunteer service for school. Main effects of school grade were significant in promotion of reading for children, indirect effect on promotion of safety community, and frequency of hearing episodes of "REPRINTS" volunteers from children. On the other hand, main effects of grade were significant in lightening psychological burdens and level of knowledge of "REPRINTS" volunteers. In terms of emotional image scale of older adults in general, neither main effect nor interaction between the grade and number of surveys were significant in all the subscales of 'socialization', 'activity', and 'cheerfulness' • **Conclusion** • The level of

knowledge and a few items of evaluations of "REPRINTS" volunteers significantly increased among parents of both low grades children and high grades children during the 2-year intervention. This study may suggest that "REPRINTS" program can contribute to establishing trust and reliance between generations of older adults and parents of school children by the children as mediators.

**PC7 571 BURNOUT SYNDROME IN FORMAL CAREGIVERS OF A LONG TERM CARE (LTC)**

M. IKEDA RIBEIRO\* (Residencial Israelita Albert Einstein , São Paulo, Brazil)  
A. AGUIAR(1), C. REBELLATO(1), N. PIRES(2), M. IKEDA(3) - (1) Residencial Israelita Albert Einstein (São Paulo, Brazil); (2) Israelita Albert Einstein (São Paulo, Brazil); (3) Israelita Albert Einstein (São Paulo, Brazil)

A Burnout Syndrome is a form stress produced in professionals who keeps a constant and direct relationship with other people, being more evident in assistential occupations. This syndrome covers physical, psychic and behavioral aspects and it may result in a fall of quality of interpersonal relationships. The objective of this study was analyzing Burnout level in a population of formal caregivers of one LTC. METHOD AND MATERIAL: The result of Maslach Burnout Inventory (MBI) applied in 52 formal caregivers professionals of a LTC was analyzed. The time average in the function was about 5 years and the scholastic level with more frequency between 9 – 11 years old. The data were divided into 4 groups, turning to account as indication the floors with higher performance of the caregivers: independents, semi-dependent functional and cognition and dependents. RESULTS: The same standard in the average values in the sub-items of scale [depersonalization (DE), emotional exhaustion (EE) and personal realization (EP)] among the groups was observed. There was low pointing in DE and EE and a high one in EP (Independent: DE = 5,9 / EE = 3,3 / EP = 15,3; Functional Semi-dependent: DE = 5,8 / EE = 3,4 / EP = 13,6; Cognitive Semi-dependent: DE = 6,3 / EE = 3,4 / EP = 15,7; Dependents: DE = 5,9 / EE = 3,3 / EP = 14,1). CONCLUSION: The average performance through MBI among the formal caregivers of a LTC presented a low degree of Burnout. Some studies show that elements like higher scholastic level and longer time in profession may act as protector effects, however, there isn't an agreement about what may be expected for each scale dominion yet or what may still protect or aggravate the Burnout symptoms. Others studies need to be done, when new variables may be explored.

**PC7 572 PROMOTING MORE POSITIVE ATTITUDES TO AGEING: THE 'AGEWISE WORKSHOP' INTERVENTION TO CHANGE ATTITUDES**

P. MAHER\* (Age and Opportunity in Ireland, Dublin , Ireland)  
M. PAUL(1), O. ANN(2) - (1) Marino Institute of Education, (Ireland); (2) Dundalk Institute of Technology (Ireland)

Introduction: Health professionals' attitudes to ageing can influence the quality of care older people receive, yet few studies have examined attitudes and experiences of front-line health professionals. We examine the effects of a workshop intervention designed to assess and improve the attitudes of health professionals towards ageing and older people. Method: Participants were health professionals across the adult age range (n=343). The workshop is delivered free of charge, lasts half a day and is delivered in workplaces to groups of between 10 and 24 participants. The workshop is led by two facilitators who use a range of techniques including role plays, quizzes and information sheets to provide information and raise awareness about later life and older adults. Assessments were made pre and post workshop; a subset of participants were interviewed at 4-8 weeks follow-up. Results: Results support the efficacy of the training workshop. Levels of concern for older people increased post workshop. Although aspects of care with older people are good (81% reported that older people frequently treated with respect), frontline professionals also reported witnessing older people frequently being patronized (37%), embarrassed (21%) and abused (21%). Differences in pre and post workshop evaluations were found: knowledge about ageing improved after the workshop, and evaluations about work-based practices addressed in the workshop changed. Participant evaluations about the quality of the workshop were positive. Discussion: Negative attitudes towards older people can be reflected in unjustified age discrimination in employment and health, and negative stereotypes of older people which deny their strengths, skills and heterogeneity. The AgeWise workshop is a brief intervention which has the potential to challenge negative attitudes and stereotypes, and inform professionals about the potential for continued development, health, and quality of life into later years.

**PC7 573 EVALUATION OF AN INNOVATING TEACHING PROGRAM TO DEVELOP COMPETENCIES REGARDING HEALTH CARE AIDES WORKING WITH THE ELDERLY**

S. TREMBLAY\* (Institut universitaire de gériatrie de Montréal, Montréal, Canada)  
L. FRANCOEUR(1), A. LEGAULT(2), L. BOURASSA(1) - (1) Institut universitaire de gériatrie de Montréal (Montréal, Canada); (2) Université de Montréal (Montréal, Canada)

Tending to frail elderly persons with loss of autonomy regarding activities of daily living (ADLs) requires a combination of knowledge, both theoretical and practical, and an attitude of openness to human values. The health care aides (HCA) are front-line caregivers who often feel overwhelmed by the magnitude of the task and the complexity or

difficulties encountered by an aging clientele increasingly dependent with multiple pathologies. These caregivers are in long-term care facilities representing the majority of the staff. In response to this situation the Institut universitaire de gériatrie de Montréal (IUGM) undertook the creation of an innovative program to support the continuous development of competencies needed for HCA to provide expert support and assistance to older persons with loss of autonomy. To target special competencies, this program has developed educational tools (DVD and an animator's guide) for educators who want to support the learning process of HCA on issues directly linked to their daily work "meal time assistance". This present study aimed to assess the implementation of this innovative program. Using a methodological approach to research and development Van der Maren (2003), we proceeded with four trials in two different long term care centers. During each trial, the training session has been systematically evaluated including the participation of the HCA in a discussion group a week after training. The project, which began in 2008, will continue in the winter of 2009. Initial results have already led to adjustments in our training approach. Future trials will further develop this educational formula.

**PC7 574 EVALUATING PSYCHO-EDUCATIONAL GROUPS AND INDIVIDUAL SUPPORT FOR CAREGIVERS OF ELDERS WITH ALZHEIMER'S DISEASE**

E. BARHAM\* (Universidade Federal de São Carlos, São Carlos, Brazil)  
D. FALEIROS(1), S. PAVARINI(1) - (1) Universidade Federal de São Carlos (São Carlos, Brazil)

This study contributes to the development of more effective intervention strategies for assisting family caregivers of elders with Alzheimer's disease (AD), by comparing the effects of a psycho-educational group coupled with training-oriented (Experimental Group – EG) or listening-oriented (Control Group – CG) home visits. In the EG, each caregiver was assisted in implementing the managerial and coping strategies presented in the psycho-educational group. To control for social contact effects, caregivers in the CG responded to an extensive interview about their situation. In the second phase of the study, the strategies used with each group were switched. All participants (Brazilians) completed evaluations before the intervention and at the end of phase 1 and phase 2. Comparisons between the EG and CG were made using Brazilian versions of the Zarit Caregiver Burden Interview (1980), Yesavage's Geriatric Depression Scale (Stoppe-Junior, 1994) and Logsdon's measure of Quality of Life in Alzheimer's disease (Novelli, 2006). Nine family caregivers for elders with AD were randomly allocated to each group, five in the EG and four in the CG. The data were analyzed using non-parametric tests (Mann-Whitney and Wilcoxon). The psycho-educational groups were effective in transmitting information, but did not reduce the caregivers' perceptions of burden, reporting of depressive symptoms or change their quality of life ratings. After the caregivers received the training-oriented home visits, their perceptions of burden significantly decreased and their quality of life ratings increased. The listening-based visits had no significant effects on the caregivers. We conclude that those who offer orientation programs for family members caring for elderly relatives with AD should further invest in evaluating the influence of home visits that assist caregivers in adjusting their managerial and coping strategies, to increase our knowledge of how to blend group-based and individual psycho-educational supports.

**PC7 575 COMMUNITY-BASED PREVENTION OF DEPRESSION IN OLDER ADULTS WITH THE PSYCHOEDUCATIONAL BRIEF INTERVENTION**

N. KUSAKA\* (Doshisha women's college, Kyoto, Japan)

This study looks at the efficacy of brief focused cognitive behavioral group intervention in the treatment and prevention of depression in older adults. For the prevention of depression, this intervention focuses on three points: education concerning depression, education concerning the importance of physical exercise, and lastly, the importance of improving family relationships and communication. Two methods of screening were utilized. First, public health surveys were employed. In all, 3,219 senior citizens took part in public health surveys, with a total of 294 citizens (9.1%) identified as being at risk for depression. The invitation letter to this intervention were sent one geographical area at a time. Second, information was drawn from local community newsletters. From these two sources, four different geographical groups were formed. Each group received 5 group sessions of 2 hours per week. Fifty-one participants received the intervention based on cognitive behavior therapy. Assessments were performed pre, mid and post treatment and there was a one month follow up comparison. The surveys aimed to measure the following aspects of depression: knowledge of the prevention and treatment of depression, daily activities, mood, and cognitive distortions. The outcome of the treatment for individuals will be measured by original questions about the clients' knowledge of depression, the number of walking steps, calories, SDS (Zung Self-rating Depression Scale) and JIBT-20 (Japanese Irrational Belief Test). General linear model fixed effects for time (pre, post and follow-up) were fitted to assessment scores. The intervention outcomes are indicated with improvements showed significant time effect on SDS, FMQ. Clients' knowledge of depression also significantly improved. The findings of this study showed that there are many potential benefits to using psychoeducational interventions with older adults.

**PC7 576 EFFECTIVENESS OF RECOLLECTION TRAINING FOR OLDER ADULTS WITH PROBABLE ALZHEIMER'S DISEASE**

B. BOLLER\* (Institut de Psychologie - Université Paris Descartes, Boulogne Billancourt , France)  
J. JENNINGS(2), B. DIEUDONNÉ(3), M. VERNY(3), A. ERGIS(1) - (1) Université Paris Descartes (Boulogne-Billancourt , France); (2) Wake Forest University (Winston-Salem, United States of America); (3) Centre de Gériatrie, hôpital de la Pitié-Salpêtrière, APHP (Paris, France)

Introduction: As a part of memory disorders' rehabilitation, a memory training technique, called the Repetition Lag Procedure, was developed to target consciously controlled memory processing (recollection) for improvement (Jennings & Jacoby, 2003). Previous results have shown enhancement of memory performance on the training task and transfer measures in cognitively healthy older adults and individuals with Mild Cognitive Impairment (Jennings & al, 2005; 2006). As this technique has proved its ability to replicate and generalize, this study was designed to extend its use to Alzheimer's patients. Materials and methods: A group of 6 patients were trained individually one hour a day, three times a week for two weeks. The training procedure consisted in multiple trials of a yes / no recognition task in which some words were repeated after a variable number of intervening words (lag). After each correct trial, the lag was gradually increased. Their performance was evaluated on pre and post training tests and compared with a recognition practice group and a no contact group. Results: Training patients have enhanced their performance after six hours of training. Their capacity to correctly identified repeated items has increased across a lag interval of 1 to 4 intervening items. Likewise, post training gains following recollection training were found on DMS 48 and source recognition tasks whereas no changes were identified in the two other groups. Conclusions: As training benefits generalized to other measures of memory, the Repetition Lag Procedure has a beneficial effect on recollection and seems to be an efficient memory training technique for Alzheimer's patients.

**PC7 577 THE EFFECT OF AN INTEGRATED PHYSICAL ACTIVITY PROGRAM ON MENTAL HEALTH IN COMMUNITY-DWELLING OLDER WOMEN: CLUSTER RANDOMIZED CROSSOVER TRIAL**

R. ONO\* (Kobe University Graduate School of Health Sciences, Kobe, Japan)  
S. HIRATA(1), K. ONO(1), Y. ISHIKAWA(1) - (1) Kobe University Graduate School of Health Sciences (Japan)

Introduction: To determine the effect of an 8 week integrated program to increase physical activity in community-dwelling older women. Methods: Two hundred and seventy-five women in 19 community centers were cluster-randomized into an intervention group (IG) and a control group (CG). A program consisted of providing fitted shoes, wearing a pedometer, and physical conditioning exercise once a week from December, 2007. The outcome measures included the number of steps taken a day and SF-36 subscales. Results: Subjects were allocated in IG (120 subjects, mean age  $80.1 \pm 0.5$  years) and CG (155,  $81.1 \pm 0.4$  years). The mean step counts decreased by 754 steps/day for IG and by 834 steps/day for CG with no significant group-difference. While the mean mental health of SF-36 increased by only 0.6 for CG, it did by 6.1 points for IG ( $p=0.03$ ). In IG, 42% of subjects increased their mean steps taken at the 8th week despite winter. Multivariate analysis showed that they were more likely to have lower baseline step counts and higher walking speed. ROC analysis identified a cut-off point of 3,412 steps/day (sensitivity of 0.58 and specificity of 0.84). Conclusion: Our 8 week integrated program aiming at increasing physical activity may have a beneficial effect on mental health for community-dwelling older women who have lower physical activity.

**PC7 578 IS THERE INFLUENCE OF THE GERIATRICS KNOWLEDGE IN THE PERCEPTION OF THE ELDERLY?**

M. ZANETTI\* (Tbc, São Paulo, Brazil)  
N. WALDMANN OKAI, M. JACUVISKE VENEGAS, L. MEN ZHAO, D. CRISTINA DE OLIVEIRA FERREIRA, D. ADÃO F. SILVA, C. MONTEIRO CONCEIÇÃO, A. I UN HUANG, C. CRISTINA DE OLIVEIRA NEVES, M. SEABRA CENDOROGLO

There is a worldwide concern in stimulating the formation of specialists in geriatrics and gerontology, to attend the aging population's needs. Objective: The objective of this study was to investigate the association between, geriatrics and gerontology courses, how the student understands the elderly and the students desire to specialize in this area. Population and methods: At total, 411 students from Federal University of São Paulo – Brasil (medical school, from first to sixth grade; fonoaudiology, first to fourth; and nursing school, first to fourth) were evaluated. They received a form with 32 pairs of characteristics regarding the elderly in general (Likert scale), and were asked if they had watched any geriatrics and gerontology classes, they were also asked if they had any interest in following that specialization. Results: Of all the students that considered specializing in that area, 98 had a positive view and 103 had a negative view. Similarly, for those who did not consider that area of specialization 70 had a positive view, while 140 had a negative view (chi-square,  $p<0.001$ ). There wasn't a statistical significance in how the groups that had geriatrics and gerontology class saw elderly ( $p=0.29$ ) or specialization preference ( $p=0.48$ ). Discussion: Geriatrics class had no influence on the students perception of the elderly, as well as the choosing of this specialization. Conclusion: To increase the effectiveness of geriatrics and

gerontology program, there must be an emphasis on ridding the elderly of the stereotypes and prejudice associated with them.

**PC7 579 ATTITUDES TOWARD THE ELDERLY AMONG HEALTH STUDENTS FROM BRAZIL**

A. JUNQUEIRA DOS SANTOS\* (Clinics Hospital of Ribeirão Preto , Ribeirão Preto, Brazil)  
L. FUNG(2), V. PEREIRA DANZINI(3), M. ZANETTI(4), C. BISINOTO BORGES(1), P. CURIATI(2) - (1) Faculdade de Medicina de Ribeirão Preto da Universidade de São Paulo (Ribeirão Preto, Brazil); (2) Faculdade de Medicina da Universidade de São Paulo (São Paulo, Brazil); (3) Escola de Artes, Ciências e Humanidades da Universidade de São Paulo (São Paulo, Brazil); (4) Universidade Federal de São Paulo (São Paulo, Brazil)

Introduction: Global aging is an increasing and recurrent theme in health sciences courses. The objective of this study is to evaluate attitudes toward the elderly among enrolled students of thirteen Brazilian Schools, from five Universities. Methods and materials: A cross-sectional study was conducted with all years students of Medicine (M), Physiotherapy (P), Nursing (N), Speech Therapy (ST), Physical Activity Sciences (PAS), Psychology (Psy), Social Service (SS) and Leisure and Tourism (LT). The students had been grouped in medical group (M), non-medical group (P + N + ST + PAS + Psy) and control group (LT + SS). Attitudes of all students were measured using the Brazilian version of the TeGeME II – Teaching Geriatrics in Medical Education study's questionnaire, with the analysis based on the Aged Semantic Differential (ASD) scale, developed by Rosencrantz and colleagues. Additional information about sociodemographic characters of students were collected. Results: A total of 2408 valid questionnaires were collected; 1411 women (58%) and 994 men (42%). A descriptive and then a significance analysis were performed. Compared to the control group, which resulted in 3.54, the medical group had more negative attitudes (3.60) than and the non-medical group (3.44). Male students (3.66) had more negative attitudes than the female (3.42) in all groups. Conclusion: The fact that the medical group had more negative attitudes toward the elderly than the non-medical group suggests that the means to deal with old people and how their body changes are studied can influence the attitudes.

**PC7 580 HEALTH PROFESSIONALS' PERCEPTION ABOUT THE NOTIFICATION OF VIOLENCE AGAINST ELDERLY IN THE PRIMARY CARE**

J. DE SOUSA PINTO\* (University of Salamanca, Salamanca, Spain)  
E. RIPARDO DA SILVEIRA(1), L. DE SOUZA VIEIRA(1) - (1) University of Fortaleza (Fortaleza, Brazil)

Introduction: The violence affects several society segments and brings severe consequences to the population's health. The study aimed to describe the health professional's knowledge about the violence against elderly and identify their difficulties about the notification of this violence perceived during their practice. Methods and materials: An exploratory and descriptive research with a qualitative design accomplished in June and July 2008, in the pos-graduation course in Family Health from the Ceará State University, Brazil, with eleven students/professionals who have already worked or were working with the strategy of family health. It was applied a questionnaire and a semi-structured interview with the following questions: how do you describe the violence against elderly? Tell us your difficulties to notify the situations of violence against the elderly. As a post-graduating student, how did you analyze the compulsory notification from the cases of violence against them at the Primary Attention? It was realized the Analysis of Content, which led to the categories: the professionals understanding about the violence against the elderly, family as aggressor/elderly as an obstacle, the fear to notify/absence of cases, unprepared professional. It was respected all the principles of researches with human being. Results: These professionals know the significance of violence against the elderly. The family was emphasized as a difficult, sometimes, being the obstacle of the professional's performance or even the principal aggressor. The professionals' fear from the aggressors in notify cases of violence, many times, leads to the sub-notification. The lack of knowledge about the violence in elderly and the lack of preparation in cope with the victims, difficulty the professional performance. Conclusion: The qualification of the professionals, who work directly with elderly, is necessary to promote the protection and security of this social class that is vulnerable to bad treats and other kind of violence.

**PC7 581 L'INTERVENTION PSYCHOLOGIQUE LORS DE L'HOSPITALISATION D'UNE PERSONNE AGÉE DANS UN COURS SEJOUR GÉRIATRIQUE. UTILISATION DU MODÈLE CONCEPTUEL DE PROGRAMME (MCP) ET DE LA MÉTHODE INTERACTIVE DE RÉSOLUTIONS DE PROBLÈMES (MIRP)**

G. RIBES\* (Université De Lyon, Bron , France)  
J. GAUCHER(1), B. CLAVEL(1), A. SAGNE(1), L. PLOTON(1), M. POUSSIN(1), S. PORTALIER(1) - (1) laboratoire sis (Bron, France)

INTRODUCTION: The hospitalization of an elderly person in a geriatric unit is supposed to be motivated by the appearance or the aggravation of somatic problems which require a diagnosis and the establishment of a therapy. However, this definition does not reflect the realities of hospitalizations. Medicals, families, socials and psychological problems need to

be identified even if the somatic problems remain the main issue. METHODS: A model developed for the evaluation of health programs was used to establish the clinical protocol for each individual. This "logic model" was introduced by Robert Flynn and Tim Aubry. It allows asking a number of issues that will lead to a global reflection. The first question is "Who does what to whom and why?". This question permits to define the role of each and to specify people to escort. The second question concerns the evaluation of the needs, and subsequently the availability of resources. The analysis of those two questions will result in the establishment of the clinical protocol. Outcomes of using this protocol will be discussed with patients, their entourage and medical team. Discussions on outcomes will permit to adapt the protocol to the individual. RESULTS : The use of this logic model applied to a patient is in its implementation phase. In this model, this phase is the key to permit an appropriation of the different actors. The patient benefits and risks, and ethic questions were the first points to be addressed. The coordination of different actors, including patient entourage, has permitted the determination of each respective role. The understanding of the intervention modes and the identification of useful tools has been improved. This study has demonstrated the importance of the psychological intervention as an interface between the different actors concerned by the clinical protocol. It has also demonstrated the necessity to "visualize" the short, average and long term objectives as an accompanying of successive crisis episodes. The study has brought lights to the relations of complementary and on the different protagonist limits.

**PC7 582 THE EXPERTS' PERSPECTIVE ON INTERVENTION – AN EXAMPLE OF ARMD INTERVENTION RESEARCH IN GERMANY**  
I. HIMMELSBACH\* (Forum Alterwissenschaften und Alterspolitik, Frankfurt, Germany)

Age-related Macular Degeneration (ARMD) is the main cause for severe visual impairment in the western countries. Most persons concerned are 65 years and older. Since cure of ARMD is not achievable yet, intervention and rehabilitation programs gain in importance focussing as well functional as psychosocial issues. Intervention research is predominantly present in quantitative pre-post designs concentrating on the change of outcomes in participants. This leads to the fact that the professional experts' perspective and influence is underrepresented in experiential studies. With this contribution a study using a qualitative approach will be presented which investigated programs for elderly visually impaired as well from the perspective of experts (n=5) carrying out the intervention as from the perspective of the participating elders themselves (n=15). The study is based on semi-structured interviews which were analyzed following the methodological paradigm of Grounded Theory. The talk will report the central categories analyzed, namely: Setting, Facing Vision Loss, Educational Forms and Phases. Furthermore the relation – in terms of contrast and coherence – with the elderly participants' view is elaborated, which leads to a problem set in interventions whether the visually impaired elder or the elder visually impaired is addressed. Including the experts' perspective in intervention research may help to understand better "how" interventions fail or succeed and may also lead to new ideas of interpreting quantitative results on outcome variables.

**PC7 583 GERIATRIC AND GERONTOLOGIC TRAINING NEEDS OF PROFESSIONALS INVOLVED IN ELDERLY CARE**  
M. GERALDES\* (National School of Public Health, Lisbon, Portugal)

- Introduction The reflection about Gerontology and Geriatrics sciences is today essential and must also involve the training of professionals caring elderly people. Basing on it I did a study about training needs of these professionals with aim is to study training needs opinion of professionals taking care of elderly.
- Methods and materials I inquired 30 professionals through a questionnaire built by myself and previous tested. This questionnaire has 11 questions organized in 2 parts. The first one includes dimensions concerning the needs of the professionals training. The second part is reserved to some personal and professional data of the inquired. It was an opportunistic sample with population who agreed to collaborate.
- Results The sample included 30 professionals (13,3% males and 86,7% females), the average age was 30 years old (46,7%) and the majority were gerontological nurse practitioners (53,3%) and general practitioners (16,7%). In their opinion the needs of professionals involved in elderly care will increase in Portugal. In this country there is no geriatric speciality but they consider it is necessary. The training needs are: on team and elderly family relationships and in clinical topics. Although there is some training it is not enough and adequate.
- Conclusion From this study we understand that geriatry and gerontology are areas important to Portugal which needs to be taught to the professionals involved in elderly care. Although some of the inquired people don't know how to do it. The two main areas of training needs are: team and elderly family relationships and clinical topics. In the inquired professional's perspective, this is an area requiring development, mainly at the geriatrics level and training of the relational subjects: professionals and families. This kind of assessment may be useful for a first phase of an intervention plan.

**PC7 584 OBJECTIVE STRUCTURED CLINICAL EXAMINATION TRAINING (OSCE) AS A FEEDBACK TOOL FOR GERIATRIC MEDICINE FELLOWS**  
J. GAMMACK\* (St Louis University, St Louis, United States)

Introduction: Geriatric Medicine fellowship training in the U.S. is only 12 months in duration. Fellows must learn patient assessment skills early in the program to achieve

proficiency by graduation. The objective of this pilot project was to develop geriatric medicine skill-based OSCE stations as a formative feedback tool for fellows early in their training. Methods: Using examples of OSCE training stations developed for medical students or with geriatric medicine content, 6 clinical cases and 3 "paper" cases were developed to test skills needed by geriatric medicine fellows. Each station included a skill-demonstration component and a written short-answer interpretation of the case. Evaluation checklists were developed to provide feedback to the fellows. Skill stations included assessment of delirium, fall risk, decisional capacity, polypharmacy, dementia, and telephone medicine. Paper stations included assessment of functional status, end of life symptoms, and frailty. Each station was reviewed and role-played in advance by faculty to identify problems in content or execution. Results: 9 fellows each rotated through 9 stations with 15 minutes allotted per station. Two faculty were assigned to each station as either the simulated patient or the evaluator. Fellow and faculty feedback was overwhelmingly positive for this OSCE. All fellows and faculty requested this be continued in the future and most desired it to take place twice each year. Stations that were most helpful included palliative care and polypharmacy. Skills for which fellows desired additional training included decisional capacity, functional assessment, and palliative care. Additional skills that faculty felt should be included in future OSCE training included breaking bad news and running a family meeting. Conclusion: OSCE training is an effective and well-received method of providing formative feedback for geriatric medicine fellows.

**PC7 585 SPIRITUALITY ASSESSMENT IN CLINICAL RESEARCH: A SYSTEMATIC REVIEW OF INSTRUMENTS**

S. MONOD\* (Service of Geriatrics, University of Lausanne Medical Center, Switzerland, Epalinges, Switzerland)  
E. ROCHAT(1), M. BRENNAN(2), S. ROCHAT(1), C. BULA(1) - (1) Service of Geriatrics, University of Lausanne Medical Center (epalinges, Switzerland); (2) Center on HIV and Aging, AIDS Community Research Initiative of America (New York, United States of America)

Introduction: Growing evidence supports the role of spirituality in influencing patient's health decisions and outcomes. Clinicians agree that assessing spirituality would be important in clinical care. However, spirituality assessment remains complex. A great variety of conceptualizations and constructs have been developed, resulting in a diverse collection of instruments to assess spirituality. Objectives: To perform a systematic review of instruments used in clinical research to measure spirituality, to propose a classification of these measures, and to identify further needs in the domain of spiritual assessment in health care settings. Method and materials: A literature search in Ovid MEDLINE, CINHAL, PsycINFO, and EMBASE databases, using the terms "spirituality", "assessment", and "adult" was performed. Religiosity measures and qualitative instruments were excluded. For each instrument, dimensions of spirituality, intended goals, and data on psychometric properties were recorded. Results: Overall, 38 instruments were identified and classified as single-item (n=6) or multi-dimensional instruments (n=32). These latter measures were then classified according to the main underlying construct into measures of general spirituality (n=19), spiritual well-being (n=5), spiritual support (n=6), and spiritual needs (n=2). Data on psychometric properties were mostly limited to reliability (internal consistency), content validity, and factor analysis. Measures of test-retest reliability, and convergent validity were reported only for a few instruments. Data on predictive validity were scarce and even though some instruments were used as outcome measures, no data on sensitivity to change was provided. Instruments measuring spiritual well-being were those most frequently used in clinical research. Conclusion: This systematic review highlights the various spirituality constructs assessed by these instruments. The proposed classification could help to select the appropriate instrument for specific research question. Information on psychometric properties remain limited, in particular, measures of sensitivity to change are essentially lacking and will be needed to use these instruments to monitor the effectiveness of spirituality-based interventions.

**PC7 586 INTEREST OF AN ETHICAL REFLEXION IN GERIATRICS**

G. PINGANAUD\* (CHU Bordeaux, Pessac, Belgium)  
V. CRESSOT(1), A. DÉCAMP(1), M. FLOCCIA(1), V. MARTIN(1), M. LE RUDULIER(1), S. VALVERDE(1), A. MERLE(1), G. PEYRAN(1), N. SEGUIN(1), V. BEAUMATIN(1) - (1) Hôpital Xavier Arnoux (Pessac, France)

Introduction: Many ethical questions regularly surges when care of an old-aged person is concerned. In this context, a reflexion group has been set to analyse different difficult clinical situations, and to facilitate decision making. Methods: The group includes professionals in Gerontology, representing different actors of this speciality. Other professionals can also participate as experts whether or not they belong to the speciality. The meetings hold twice a month, and two clinical cases are discussed. Each case is presented by both the physician and the nurse before gathering opinions of all participants for final analysis and conclusion. Written propositions are made for a final report. The clinical issue is re-discussed during the next meeting. Results: Twenty meetings were held since March 2007. The analyses of clinical situations were done in sixteen of them; two were dedicated to the redaction of a decisional algorithm; two others were held in emergency for requiring a quick decision. The topics which have been discussed are: refusal of care (2), ask for euthanasia (2), choice of terminal care settings (3), transition from curative to palliative stage (5), stop-feeding decision (5), handling of family secrets

(2), contention (1) and finally, transfers to specialised departments (1). Conclusion: Three types of situations were identified from this experience: • The "crisis" for which the ethical group should rapidly be gathered • The "aftermath" which involves an important emotional tension • The subsequent reassessment of general concepts The place of this staff in a large Geriatric teaching hospital is discussed, as well as how to involve more professionals and to assess the impact.

**PC7 587 CONCEPT ANALYSIS: "DIFFICULTY" EXPERIENCED IN NURSING**  
M. CHIDA\* (Iwate Prefectural University, Takizawa, Japan)

The purpose of this study is to clarify concept "difficulty" experienced by nurse using the strategies for concept analysis proposed by Walker and Avant. The attributes: "care receiver's behavior", "negative cognition", "support to the patients and their family", "select appropriate methods of nursing practice", "psychological response by nurses: disparity between ideal nursing situation and the realities of nursing". The antecedents: "existence of nurse as care provider", "existence of care receiver", "existence of nurse that aspires to provide good nursing care", "nurse's own cognition that they are not good at nursing", "limitations of nursing practice performed as part of an organization (duty)". The consequences: "negative physiological, psychological and behavioral responses of nurse", "measures to resolve the difficulty", "the risk of inability to continue working", "deterioration in the relationship between the nurse and patient", "spiral of difficulties". The difficulties felt in situations when nurses were unable to practice fundamental duties that had to be accomplished. The existence of the concept of "difficulty" is based on the premise that nurses had in mind a professional job situation that they wanted to find themselves in. The superordinate concept that dominates all of these categories is the existence of a disparity between the ideal nursing situation and the realities of nursing. The concept of "difficulty" is associated with various background factors, such as individual differences in the nurses' perceptions of difficulty, and problems with hospital administration such as a nursing care system and the distribution of human resources.

**PC7 588 SOCIAL BIOETHICS AND RECOGNITION: A PROPOSAL OF SOCIOLOGICAL INVESTIGATION IN GERONTOLOGY**  
R. PUTTINI\* (Botucatu Medical School, UNESP – São Paulo State University, Botucatu, Brazil)  
A. SCHUMACHER(3), S. BOCCHI(2), T. NOJIMOTO(3), A. MEDICI(3), G. HERCOS(1), I. REIS(1), M. OLIVEIRA(2), I. BARCOS(2), V. MAZIERO(2), A. LEOPOLDINO(2) - (1) Departament of Public Health, Botucatu Medical School, UNESP – São Paulo State University (Botucatu, Brazil); (2) Departament of Nursing, Botucatu Medical School, UNESP – São Paulo State University (Botucatu, Brazil); (3) Department of Administration and Technology – Economy and Sociology Area; Faculty of Agronomical Sciences, UNESP – São Paulo State University

Introduction Bioethics arose in the USA, and its four basic principles (beneficence, non-maleficence, justice and autonomy) became known worldwide. In the 1990s, criticism emerged in face effectiveness lack front sanitary and environmental problems observed in countries in the southern hemisphere. New conceptual bases have been constructed for coping with these persistent problems. The dominant topics sometimes aiming at the protection of individuals, sometimes at that of population groups can be distinguished as Clinical Bioethics and Social Bioethics. Objective We consider that, in the praxis of work concerning empirical investigation on the elderly, the sociological theory, guided by recognition, approximates the propositions from Social Bioethics. Methods Two sociological investigation were developed involving elderly individuals from the city of Botucatu, Brazil. Data were collected by means of semi-directive and non-directive interviews under two methodological angles: hypothetical-deductive and inductive. In the first, the sociological frameworks of Axel Honneth's theory of recognition are testing hypotheses in search of three domains: self-esteem, self-respect and self-confidence. In the second, the framework of the Grounded Theory are using in search for the theoretical aspects concerning elderly individuals' vulnerability. Results In the first methodological approach, the results are deduced from the elderly individuals' discourse on ageing. In the second, the inductions from the elderly individuals' discourse are described by categorizations. This range of information enabled us to perform complex readings of the intersubjective ageing-related conflicts among the elderly persons. A reconstruction model will be tested on the elderly individuals who were interviewed. Conclusion The theory of social recognition enabled the empirical investigation of the values related to the elderly individuals' well-being. In the field of Gerontology, we affirm that this sociological research approximates propositions of Social Bioethics since the autonomy and vulnerability of the elderly, as priority topics, include the elderly individuals themselves as the subjects of knowledge.

**PC7 589 LEADING OF MOBIL GERIATRIC UNITS IN THE RELEVANCE OF APPLICATION OF THE ANAES GUIDELINES ABOUT PHYSICAL RESTRAINT IN ACADEMIC HOSPITAL**  
V. BELLAMY\* (Hôpital saint antoine, Paris, France)  
ALLOUCH(1), R. GASPARD(1) - (1) hôpital saint antoine (paris, France)

The first time drew the interferences about the practice and the knowledge from physical restraint by two surveys : - one-day survey of the patients who are under physical restraint

in all hospital. The reasons, the used means, the context of decision, the existence of written medical prescription , the traceability of the motivation of this prescription, the assessment profits/risks, the traceability of supervision of side effects and information for patients and/or their families were studied. - survey about knowledges (definition, risks, means, difficulties) also. Résults One-day survey 13% of hospitalized patients are under physical restraint. The reasons are principally the risk of falling and the delirium. The decision to restrain physically is always taken by nurses sometimes with auxiliary nurse never with doctor. The used means is principally the bedrails. The medical prescription is almost never written. The traceability of the motivation of this prescription and the assessment profits/risks are almost never found. It's the same think to the traceability of supervision of side effects and information for patients and/or their families. Survey about knowledges Rate of answers is 50%. 27% of teams take a good definition of physical restraints, 91% estimate this practice has risks, principally injuries by ties, the risk of falling and excitement. The quoted means are principally ties of wrist, bedrails or sheets. 45,5% of nursing teams feel difficulties about this practice : to have a medical prescription, no adherence of patients or their families, to feel ethic problem or suffering to restrain someone. 66% want a formation. Comment After the assessment, it's necessary to work on alternatives at the physical restraint by elaborating guidelines about: - management of excitement - prevention of running away - risk of falling. And doing a procedure about the management of physical restraint when it is indispensable. Conclusion The evaluation of professional practices about physical restraint in geriatric units is known but this experience can be used in no geriatric hospitals through mobile geriatric units.

**PC7 590 THE CAPACITY TO APPOINT A PROXY BY PERSONS WITH COGNITIVE IMPAIRMENT: THE EXAMPLE OF VOTE**

A. BOSQUET\* (Assistance Publique Hôpitaux de Paris, Hôpital Louis Mourier, Colombes, France)  
A. MEDJKANE(2), L. AFFO(3), F. BENSELAMA(4), C. BOUGHIDA(5), P. CHARRU(6), P. VINCENUEX(7), I. MAHÉ(8) - (2) Assistance-Publique – Hôpitaux de Paris (AP-HP), Hôpital Louis Mourier, Service de Médecine Interne (Colombes, France); (3) Assistance-Publique – Hôpitaux de Paris (AP-HP), Hôpital Louis Mourier, Service de Gérontologie, (Colombes, France); (4) Assistance-Publique – Hôpitaux de Paris (AP-HP), Hôpital Louis Mourier, Service de Gérontologie, (Colombes, France); (5) Assistance-Publique – Hôpitaux de Paris (AP-HP), Hôpital Louis Mourier, Service de Gérontologie, (France); (6) Assistance-Publique – Hôpitaux de Paris (AP-HP), Hôpital Louis Mourier, Service de Médecine Interne (France); (7) Assistance-Publique – Hôpitaux de Paris (AP-HP), Hôpital Louis Mourier, Service de Médecine Interne (France);

INTRODUCTION The capacity to design a proxy (CDP) by cognitively impaired (CI) persons is poorly documented, whatever the context: consent to research, consent to treatment, everyday decision and voting. No tool is available to assess the CDP. CI subjects are most prone to require proxy appointment, in particular for voting in countries where proxy voting is allowed. The aim of the present study is to assess the CDP for voting in an internal medicine and 2 different geriatric populations. METHODS AND MATERIALS We developed a 3 item CDP questionnaire (CDPQ) exploring choice, understanding, reasoning about proxy appointment (scored 0 to 3) and proposed it to all French nationality patients, present at 2008 municipal French election day in the Internal Medicine department, the Geriatric Rehabilitation department and the nursing home of teaching hospital. The questionnaire performance was related to MMSE score and demographic data. RESULTS 138 patients were included. 92 answered the questionnaire (sex ratio 0.4, mean age 74). Means of CDPQ scores were 1 (1.2), 2.2 (1.1) and 2.2 (1), respectively in the nursing home, the Internal Medicine and the Geriatric Rehabilitation departments. There was a significant correlation between CDPQ and MMSE scores ( $rs=0.615$ ,  $p<0.0001$ ). MMSE score <10 may predict a CDPQ score < or equal to 2 (PPV 84%, specificity 95%) and MMSE score >20 may predict a CDPQ score >2 (PPV 90%, specificity 88%). CONCLUSION CDP testing is feasible in widely different patients. For highest and lowest MMSE levels, MMSE score is highly predictive for CDPQ values. For intermediate MMSE scores, CDPQ assessment may contribute to give specific information on CDP. Further studies are needed to assess the relevance and the implication of those data.

**PC7 591 STIMULUS ONSET ASYNCHRONY (SOA) SENSITIVITY AND MODALITY EFFECT IN ALZHEIMER'S DISEASE AND SCHIZOPHRENIA**

S. SCHUMM\* (AP-HP, Ivry sur seine, France)  
G. SIMMAT(1), G. FERREY(2), J. SENON(3), C. SEBBAN(4) - (1) CHU Henri Laborit (Poitiers, France); (2) Hôpital Simone Veil (Eaubonne, France); (3) CHU Henri Laborit (86000, France); (4) Hôpital Charles Foix explorations Fonctionnelles (Ivry sur seine, France)

INTRODUCTION : Since many years lengthening of Reaction Time (RT) has been observed in Alzheimer's disease and schizophrenia. Today using a serie of RT with different paradigms and cognitive models of mental steps involved in responses, it's possible to estimate the duration of elementary mental operations. This study shows such an approach and compares Alzheimer and schizophrenic patients. METHODS : 14 healthy young subjects ; 36 healthy elderly subjects ; 13 patients with mild Alzheimer's disease ; 15 young schizophrenic patients and 16 middle-aged schizophrenic patients from two different hospitals were included. RT paradigms include : simple visual reaction time (VRT) ; Visual Backward Masking (VBM) ; Mnemonic Visual Prospection ; Visual

Prospection using two SOA (0 ; 600 ms). Same stimuli were used in all paradigms as response mode except for the VBM. The analysis was done on correct responses only (ANOVA). It concerns VRT, the durations of stimulus structuration and its mental representation elaboration, SOA sensitivity and modality effect (difference between « Different » and « Identical » responses). RESULTS : the main results were : 1) in the 3 pathological groups : a 30-50% slowing down of central steps of the visual processing with a slight structuration lengthening but without mental representation elaboration lengthening ; 2) a dramatical SOA sensitivity decrease in the two schizophrenic groups whereas an important increase was observed in the Alzheimer's group ; 3) the modality effect was by far higher in the Alzheimer's group compared to those observed in the schizophrenic and control groups. CONCLUSION : central processing of visual stimuli appears lengthened in Alzheimer and schizophrenic patients. First steps, automatic processing, are affected in schizophrenic patients whereas later steps, controlled processing, are impaired in Alzheimer patients.

**PC7 592 ASSESSMENT OF QUALITY OF LIFE OF RURAL AND URBAN ELDERLY POPULATION OF WARDHA DISTRICT**  
 A. MUDEY\* (JAWAHARLAL NEHRU MEDICAL COLLEGE, SAWANGI (M) WARDHA.MAHARASHTRA,INDIA, WARDHA, India)  
 S. AMBEKAR(1), R. GOYAL(1), V. WAGH(1) - (1) J N M C SAWANGI(M) WARDHA (WARDHA, India)

INTRODUCTION: All aspect of "Health Status " life style, satisfaction, mental state or well being together reflects the multidimensional nature of QOL in an individual . For the year 2003 the SRS estimates are 7.2% of total population were above the age of 60 years. India has acquired the label of "an aging nation" with 7.7% of its population being more than 60 yrs old .Urbanization is rapidly spreading through India. OBJECTIVES: - To assess the difference of quality of life between rural and urban elderly population in Wardha district. - To find out the association between the sociodemographic profile and quality of life of elderly population in Wardha district. MATERIAL AND METHODS: The Community based cross sectional study was conducted in Wardha district on 800 subjects of age group above of 60 years age , study subject were selected from urban (n=400) and rural (400) using multistage simple random technique. Face to face interview using pretested questionnaire by trained interviewers to collect data. The WHOQOL bref was used to assess the quality of life. RESULTS: The study showed that the elders living in the urban community reported significant lower level of quality of life in the domains of Physical 51.2 (S.E.-3.6) and psychological 51.3 (S.E.-2.5) than the rural elderly populations. The rural elderly population reported significant lower level of quality of life in the domain of social relation 55.9 (S.E. - 2.7) and environmental 57.1 (S.E.-3.2) than urban elderly population. CONCLUSION: The difference between the quality of life in rural and urban elderly population is due to the differences in the socio-demographic factors chronic disease, social resource, life style behaviors, financial resources and income adequacy.

**PC7 593 OPTIMISM PREDICTS HIGHER SURVIVAL AT ADVANCED AGES - A TEN-YEAR FOLLOW-UP OF 2,262 NONAGENARIANS IN THE DANISH 1905 COHORT.**  
 H. ENGBERG\* (Institute of Public Health, Odense C, Denmark)  
 B. JEUNE(1), K. ANDERSEN-RANBERG(1), J. VAUPEL(2), K. CHRISTENSEN(1) - (1) Institute of Public Health, Department of Epidemiology, University of Southern Denmark, Denmark (Odense C, Denmark); (2) Max Planck Institute for Demographic Research, Rostock, Germany (Odense C, Germany)

Introduction: Predictors of survival among the oldest-old are not well understood, and subjective measures have only been studied very little. The aim of this study was to examine the effect of being optimistic about one's own future on survival among the oldest-old. Material and methods: The Danish 1905 Cohort Survey is a nationwide, longitudinal survey comprising all individuals born in Denmark in 1905. At baseline in 1998, a total of 2,262 persons aged 92 or 93 agreed to participate in the intake survey. The baseline in-person interview consisted of a comprehensive questionnaire including physical functioning and health, and a question about whether the respondent had an optimistic, neutral or pessimistic outlook on his or her own future. Results: Univariable Cox regression analyses revealed that women and men who had an optimistic outlook on their future were at lower risk of death compared to their neutral counterparts (HR 0.82, 95%CI (0.73-0.93) and 0.81, 95%CI (0.66-0.99), respectively). When activities of daily living, cognitive functioning and self-reported disease was taken into account the association between optimism and survival weakened in both sexes, but the general pattern persisted. Women who had an optimistic outlook on their future were still at lower risk of death compared to neutral women (HR 0.85, 95%CI (0.75-0.97)). The risk of death was also decreased for optimistic men compared to their neutral counterparts, but the effect remained non-significant (HR 0.91, 95%CI (0.73-1.13)). Conclusion: This study provides evidence that an optimistic outlook on one's own future may be an important predictor of survival among the oldest-old women but to a less extent among the oldest-old men.

**PC7 594 EFFECTS OF PRODUCTIVE ROLES AND PRODUCTIVE ROLE IDENTITY ON THE AFFECTIVE WELL-BEING OF THE ELDERLY IN JAPAN.**  
 J. NAKAHARA\* (Osaka University, Ikeda, Japan)  
 A. FUJITA(1) - (1) Osaka University (Suita, Japan)

A number of previous studies have shown the positive effects of productive activities on the psychological well-being of the elderly who are voluntary involved in these activities. This study adopts the perspective of the interactional role theory in order to consider the social psychological mechanism in which an increase in productive activities results in an increase in psychological well-being. The interactional role theory hypothesizes that the effect of productive roles on affective well-being brings about a productive role identity. Therefore, the purpose of this study is to verify this hypothesis in the case of the elderly Japanese by using cross-sectional and longitudinal data. Two mail surveys (wave 1 and wave 2) were conducted for a randomly selected sample of individuals between 65 and 74 years of age (n = 215), and wave 2 (6/7/2009) was conducted around five months after wave 1 (2/3/2009). The results of the covariance structure analysis that was conducted using the cross-sectional data in wave 1 were as follows: (1) a number of productive roles and the frequency of engaging in productive roles positively influenced productive role identity but not affective well-being, and (2) the productive role identity increased affective well-being. Moreover, the result of the modelling analysis of the cross-lagged effects that was conducted using the longitudinal data in wave 1 and wave 2 showed that while the productive role identity in wave 1 anticipated affective well-being in wave 2, the affective well-being in wave 1 did not anticipate the productive role identity in wave 2. A set of results confirm my hypothesis in Japan, and findings indicate that the positive formation of productive role identity is more important than adopting productive roles in order to increase affective well-being.

**PC7 595 THE RELATIONSHIP OF SMOKING AND GRIP STRENGTH AMONG THE COMMUNITY-DWELLING ELDERLY IN KOREA**  
 S. PARK\* (Hallym University, Chuncheon-si Gangwon-do, Republic of Korea)  
 S. JEON(1), J. JEONG(2), D. KIM(4) - (1) Hallym University (Chuncheon, Republic of Korea); (2) Hallym University (Chuncheon, Republic of Korea); (4) Hallym University (Chuncheon, Republic of Korea)

Introduction: Lower grip strength was reported to be associated with a decline in bone marrow density (BMD)and to increase the risk of spine fracture among the elderly. Smoking, one of major components determining bone marrow density, was also known to have an indirect effect on bone loss. This study was conducted to elucidate whether smoking is associated with grip strength in the community-dwelling elderly in Korea. Methods and materials: The survey was conducted among persons participated in the Hallym Aging Study, population-based cohort of 647 men and women aged 45 or over. They were invited to a general hospital and were evaluated for clinical measures. Grip strength was measured using digital dynamometer TKK-5401. Results: Out of 647, 461 (218 men, 243 women) satisfied inclusion criteria in this study. Mean of grip strength among men and women was 30.8kg and 17.3 kg, respectively. After adjusting for covariate variables, grip strength was higher in order of none, ex, and current smoking (33.4, 30.7 and 29.4kg). Current smoking was found to increase the risk of the decreased grip strength (adjusted Odds Ratio [aOR]=3.17, 95% Confidence Interval [CI]=1.04-9.71) compared with non-smoking in men. If the period abstained from smoking is 6 years or over, the mean of grip strength of these ex-smokers increased to equal level of non-smokers. Men with low body mass index(BMI) <23kg/m<sup>2</sup> were more likely to have decreased grip strength than overweight men with BMI =>25kg/m<sup>2</sup>. Women with no education (OR=3.74, 95% CI=1.37-10.47) and with osteoporosis (OR=2.53, 95% CI=1.14-3.72) appeared to have higher risk of decreased grip strength than women with higher education of 7 years or over and with normal bone density, respectively. Conclusion: These results showed that current smoking was an independent risk factor for decreased grip strength in men.

**PC7 596 ESTIMATION OF SHARED HERITABILITY FOR COGNITIVE CAPACITY AND MORTALITY: ASSESSMENT OF DISCRETE-EVENT TIME MODELING**  
 T. TÖRMÄKANGAS\* (University of Jyväskylä, Jyväskylä, Finland)

Introduction: The primary aim of this study was to estimate the shared heritability related to cognitive capacity and mortality in a bivariate quantitative model. Secondly, we investigated the utility of discrete-time event models with random effects in the modeling of heritability. We used mortality as the event time variable, to make comparisons to continuous event time models. Methods and materials: The subjects included 267 intact twin pairs of the OCTO-twin study aged over 80 years. Excluded were pairs with dementia or suspected dementia. By approaching survival data as longitudinal categorical data with censorings viewed as missing data under the missing-at-random assumption, it was possible to construct latent class mixture models for event time models with continuous random effects to model dependency within twin pairs, and to include the continuous phenotype in the model. We used the data from the first eight years of the study in a hybrid model for event times and a cognitive capacity measure (factor of Block Design, Synonyms, Figure grouping, Thurstone Memory test, Digit span, WAIS) . Results: We observed an additive genetic component (60 %, CI 95%: 27%, 93 %) for cognitive capacity and a common environmental component (79%, CI 95%: 53%, 100%) for first four years

and no significant components for the second four years of mortality follow-up. Time-invariant follow-up measurements gave similar estimates in a frailty model, and our proposed model. Conclusions: Firstly, we found the composition of variation in cognitive capacity and all-cause mortality to be due to separate sources of variability. Genetic interpretation was only supported for cognitive capacity. Secondly, our results suggest that discrete time models are a useful and flexible tool for assessing heritability. These models have potential for assessing complex relationships with other longitudinal measurements in easier terms than continuous counterparts such as frailty models.

#### **PC7 597 PERSONALITY TRAITS AND ACTIVE AGEING**

O. RIBEIRO\* (UNIFAI - Research Unit on Ageing, Porto, Portugal)  
C. PAÜL(1), M. AZEVEDO(1) - (1) UNIFAI - Research Unit on Ageing (Porto, Portugal)

Active ageing (WHO, 2002) is a worldwide aim and there are several indicators that characterize elderly persons as active. Personality traits are among those characteristics since they are thought to partially explain a more or less successful adaptation of the individual to changes during the aging process. In this cross-sectional study we made an analysis of data from a large Portuguese study on active ageing (DIA Project) conducted both in mainland and the Portuguese islands of Madeira and Azores. Data were obtained from 1115 community old dwellers (mean age 70 years old; SD 8.6 years) who responded to an extensive assessment protocol (P3A) that included a personality questionnaire. Participants were classified according to their scores on several measures of physical, social, psychological and cognitive functioning and distributed in different groups. The results are discussed considering the differences found on the personality traits scores (namely Neuroticism, Extraversion and Openness to the Experience) between those participants presenting optimal scores for general well-being and those presenting an average functioning, as well as considering differences between age groups. Authors discuss some implications for understanding personality influences as personal determinants on the active aging model.

#### **PC7 598 EDUCATION, WEALTH, INCOME, OCCUPATION, AND COGNITIVE IMPAIRMENT IN LATER LIFE**

Y. LEE\* (Ajou University School of Medicine, Suwon, Republic of Korea)  
J. BACK(1), J. KIM(2) - (1) Ajou University School of Medicine (Suwon, Republic of Korea); (2) Institute on Aging, Ajou University Medical Center (Suwon, Republic of Korea)

Introduction: Cognitive impairment poses a serious threat to health and well-being in late life. Its risk may differ by socioeconomic status (SES), a widely recognized attribute of health. This study examines the influence of SES on cognitive impairment in older adults living in the community. Methods and materials: This is a cross-sectional study of a nationally representative sample of 4155 persons aged 65 years and older from Wave 1 (2006) of the Korean Longitudinal Study of Aging (KLoSA). Cognitive function was assessed using the Korean version of the Mini-Mental State Examination. SES variables included education, household income, net assets, and occupation. Multivariate logistic regression analyses were conducted by age group (65-74, 75+) and gender, adjusting for demographics, chronic conditions, health behaviors, depression, and physical disability. Results: In the unadjusted analysis, lower levels of education, household income, net assets, and non-white collar job were significantly associated with a higher risk of cognitive impairment. Overall, these associations were observed within age groups and gender. Adjusting for the correlates, the middle school educated showed 67% higher odds of cognitive impairment, than those with a college education. Persons in the lowest quartile of net assets had the highest odds of cognitive impairment (OR [95% CI]=1.59 [1.21, 2.09]). Respondents with a lifetime of unemployment were 2.2 times more likely to be cognitively impaired, compared with the upper white-collar group. In the young-old, significance was retained for education, net assets, and occupation, whereas for the old-old only education remained a significant factor. In men, significant associations were observed for all SES indicators except income, while in women, education and net assets predicted cognitive impairment. Conclusion: The wide disparities in cognitive health across social gradients suggest the need for more investments in health programs and targeting of appropriate services for the disadvantaged groups of the older population.

#### **PC7 599 SCREENING IN THE ELDERLY PEOPLE - SCREENING PROTOCOL FOR THE IDENTIFICATION OF VULNERABLE ELDERS RNAR - 75**

M. DUARTE\* (UNIFAI - University of Porto, Porto, Portugal)

Introduction: The screening methodology is used for a risk or non-risk assessment, in the elders, with the purpose of minimizing the primary ageing process, prevent pathologic ageing and optimize the answers at the health and social level, in order for them to adjust to the needs of the elderly. Methods/Materials: This study the application of the Screening Protocol for the Identification of Vulnerable Elders RNAR - 75, in 240 subjects, 61% of the feminine gender and 40% of the masculine gender, with more than 75 years of age, distributed in a balanced way in contexts of community service and in primary health care services. The multidimensional protocol includes dimensions of biological as well as psychosocial nature. The average time for its use is 20 to 25 minutes. Results: In what concerns geriatric indicators, 37% shows a low body mass index (BMI) and 19% a high index; 43% presumes risk of being polimedicated; 40% demonstrates risk of falling; 51%

risk of incontinence and constipation. As for sensorial processes, 53% shows risk of hearing threshold and 58% risk in visual acuity. In what concerns functionality, 23% and 70% show risk of being compromised in the AVD and AIVD, respectively. At the psychological level, 58% shows a predisposition for depressive symptomatology and 52% shows risk of cognitive deficit. In the socio-familiar sphere 20% demonstrate risk in the social relationships and family support. At last, in the context of risk assessment for mistreatment of the elder, it has been seen that 20% presumes verbal aggressiveness, 9% financial abuse and 3% physical abuse. Conclusion: Generally, the screening protocol sets the elders in a medium record, in what concerns the assessed risk in each construct. In this sense, the assessment of biopsychosocial risk allows to operationalize intervention strategies adjusted to older people.

#### **PC7 600 SUICIDAL IDEATION IN A SAMPLE OF GERIATRIC INPATIENTS**

U. SPERLING\* (Universitätsmedizin Mannheim. University Medical Centre Mannheim, Mannheim, Germany)  
C. THÜLER(1), H. BURKHARDT(1), R. GLADISCH(1) - (1) Universitätsmedizin Mannheim. University Medical Centre Mannheim (Mannheim, Germany)

Introduction The will to live is affected adversely in a number of the elderly. How often can death wishes be found in a sample of geriatric inpatients? What are the characteristics of afflicted and of non afflicted persons? In what way differ the degrees of suicidality with respect to the context in which they occur? Are they stable over time or are they changing? Methods and materials 138 inpatients of a geriatric hospital were screened. 16 persons of the case group and 21 controls took part in intensiv interviews at 2 measurement points within one week. Medical data where assessed as well. Results 36% of all patients reported passive or active suicidal ideation, suicide plans, or suicide attempts during the past half year. Cases and controls in the interview group differed regarding to depression, cognitive impairment, worse health, more intake of medicine, less hope, less satisfaction, stress, and feeling to become a burden. Nearly all reported that death would be a satisfying state. First hypotheses for intervention can be formulated on the basis of the association of the degrees of suicidality with different context variables. Suicidality remained equal or increased in half of the participants during the time of one week. In the other half suicidality decreased. Conclusion The prevalence of suicidal ideation in elderly patients must not be underestimated. Not only active but also passive suicidal ideation demands attention. Generally speaking the attention to active and passive suicidality can be improved by looking out for any concrete mention, depression, minor hope, and comments that death would be a satisfying state. Specific intervention measures are required in view of the different contexts in which the degrees of suicidal ideation occur. The observed variation of suicidality in time underlines that intervention is helpful for elderly patients.

#### **PC7 601 COGNITIVE FUNCTIONS AND SELF RATED HEALTH: WHAT ASPECTS OF COGNITION ARE RELATED TO JUDGMENT OF OUR HEALTH?**

L. ANNA\* (Hospital Sant'Orsola-Malpighi, University of Bologna, Bologna, Italy)  
M. ANDERW(2), N. FALLAH(2), K. ROCKWOOD(2) - (2) Geriatric Medicine Research Unit, Dalhousie University and Queen Elizabeth II Health Sciences Centre (Canada)

Introduction Self-rated health (SRH) is associated with adverse outcomes, but the mechanisms are incompletely understood. In particular, it is unclear how SRH might be associated with cognition. We studied associations between SRH as measured by a Self-Rated Health Deficits Index (SRHDI), depressive symptoms, and neuropsychological test performance to investigate which aspects of cognition could be correlated with poor SRH. Methods In the Canadian Study of Health and Aging, individuals aged ≥65 completed a self-administered questionnaire, a battery of neuropsychological tests, and a screening interview. 280 participants, of whom 177 (63%) were women, had completed all three of these elements. We correlated SRH with each neuropsychological test score and with depressive symptoms. Data were analysed using spearman correlation and split by gender linear regression to adjust for age, 3MS, years of education, depression symptoms, and frailty as measured using a frailty index. Results The SRHDI was correlated with memory test performance in women: ( $p=0.030$ ,  $r=-0.18$ ), visual search and cued recall ( $p=0.016$ ,  $r=-0.20$ ). In contrast, for men SRHDI was correlated with verbal fluency and comprehension: Animal Naming ( $p=0.044$ ,  $r=-0.21$ ) and token test ( $p=0.011$ ,  $r=-0.27$ ). Women with depressive symptoms (mean SRHDI 0.33) had worse SRH than those without (mean SRHDI 0.25) ( $p=0.013$ ). These associations were independent of age, educational attainment, and Modified Mini-Mental State Examination (3MS) score. Conclusions SRH was weakly associated with performance on memory tests in women and language comprehension and fluency in men. For women, depressive symptoms were associated with worse SRH, but this was not the case for men. These results suggest subtle sex differences in how cognition and depressive symptoms relate to SRH, and underscore the importance of considering these sex differences in future studies of SRH and cognition.

#### **PC7 602 A RELATED FACTOR OF MUSIC THERAPY & COLLABORATE WITH THERAPISTS IN OTHER FIELDS IN A SENIOR HEALTH & WELFARE DOMAIN**

T. YOSHIE\* (Obirin University institute of Aging and Human Development, HAMAMATSU-SHI, Japan)  
J. YU(2), H. HAGA(3), Y. SUZUKI(3) - (2) 3 (MACHIDA-SHI, Japan); (3) 3 (MACHIDA-SHI, Japan)

**Objective:** In various fields necessity for collaborate with therapists in other fields has been pointed out recently. However, music therapy, there has been little study. Therefore, this study examine for related factor of Music Therapists and collaborate with therapists in various other fields in A Senior Health and Welfare Domain. From now on, I intend useful for practice of Music Therapy. **Methods:** A survey was carried out in October 2005 by mailing self-typed questionnaire to Japanese Music Medical Treatment Society certified Music Therapists and 92 Music Therapists(68.1% of total recipients), who returned valid responses, were selected as 72 Music Therapists who involve in Senior Health and Welfare domain for analysis in this study. A four-item scale was used for an answer of 5 items of the collaboration. 5 items are self-efficacy derive from collaborate with therapists in various other fields, acquisition of information for objects, exchange of information with therapists in various other fields, knowledge of therapists in various other fields, specialty knowledge of therapists in various other fields. About Psychological Independence, this study used a measurement that was developed by SUZUKI and SAKIHARA that consist of 8 items. **Results:** In the multiple regression model, there was significant in Music Therapists that collaborated with many therapists in various other fields so that self-efficacy and Psychological Independence were high. In the logistic model, there was significant difference by collaborated with therapists in various other fields. Specialty knowledge contributed to collaborated with a Doctor positively. Self-efficacy contributed to collaborated with a Occupational therapist and a Speech-Language-Hearing Therapist positively. **Conclusion:** Self-efficacy and Psychological Independence contributed to collaboration positively. Also, there was significant difference by collaborated with therapists in various other fields.

**PC7 603 DEVELOPING A 5-ITEM COMPUTERIZED ADAPTIVE TEST FOR GERIATRIC DEPRESSION: AN EFFICIENT AND ACCURATE SCREENING TOOL**  
K. SCOTT\* (Harvard Medical School, Brigham and Women's Hospital, Hebrew SeniorLife, Boston, United States of America)  
F. YANG(1), R. JONES(1), D. TOMMET(1), C. GRACE(2), F. BRENT(3), P. STEPHEN(4), A. ALAN(1), C. EILEEN(2), M. SARAH(2), T. KATY(2) - (1) Harvard Medical School, Beth Israel Deaconess Medical Center, Institute for Aging Research, Hebrew SeniorLife (Boston, United States of America); (2) Harvard Medical School, Brigham and Women's Hospital, Psychiatry (Boston, United States of America); (3) Harvard Medical School, McLean Hospital (United States of America); (4) Harvard Medical School, Cambridge Health Alliance (Somerville, United States of America)

**Background.** Adaptive depression screening tools are important for clinicians and researchers to efficiently and accurately identify depressive symptoms. Developing a computerized adaptive test (CAT) using latent trait item response models is one way to streamline depression screening questions. This study shows how a computerized adaptive test has higher validity and reliability than a static short-form depression screening test; with high sensitivity and specificity when compared to a powerful depression screening tool based on the Diagnostic and Statistical Manual (DSM)-IV criteria for major depressive disorder. **Method.** Simulations were conducted to examine the validity and reliability of the CAT in relation to the 8-item static depression items from the National Institutes of Health (NIH) Roadmap Initiative Patient Reported Outcomes Measurement Information System (PROMIS) measures for 240 simulees. We then piloted the CAT and the 8-item PROMIS static short form in 60 older adults living in the greater Boston area. **Results.** The difference in the distribution of measurement errors shows greater precision and reliability for the CAT than the 8-item short form test based on the simulations. In the pilot sample, we found the reliability of the 5-item CAT to be 0.90, with a sensitivity at 100% and specificity at 97% compared to the Patient Health Questionnaire (PHQ)-9 major depression screening based on the DSM-IV. The total time saved by conducting the CAT compared to the 8-item static short form was a 38% reduction in administration time. **Conclusion.** The CAT is a highly valid and reliable indicator of the true trait level, and shows relatively higher accuracy and reliability than the 8 item-static short form. The CAT also shows higher efficiency, reliability, sensitivity, and specificity compared to the PHQ-9. Item response models are important for developing efficient and accurate depression screening tools for older adults.

**PC7 604 CAREGIVER SATISFACTION AND CAREGIVER DUTY FULFILLMENT: CENTRAL CULTURAL CONCEPTS IN CAREGIVING**  
L. AREVALO-FLECHAS\* (The University of Texas Health Science Center at San Antonio, San Antonio, United States)  
S. LEWIS(1), C. BRADEN(1), S. GILL(1), A. GAIL(2), M. MARTHA(1) - (1) University of Texas Health Science Center at San Antonio (San Antonio, United States of America); (2) University of Texas at Austin (United States of America)

Despite many years of research, the concept of burden remains too broad to be the best outcome indicator of the effectiveness of caregiver interventions. For the most part, research in the area of Latino/Hispanic caregiver burden has been neither culturally competent nor linguistically congruent. Aims To describe the perceptions of the caregiving experience of bilingual (Spanish-English) and monolingual (Spanish) Latino/Hispanic family caregivers of patients with Alzheimer's disease, and the culturally and linguistically relevant expressions and terminology used by these caregivers to describe the consequences of caring for a family member with Alzheimer's disease. **Methods** An ethnographic study (Modified Spradley) was conducted to compare monolingual

Alzheimer's caregivers in Colombia, South America, and bilingual Alzheimer's caregivers in Texas, United States. 20 caregivers participated in formal semi-structured interviews. Participant observations were completed with 27 additional caregivers. **Results** Three overarching themes were revealed: a) caregiving has consequences, b) caregiving fulfills a duty, and, c) caregiving is satisfying. Additional components of each theme were identified. In addition, the linguistic exploration revealed that the bilingual caregivers did not spontaneously use the word burden to describe their perception of their experience. Most bilingual caregivers in the U.S did not understand the word cargo (most used translation of burden to Spanish). In contrast, all Colombian caregivers understood the meaning of cargo, however they did not perceive their caregiving experience as such. **Conclusions** The best measures of the impact of caregiving duties and of the interventions to minimize the negative effect of caregiving may lie, not in the position on Latinos/Hispanics of the Euro-American concept of burden, but in other concepts that more positively express the impact of caregiving. Caregiver duty fulfillment and caregiver satisfaction are proposed as positive perceptions of the caregiving experience of Latino/Hispanic Alzheimer's caregivers. Both concepts are culturally competent and linguistically congruent.

**PC7 605 "SCALA DI VALUTAZIONE DI EMOTIVITA' E BENESSERE NELL'ANZIANO" (SVEBA): ANALYSIS OF PSYCHOMETRIC CHARACTERISTICS**  
E. FERRARI\* (Modena and Reggio Emilia University, Modena, Italy)  
F. NEVIANI(1), M. VESCHI(1), L. BERGAMINI(1), B. MANNI(1), V. GUERZONI(1), A. PELOSI(2), M. NERI(1) - (1) Modena and Reggio Emilia University (Modena, Italy); (2) Parma University (Modena, Italy)

**Introduction:** the psychopathology in the aged it is undetected and untreated, it can last for years associated with a poor quality of life, difficult with social and physical functioning, poor adherence to treatment, worsening of medical problems. A screening instrument to detect it would allow a more comprehensive approach to the patient. The range of symptoms could span from depression to anxiety, but most of the short check-lists available are focused on depressive symptoms. For this reason a 15 items check-list, designed to cover a wider array of symptoms, has been designed for the Italian population. The study investigated the presence of symptomatological clusters to detect possible different symptom' profiles in populations with different comorbidity. **Methods and materials:** Sample: 214 home-dwelling elderly Ss ( $M=31,8\%$ ,  $F=68,2\%$ ), aged 65+ (mean age= 80,2 yr, sd 7,16) referred to geriatric unit. Exclusion criteria were moderate-severe dementia, psychosis and severe medical comorbidity. The matrix of correlations, the Keiser-Meyer-Olkin and Bartlett test were applied to check for applicability of factorial analysis, then a "principal axis factoring extraction method" was applied. **Results:** The sample showed a mean score of 4,45 (sd 3,50) at the SVEBA index. The analysis identified 4 factors, confirmed by the generated Cattell plot curves. These factors explained the 54% of the total variance. The first factor collected 4 items related to lack of motivation and initiative. The fourth factor included items related to somatic complaints and anxiety. The third factor collected symptoms related to sleep disturbance. **Conclusion:** In the structure of SVEBA index is possible to identify three main symptoms profiles related to motivation, anxiety and somatic symptoms and sleep disturbance. These results seem able to confirm the good clinical validity of SVEBA, given that the clusters identified are among the more frequent in the profile of psychopathology of the elderly populations.

**PC7 606 THE CANADIAN COALITION FOR SENIORS**  
K. WILSON\* (Canadian Coalition for Seniors' Mental Health, Toronto, Canada)  
S. HELSDINGEN(1), D. CONN(1), J. LE CLAIR(1) - (1) Canadian Coalition for Seniors' Mental Health (Toronto, Canada)

The Canadian Coalition for Seniors' Mental Health (CCSMH) was established in 2002 and since its inception, the CCSMH has grown to be Canada's leading non-governmental organization that focuses on seniors' mental health issues. With a membership of over 1000, the mission of the CCSMH is to 'promote the mental health of seniors by connecting people, ideas, and resources.' In 2006 the CCSMH received funding from the Public Health Agency of Canada to develop national, multi-disciplinary evidence based guidelines on the assessment and treatment of mental illness in seniors. Four Guidelines were created with focuses on depression, delirium, suicide prevention and mental illness in long term care homes. Since their release over 40,000 copies have been disseminated across Canada and worldwide, and the CCSMH has turned its focus to the implementation of the guideline recommendations into practice and policy. With additional funding from the Public Health Agency of Canada, the CCSMH has formed seven pilot projects working to create knowledge translation products as tools to facilitate implementation. These include pocket guides for physicians, training packages including an interactive case-based DVD, adaptations of the guidelines to palliative care settings, and module based tele-educational sessions. In addition, networks have been created and strengthened during the pilot process. The four Guidelines are also informing new guides for seniors and families, which will translate the information in the guidelines to a target new audience. Released in April 2009, these Guides will help seniors and families to understand the guideline topics and to empower them to understand their own risk factors, illness and options for medical and psychosocial care, based on the most current evidence. The goal of this session is to

provide participants with innovative examples in guideline implementation and knowledge translation in seniors' mental health.

**PC7 607 RESILIENCE IN LATER LIFE: THE GERIATRIC DEPRESSION SCALE IN QUALITATIVE RESEARCH**

T. DONG\* (The University of Sydney, Rooty Hill, Australia)

A. RUSSELL(1) - (1) The University of Sydney, Cumberland Campus (Lidcombe, Australia)

**Introduction:** The aim of this research was to investigate how elderly nursing home residents in Australia conceptualise the phenomenon of depression, its causes and effects in the context of limited lives. Standardised assessment instruments (SAIs) such as the Geriatric Depression Scale – Short Form (GDS-SF) are increasingly used in residential aged care facilities to screen for depressive disorders among older people. The process of interviewing using SAIs, however, has not been scrutinised in the same depth. **Methods:** Six residents from a Western Sydney nursing home were interviewed using a modified version of the GDS-SF questions as an open-ended in-depth interview which was transcribed and analysed using thematic content analysis. **Results:** Four of the six residents from the main study were classified as having moderate symptoms of depression according to the GDS-SF, however, none of these residents identified themselves as depressed people, despite their frailty and physical and social limitations. The study found that respondents can often generate contradictory material during the course of a GDS assessment and were commonly at pains to explain that they were intrinsically active and independent people, even if circumstances prevented them demonstrating this at present. While admitting to physical dependency, they countered negative implications by showing how it was resisted. The information residents volunteered in relation to the GDS-SF items were given in the form of talk or stories, which were treated as data in their own right. Three themes emerged that residents associated with feelings of depression including: poor physical health; socio-environmental factors; and difficulties maintaining close personal relationships. The findings paradoxically revealed resilient behaviour alongside feelings of depression in the respondents' talk generated by the GDS. **Conclusion:** The study has generated meaningful insights into the phenomenon of depression, in particular of resilience, by incorporating the feelings and perspectives of elderly nursing home residents.

**PC7 608 SUICIDE IN OLD AGE IN MAGDEBURG IN EAST GERMANY – THE INFLUENCE OF FUNDAMENTAL SOCIAL CHANGES**

A. GENZ\* (University of Magdeburg, Magdeburg, Germany)

A. LUX(2), B. BOGERTS(1) - (1) Psychiatric Clinic (Magdeburg, Germany); (2) Institute for Biometry and Medical Informatics (Magdeburg, Germany)

**Introduction** Following the reunification of Germany the overall suicide rates in East Germany declined steeply – according to official statistics now reaching an all-time low. The age group above 65 years deserves special attention due to their growing proportion in a constantly aging population. So far no descriptive analysis including relevant social influences on suicide has been undertaken. **Methods and Materials** The suicides in two time periods – 1985 to 1989 (A) and 1999 to 2004 (B) – in Magdeburg, the capital of Saxony-Anhalt, were compared analyzing in a first step all cases of death registered in the city, followed by an analysis of the files of the department of public prosecution. Suicide rates were then calculated using vital statistics and correlations to basic social factors estimated. **Results** A total of 470 suicides occurred in period A, among them 87 men and 86 women of age 65+, compared to a total of 206 suicides in period B, among them 25 men and 25 women of older age. Comparison between age groups showed that elder men and women by far showed the strongest decrease in suicide risk of all age groups and benefited most of the social changes. Correlations were found with the following factors: Replacement of town gas containing toxic carbon monoxide by nontoxic natural gas; legislative ban of barbiturates; number of psychiatrists and psychotherapists practicing in the city; immensely increased use of antidepressants according to prescription data. **Conclusion** People of elder age benefit most of all age groups from the fundamental social transformation process. Among the complex causal factors mediating lower suicide risk are restrictions of easily available "soft" lethal methods. An progress in medical support also has to be mentioned. An analysis of the individual motives is still lacking and urgently needed to identify those persons still most at risk for suicide.

**PC7 609 ROLE OF NUTRITION IN ALZHEIMER DISEASE(AD) PREVENTION AND RECOVERY IN ELDERLY**

N. SARAFRAZ\* (Medical university, Kashan, Islamic Republic of Iran)

M. KAFAIE(1), F. ABBASZADE(1), A. BAGHERI(1) - (1) 1 (Kashan, Islamic Republic of Iran)

**Background & objective:** World population is getting old very fast and elderly is one of the main population groups in countries which have allotted big part of health and treatment services to themselves. One of the most prevalent diseases in elderly which is caused their disability and practically prevents them of having a normal life. Alzheimer is a degenerative brain disease and leads to memory loss and awareness and personality destruction. Role of genetics in Alzheimer etiology is very little. Environment and diet are known as its main risk factors and nutrition is a factor which has a special importance.

**Materials and methods:** Reviewing local and international articles. **Results:** Alzheimer disease is often accompanied by malnutrition. Severe loss of  $\geq 5$  kg in 6 months is a risk factor that is usually caused by forgetting intake of food or drinking. So the patients lose weight very fast which leads to Cachexia at the end of the disease. Laboratory findings have suggested that oxidative stress may contribute to the pathogenesis of AD. Antioxidants such as vitamin C and  $\beta$  carotene in fruits and vegetables have a protective role in preventing this disease. Vitamin E is another antioxidant which can help to decrease the risk of afflicting disease. Other than fruits and vegetables, the effect of some types of spice have been studied in prevention and recovery of AD. Researchers believe that the low prevalence of Alzheimer in India comparing to US is related to the consumption of curry powder which is consumed a lot in India. Also researchers have found during some studies that there is a special ingredient in turmeric and curry powder which can increase the number of brain defense cells or macrophage cells that eliminate  $\beta$  amyloid that is related with AD. Effective ingredients in turmeric and curry powder is Curcumin that has antioxidant and anti-inflammatory effects. Also researches have shown that drinking tea has similar effects like Alzheimer drugs. Acetyl choline esterase in tea have similar effects to anti-Alzheimer drugs. Extracted Ginkgo biloba tree which have developed in Asian countries has very useful effects such as developing blood and oxygen circulation for better brain function. Extracted Ginkgo biloba tree which have developed in Asian countries has very useful effects such as developing blood and oxygen circulation for better brain function. **Conclusion:** Healthy nutrition and adequate intake of crucial types of micro nutrients, especially antioxidant and also paying attention to elderly nutrition and monitoring nutritional status assessment can prevent incidence and progression this disease. **Key words:** Alzheimer – antioxidant — nutrition

**PC7 610 MENTAL HEALTH OF RURAL ELDERLY POPULATION: FOCUS ON DEPRESSIONS**

I. PETROV\* (Medical University of Sofia and Bulgarian Association on Ageing, Sofia, Bulgaria)

Between 1971 and 1984 a comprehensive cross-sectional and longitudinal investigation on the mental health of rural (Shop) population aged 70 and over from 46 villages near Sofia was carried out (N=707). At initial examination 43.5% were well or very well psychologically adjusted - normal ageing. Some kind of mental problems had 37.4% - mostly mild and moderate disorders, usually not impeding the everyday domestic, agricultural and cattle-breeding activity of the elderly and well tolerated by their families and neighbours. Mood and/or cognitive disorders prevailed. An attempt to analyse all depressive spectrum i.e. from clinically expressed (pervasive) old age depressions to borderline depressive states and depressive signs inherent to the ageing process per se was made. It appeared to be difficult to delimit ones and others from gerontological viewpoint. In 1981 using mostly clinical criteria I analysed 8.3% true depressions (Petrov: Etats dépressifs après l'âge de soixante-dix ans. Minerva Medica, vol. 72). Revising later the same material I found the full range of people with depressive signs embracing 22.2% (16.4% minor or borderline; 5.8% pervasive depressions). Besides, 14.6% of the elderly studied referred to a border zone between normal ageing and depression (Petrov, St. Petersburg, 2007). The Self-Evaluation test used revealed that similar themes – health, family relations in narrow circle, old age, work capacity and economic security - dominated the value thinking and motives of dissatisfaction, but they were significantly more common in depressions than in rural elderly without depression (in most cases at  $p < .001$ ). The clinical-psychological follow-up (for maximum 16 years period) revealed stable mental health in 24.0%, including stable good condition in 15.9%. Some improvement toward a better mental balance showed 16.8%. In 55.1% a deterioration occurred - leading to cognitive decline, anxiety or dysthymia-depression (22.5% developing depression and/or anxiety or worsening of such a condition).

**PC7 611 E-MAIL CONSULTATIONS ON DEMENTIA**

I. HOLMEROVÁ\* (Centre of Gerontology, Prague, Praha , Czech Republic)

H. VAŘKOVÁ(1), B. JURAŠKOVÁ(2) - (1) Centre of gerontology, Prague (Praha, Czech Republic); (2) LF UK Hradec Králové (Hradec Králové, Czech Republic)

Consultations and providing information to persons with dementia and their family caregivers are important aims of Alzheimer societies. Enough information and support are important conditions for informal caregivers to be able to cope with their situation. Czech Alzheimer Society has experience with personal consultations, self support groups, printed information materials etc. In the last months of 2007 we have started „electronic consultations“ via our webpage. **Methods:** We analyzed 256 e-mails sent to the webpage www.alzheimer.cz from the beginning of this service in the end of 2007 until June 2008. **Results:** Above mentioned e-mails contained 303 questions. Various questions concerning professional services for persons with dementia (how and where to find services) were most frequent (78). Staff members from different health and social care institutions asked us about different (sometimes very basic) issues concerning care in 27 cases. 21 family caregivers asked how to care in the family and in 10 cases we helped to find information sources on how to care, in 12 how to cope with behavioral problems, 17 questions concerned pharmacotherapy and 17 the diagnostic process. 14 persons asked about genetic aspects of dementia. In 12 cases we learned about bad experience with care and advised how to proceed, in 6 cases how to cope with exhaustion and burn-out of family caregivers

etc. Conclusion: The spectrum of questions reflects the situation of care provision for persons with dementia in the Czech Republic. It supports the opinion that we need not only more and better services for persons with dementia but also enough information about them. Education on dementia should be included in the curriculum of health and social care professionals. This research project was supported by the institutional research plan MSM 0021620843 FHS UK.

**PC7 612 PSYCHOGERIATRIC UNIT: A RETROSPECTIVE STUDY OVER 18 MONTHS**

J. ROCHE\* (Hôpital Gériatrique - CHU de LILLE, LILLE, France)  
N. BOULARD(1), C. DI POMPÉO(2), D. HUVENT(1), F. PUISIEUX(1) - (1) Hôpital Gériatrique - CHU de LILLE (LILLE, France); (2) Laboratoire d'évaluation médicale - Faculté de Médecine de Lille (LILLE, France)

Introduction: A psychogeriatric unit of five beds was created in 2003 at Lille hospital (France). Two different types of patients are hospitalized: dementia patients with behavioral disorders and old psychiatric patients. Methods and materials: Data collection has been performed in the psychogeriatric unit from January 2007 to July 2008. Only one investigator collected data from social and medical records. We have investigated clinical outcome. Comparisons of patients presenting dementia versus patients with psychiatric disorders have been performed using SPSS software for statistical analysis (khi2 Test, Fisher's exact test, Mann-Whitney U test). Results: 72 patients (49 with dementia and 23 presenting psychiatric disorders) were hospitalized during these eighty months with an average length of stay of 66 days. Median age was 78 years old, with majority of female (65% and 85% for dementia group and psychiatric group respectively, p=0,048). However there is significant discrepancy between the two groups, psychiatric patients are younger (p=0,005). Both groups presented a lot of medical comorbidity. Half of patients was coming from home or nursing home. Leading causes of hospitalisation for the dementia group were agitation or aggressive behaviors (50%), depressive disorders (18%); and for the psychiatric group: depressive disorders (39%), delusional ideations or hallucinations (26%). Diagnosis of dementia was not initially known for 13 patients. A guardianship order was requested for 10% of the patients. For the dementia group, the psychotropic drugs have been largely modified during hospitalisation (less anxiolytic drugs (p=0,004), more thymoregulator treatments (p=0,008)). This elderly population is particularly frail with higher risk of falls, infections or delirium. For 80% of patients a clinical improvement was observed during the hospitalization. Conclusion: These psychogeriatric patients need a comprehensive health care in specific units because of many comorbidities. A medical monitoring is often necessary after hospitalization (65%).

**PC7 613 FEATURES OF CRIMINAL BEHAVIOR IN THE ELDERLY: ABOUT 6 CASES**

I. KSANTINI\* (Razi hospital, Manouba, Tunisia)  
W. CHERIF(1), K. HAJJI(2), B. MALIKA(3), K. GALIA(4), K. IMEN(5), Z. LILIA(6), L. RAJA(7) - (1) psychiatric service C Razi hospital (Manouba, Tunisia); (2) psychiatric service C Razi hospital (Manouba, Tunisia); (3) psychiatric service C Razi hospital (Manouba, Tunisia); (4) psychiatric service C Razi hospital (Manouba, Tunisia); (5) psychiatric service C Razi hospital (Tunisia); (6) psychiatric service C Razi hospital (Tunisia); (7) psychiatric service C Razi hospital (Tunisia)

Introduction: The elderly are less often arrested, judged or experted than younger adults, even if criminal behavior is not so uncommon. The objective of our work is to determine the sociodemographic and clinical characteristics of old offenders and the type of criminal behavior. Methods and materials :This is a retrospective study about all reports of psychiatric expertises done in the department C of Razi hospital from 1 January 2006 to 31 December 2008. The information was collected with a predetermined form with 16 items. Results : Six files were selected: the average age was 75.33 years. The sex ratio (M / F) was 5. The majority of our patients were married (5cases), illiterate (4 cases), unemployed (5 cases), rural (4 cases) and without criminal records (6 cases). Psychiatric antecedent were found in two cases. The offences committed were: murder (2 cases), assault and battery (2 cases) and embezzlement (1 case). Conclusion : The main clinical diagnoses were: depressive disorder, bipolar disorder, Alzheimer dementia and substance abuse. Most authors agree that there is a real organic and / or psychiatric disorder causing this criminal behavior and tend to judge old offenders as irresponsible.

**PC7 614 PREVALENCE OF DEPRESSIVE SYMPTOMS IN ELDERLY PEOPLE FROM BRAZIL'S MIDDLE-WEST REGION, AND ITS INFLUENCE ON THE PERFORMANCE OF MINI-MENTAL STATE EXAMINATION**

A. JACOMINI\* (UNIC, Cuiabá, Brazil)  
B. CORDEIRO(1), C. SINGULANE(1), C. MAGALHÃES(1), A. SANTOS (2), B. BORSATTO GALERA(3) - (1) Medical University of Cuiabá (Cuiabá, Brazil); (2) Department of Psychiatric from University Hospital of Cuiabá (Cuiabá, Brazil); (3) Department of Molecular Biological and Genetic from University Hospital of Cuiabá (Cuiabá, Brazil)

(3) Department of Molecular Biological and Genetic from University Hospital of Cuiabá (Cuiabá, Brazil)

Introduction: Depressive symptoms in the elderly are often related to cognitive deficits, which lead to the presumption that there is a strong association between these conditions. Such entities, appear to indicate something beyond the normal process of aging, therefore, to attend the health needs of this population it is essential to be aware of which injuries occur more frequently in this age group. With this purpose this study aims to investigate the prevalence and intensity of depressive symptoms in elderly from three levels of health care. Methods: A population-based sample of 573 elderly of both sexes participate this study. We evaluated scores on the Reduce Geriatric Depression Scale (GDS-15) in addition to Mini-Mental State Examination (MMSE) which was associated with a form of socio-demographic data in order to consider the influence of education in this cognitive scale. Results: Of the participants, 76.44% (n = 438) were females and 23.56% (n = 135) males. Of this total, 10.64% (n = 61) were illiterate, 48.87% (n = 280) read and write (less than 8 years of study), 27.57% (n = 158) were between 8 and 11 years of study and 12.8% (n = 71) had more than 11 years. Regarding the MMSE scores, the average were 23.72%, the female average was 24 points and the male 23 points. It was observed that in 73.82% of the sample the scores of GDS were normal. However 4.01% of the elderly present GDS scores that indicate severe depression (above 9). Conclusion: It was observed the high prevalence of depressive symptoms that is independent of the gender and also the influences of this framework in the performance of MMSE taking into account their level of education.

**PC7 615 QUALITY OF LIFE, ANXIETY AND DEPRESSION IN ELDERLY PATIENTS WITH COPD**

M. MEDINAS-AMORÓS\* (University of Balearic Islands, Palma de Mallorca, Spain)  
M. MAGDALENA(1), G. PATRICIA(2), M. CARMEN(3), M. BELÉN(3) - (1) Joan March Hospital (Spain); (2) Hospital Son Llatzer (Spain); (3) University of Balearic Islands (Spain)

Within the chronic respiratory diseases, COPD is the most prevalent. The measurement of the specific Quality of Life (QOL) for the COPD provides data about the impact of this on its daily life and psychological familiar structures. The objective of the present study was evaluated the differences between dyspnoea perception, general health, anxiety and depression symptoms, in two groups of elderly patients with COPD (n=28). The elderly patients with advanced COPD who compose the sample were distributed in two groups according to level of the quality of life, measured by the St. George's quality of life questionnaire (good QOL n=11; bad QOL n=17); later they were evaluated by means of following questionnaires: the Hospital Anxiety and Depression Scale (HADS), the scale of the Medical Research Council (MRC) for dyspnoea and the Goldberg General Health Questionnaire (GHQ). The results show statistical significant differences between both groups in the level of dysnea (p<0.05), anxiety (p<0.05), depression (p<0.05) and subscales (anxiety/insomnia and depression) of GHQ (p<0.05). Multiple regression analysis identified subscale anxiety/insomnia of GHQ as a good predictor of QOL deterioration in these patients. In conclusion the worsening of the quality of life was related to psychopathology especially in elderly patients with COPD.

**PC7 616 DISPNOEA AND PSYCHOPATHOLOGY IN ELDERLY COPD PATIENTS**

C. MAS-TOUS\* (University of Balearic Islands, Mallorca, Spain)  
M. MAGDALENA(1), G. PATRICIA(2), M. BELEN(3), A. CATALINA(3) - (1) Joan March Hospital (Spain); (2) Hospital Son Llatzer (Spain); (3) University of Balearic Islands (Spain)

Chronic Obstructive Pulmonary Disease (COPD) is a progressive disease with dyspnoea perception as a main symptom. In severe stages, dyspnoea can constitute a risk factor for depression, anxiety and somatization diseases. Objective: the objective was to evaluate the presence of these psychopathologies based on dyspnoea and severity stages in patients with COPD. Materials and methods: patients (n=51) were evaluated by means of the Hospital Anxiety and Depression Scale, the scale of dyspnea (MRC), the General Health Questionnaire (GHQ-28) and spirometric criteria. Results: the increase of dyspnoea level and disease severity, produce a progressive worsening of anxious, depressive and somatic symptoms with clinical relevance (p<0.05). There was a significant co-relation between those parameters (p<0.05). Conclusions: the early detection and treatment of these psychopathologies associated with dyspnoea and evolution of the disease must be an important factor in this complex pathology.

**PC7 617 PROMOTING AND SUPPORTING SENIORS MENTAL HEALTH IN CANADA: A SYSTEMATIC APPROACH**

P. MACCOURT\* (Canadian Coalition for Seniors' Mental Health, Toronto, Canada)  
K. WILSON(1) - (1) Canadian Coalition for Seniors' Mental Health (Toronto, Canada)

In response to the aging population and associated increase in prevalence of mental health problems anticipated, the Public Health Agency of Canada has funded several national projects. The purposes of the projects, carried out by the BC Psychogeriatric Association

and the Canadian Coalition for Seniors Mental Health, are to build the capacity of seniors, health care providers, communities and the health and social service systems to support the mental health of all seniors, including those who are mentally ill or at risk of mental health problems. The projects have increased awareness of issues related to seniors mental health and produced the following: (1) handbook by seniors for seniors about meeting the mental health challenges of aging; (2) Best Practices Guidelines for (i) Long Term Care (With a Focus on Depression and Behaviours,(ii) Assessment and management of Delirium, (iii) Assessment and Management of Depression, (iv) Suicide Prevention, for health care providers and "translated" for seniors; (3) Psychosocial Resource manual for care providers; (4) Seniors Mental Health Policy Lens; (5 ) Canadian Psychosocial Research Agenda for Seniors Mental Health (6) Guidelines for Supporting Seniors Mental Health During Cancer Care; (7) Seniors to Seniors booklet about meeting the mental health challenges of cancer. Together these initiatives and the inter-sectoral collaborative process used, have increased awareness of mental health challenges of aging and provided seniors, health care providers and the health and social service system with tools to address them.

**PC7 618 VALIDATION OF ABBREVIATED MENTAL TEST AND ITS CORRELATION WITH MINI-MENTAL STATE EXAMINATION IN IRANIAN ELDERLY**

M. FOROUGHAN\* (Iranian Research Center on Aging, Tehran, Islamic Republic of Iran)  
Z. JAFARI(1), Z. GHAEMMAGAM FARAHANI(2), P. SHIRINBAYAN(2),  
M. RAHGOZAR(2) - (1) Iranian Research Center on Aging (Tehran, Islamic Republic of Iran); (2) University of Social Welfare and Rehabilitation (Tehran, )

Dementia is going to be an important public health problem in many developing countries in near future. Therefore, providing a reliable, easy to apply, time saving and culture free instrument for screening dementia in large populations is a necessity for these countries with their ever-increasing number of older population and limited economical and/or human resources. The purpose of this study was to determine the reliability of Abbreviated Mental Test (AMT) developed by Hodkinson in Iranian elderly and to see whether it can be a legitimate alternative for previously standardized Farsi version of MMSE. MMSE and AMT were implemented for 100 patients with dementia, randomly selected among the members of Iranian Alzheimer's Association. The same tests also applied to 100 non-demented controls living in the neighborhood community. Subjects and controls had at least 4 years of formal education and were of both sexes. DSM-IV-TR criteria and Global deterioration Scale used as gold standards. Gathered data were analyzed using the software SPSS, Version 13th. The results showed that AMT is a reliable test for detecting dementia (Cronbach's Alpha=0.905) among Iranian elderly. AMT scores were also highly correlated with MMSE scores ( $p=0.000$  at  $0.01$  level). At cut off six, the sensitivity of AMT amounted 85.1% and the specificity was 99%. It is concluded that AMT is an appropriate psychometric instrument for detecting dementia in Iranian elderly and can safely be substituted for the more detailed and sophisticated test, MMSE.

**PC7 619 APPLICABILITY OF THE RRS-4, A SHORT OBSERVER SCALE FOR SCREENING GERIATRIC DEPRESSION, IN PRIMARY CARE.**

S. BONIN-GUILLAUME\* (Assistance Publique des Hôpitaux de Marseille, Institut des Neurosciences Cognitives de la Méditerranée, Marseille, France)  
J. CLEMENT(1), E. JOUVE(2), O. BLIN(2) - (1) Centre Hospitalier Universitaire de Psychiatrie Esquirol (Limoges, France); (2) Centre de Pharmacologie et d'Evaluation Thérapeutique, Faculté de Médecine (Marseille, France)

Screening for depression is critical to improve diagnosis and management of depression in elderly populations. Short and ease-to-use instruments are of importance to help primary care physicians to screen for geriatric depression in routine practice. We tested the applicability of the RRS-4 in a community living depressed old sample. Method: 751 patients > 60 years old detected as depressed (clinically depressed and MiniGDS score  $\geq 1$ ) and treated by their General Practitioner were included in an observational study (ODESSA). Each patient was assessed, at inclusion and at follow up, with the RRS short form (RRS-4) an observer depression rating scale of which a threshold of 3 has been validated in medically ill old depressed. Only patients with completed data, without dementia, stroke or Parkinson Disease, and under antidepressant were considered for analysis. Results: 551 patients (mean age  $\pm$  SD: 73.8 y.o.  $\pm$  8.8, 69.9% female) were retained for analysis. At inclusion 98.7% scored  $\geq 3$  on the RRS-4 (mean score  $\pm$  SD: 8.7  $\pm$  2.5). At the second visit (median: 31 days; minimum: 2 - maximum: 249), 12.5% of the patients were on depression remission according to the RRS-4 score (under 3) for only 9.1% on the MiniGDS score (score =1). The RRS-4 mean score ( $\pm$  SD) at second visit was:  $5.4 \pm 2.6$ , which represented a decrease of  $3.2 \pm 2.9$  on the RRS-4 total score. Each RRS-4 item decreased its score for more than 30% at the second visit. Conclusion: the RRS-4 is a brief and ease-to-use observer depression rating scale particularly suitable to detect depression in primary care as it detects depression without the need of patient compliance. It showed good concordance with the miniGDS for depression detection. Moreover we report a better remission score after treatment than the MiniGDS. This result has been

previously reported in young depressed adults. However, further studies are needed to test the RRS-4 sensitivity to change under treatment in depressed old patients.

**PC7 620 SPIRITUALITY AND RELIGION AS PREDICTORS OF SUCCESSFUL AGEING IN LATER LIFE**

C. WALKER\* (University of Southampton, Southampton, United Kingdom)  
P. COLEMAN(1) - (1) University of Southampton (United Kingdom)

Introduction The perception of meaning and purpose in later life has been studied in relation to healthy ageing (e.g. Busse, 1985). Religion and spirituality can contribute towards meaning, but as components of health and well-being have been largely ignored. It has been suggested that spiritual and religious resources can contribute towards successful ageing via a number of different pathways, from helping older adults adjust to disability and loss, to religious influence on health behaviours (Baltes & Smith, 2003, Coleman & O'Hanlon, 2004). Crowther and colleagues (2002) proposed 'positive spirituality' as an additional component in Rowe and Kahn's (1998) model of successful ageing. With a growing interest in the spiritual influences on health attempts have been made to examine these links. The present study investigates religious and spiritual beliefs and practices as predictors of successful ageing in a UK sample. Methods and Materials The survey is being sent to 200 adults (aged between 55-100yrs) living in the UK. The sample represents a range of older adults in the British population. Mental health, physical health and social support are measured. Religious and spiritual beliefs and practices are investigated in depth and well-being is measured using Ryff's (1989) scales of psychological well-being. Results Data will be analysed using correlation and hierarchical regression techniques. Controlling for the effects of socio-demographic, mental health, physical health and social support variables, spiritual and religious measures will be entered into the regression model last to test their predictive value in relation to individual well-being. Analysis will also examine age related differences in the effects of spiritual and religious beliefs, focusing on three groups; the 'baby boomers' (55-65yrs), the 'young old' (65-74yrs) and the 'middle-old old' (75+yrs). Conclusion Findings will be discussed in relation to the current controversies around rising spiritual interest and declining religious affiliation among older people in the UK, and the implications for health provision and policy.

**PC7 621 BEHAVIORAL ROUTINIZATION OF HEALTHY OLD ADULTS: INFLUENCE ON COGNITIVE RIGIDITY AND FLEXIBILITY**

I. TOURNIER\* (Université Victor Segalen Bordeaux 2, Bordeaux, France)  
V. POSTAL(1), S. MATHEY(1) - (1) Université Victor Segalen Bordeaux 2 (Bordeaux, France)

Introduction Routinization during aging is characterized by an increase in preference for habitual behavior. A possible consequence of high routinization is the risk of rigidity increase and flexibility reduction (Bouisson, 2002). The Einstellung Water-Jar Task (WJT; Luchins, 1942) allows the study of cognitive rigidity through perseveration in set solution use. The Trail Making Test (TMT; Reitan, 1959), by proposing one task (TMTA) and then alternating between two tasks (TMTB), gives a measure of cognitive flexibility (TMTB - TMTA). The aim of this study was to investigate the influence of routinization on the adaptation skills of healthy older adults. More particularly, we hypothesized that old adults with high routinization present more cognitive rigidity and less cognitive flexibility than those with less routinization. Methods and materials In the first experiment, 34 healthy old adults ( $M = 63.7$  years) performed the WJT, and in the second experiment 52 healthy old adults ( $M = 66.7$  years) completed the TMT. Routinization was estimated with the Preferences for Routinization Scale (Bouisson, 2002) and participants were classified as showing low and high routinization levels. Results Results on the WJT revealed that, compared to low routinized participants, high routinized participants showed more perseveration in the use of the set solution, whereas a more direct solution was available. Concerning TMT, high routinized participants presented less flexibility (measured by difference TMTB - TMTA response time) than low routinized participants. Conclusion Routinization preferences of healthy older people in daily life behavior were associated with an increase in cognitive rigidity (Exp.1) and a decrease in cognitive flexibility (Exp.2). These findings demonstrate strong links between behavior and cognitive skills, and suggest a negative impact of excessive routinization on the adaptive resources of elderly adults.

**PC7 622 DOES CHILDLESSNESS REDUCE WELL-BEING AT ANY STAGES OF THE LIFE COURSE?**

T. HANSEN\* (NOVA, Oslo, Norway)  
B. SLAGSVOLD(1) - (1) NOVA-Norwegian Social Research (Oslo, Norway)

Introduction: The study explores and distinguishes links between parental status (childless persons, parents with residential children, and empty nest parents) and a range of psychological well-being outcomes at different stages of the life course. Methods and materials: Data are from the Norwegian Life Course, Gender and Generation (LOGG) study (age 18-84, N=15,500). We separate outcomes into cognitive (life satisfaction and self-esteem) and affective (positive and negative affect, depression, loneliness) components. Results: Parental status has a net effect on cognitive well-being among women, as childless women report significantly lower life satisfaction and self-esteem than

both mothers with residential children and empty nest mothers. However, motherhood is inconsequential for affective well-being. Among men, parental status is unrelated to any of the well-being aspects. Parental status effects are consistent across age groups, marital statuses, and educational levels. Conclusion: Overall, the results do not support the old myth that children make people substantially happier or that not having children jeopardizes well-being in later life. It was surprising that childlessness was inconsequential for well-being also among older, formerly married men, a group that tend to be at particularly risk of social isolation and loneliness. On the other hand, having children in the home is unrelated to psychological distress. This finding contrasts US literature and highlights the role of social policies in shaping the impact of parental status on well-being.

**PC7 623 LONELINESS AND SOCIAL ISOLATION IN OLD PEOPLE LIVING IN THE COMMUNITY**

C. PAÚL\* (Instituto de Ciências Biomédicas Abel Salazar - University of Porto, Porto, Portugal)  
Ó. RIBEIRO(1) - (1) University of Aveiro (Aveiro, Portugal)

Introduction Loneliness and social isolation are two core concepts regarding social relationship in human life that are particularly relevant in old age. This study focuses on the prevalence of loneliness in a community sample of people aged 50+ and aims to identify the factors that can contribute to its experience. Methodology Within the context of an extensive Portuguese project on active aging, 1266 persons were interviewed using a standard questionnaire including measures of loneliness, social network, psychological distress, mental status, general health condition and socio-demographic variables. Results The prevalence of loneliness was 16.3% (N=206). Findings show that 4.6% of the participants reported feeling always lonely and 11.7% feeling loneliness regularly. Our data confirmed the expected univariate association between loneliness, widowhood, self perceived poor health, psychological distress and cognitive deficit but failed to show, when controlling for all the other variables in the model, the association with gender, age, living arrangements, social network or the number of health problems. As we did not find any relevant association between loneliness living alone and social network, that become non-significant in the adjusted model of loneliness, we suggest that both concepts of emotional and social isolation, are independent and the subjective and affective nature of loneliness in old age. Predictors of loneliness (explaining 29% of variance) are: being widow, perceiving own health as poor or very poor, and having psychological distress and cognitive impairment. Conclusions Authors emphasize the importance of psychological variables (namely depression) as predictors of loneliness and the need for social and psychological interventions to prevent its consequences in morbidity and mortality.

**PC7 624 DOES SENSE OF CONTROL DECLINE OVER A FIVE YEAR PERIOD AMONG NORWEGIAN MIDDLE-AGED AND OLD?**

B. SLAGSVOLD\* (NOVA- Norwegian Social Researc, Oslo, Norway)  
A. SØRENSEN(1) - (1) NOVA- Norwegian Social Research (Oslo , Norway)

Introduction High sense of control is related to benefits in many aspects of life. A number of studies have however shown that the sense of control is lower among the elderly than among younger people. Such cross-sectional findings may suggest that the sense of control declines as people get older, but very few studies have used longitudinal data to examine whether such age variations are due to cohort or aging effects. With data from two waves of the Norwegian NorLAG study, we ask: Does the sense of control decline among middle-aged and old over a five year period? Are there factors that seem to accelerate the decline or to slow it? Method and materials. Analyses are based on data from the Norwegian Life-course, Ageing and Generation Study - NorLAG. The sample consists of 2471 persons aged 40 to 85 have been have been interviewed and have returned a postal questionnaire both in wave 1 (2002-2003) and wave 2 (2007-2008) of the study. Sense of control is measured by The Personal Mastery Scale (Pearlin & Schoeler 1978). Results In contrast to research based on US data, we find that there is little to no change in the sense of control over five years for men and women aged 40 to 75 in the first wave of the study. Only those aged 75 and older experience a significant decline over the next five years. Similar patterns are found for women and men and for people with different levels of education. Employment, good physical health, and a high score on agentive orientation in wave 1, slow down the decline in sense of control. Conclusions Sense of control does not decline in a community based sample of Norwegians until rather high age. Possible reasons for the distinct Norwegian findings may include the high levels of trust and social capital characterizing the Norwegian society, and the favorable and optimistic economic climate between 2002 and 2007.

**PC7 625 ATTACHMENT TO LIFE IN OLD AND VERY OLD AGE – SHIFTING IMPORTANCE OF RESOURCES**

C. ROTT\* (Institute of Gerontology, Heidelberg, Germany)  
D. JOPP(2), F. OSWALD(3) - (2) Fordham University, Department of Psychology (United States of America); (3) Heidelberg University, Institute of Psychology, Dept. of Psychological Ageing Research (Germany)

Introduction: Active attachment to life is an existential issue especially in old and very old age and can be captured by the construct valuation of life (VOL). As old and very old

individuals may differ in terms of endorsement and with respect to what makes a life worth living, the present study investigated whether mean levels and the explanatory value of socio-demographic, social, and health predictors for VOL would differ between young-old and old-old individuals. Methods and materials: A sample of 356 community dwelling individuals aged 65 to 94 years was presented with Lawton's POSVOL questionnaire and other established measures to assess predictors of VOL. Results: Mean level of VOL decreased from the third to the fourth age. Zero-order correlations showed significant relations between socio-demographic (i.e., age, gender, marital status, education), social (i.e., social contacts, phone calls, volunteering, contact with youth), and health (i.e., mobility, vision, hearing, activity restrictions, ADL, IADL) indicators. Results of a multiple hierarchical regression analysis demonstrated that health indicators explained twice as much variance of VOL compared to social indicators, whereas socio-demographic indicators including age made no longer an independent contribution. Separate analysis for young-old and old-old participants further revealed age-differential prediction patterns. For the young-old, the role of health factors was especially strong, whereas specific social factors became more important in the old-old group. Conclusion In sum, age-differential predictive values of the resources seem to indicate positive adaptation to aging in that old-old individuals seem less influenced by poor health and appreciate the social resources that make their day. Taking into account such prediction patterns may help to design specific intervention for young-old and old-old individuals.

**PC7 626 POSITIVE ASPECTS OF THE CARE GIVING OF DEMENTIA PATIENTS. THE RELATIONSHIP WITH POSITIVE EMOTIONS**

G. ALVARO\* (FUNDACION INGEMA, San Sebastian, Spain)  
Y. JOSE JAVIER(1), E. IGONE(1), I. AINHOA(1), L. IKER(1), U. ELENA(1), G. NEREA(1), L. IDOIA(2), S. MARIA TERESA(1), F. DAVID(1), D. ELENA(1) - (1) FUNDACIÓN INGEMA (SAN SEBASTIAN, Spain); (2) ASOCIACIÓN DE FAMILIARES DE ENFERMOS DE ALZHEIMER (PAMPLONA, Spain)

Introduction: It is well documented that the care giving process of Alzheimer's patients has impact on the informal care giver on several domains of the care giving person, mainly in the affective, health, social and in the psychological well being. However, recently had emerged new research lines centered in the study of the positive aspects of the care giving process. This research has addressed that there are also positive aspects related with the care giving process. As a result, the aim of this study was to analyze the positive effects of the care giving process among Alzheimer's caregivers and its association with emotional parameters. Method and Materials: A cross-sectional analysis of self-reported data was conducted. Measures of demographics, satisfaction with the care giving and positive and negative affect were administered to 51 Spanish community dwelling Alzheimer's patients informal caregivers. Satisfaction with care giving was evaluated through the Satisfaction with Care Questionnaire (Lawton et al., 1989) and the positive and negative affect was measured by the Positive and Negative Affect Schedule (PANAS, Watson et al, 1988). Results: Pearson correlation analyses were carried out in order to analyze the relationship between satisfaction with the care giving and emotions. A negative association was found between proud [ $r(49) = -.358; p<.01$ ] and enthusiastic feelings [ $r(49) = -.360; p<.01$ ], when relating each one to dissatisfaction with care giving. Conversely, to be ashamed is positively related with care giving dissatisfaction [ $r(49) = .338; p <.05$ ]. This data outline that caregivers that are proud and had enthusiasm are more likely to be satisfied with the care giving while caregivers that are more ashamed are more dissatisfied with the care giving. Conclusions: These results had the potential to substantially increase our understanding of basic care giving research and the outcomes of intervention efforts.

**PC7 627 THE RELATIONS BETWEEN SUBJECTIVE WELL-BEING AND PHYSICAL, PSYCHOLOGICAL AND SOCIAL FUNCTIONS AMONG THE OLDEST OLD**

M. TAKAYAMA\* (Keio University, Yokohama, Japan)  
J. ANDO(1), Y. ARAI(1), R. FUKUDA(1), H. AKIYAMA(2), Y. GONDO(3), N. HIROSE(1) - (1) Keio University (Tokyo , Japan); (2) The University of Tokyo (Tokyo, Japan); (3) Osaka University (Osaka, Japan)

Introduction. During the last few decades, the gerontological literature documented the positive aspects of aging, especially among the young old. However, recent studies of the oldest old suggest that the process of optimization in very old age is more difficult than in earlier age. The aims of this study are to examine (1) age differences in physical, mental, and social functions and well-being among the oldest old; and (2) the relations between well-being and physical, psychological and social functions. Methods. We sampled 1,600 Japanese older men and women aged 85+ living in Tokyo. Sixty hundreds and sixty people completed the test battery of physical functions (ADLs, IADLs and subjective health), psychological/mental functions (MMSE and self-efficacy), social relations (social network support and companionship), and subjective well-being(WHO-5 and PGC). Results. Age differences were found among 3 age groups(85-89, 90-94, and 95+ years old) in ADLs, IADLs, MMSE and social network. The older group had lower ratings in these variables than the younger group. But, there were no age differences in well-being, subjective health and social support (the quality aspect of social relations). For women, well-being was significantly associated with providing social support, companionship, self efficacy and subjective health. For men, well-being was related to the social network and support from family and subjective health. Conclusion. The results suggest that physical and mental

functions and social network decrease with age among the oldest old who are healthy enough to participate in this type of research, but that subjective well-being continues to be maintained. The elder people may shift the placement of importance from physical and mental functions to close relationships and emotional satisfaction in order to maintain subjective well-being.

#### **PC7 628 EMOTIONS IN EVERY DAY LIFE**

Y. JOSE JAVIER\* (FUNDACION INGEMA, SAN SEBASTIAN, Spain)  
D. PURA(1), M. MARIA(1), S. MARIA TERESA(1), E. IGONE(1), U. ELENA(1), G. NEREA, F. DAVID - (1) FUNDACION INGEMA (SAN SEBASTIAN, Spain)

**Introduction:** The subjective dimension of ageing is progressively playing a bigger role in the clinical practice, as well as in research in Gerontology. The current empiric evidence supports the fact that in the older there is a more complexity and emotional richness, a more adequate management of emotions, and, among other questions, a better integration between emotion and cognition. The current research has the goals of describing and analysing the places in which emotions have a bigger importance in the elderly, and which are the emotions that concue in them. Methods and materials: The sample was comprised by 90 people from Spain. 40 men and 50 female, between 65 and 85 years old, including healthy and frail people. Qualitative analysis techniques have been applied to them: focus groups (n=66) and in-depth interviews (n=24). Results: The results highlight the existence of 5 spaces of main importance in the ageing process, where emotions play a fundamental role, and which are: • The space of Affect (feelings to people or things): love, attachment, disgust, desire, respect, solidarity, tenderness. • The space of Certainty (related to trustworthiness and security/insecurity): relief, calm, restlessness, insecurity, fear, serenity, awe. • The space of Action (related to the mood to perform activities): discourage, depression, enthusiasm, hope, frustration, laziness, and pessimism • The space of Relationships: comprehension, loneliness, rejection • The space of Joy: fault, happiness, melancholy, nostalgia, sadness, shame. Conclusions: The analyzed data suggest the importance of emotions in 5 vital spaces for the elderly people in the process of ageing, that constitute by themselves 5 future spaces for interventions in Gerontology.

#### **PC7 629 BELIEFS ROLE IN THE ACCEPTANCE AND REFUSAL TO PARTICIPATE IN A DEMENTIA PREVENTIVE STUDY**

D. CONIASSE- BRIODE\* (OCTOGONE (EA 4156), Toulouse, France)  
V. IGIER(1) - (1) Maître de Conférences, OCTOGONE (EA 4156), CERPP (Toulouse, France)

**Introduction** Incidence and prevalence of Alzheimer Disease will increase in the coming years. The absence of effective treatment contributes to develop researchers' interest for prevention. To understand why some elderly people agree to participate in a dementia preventive study while others refuse to take part is an important issue in research. More exactly, the purpose of this study is to determine how health locus of control (internal control, control by powerful others, chance control; Walltson and al., 1994) and perceived threat of disease participate in the discrimination of elderly's decision-making process in taking part or refusing to participate in a dementia preventive study. Method and material 60 participants aged 70 years old and more, of whom 29 persons who accepted and 31 who refused to take part in preventive study completed a questionnaire which evaluated health locus of control (MHLCS, Walltson and al., 1978) and perceived threat of disease (Roberts and al., 2003). Results Results indicate that variables which contribute the most to discriminate the two groups are: chance control, control by powerful others and perceived threat. In other words, persons who accepted to participate showed a "power of others" control and felt more threatened by Alzheimer disease than people from the other group. Furthermore, persons who refused to take part in the study are more likely to present a "chance" control. Conclusion Reporting that elderly people who accept or who refuse to take part in a preventive study present health's external control confirms previous studies' results. These results imply that if we want to increase elderly's people empowerment towards their health, and of this fact increase their feeling of control and their adherence to preventive programs, we should inform them.

#### **PC7 630 ALZHEIMER'S DISEASE: PROGRAMME OF PSYCHOGERONTOLOGY AND SOCIO-EDUCATIONAL ATTENTION TO THE FAMILY**

D. VIEIRA DA S. FALCÃO\* (Universidade de São Paulo - USP, Santo André - São Paulo, Brazil)

**Introduction:** Psychogerontology aims to find, among other objectives, ways of intervening in dementias being the most common of them the Alzheimer's disease (AD). The Programme mentioned above aims to investigate the impact of this infirmity on the social and family relationships of the caretakers, promoting support to those people through individual and group activities. Methods and Materials: The appointments are done in a Centre of Rehabilitation and in a Geriatric Hospital-Day once a week for 12 weeks. The participants were family members of those who have Alzheimer in an early or moderate stage of the disease participated. The meetings, which last for 1 hour and 30 minutes, show orientations about the old age and AD through audiovisual resources and group dynamics. The participants share their experiences and their speeches are recorded, transcribed and analysed through the technique of Bardin. Quantitative and qualitative instruments were

applied: Family System Test, Genogram, and Social Convoy Diagram. The rules indicated by the authors of those instruments were followed. Results: 24 family members participated, 20 were women and 4 were men with a mean age of 68. It was noticed that the disease reached the structure and family dynamic of those people, especially in relation to the hierarchy because the sick people do not have the same power anymore. The characteristics of the social network of the caretakers affect the quality and the kind of support received. Lone caretakers say they have a smaller and less satisfactory social life. The evolution of the disease demands a greater attention by the caretakers, restricting their social involvement and triggering symptoms such as stress and depression. Conclusion: The project offers therapeutic and informative benefits about the disease, altering, in a significant way, the subjective well-being of the participants, favouring the enlargement of the social and emotional support network.

#### **PC7 631 THE FAMILY RELATIONSHIPS IN THE PERSPECTIVE OF CARETAKING DAUGHTERS OF PARENTS WITH ALZHEIMER'S DISEASE**

D. VIEIRA DA S. FALCÃO\* (Universidade de São Paulo - USP, Santo André - SP, Brazil)  
J. S.N.F. BUCHER-MALUSCHKE

**Introduction:** Alzheimer's disease (AD) is the most common form of dementia, and one of its main consequences is the fact that it affects all the family system. This research aims at investigating the family relationships between daughters and their parents (father or mother, possible or probable AD patients). Methods and Materials: The sample consisted of thirty-two daughters and their respective parents (six fathers and twenty-six mothers). We started from a bibliographical review, out of which we devised an open interview with a semi-structured format. This was recorded, transcribed and later analyzed according to the Bardin technique. We also used FAST (Family System Test), a tool consisting of a bi-dimensional investigation process with the view to analyzing, structurally and systematically, the subjects' perceptions insofar as their family relationships went. Results: The results have pointed out that, upon receiving the news of the diagnosis, the majority of daughters and of their relatives reacted negatively. Prior and subsequent to the disease, the most highlighted sub-category was unfavourable family relationships (conflicts). It was also verified that the daughters perceived a hierarchical inversion of power regarding their Alzheimer mothers ( $Z=-3,6$ ;  $p<0,001$ ). Nevertheless, it was clear that the daughters would rather exercise their authority less often, which reveals their discontentment with being, in fact, their mothers' mothers at times. Even though the caregivers have realized the hierarchical inversion in relation to their mothers, the emotional bond (cohesion) towards their mothers did not grow less strong. Conclusion: The search for professionals as crucial when the disease is in its initial stage so as to facilitate treatment and to promote the health of the family. Having a great range of information about the disease may favour the family system when it comes to decision-making and to practical measures which can contribute to the emotional balance of those involved.

#### **PC7 632 AND THE NOMINEES FOR THE CATEGORY "WISDOM" ARE ....**

K. NASCHENWENG\* (University of Klagenfurt, Klagenfurt, Austria)  
S. KÖNIG(1) - (1) University of Klagenfurt (Klagenfurt, Austria)

**Introduction:** The present study is part of a greater research project, namely "The Development and Manifestation of Wisdom", which is currently conducted at the University of Klagenfurt. Wisdom is often considered as the ideal endpoint of human development (Clayton & Birren, 1980). We propose, that experience with and reflection upon difficult life events can foster the development of wisdom. Methods/Materials: Through several public calls people were asked to nominate a wise person they personally know. Nominees were invited to participate in the study. The present findings focus on the nomination part of the study. The nominators were interviewed via telephone using a semi-structured interview in order to collect demographical data and to determine the reasons for the nominations. Furthermore, the nominators were asked to describe a specific episode in which the nominee acted in a wise way, and to characterize the nominated person in their own words as well as through rating lists. Results: Overall, the results indicate that most nominees were older than the nominators, and more men were nominated regardless of the gender of the nominators. Concerning characteristics of the nominees, some differences were discovered between male and female nominees and nominators. Most nominators reported episodes where the nominee helped them to resolve a problem by showing them a new perspective, giving advice, or being empathic. Conclusion: Most results are consistent with findings of previous studies, especially those concerning age and gender of the nominees (e.g. Denney, Dew & Kroupa, 1995; Sowarka, 1989). On the other hand, data about wisdom episodes offer new insight about the concrete manifestation of wisdom.

#### **PC7 633 THE EFFECTS OF AGE AND EDUCATION FOR THE CANCELLATION TASK PERFORMANCE**

H. HUANG\* (National Kaohsiung University of Applied Sciences, Kaohsiung, Taiwan)  
T. WANG(1) - (1) National Cheng Kung University (Tainan, Taiwan)

**Introduction:** Cancellation tasks are widely used for the assessment of selective attention. However, the factors of age and education for the cancellation task performances were not widely investigated. The aim of this study is to evaluate the effects of age and education

for cancellation accuracy and time from young to late adulthood. Method There were 162 community residents (Tainan city, Taiwan) with no known neurological history volunteered to participate in this study. Participants performed symbol cancellation tasks in a computer-based system. Their age are from 18 to 89 years old (Mean = 42.4, SD = 16.47) with the mean education years of 13.9 ( $\pm$  4.38). Each participant has practiced the trial session prior to the test to ensure competence in using a stylus to cancel the target on the tablet PC screen. Result After controlling for education, age is minimally correlated with task time (random form:  $r = .191$ ,  $p = .015$ ; structured form:  $r = .328$ ,  $p < .001$ ), but not accuracy. We further divided participants into two groups by age (below and above 50 years old) and using MANOVA procedure to test the effects of forms and age on task time and accuracy. Main effect of age was only significant for task time ( $F = 5.309$ ,  $p = .023$ ), while the education covariate significantly with task time ( $F = 7.688$ ,  $p = .006$ ) and accuracy ( $F = 5.730$ ,  $p = .018$ ). Conclusion We found that age is related to the task time. Education plays an important role in cancellation performance that poorer accuracy may be associated with lower education. The sluggish pattern by aging may associate with both motor speed and attention shift. Further investigation is suggested to explore whether motor speed is associated with task performance in people across life span.

**PC7 634 DO PRODUCTIVE ACTIVITIES COMPENSATE FOR THE LACK OF PAID WORK? AN ANALYSIS ON THE EFFECTS OF UN-PAID WORK ON THE SUBJECTIVE WELL-BEING OF SENIOR JAPANESE MEN**  
**K. KATAGIRI\*** (Nipponkoo Welfare Foundation, Bunkyo-ku, Tokyo, Japan)  
**I. SUGAWARA(1)** - (1) The University of Tokyo (Tokyo , Japan)

Previous literatures discussed the various effects of productive activities on senior citizens. Japanese men have traditionally been considered to be workaholics who experience negative effects on retirement because of the loss of the many psychological and social resources. Productive activities compensate for the meaning of life that was previously contributed to by employment. This study aims to examine the effects of productive activities on the psychological well-being of senior Japanese men. In 2002, a questionnaire survey was conducted for the probability samples of 580 married men in their sixties and their wives in the Tokyo metropolitan area (response rate: 62.8%). Full-time or part-time workers, retirees and their wives (260 couples) were analyzed and productive activities—paid-work, volunteer work and housework—were examined. Multiple regression analysis was conducted. First, the effects of full-time and part-time job and volunteer work were examined. Volunteer work had the positive effect of reducing feelings of loneliness. The interaction term of paid work and volunteer work was significant. When working people performed volunteer work, they experienced lesser feelings of loneliness than those not doing volunteer work. Housework lowered their self-esteem. However, the interaction term of paid work and housework was significant. Working people doing housework showed higher life satisfaction than those not sharing housework. The effects of productive activities differed. People probably made social contacts through volunteer work, which reduced their feelings of loneliness. Perhaps, traditional sex role norms were related to the negative effects of housework. Interestingly, the positive effects of productive activities for the employed people were more pronounced than those for the retired; this suggested that the quality of work for the old people might differ from their previous work at younger days, thus deteriorating their well-being. Further research is required on the quality of work engaged in by old workers.

**PC7 635 SUPPORTIVE COMMUNITY LIVING SERVICE CONCEPTION: INFORMATION COMMUNICATION TECHNOLOGIES ACCEPTABILITY AND ORGANIZATIONAL INTEGRATIVE ASSESSMENT METHODS IN CONTEXTUAL ENVIRONMENT**  
**J. REERINK-BOULANGER\*** (Université de Haute Bretagne - Rennes 2, Rennes cedex, France)  
**B. PATRICE(2), J. ERIC(1), S. ALAIN(1)** - (1) Centre de Recherches en Psychologie, Cognition et Communication-EA 1285, Université de Haute Bretagne - Rennes 2 (Rennes cedex, France); (2) IETR - Institut d'Electronique et de Télécommunications de Rennes - CNRS : UMR6164, Université Rennes I (Rennes cedex, France)

Introduction This paper presents an evaluation research program which aims at validating supportive community living services conception methodology in contextual environment. This approach takes place in an urban home based services, systems and policies development activity to support aging and dependency. The fragmentation of service provision in the domain of supportive community living was not born yesterday : multiplicity of stakeholders involved in the activity, atomization of assistive products, services and technologies for personal use in daily living conditions, lack of generalized and homogeneous evaluation programs in contextual environment. The purpose of this paper is to propose an integrative methodology for products, services and Information Communication Technologies (ICT) development evaluation process in domestic living environment. Methodology The methodological frame of this research is supported by system acceptability model (Nielsen, 1993) which provides a global evaluation process based on financial, technical, social and individual acceptability criteria. The approach that we developed also descended from work organisation structural factors and consumer-worker interaction as a macro activity process in the field of service relation (Engeström, 1999). Results The results of this research concern three components. Firstly, an innovative device evaluation which is compatible with stakeholders' compelling needs (elderly

people, socio-health workers and family carers). Secondly, an understanding of collective activities, positions and views of stakeholders involved. The potential perturbations impacts of technologies will be highlighted in order to build the basis of new work organization and practice change. Ultimately, the conceptualisation of engineering service life cycle evaluation process applied to supportive community living. Conclusion A service oriented evaluation methodology has been set up to target independent living conditions through ICT products and services for elderly people and change management in work organizations. This new research paradigm aims at allowing elderly people to stay in their familiar home environment despite progressive loss of independence.

**PC7 636 TOWARD A DEFINITION OF SOCIAL AND EMOTIONAL LONELINESS FOR OLDER ADULTS**

**S. SQUIRES\*** (Trinity College Dublin, Dublin, Ireland)  
**C. SHEEHAN(2), R. ROMERO-ORTUNO(1), V. BUCKLEY(1), B. ODEA(1), B. LAWLOR(1), D. PRENDERGAST(3)** - (1) Trinity College Dublin (Dublin, Ireland); (2) National University of Ireland (Galway, Ireland); (3) Intel (Leixlip, Ireland)

Introduction: Older people who are socially engaged are better able to cope with the challenges of old age, and remain healthier both mentally and physically. However, as the life course unfolds, physical mobility may become restricted, friends and family become busy or live at a distance, and peers dwindle. Many older people risk becoming lonely. While loneliness has been seen as a single state, evidence suggests that loneliness can be divided into two distinct types: social and emotional (Weiss 1973). However, we do not have a good definition of either social or emotional loneliness. Most recently O Luanaigh and Lawlor (2008) suggested social loneliness can be associated with a lack of social integration while emotional loneliness is the result of psychological factors. In this paper we will report on progress toward developing definitions for social and emotional loneliness. Methods and materials: A mix of quantitative assessments and qualitative ethnographic case study methods were used to provide both statistical models and in-depth understanding. Within a clinical setting we assessed a range of demographic, psychological, social and medical variables. Ethnographic case study methods provided in-depth qualitative dimensions of loneliness relationship to social networks and social support. Results: We found a stronger relationship between small social networks and Social Loneliness. Social Loneliness is also associated with poor nutritional indices. Emotional Loneliness was associated with certain personality traits and general anxiety suggesting a lowered ability to cope with life events. Conclusion: Understanding the difference characteristics of socially and emotionally lonely older adults provides the opportunity to develop clear definitions of each, leading to targeted interventions best suited to the type of loneliness identified.

**PC7 637 SEXUAL BEHAVIOR AND PHYSICAL CAPABILITIES IN ELDERLY: THERE IS RELATIONSHIP?**

**P. GREVE\*** (UFSCar, Mogi das Cruzes, Brazil)  
**J. REBELATTO(1), D. PEÇANHA(1), M. RAMOS DA SILVA(1), E. CARNESECA(1)** - (1) Federal University of São Carlos (São Carlos, Brazil)

The aim of this study was to identify characteristics of sexual behaviour and their correlation with the physical capabilities flexibility, strength, balance and body mass index (BMI) in older individuals active. Participated 17 individuals (61.1; +7.5 years) who were part of a programme of physical activity. The volunteers answered a questionnaire about sexuality and went through a physical evaluation, where they were assessed the BMI, flexibility, strength of grip manual and the physical condition (VO2máx). Responses were correlated with each other and with the physical capabilities assessed. Statistical analysis was performed using the Coeficiente Correlation of the Pearson, Correlation of Spearman, the Chi-square test and the test R2. It was noted that 76% were married, 60% thought his body pleasant, 80% were in a higher degree of satisfaction with life, 17.6% had relations several times a week and 23.5% once a week. The average physical evaluation were BMI = 27.39 (+ 4.2) kg/cm<sup>2</sup>, flexibility = 256.95 (+ 85.9) mm, force = 34.77 (+ 8.6) KgF and VO2máx = 26 , 16 (+ 8.67) l/min-1. There wasn't correlation between the frequency of sex with BMI, strength, flexibility and VO2máx. There were a slight correlation between 'satisfaction with life' and 'frequency of relations', and between BMI and satisfaction with the Corps. Physical aspects as flexibility, strength and VO2máx not correlate with the characteristics of sexual behaviour studied. There is correlation between BMI and relationship with the body, between change of sentiment and age, and between satisfaction with life and frequency of sexual intercourse.

**PC7 638 LONG-STANDING ACTIVITY PARTICIPATION: THE RELATION OF OCCUPATION TO SUCCESSFUL AGING AND WELL BEING**

**R. STEVEN-RATCHFORD\*** (Towson University , Towson, United States of America)

Introduction. This study examined the relation of long-standing occupation to successful aging, quality of life, and life satisfaction. Long-standing activity participation was defined as occupational engagement in a particular activity for a period of five years or more. Quality of life and life satisfaction were defined as positive states of well being that were assumed to be factors inherent in successful aging. Successful aging was defined as continued good health and well being in concert with high function and active engagement

with life (Ros & Kahn, 1999). Life satisfaction was overall contentment with life. Quality of life was defined as overall positive well being that included health status and contentment with life. Engagement in long-standing occupation provides seniors with a healthy way to occupy time, and a means for staying active and socially connected. Methods and Materials. Correlational research procedures were used to collect data on occupation, well being, and successful aging in a sample of 278 community-dwelling older adults. The Long-Standing Occupation Measure (LSOM,  $r=.81$ ) was used to measure activity participation. The Successful Aging Profile (SAP,  $r=.84$ ) was used to measure successful aging. The Quality of Life Scale (QOLS,  $r=.92$ ) was used to measure quality of life. The Satisfaction with Life Scale (SWLS,  $r=.81$ ) was used to measure satisfaction with life. Spearman rho analyses were used to determine coefficients ( $p < 0.05$ ). Results. Findings indicated that there were moderate significance relations between long-standing occupation and successful aging and well being. These findings indicated that long-standing occupations had a moderate significant relation to successful aging and well being. Conclusion. This sample of older adults had participated in a variety of occupations including volunteerism, hobbies, and gardening across their lifetimes. These activities kept them socially connected and related to their overall life satisfaction and quality of life.

#### **PC7 639 ATITUDES TOWARDS ELDERLY SEXUALITY**

B. TOMAZ\* (Student ISPA, Lisboa, Portugal)  
T. ROCHA, R. CARVALHO

The aim of this exploratory study was to find the potential difference in attitudes towards elderly sexuality, between elderly and young adults. The sample consisted in 10 subjects, divided in two groups. The J group with 5 individuals with ages between 20 and 30. And the I group formed by 5 individuals with ages equal or greater than 65. The age was the only variable in the sample, which was controlled. To access the data it was used a semi-structured interview. For the analysis of the collected data it was applied the Osgood Semantic Differential Scale (-3 to +3 scale). From the interview 18 sub-categories emerged, distributed in 4 major categories (Social, Behavioural, Physiological and Psychological). The I group presented higher values than the J group in every category. The Physiological category showed the more neutral values in both groups ( $I=0.26$ ;  $J=-0.32$ ). The I group presented the higher value in the Psychological category (1.08). The higher difference between groups (0.98) also appeared in this category. The average of the four categories showed that the I group had a most positive attitude towards elderly sexuality (0.67), than the J group (0.03). The values that are shown by the J group, may indicate a lack of investment in this issue. The elderly have a more positive attitude towards sexuality in their age, than the young adults. The value that they present is lower than one, which could point to a partial, difficult or painful way of experiencing their sexuality. It shows that the elderly live their sexuality in an environment ruled by lack of information, prejudice and social believes. This study confirms the need of sexual education. That should be thought not only to the youngest, that are the tomorrow's elderly, but also to the elderly of today.

#### **PC7 640 AGEING IN PLACE & NEIGHBOURHOOD ENVIRONMENT WALKABILITY**

D. MARK\* (Swansea University, Swansea, United Kingdom)  
J. PHILLIPS(1), N. FOREMAN(2), A. HOCKEY(3), M. LEWIS(1) - (1) Swansea University (United Kingdom); (2) Middlesex University (United Kingdom); (3) Anglia Ruskin University (United Kingdom)

Ageing in place is defined as an individual's functional interdependence with their local area. Their cognitive, affective and behavioural functioning as embedded within the physical environment of their residence and residential location, and the formal and non-formal networks of support contained therein. In the present study ageing in place (AiP) is investigated from the perspective of the inter-relationship between the walkability of the residential location (the neighbourhood) and the mediating effect of older adults' navigational skills and activity level. Latent variable partial least squares data analyses indicate a significant direct relationship between neighbourhood environment walkability and AiP with neighbourhood environment walkability, diversity and accessibility of land use mix, street connectivity, aesthetics and infrastructure and safety for walking contributing to the significant relationship while the presence of traffic hazards and the hilliness of the area were significantly negatively related. An indirect relationship via wayfinding route and orientation strategies and sense of direction was evidence, however activity level was non-significant.

#### **PC7 641 STRESS AND EVERYDAY MEMORY FUNCTION: COMPARING CAREGIVERS AND NON-CAREGIVERS**

L. MCDONALD-MISZCZAK\* (Western Washington University, Bellingham, United States)  
J. ANDERSON(1), S. NEUPERT(2), S. EDMUND(1), J. OTTMAR(1), S. POTE(1) - (1) Western Washington University (Bellingham, United States of America); (2) North Carolina State University (Raleigh, United States of America)

Introduction: Daily stress can negatively impact cognitive function (e.g., Vitaliano et al., 2005), so it is important to study memory function under stressful circumstances in a

realistic living situation. Methods: Fifteen caregivers ( $M=71$ ,  $SD=7.81$ ) participated in the study for 14 days, and 20 non-caregivers ( $M=78$ ,  $SD=5.95$ ) participated for 7 days. Everyone completed standardized cognitive tasks (including information processing speed), daily stress assessments, and performed a challenging everyday memory task. Results: A fully unconditional multilevel model revealed that 30% of the variance in the everyday memory task was between people, while 70% was within people. Although the number of stressors experienced each day was not related to daily memory performance and caregiver status did not moderate the within-person relationship, subsequent models considered specific stressor domains separately and examined the role of cognitive performance. Results revealed that on days when caregivers experienced health-related stressors they benefitted much more from having faster processing speeds; that is, they remembered better than on days when they did not have health-related stressors, and they outperformed non-caregivers with high scores ( $\gamma_{13} = .08$ ,  $t = 2.18$ ,  $p = .03$ ). This model explained 16% of the within-person variance and 29% of the between-person variance in daily memory. An additional model revealed study-related stressors were equally detrimental to all caregivers, regardless of processing speed. However, for non-caregivers, study-related stressors and slower processing speeds were detrimental; if non-caregivers had faster speeds, they seemed to be buffered from the negative effect of the study-related stressor ( $\gamma_{13} = -.04$ ,  $t = -1.92$ ,  $p = .05$ ). This model explained 19% of the within-person variance and 35% of the between-person variance in daily memory. Conclusion: Better cognitive function can buffer the impact of particular stressors on everyday memory ability for both caregivers and non-caregivers.

#### **PC7 642 CELL PHONE SOFTWARE TO AID SENIOR CITIZENS IN RECALLING NAMES**

R. BAECKER\* (University of Toronto, Toronto, Canada)  
K. FENWICK(1), M. MASSIMI(1), S. BLACK(2), E. ROCHON(1), D. RYAN(2) - (1) University of Toronto (Canada); (2) Sunnybrook Health Sciences Center (Canada)

Introduction: This project is motivated by surveys of senior citizens who report difficulties in recalling people's names. Our aim is to design, build, deploy, and evaluate novel location-aware cell phone software to assist older adults in recalling names. Methods: An interdisciplinary team of computer scientists, neurologists, geriatricians, and speech/language pathologists researched user needs through participatory design sessions with five older adults. We created a series of increasingly richer prototypes of Internet server software and cell phone client software that communicates with this server. The server stores a database of one's social network and places one frequent. An inference engine uses this information and knowledge of the cell phone's location to suggest names of people one might plausibly encounter in that place. The client software presents the forecast of names to the user, engages in a dialogue with the user about forecast quality, and solicits data that should be added to the database to improve future forecasts. We are pilot testing with 8 individuals, gathering quantitative data on forecast quality, and recording interview data on the suitability of the technology and its use. Results: We shall present first results from the pilot studies, including how good the forecasts are, how our subjects enter social networks into the system, and how and under what conditions forecasts are requested. We shall report on improvements in the functionality and user interface for both server and client. Conclusion: Evidence from pilot studies is sufficiently positive to suggest that further work is warranted on a context-aware cell phone that uses a representation on one's social network and knowledge of the phone's location to suggest who one might plausibly encounter, and that such forecasts are likely to be beneficial to seniors. One next step will be a controlled field experiment using participants with mild cognitive impairment.

#### **PC7 643 COGNITIVE DEMAND ESTIMATED IN ACTIVITIES OF DAILY LIFE AND ITS RELATIONSHIP WITH COGNITIVE FUNCTIONING IN ELDER PEOPLE**

J. LABRA\* (UNIVERSITY OF OVIEDO, OVIEDO, Spain)  
J. MENOR(1) - (1) UNIVERSITY OF OVIEDO (33003, Spain)

INTRODUCTION: The performance in activities of daily living cognitively demanding could have a positive result in cognitive functioning delaying brain slowing commune to aging and improving performance in different cognitive processes involved. In this research we examine the relationship between the estimate of cognitive effort in activities that elder people engaged in their daily lives and different cognitive processes.

MATERIALS AND METHODS: We conducted a cross-sectional study on a sample of 52 persons over 60 years without cognitive impairment and healthy that lives in rural areas. In the evaluation we used a questionnaire on activities of daily living and a neuropsychological battery which measures different cognitive processes: episodic memory, working memory, processing speed and visual search, attention, reasoning and executive processes. RESULTS: After analyzing statistical of data we see that the estimate of the cognitive effort which the elderly make in their daily living activities are related to neuropsychological tests that measure working memory, processing speed and visual search, reasoning and executive processes. In contrast, there has not been found relationship between the estimate cognitive effort and episodic memory tests.

CONCLUSION: The results show that episodic memory is not the most important factor in the estimate of cognitive effort in the activities of daily living and the need to consider other processes such as processing speed, working memory and executive function in

cognitive training to improve the functional capacity for instrumental activities of daily living of the elderly living in the community.

**PC7 644 GIVING AND RECEIVING SUPPORT IN OLD AGE: ITS CONTRIBUTION TO SATISFACTION WITH LIFE**

J. BUZ\* (Universidad de Salamanca, Salamanca, Spain)  
L. LOPEZ(1), M. SANCHEZ(1), B. BUENO(1), A. NAVARRO(1) - (1) Universidad de Salamanca (Salamanca, Spain)

**INTRODUCTION:** Within the context of intergenerational relations, the social exchange theory posits that those people who receive more than they give experience the highest levels of wellbeing. The equity theory suggests that the highest levels of wellbeing are associated with balanced relationships. In spite of the abundant research on mutual support relationships and wellbeing, the empirical evidence for such theories is hardly conclusive. Our aim is to test both theories considering the exchange of support between elderly people and their adult children. **METHOD AND MATERIALS:** 489 elderly people were interviewed (aged 60-98; M = 73.3 years, 42% males, 58% females), in good health and living in the community. Items were drawn up using a Likert scale (1-4, Never – Many times) to obtain the frequency of support (instrumental and emotional) received from sons and daughters. **RESULTS:** The ANOVAs performed, controlling the effect of socio-demographic and subjective health variables, revealed that the situations of reciprocity and non-reciprocity in instrumental support produced the same levels of satisfaction with life. However, in emotional support, equitable relations led to higher levels of satisfaction. **CONCLUSIONS:** The results partially support the equity theory, thereby indicating the significant role of reciprocity and emotions in wellbeing. Some consideration should be given to the possible role of cultural norms on the support for and from adult children in old age.

**PC7 645 WORKING CONDITIONS AND WORK-RELATED MENTAL HEALTH AMONG KOREAN OLD-AGE WORKERS**

K. SU HYUN\* (Kyungpook National University, Daegu, Republic of Korea)  
E. CHOI(1), S. KIM(1), E. LEE(1) - (1) Kyungpook National University (Daegu, Republic of Korea)

**Introduction :** Psychosocial working conditions in modern societies have become increasingly important. Especially old-age workers are more vulnerable to work-related mental ill-health because of their poor working conditions and ageing work. This study aims to examine association of working conditions with work-related mental healths. **Methods and materials:** This study focused on the 1,044 aged workers(aged 50-64, 760 male and 284 female workers) from the first Korean working conditions survey(KWCS) data in 2006. Work-related mental health had been defined as having one or more symptoms of stomach pain, stress, sleeping problem, anxiety, and depression. We computed the percentage of work-related mental ill health problems, all-adjusted odds ratio(OR) using the SAS logistic procedures. **Results:** 195 workers(18.7%) had one or more work-related mental ill health problems. The prevalences of mental ill-health problems were 5.6% and 3.2% for stomach pain and 18.7% and 14.4% for stress, 5.3% and 3.5% for sleeping problems, 4.1% and 2.5% for anxiety, and 3.3% and 1.8% for depression in male and female aged workers. Job strain and the perception of work-life balance were associated with work-related ill mental health. **Conclusions:** To improve mental health, job demand should be reduced and work-life balance maintained among Korean aged workers. This study will support development of more targeted mental health interventions.

**PC7 646 RACE AND SOCIOECONOMIC DIFFERENCES IN HEALTH BEHAVIOR TRAJECTORIES ACROSS THE ADULT LIFE COURSE**

B. SHAW\* (University at Albany, Rensselaer, NY, United States)  
K. MCGEEVER(1) - (1) University at Albany (Albany, NY, United States of America)

**Introduction:** The purpose of this research was to describe how individual health behaviors – including alcohol consumption, smoking, physical activity, and weight management – change over a 16-year period in progressively older age groups. Additionally, race- and education-based variations in intra-individual changes in health behaviors were examined. **Methods and Materials:** We used hierarchical linear modeling with data from 3,617 American adults aged 25 and older who were interviewed up to four times. **Results:** On average, levels of alcohol consumption and the likelihood of smoking both declined over time. While rates of decline in alcohol use moderated among older adults, rates of decline in smoking were steepest among older adults. Physical activity levels increased among young adults and decreased among older adults; the odds of being overweight followed the same pattern. Significant race- and education-based variations were evident in both the levels and rates of change in these health behaviors. For instance, while White Americans exhibited significant advantages over Black Americans with respect to levels of physical activity and the odds of being overweight, these advantages diminished over time, particularly among older adults. Regarding education, adults with high levels of education consumed more alcohol than the less well-educated, and these differences persisted over time and across age groups. Furthermore, low education adults were more likely than those with high levels of education to smoke, and were also less likely to experience late life drops in the odds of smoking. **Conclusions:** These findings suggest the presence of substantial and evolving race- and education-based stratification in health behaviors

throughout the adult life course. While many of the race differences appear to diminish over time and during late life, education-based differences seem to persist or grow. Future work in this area should examine the health effects of various trajectories of health behaviors during later life.

**PC7 647 A NOVEL APPROACH TO EXAMINING THE LIFE SATISFACTION INDEX-Z DIMENSIONS AMONG COMMUNITY-DWELLING OLDER ADULTS**

F. YANG\* (Harvard Medical School, Brigham and Women's Hospital, Hebrew SeniorLife, Boston, United States)  
F. CLARK(1), M. CARLSON(1), C. CHOU(1), D. MANDEL(1), J. BLANCHARD(1), J. HOLGUIN(1), A. MARTERELLA(1) - (1) University of Southern California (Los Angeles, United States of America)

**Introduction:** Life satisfaction is a major aspect of psychological well-being that may influence how older adults live. Life satisfaction has been defined by the preferred feeling about oneself and measuring life satisfaction among diverse older adults is a challenging and important area of research. With different dimensions and levels of life satisfaction, there are varying associations with mortality and other adverse health outcomes. Therefore, this study examines the measurement properties of the Life Satisfaction Index-Z(LSIZ) using a novel approach that considers both the common and unique factors of the scale. **Methods and materials:** In 480 older adults (aged 65 and older) from the University of Southern California Well Elderly Study, we conducted a confirmatory factor analysis on the LSIZ (13 items) using a bifactor model under item response theory. **Results:** We found that a bifactor model adequately described the LSIZ scale ( $c^2=106.48$ ,  $df=40$ ,  $CFI=0.95$ ,  $RMSEA<0.06$ ). There were three unique factors that were also present with the common underlying life satisfaction factor: Zest, Congruence, and Mood. While these factors are consistent with previous LSIZ dimensions, we found that the Mood factor consisted of only the negatively worded items. Based on the factor loadings, the mood factor was also identified as the nuisance factor, which did not conceptualize the common life satisfaction factor as well as the other factors in the bifactor model. **Conclusion:** This is the first study, to our knowledge, that uses the bifactor model to examine the Life Satisfaction Index-Z in the field of gerontology. The USC Well Elderly Study consists of a diverse group of older adults, rather than a homogenous sample, to account for possible measurement bias when assessing for life satisfaction and relating the total score to outcomes. Careful attention must be paid to negatively worded questions used in independent living older adults as they may not be measuring overall life satisfaction, when summed as a total score.

**PC7 648 AWARENESS ACROSS A LIFE-SPAN: A COMPARISON OF OBJECTIVE AND SUBJECTIVE MEASURES IN AGING.**

K. RICHARDSON-FRANKTON\* (University of Hull, Hull, United Kingdom)  
G. MAZZONI(1), C. GUERRINI(1) - (1) University of Hull (United Kingdom)

**Background:** Estimating one's own cognitive functioning is crucial for everyday life and insight of possible cognitive decline. It is quite common for healthy adults to have some concerns about their memory, particularly as they get older. We report here the results of the first part of a larger study aimed at investigating four aspects of self-evaluation of cognitive functioning. The first concerns the possibility that cognitive evaluations change as a consequence of experience of tests; the second aims to understand whether complaints represent an accurate appraisal of memory problems or an incorrect self-evaluation. The third aim is to assess whether the pattern of self-evaluation is similar across cognitive domains, as previous studies have largely concentrated on metamemory and metacognition, whilst fewer studies have extended their research of self-evaluation to other domains (Ackerman & Wolman, 2007; West et al., 2002). The fourth aim is to understand whether the ability to self-evaluate deteriorates as we grow older, as previous aging research suggests that older adults lack metacognitive ability (Vecchi, 1999; McCallum et al. 1985; Best et al. 1990). **Methods:** Questionnaires were developed to measure self-evaluation of cognitive functioning in different domains (semantic memory and language). Participants' self-estimated ability scores in both domains were collected, before and after abilities were assessed with neuropsychological tests. **Results:** The reliability for both questionnaires was high (Cronbach's alpha =.70 and 0.95). Correlations were calculated for both questionnaires before and after testing, both reached significance. Correlations between self-evaluation and objective ability in language reached significance with memory barely failing to reach significance. **Conclusion:** Preliminary data show that young adults tend to provide lower estimates of their cognitive abilities after experiencing cognitive tests suggesting that actual performance can modify self-perception. The positive correlations between self-evaluation and performance on neuropsychological tests provide evidence for relatively accurate estimation of cognitive skills.

**PC7 649 ASSOCIATION OF MENTAL INDEPENDENCE WITH SELF-RATED HEALTH IN THE JAPANESE ELDERLY**

S. WATANABE\* (J. F. Oberlin University, Tokyo, Japan)  
H. SHIBATA(1) - (1) J. F. Oberlin University (Tokyo, Japan)

**Introduction:** Physical independence has been identified as a factor of self-rated health that has been well known as a predictor for future health status and mortality in the elderly. However, the relation of mental independence and self-rated health is not clear. The

purpose of this study was to reveal the relationship between mental independence and self-rated health among elderly people living in Tokyo. Methods and materials: Data was collected from 1,294 residents of four age groups (305 residents aged 35-40 years, 288 residents aged 45-50 years, 302 residents aged 55-60 years, and 399 residents aged 65-70 years) in Setagaya-ku, Tokyo by random sampled mail survey in 2007. Self-rated health was classified into four categories (1, poor; 2, fair; 3, good; 4, very good). Mental independence was assessed using the Mental Independence Index (Suzuki and Sakihara, 2003) consisted of the purpose directionality subscale (4-item) and self-responsibility subscale (4-item). Generalized linear model was used to test hypotheses. Results: Self-rated health in the aged 55-60 years group was relatively low. The total score of the mental independence index in men was higher than in women (26.4 vs. 25.5), and in women, the total score of the mental independence index increased with age. The independent factors of high self-rated health were no subjective symptoms, having a job, high mental independence, and no medical remark. There were some interaction effects. The relation of mental independence and self-rated health was remarkable in the group without a regular occupation. The relation of occupation and self-rated health was remarkable in the aged 55-60 years group. Conclusion: Mental independence was one of the relevant factors of self-rated health in each age group. Self-rated health in the aged 55-60 years group including baby boomers was relatively low, and there was an interaction with occupation.

#### **PC7 650 QUALITY OF LIFE IN THE OLD AGE: DESCRIPTION AND MODEL OF ROUTE.**

M. D' ALESSANDRO BELLO, M. SC.\* (This is my thesis for obtaining my Master degree in Psychlogy at Universidad Simón Bolívar. Caracas, Venezuela)

In the last years the expectancy of life increases. There are many studies about third age. For examples: (González-Celis, 2002; Lang y Heckhausen, 2001; Asakawa y cols, 2000; Ministerio de Trabajo y Asuntos Sociales de España, 1996; Tamer, 1989). However, in Venezuela researches in this field are insufficient. Recently, the interest for study in older population in their different aspects has emerged. Based on the research "Calidad de vida en la vejez en los distintos contextos" (Quality of life in the old age at different contexts) by the "Ministerio de Trabajo y Asuntos Sociales de España" (Work and Social Affairs Ministry of Spain), the present study, "Calidad de vida en la vejez: descripción y modelo de ruta" (Quality of Life in the old age: description and model of route) was developed. The main objectives of the present investigation are: to describe the quality of life of a group of subjects that belongs to the third age and inhabits in Chacao, a place located in the Metropolitan Area of Caracas – Venezuela, and to analyze the relationships among a set of variables and its power of prediction on the quality of life of the above mentioned group. The gender, the age, the social status, the educational level, the place of residence, the participation in a social program identified as "Programa de la Juventud Prolongada" (Program of the Prolonged Youth) and the use of the services given by the "Casa de la Juventud Prolongada" (Home to the Prolonged Youth) were the variables taken into account. The sample of the study was 300 subjects. They complied with the criteria of selection: to belong to the third age (65 years or more), to live in Chacao, an area located in the Metropolitan Area of Caracas, and no cognitive deficiencies. The instruments of measure utilized were: MiniMental Test, Questionnaire of Personal Information and "Cuestionario Breve de Calidad de Vida (CUBRECAVI)" (Brief Questionnaire of Quality of Life. In reference to the description of the quality of life, in the present study, the majority of the sample reported better quality of life at the subscales health, functional skills, satisfaction with their life and quality of the environment. Nevertheless, the majority reported diminished quality of life at the subscales social integration, constructive use of time and social and sanitary services. Related with the analysis of the relationships among a set of variables and its power of prediction on the quality of life of the subjects, the results were: men, the younger individuals, those who belonged to a higher social status, those who had higher educational level, those who lived at their own home, those who took part in the program identified as "Programa de la Juventud Prolongada" (Program of the Prolonged Youth) and those who did not use the services given by the "Casa de la Juventud Prolongada" (Home to the Prolonged Youth) were the ones that reported better quality of life. The present study is a contribution to the comprehension of the quality of life in the old age from an integral and multifactorial perspective that support the concept proposed by the biopsicosocial model of the health and it provides a platform for probable and future programs. Keywords: Quality of life in the old age and social, demographic and situational variables. D' Alessandro, M. (2004). Calidad de vida en la vejez: descripción y modelo de ruta. Tesis de Maestría no publicada para optar por el título de Magíster en Psicología. Universidad Simón Bolívar, Caracas, Venezuela.

#### **PC7 651 SUCCESSFUL AGING: WHO MET THE CRITERIA?**

N. MENDOZA RUVALCABA\* (Universidad de Guadalajara, Zapopan, Mexico)  
E. ARIAS MERINO(1), I. DÍAZ GARCÍA(1), A. SÁNCHEZ MORALES(1) -  
(1) Universidad de Guadalajara (Guadalajara, Mexico)

Introduction: Is not clear which indicators characterize elderly persons as successfully aged. Our aim was to measure the prevalence of successful aging in Mexican women according with definitions and indicators reported in different world wide studies. Methods: Data analysis from the cross-sectional study "Mujeres Grandes" conducted in Guadalajara, Mexico 2007. Data were obtained from 638 women participants, aged 60+ (mean=70.9, SD=7.1), all of them were classified as successful or not successful based

on 16 different authors definitions. Results: The range of proportion of successfully agers varied greatly from 1.7% to 97%, the mean was 38.4% (SD: 31.2; median: 32.6; percentile: 25-75=6.7-67.2). The major variations were found when definitions included disease-free criteria, with a mean proportion from 2.9% (SD: 1.2; median: 2.9; percentile: 25-75=1.7-4.2) to 46.5% (SD: 28.8; median: 48.2; percentile: 25-75=20.3-73.3) when excluded. According with definitions including all biological-psychological-social criteria, mean proportion was 2.3% (SD: 0.8; median: 2.3; percentile: 25-75=1.7-2.9). When only biological criteria were included, mean proportion of successful agers was 63.8% (SD: 21.2; median: 73.3; percentile: 25-75=41.7-76.4), according with the only one definition including just psychological criteria 97.2%, none reported only social criteria. The proportion of successful agers was 28.5% (SD: 21.7; median: 23.3; percentile: 25-75=7.3-52.8) according with definitions including both biological-psychological criteria. The most used criteria for successful aging were functional and cognitive ability. Among the studies including functional ability, mean proportion of successful agers in our population was 34.6% (SD: 29; median: 28.2; percentile: 25-75=5.6-61.2), and was duplicated among definitions of studies that did not include (mean: 64.7%; SD: 45; mean: 64.7; percentile: 25-75=32.2-97.2). When cognitive ability was not taken into account, 54.6% (SD: 33.7; median: 70; percentile: 25-75=23.3-76.4) met the criteria of successful aging, and when it was, just the half 25.7% (SD: 23.8; median: 17.3; percentile: 25-75=3.6-52.8). Conclusion: The arbitrary nature of the definitions resulted in considerable variation in the proportion of successfully agers in the same population. It is necessary to establish a standard for defining and quantifying the concept of successful aging.

#### **PC7 652 SIMPLIFYING AND INDIVIDUALIZING HEALTH-RELATED INFORMATION PROMOTES RECALL**

N. NOTTHOFF\* (Stanford University, Stanford, United States)  
L. CARSTENSEN(1) - (1) Stanford University (Stanford, CA, United States of America)

Introduction: Health-related instructions are important for health promotion among elderly and their ability to manage health problems. Health professionals and studies report that individuals recall very little of the information that is provided in terms of diagnoses or advice regarding health-promoting behaviors. In this study, the complexity and emotional valence of health-related advice was manipulated to find out, if recall could be improved. Particular attention was paid to the differences between younger and older adults. Methods and Materials: Younger adults (n=37, mean age=24.57) and older adults (n=34, mean age=74.18) performed a standardized step test and were informed about the general meaning of the test for health promotion as well as about their personal performance scores. The complexity and emotional valence were manipulated. Recall was tested in a delayed free recall task. Results: Both age groups recalled the information of low complexity better than the highly complex one. Additionally, low complexity with a negative framing was most advantageous for the old persons (32% recalled compared to 20% in all other conditions) ( $p<0.05$ ). All participants recalled more about their personal performance scores than about the meaning of the test for health maintenance. Test performance and recall were related in the older group only. The higher their personal performance score, the better they recalled particularly the negatively framed information (meaning of the test for health:  $r=0.43$ ,  $p<0.1$ ; personal performance:  $r=0.51$ ,  $p<0.05$ ). When information was framed positively, test performance was only related to recall of personal performance scores ( $r=0.47$ ,  $p<0.01$ ;  $r=0.54$ ,  $p<0.05$ ). Conclusion: The study confirmed that for the elderly the reduction of complexity of information, and its individualization can improve recall of health related advice.

#### **PC7 653 EFFECTS OF AGING ON THE ABILITY TO IGNORE TASK-IRRELEVANT FLUCTUATION IN PITCH DISCRIMINATION TASKS**

B. ESPINOZA-VARAS\* (Univ. Oklahoma Health Sciences Ctr., Oklahoma City, United States of America)

Selective-attention deficits impairing the ability to extricate relevant from irrelevant information at the perceptual level could help diagnose age-related cognitive decline at an early stage. The experimental evidence supporting this claim is already considerable, but it remains to be determined where and how the irrelevant information interferes with the relevant one. To help answer this question, the effects of irrelevant duration or level differences on pure-tone frequency discrimination thresholds (FDTs) were studied in healthy, normal-hearing, young and older adults. Target tones were presented either in isolation or followed by a distracter tone after a 90- or 350-ms silent interval; both tones were 1000 Hz, 80 ms, and 70 dB SPL. Irrelevant differences occurred simultaneously with relevant frequency differences or sequentially, in the distracter. With both presentation formats and silent intervals, FDT elevations (i.e., interference) were much larger in older than in young adults if the irrelevant differences were in level, but if they were in duration, FDT elevations were small in both groups; these trends could be accounted for in terms of context effects. The interference seems to take place at relatively late rather than early information-processing stages because it happens both simultaneously and retroactively (i.e., sequential), and depends on the similarity of relevant and irrelevant dimensions.

**PC7 654 A META-ANALYSIS OF COGNITIVE AND PHYSICAL FITNESS TRAINING TRANSFER EFFECTS**

S. HINDIN\* (University of Southern California, Los Angeles, CA, United States)  
E. ZELINSKI(1) - (1) University of Southern California (Los Angeles, CA, United States of America)

**INTRODUCTION** The effectiveness of transfer of cognitive abilities in older adults through cognitive and physical fitness training has been questioned. We conducted a quantitative meta-analysis to determine what kind of training and construct combinations have shown the largest transfer effect sizes. We hypothesized that not all training studies would yield similar effect sizes and that cognitive training would differ from aerobic exercise study effect sizes for different cognitive abilities. METHOD Thirty-five cognitive training studies were selected if they tested the transfer of untrained cognitive abilities from one area to another for older adults. Only studies with older adult control groups were included. All of the d values were coded for one of three training types: cognitive training, which could be either strategy or practice, or aerobic training. Effect sizes were computed for the transfer abilities of functional abilities, memory, mental rotation, reasoning, speed, subjective changes, supervisory, visual, working memory, and IQ. 365 d values were calculated from the 35 studies. Overall tests of homogeneity were performed for the three different training types as well as for the ten dependent cognitive constructs. RESULTS The overall effect size was very small, with a mean d of .04 and heterogeneous across studies ( $Q = 698$ ). Both cognitive and aerobic studies were also heterogeneous ( $Q$ 's of 545 and 153). Evaluation of specific transfer abilities indicated that memory and reasoning showed no transfer in aerobic studies; as shown previously, speed, supervisory abilities, and working memory were improved, with effect sizes ranging from .12 to .19. For cognitive training, speed, memory, and subjective appraisals improved, with effect sizes ranging from .12 to .38. DISCUSSION This meta-analysis revealed that cognitive training and aerobic training studies differ in transfer outcomes and effect sizes, suggesting that combining both approaches may optimize improvement in cognitive aging.

**PC7 655 "ONE WHO PLANTS A GARDEN, PLANTS HAPPINESS": THE THERAPEUTIC BENEFIT OF GARDENING ACTIVITIES FOR OLDER COMMUNITY DWELLING ADULTS**

T. SCOTT\* (University of Queensland, Brisbane, Australia)

The importance of the aesthetics of nature to human well-being is commonly acknowledged, and a growing body of evidence describes the psychological and physiological benefit obtained from natural environments. According to Biophilia theory humans are not only genetically encoded to respond positively to natural environments, our emotional, intellectual, and physical well-being depends upon having access to nature (Wilson, 1984). For older adults, gardening activities potentially provide an outlet for enhanced physical and emotional well-being. Increased physical activity can reduce the risk of some cancers, Type 2 diabetes, heart disease and depression (Mathers, Vos, & Stevenson, 1999), all of which are significant contributors to Australia's health care costs. Therefore having an understanding of older adults' motivation for continuing participation in gardening would be beneficial. The aim of the present study was to further an understanding of the therapeutic benefits of adults' gardening experiences. It was hypothesised that participants' experiences of gardens and green spaces would be linked to their enhanced physical and emotional well-being. Method and Materials The sample consisted of 31 community-dwelling adults ( $F=21$ ,  $M=10$ ), whose ages ranged from 50 to 86 years ( $M= 67.35$ ,  $SD=8.68$ ), recruited from New South Wales and Queensland, through local church and social groups. A self-report survey instrument was constructed for the study based upon a framework of biophilia (Wilson, 1984) and ageing theories (Baltes et al., 1999). Participants indicated their agreement, on a scale of one to five, with a set of attitude statements. The survey also included several open ended questions, demographic questions, and a gardening activity inventory. Results and Conclusions Quantitative and qualitative analysis showed that participants derived a sense of purpose, and enjoyed physical and emotional well-being through their gardening experiences. They enjoyed the tangible benefits, as well as the aesthetics of gardens, citing "pleasure" as the primary reason for their continued involvement. Those participants who indicated that they were members of a gardening group, reported significantly more 'social benefits', compared to those who were not. The findings have implications for encouraging older adults' participation in gardening activities, and for the creation of social gardening programs for older adults residing within the community and in residential aged care facilities.

**PC7 656 THE CHANGES OF EMOTION EXPERIENCES, DEATH ANXIETY, AND SUBJECTIVE WELL-BEING IN OLD AGE: AN ANALYSIS OF LONGITUDINAL STUDY.**

K. RYU\* (Hallym University, Chuncheon, Republic of Korea)

The purposes of this study were to investigate the changes of subjective well-being(SWB) and emotional experiences(EE), death anxiety(DA) in old age and to analyze the effects of EE, DA on the SWB in old age based on the longitudinal data. Hallym longitudinal aging study was started at 2003. The 1st wave was in 2003 and 2,529 old adults were participated. The 2nd wave study was with 1,798 participants and the 3rd wave study was with 1,131. Using PANAS, PGCMS and the death anxiety questionnaire, this study was performed. In results, the SWB was not dramatically decrease with age. Female old adults'

SWB were lower than the male old adults. The elderly experienced more positive emotions(PE) than the negative emotions(NE) and the frequencies of experience of negative emotions were not increase with age. The elderly experience less negative emotions as they get older. Death anxiety was increased with age and female old adults experienced more anxiety than the male old adults. Experiencing more PE, less NE and lower death anxiety had positive effects on maintaining the SWB in old age. Especially, experiencing less negative emotions was more helpful to optimize one's SWB in old age than experiencing more positive emotions. These results support the socioemotional selectivity theory and emphasized the importance of quality of emotional life in old age.

**PC7 657 THE MEANING OF AGING FOR ELDERLY HOMOSEXUAL MEN IN ISRAEL**

A. WALDMANN\* (Bar ilan university, israel and rishon-lezion mental health community center, israel, Herzliya , Israel)  
N. BAUM, V. SOSKOLNE

**Introduction** Understanding the meaning of aging as it is perceived and experienced by elderly homosexuals in Israel is the theme of this qualitative research. Literature points at the fact that the population of the elderly homosexuals suffers from exclusion and stigmas by elderly heterosexuals and at times also by the young men in the homosexual community. The present research aims to shed a light, on the experience and the perception of aging among elderly homosexuals who did not expose their sexual inclination. This research is first of its kind which is held among elderly homosexuals in Israel. Methods The aim of the present research is to learn, through the elderly themselves and based on phenomenological methodology including semi-structured in depth interviews, about their world, perceptions , experiences and the manner in which elderly homosexuals grasp and perceive their aging within the Israeli society. The population in this research included ten elderly homosexual between the ages of 72 and 80. Results The findings of the research pointed out four major themes that preoccupy the elderly homosexuals: the conflict between acceptance of the old age and its denial; difficulties in getting older and the coping modes with them; the familial and social relationships of the elderly homosexuals and homosexuality and the attitude towards it all along the years. Conclusion The conclusions of the research were: (1) There is more similarity than difference between the aging process of the homosexual elderly and that of the heterosexual elderly (2) the elderly find it difficult to accept their old age but they do not reject the changes bound by the actual aging process (3) there are difficulties in the familial and social relationships of the elderly and their source is usually linked with their sexual inclination and seldom with their aging (4) the concept "coming out of the closet" as it appears in professional literature does not correlate with the actual process of coming out of the closet of the interviewees .

**PC7 658 RELATION OF EVALUATOR'S ATTRIBUTE TO SELF-REPORTED VISUAL AND/OR HEARING DIFFICULTIES.**

Y. ISHIOKA\* (Osaka University, Suita, Japan)  
Y. GONDO(1), D. UENO(1), N. RENGE(1), I. KUROKAWA(1), A. FUJITA(1) -  
(1) Graduate School of Human Sciences Osaka University (Suita City, Japan)

**Introduction** Recently, influences of sensory losses to the psychosocial variables are draw attention in the epidemiological research for the elderly people. Availability of subjective reported sensory impairment rather than objective measure of sensory loss are pointed out because subjective report in visual and hearing impairment reflect the level of the difficulty experiencing in the daily activities (Massof et al., 2001). A study that validated the relationship between audiology and self-reported hearing difficulties among healthy workers showed lower correlation between two measurements (Hashimoto et al., 2004). However, he concluded although subjective reported hearing difficulties may not be replaceable measure to objective audiology measurement, but may be useful tool to detect psychosocial problems of hearing. Thus, the aim of this paper is to test relationship between self-reported visual and/or hearing difficulties and psychosocial background. Methods and Material Participants were younger people ( $N=352$ ), middle-aged ( $N=325$ ), and younger elderly ( $N=565$ ). Visual and hearing impairments were assessed by the self-assessed measurement in everyday situations; seeing well enough to read street signs at night, a friend across the street, and newspaper, and hearing enough to understand words in a normal conversation, over the telephone, and on a conversation.(Wallhagen et al., 2004; Strawbridge et al., 2007). Response sets and scores for each problem were none (0), a little (1), some (2), and a great deal (3). In addition to sociological background of age, sex, living together, outgoing frequency, we also measured self - rated health, mental health, and 5 dimension of personality traits. Result In younger elderly, there were statistically significant but moderate correlation between hearing impairment and neuroticism ( $r=.091$ ) and extroversion ( $r=-.089$ ), and between visual impairment and living together ( $r=-.088$ ), self-rated health ( $r=-.177$ ), mental health ( $r=-.121$ ), neuroticism ( $r=.127$ ), extroversion ( $r=-.193$ ), agreeableness( $r=-.088$ ), and conscientiousness ( $r=-.251$ ). Conclusion The results indicated that psychosocial background has some relation to self-reported sensory difficulties.

**PC7 659 FREQUENCY OF GOING OUTDOORS AND SUBJECTIVE WELL-BEING AMONG OLDER ADULTS IN JAPAN: A 5-YEAR LONGITUDINAL STUDY**

S. LEE\* (Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan)  
S. SHINKAI(1), Y. FUJIWARA(1), H. YOSHIDA(1), Y. KOUSA(1), T. FUKAYA(1) -  
(1) Tokyo Metropolitan Institute of Gerontology (Tokyo, Japan)

**Introduction:** Previous studies have demonstrated that frequent going outdoors in daily life is beneficial effect on physical health for older adult. However, little is known about its effect on subjective well-being. The purpose of this study was to determine the role of frequency of going outdoors on self-rated health using a sample of Japanese older adults. **Methods and Materials:** Out of one-third randomly selected subjects from all residents aged 55 to 79 years who lived in Hatoyama town, 1.5 hours apart from central Tokyo, 677 subjects without any mobility difficulty completed both the baseline and follow-up surveys 5 years apart (2002-2007). The town consists of two different residential areas; one is so called "New Town" which was developed in 70's, and another is original agricultural area. Frequency of going outdoors in daily life was assessed by following 4 categories: more than once per day, once per 2-3 days, once per a week, and seldom. Subjective well-being was operationally defined by self-rated health. Responses were coded as excellent/good=1 and fair/poor=2 for the analysis. Multivariate logistic regression analyses were used to determine an independent association between the frequency going outdoors at baseline and self-rated health at follow-up, controlling for potential confounders such as age, gender, residential area, educational attainment, self-rated health, medical conditions, subjective rating of economical status, social support indices at baseline. **Results:** Those who went outdoors more often at baseline likely reported to have better subjective health at follow-up ( $p<0.001$ ). Even after multiple-adjustment, the effect of frequency of going outdoors remained significant (odds ratio=1.79, 95% confidence interval 1.17-2.74,  $p=0.007$ ). **Conclusion:** Frequent going outdoors in daily life have beneficial effect on subjective well-being in older adults independent of potential confounders, suggesting the importance of physical and social activity.

**PC7 660 OLDER ADULTS' POOR MEMORY PERFORMANCES ARE NOT INEVITABLE! THE COMPENSATORY ROLE OF MOTIVATION**  
**M. BEAUDOIN\*** (Université de Savoie, Chambéry, France)  
**O. DESRICHARD(1) - (1)** Université de Savoie (Chambéry, France)

Research into the psychology of aging has shown the existence of a decline in various memory functions. One explanation for this age-related memory decline, developed since the mid-1980s, involves the construct of memory self-efficacy (MSE), people's confidence in their memory abilities. The literature on MSE converges to show that older adults obtain lower memory performances in part because they believe their memory is poor. However, the mechanisms responsible for this effect are poorly understood. The aim of our study was to test the hypothesis that the impact of one's MSE on one's episodic memory performance is mediated by one's persistence when performing memory tasks. Eighty-one adults aged 55 and over participated in this study. The participants completed a MSE questionnaire and performed a difficult self-paced word-list free recall task. The time taken to study the word-list (study time) was taken as a measure of persistence during encoding. Participants' age, education level, depressive symptoms, memory span and episodic memory abilities were collected to be controlled, as were several other variables potentially confounded with study time such as time-consuming regulation actions (performance monitoring, strategy use...). The results showed the expected mediation effect. Controlling for the potentially confounded variables, word recall scores were positively predicted by MSE scores, with this effect being partially explained by the longer study time of participants with higher MSE scores. In conclusion, our data support the hypothesis that the positive impact of one's MSE on one's memory performance is mediated by one's persistence on the task. Our results are discussed in relation to classical theoretical models of memory aging focusing on the "cold" and uncontrollable aspects of cognitive aging (e.g., speed of processing) to propose a more complete and optimistic view of memory aging. The practical implications of such a model are then highlighted.

**PC7 661 OBSTRUCTIVE SLEEP APNEA SYNDROME (OSAS): DIFFERENTIAL COGNITIVE IMPAIRMENTS ACCORDING TO AGE**  
**F. EL MASSIOUI\*** (Laboratoire CHArt (Université Paris 8) & Laboratoire , Saint-Denis, France)  
**P. DEBLOIS(3), L. RICO-DUARTE(1), M. BRAMI(1), F. MASSELOT-GOMIS(1), N. ZREK(3), F. BOUR(3), M. OUHAYOUN(3), F. HERAUT(4) - (1)** Laboratoire CHArt - UFR de Psychologie, Université Vincennes / Saint-Denis Paris 8 (Saint-Denis, France); (3) Centre Hospitalier de Gonesse - Service d'Exploration Neurofonctionnelle (France); (4) Service d'Exploration Fonctionnelles. Hôpital R. Poincaré (Garches, France)

Numerous studies show that patients suffering from OSAS develop neurocognitive impairments. The present study aimed to assess the relationships between OSAS, age and cognitive disorders. **Methods:** 27 community-dwelling recently full night polysomnography-diagnosed untreated OSAS, aged from 29 to 75 years (Group 1: mean years [standard deviation]= 42,45 [6,7]; Group 2: 54,71 [3,15]; Group 3: 68 [5,48]) were studied. All patients performed neuropsychological tests (MMSE, Dual task (DualT), Trail Making Test (TMT)). In order to assess patients' abilities in immediat/delayed recall and memory span, patients were presented a list of 16 words in three successive trials. They had to recall items after each presentation (immediate recall) and fifteen minutes latter (delayed recall). Memory span ability was assessed with tests of increasing complexity: Digit Span forward (Digit-f), Digit Span back (Digit-b) and Digit Ordering Test (DOT). Results were compared to healthy subjects data and between the three groups Results: Patients' scores in MMSE were similar as those of healthy subjects. In DualT, no between group difference was observed. In TMT, there was an age effect ( $p<0,01$ ), particularly

marked in TMT-B condition ( $p<0,001$ ). In immediate recall tests, even though all subjects improved their performance in successive trials ( $p<0,001$ ), older subjects showed lower performances than younger subjects ( $p<0,05$ ). In delayed recall, all performances decreased ( $p<0,01$ ), with no age effect. In memory digit span, a difference between the three tests was observed (Digit-f > Digit-b > DOT:  $p<0,001$ ), with no age effect. **Discussion:** Age and OSAS seem to alter in the same way older patients' performances. However, the most striking result of this study is the low performances of younger patients in the memory span digit test, assessing working memory. These performances are in the same range as those of the elderly healthy subjects, suggesting that OSAS could be a model of early pathological aging.

**PC7 662 MEMORY TRAINING FOR OLDER ADULTS WITH LOW EDUCATION: MENTAL IMAGES VERSUS CATEGORIZATION**  
**M. YASSUDA\*** (São Paulo University, São Paulo, Brazil)  
**H. SALMAZO DA SILVA(1) - (1)** São Paulo University (São Paulo, Brazil)

**Introduction:** Considering that in developing countries such as Brazil, a high percentage of older adults are illiterate, or have limited educational experience, it is necessary to investigate which training strategies may be more effective for cognitive improvement in this group. This study aimed to describe the potential benefits of memory training to older adults with zero to two years of formal education, and to compare the effectiveness of categorization and visual imagery training. **Method and materials:** 29 healthy older adults with zero to two years of formal education participated. 16 participants received training based on categorization (categorization group- CATG) and 13 received training based on mental images (imagery group - IMG), one group served as control for the other due to the fact that they trained different strategies. Training was offered in 8 sessions of 90 minutes. The participants were evaluated pre and post training through cognitive screening tests (MMSE - Mini Mental State Examination, VF - Verbal Fluency animal category), episodic memory tests (18-picture memory test and the RBMT - Rivermead Behavioral Memory Test) and the GDS - Geriatric Depression Scale. **Results:** IMG improved performance in episodic memory tests and had reduced depressive symptoms. CATG increased the use of categorization strategy, but did not increase performance in episodic memory tests. **Conclusion:** Results suggest that the strategy based on the creation of mental images was more effective for older adults with low formal education.

**PC7 663 NIGHT PRAYING AND ITS EFFECT TO QUALITY OF LIFE IN AGING**  
**S. HADIATI \*** (School of medicine, university of airlangga, Surabaya, Indonesia)

Aging in Indonesia now reach 11% of total population. so it is needed to increase his/her quality of life (QOL), to reduce the burden of worker dependent ratio. Since Moslem is 85% of the population, and aging condition tended to raise the spirituality and moreover its enthusiasm is better in women aging, the research was conducted in organisation of fatayat (special for women moslem adult), affiliated to the Nahdlatul Ulama, which was the biggest Moslem NGO. Research question: what is the effect of regulatory night praying in aging? Is there any difference effect with in teens/adult like Psychoneuroimmunology theory? We conducted the quasixperimental pre-post design study and this was analysed in multi variate and would become as preventive treatment to worsen condition in aging. All of respondent are 43 member of board of east java branch of fatayat NU, who live in Surabaya, and more 60 years old. All was informed consent and agreed to volunteer. They agree to conduct night praying for 2 rakaat (the essential unit of praying ritual) every night at 2.00-3.30 dawn for 3 months. before and after intervention we examined the clinical and laboratory. We used telephone survey to ask the conduct of night pray and its symptom effect. Only 19 women could night pray for 1 month regulatory, (regarding to not accustomed, too fatigue etc) and only 11 could passed this intervention. So, the grouped was divided to 2 part, ie. used to be and not to night pray. There was correlation between clinical and laboratory examination result between night pray and not, and between the aging women who have degenerative illness or not. The complaint of pain was reduced, the degenerative illness was less, and cortisol was increased in women who night pray, which means they were eustress, sincere. it could raised the serotonin, epinefrin and endorphin, then give to well psychological effect. It suggest the confirmation between the effect of psychoneuroimmunology in all years of old, and would conform spiritual practice could be as a tool to raise the quality of life in a cheaper way and every day life.

**PC7 664 SOCIAL SUPPORT AND WELL BEING IN PERUVIAN OLDER ADULTS**  
**D. GAZZOLO\*** (SCHOOL OF PSYCHOLOGY UNIVERSIDAD RICARDO PALMA AND INSTITUTO DE GERONTOLOGIA UNIVERSIDAD PERUANA CAY, LIMA, Peru)

The last ten years in Peru implied a breakthrough in practice, policies and research in gerontological work, however living conditions in the country show us a great inequality among Peruvians. Our study examined social support (SP) and well-being (WB) in a community dwelling older adults sample in Lima- Peru, and also types of SP. **Methods and Materials:** Participants were 639 older adults who attended senior clubs from different counties of Lima., 60% women , range of age 60-79 , with no cognitive problems assessed with the Minimental. These persons were interviewed to assess four domains of social support ( informational, emotional , tangible and integration) and well being. We used a

spanish version of the Social Support Scale by Neal Krause , previously adapted and a Spanish version of the Morale Scale by Powell Lawton also previously adapted to this population. Correlations between SP and WB were examined within age groups (60-64, 65-69, 70-74, 75-79) and across ages. Results: Initial findings show that correlational analyses revealed positive significant relationships between all four types of SP and WB and also that older adults received more emotional and informational support from their families than tangible and integration support. Conclusion: Our findings initially suggest that SP has an important implication for the psychological WB of older adults, specially in our country with 70% of older adults that do not have real social protection and thus, they are an invisible group for our society and also that people like to advise and encourage other persons very easily but when real help is needed the motivation to aid older adults begin to diminish. We have more data to consider policies and more research to address these social problems.

**PC7 665 THE ROLE OF FAMILY AND FRIENDS IN BEREAVEMENT PROCESS: A QUALITATIVE RESEARCH WITH OLDER WIDOWS AND WIDOWERS LIVING ALONE IN JAPAN**  
I. SUGAWARA\* (University of Tokyo, Tokyo, Japan)

Loss of the spouse is a common life event in late life. Older people who live alone are in a high-risk group for social isolation and it is an emerging issue in Japan to understand the life of older widow(er)s living alone and to provide appropriate support to them. However, little research has been conducted on older widow(er)s who live alone in Japan because traditionally older people who lose their spouses live with their adult children. Recently multi-generational family becomes less common and more and more older people live by themselves. The aims of this study were to examine the stresses older people face after the loss of spouses, and to understand the role of family and friends in bereavement process. Semi-structured in-depth interviews were conducted with fifteen older Japanese living in Tokyo metropolitan area who lost their spouses recently. Grounded theory approach was adopted. The result showed that the common stresses just after the loss of the spouses were financial matters and grief. At this period, children provide various kinds of support to their parents, and friends sometimes caused negative stress, rather than providing support. After a period of time, however, the role of friends appeared to become important. Going out and having fun with friends could distract them from mundane loneliness. They could find new hobbies and new social network through their friends. These functions were hard to be obtained from their children. The study suggested the unique role of friends in the bereavement process. A community program which provide opportunity for social interactions among older people might work as an alternative for the widow(er)s who do not have close friends. In the future study of bereavement, much more attention should be paid to the function of friends.

**PC7 666 ALLOCENTRIC AND SEQUENTIAL EGOCENTRIC NAVIGATION: NEUROPSYCHOLOGICAL CORRELATES AND IMPACT OF AGING**  
V. DELEPINE\* (CNRS, Paris, France)  
L. RONDI-REIG(3), K. IGLOI(2) - (2) CNRS (Paris, France); (3) CNRS (France)

Our aim was to explore if normal aging has an impact on the choice and performance of navigation strategies. 50 healthy subjects (22-89 years old) were evaluated on neuropsychological tests, and on the virtual version of the Starmaze labyrinth. In this task, participants had to learn to navigate to a hidden location having the possibility to use either an allocentric or a sequential egocentric strategy, or both. The task comprised training and probe trials: during the former, subjects were free to use sequential egocentric or allocentric strategies, whereas modified departure points in probe trials allowed to dissociate both strategies according to the performed path. During three following trials, subjects were forced to use egocentric, and then the allocentric strategy. The results showed that it took older adults longer than younger ones to locate the goal (13 vs. 9 training trials) but performance was identical for all age groups at the end of the task. The correlation analysis with neuropsychological tests revealed that the observed slowdown is due to executive and mnemonic deficits. Young subjects used only sequential egocentric or allocentric strategies throughout the task, whereas half of the older adults used either mixed or unorganized strategies in the first part. By the end of the task, distribution of sequential egocentric and allocentric navigation strategies were equivalent. During the following imposed trials, all subjects were capable of correctly using not spontaneously used strategies, showing that old adults were capable of conjoint strategy encoding. Overall, results show that older adults reach exact same performance as their young counterparts after extensive training. This suggests that age affects learning speed but not final performance or strategy choice. We are evaluating use of navigation properties as early indicators of cognitive impairment, by studying navigation performance in normal subjects and MCI patients.

**PC7 667 AGE-EFFECTS IN DISTRACTIBILITY: A MATTER OF PERCEPTUAL OR CONCEPTUAL INTERFERENCE?**  
C. TITZ\* (DIPF German Institute for International Educational Research, Frankfurt am Main, Germany)  
M. HASSELHORN(1) - (1) DIPF, German Institute for International Educational Research (Frankfurt am Main, )

Introduction: According to the inhibition deficit account, inefficient attentional control weakens older adults' resistance to distraction (Hasher, Zacks & May, 1999). Distracting information can thus withdraw attention from relevant stimuli. Distractibility has experimentally been measured by comparing response times in control-conditions (target and distractor), with response times in single-target-conditions (target only). Control-trials and single-target-trials differ, however, in both perceptual and conceptual features. In the current study, we examined whether age effects in distractibility stem from visual or conceptual distraction. Methods and materials: Participants were forty younger ( $M = 25$  years,  $SD = 2.5$ , 28) and forty older adults ( $M = 67$  years,  $SD = 4.7$ , 22) not differing in verbal intelligence nor health-status. Participants had to name a green target line-drawing, while ignoring a red distractor. A  $2 \times$  (age group)  $\times$  2 (trial-condition)  $\times$  2 (distractor condition) design was used. Trial condition consisted of control-trials (CO, target and distractor) and single-target trials. Within the single-target trials, distractor condition varied as a nested between-subjects factor (target alone, ST, or target superimposed with nonsense line-drawings, ND). Results: Reaction times on targets were analyzed in a  $2$  (age group)  $\times$  2 (trial condition)  $\times$  2 (distractor condition) analysis of variance. The most important result was a three-way-interaction for age group by trial condition by distractor condition  $F(1, 76) = 9.1$ ,  $MSE = 711.4$ ,  $p < .005$ . The difference in reaction time was greater for older than for younger adults, when CO was compared to ST, but not, when CO was compared to ND. Conclusions: Age effects became obvious, when trials differ in visual features (CO vs. ST), but not, when trials were paralleled for visual features and differed only in conceptual competition (CO vs. ND). It is thus reasonable to conclude that age effects in distractibility stem from visual distraction.

**PC7 668 WELL BEING IN OLDER AGE: FROM FLOW TO EUDEMONIA AND HEDONISM**  
M. FERREIRA\* (University of Minho, Guimarães, Portugal)  
T. FREIRE(1) - (1) University of Minho (Braga, Portugal)

Introduction: The importance of positive experience, specifically the analysis of the components and determinants of one's well-being, has gained increased recognition by scholars. According to empirical research, well being is related with better coping, lower morbidity and lower mortality. Because of that, in older age well being assumes an increased importance. Recently, some scholars have defended that well being is a multifaceted construct composed by an eudemonic dimension, which focuses on meaning and self-realization, an hedonic dimension, which focuses on happiness and on pleasure attainment and pain avoidance, and by a third dimension which involves the presence of an intrinsically motivated state that results in a deep and intense involvement on the task, the flow. Considering these well being dimensions, the main goals of this study are to analyse the well being levels of the elderly in each one of the three dimensions (subjective well-being, psychological well-being and flow), and to examine the correlations between them in order to explore their conceptual relations. Methods and materials: Participants were 30 elderly (mean age of 71 years old; 46% men and 54% women) recruited on Portuguese senior associations. Data were collected using self-report measures (Portuguese versions), namely the Flow Questionnaire, the Scales of Psychological Well-Being (Ryff, 1989), and the Satisfaction with Life Scale (Diener, 1985). Results: Two types of results are presented: first, a characterization of the levels of satisfaction with life, psychological well-being and flow (measured through the individual levels of involvement, enjoyment, control, concentration and interest), experienced by the participants; second, the correlations between the levels of flow and the others two well being measures. Conclusion: Positive experiential profiles in old age are discussed, considering differences and similarities on well-being dimensions. The role of flow and optimal experience in old age is highlighted, concluding about its impact in healthy life trajectories and in individual and social well-being.

**PC7 669 NATURE OF COGNITIVE DEMANDS MODULES AGE-RELATED REORGANIZATION**  
J. ANSADO\* (Centre de Recherche, Institut Universitaire de Gériatrie de Montréal, Montréal, Canada).  
MONCHI(4), S. FAURE(3), N. ENABIL(1), Y. JOANETTE(1) - (1) Centre de Recherche, Institut Universitaire de Gériatrie de Montréal (Montréal, Canada); (3) Laboratoire de Psychologie Cognitive et Sociale, Université Nice Sophia Antipolis (France); (4) Département de radiologie, Université de Montréal (Canada)

Introduction: Neurofunctional reorganization is associated to successful cognitive aging. This reorganization follows both inter- or an intrahemispheric pattern. Cabeza (2002) proposed the HAROLD phenomena to account for the fact that the brain activity of elderly tends to be less lateralized. At the same time the intrahemispheric pattern is also reshaping. Davis and colleagues (2007) reported the presence of a Posterior-Anterior Shift in Aging. Finally, Banich and colleagues's finding (1998) which suggests that the interaction between the two hemispheres represents a flexible mechanism allowing them to couple for high-demanding conditions. Based on these findings, we hypothesized that the aging is characterized by a greater hemispheric coupling in older adults and that intrahemispheric pattern could also be modulated by task difficulty. We thus investigated age-related changes in activation patterns during the performance of a letter-matching task with several levels of complexity using functional Magnetic Resonance Imaging (fMRI). Methods: Sixteen healthy youngs adults and 16 healthy old adults were submitted to an active and a control task. The active one has several levels of complexity based on a "high" and "low"

cognitive level across two variables: decision complexity and attentional load. The control task was a letter-case judgment, similar to the stimuli in the experimental task. Results and discussion: Preliminary analyses show that increasing attentional load is associated with a bilateral activity of the putamen and the middle occipital gyrus (area 18 and 19) in the young adults whereas older adults showed significant activity for additional sites in right and left Parietal Lobe (area 7). For the high condition of decision complexity a direct group comparison showed a greater activation in a number of areas (right insula superior temporal gyrus and superior frontal gyrus) for the older vs. the younger adults suggesting an occipital to temporo-frontal reshaping in aging.

#### **PC7 670 RELATIONSHIP BETWEEN SUBJECTIVE ISOLATION AND SOCIAL CAPITAL**

M. NISHI\* (Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan)  
Y. FUJIWARA(1), E. KOBAYASHI(1), T. FUKAYA(1), M. SAITO(2), Y. INABA(3), S. SHINKAI(1) - (1) Tokyo Metropolitan Institute of Gerontology (Tokyo, Japan); (2) Graduate School of Sophia University (Tokyo, Japan); (3) Nihon University (Japan)

Introduction: The purpose of this study was to explore community-related factors associated with subjective isolation among older adults in Japan. Method: The survey was administered between July and September 2008 in Wako-city, Saitama prefecture, Japan. The south area of this city lies next to Tokyo. Data were collected from 25.6% of the whole community-dwelling older adults aged 65 years and over (n=9886). Questionnaires were distributed and returned by mail or by hand of residents in local welfare commission. We asked variables related to local community such as social capital (Fujisawa et al., 2007: civil trust, mutual help, secure and pleasant community environment, etc), neighborhood environment (problems associated with community living such as traffic, access of public transportation, etc) and residential term. Results: 70.1% of residents responded (n=1772, mean age $\pm$ SD: 73.3 $\pm$ 6.3, male: 47.9%). Within subjects who answered to the subjective isolation status, 43.9% reported that they almost never feel isolated from others, 41.7% reported they less likely feel isolated, 14.4% reported they sometimes or often feel isolated. Simple correlation analyses demonstrated that subjective isolation significantly correlated with social capital score, several variables of neighborhood environment and duration of residence, in addition to age, mobility capability, depressive symptom (Geriatric Depression Scale), working status, family composition. After adjustment with other variables (age, sex, depression level, etc), social capital score was still significantly associated with subjective isolation. Conclusions: This study showed a strong relationship between older resident's subjective isolation and social capital. Our results suggest that quantity or quality of community environment including social capital might have an effect on mental health. Considering the possibility that physical and psychological vulnerability increases with age, exploring the most necessary social capital element in communities will be an important theme for further research.

#### **PC7 671 THE INFLUENCE OF HAVING CHILDREN AND THEIR SUPPORT FOR SUBJECTIVE WELFARE OF ELDERLY WHO LIVE ALONE**

A. KIIS\* (Tallinn University, Tallinn, Estonia)

Introduction. In general the relationship between the elderly and the people close to them involves mutual assistance, in addition to that the family relations also meet social and emotional needs. Methods and material. The initial sample consisted of 1805 potential respondents living alone, i.e. approximately 3% of all elderly over 65 living in one-member households in Estonia. The current study (2004–2005) analyses the questionnaire responses of 427 persons. When conducting the research the proportion of the gender and the place of residence distribution of the whole population was taken into account. The data has been analyzed as frequency distributions. Results. Among the respondents 34.8% were men and 65.2% were women. 73.9% of elderly who lived alone had children, incl 75% of men and 71% of women. The children live in the same town or parish for 60% of men and 64% of women. 28% of elderly fathers and 30% of elderly mothers are visited by their children once a week. 38% of elderly men and 27% of elderly women visit their children on average once a month. The children are also those people with whom all men and 99% of women wish to communicate the most. Financial support is received from children by 19% of men and 36% of women. The children (and grandchildren) are also the persons to whom the elderly turn most often for help: 29% of men and 46% of women. When evaluating their state of mind: when they had children 66% of men and 42% of women felt happy; when they did not have children then 7% of men and 33% of women felt happy. In conclusion. Having children (and their support) guarantees for the elderly subjective wellbeing, it is especially important for elderly men.

#### **PC7 672 NEGATIVE PRIMING – EFFECT OF TARGET SELECTION OR RESPONSE GENERATION? A STUDY WITH YOUNGER AND OLDER ADULTS**

J. BEHRENDT\* (University of Göttingen, Göttingen, Germany)  
M. IHRKE(1), H. SCHROBSDORFF(2), J. HERRMANN(1), M. HASSELHORN(4) - (1) Bernstein Center for Computational Neuroscience Göttingen (Göttingen, Germany); (2) Georg-Elias-Müller-Institute for Psychology, University of Göttingen (Göttingen,

Germany); (4) German Institute for International Educational Research (DIPF) (Frankfurt, Germany)

Introduction: In our project we investigate aging effects of selective attention using the negative priming paradigm as investigation tool. Negative Priming (NP) describes the phenomenon of prolonged reactions when people have to respond to a target stimulus that was the distractor stimulus at the previous prime trial. A central problem of interpretation of the NP effect is the lack of agreement about the underlying mechanism. However, the complex pattern of results does not clearly favour inhibition or retrieval based theories. In order to reveal which of the theories can account for the pattern we created a computational model of NP. The model attempts to consider all relevant mechanisms. Various NP experiments have been done to validate the assumptions of the model. One major problem of interpretation of empirical data was that at measures of reaction times target-selection and response-generation processes are confounded. Methods: Therefore we developed an experimental method based on the measurement of eye movements with EOG-electrodes, which allows us to separate the target- and response-selection stage. In our study 32 younger and older adults were instructed to select the target at the priming stimulus at first and after the glance down read the comparison word and respond as quickly as possible. Results: The analyses of target-selection and response-generation times revealed that in general both processes seems to be involved in NP effects. The magnitudes of NP effects are different depending on the factors of aging and response repetition condition. Conclusion: Because a functional aging difference in processing an NP task emerges only at target-selection time, especially older adults have obviously more problems than younger adults to handle distracting information. Concerning the response-generation time the NP effect emerges only if the required response changes from prime to probe independent of the age of the participants.

#### **PC7 673 PERCEIVED SOCIAL SUPPORT IS ASSOCIATED WITH ALLOSTATIC LOAD DIFFERENTLY BY MEN AND WOMEN**

L. FALCON\* (Northeastern University, Boston, United States of America)  
I. TODOROVA(1), K. TUCKER(2) - (1) Northeastern University (Boston, United States of America); (2) Tufts University (Boston, United States of America)

Introduction: Social support may influence the accumulation of physiologic dysregulation or allostatic load (AL). Puerto Ricans in the United States experience a number of health problems and share many of the characteristics of disadvantaged immigrant groups. Methods: Using linear regression analysis, we examined associations between perceived social support and allostatic load in 1360 participants, aged 45-75 y, in the Boston Puerto Rican Health Study. AL score (range 0-11) was the sum of indicators of high cholesterol, waist circumference, glycosylated hemoglobin, diastolic and systolic blood pressure, plasma c-reactive protein, urinary epinephrine, norepinephrine and cortisol; and low HDL cholesterol and DHEA-S. Characteristics of social networks and perceived benefits from social support were measured using the Norbeck Social Support Scale. Results: Controlling for age, gender, acculturation, and income, social network size or length of relationship to existing members were not significantly associated with AL. Interactions with gender were significant for perception of emotional support (PES) from network ( $P=0.008$ ) and approached significance for perception of tangible aid (PTA) from network ( $P=0.06$ ). PES (mean 14.0 +/- 3.0, range 2-40) was significantly associated with lower AL in women ( $b=-0.053$ ,  $P=0.011$ ) but not men ( $b=0.053$ ,  $P=0.16$ ). PTA (mean 5.8 +/- 2.1, range 0-20) was significantly associated with greater AL in men ( $b=0.17$ ,  $P=0.001$ ), and approached significance in the protective direction for women ( $b=-0.05$ ,  $P=0.10$ ). Conclusions: Perception of support appeared as more important than size or length of connection to social network in relation to AL in these older Puerto Rican adults. However, perceptions of support from social networks differed by gender, with protective effects for women, particularly for PES, but greater AL with greater perceived support among men, particularly for PTA. These results may reflect differing stress responses by gender to the need for and acceptance of assistance. Further studies are needed to clarify these relationships.

#### **PC7 674 AGING AND THE EFFECTS OF EDUCATION ON THE INTER-HEMISPHERIC DYNAMIC FOR WORD PROCESSING: A NIRS STUDY**

K. KAHLAOUI\* (Centre de recherche - Institut universitaire de gériatrie de Montréal, Montréal, Canada)  
C. DEMERS(1), A. MACHADO(2), F. LESAGE(2), B. SKA(1), Y. JOANETTE(3) - (1) Centre de recherche - Institut universitaire de gériatrie de Montréal (Montréal, Canada); (2) Ecole polytechnique - Université de Montréal (Montréal, Canada); (3) Faculté de Médecine - Université de Montréal (Montréal, Canada)

Introduction: Over the last years, education has been consistently related with better cognitive abilities in aging. Recent neuroimaging research showed the presence of a brain's compensatory mechanism in high-educated older adults suggesting the presence of alternative networks subtending the preservation of cognitive abilities in successful aging. However, there is no evidence concerning the effects of the education on hemispheric asymmetries for language during aging. This study investigated the effects of education on hemispheric dynamics of words during aging using Near-Infrared Spectroscopy (NIRS). Method: Ten high-educated younger adults, 10 high-educated older adults, and 10 low-educated older adults participated in this study. All of them were healthy, right-handed and native speakers of French. Participants performed a lexical decision task. Both sources and

optodes of NIRS were placed bilaterally over frontal and temporal regions of brain. NIRS parameters (oxyhemoglobin [O2Hb], and deoxyhemoglobin [HHb]) were analyzed using an event-related paradigm. Results: Behavioural results showed higher error rates for low-educated older participants compared to high-educated young and older participants. NIRS data showed differences occurring in each hemisphere. For the right hemisphere (RH), an O2Hb increase was observed for both young and high-educated older adults relative to low-educated older adults. An HHb increase was also observed for both low- and high-educated older adults relative to younger adults. In contrast, no difference was found in the left hemisphere (LH) between groups of participants for both O2Hb and HHb. Conclusion: These findings provide evidence of the effects of both education and age on brain's hemodynamic parameters. The increase of O2Hb and HHb in the RH for high-educated older adults is compatible with the idea of the presence of a compensatory mechanism allowing to maintain their performance. In conclusion, the increased involvement of the RH for language with age might be linked with preserved performance.

**PC7 675 COGNITIVE ENHANCEMENT AMONG OLDER ADULTS: AN INTEGRATED APPROACH**  
S. PASUPULETI\* (The University of Toledo, Toledo, United States of America)

Cognitively healthy older adults are likely to have a better quality of life and hence may be able to afford independent living and successful aging. Researchers, after decades of work, across disciplines, have produced convincing evidence demonstrating positively influences of cognitive capacities and performance among older adults. Henceforth, the "theorem that cognitive decline is inevitable" may not necessarily be true." Latest research proves that brain has plasticity character, which can be enhanced through physical, mental, and social activities that in turn directly/indirectly engage cognitive abilities (Mahncke et al., 2006; Yang, Krampe & Baltes, 2006; Salthouse, 2006). Physical activities such as aerobics, fitness exercises, yoga, walking, etc. are linked to improved cognitive functioning, self-confidence, better coping strategies to stress, and psychological well-being (Singh-Manoux, Hillsdon, Brunner, Marmot, 2005; Taylor, Salles, & Needle, 1985). Brain-plasticity-based training programs produced significantly superior improvement in generalized measures of auditory, attention and speed processing (Smith, et al., 2006). Creative and intellectually engaging tasks are positively correlated to psychological well-being, dealing with life stressors, and healthy living. Social interaction (social contact) was found to be a significant predictor of cognitive functioning. Also, physical activity, social networks, and engagement have positive influences on cognitive functioning and social competence (Vance, Wadley, Ball, Roenker, and Rizzo, 2005). Positive/supportive social interactions can significantly improve working memory and speed processing abilities of the brain (Ybarra, et al., 2008). These research trends will have immense impact on gerontological practice models, which need to be conceptualized in an integrated way. The current approaches to research and practice are fragmented and lack unified perspectives on cognitive aging. The presentation is based on the content analyses of research studies focusing on physical, mental (cognitive), and social (including civic) engagement activities involving older adults. Summarized results of the analyses of past research are conceptualized into an integrated model for practice with older adults.

**PC7 676 AGING AND THE CONVIVIALITY WITH THE CONTEMPORANEOUS TECHNOLOGIE IN THE COMMUNICATION**  
H. RIZZON-MARIANI\* (Universidade de Caxias do Sul (UCS), Caxias do Sul - RS, Brazil)  
L. GIORDANO

The technological innovations have been allowed to enlarge and to differentiate the communications that are more and more sophisticated, so they bring inquietude and social and cultural changes. It is questioned: how it is to age at the beginning of 21th century, considering the conviviality with the advance of the technology in the communications? This question was cut out of the research: "Space of Memories – images, words and feelings: body/sexuality and the subjective position in aging at the beginning of 21th century", it is characterized for being a qualitative study. The delineation of this research was its transversal cut study. The participants (30) had been selected by intentionality, in view of criteria: the aged with more 60 years old, professors and/or students in an university of the Northeast Region of the Rio Grande do Sul. The semidirected interview was an used technique in view of objectives of the research: to identify the present subjective position in aging, regarding oneself as the social conviviality with the fast development of the technology in the communications to propose actions and interventions that promote the creative and responsible subject for its health in aging. The findings are being treated and they are interpreted from the communication and psychoanalysis' theoretical contributions. The partial results point two subjective positions of aged: (a) unrest generated by conviviality with the digital technology; (b) autonomy and engagement with the innovative process of communication.

**PC7 677 ADULT LITERACY AND LEARNING IN HEALTHCARE**  
M. WOLF\* (Northwestern University, Chicago, United States)

The relationship between literacy and health outcomes are well documented in adult medicine, yet specific causal pathways are not entirely clear. Despite an incomplete

understanding of the problem, numerous interventions have already been implemented with variable success. Many of the earlier strategies assumed the problem to originate from reading difficulties only. Given the timely need for more effective interventions, it is of increasing importance to reconsider the meaning of health literacy in order to advance our conceptual understanding of the problem and how best to respond. One potentially effective approach might involve recognizing the known associations between a larger set of cognitive and psychosocial abilities with functional literacy skills. We review the current health literacy definition and literature and draw upon relevant research from the fields of education, cognitive science, and psychology. In this framework, a research agenda is proposed that considers an individual's health learning capacity, referring to the broad constellation of cognitive and psychosocial skills patients or family members must draw upon to effectively promote, protect, and manage theirs or a loved one's health. This new, related concept will ideally lead to more effective ways of thinking about health literacy interventions, including the design of health education materials, instructional strategies, and the delivery of healthcare services to support patients and families across the lifespan.

**PC7 678 SPEED OF INFORMATION PROCESSING AS A GOOD PREDICTOR OF AGE-RELATED EXECUTIVE DECLINE IN NORMAL ADULTS**  
M. AUDIFFREN\* (Université de Poitiers, Poitiers, France)  
C. ALBINET(1), G. BOUCARD(1), C. BOUQUET(1) - (1) Université de Poitiers (Poitiers, France)

Aging of executive functioning is actually well documented and considered to be informative about adult age differences in cognitive functioning. Executive functioning can be broadly defined as control processes responsible for planning and monitoring other elementary cognitive operations. Miyake et al. (2000) have argued that executive functioning can be fractionated in at least three separable component processes: updating of working memory, shifting attention between tasks or task elements, and behavioral inhibition. The real contribution of executive functioning in age-related cognitive decline is controversial and still questioned (e.g., Salthouse et al., 2005). According to the micro perspective of cognitive aging, frontal executive functioning would be specifically impaired by aging. By contrast, the macro perspective considers that the age-related effects on cognitive tasks can be explained by the decline of a broader factor such as speed of information processing (Salthouse, 2004). The aim of this study was to determine the percentage of variance explained by speed of information processing in age-related decline observed in several executive functioning tasks. Twenty eight elderly (17 females and 11 males,  $M = 70.8$  years) and 28 young adults (17 females and 11 males,  $M = 22.7$  years) performed a battery of nine tasks. The "inhibition" function was evaluated through the random number generation test, the Stroop task and the stop task. The "updating" function was assessed through the letter running span task, the spatial running span task. The "shifting" function was evaluated through the Wisconsin card sorting test and two reaction time tasks involving switching between two tasks. The speed of information processing was measured with a highly compatible two-choice reaction time task. Results showed that choice reaction time performance explained the major part of the variance of age-related cognitive decline observed in all the tasks involving executive functioning except for the spatial running span test.

**PC7 679 INHERITANCES GAMES: DONORS AND HEIRS MATERIAL VALUES IN INTERACTION**  
M. PATRAO\* (University of Aveiro, Aveiro, Portugal)  
S. RODRIGUES(1), H. VICENTE(1), L. SOUSA(1) - (1) University of Aveiro (Aveiro, Portugal)

Introduction: Material inheritance distribution involves donors and heirs in a process that comprises practical decisions but also constitutes a crucial course in the family development of the sense of continuity and identity. Literature suggests the need to develop comprehensive approaches to understand the factors influencing this process, like attitudes and (material) values. Previous research has focused on descriptive variables, neglecting donors' and heirs' perceptions and expectations. This exploratory study examines donors and heirs material values and how those values impact their relationship in the context of the material inheritance management. Methods and materials: Data from 100 subjects (50 donors and 50 heirs) were obtained through a questionnaire involving the following instruments: i) Material Values Scale (Richins & Dawson, 2004); ii) Money Ethic Scale (Tang, 1995); iii) Money Belief and Behavior Scale, (Furnham, 1984); iv) affective valuation of possessions adapted from the Self-Confrontation Method (Hermans, 1992). Data were analysed through descriptive, comparative and correlational statistics. Results: Main findings suggest that: i) material possessions are connected to self-actualization motivations, expressed in feelings such as self-esteem, personal strength and happiness; ii) donors tend to be more materialistic, relate possessions to success and are centred in money savings; iii) heirs are less materialistic than donors, relate possessions to happiness and also emphasize the money saving (but less than donors). Conclusion: Emotional experiences towards possessions are willing to frame the interactions between donors and heirs in a silent game of entitlement and obligation where each part attempts to satisfy their (financial/emotional) motivations and needs. This game may launch the family in a context of distrust, insecurity and veiled resentment (misunderstanding), activating

conflicts and family dissatisfaction; however it also represents an opportunity to express filial and parental maturity.

**PC7 680 RELATIONSHIP BETWEEN WORKING MEMORY AND EMOTIONAL EPISODIC MEMORY IN JAPANESE OLDER ADULTS.**

D. UENO\* (Osaka University, Suita, Japan)  
K. MASUMOTO(2), M. KAWASAKI(1), I. KUROKAWA(1), Y. GONDO(1), A. FUJITA(1) - (1) Osaka University (Suita, Japan); (2) Shimane University (Suita, Japan)

**INTRODUCTION:** Some studies revealed that the cognitive function enhances retrieving positive information. This study examined the correlation between working memory and emotional episodic memory. **METHODS and MATERIALS:** The participants were 42 older adults (Mean age= 71.7). The material was 90 non-emotional words and 90 word-paired emotional pictures. The pictures were selected from the International Affective Picture System (IAPS; Lang, Bradley, & Cuthbert, 1995). All stimuli were equally divided by the standardized emotional valence of pictures into positive, negative, and neutral conditions. The participants were asked to remember the 45 paired stimuli (15 positive, 15 negative, 15 neutral) from each condition in leaning session. In learning session, the stimuli were presented in every 5 seconds at random. After the learning session, participants asked to recall the presented words. Working memory was assessed by the arithmetic and digit span, letter-number sequencing in WAIS-III. **RESULTS:** There was not significant difference at memory performance in the negative condition ( $M=3.12$ ) and in the positive condition ( $M=3.71$ ). However, there was significant positive correlation between working memory and memory performance in the positive condition. **CONCLUSIONS:** These results suggest that older adults need more working memory when retrieving positive information than when retrieving negative information.

## Track D - Social Research, Policy and Practice

**PD7 681 THE CONCEPT OF LIFE PROJECT IN GERIATRICS**  
B. ORELLANA\* (APHP, Cachan, France)

The project is very fashionable nowadays, and the aged personnes are no exception. The most part of rest homes or long care units laud today the life project, in its collective or individual form. One can wonder what is the meaning of that very contemporary preoccupation, in a World that generally mistreat its elders. The residents of a nursing home have been questionned about objectives of their life project, in order to add it to their living contract, to improve care and life quality. More than thousand « projects » or « wishes » have been collected. As only a few personnes could answer (because of age or disease), most of the time, the nurses ought to formulate the project they thought the residents had. We have classified and analysed the results by theme, frequency and redaction. We found four large project types, care projects rather than life projects, that are corresponding to the fundamental needs of human being that are described by the first care theorists, long ago. Only nine projects should be considered as real life projects, according to the characteristics required : space, time, conception and realisation. Our analysis brought to light the difficulty for aged personnes, especially when they are diseased and enclosed, to have and formulate a project, and also the very important impact of collective representations on the way the nurses imagine the life project of a resident. The observations emerging from that study are showing the way our society considers its elders, bringing to light the contradictions between project and retirement, individual liberty and collective constraints, life project and near death. Finally, the project is rather societal, rehabilitating an ethic reflexion that could give sense to the concept of life project of very aged personnes.

**PD7 682 PSYCHO-SOCIAL FACTORS AFFECTING ELDERS' MALTREATMENT IN LONG-TERM CARE FACILITIES**  
M. BEN NATAN\* (Haifa university, Hadera, Israel)  
A. LOWENSTEIN(1), Z. EISIKOVITS(1) - (1) Haifa university (Israel)

The purpose of the current study was to examine and analyze the major variables affecting elders' maltreatment in nursing home residents. The study was based on two theoretical paradigms (Theoretical model for predicting causes of maltreatment elderly residents developed by Pillemer (1988) and the Theory of Reasoned Action developed by Ajzen & Fishbein, 1980) for understanding decisions made by staff to mistreat older nursing home residents. The research population consisted of staff of 22 nursing homes in Israel. Six hundred questionnaires were distributed to these facilities and 510 were completed and returned. In addition, 24 questionnaires were distributed among directors of the facilities, and 22 were returned. The findings indicate that slightly more than half of the staff sampled reported abuse of elderly residents over the past year, involving one or more of types of maltreatment. The total number of various types of maltreatment reported was 513. About two-thirds of the cases were incidents of neglect. 70% of the respondents reported that they had been present at incidents in which another staff member abused an elderly resident in one or more types of maltreatment, while in such situations mental abuse and mental neglect were the most prevalent forms of maltreatment. The findings show that staff attributes, i.e., the degree of emotional burnout and resident traits, i.e., their

cognitive status (dementia) impact physical and mental abuse; while institutional features, i.e., staff turnover rate and staff characteristics – their level of emotional fatigue – impact physical and mental neglect. Finally, resident traits, i.e., their dementia, are the most significant variable influencing the total number of maltreatment cases. This is the first study that examines elder maltreatment in the long term care population in Israel. The research findings lead to an expanded and improved research model for investigating maltreatment of elders.

**PD7 683 VIOLENCE AGAINST AGED PEOPLE: OCCURRENCES, VICTIMS AND AGGRESSORS**

V. FALEIROS\* (University of Brasilia and Catholic University of Brasilia, Brazil)

**Introduction** Collecting data from Health, Police, Public Ministry and Aged-dial in the 27 Brazilian state capitals. Violence is relational and complex, both in the structure and institutions as well as in the familiar relations, in a relation of asymmetric force that denies the other and brings suffering, in general, kept in silence. **Method** The descriptive research of violence incidence against people over 60 was carried out in quantitative and qualitative way in database of 27 capitals with occurrences, victims and aggressors. Results In 2005 there were 61,930 occurrences in general with diversities of profiles in each capital. The death rate by external causes in aged people in hundred thousand inhabitants varies from 65,75 to 272,29 (2000), being traffic accidents that kill more men than women and admission in hospitals caused by falls affect more women. There were 15,803 occurrences of intrafamilial violence: physical violence places between 30% and 75% of the denunciations in 10 capitals; psychological violence between 20% and 50% in 14 capitals; the financial violence places in 12 capitals between 20% and 50%; the abandon is situated between 10% and 19% in 10 capitals and negligence between 10% and 50% in 13 capitals. Most of the victims are women 60%. There are aged victims from 60 to 101 years. Most of the aggressors (57,46% in average) are their sons and daughters, followed by grandsons and granddaughters with variations from 4,5% to 23,9% and the average of 9,45%. **Conclusion** The types of denunciations vary according to the denunciation place with predominance of physical violation in the police, financial violence in the justice and the abandon in the Social Assistance. The social violence expresses itself in the mortality and admission in hospitals by external causes and intrafamilial violence, multiple and complex.

**PD7 684 HOW COMPETENT ARE HOSPITAL CLINICIANS PERCEIVED TO BE IN MANAGING THE CARE OF OLDER PEOPLE?**

T. MCDONALD\* (ACU National, North Sydney, Australia)

**Introduction:** The extent to which anecdotal reports of unsafe hospital clinical management practices concerning older patients occur were surveyed along with long-term care providers' views on whether standards set in national statements on best practice for hospital care of older people are met. **Methods and materials:** A national survey of aged care service providers sought information on safety and quality associated with local hospitals providing acute health services to residents. 371 responses from across Australia and including metropolitan and regional areas (Estimated response rate 55%). Mixed method approach included descriptive analysis using SPSS and thematic analysis of optional comments. **Results:** Quantitative - Problem areas identified by health professionals external to hospitals include: Timing of patient transfers from hospitals (70.89%); Coordination problems (51.21%); Information on patient's condition (72.51%); Appropriate hospital management of mental confusion (41.42%); Nutritional status of patients on discharge (28.30%); Skin integrity status of patients on discharge (66.04%); Adequate documentation of clinical treatment in hospital (78.17%); Information provided by hospital clinicians to families (50.67%); Medication regime prescribed prior to patient discharge (63.43%). Concurrent evaluation of hospital performance against national standards revealed an equally poor result. Qualitative - Accounts of clinical care in specific situations indicate a perceived culture of dismissiveness by nursing and medical clinicians of the care and safety needs of older patients. Justifications used to respond to these examples of neglect include workload pressures and clinician judgements of older patients' eligibility for hospital access. The larger the hospital the more likely these attitudes are observed by colleagues external to the hospital. **Conclusions:** Responses by aged care professionals provide insights on hospital performance related to care and safety of older people. The issues identified here provide a basis upon which to build effective consultation and safe care.

**PD7 685 HEALING BROKEN WINGS – BEST PRACTICES FOR TACKLING ELDER ABUSE OUTCOMES OF AN INTERVENTION MODEL**

S. ALON\* (JDC-ESHEL , Jerusalem, Israel)

A. BERG-WARMAN(1) - (1) Mayers JDC-Brookdale (Jerusalem, Israel)

Dealing with elder abuse calls for a diversity of interventions (psychosocial treatment, legal intervention, supportive services, etc.). The presentation describes findings and outcomes of an evaluation study of an intervention model developed and implemented in Israel from 2005–2008. **Goal:** To examine the implementation of the model and its contribution to the reduction of elder abuse and the collateral damage. **Population:** (1) 558 elderly victims exposed to abuse and neglect who participated in the program; (2) 22 professionals – social workers and professional partners in the community.

Instruments: Intake questionnaires; periodic evaluation questionnaires; in-depth interviews with victims, abusers, and professionals; observations of a supportive group; multidisciplinary teamwork. Findings: The most widespread type of intervention is therapeutic counseling (victims and abusers). Over a third of the victims received supportive services. Legal intervention was used in a similar percentage of cases. In almost two-thirds of the cases, an improvement was reported. Victims described the improvement in terms of reduced offending behaviors and of being more assertive towards abusers. The abuse stopped altogether in 20% of the cases. In cases of neglect, there was a 72% improvement. Legal intervention yielded the highest improvement rate. Social workers reported they had acquired expertise and knowledge. Their work became more methodical and they implemented a range of interventions. Partnerships between social workers and other professionals in the community were enhanced and strengthened. Conclusion: Calling on a multidisciplinary team of professionals using a combination of diverse intervention methods and a variety of services can lessen the damage caused by the abuse and help to heal victims' wounds. Key words: Elder abuse and neglect, intervention model, evaluation, outcomes.

**PD7 686 GEOGRAPHICAL VARIATION IN HEALTH OUTCOME AND HOSPITAL SERVICES UTILIZATION AMONG THE ELDERLY IN HONG KONG**  
 K. WONG\* (Chinese University of Hong Kong, Hong Kong, Hong Kong)  
 J. WOO(1), P. CHAU(2) - (1) Chinese University of Hong Kong (Hong Kong, Hong Kong); (2) University of Hong Kong (Hong Kong, Hong Kong)

Introduction: Geographical variation in health outcome has been explored relatively rarely in relation to the hospital services usage. The purpose of this study was to capture the spatial variations in health status and health services utilization in the elderly population using Hong Kong data. Materials and methods: A secondary analysis on a database from the Hospital Authority (HA) which covers 98% (N=243,245) of the total deaths in Hong Kong during 1999 to 2005 was conducted. Deaths at age 65 and above (N=184,671) were included in the analysis. Standardized mortality ratios (SMRs) adjusted for age and sex were calculated for each of the 18 districts in Hong Kong. The variation in utilization by the elderly was analyzed across districts in terms of the utilization ratios determined by the length of stay in HA hospitals, number of inpatient admission, numbers of visits to specialist outpatient clinics, and attendance at accident and emergency department. Results: Deaths at age 65 and above contributed to 77% of the total deaths in the dataset. The number of deaths varied from 1% to 9.1% across districts. Spatial analysis of SMR showed a significant variation in mortality: SMR in districts such as Yuen Long, Kowloon City and Tsuen Wan were almost 30% higher than the average of Hong Kong, while the SMRs of Islands, Sai Kung and Kwun Tong districts were 20% lower than the average. Health services utilization varied geographically with a difference in utilization ratios ranging from 35% to 44%. However, the pattern of these variations depended on the types of service being analyzed. Conclusions: Mortality and health services utilization in the elderly citizens demonstrated substantial spatial variations in Hong Kong. This descriptive geographical analysis may help signposting to the locations where further public health investigations can be beneficial to them.

**PD7 687 WHAT SHAPES THE DWELLING-TYPE CHOICES OF OLDER CANADIANS? AN INVESTIGATION USING THE AGING AND SOCIAL SUPPORT SURVEY (GSS16)**  
 M. HAAN\* (University of Alberta, Edmonton, Canada)  
 T. PERKS(1) - (1) University of Lethbridge (Canada)

Introduction As the Canadian population ages, a growing proportion of people will enter their elder years. Naturally, this will have many consequences, and has become an area of growing policy concern. There have been extensive debates about the impact of this change, ranging from discussions about issues that directly affect seniors, such as how health and wellness will be maintained in the face of increased longevity, to issues that affect all Canadians, such as the pressure that an aging population puts on the health care system, other government services, and the Canadian labour market. This study determines how an aging population will impact housing in Canada. Methods and Materials The purpose of this study is to identify some of the factors that predict the distribution of Canadians 55 and older across three private residential dwelling types. It uses the 2002 Aging and Social Support Survey (GSS16), multinomial logit regression, and cohort-component projection techniques to identify how social support networks, health, and economic characteristics can be expected to shape the residential choices of older Canadians in the coming years. It focuses in particular on the distribution of 55-75 year olds across three private dwelling types from 2002 to 2022: 1) general community living; 2) age-restricted housing; 2) age-restricted housing with nursing care. Results The main conclusion of this study is that social support characteristics are the strongest predictors of dwelling type. Individuals appear to choose their dwellings according to their social needs and wants, rather than just their economic or health characteristics. Conclusion There will be increased age-specific demand for all dwelling types in Canada in the future, but a

reduction of over 2 million people leaving dwellings without an age requirement between 2002 and 2022. Public policymakers have done little prepare for this crisis.

**PD7 688 RECENT TRENDS IN MORTALITY RATES FOR CEREBROVASCULAR DISEASE IN THAILAND, 1998-2006**  
 A. PRASERTCHAI\* (Chulalongkorn University, Bangkok, Thailand)  
 S. JITAPUNKUL(1), W. AEKPLAKORN(2), V. KURUCHITTHAM(3) - (1) Faculty of Medicine, Chulalongkorn University (Bangkok, Thailand); (2) Community Medicine Center, Ramathibodi Hospital, Mahidol University (Bangkok, Thailand); (3) 4 College of Public Health Sciences, Chulalongkorn University (Thailand)

Introduction: In Thailand, the mortality rate for coronary heart disease (CHD) or cerebrovascular disease (stroke) has increased between 1991 and 1996. Especially, stroke has become the more frequent cause of disability in the older age groups. Thai older population is also growing faster than the growth of the total population. The increase in the Thai population aged 60 years and older might have been expected to precipitate an increase in absolute number of death and disability from stroke. It affects health and long-term care needs. This study aimed to examine trends in age-specific and age-standardized mortality rates for stroke in Thailand. Methods and materials: Mortality data during 1998-2006 were analysed based on ICD-10 for stroke from Bureau of Health Policy and Planning, Ministry of Public Health. Both five-year age-specific and age-standardized mortality rates per 100,000 were calculated and descriptively analyzed for trends. Results: During 1998-2004, age-standardized mortality rates for stroke increased from 10.29 to 38.93 in male and 7.66 to 29.93 in female. Thereafter it shows sharply decline trends in 2006. For each year, stroke mortality rates increased with age and peaked at age-group 60-84. In 2006, the highest mortality rates were 24.44 and 19.37 for male and female, respectively. Conclusion: The stroke mortality rates had increased at least twofold in 8 years for both sexes. Interestingly, the mortality decline during 2004-2006 has been attributed to the use of antihypertensive agents. The increase in mortality might be explained by increased risk factors such as hypertension, smoking, obesity, and aging population. With the high stroke mortality rates, Thailand should increase its effort in controlling and reducing the coronary risk factors by promoting healthy behaviors such as physical activity and healthy diet.

**PD7 689 CENTENARIANS AND HEALTH IN AUSTRALIA**  
 J. MCCORMACK\* (Latrobe university, Melbourne, Australia)  
 H. BOOTH(2) - (2) Australian National University (Melbourne, Australia)

•INTRODUCTION: The global phenomenon of ageing societies highlights the need to understand the health implications of and for our very oldest citizens. Many key actors including governments, policy makers, service providers and families will benefit from increased knowledge of the health status of the oldest old. As there is a dearth of information on this topic in Australia, the purpose of this paper is to begin building an information database on health and ageing of the aged population, especially those in their 9th, 10th and 11th decades of life. The current work in progress focuses on centenarian functional status, living arrangements and aged care service use. It also compares centenarians with octogenarians and nonagenarians. •METHODS AND MATERIALS: The data are drawn from confidentialised records of the Australian Aged Care Assessment Program and include first assessments for 14000 persons aged 80+, including 109 centenarians. Descriptive statistics are used to illustrate their characteristics and service recommendations. Logistic regression is used to identify predictors of living arrangements and recommended services. •RESULTS: Reflecting differential survival by sex, centenarians are predominantly female and widowed. More than half are mobile (60%), continent (51%) and aware of time/place (65%); these functional abilities are correlated with each other but are not related to sex and marital status. Disability, especially continence, is associated with institutional residence. Marital status is also a predictor of institutional residence unless multiple disabilities occur. Centenarians are more disabled than octogenarians but not always more so than nonagenarians. Age is a significant predictor of recommendations for several aged care services for centenarians living in the community after controlling for living arrangement. •CONCLUSION: Further research is needed to understand the relationships between age, functional ability, living arrangements and recommended aged care services for our oldest old citizens.

**PD7 690 A RESEARCH ON THE EFFECTS OF THE CLOTHES OF OLD WOMEN ON THEIR PSYCHOLOGY IN TERMS OF SOCIAL RESPONSIBILITY**  
 M. ÖZKAN\* (Vocational School of Düzce, Düzce, Turkey)  
 G. ABANOZ(1) - (1) University of Düzce (Düzce, Turkey)

Consequently, although it was impossible to stop the ageing process, it was observed that human life was lengthened through health policies. When the improvement in living conditions and the increase in average life span are considered, it is clear that the problem of clothes will affect specific consumer groups more. It is not an acceptable that individuals having separate life stories and experiences are isolated and forced to withdraw to seclusion. The process of ageing brings along numerous physiological and psychological changes. In old ages, biopsychological regression is inevitable so the quality of life can be spoilt. A lot of studies must be done to increase the life quality of old people and to make social harmony

effective and continuous. This may be a sign of the development level of that society. This research was limited to women over the age of 65 who live at homes for the elderly and in their own family environment. The data of the study include data and related sources that were obtained through a survey form of 26 questions administered to 62 women over the age of 65 in order to determine their needs and problems about clothes. The obtained data were compared using statistical methods to determine the differences between the old people residing in the homes for the elderly people and old people living with their families. While a piece of clothing is being designed, the aim should be to provide physical comfort, decrease psychological problems, increase self-confidence, and ensure their acceptance in the society and their social harmonization. In this context, it is crucial to determine the problems, demands and needs of old women that form a special consumer group related to clothes, and designing and manufacturing clothes of optimal functional characteristics for them.

**PD7 691 AGEING, EPIDEMIOLOGIC TRANSITIONS AND DEMENTIA IN FOURTH WORLD ABORIGINAL AUSTRALIA**

L. JACKSON PULVER\* (Prince of Wales Medical Research Institute, Sydney, Australia)

Introduction: Australian Aboriginal people, both remote and urban living, have high mid-life mortality rates from systemic diseases and a large life expectancy gap of around 17 years compared to the general Australian population. Remote Aboriginal Australians in the Kimberley Region have recently been shown to have the highest recorded rates of dementia, most commonly Alzheimer's disease, in any studies in the world literature. We have reviewed and compared epidemiologic transitions in Aboriginal and in non-Indigenous Australians to examine why urban Aboriginal people, who form the large majority, have high systemic disease rates, with the hypothesis that they also have high dementia prevalence rates. Methods and Materials: Using a life cycle approach we have conducted a major literature review of Aboriginal ageing, cognition and dementia; are undertaking a NHMRC funded study examining dementia prevalence in c. 700 urban Aboriginal people aged 45 years and over assessing both social and biological determinants of health - to explore the high levels of dementia risk factors in urban Aboriginal communities. Results: From the 1990s, Aboriginal fertility is falling, survival is increasing and absolute numbers of older people are rising as a result of recent improvements in Aboriginal health; however this is occurring 50 years after the classic or western epidemiologic transition to delayed chronic systemic diseases. A new transition to neurodegenerative diseases characterises population ageing this century. A combination of persistent socio-economic and educational disadvantage in childhood/early-life and high chronic/vascular disease rates in mid-life, is likely to accelerate the epidemiologic transition to neurodegenerative diseases as Aboriginal people age. Conclusions: High dementia rates in Aboriginal Australians, occurring despite current improvement in health status, reflect the combination of educational disadvantage and a delayed epidemiologic transition to mid-life vascular diseases, producing an accelerated epidemiologic transition to neurodegenerative diseases.

**PD7 692 THE ELDERLY SUICIDAL GENRE IN BRAZIL**

J. TEIXEIRA\* (PUC-SP, SAO PAULO, Brazil)  
J. HIGA(1), S. FUENTES(2), M. PAGENOTO(3), I. FERRAZ(4) - (1) PREFEITURA M RIO DAS OSTRAS (Rio das Ostras, Brazil); (2) PUC SP (Saõ Paulo, Brazil); (3) PUC-SP (Sao Paulo, Brazil); (4) PUC-SP (Sao Paulo, Brazil);

Introduction- Considering is a individual act,with a great psicological and social impact not only for the family,society,but also for the healthy professional who takes care of it,we found necessary to disseminate all the precious information we have.We choose to explore:"The Elderly Suicidal Genre",which we expected to contribute in relevance,bringing it to a never and greater visibility. Aim- To quantitatively analyze elderly suicidal mortality by genre,in selected Brazilian States,during the period of 2000 a 2005. Method- Demographic data,for individuals older than 60 years obtained from the Brazilian Institute of Geography and Statistics(IBGE),for the period of 2000 a 2005.Results-Our results show that 60% of the 16.5 millions Of elders in Brazil are concentrated in Five States: 1)Sao Paulo(23%),2)Rio de Janeiro(11%),3)Minas Gerais(11%),4)Rio Grande do Sul(7%) and Bahia(7%).From those,57%are women.16% of elderly mortality is attributed to suicide,with a predominance of males committing suicide(82%).A growth in suicide among elders in all the studied states was found,except in Rio Grande do Sul.The following,increase in females suicide is found at Bahia(25%),Minas Gerais(45%),Sao Paulo(7%) and Rio de Janeiro (7%).Conclusion: Even though a higher percentage of elderly suicide is found in male,the amount of female has grown in the period between 2000 a 2005.The dissemination of this information is extremely important for professionals who take of elders as it can play an important role in the diagnose of the conditions which contribute to risk factors for suicide.This may also aid the prevention of suicide or stimulate a creation of new public policy strategies.

**PD7 693 AN AUSTRALIAN PERSPECTIVE ON HOME EQUITY RELEASE PRODUCTS FOR OLDER PEOPLE: PANACEA OR THREAT TO AGEING IN PLACE?**

C. BRIDGE\* (University of Sydney, Lidcombe, Australia)  
P. PHIBBS(2), M. MATHEWS(1), T. ADAMS(1), K. HAL(1) - (1) University of Sydney (Lidcombe, Australia); (2) University of Western Sydney (Penrith South DC, Australia)

Equity associated with home ownership can only be accessed in later life by property sale; through traditional home equity loans, which require regular payments; or through an equity release product, which requires no repayment until death or voluntary relocation. Reverse mortgages and home reversion schemes present both significant risks and benefits for older home owners. The measure of these risks and benefits appears to depend on a variety of factors, including contract terms, legal requirements, the consumer's use of the proceeds, the amount and manner in which the proceeds are paid, and unpredictable economic changes and life/independence expectancies. In addition to potential contractual issues, the type and conditions of a particular product may change a consumer's eligibility for government benefits and trigger tax liabilities. Australian reports on Ageing in place and intergenerational and intra-familial transfers indicate that a shift in values and priorities was evident with a number of older persons expecting to access home equity prior to death. Reverse mortgages and home reversion schemes present both significant risks and benefits for older homeowners. The multi-method research design employed in this Australian Housing and Urban Research Institute research project involved four overlapping phases: literature review, legislative review, data analysis, and focus groups and interviews. During each research stage, a user group (including policy makers, methodologists, content specialists) reviewed and commented on the research approach and the model development. This presentation reports on the potential advantages and disadvantages of our current equity release products by comparing them with outcomes and by making international comparisons. A synopsis of outcomes based on data triangulation will be used to comment on how policy initiatives could be better employed to shape equity release products outcomes for older consumers in order to maximise well being and ageing in place outcomes.

**PD7 694 EVALUATING POLICIES THAT SIMULTANEOUSLY TARGET SEVERAL CHRONIC DISEASES IN AUSTRALIA'S AGEING POPULATION**

A. WALKER\* (Australian National University, Canberra , Australia)  
J. BUTLER(1), S. COLAGIURI(2) - (1) Australian National University (Australia); (2) University of Sydney (Australia)

Introduction: Chronic diseases - eg heart disease, cancer, diabetes - affect around 80% of older Australians, are the main causes of disability and premature death, and account for 70% of health expenditures. Australia's population is ageing, so in future both the prevalence of chronic diseases and the related treatment costs are expected to increase considerably. We will report on a new person level model-system able to account for multiple chronic diseases (comorbidities) that Australians may acquire as they age. Under different assumptions about the rate at which Australia's population ages, we will simulate policy interventions that simultaneously target several chronic diseases. Methods: The chronic disease model-system we developed links disease-specific progression sub-models to an 'Umbrella' microsimulation model representing the Australian population. The current version considers type 2 diabetes, cardiovascular disease (CVD), and CVD as a complication of diabetes. It projects 20 years ahead and accounts for individuals' demographic, socioeconomic and health-risk-factor characteristics; progression of their health status over time; their number of chronic diseases; their quality of life; and health-related expenditures. Also, it estimates the costs and the benefits of simulated policy interventions. Results: Under different assumptions about the rate of population ageing, we will report on simulations of a 'life-style-change' policy intervention. The simulations will simultaneously account for people with diabetes only, CVD only and with CVD as a complication of diabetes. We will estimate the extent to which intervention-induced adoption of healthier lifestyles is likely to attenuate the impact of population ageing. Conclusion: Accounting for multiple chronic diseases at the level of the individual allows improved predictions of the health, quality of life and expenditure implications of population ageing.

**PD7 695 LONG-TERM CARE INSURANCE IN GERMANY IMPLIES PATTERNS OF LINKAGES AMONG BENEFITS AND SOCIO-ECONOMIC INDICATORS**

E. SATO\* (Tokyo Medical and Dental University, Graduate School, Tokyo, Japan)  
S. SATO(1) - (1) Meiji Gakuin University (Tokyo, Japan)

Introduction: This study examines the public Long-Term Care Insurance program in Germany in view of socio-economic indicators, and shows linkages among benefits and socio-economic characteristics. Methods and materials: A principal component analysis was conducted using variables related to LTCI from Statistisches Bundesamt Deutschland. Results: Four interpretable significant principal components were found. Component I; High positive loadings had "nursing-home staffs", "monthly income of white-collar and blue-collar workers", "nursing-homes at care level 1, 2 and 3" and "nursing-homes". High negative loadings were "unemployment", "females and male needing care" and "home-care service facilities". This demonstrated a relationship between individual economic strength and care. Component II; High positive loadings were "home-care services at care level 1 and 2", "home-care service staffs" and "home-care service facilities". High negative loadings were "care allowances" and "population". It was associated with the availability of home-care services. Component III; High positive loadings were "nursing-homes at care level 1 and 2" and "nursing-homes". A highly negative loading was "home-care services at care level 3". This expressed factors related to the use of nursing-homes. Component IV; Positive loadings were "males and females needing care" and "using nursing-homes at care level 3". A highly negative loading was "aging of population". It

was related to aging and the need for care. Conclusion: Economic strength appears to be the most important factor in deciding care in Germany by Component I. People with economic strength seemed to prefer care at nursing-homes to care at home by Component I and III. People seemed to prefer using professional care at home to using care allowances at home by Component II. The number of people needing care tended to decrease, though the aging population continues to increase by Component.

**PD7 696 COST OF THE TREATMENT OF HYPERTENSION IN A GERIATRIC POPULATION: EPROSARTAN VERSUS DIURETICS**

J. ALVAREZ-GREGORI\* (UDMFYC SALAMANCA & UNIVERSITY OF SALAMANCA, Salamanca, Spain)  
J. ALVAREZ GREGORI(1), J. MACIAS NUÑEZ(1), A. DOMINGUEZ GIL-HURLE(1), M. GROUP(2) - (1) University of Salamanca (Salamanca, Spain); (2) Research group in Hypertension (Salamanca, Spain)

**Background:** Diuretics are considered as first choice in treating hypertension in the elderly because of their clinical efficacy and especially due to their low cost. This feature has been used by health resources managers to promote their use. However, it is necessary when considering the costs of treating hypertension in a population to assess also the side effects that diuretics produce, particularly in the elderly. **Methods and Materials:** Treatment costs of hypertension were analyzed in 220 hypertensive geriatric patients (male and female over 65, mean age 71,8) from the GP office and the Renal unit, distributed into two groups: the first group (N=90) treated with diuretics and the second group (N=130) treated with eprosartan, an angiotensin II receptor antagonist. Patients were followed up for 1 year. **Results:** The response to the antihypertensive therapy was similar in both groups. The costs related to the acquisition of the drugs and the costs derived from the secondary adverse events were included in the analysis. In the case of diuretics, the adverse events increase the use of health care resources due to urinary incontinence, purchase of adsorbents, hyponatremia, and two cases requiring hospital admission. The patient/day cost was 1.05 € for the group treated with diuretics and 0.97 € for those treated with eprosartan. **Conclusion:** When talking about diuretics in the geriatric population the price of the drug over the counter, is not representative of the actual antihypertensive treatment expenditure. According to the results obtained in our study, eprosartan, despite having an acquisition cost higher than that of diuretics, the overall costs of the treatment are not altered; This favours its usage safety, which may possibly contribute to improved prescription compliance. This conclusion should be taken into consideration when thinking about the economic restrictions on the use of drugs.

**PD7 697 BALANCE IN AGED CARE CONSUMER CHOICE OR ECONOMICS OF GOVERNMENT POLICY**

J. PRETTY\* (Aged & Community Services Association NSW & ACT, RHODES, Australia)

**Introduction :** Australia's aged care system is dominated by residential care, with 75% of Government funding and most of its policy initiatives being directed towards this type of care. By contrast, consumer research says older people wish to age in their own home, wherever they determine their home to be. **Methods:** A survey by Aged and Community Services Australia found vacancies occurring in residential care, with consumers indicating their preference to remain at home. A research project the LEK study indicated that the cost of care provided within the community was more expensive than that provided in a residential setting. **Results** A comparison of the outcomes of these results will be discussed along with the choice and demands of future Consumers. The key points discussed in this paper will be: •The changing consumer needs for services. •The appropriateness of current government policies focusing on inflexible models of care. •The future impact of community care, with specific reference to programs providing a very high level of care within the home environment and programs targeting post acute care transitions. •The consumer and government positions on user pay service delivery. •Arguments about the cost of care in residential and community settings. •The separation of care and accommodation to allow informed choices by consumers. **Conclusion** The paper will conclude that there will be a continuing requirement for both forms of institutional care and community based care. However, if services are to meet the needs of an ageing population, government policies must address the economics of the provision of care to meet these needs and allow services to develop that are flexible and will meet the needs of future consumers both for those who are financially secure as well as those who are disadvantaged.

**PD7 698 TITLE: USING PARTICIPATORY TECHNIQUES AS A QUALITATIVE METHODOLOGY WITH GROUPS**

L. CRAWLEY\* (University College Dublin, Dublin, Ireland)  
R. JOYE(1) - (1) UCD (Dublin, Ireland)

**Background and Context:** The presenters of this paper have recently trained in participatory research techniques (PRA). PRA research techniques are particularly useful when the researcher needs to gain an 'Emic' understanding of the contexts in which the participants inhabit. Using examples from their own work with older women and Filipino nurses they will demonstrate a variety of techniques will be demonstrated and explained as to where in the research process they may be useful. **Methodology:** PRA research

techniques will include how to develop an understanding of an individual or a group's greatest problem using pie charts. Gain an insiders view of an individual or groups understanding of various social contexts using Emic questioning techniques. Finally using a matrix to find possible solution to causes and problems Analysis: PRA techniques can also contribute to analysis. Each technique must be analysed before moving on to another technique so that an appropriate technique will be used. For example Pie Chart analysis can assist the researcher identify relevant categories in which to carry out a survey or in the development of an interview schedule. Likewise, a matrix can provide the analysis of possible solutions to a problem which has been identified from participants.

**PD7 699 SUPPORTING LIFELONG LEARNING ABOUT HEALTH AND HEALTHY AGING THROUGH DIGITAL TECHNOLOGIES**

L. TREY\* (The University of British Columbia, Vancouver, Canada)

The purpose of this presentation is to address issues of low health literacy among seniors in Canada and the potential of digital technologies to contribute to health literacy. The Canadian Council on Learning (2008) reports that more than 80% of seniors have inadequate health literacy skills. With the development of the web as a source of health information, digital (i.e., multi-modalities of image, sound, text) literacies are vital in sustaining health literacy. With the expectation for seniors to be informed about their health conditions and to be able to participate in decisions about health options, learning how to use web and mobile resources can be critical. The aim of this study is to investigate the value of facilitating seniors' (ages 65 and older) development of digital literacies for accessing and using health services. In this study, a digital literacies workshop (twelve weekly classes) is offered at the National Academy for Older Canadians. Data collection consists of semi-structured interviews, recordings of conversations about health and digital technologies, video observations documenting the nature of seniors' interactions with technologies, and Internet logs. Detailed examination of the interviews and artefacts gathered during workshops provides foundation for identifying (1) factors influencing seniors' learning about health, (2) practical strategies used for enhancing health literacy; (3) the effectiveness of online learning strategies (e.g., web reading about health services, communicating with medical professionals through websites, participating in online community support groups) for accessing health information. The findings will inform and guide educators and policy makers in developing lifelong learning curricula and community programs to address seniors' health and information needs.

**PD7 700 PREPARING THE REMOTE PRIMARY HEALTH CARE WORKFORCE FOR WORK WITH OLDER PEOPLE AND PEOPLE WITH DEMENTIA**

M. LINDEMAN\* (Flinders University, Alice Springs, Australia)  
P. KUIPERS(1) - (1) Flinders University (Alice Springs, Australia)

**Introduction:** There is a need to develop appropriate models of care and service responses for older people in remote and Indigenous communities, and a resultant need for workforce development to facilitate these new approaches. Knowledge translation offers insights into the processes involved in facilitating the uptake of research evidence into practice. **Method:** This paper discusses the challenges present in developing professional development programs for the remote primary health care workforce, drawing on two recent learning programs developed, implemented and evaluated in the Northern Territory, Australia: 1) assessment of client need for home and community care services and 2) recognising and responding to dementia in Indigenous communities. **Results/conclusions:** The paper addresses key considerations for knowledge translation for these settings such as: • characteristics of remote areas (particularly where the needs of older people may not be a priority due to basic public health concerns and the high prevalence of infectious and other chronic diseases); • cross-cultural contexts; • the profile of the primary health care workforce; • difficulties in responding to workforce learning needs where a public knowledge base is inadequate and an evidence base is lacking or emerging; and • challenges presented by geographic and professional isolation. The importance of developing a research and education agenda that is relevant for working with older people and people with dementia in remote and Indigenous communities is highlighted. The paper concludes by proposing key principles for effective knowledge translation which will facilitate changed practice and service development.

**PD7 701 THE ROLE OF THE SOCIAL COMMUNICATIONS DEPARTMENT OF OPEN UNIVERSITY OF THE THIRD AGE, RIO DE JANEIRO STATE UNIVERSITY – UNATI/UERJ IN THE DIFFUSION OF EDUCATION, EXTENSION AND RESEARCH**

M. TEODORO\* (University of the State of Rio de Janeiro, Rio de Janeiro, Brazil)

The information management in an organization is extremely important, since it is a chief means of productivity. Nowadays governmental institutions, corporations and individuals have in their press relations a solid base to better integrate their objectives with their target audiences. Since 1993 UnATI – a Portuguese acronym for Open University of the Third Age – has been developing at UERJ a program aimed at people over 60 years old as a way to contribute to the betterment of not only their physical and mental conditions, but also of their sociability through a number of possibilities made available to them at the University. Given the huge flow of information at UnATI/UERJ, the existence of a formal structure of

communications is justifiable. In order to rationalize and publicize this informational flow produced by either UnATI/UERJ or society, the Social Communications Department was thus implemented in 1998 and, ever since, both formal and informal communication canals between UnATI/UERJ and its target audiences have been successfully developed. To such an end, communication tools are produced, as press-releases and didactical materials used by the university's multidisciplinary teams. By means of a regular and systematic evaluation of routine activities, the Social Communications Department of UnATI/UERJ can be regarded today as an effective tool for the integration of UnATI/UERJ and their target audiences, which has already led to UnATI/UERJ's better social communications as an institution dedicated to education, extension and research. All the activities developed by the Social Communications Department of UnATI/UERJ are therefore seen as real projects considering their magnitude and importance in dealing with issues related to the human aging and elders' dignity as a whole –subjects that are now in vogue among the media.

**PD7 702 FROM RESEARCH TO PRACTICE: KNOWLEDGE TRANSFER IN AGING**  
P. DONAHUE\* (Renison University College, Waterloo, Canada)  
S. HIRST(1) - (1) Faculty of Nursing, University of Calgary (Canada)

Despite the wealth of gerontological research that exists today, there are still problems with getting this knowledge into the hands of policy makers, program developers and health and social service providers. These individuals need this information most to work with and on behalf of older adults and their families. To address this gap, the National Initiative for the Care of the Elderly (NICE), is working to translate existing gerontological research into practical tools that can be used by groups, professionals, and individuals to improve the care for older adults. This is being accomplished through the development of a number of "Theme Teams" working on aging-specific issues. Using a case study approach, this presentation will review the NICE Network's "Caregiving Theme Team" to illustrate one way in which NICE is carrying out knowledge transfer. Highlights will include the process of theme identification, group formation and functioning, the tool development process, and lessons learned.

**PD7 703 CREATING AN ACADEMIC SHIFT IN GERONTOLOGICAL NURSING EDUCATION**  
S. HIRST\* (University of Calgary, Calgary, Canada)  
P. DONAHUE(1), Y. HANEY(2), B. STARES(3) - (1) University of Waterloo - Renison College (Canada); (2) Fraser Health Region (Canada); (3) University of Alberta (Canada)

The population of Canada is aging. Increasing numbers of older Canadians require that today's health care professionals – registered nurses, social workers, and medical practitioners – have a strong educational foundation that focuses on client centred care of older adults. Yet, at the same time, caring for older adults is challenging and complex work that is sometimes plagued by a negative image. Described in this poster is an innovative partnership between the Faculty of Nursing of the University of Calgary, the Brenda Strafford Foundation, and the National Initiative for Care of the Elderly (NICE) to create an undergraduate curriculum for nurses. The outcome is an undergraduate degree program that promotes and celebrates care of older adults. The primary work in developing standards for gerontological education was completed by NICE. A Delphi process was used to identify from the standards, the core content and clinical experiences required by undergraduate nursing students. This knowledge informed the development of a new four year curriculum. In this curriculum, care of older adults is both a thread woven throughout most courses of the program and a distinct theory and clinical course. Faculty members responsible for this initiative quickly realized that they needed to interact with instructors who work with students in the clinical setting, to ensure that they too were informed about gerontological standards of care. Included in this poster is a description of the Clinical Instructors Day designed to both promote content knowledge and positive attitudes in those who work with students.

**PD7 704 THE 3 C'S: COMPETENCIES, CURRICULUM, AND CREDENTIALING**  
B. PIANOSI\* (Huntington University, Sudbury, Canada)

A gerontology dialogue on the challenges of gerontology's future: competencies, core curriculum, and credentialing. Participants contribute to the ongoing debate. There is considerable debate, in the context of a growing older population, regarding the appropriate training and certification of gerontology professionals who will be responsible for providing high quality and safe care to an increasing population of seniors. A major component of this debate is determining what constitutes high quality and safe care, the specific training and competencies needed by gerontology professionals and the possibility of credentialing such a profession. Enlarging on a comprehensive review of the current literature and the investigation of community agency perceptions of the competencies needed to provide high quality and safe care to seniors, this discussion will look at the pros and cons of credentialing gerontology professionals and what the implications of such development would be. Are we ready to make changes to policies, so that organizations and agencies providing services to seniors are mandated to have at least one "credentialed" gerontologist working in their organizations. What would that mean? Objectives of the

session: 1. To discuss the pros and cons of credentialing for gerontology professionals. 2. To outline possibilities for policy development in the employment of professional gerontologists.

**PD7 705 THE QUESTION OF COMPETENCE AND EDUCATION FOR PERSONNEL IN ELDERLY CARE SERVICES**  
P. AHNLUND\* (Social Work, Umeå University, Umeå, Sweden)

Introduction Elderly care has undergone structural changes during the last decade in Sweden. In the case of care for elderly, the 1990s is characterized by restrictions concerning the allotment of help and support. Consequently, elderly care has become more exclusive e.g. fewer elderly are granted support and the care includes more elderly with extensive care needs. The recruitment of care workers has been a problem for Swedish municipalities for some time. The combination of large-scale retirements among care workers and a declining interest in health and care education among students has led to a more general and national concern for future recruitment. Methods and materials The results are based on a qualitative interview study with 29 persons working in the care for elderly. Six of them work as middle managers and 23 as care workers. The aim of the study is to analyze the abovementioned persons' understanding of the meaning of education for care workers. Results and conclusion In relation to the national recommendations established for care personnel with regard to training and education, middle managers in elderly care are in favour to the idea that all care workers should have the auxiliary nurse qualification. However, in the practical work of recruiting staff, the interpretation is that the education lacks legitimacy because it is not that skill which takes priority. The majority of the personnel interviewed agree on that the auxiliary nursing qualification serves no purpose in elderly care. This is surprising, as elderly care has changed character over the recent decades with the result that the work has become increasingly formalised in order to include care for the "oldest old". There is a lack of consensus concerning how general knowledge can be applied in concrete terms and of how the concrete knowledge can be used in practice.

**PD7 706 METHODOLOGIES AND PEDAGOGICAL ACTIVITIES DURING OLD AGE**  
C. VIEIRA\* (UERJ / UnATI - Universidade do Estado do Rio de Janeiro / Universidade Aberta da Terceira Idade, Rio de Janeiro - RJ, Brazil)

Introduction: The project aims at Education for the Elderly, evaluating educational techniques and resources available, providing a better way of learning for this kind of group, legitimating intellect improvement, self-esteem and resocialization. More than 100 activities are offered to people who are over 60. They are divided into four thematic areas: Education for Health, Art and Culture, General Knowledge and Foreign Languages, Specific Knowledge on Old Age. Besides the pre-registration in the free courses carried out via modules, more than a thousand vacancies are offered annually. Methods and materials: The practice of checking the learning process by activities developed in the classroom shows that students are aware of what they have learnt. Whenever they have any difficulties, they can ask for the module repetition. The students' reality is dealt with in the courses, and the problems that affect the elderly in their exclusion from society, their construction and reconstruction of knowledge are discussed. Freire's pedagogy is highlighted in the activities, also favouring knowledge that converges to Piaget and Vygotsky, in the student's construction and development during his/her learning stages. Results: The courses are evaluated annually. Teachers are asked to hand in reports according to their disciplines. With the data supplied, there is documentation. The students answer questionnaires, make comments on the discipline taken, give suggestions for the next year and etc., producing a report about the courses' reality, which will legitimate methods, strategies and ways of learning that best adapt to the group. Therefore, there is the opportunity to improve the students' development and the teacher staff's recycling. Conclusions: Significant contribution to the improvement of old people's life quality, by means of several free courses. Thus, raising awareness that old age can be healthier and happier.

**PD7 707 DEVELOPING EFFECTIVE POLICIES AND PRACTICES FOR SENIOR ADULT LEARNERS AT UNIVERSITY**  
J. COOK\* (Australian Catholic University, Brisbane, Australia)

Introduction Increasingly, senior adult Australians and their international contemporaries are choosing to attend regular University undergraduate and post-graduate courses to fulfil their lifelong learning needs. In contrast to younger students, they are less concerned with vocational training, and more with studying for interest and pleasure. Therefore, there is a need for Universities to attune their policies and practices to this growing cohort. This paper discusses an approach for developing an insight into the existential world of senior adult learners at University, their needs, their wants, and their insights, with the view to the development of senior-friendly policies and practices. Methods and materials Using individual interviews with a diverse range of senior adult learners at a major Australian University, a collective picture of their lived reality will be developed from each of the rich descriptions provided by the participants. The Gerontagogy approach will be used as it situates the research in the 'sciences' of education, using gerontology, and andragogy as part of a collection of multidisciplinary tools. Results Discovering what senior adult learners

think about their university experience may be of benefit to students and educators, to the institution they attend and to the community. The findings can be used to both remediate and modify practices which inhibit full and meaningful participation in university life, or to illuminate and promote those elements that encourage senior adults to participate in and enjoy the benefits of a university education. Conclusion Research about senior adult learners typically considers them within a framework of 'ageing' rather than as an older student. Rather than linking education to ageing, this research seeks to focus on the lived experience of individuals, allowing senior people to have a voice in the research process that may ultimately inform or generate policies that improve the quality of their life.

**PD7 708 TRAINING PROFESSIONALS FOR DELIVERING INGREATED HEALTH CARE TO THE AGED: THE INTERDISCIPLINARY EXPERIENCE OF NAI -UNATI/UERJ**

L. MOTTA\* (Universidade do estado do Rio de Janeiro, Rio de Janeiro, Brazil)  
C. CALDAS(1), M. ASSIS(1) - (1) UERJ (Rio de Janeiro, Brazil)

The training of professionals in the field of healthcare for the aged is one of the priorities of the national policy for the aged in Brazil due to the accelerated aging of the population. The Núcleo de Atenção ao Idoso (NAI), a unit of the Open University of the Third Age/UERJ (UNATI/UERJ) develops an educational program in this field, based on practical care delivery with emphasis to inter-disciplinarity and teamwork. The program includes different training levels and modalities: Residency, Specialization, Professional Practice and Graduation. The program includes an introductory course in gerontology and geriatrics common to all areas, and specific theoretical-practical qualification coordinated by the professional staff from the respective areas. The practical activities occur in different sceneries: long term care institutions, health promotion educational settings, outpatient facilities and the university hospital. Interdisciplinary thinking and acting is a continuous exercise, and the team should be open to innovative strategies. The experience is a contribution to the increasing social demand for qualified professionals committed with the principles of the Unified Health System and integrated health care.

**PD7 709 HOW AN ELECTIVE COURSE ON GERONTOLOGY NURSING INFLUENCES THE PREPARATION OF STUDENTS TO CARE OF OLDER PEOPLE**

E. LAMBRINOU\* (Cyprus University of Technology, Nicosia, Cyprus)  
T. KALAVANA(1), P. SOURTZI(2) - (1) Department of Psychology, University of Cyprus (Cyprus); (2) Nursing Department, University of Athens (Greece)

Introduction: Demographic changes and health care problems create new enlarged roles for nurses in order for them to respond to the needs of older people. Attitudes of nurses seem to affect the preference of working with older people and the quality of care provided to them. Several studies state how education affects attitude. Therefore, this study examined the impact of an elective gerontology nursing course on the knowledge and attitudes of nursing students towards older people. The hypothesis was that an elective course on gerontology nursing that includes clinical practice with healthy, autonomous older people, would affect positively the attitudes and knowledge of nursing students. Methods and Materials: A two wave longitudinal study (3 years apart) conducted. Nursing students (N=175, mean age=20.95 at second wave) completed a self-report questionnaire that included demographic questions, the Kogan's Old People Attitude Scale and the Palmore's Facts on Aging Quiz for the measurement of students' knowledge before and after the course studies. ANOVA and Linear regression analysis were used. Results indicated that students who did not undertake the elective course of gerontology nursing presented a less favourable disposition toward older people, whereas nursing students who have taken gerontology nursing showed more favourable attitudes towards them. Furthermore, students who did not follow the elective course of gerontology nursing had more misconceptions about older people than those who followed it. Conclusion: This study points out that further gerontology courses aiming to increase the nursing students' knowledge about ageing and older people's care could improve students' attitudes toward older people, motivate them to prefer working with them and thus, increase the quality of care offered.

**PD7 710 A MODEL FOR CREDENTIALING THE EDUCATION OF GERONTOLOGISTS**

A. PELHAM\* (National Association for Professional Gerontologists, Healdsburg, CA, United States of America)  
D. SCHAFER(2), M. MEYER(3) - (2) National Association for Professional Gerontologists (Healdsburg, CA, United States of America); (3) University of Applied Sciences (Germany)

Introduction: Gerontology programs, students, graduates, and the community have suffered in a variety of ways because gerontologists have not been certified, licensed or credentialed by a national organization. Students are less likely to choose a field of study offering no certification or license. More comprehensively prepared gerontology graduates have often struggled to compete in the professional marketplace with other health and human services graduates who are credentialed. Without a credentialing process, the general public has had no way to evaluate the skill level of people hired to work in services for elders. In fact, the absence of credentialing has allowed opportunists to move into the field and represent

themselves as trained gerontologists. Methods and Materials: To address the lack of credentialing of gerontologists a group of gerontology leaders studied various credentialing organizations in other disciplines, selected best practice standards and formed the National Association for Professional Gerontologists (NAPG), a non-profit organization: <http://www.napgerontologists.org>. Results: The creation of NAPG has resulted in a credential model that is comprehensive and exacting. It consists of a five-level, peer-reviewed credentialing process, including a special membership category for current students, as well as continuing education opportunities for professionals, a code of ethics for gerontologists and a professional network. Conclusion: Although begun in the United States, NAPG welcomes the graduates of European (EuMag), and other international programs to apply for credentials. There remains the need for mechanisms to accredit academic gerontology programs. The NAPG poster provides a graphic model of the interrelationship between credentialing and accreditation; highlights the negative consequences of a lack of program accreditation; and offers a strategy for enhancing the discipline of gerontology. Both credentialing and accreditation are essential because only the discipline of gerontology can synthesize the field's many realms of knowledge.

**PD7 711 SHATTERING THE SILENCE: ELDERLY WOMEN TALKING ABOUT URINARY INCONTINENCE IN LONG-TERM CARE**

C. MACDONALD\* (Dalhousie University PhD Nursing Student, Halifax, Nova Scotia, Canada)  
L. BUTLER

Urinary incontinence (UI) is a prevalent health issue affecting the quality of life of many elderly women living in long-term care. Attention has been primarily focused on the physiological complications of UI and the associated symptom management, with minimal consideration given to understanding the lived experience from women's perspectives. What it means to experience UI and its impact on quality of life, given the management strategies imposed on residents in long-term care facilities, is a critical concern for the delivery of quality nursing care. This qualitative study using one-to-one interviews, explored elderly women's experiences with UI while living in long-term care facilities. Data were analyzed using thematic analysis that revealed three themes related to the meaning of UI to the women, physical implications of UI, and institutional culture of UI in long-term care. Within these three themes, the women expressed common concerns. The results of this study provided information that could influence changes in nursing practice related to individualized UI care, empowering women experiencing UI, and dispelling ageism in long-term care. The study also suggests opportunities for improving health care education related to the quality of life of women who experience UI, and the need to make the experience more visible and openly discussed as a health issue rather than the traditional condition of aging. Incorporating content regarding UI into core curriculum of health care professionals' learning, particularly nurses and physicians is critical for change to occur. Within, long-term care facilities it is imperative to ensure that licensed practical nurses and personal care worker programs provide appropriate knowledge and education on UI. This study provided a voice for women's stories and supported the expression of personal concerns, attitudes and feelings related to such an intimate and silenced topic.

**PD7 712 STAFF RESIDENT COMMUNICATION PRACTICES IN RESIDENTIAL AGED CARE – STRATEGIES FOR ENHANCEMENT**

J. TINNEY\* (National Ageing Research Institute, Melbourne, Australia)  
B. HARALAMBOUS(1), L. DOWSON(1), C. HEMPTON(1) - (1) National Ageing Research Institute (Melbourne, Australia)

Introduction This paper draws on a study involving four residential aged care facilities. The aims were to explore staff beliefs and attitudes concerning residents' communication and social needs; identify barriers to communication; and develop and pilot communication training materials for staff. Methods and materials Interviews were conducted with two senior managers from each site and staff were surveyed for views of their current practice; staff development and communication training programs; and perceptions of barriers to communication with residents. The second stage involved focus groups to explore staff understanding of communication issues, and observation and mapping of normal staff routines and communication practices. In the third stage, communication training materials were developed and staff training workshops conducted. The evaluation stage will include a repeat of the staff survey and analysis and comparison of data. Findings Staff demonstrated a generally high awareness of residents' communication needs. However, they expressed frustration about the competing demands of care task fulfilment and emotional support of residents, regretting that the latter tended to receive lower priority. Key factors in staff ability to address communication challenges were explicit organisational values; training; management support and team loyalty. Despite staff awareness of communication needs, the project has highlighted the need for ongoing training about the progression and impact of dementia to ensure that all staff understand the behavioural and psychological symptoms. A practical research finding was the difficulty experienced in recruiting staff, indicating a need for more time and contact with the staff to raise awareness of the research goals and engage them in the research process. Management support is crucial in this. Conclusion Many staff have the awareness and

skills to recognise and try to meet residents' communication needs, but because of time and other constraints can feel burdened by the need to prioritise physical care over emotional.

**PD7 713 THE DA VINCI PROJECT: COLLABORATIVE DEVELOPMENT OF A UNIVERSAL GERONTOLOGY CURRICULUM WITH THEORY AND PRACTICE**  
R. TAKAHASHI\* (AU-NCSA Center for Gerontology at Andhra University, Visakhapatnam, AP, India)  
M. RAJU(1), T. DEVI(2), M. THOTA(3), N. HATANAKA(4) - (1) Andhra University (Visakhapatnam, AP, India); (2) Lebenshilfe for the mentally handicapped (Visakhapatnam AP, India); (3) Nippon Care-Fit Service Association-India (India); (4) NCSA Center for Gerontology (Japan)

In March 2007, Gerontology International Synthesis Meeting was held in Okinawa, Japan. Later in September 22nd 2007, AU-NCSA Gerontology Center was inaugurated in Andhra University of Andhra Pradesh State. This Center will develop glocal (global + local) activities as a universal model of collaborative research, learning and practice center of Gerontology. The author calls its collaborative learning curriculum as "Yoga Gerontology Collaborative Learning Curriculum". The basic idea of Gerontological collaborative learning is to help people become able to spend time wisely. 'Manuke', a Japanese word that means "fool", consists of two words: "Ma", which means "time" or "temporal sense", and "neke", which means "lacking" or "unconscious". A person that is "unconscious of time" is called "manuke". Such a person cannot sense the atmosphere, or in other words, lacks awareness (kigatsuku). The word "yoga" originated from the Sanskritic word "yuz", which means "to put a yoke". A yoke is a crossbar that is put behind the neck of cattle when pulling a cart. "Yoga" means to put the yoke on, that is to connect the cattle and the cart.<sup>1)</sup> In Japanese, this is called "kizuna". These characters originated from the rope to tie down farm animals. This is similar to another rope, which can be represented by the word "kigatsuku" (awareness), that is hard to observe unless the wavelength of one's heart is synchronized with that of the universe. Some people are well aware while others are blunt. Therefore, the goal of Da Vinci Project 2012 is to seal the people with the sense awareness from universal observing point. Based on the Proclamation of Gerontology International Synthesis Meeting 2007 in Okinawa, and by the cooperation of Association for Gerontology in Higher Education and International Association for the Scientific Study of Intellectual Disabilities.

**PD7 714 SENIORS LEARNING IN SOCIAL NETWORKS IN EUROPE (SELERNET)**  
F. KOLLAND\* (University of Vienna, Vienna, Austria)  
D. KÖSTER(1), M. RANGA(2), L. SAFTU(3), Z. GANKOVA(4) - (1) FOGERA (Witten, Germany); (2) Hellas50+ (Greece); (3) Romanian Institute for Adult Education (Romania); (4) TUGabrovo (Bulgaria)

Introduction: Older people of low social status tend to live socially and spatially segregated. This action research project, to be carried out simultaneously in Germany, Austria, Romania, Bulgaria and Greece, aims to integrate older people into educational processes. This integration is to take place by means of the development of social networks. The project aims to show how the establishment of social networks can lead older people who do not actively pursue education to participate in learning and educational processes. The target group will improve their learning and behavioural skills, allowing them to play a more active role in community life and contribute to social change. The fundamental assumption is that older people who do not participate in education are prepared to become involved in social networks and thereby to learn when they can expect their activities to lead to an improvement in their quality of life. Methods and materials: On the basis of social area analyses, which include both district inspections and area-related interviews, indicators are to be developed which relate to the quality of life of older people. The aim is to identify indicators which allow low-threshold access to social networks. The social networks which thus develop should then be used to establish bottom-up learning processes. This methodological approach is an attempt to follow in the tradition of action research, with both quantitative and qualitative processes being tested. Results: The social area analyses show space as a social product, with processes of both inclusion and exclusion becoming visible. On the one hand local relationships between public areas transfer into private living spaces (leisure, education, social relationships); on the other hand, there is reduced spatial dependence. The space loses its homogeneity in terms of social relationships.

**PD7 715 INTERNET USE AMONG OLDER PEOPLE IN GERMANY – THE PREDOMINANCE OF COHORT EFFECTS**  
M. DOH\* (Institute of Psychology, Heidelberg, Germany)

Across the past decade the Internet use spread tremendously in modern societies. In Germany, two thirds of the total population, but only one quarter of elders over 60 are onliners. Often reported predictors of internet use are socio-demographic factors (education, income, gender, occupation) and psychological factors (intelligence, technology attitudes, personality), particularly important in old age. The aim of this presentation is three-folded. First, is the digital divide about to be bridged? Second, is there a dynamic trend among elderly people to adopt the internet? Third, is the exclusion of the

"fourth age" particularly due to a cohort effect? Data was drawn from the (N)Onliner-Atlas, a nation-wide internetstudy, comprising 6 annual surveys (2002-2007, N=50,000 each, aged 14 to 99). Multivariate logistic regression models were computed to examine the impact of socio-structural predictors and the effect of cohort on internet use. The "Digital-Divide-Index" shows slow decline of the access gap from 2002-2007, however the gap between young and old continues. Due to the logistic regression results, the relevance of socio-structural predictors increases among older cohorts. Furthermore the results suggest a substantial effect of cohort, dominating the age effect. The adoption of the internet seems to be predominantly affected by cohorts, in that older cohorts show no significant development in the adoption process in contrast to younger cohorts. Thus, accordingly to the theory of Rogers diffusion of innovations older cohorts are late adopters, obviously cohorts of the "fourth age" are permanently offliners. In addition to the concept of Schäffers generation-based "culture of media practice" offers implications for social and education policy: for cohorts of the "third age" the internet can be attracted in terms of development resource and health prevention whereas cohorts of the "fourth age" may be addressed in terms of health intervention programs.

**PD7 716 AN INNOVATIVE WEB-BASED APPROACH FOR HELPING COMMUNITIES BECOME MORE**  
A. SCHARLACH\* (University of California, Berkeley, Berkeley, United States)

This presentation describes an online educational initiative to help communities respond more effectively to the needs of their aging populations, by (1) facilitating dissemination of emerging knowledge regarding community change processes, (2) sharing best practices, and (3) promoting peer networks and cross-learning designed to help communities become more "aging-friendly." Live and pre-recorded presentations began on February 13, 2008, and continued for three consecutive weeks, followed by a Community of Practice (CoP), a structured networking and knowledge-sharing process that continued for more than six months. Participants had access to more than 30 presentations by experts on community development processes, an extensive Resource Library containing more than 300 reports and best practices guidelines, and ongoing networking opportunities through a variety of online communication modalities, including instant messaging, virtual meeting rooms, and structured collaborations. Nearly 2,000 individuals from 17 countries participated in one or more of the online activities. Participants included senior citizens, policy makers, community organizations, foundations, businesses, local governments, urban planners, and transportation and housing experts. For 75% of these participants, this was their first online conference of any kind. Respondents to an online evaluation questionnaire indicated that the initiative had provided access to new resources (95%), expanded knowledge (90%), or promoted useful peer interaction (84%), and 72% reported specific plans to use the information gained in a current or future project. Respondents were most satisfied with the expert presentations (95%) and the Resource Library (91%), and somewhat less satisfied with opportunities for peer interaction (67%). This innovative online educational initiative contributed to information dissemination designed to help communities in 17 countries respond more effectively to the needs of their aging populations. Quantitative and qualitative evaluation data suggest critical implications for improving virtual communication and knowledge sharing in a Web 2.0 environment.

**PD7 717 TAIWANESE MEDICAL AND NURSING STUDENT INTEREST LEVELS IN AND ATTITUDES TOWARDS GERIATRICS**  
Y. CHI HUA\* (Chung Shan Medical University, Taichung, Taiwan)  
L. MENG CHIH(1) - (1) Chung Shan Medical University (Taichung, Taiwan)

Introduction: To investigate the attitudes of medical and nursing student towards the older Chinese population in Taiwan. Methods and materials: A reliable and valid Chinese language version of Kogan's Attitudes toward Older People (KAOP) with 17 matched item pairs (34 items) was completed by 275 medical and nursing students. Descriptive data analysis was employed. Results: Participants reported slightly more positive attitudes (Mean:  $144.30 \pm 17.89$ ) than those reported from studies in other countries (Jordanian: Mean:  $110.6 \pm 21.79$ ). Students who were females (Mean:  $148.27 \pm 18.97$ ), younger (Mean:  $146.01 \pm 18.59$ ) and studying nursing (Mean:  $156.86 \pm 17.56$ ) were more likely to report more positive attitudes than older (Mean:  $140.04 \pm 15.31$ ), males (Mean:  $140.47 \pm 15.93$ ), studying medicine (Mean:  $138.77 \pm 15.04$ ). Conclusions: Results show that students may have greater ambivalence attitudes on 10 out of 17 matched item pairs which provides useful information for faculty involved in aged care curriculum design. Working as a volunteer in the university hospital may increase students' interaction with the elderly and this may positively influence attitudes towards the elderly.

**PD7 718 PROMOTING EVIDENCE-BASED PRACTICE OF "HOW TO" KNOWLEDGE IN MULTIDISCIPLINARY WORK CONTEXTS**  
C. MCWILLIAM\* (University of Western Ontario, London, ON, Canada)  
A. KOTHARI(1), C. WARD-GRIFFIN(1), D. FORBES(1), B. LEIPERT(1), M. KLOSECK(1), K. FERGUSON(1), M. FLUIT(1), S. COLEMAN ET AL.(2) - (1)

University of Western Ontario (London, ON, Canada); (2) South West Community Care Access Centre (London, ON, Canada)

**Introduction:** Promoting evidence-based knowledge throughout in-home care is a huge challenge. Providers representing multiple disciplines and agencies work autonomously within loosely networked "teams". **Methods:** To promote an evidence-based partnering approach in one Canadian jurisdiction, heterogeneous groups ( $n = 14$ ) of researchers, decision-makers and practitioners ( $n = 253$ ) used participatory action to develop and test a knowledge translation model, implementing two action cycles over 2 years. Baseline and end-of-cycle surveys measured learning readiness (supportive context; self-efficacy; self-motivated learning), partnering (job motivation; empowerment; team functioning) and partnering outcomes (partnering effort; job satisfaction; perceived effectiveness). A purposeful sample of audio-taped meeting transcripts and observations, analyzed using an editing approach, identified barriers/facilitators (Cycle 1). Social phenomenology was used to construct the model (Cycle 2). **Results:** Quantitative: gains in learning readiness, knowledge uptake and application, including: supportive context ( $p = .001; .001$ ), self-motivated learning ( $p = .001; .001$ ), job motivation (no change;  $p = .001$ ), team functioning ( $p = .08; .028$ ), partnering effort ( $p = .085; .016$ ) and perceived effectiveness (no change;  $p = .001$ ). Qualitative: barriers/facilitators included the organization's priorities and resources; team communication and coordination, and individuals' attitudes and practice patterns; four strategies comprised effective implementation: overcoming barriers and optimizing facilitators through integrated effort amongst people representing the macro-, meso- and micro- components of the organization; transcending "science push" and "demand pull" through social interaction; synthesizing the evidence with tacit and experiential knowledge; and integrating knowledge translation throughout everyday work. **Conclusions:** With consistent effort and supportive resources throughout a service infrastructure, this model fosters agency in co-creating knowledge applications, a "level-playing field" for mutually refining the context for KT, and transformative leadership in integrating KT within everyday work. Researchers and decision-makers need to forfeit control of outcomes, attending instead to nurturing the process. (Funder: CIHR)

**PD7 719 LIVE HER AGE® WOMAN EDUCATIONAL PROGRAM FOR HEALTHY AGING OF WOMAN IN MURCIA REGION**

J. AVILES HERNANDEZ\* (Universidad Católica De Murcia, Murcia, Spain)  
J. SALMERON AROCA(1), T. MORENO(2), D. JOICIANE(3), F. EVA(4),  
B. DANIEL(5) - (1) Servicio Murciano De Salud (Spain); (2) Instituto De La Mujer  
(Spain); (3) Universidad Federal De Uberlândia (Brazil); (4) Servicio Murciano De Salud  
(Spain); (5) Universidad De Nice (France)

**INTRODUCTION:** Women's Institute of Murcia Region (WIMR) has been development a specific educational program on gerontology (Living her Age: Woman), following recommendation of WHO: "Active Aging". The main objective is educational, looking for avoiding or anticipating pathologic aging. We have to remember that Gerontology is the best adapted discipline on prevention of pathologic aging, fragility and illness. **METHOD AND MATERIALS:** Descriptive study from 2003 until 2008 with 1440 women population (mean age 61.2; Minimum: 38 Maximum: 84) With 48 centers which depending on WIMR. Each center imparts this educational program (theoretical and practices contents) during 18 hours, this program has the six unit: Biology of Aging, Physical Exercise and Health, Urinary incontinence; Diet and Aging, Stress, Memory and Aging, and Osteoporosis. At the end of the Educational Program we ask them for answering a test for evaluating the program and teachers **RESULTS:** We have a media of attendance of 30 pupils. 90% of women have covered more than 75% attendance and they have got the accreditation. Global evaluation of the women of the Educational program has been 4.6/ 5 on item selection of the proposed topics and deep on teaching; 4.8 /5 teachers and educational methodology, 4.8/5 interest of the topics and 4.3/5 usefulness and impact on daily life. **CONCLUSIONS:** To consider aging like a natural process and teaching women that we can act over it, anticipating and avoiding pathological aging is the main objective of this educational program. It has been development for integrate and socialize the women, with primary endpoints on improving quality of life. We have worked with the recommendation of the WHO for Gerontology teachers and educators to promote a more positive image of aged woman in the way of avoiding social exclusion/ marginalization.

**PD7 720 IMPROVING OUTCOMES WITH STRUCTURED MULTIDISCIPLINARY EDUCATION TO IMPROVE LONGEVITY, HEALTH AND WEALTH OF HOSPITALIZED OLDER ADULTS**

B. LAURILA\* (Health Sciences Centre, Winnipeg, Canada)  
C. JOHNSON(1), T. MATVIYCHUK(2) - (1) Health Sciences Centre (Canada); (2) Health Sciences Centre (Canada)

Factors associated with poor outcomes for hospitalized older adults can be found within the care delivery system. This is significant when you consider at the Health Sciences Centre (HSC) in Winnipeg, Manitoba, Canada, it is estimated that at any given time, over 60% of the adult population is over age 65. These patients can be found in most acute care areas within the centre. This presents many challenges in acute care as older adults tend to have longer lengths of stay. Coupled with this are clinicians who are often not well versed in the care of the older adult. To address challenges for hospitalized older adults, the Nurses Improving Care for Healthsystem Elders (NICHE) survey, entitled the Geriatric Institute

Assessment Profile (GIAP), was conducted in the fall of 2005. The GIAP assessed attitudes towards caring for the older adult, knowledge of guidelines for the care of the older adult and common geriatric syndromes, and perception to barriers to best nursing practice for older adult patients. Results indicated participants felt that further older adult education would be beneficial to their current practice. Nursing leadership at HSC addressed this key finding through supporting the development of the Older Adult Clinical Practice Level 1 (OACPL1) courses. This two day course, incorporating multidisciplinary presenters, focuses on common geriatric syndromes such as incontinence, falls, skin and wound care, delirium, and dementia, as well as other relevant issues. While all healthcare disciplines have been invited to attend OACPL1, attendance since OACPL's introduction in 2008, has been largely limited to new nursing recruits. Strategies to attract participants from other disciplines are being implemented in 2009. Evaluations received indicate participants find the courses beneficial and relevant to their practice. OACPL1 development, implementation, challenges and successes and future strategies for the continued evolution of OACPL1 will be discussed.

**PD7 721 CONNECTED AGEING: THE POLICY AND PRACTICE FOR PROMOTING DIGITAL LITERACY AMONG SENIOR CITIZENS IN CHINA, WITH A PLAN TO INTEGRATE INFORMATION AND SOLUTIONS THAT CAN ENABLE INDEPENDENT LIVING IN A FAST-AGEING DEVELOPING COUNTRY.**

N. WANG\* (Gerontological Society of China, Beijing, China)

By the end of 2008, China had 298 million internet users, of which only 17 million are over 50 years of age. Compared to developed countries, the over 50s in urban China are having similar access to computers and broadband connection, but have a much lower penetration of internet (only 5% in China compared to over 60% in the UK, US, etc.). They have suffered from difficulties in learning how to use digital tools. Obscure theories and Chinese typing (using a keyboard) are among the main daunting tasks for them. A project launched in late 2008 by Gerontological Society of China (GSC) together with China Association of Science and Technology (CAST) has greatly lowered the barrier to educate the seniors. With only 8 hours of interactive training, a complete beginner to computer and internet can immediately acquire the skills to surf the internet, use search engines, send and receive emails, as well as connect to others via instant messaging including video chat. By helping now thousands and eventually millions of Chinese senior citizens to complete the first steps in becoming digitally literate, the project is aiming at then providing further education, possibly in many different subjects, through an integrated online platform. With an expected majority of 95% Chinese elderly to age at home, this digital literacy initiative may prove to be crucial for enabling general access to independent living-related information and solutions. Public and private efforts are to be combined in developing the online platform with a simple, senior-friendly interface. Once connected, the senior citizens can much more easily access solutions in healthcare, financial services, retirement living, home security, mobility, leisure as well as active participation in commercial and volunteering initiatives. This project may be an example for other developing countries to educate, connect and empower the seniors.

**PD7 722 INCREASING CAPACITY FOR GERIATRIC AND GERONTOLOGY CONTENT IN CANADIAN NURSING EDUCATION**

L. MCCLEARY\* (Brock University, St. Catharines, Canada)  
K. MCGILTON(1), D. RYAN(2), O. ABRAM(2), V. BOSCAR - (1) Toronto Rehab  
(Toronto, Canada); (2) University of Western Ontario (Toronto, Canada)

Consistent with international findings, surveys of Canadian undergraduate nursing programs indicate limited capacity for gerontology nursing education. Gerontology content is integrated in most programs. As few as 5% of faculty have advanced gerontology education. Content is taught by non-experts. In the 2006 Canadian Registered Nurse Examination, less than half of questions related to patients over 80 years old were answered correctly. This paper describes the process of advocacy by the National Initiative for Care of the Elderly for nursing gerontological core competencies and a program that enhances curriculum and capacity for undergraduate teaching. Lessons learned from advocacy for improved curriculum through partnerships with and lobbying of professional, licensing, and accreditation organizations and nursing leaders are described. The rationale, process, and outcome of a Canadian knowledge exchange workshop is described. Nursing faculty and PhD students are participating in a 1? day workshop that will: (1) transfer new research based evidence and knowledge about care of older persons to Canadian nursing educators; (2) provide them with tools to incorporate evidence based gerontology and geriatrics content in undergraduate curriculum; and (3) engage them as knowledge transfer champions for evidence based gerontology content in nursing curriculum within their universities, provincially, and nationally. Participants conduct a curriculum survey of their program and a detailed assessment of one course. At the workshop they receive evidence based resources from the U.S.A. and Canada that can easily be incorporated into teaching, including "state-of-science" reviews produced by the American Association of Colleges of Nursing, the RNAO Educator's Resource for integrating Best Practice Guidelines, and knowledge transfer tools. They develop strategies to integrate this material in teaching, share resources with colleagues, and influence curriculum change. The workshop

incorporates multiple strategies to support non-experts who teach gerontology content to undergraduates.

**PD7 723 ENJOYING RETIREMENT**

D. MONTANO ARIAS\* (UNIVERSIDAD DEL CAUCA, POPAYAN-CAUCA, Colombia)  
M. DOLORES CRISTINA(1), B. CARMEN ROSALBA(1) - (1) UNIVERSIDAD DEL CAUCA (POPAYAN-CAUCA, Colombia)

ENJOYING RETIREMENT To study the relationship between the program's objectives and the project of the current life of the retired administrative staff at the University of Cauca with reference to health and their social, personal and group circumstances was the purpose of this research. It was based on Robert Estaker's model which is characterized by the assessment aimed at the complex and dynamic nature of educational programs, bearing in mind various aspects and components. The fieldwork involving twelve informants had the following selection criteria: 1) The willingness to participate in the research project, 2) attendance to more than three pedagogic workshops and 3) to be retired. Profound observations and interviews have been carried out and actions were focused on focus group. The pedagogic model relates to the Adult Education and the most important result of the study were considered. There are two main areas in the pedagogical model: 1, Research of interests, needs and potential of the study population, in addition to their social and economic characteristics. 2. Pedagogic and didactic organization from flexible management which makes possible the auto-evaluation exercise and reflection on collective and individual life styles. This kind of program can't be standardized in the sense of being applicable in the same way to any context, population or person no matter how similar the circumstances may appear. It's obvious that there's a difference between the contextual proceeding, education level, occupation and gender, among other things just the very concept of quality of life or welfare. Pedagogic work strategies were focused on workshops, group activities, interaction between academic peers, etc, without forgetting integration activities and social action that strengthen the feeling of relevance and the process of individual and collective development projects for life.

**PD7 724 WORLDVIEW ENVIRONMENTAL SCAN ON ELDER ABUSE: KNOWLEDGE TRANSFER**

E. PODNIEKS\* (Ryerson University, Toronto, Canada)  
P. TEASTER, T. WANGMO, L. BARRETO

WorldView Environmental Scan on Elder Abuse: A Knowledge Transfer Podnieks, E., Ryerson University; Teaster, P.B., and Wangmo, T., University of Kentucky; Baretto, L., Help Age International, Peru. The WorldView on Elder Abuse Environmental Scan was built on the recommendations from the Madrid International Plan of Action (2002) in order to collect information on the nature of elder abuse and responses to it from a global perspective. The Scan represents a first step in this important global research, leading to more in-depth investigation and expanded collaboration with international countries. The Scan gathered information about the problem of elder mistreatment, as well as information on legislation and policy, services and programs, educational resources and needs, training, and past and ongoing research. A total of 53 countries responded to the survey questionnaire, which represented the six world regions designated by World Health Organization. From these countries, 362 respondents completed 190 surveys. Findings revealed that contributors to elder abuse include changing social and economic structures, isolation of victims, inadequate knowledge of laws and services; intergenerational conflict, and poverty. Barriers to seeking resources to intervene and protect older adults included the culture of the country, language issues, literacy, stigma, lack of mobility, funding, and familiarity with and access to the internet. In this presentation, we draw attention to the enormous diversity among countries, which underscores the personal tragedy of elder abuse and the inadequacy of existing systems to effectively prevent or treat the problem. The data serve as a catalyst to take actions, both globally and nationally, while emphasizing the changes necessary to protect the rights and dignity of older adults.

**PD7 725 DISTANCE CAREGIVING AND THE ELDERLY: EMPIRICALLY BASED INTERVENTION TECHNIQUES AND ASSESSMENT.**

J. BLACKBURN\* (Hunter College, New York, NY , United States)  
VIDEKA(1), P. TOSELAND(2) - (1) University at Albany (Albany, NY, United States of America); (2) University at Albany (Albany, Ny, United States of America)

Recent research suggests that maintaining contact with elderly parents and providing care for them from a long distance represent major challenges for a burgeoning number of families across the globe. In the United States it is estimated that approximately seven million family members currently provide long distance care and that these numbers will double in the next fifteen years. Therefore, we need to provide caregivers with information that can be used to prepare and empower those who are geographically separated from their elderly family members. Over the past several decades, research on caregiving for older family members has focused primarily on caregivers who live close to or with the elderly family members. There have not been few studies that have examined the impact of geographical distance on the caregiving role. However, the studies that have been done indicate that distance not only complicates the quality and quantity of care, but we lack

well controlled studies that have evaluated the efficacy of these distance caregiving programs/interventions. Therefore, we first examined research on distant caregiving to provide an understanding of the key issues facing caregivers and their elderly family members. Second, we identified existing resources and guidelines that are followed in the intervention and practice literature as it relates to distance caregiving. Finally, we discuss the results of an evaluation of a distance caregiving program and the implications of these results for distant caregivers and their families. We conclude by discussing how professionals can assist caregivers to prepare for a distance caregiving role and to assess the merits as well as the resources needed to fulfill this role. We argue that future research needs to identify relevant and meaningful categories of distant caregivers for service providers and the number and nature of the complicating factors associated with this role.

**PD7 726 PALLIATIVE CARE IN NURSING HOMES: THE IMPORTANCE OF ARTICULATING FUNCTIONAL DECLINE IN ADVANCED CHRONIC ILLNESS**

M. BERN-KLUG\* (The University of Iowa, Iowa City, United States)

The 21st century will witness the impact of major changes in the demography of dying. Throughout the world more people will die within the context of advanced chronic illness than ever before, and much of this dying will be among older adults. Current standards of care related to medical treatment and emotional care for people who are considered to be dying do not necessarily reach people with advanced chronic illness. This is because "dying" is operationalized as "close time until death" rather than "high risk of being dead; time uncertain." This is especially true in long-term care settings. This session will discuss the need for more attention to the palliative care needs of older adults with advanced chronic illness in long-term care settings (in particular in the nursing home setting) in the U.S. The role of nursing home social workers in providing psychosocial care—as part of palliative care—to older adults with advanced chronic illness will be discussed. With more emphasis on anticipating and documenting physical and/or cognitive frailty, the transition to an emphasis on palliative care may be more smooth.

**PD7 727 LIFE IN OLD AGE**

N. CHEN\* (University of Missouri , Lee's summit, Missouri, United States of America)

Introduction Growing old can mean different things to different people. Several studies focus on age 60 and over and very few of them look beyond 80 years old. This study is to explore older people's life experiences and meaning beyond 80 years old. Methods A phenomenological research methodology was used to have better understanding and insightful interpretation of life experiences. Open-ended interview questions and thematic analysis were conducted to have deeper insights into people's life experiences. Twenty people ages 80 and older participated in the study. Results In this study, participants were actively engaged in communities despite their losses and physical limitations. A sense of worth through volunteer work and social networks helped them connect to communities. They were satisfied with their lives and appreciated what they had. Faith and religion gave them peace and fulfillment. The majority of them felt they were not old and expressed the beauty of being their age. They viewed people several years older than them as old. Comparison to others who were worse off made them feel blessed with their health. Their perception on "who is old" depended on a person's health, feelings, and attitude. They had mixed feelings about "end of life." Some of them anticipated preparation or expressed uncertainty for their future to come. Others were not ready to give up because there were new things that they wanted to see and do. Conclusion Having strong faith, positive attitude, flexibility, and a purpose in everyday provided them with a comfortable and contented life. Although they continued to cope with challenges of later life, their optimism and motivation kept them going. Getting back to communities and connecting with others were important as long as they were capable. Regardless of their health status, they looked forward to learning, sharing, serving,

**PD7 728 TESTING SELF-EFFICACY AS A PATHWAY THAT SUPPORTS SELF CARE AMONG DEMENTIA FAMILY CAREGIVERS IN A PSYCHOEDUCATIONAL INTERVENTION**

M. SAVUNDARANAYAGAM\* (University of Wisconsin-Milwaukee, Milwaukee, Wisconsin, United States)  
M. BRINTNALL-PETERSON(1) - (1) University of Wisconsin-Extension (Madison, WI, United States of America)

This study investigated the impact of a psychoeducational intervention on health risk and self-care behaviors of dementia caregivers (N=325). Moreover, this study investigated the extent to which changes in self-efficacy explained changes in health risk and self-care behaviors. Our findings revealed that family caregivers experienced reductions in health risk behaviors, and improvements in exercise, stress management, and relaxation activities. Improvement in self-efficacy was linked with reductions in health risk behaviors, and increased involvement in stress management and relaxation activities. We discuss implications in terms of the need to understand the mechanisms by which interventions influence family caregivers.

**PD7 729 THE IMPACT OF PARENT-CARE TRANSITIONS ON THE MARITAL QUALITY AND WELL-BEING OF ADULT DAUGHTERS AND SONS**  
J. BOOKWALA\* (Lafayette College, Easton, United States)

This study prospectively examines the impact of parent-care transitions using data from the US National Survey of Families and Households (NSFH). It uses three waves of data to assess the effects of transitioning into and out of the role of parent care on the marriage and well-being of adult daughters and sons. The sample consisted of 317 participants: 129 recent caregivers, 72 veteran caregivers, and 116 former caregivers, all non-caregivers at baseline (mean age=39.8 years, SD=8.0; 58% [n=184] female). Two indicators of marital quality – marital happiness and marital inequity – and two well-being indices – depressive symptomatology and life satisfaction – were the primary study outcomes. 3-way mixed-MANCOVAs (caregiver-transition group x caregiver gender x time; covariates: age, race, education, and number of children) were used to compare differences on marital quality and well-being. The primary findings include a significant main effect of caregiver-transition group for marital happiness ( $F[1,307]=4.03, p<.05$ ) and marital inequity ( $F[2,307]=3.90, p<.05$ ) and a significant 3-way interaction for depressive symptomatology (multivariate  $F[2,307]=3.10, p<.05$ ) and life satisfaction (multivariate  $F[2,307]=3.32, p<.05$ ). On average, recent caregivers reported greater marital happiness and less marital inequity than veteran adult-child caregivers. Depressive symptomatology varied over time across parent-care transition groups but only for caregiving daughters, with veteran caregiving daughters reporting a significant increase in depressive symptoms over time. On life satisfaction, former caregiving sons, but not daughters, experienced higher levels after exiting the parent-care role. Results regarding marital quality are consistent with the stress and coping literature and those for well-being can be understood by taking a gendered view of the wear-and-tear model of caregiving.

**PD7 730 THEMES FROM LIFE STORIES OF OLDER EARTHQUAKE SURVIVORS: 13 YEARS AFTER THE GREAT HANSHIN EARTHQUAKE**  
K. KANDA\* (Kwansei Gakuin University, Nishinomiya, Japan)  
Y. SAKAMOTO(1), L. CHEN(1) - (1) Kwansei Gakuin University (Nishinomiya, Japan)

**INTRODUCTION:** Thirteen years have gone by since the terrible disaster caused by the Hanshin Earthquake (magnitude 6.8) hit Kobe City, but its effects seem to hit older adults to this day. In 2006, 62 suicide cases were reported as deaths resulting from the effects of the earthquake. Growing old after a terrible disaster seem to have a prolonging effect on older adults. Hence, this study investigates the memories of the earthquake and how living survivors view life after the quake. **METHODS:** Semi-structured interviews were conducted with older survivors 65 years and older living in Kobe (n=8), and then transcribed for thematic analysis. **RESULTS:** Unique themes have surfaced from the interviews. Particularly, findings suggest that resilience is a key to coping losses and overcoming negative memories of a terrible disaster. **CONCLUSION:** Strengthening older survivors' capacity for resilience is an important practice issue for geriatric professionals. Furthermore, continuing investigation of older adults who experienced the Hanshin Earthquake is warranted particularly to identify needs which still remain unanswered after 13 years.

**PD7 731 AGING IN THE COMMUNITY: HEALTH AND FUNCTIONING PROFILES OF ELDERLY LIVING IN THE COMMUNITY ACROSS FRANCE, CANADA, THE U.S. AND JAPAN**  
K. MULHORN\* (Drexel University, Philadelphia, United States)

One objective of the International Classification of Functioning, Disability and Health (ICF) is to create a "common language" for measuring and monitoring functioning. This proposed pilot project begins the process of core sets development of profiles of aging populations living in the community across different countries. Key Issues when applying the ICF in medicine involve practicability and usefulness for research and clinical practice, how to link the ICF to the International Classification of Diseases and how to maintain comparability across conditions and settings. The development of ICF Core Sets addresses all these challenges. The ICF Core Sets are categorical profiles to describe and classify functioning in people in a determined context and/or with a health condition in research and clinical practice. ICF Core Sets for different health-care situations and for different health conditions including musculoskeletal and neurological conditions have already been developed. The ICF Core Set for the elderly is missing until now. With this new development, it will be possible to address the needs of elderly persons in relation not only to body functions and structures but also in relation to activity and participation. It will also be possible to identify relevant environmental factors which contribute to better levels of functioning and less disability. In the first phase of the research the author and collaborators in other countries will follow several groups of elderly living in the community to determine those factors that indicate a risk of functional decline. Then, ICF will provide a tool for comparing the functional status of the participants.

**PD7 732 THE IMPACT OF LONG-TERM CARE INSURANCE ON FAMILY CAREGIVING IN KOREA**  
Y. PARK\* (Kangnam University, Yongin-si, Kyunggi-do, Republic of Korea)

Long-term care has emerged as one of the most critical issues in rapidly aging Korean society. In 2008, Korean government implemented a new social insurance on long-term care

insurance for elderly, and this has started to change the landscape of family caregiving in Korea. The purpose of this research is to delineate the process of socializing care in the elderly services in Korea, and explore its impact on family caregivers. Results from qualitative study of families receiving home help and daycare services will be presented. Policy implications for developing a balanced model of long-term care will be drawn as well.

**PD7 733 USING A FOCUS GROUP STUDY TO EXPLORE EXPERIENCES AND PERCEPTIONS IN SENILE DEMENTIA PATIENTS' FAMILY CAREGIVERS**  
S. UEI \* (Mennonite Christian Hospital, Hualien, Taiwan)  
S. UEI(1) - (1) Mennonite Christian Hospital ( Hualien, Taiwan)

**Introduction** The immense and lasting attending need demented persons require will effect great challenges to families as dementia population increases in global aging. Caregivers of dementia patients, in particular, usually endure unsurpassable stress during the course of accompanying as care taking approaches for dementia patients differ from those for patients of other illnesses. For all these reasons, the purposes of the research are to explore the senile dementia patients' family experiences and perceptions on their care giving involvements. Understanding their perceptions is very important in order to design effective nursing interventions for enhancing health family functions. **Methods & Materials** A qualitative study using a focus groups and participant observations were conducted to obtain the experiences, perceptions and coping strategies by process recording from eleven senile dementia patients' family caregivers. Two focus group sessions were held and each lasted from 2.5 to 3 hours until no new data was forthcoming. Content analysis was used for data analysis. Results Volunteer participants included five females and six males aged from 35 to 60, with an average age of 47.8. The mean time of their care giving involvements was 6.1 years, ranging from 10 months to 30 years. Through an inductive content analysis, four themes and seven sub-themes were named and defined in this study; included: 1. Shared Memories: A sense of loss, 2. Through It All – Misunderstood and Burdens, 3. A Long Road to Go – Responsibilities, On call, and Challenges, and 4. Not Alone – Role reversal and Sharing. **Conclusion** The study found that senile dementia patient's family members need assistance in various areas to help them undergo the complex and uncertain processes of care giving. Interactions with other family caregivers and exchange of care giving information have positive influences on both situational responses and stress management.

**PD7 734 FACTORS INFLUENCE THE CHANGED FAMILY CARE-GIVING PATTERNS IN TAIWAN: AN INVESTIGATION FROM RELIGION AND SOCIAL REPUTATION PERSPECTIVES**  
A. LIVINGSTONE\* (The University of Southern Queensland, Hervey Bay, Australia)  
S. WANG(1), A. TUCKETT (2), J. SOAR (1) - (1) University of Southern Queensland (Australia); (2) University of Queensland (Australia)

With more women enter the work force and fewer children, the nursing home placement become one of the options of looking after the older relatives. Literature (Butcher, Holkup, Park & Maas, 2001; Kim & Lee, 2003) that addresses the decision making for nursing-home placement, underscores how difficult it is to make this decision and adjust. There is seldom research addressed the cultural issues such as religion and social reputation impact on this nursing home placement of older relatives' process and this care-giving pattern. These issues are important and should be addressed as family caregivers in Asian have to be challenged by traditionally culture values. However, these cultural role and responsibility might have changed with time. This paper provides findings that elicit the social-cultural factors which including adult children's responsibilities, religion and social reputation influencing family caregivers' decision when they deciding nursing home placement of older parents. These findings stem from a phenomenological study, conducted in two nursing homes in Taiwan. Data were collected from 5 nurses and 7 adult children by interviewing and observations conducted amongst family caregivers and nursing home staff. Data were thematically analysed consequent on the reading and re-reading of field notes and interview transcripts. The results have revealed some family caregivers were concerned about their reputation and the judgments of other people when placing their parents into nursing home. It is considered shameful and unfilial. Family caregivers were challenged by societal pressures. In term of religion, family caregivers often used often used Karma to explain their feelings and responses to nursing home placement of their older parents. The findings of this study have demonstrated family caregivers of nursing home residents in Taiwan were confronted by pressures from society. However, these society values were seen to be emerging as Taiwanese society was undergoing changes.

**PD7 735 ADULT DAUGHTERS AND AGING MOTHERS: CAREGIVER ROLE IDENTITY DISCREPANCY, GUILT AND BURDEN**  
J. GONYEA\* (Boston University, Boston, United States)  
R. PARIS(1) - (1) Boston University (Boston, United States of America)

Although guilt is identified as being a common emotion experienced by family caregivers in the clinical literature, it has only recently emerged as a construct in the empirical research focused on identifying predictors and/or outcomes of caregiver distress. Thus, in this study, we draw on role theory to explore the relationship between adult daughters'

appraisal of their "caregiver role standards"—the degree to which they feel they meet, exceed, or fail to meet these standards—and their experiences of caregiver guilt and burden. Our data are drawn from the Mills Longitudinal Study, a representative sample of 142 members from the senior classes of Mills College (a women's college) in 1958 and 1960. Our analysis uses the wave 5 (age 61 assessment) dataset. At age 61, the women not only completed self-report mailed surveys, but also participated in 2 to 3 hour face-to-face interviews which (with participants' permission) were audiotaped and subsequently transcribed. Our sample is based on the 66 women who spoke about their mother-daughter experiences in the open-ended questions in the parent care section of the interview. Hierarchical regression analysis revealed guilt was positively correlated with burden and that it accounted for a significant amount of the variance in caregiver's sense of burden even after contextual and caregiver stressor variables were controlled. Using role theory, we begin to explore how adult daughters construct a "caregiver identity standard" and internalize a set of meanings and rules that define which behaviors or actions are appropriate for acting in the caregiving role. Our research suggests the importance of clinicians seeking to understand how daughters judge their caregiving performance and targeting negative self-appraisals, which affect their mental health, for change.

**PD7 736 TRENDS IN THE RELATIONSHIP BETWEEN FORMAL AND INFORMAL CARE OF OLDER PEOPLE WITH FUNCTIONAL DEPENDENCIES LIVING AT HOME IN BRITAIN (1980-2001)**  
D. PATSIOS\* (University of Bristol, Bristol, United Kingdom)

**Introduction** The number of older Britons needing assistance with Activities of Daily Living (ADL) such as washing, dressing, cooking and cleaning has increased considerably in the past 25 years. Most care is provided by 'informal unpaid' caregivers, predominantly close relatives and friends, but some also receive assistance from health and social services or pay for help privately. This research examined 'how' and 'why' the relationship between formal and informal care for functionally dependent older people living at home in Britain changed between 1980 and 2001. Methods Data were restricted to people aged 65 and over who responded to the Elderly People in Private Households 'trailers' in six General Household Survey (GHS) years (1980, 1985, 1991, 1994, 1998, and 2001) and who reported at least one functional limitation (N=5,513). Seven typologies of care were constructed using combinations of Primary and Instrumental Activities of Daily Living (PADLs and IADLs) and specific source(s) of care (eg. spouse/partner, health and social services). GHS data combined with publicly available health and social services data was pooled and analysed. Government Actuary's Department (GAD) population estimates were used to estimate the number of older people falling into each typology of care. Multivariate statistical analyses were then used to establish the most important predictors of different typologies of care over time. Results and Conclusions Increasing numbers of older people received care solely from informal caregiving networks and paid private help, with fewer numbers receiving support from health and local authorities. Individual and household predictors (eg. age group and living arrangement), period (eg. sample year) and need variables (eg. level of dependency) played a greater role than system-level (eg. community care staff) variables in accounting for variation in the relationship between formal and informal care over time.

**PD7 737 MIDLIFE MARITAL HAPPINESS AND ETHNIC CULTURE: A LIFE COURSE PERSPECTIVE**  
B. MITCHELL\* (Simon Fraser University at HC, Vancouver, Canada)

**Introduction:** It is well established that marital relationships remain integral to individual and family health and well-being and that some marriages are happier than others. Indeed, those in happy marriages tend to report better health and subjective well-being (such as lower rates of depression and psychological distress), while those in "unhappy" marriages glean less favorable benefits. Continuing high rates of immigration and changing family structures also contribute to increasingly diverse marital patterns in North American society. Drawing from life course theory, the purpose of this paper is to further explore cultural, socio-demographic, and relationship factors and their association with midlife happiness in aging families. **Method:** Data are drawn from in-depth interviews with a sample of 390 middle-generation married mothers and fathers (ranging in age from 40-78, with an average age of 56.4) living in Metro Vancouver, British Columbia, Canada. These respondents self-identify as belonging to one of four cultural groups: British, Chinese, Indo/East Indian, and Southern-European. **Results:** Both quantitative and qualitative results reveal that most respondents report relatively high levels of marital satisfaction. However, a significant minority of respondents report being in less than very satisfactory marriages. Similarities in midlife marital happiness are also found across the four cultural groups, although perceived marital stressors underlying unhappy marriages vary across groups. Moreover, relationship dynamic factors, fewer competing demands, immigration status, and religiosity are associated with greater marital happiness. **Conclusion:** Relationship dynamic factors (i.e., intimacy satisfaction, doing activities together) and the experiences associated with competing demands on time (i.e., caring for other family members, paid work) surface as the most significant predictors of marital happiness. Implications for

aging parental marital relations and community supports are also highlighted, with emphasis on those at greater risk for relationship stress, strain, or crisis.

**PD7 738 BRAIN FITNESS ACTIVITIES: HEALTH AND COGNITION AMONG OLDER COMMUNITY SENIOR CENTER PARTICIPANTS**  
S. BUSHFIELD\* (New Mexico State University, Las Cruces, United States)  
T. FITZPATRICK(1) - (1) McGill University (Quebec, Canada)

Few studies have examined brain fitness activities and their relationship to mental and physical health and cognitive abilities. With increasing numbers living well into their nineties and the advent of the baby boom generation turning 65 years old, the number of individuals expected to develop Alzheimer's Disease will increase. Data were collected from nine French and English Senior Centers in the Montreal, Quebec area. A self-administered survey, translated in both English and French, was used among a sample of older women (N = 257) to assess brain fitness activities' influence on physical and mental health. In order to measure the major variables in the study, a modified version of the Psychological General Well-Being (PGWB) Schedule (Dupuy, 1984) was used. To measure cognitive/brain fitness activities, 13 different independent variables were included, representing cognitive activities such as travel, computer and computer labs, volunteering, cultural activities, strength training, speakers, group work, languages, career decisions and so forth. Five dependent variables representing self-reported mental and physical health were assessed using two items from the survey questionnaire. Qualitative data based on a phenomenological approach was also obtained from face-to-face interviews to further capture the meaning of cognitive functioning on mental and physical health. Multivariate Analysis (MANOVA) with post-hoc Bonferroni-t-tests revealed that activities such as aerobics, strength exercises, career decisions, working for pay, participating in a computer lab, learning new languages, group work and listening to speakers were significantly related to the physical health indicators of self-reported health and chronic conditions. Activities such as laughing together, career decisions, working together on a project, and strength exercises were significantly related to mental health indicators such as overall feelings (spirit), happiness and an interesting life. The results have implications for practitioners and future research in healthy aging.

**PD7 739 ASSESSMENT OF INFORMAL CAREGIVERS**  
D. JORGENSEN\* (The University of Auckland, Auckland, New Zealand)  
M. PARSONS(1), S. JACOBS(1) - (1) the University of Auckland (Auckland, New Zealand)

**Introduction:** Australasian pioneering spirit has stressed the need for the individual to cope with as little assistance as possible, except at the beginning and end of life. It is only when families are no longer able to cope with demands and needs of the disabled person that they seek formal assistance. It is hardly surprising that informal caregiving has been cited as one of the most stressful social situations. **Aims:** To investigate the causes of stress in caregivers; what measures can be put in place to assist caregivers and disabled people; implications for funders and policy makers. **Methods:** Mixed methods framework was used to ensure that multiple perspectives and views were considered. The study involved hour long interviews focussing on the type of support received and experience of caring. Caregivers Reaction Assessment and Depression (CES-D10) scales were used to assess sense of burden and screen for depression. **Results:** Carer stress was significant (mean score was 70 out of 120) and was higher in mothers and female partners. Depression was evident in caregivers aged 30 to 50. The qualitative analysis themes included: financial hardships, lack of information, social isolation, battling for everything, poor respite care and the inability to receive adequate physical support for the disabled people. **Conclusions:** A sequential model was developed from the themes. By far the majority of caregivers needed extra support of some kind.. The support wanted by caregivers ranged from financial, physical and emotional, including a listening ear. The majority of caregivers were happy to offer suggestions, such as a one-stop-shop for information, and more flexible funding and respite options particularly for children and younger adults. This large mainly qualitative study offers policy makers and funders a clear insight into the present needs and vulnerability of informal caregivers of people with disabilities.

**PD7 740 RESILIENT AGEING IN PLACE: IMPROVING THE LIVES OF OLDER PEOPLE LIVING IN NEW ZEALAND COMMUNITIES**  
L. KIATA\* (University of Auckland, Auckland, New Zealand)  
J. WILES(1), N. KERSE(2) - (1) Social & Community Health, University of Auckland (Auckland, New Zealand); (2) General Practice & Primary Health Care, University of Auckland (Auckland, New Zealand)

In many countries including New Zealand, community living has been promoted as desirable for older people. In this study we are exploring use of participative qualitative research strategies including interviews and photo-elicitation to understand what factors make a community environment acceptable to diverse older New Zealanders. Everyday environments shape well-being and health. By focusing on older people living in two New Zealand communities, we are investigating how elders live in ways that are suitable for them. Our questions revolve around what physical, social and emotional factors make a community environment that is stable and acceptable, and whether this is the same for all

groups of older people? How do we understand in useful ways the day-to-day lived worlds of older people? What are the factors that keep older people connected in positive ways to their communities? What are some of the barriers to ageing well in the community? By better understanding what older people and their support networks want and expect from their communities, we can maximise the benefits of a stable environment on health, while acknowledging the difficulties associated with growing old. To this end, we are working with older people to seek their perspectives about what 'resilient ageing in place' means. In this presentation, we will report on the processes and initial findings of the study, highlighting the use of participant-led focus group interviews and the contrasts and similarities between the needs of older people from diverse cultural groups including European New Zealanders, Maori, Pacific, and other ethnic groups.

**PD7 741 MEALTIMES AND CHANGE IN THE CONTEXT OF DEMENTIA**

R. GENOE\* (University of Waterloo, Waterloo, Canada)

S. DUPUIS(1), H. KELLER(2), L. SCHINDEL MARTIN(3), H. REIMER(2), G. EDWARD, C. CASSOLATO - (1) University of Waterloo (Canada); (2) University of Guelph (Canada); (3) Ryerson University (Canada)

**Introduction:** The Eating Together Study is a three-year grounded theory study exploring the meaning of mealtimes among persons living with dementia and their primary care partners. Although little is understood about mealtimes in the context of dementia, they can be stressful for families as changes in eating patterns and preferences occur with the progression of dementia. This presentation will report on findings of the study focused on one of our emerging themes: Evolving Life. **Methods and Materials:** Twenty-seven community dwelling persons living with dementia and their care partners were recruited through Alzheimer Society chapters using both theoretical and purposive sampling. Participants engaged in annual individual and dyad in-depth interviews with one of five trained interviewers. Data were analyzed simultaneously using initial and focused coding and constant comparisons to identify a substantive theory on the role of mealtimes in the dementia context. **Results:** Evolving life is a process that participants use to adapt to changes in their lives. First, awareness that change has occurred is triggered. Once participants become aware of change, they assign meaning to change. Next, participants transform as a result of change in a way that meets the needs of both members of the dyad. While some families are able to use this process for adjusting to change, others have more difficulty, finding themselves resisting change, and struggling to transform. **Conclusions:** Mealtimes both reflect and provide insight into the changes that occur among persons who are living with dementia and their care partners. Those who are able to adjust to change with relative ease find new ways to live their lives to the fullest. Those who find it difficult to transform in response to change experience increased physical and mental health issues as a result of the added stress of living with dementia

**PD7 742 MEALTIMES AS "THE WAY WE ARE": THE MEANING AND EXPERIENCE OF MEALTIMES IN THE DEMENTIA CONTEXT.**

H. KELLER\* (University of Guelph, Guelph, Canada)

S. DUPUIS(2), L. SCHINDEL MARTIN(3), R. GEONE(2), H. REIMER(1), G. EDWARD(1), C. CASSOLATO(1) - (1) University of Guelph (Canada); (2) University of Waterloo (Canada); (3) Ryerson University (Canada)

**Introduction:** Eating Together Study I is a longitudinal (3 years) grounded theory inquiry into the meaning and experience of mealtimes for families living with dementia. There is very little information on the mealtime process and concerns for these families. However, the limited literature indicates that the stresses of family care are associated with eating behaviours that affect mealtime, often resulting in weight loss for the person with dementia. This presentation will present the Mealtime Theory which has resulted from this research program. **Methods & Materials:** 27 families living in the community and experiencing dementia were recruited through Alzheimer Society chapters using purposeful and theoretical sampling. In-depth interviews were conducted yearly with the caring dyad together and individually for the care partner and the person with dementia. Team analysis was concurrent with data collection, as per grounded theory methodology, with analysis informing the focus of subsequent interviews. Interviewers completed initial coding and memos and these data were shared with the rest of the team in regular meetings to define concepts in more focused coding, theoretically saturate categories and develop a substantive theory on mealtimes. **Results:** Mealtimes 'mirror the way we are' and reveal the essence of what it is to be human while living with dementia. Mealtimes reflect how these families were being connected, honouring identity and adapting to an evolving life. These three subprocesses influence each other and impact the 'way we are' which can be a continuum from existing with dementia to living life as fully as possible. **Conclusion:** This is the first substantive theory that explains the meaning of mealtimes to families, specifically in the dementia context. Understanding what is meaningful and important at mealtimes can help to identify what activities and processes need to be supported to promote positive experiences and family relationships.

**PD7 743 REFUGEE WOMEN FROM CENTRAL AMERICA: REMEMBRANCES OF COUNTRY OF ORIGIN AND ENVISIONS ABOUT AGING IN CANADA**

N. HRYCAK\* (University of Calgary, Calgary, AB., Canada)

**Introduction:** The major goal of this research is to discover knowledge about the help-seeking processes and the problems and strengths of the Canadian health care system from

the emic perspectives of Central American refugee women and their families in Canada. To appropriately care for the growing population of refugees, knowledge dissemination about their practices across the life span is essential. **Method:** This qualitative research study was designed to thematically analyze the process of help-seeking from the experience of six Central American refugee women and their family's experience with the health care system in Canada. Information from the participants indicates that the Central American forced migration experiences pose an important clinical challenge for both physical and mental health services throughout the lifespan. Theirs is a language of negotiation and to some extent resistance to some of the practices and changes they find in Canada. **Results and conclusions:** The findings from this study provide a greater understanding on the effectiveness of the health care system in reaching the ethno cultural communities, while providing data on the groups' physical and mental health care needs and reasons for seeking care. The remembrances of experiences of cultural identity and practices including health and well-being from birth to old age offer concrete accounts of where and how they lived and what was meaningful to them to retain in old age. The study provides a worthwhile contribution to the literature in the education of health care personnel to be responsive to the needs of people experiencing forced migration. The participants' reminiscent experiences about their life in their home country and what they need in Canada are vital to what they envision as healthy and meaningful in old age. Policy makers too need to consider cultural variation throughout the lifespan in health systems.

**PD7 744 PSYCHOLOGICAL INTERVENTIONS IN DEMENTIA CARE: EFFECTIVENESS AND IMPLEMENTATION**

I. CANTEGREIL\* (Hôpital Broca, Paris, France)

Alzheimer's disease (AD) obliges families to make major decisions in care-giving (i.e. institutionalisation). When exploring possible ways for the future, individuals' different perspectives and beliefs have to be respected. As the issues to be addressed are very sensitive, maladaptive communication and bad relationships within a family may induce major conflicts impacting negatively on the person who is suffering from dementia. When family conflicts hinder decision making people may need professional support. Therefore, since September 2006, the Broca hospital proposes systemic therapy to families which experience or suffer a major crisis after disclosure of diagnosis. The main objective of this intervention is to help families finding constructive ways to help the person with AD. The underlying idea is that changes in interaction patterns and relationship may trigger repercussions on care-giving and decision making. The basic theory of the proposed family therapy is derived mainly from cognitive psychotherapy and systems theory. The latter claims that the behaviour of the family as a whole is larger than the sum of the behaviours of its members. Subsequently, the therapists do not work with caregivers on an individual basis but treats the family as a whole. Family therapy focuses more on how patterns of interaction and maladaptive relationships maintain problems rather than trying to identify the cause. So primacy is given to the interrelationships and not to burden due to BPSD or other typically dementia related problems. The impact of the systemic intervention has been evaluated in 2007 and currently a new research project on dysfunctional interaction patterns and communication between care-recipient – main caregiver and other family members has started end 2008. This paper presents (preliminary) results.

**PD7 745 AN INTERNATIONAL COLLABORATION IN END-OF-LIFE CARE – TRANSFERRING KNOWLEDGE INTO PRACTICE**

C. KLINGER\* (Ste. Anne's Hospital, Ste-Anne-de-Bellevue, Canada)

M. SAVOIE(2) - (2) Ste. Anne's Hospital (Toronto, Canada)

NICE is an international network of researchers, practitioners and students dedicated to improving the care of older adults, both in Canada and abroad. Members represent a broad spectrum of professions. The overarching emphases of NICE are networking and knowledge transfer – that is, getting sound research into practice. NICE operates through a network of Theme Teams and Committees. The End-of-Life Issues Theme Team is working on tools to assist terminally ill persons and their caregivers. The End-of-Life Issues Theme Team has been in existence since the inception of NICE. The Team includes international members from China and South Africa. **Methods and Materials** The Theme Team has developed an informational tool dedicated to families providing care to a dying relative. Entitled "When Someone Close To You Is Dying", the brochure includes useful and timely information on what to expect, how to prepare for and how to assist someone who's dying. An entire section is dedicated to advance care planning and substitute health care decision-making. The informative brochure is available in French and English and is currently being translated in Cantonese. The tool is available online and is being distributed in its hardcopy version through a Canadian palliative care provider organization and provincial and local palliative care services. Results Families/carers using the informational tool are asked to complete a satisfaction survey. The results of the survey are used as a feedback mechanism to further enhance the informational resource tool. The preliminary feedback received to date indicates favourable outcomes/client satisfaction. **Conclusion** The objectives for this presentation are to describe NICE as a multi-professional network, to share the content of our informational tool on end-of-life care and

to discuss the challenges of its distribution, continuous improvement/feedback as well as in measuring client satisfaction.

**PD7 746 ABUSE OF OLDER PERSONS WITH DEMENTIA BY FAMILY CAREGIVERS: AN INQUIRY INTO THE ROLE OF CAREGIVER STRESS.**  
E. YAN\* (University of Hong Kong, Hong Kong, Hong Kong)  
T. KWOK(1) - (1) Chinese University of Hong Kong (Hong Kong, Hong Kong)

This study examines the relation between caregiver stress and abusive behavior directed towards older persons with dementia. A total of 122 family caregivers of older persons with dementia participated in this study. Participants provided information on their demographic characteristics, care recipient's problem behavior (Cohen-Mansfield Agitation Inventory), caregiver stress (Zarit Burden Interview), and whether they directed any abusive behavior at the care recipients in the past year (the psychological aggression and physical assault subscales of the Conflict Tactics Scale). Abuse is common in this sample – 62% and 18% of the caregivers reported having verbally or physically abused the care recipients in the past year. Family caregivers who spent more days cohabiting with the care recipients ( $r=.37$  and  $.33$  for verbal and physical abuse respectively,  $p<.01$ ), observed more behavioral problems in the care recipients ( $r=.25$ ,  $p<.01$  for verbal abuse), and reported a higher level of caregiver stress ( $r=.33$ ,  $p<.001$  for verbal abuse) recounted more abusive behaviors. Results of hierarchical regression analysis showed that number of days cohabiting with the care recipient, care recipient's problem behavior, and caregiver stress were significant predictors for verbal abuse ( $R^2=.27$ ). Caregiver stress completely moderated the effects of care recipients' problem behavior on verbal abuse in this model. For physical abuse, number of days cohabiting with the care recipient was the only significant predictor ( $R^2=.07$ ). A high level of caregiver stress is related to a high level of verbal abuse but not physical abuse displayed by caregivers of older persons with dementia. Further studies are needed to examine factors related to physical abuse. Efforts to develop prevention and intervention programs for the abuse of older persons with dementia should take into account community support, education and training for family caregivers to mitigate their stress.

**PD7 747 EXPLORING THE INTERFACE BETWEEN ENVIRONMENTAL HEALTH AND GERONTOLOGY IN CANADA**  
C. HUANG\* (Government of Canada, Ottawa, Canada)

Introduction Environmental health is an important issue for older Canadians. Seniors are more physiologically vulnerable to environmental hazards than younger adults due to their reduced capacity to adapt to environmental stresses and to the presence of chronic health conditions, which can be exacerbated by environmental risks. Moreover, there is evidence that current health status can be influenced by exposures which occurred earlier in life. In 2007, the Government of Canada committed to protect the health of Canadians from environmental risks, particularly those who are most vulnerable – children and seniors. In response to this commitment, Health Canada organized a workshop in February 2008 on senior's environmental health. This presentation is based on the outcomes of the workshop and will highlight seniors' vulnerabilities to environmental risks, key issues on environmental health for seniors in Canada, and Health Canada's response to the recommendations of the workshop. Methods Sixty key stakeholders from the gerontology and environmental health communities attended the workshop which explored the relationship between environmental risks and the health of seniors. Results Recommendations developed by workshop participants related to expanding the knowledge base on seniors environmental health to inform policy, especially on pressing issues such as: the quality of seniors' living environment; the relationship between environmental exposures and physiological changes of aging; educating health care professionals in this area; and potential health risks associated with earlier exposures to environmental contaminants. Conclusion This workshop identified key environmental health issues for Canadian seniors, as well as recommendations which will help to inform Health Canada's work in developing strategies to strengthen the protection of seniors' health from environmental hazards. Health Canada will continue to work with key stakeholders and other government departments to advocate for health policies, programs and research which address seniors' environmental health issues.

**PD7 748 "WELL YOU JUST GET ON WITH IT" - EXAMINING THE IMPACT OF GRANDPARENTING A CHILD WITH A DISABILITY**  
S. WOODBRIDGE\* (Griffith University, Meadowbrook, Australia)

Introduction: The ageing of the world's population has meant that it is now possible for children born today to be part of three, four and sometimes five generation families. Each generation will have a particular view and expectation of what being a grandparent means and how that role should be played out in their family and in their culture. How a grandparent functions as a grandparent will be influenced by a number of factors including the age of the grandparent; their health status; their financial situation; their location; their own experience of being grandparented and the relationship they have with their own children. This paper presents the findings of an Australian study which identified how the birth of a grandchild with a disability impacts on the roles and relationships grandparents expected to have in their families. Method: The study conducted in-depth qualitative interviews with 22 grandmothers

and grandfathers whose grandchildren had a range of physical or intellectual disabilities, either at birth or as a result of trauma and who were under the age of 17. Results: Grandparents reported that they had experienced a range of emotional responses to the diagnosis that their grandchild had a disability and that this had impacted on their grandparenting role within the family. Grandparents reported that they fulfilled both instrumental and symbolic roles as required and that they adjusted their expectations to suit the situation. Grandparents used their knowledge and skills to assist the family reach their desired goals for the child, as well as being there for their own child when stressful and anxious times arose. Conclusion: The results of this study will inform the current knowledge on the important roles played by grandparents and makes a call for greater recognition and support within governments and the community for this important contribution.

**PD7 749 LIVING WITH PARKINSON'S DISEASE: CHANGES AND FAMILY LIFE**  
F. NAVARRO PETERNELLA\* (No, Maringá, Brazil)  
S. SILVA MARCON

Introduction:Living with a chronic illness demands changes in habits, relationships and customs. The objective of this study was to understand how Parkinson's disease patients and their family members notice lifestyle changes over time. Methods and materials: This was a qualitative descriptive study, conducted with 20 individuals residing in the city of Maringá - PR – ten Parkinson's patients and their closest family member. Data were collected between October and December 2007, by means of semi-structured interviews. Results: From the discourse analysis, we verified that in spite of the difficulties, many patients show acceptance or conformity regarding the limitations imposed by the disease, while others still experience anger and hope for a cure. Conclusion: The greatest changes demonstrated by patients and family members are regarding the question of dependence and loss of autonomy for work, daily life and leisure activities, which impact the entire family dynamic.

**PD7 750 EMERGENCY AND DISASTER PREPAREDNESS AND RESPONSE CAPABILITIES OF ELDERLY INSTITUTIONS IN PUERTO RICO**  
M. OLIVER- VAZQUEZ\* (University of Puerto Rico, Medical Sciences Campus, San Juan, Puerto Rico)  
R. RIVERA-GUTIERREZ(1), H. MARIN(1), L. RODRIGUEZ(1), J. NORAT(1) - (1) University of Puerto Rico, School of Public Health (San Juan, Puerto Rico)

Introduction The 2005 hurricane season evidenced elders' vulnerability and mortality risks during natural disasters. Chronic morbidity, sensory changes, isolation and economic problems affect elder's capacity to respond and recover from an emergency or disaster. Individuals, who require medical treatments and the provision of care or food from others, such as elders living in nursing homes or enrolled in senior centers, have increased vulnerability. Therefore, careful emergency planning and preparedness must be a priority. Methods and materials This study evaluated the level of emergency preparedness and response capability in a stratified sample of 118 institutions (nursing homes, senior housing, day centers and foster homes) that serve older persons in Puerto Rico. A "risk index" by type of institutions and zone hazards was developed for data stratification and sampling. An assessment instrument was developed and validated. Face-to-face structured interviews were performed using quantitative and qualitative questions about emergency preparedness, evacuation planning, personnel training, communications and community resources. Geographically referenced information was collected to identify institutions that were located in emergency risks zones. Data was analyzed with EpiInfo 6.0 and SAS. Results Preliminary results revealed that representatives of nearly half of the institutions did not feel vulnerable to disasters or emergencies such as fires, hurricanes, earthquakes and epidemics, and 78% do not identify older adults with special needs that deserve attention in emergency situations. Although 90% of the institutions have written plans and procedures, less than half of them have performed emergency risk evaluations, only one third have established procedures to identify potential risks. Only half of the institutions communicate their emergency plans to the population served. Conclusions Studied institutions present a variety of weaknesses regarding disaster and emergency planning that must be addressed to improve emergency preparedness and response capabilities, and reduce adverse consequences for older adults.

**PD7 751 CHANGES IN THE FILIAL OBLIGATIONS OF FAMILY CAREGIVERS UNDER THE PUBLIC LONG-TERM CARE INSURANCE SYSTEM IN JAPAN**  
T. TAKAKO\* (National Institute of Public Health, Wako-Shi, Japan)  
S. HIGASHINO(1), M. OTAGA(2) - (1) University of Shizuoka (Shizuoka-shi, Shizuoka-ken, Japan); (2) Rikkyo University (Shizuoka-shi, Shizuoka-ken, Japan)

Introduction: Japan's public Long-Term Care Insurance (LTCI) system for the elderly was implemented with the slogan "From Care by Family to Care by Society." We examined the changes in the perceived filial obligations of family members providing long-term care to seniors in their households and explored the relationship between this change and the caregiver's attributes before and after the introduction of LTCI in Japan. Methods and Materials: Using a sample of 611 caregivers from a city that participated in two surveys conducted before and after the implementation of LTCI, we measured the changes in filial

obligation scores with three latent variables: support for economic stability, aids for emotional satisfaction, and physical support for health. Furthermore, we conducted a multiple regression analysis using the quantitative changes as dependent variables, and the following factors as independent variables: the attributes of the senior and the caregiver, periods of care, family relationship, and filial obligation score before the implementation of LTCI. Results: The analysis revealed that the total scores and latent variables' scores were lower in the second survey than in the first. However, our analysis of the relationship between the caregivers and seniors revealed that the "daughter-in-law" was the only group in which the total scores significantly decreased in the second survey. The multiple regression analysis showed that the quantitative changes in filial obligation scores were lower for sons than for daughters-in-law in the total scores and the latent variables' scores. Compared with daughters-in-law, daughters by birth had significantly smaller quantitative changes in the "aids for emotional satisfaction" scores. Spouses demonstrated similar quantitative changes to those of daughters-in-law. Conclusion: Our results indicate that the introduction of LTCI in Japan had a significant impact on the perceived filial obligations of family caregivers.

**PD7 752 AN ANALYSIS OF INFORMAL CARE ACROSS SIX ASIA-PACIFIC COUNTRIES: A POLICY MAKERS' PERSPECTIVE**  
M. IWAKUMA\* (Kyoto university, Kyoto, Japan)  
R. IBRAHIM, L. KIATA, M. ONO, Q. NAN, T. ERIKA

A "greying" population is a phenomenon pervasive in Asia-Pacific regions, in tandem with a lowering birth-rate, increased urbanization, and/or changing family caregiving structures. Under these circumstances, the notion of an "informal care" system has caught the attention of policy makers and older people themselves. On one hand, informal care provides the elderly with an appealing idea of ageing in place within the context of the family and/or neighbourhood. Policy makers however, seem to have an underlying economic motive in the promotion of informal care, particularly as an effective cost-cutting measure on long-term care expenses. Despite the different motives from different stakeholders, little research has been conducted on informal care. Also scarce is cross-cultural studies across Asia-Pacific countries. Of prime importance is the issue of culture which plays a significant role in provision and expectations in informal care contexts. This research project is intended to detail the under-researched topic of informal care systems from the perspective of policy makers and/or legislators' in six Asia-Pacific countries (Japan, New Zealand, China, Nepal, Australia, and Malaysia). Nine researchers in these six countries will conduct semi-structured interviews with four policy makers/legislators to decipher rich, qualitative information concerning: a) the nature of current informal care provision and b) factors influencing provision of informal care arrangements to older people. The interview data will be transcribed in the first language of the participants and translated into English, which allows for a following cross-cultural comparison. A multi-method ecological research design will be used to highlight differences and similarities among the countries. The research team expects to address such issues as filial piety, communities, ageing in place, support networks, and/or a governmental resource for the elder care.

**PD7 753 UNDERSTANDING THE IMPACT OF CARE-GIVING ON SLEEP: A NEGLECTED DIMENSION**  
S. ARBER\* (University of Surrey, Guildford, United Kingdom)  
E. BIANCHERA(1), S. VENN(1) - (1) University of Surrey (Guildford, United Kingdom)

Introduction Despite extensive research on the burdens and impact of caregiving for frail older parents, partners, and other relatives, little research has examined how care-giving at night impacts on carers' sleep quality and well-being. Methods and Materials This paper analyses qualitative interviews with 50 women aged 40-80 in Italy, and 60 men and women aged 65+ in the UK. Interviews focused on self-perceptions of factors influencing respondents' quality and duration of sleep. Results Thematic analysis identified four main ways that caregiving adversely affects carers' sleep: (1) providing direct care at night, including monitoring/surveillance, and nighttime disruptions by the care recipient, (2) sleep disruption or 'light' sleep due to caregivers' anticipation of needing to provide physical care at night, (3) sleep interruptions through worries and anxiety about the wellbeing, current illhealth, or future of the care-receiver, and (4) the 'legacy of caregiving', which interrupted carers' sleep for lengthy periods after care-giving ceased. Caregiving for parents and elderly relatives had major adverse effects on women's sleep in Italy, while caregiving for partners affected both older men's and women's sleep in the UK. Conclusion Intensive coresident caregiving for parents, partners and other relatives can severely disrupt caregivers' sleep, adversely affecting their well-being. The paucity of welfare provision for frail older people in Italy is implicated in high sleep disruption associated with caregiving for parents in Italy. Adverse effects on sleep of caring for frail relatives can precipitate residential admission, and therefore needs more policy attention. The impact of caregiving on sleep has hitherto been neglected in research on informal care. We acknowledge support from EU Marie Curie RTN (MCRTN-CT-2004-512362), and

New Dynamics of Ageing initiative, a programme supported by AHRC, BBSRC, EPSRC, ESRC and MRC (RES-339-25-0009)

**PD7 754 ATTITUDINAL BARRIERS TOWARD USE OF COMMUNITY RESOURCES**

R. WACKER\* (University of Northern Colorado, Greeley, United States)  
S. COLLINS(1), P. KEITH(2) - (1) Univ of Northern Colorado (Greeley, United States of America); (2) Iowa State University (Ames, United States of America)

Informal caregiving services provided to community dwelling elders by family members has become a normative familial task and is associated with high rates of stress and emotional exhaustion. While there are community based services available to assist carers in the tasks of caring, researchers have identified that only a small fraction of carers use community based services. Therefore it is important to identify variables that impede caregiver's acquisition of community based services that can support them in executing caregiving tasks. Although predisposing, enabling and need factors are most often used to predict awareness and use of community resources by carers, few studies have investigated attitudinal barriers of community resources awareness which is the greatest predictor of use. We investigated the reliability of 10 questions used to measure attitudinal reluctance and examined the relationship between demographic variables, social contact and attitudinal reluctance and awareness of community resources. Data were collected from a random sample of households with carers who were identified via phone. Of the 360 identified carers identified, 224 agreed to participate by responding to a mailed survey. Results indicated that five questions measuring attitudinal reluctance – not wanting to talk about personal matters, feeling embarrassed, families should take care of problems, personal troubles should be resolved within the family, and not wanting to be dependent on others had a reliability of .83. The results of a Pearson correlation revealed that attitudinal reluctance was related to age (-.18, p=.00), income (.21, p=.00), and awareness of social services (.18, p=.002). A regression analysis revealed that education ( $t=3.177$ ,  $p=<.001$ ), attitude ( $t=2.443$ ,  $p=<.02$ ), and IADL impairment ( $t=-2.214$ ,  $p=<.03$ ) were significant predictors of awareness of community based services. Implications of these exploratory findings for research and practice will be discussed.

**PD7 755 A POPULATION BASED STUDY OF CAREGIVING BURDEN OF CENTENARIAN CAREGIVERS IN NORTHERN JAPAN**

S. FREEMAN\* (Tohoku University School of Medicine, Sendai, Japan)  
H. KUROSAWA(1), S. EBIHARA(1), M. KOHZUKI(1) - (1) Tohoku University School of Medicine (Sendai, Japan)

This study investigated caregiving burden of the oldest old specifically focusing on caregivers of centenarians and aimed to determine if caregivers of centenarians in Japan can be considered models for successful caregivers. Data was collected from 160 people aged 80-107 and 84 of their caregivers aged 24-92 using a self-reported questionnaire survey. Caregivers of centenarians do not exhibit significantly less burden, less prevalence of depression, or higher quality of life than caregivers of 80-99 year olds. Burdened caregivers experienced poorer general health, more bodily pain, less vitality, difficulties with social functioning, and poorer mental health than less burdened caregivers. While all caregivers scored below expected Japanese average scores for HRQOL SF-36 those reporting utilization of private care services, providing care regularly, and providing care for more than five hours per day exhibited the lowest scores. Caregivers of centenarians may not represent models of successful caregivers. Caregivers showed equal distribution of light and heavy burden among recipient age groups therefore it may be inferred that as care recipient age increases it is not inevitable that they become heavier burdens on their caregivers. This is the first in-depth study to investigate the unique situation of centenarians and their caregivers in Northern Japan.

**PD7 756 SOCIAL SPACES, RURAL PLACES: AGEING-IN-PLACE AND SOCIAL NETWORKS IN RURAL SOUTH AUSTRALIA**

H. FEIST\* (University of Adelaide, Adelaide, Australia)  
P. HUGO(1) - (1) University of Adelaide (Adelaide, Australia)

Australia has a policy focus on ageing-in-place supported by family, community and service provision in the home. Hence, home and community are important environmental variables for ageing-in-place. Older people are over-represented in rural places and their proportion of the population is growing faster than in urban areas. There is often an assumption that rural regions have supportive communities with strong, localised kinship and friendship ties without any real conceptualisation of social network patterns. Methods: 223 in-depth surveys were conducted face-to-face with older people, aged 70+ living in rural South Australia. Surveys included profile information, the SF-36 Health Score, the UCLA Loneliness Score and comprehensive social network information. Utilising GIS technology data was geocoded and mapped to create spatial data about the social networks of participants. Variables such as mobility, health, gender, loneliness, living alone and location were considered when analysing social network attributes. Results: The focus of GIS analysis was the exploration of social network properties, determining where social networks (and potential support networks) were located. This was analysed in several different ways, as: • case studies of individual respondents, • layers of data for respondents

in particular towns or regions, • layers of data for particular types of respondents (e.g. non-drivers), • a method of linking locations of services and facilities to respondents and general 2006 census data. Conclusion: Identifying the spatial distribution of both the older population and their support/social networks gains importance as older people continue to age-in-place. Utilising GIS technology enables a deeper understanding of the spatial complexities of social networks. The assumption that older people in rural regions will have strong, localised social networks to support their ageing-in-place does not take into account the diversity of social network types highlighted in this study.

**PD7 757 THE NURSING CONTRIBUTION TO PALLIATIVE CARE IN A COMMUNITY HOSPITAL**

L. BRERETON\* (Sheffield Hallam university, Sheffield, United Kingdom)  
J. STEERS(1), C. INGLETON(2) - (1) Sheffield Hallam University (United Kingdom); (2) University of Sheffield (United Kingdom)

Background: The End of Life Care Strategy (2008) sets out a framework to enable people to receive care at the end of life in a place of their choice. Choice, in this case, is assumed to be home. For many older people home care may be neither a desirable or practical choice. The increasingly ageing population will demand that care facilities will need to expand substantially, to minimise the predicted gap between future preferences and reality. Community hospitals are local hospitals, providing care for local populations. They could be important to meet this increasing demand for end of life care, yet, little is known about the contribution they make to this field. Aim: To explore the nursing contribution to those with life-limiting illness in a community hospital. Methods: Constructivism provides the structure to explore the experiences of key stakeholders, using multi-method case study design. Data collection included: participant observation, informal and formal conversation and document review. Theoretical sampling was used to select 'cases'. A case is the person with life-limiting illness and those directly involved in their care. Seventeen cases were sampled: 9 recruited and 7 explored in-depth. 'Framework' (Ritchie et al. 2006) facilitated the emerging construction through within and cross-case analysis. Results: See Steers et al. (2008) for a description of the nursing contribution. The caring environment was described as 'more like home than hospital'. This was largely due to the physical character of the community hospital, but was also found to be due to, a sense of 'homeliness' instilled into the environment from the nurses' attitudes towards caring. Conclusion: This community hospital provided palliative care for older people in a 'home-like' environment. This may mean that for those where home care is not realistic, community hospitals may be the next best alternative.

**PD7 758 SOCIAL EXCLUSION AND CULTURAL DETERMINANTS OF WELL-BEING OF OLDER PERSONS IN LEBANON: A CASE STUDY**

L. ABI-HABIB\* (University of Balamand, Beirut , Lebanon)  
H. CHEMAITELLY(1), L. JAALOUK(1) - (1) University of Balamand (Beirut, Lebanon)

As part of a psychosocial needs assessment, a study was carried out among older persons living in Lebanon in areas affected by the conflict of July 2006. Funded by the World Health Organization and supported by the University of Balamand, Lebanon, the study was carried out by a team of investigators at the Faculty of Health Sciences of the University. The study adopted a rights-based perspective to advocate the integration of older persons in planning and community interventions, with respect to their views and needs on a diverse range of health and social issues. The study intended to show how the research process can be explicitly used as a means to enhance awareness of older persons of their right to be recognized and consulted, and to advocate the rights of older persons and enhance awareness in Lebanese society at large. The methodology comprised face-to-face interviews with a random sample of 345 people aged 65 and older, living in a single district in South Lebanon. The majority were illiterate. A three part tool was used, consisting of the CANE, the EQ5D and culturally tailored socio-demographic questions. The CANE IV was explicitly chosen, since it directly solicits the views of older persons and rates their satisfaction and opinions on issues such as family care. Results showed a diversity of elderly needs and perceptions, which varied according to age and to gender, with there being increasing psychosocial needs in relation to perceived decreasing appropriate social and family support. The results call into question Lebanese cultural stereotypes of elderly being looked after by family and community networks. The study highlights the lack of governmental services tailored to the needs of older persons, and reveals the increasing isolation, depression and poverty that people experience as they age, particularly women.

**PD7 759 PERCEPTIONS OF PHYSICAL RESTRAINT BY FAMILY CAREGIVERS OF HOME-DWELLING ELDERS**

S. KURATA\* (Hamamatsu University School of Medicine, Hamamatsu, Japan)

While physical restraints (PRs) were forbidden in institutions, those in home-dwelling impaired elders have not been elucidated. Family caregivers may unconsciously use PRs, which could include or lead to abuse. Home-care providers need to grasp the conditions and specificities of PRs at home and to support family caregivers. For the first step, we investigated how the family caregivers perceive PRs. Methods: A self-administered questionnaire survey was conducted for family caregivers of home-dwelling elders: the Japanese version of the perceptions of Physical Restraint Use Questionnaire; whether or how they recognize the term "PR," PR procedures prohibited in institutions, and the

harmful effects of PRs; whether they have taken a class of PRs; and whom they consult when hesitating about PRs. Results: Through 43 care managers, 375 family caregivers responded. The recognition rate of PR was 21%, and higher in younger caregivers ( $p=0.001$ ). Newspaper/TV was the most frequent information source on PR (46%). "Binding to bed" was most recognized (50%) and "mitten glove" least (21%). For the harmful effects, "muscle weakness, joint contracture, pressure ulcer" was most recognized (74%) and "further medical treatment and economic burden" least (39%). For the reasons requiring PRs, "preventing pulling out an IV" was most perceived (40%) and "providing quiet time or rest for an overactive older person" least (2.4%). Almost all (94%) of caregivers have never taken a class of PRs. Family caregivers most prevalently consult care managers about PRs (35%), second most physicians (30%), and least nurses (8%). Conclusions: Family caregivers, particularly older, hardly recognize PRs without binding procedures as PRs, and hardly have information sources except mass communications and opportunities of attending a class of PRs. It is important that visiting nurses more cooperate with physicians and care managers in supporting family caregivers to minimize PRs.

**PD7 760 THE SPENDING PATTERNS OF THE OLD-AGE PENSION BY THE FRAIL ELDERLY**

C. STRYDOM\* (North-West University (Potchefstroom Campus), Potchefstroom, South Africa, Potchefstroom, South Africa)  
P. STRYDOM(1) - (1) North-West University (Potchefstroom Campus) (Potchefstroom, South Africa)

INTRODUCTION A specific old-age home in South Africa delivers certain community outreach services. A team of registered nurses have been delivering these home-care services since 2002, which include physical care, a meal service and a transport service. It was realised by the nurses that the elderly in their care had very little to spend on themselves despite receiving government pensions. This led to the question of possible neglect and financial abuse by their caregivers and that it could possibly be attributed to financial abuse. METHOD An exploratory design was used. The survey research, and specifically personal interviewing in accordance with a semi-structured schedule was utilised. By means of systematic sampling, 30% of the population, thus 100 old-age pensioners, were involved. RESULTS In many cases an assigned person is used to obtain the pension from the pay point. It was found that approximately 30% of the participants could not account for their monthly expenditure. Half the participants did not leave a neat and cared for impression and even showed signs of being neglected. In more than 30% of the cases financial problems were evident due to the fact that there was no food in the home, the home smelled of urine and filth, dirty laundry and bed linen were evident and windows were without curtaining. It was found that on average, the elderly participants shared a two-bedroom house with six other people. Some participants mentioned that the entire family lives on their income and that children and grandchildren only visit them on pension days. CONCLUSION Financial abuse can be expected in many cases, but the elderly did not want to admit it and tried to cover it up due to many reasons.

**PD7 761 FAMILY AND CARE GIVING FOR THE AGED IN NIGERIA: A SOCIOLOGICAL APPROACH**

F. EBOIYEHI\* (Obafemi Awolowo University, Ile-Ife, Nigeria)

Traditionally, the extended family system is an important agent of care giving for the aged. However, this structure is gradually breaking down. Yet, there is no formal social security in place to fill this gap. Furthermore, ageing issue attracts little attention in Nigeria. This study therefore, examined the nature of care system for the aged and the coping strategies among the Esan of South-South Nigeria. The study adopted qualitative research methods: in-depth interviews (IDIs), Focus Group Discussions (FGDs) and Participant Observations. Two Local Government Areas (LGAs), Esan Central and Southeast and 4 communities in each of the LGAs (two rural and two urban) were purposively selected. In all, 32 IDIs comprising 16 aged and 14 caregivers, eighteen FGDs consisting seven groups of aged and six groups of caregivers were conducted. Data were analyzed using ethnographic technique. There was diminishing extended family ties and increasing social distance between aged parents and their adult children. The decline was associated with age-selective rural-urban migration and emerging nuclear family structure. This was linked to social changes toward westernization and coping strategies associated with decline in real income of caregivers due to the downturn of the Nigerian economy. The aged adopted various coping strategies, which included subsistence farming, night guard, selling of some personal belongings for subsistence, alms begging and petty trading. Only a few of the aged depended on pension and/or some support from children and church members. Aged care is diminishing among the Esan. This is manifested in the breaking down of the extended family network and emerging nuclear family system. There is need to re-awake the extended family social security system toward their wellbeing. This may be achieved within the framework of a creative multi-track social policy intervention that will involve government and civil society.

**PD7 762 DESIGNING WITH & FOR THE ELDERLY: A PARTICIPATIVE RESEARCH TO RETHINK THE BATHROOM**

E. MORALES\* (Institut universitaire de gériatrie de Montréal, Montréal, Canada)  
J. ROUSSEAU(1), R. PASSINI(1) - (1) Research Center Institut universitaire de gériatrie de Montréal (Montréal, Canada)

Understanding the real needs of the senior population concerning their interaction with the physical environment and the creation of accurate design solutions, are major concerns for

designers and occupational therapists. Despite the common interests, these fields rarely work together. In addition, collaborating with the actual users (seniors) throughout the conceptual process of a design solution has been adopted in very few occasions. This qualitative research is divided in two main sections, the first explores the current experiences lived in the bathroom by some senior participants with motor disabilities; and the second focuses on the development of conceptual ideas (through a participative design approach), to rethink the bathroom with the same participants promoting the development of comfortable experiences. Two caregivers and six seniors with different degree of motor disabilities participated in 3 different sessions each. The research was developed in a semi direct interview format. The first interview was devoted to the first section of this research while the other two sessions for the second section. An external researcher validated the interpretation of the analysis of the experience. The main ideas and the graphic results proposed by the senior participants along with the researcher-designer, were confronted in a focus group integrated by occupational therapists specialized in clinical attention. Results suggest a very complex relationship between the participants and their bathroom, where comfort does not necessarily play a fundamental role. Results from the conceptual ideas show innovative and feasible solutions that are not in the market yet and, being revised by OT's, seem very promising. One of the major contributions of this research is the process itself, as it gathers designers, OT's and users in the conceptual process of design solutions, this methodology can be applicable to other areas at home or at institutions.

**PD7 763 JAPANESE SOCIAL SUPPORT NETWORKS AMONG THE ELDERLY LIVING ALONE IN A MARGINAL COMMUNITY**

Y. WATANABE\* (Health Science University, Fujikawaguchiko, Minamitsuru, Yamanashi Pref., Japan)

Introduction A marginal community is defined as a community in which over 50% of the population is over 65 years old, and faces difficulty maintaining adequate function of the residents' daily lives. Difficulties facing the marginal community can include unemployment, shopping for daily necessities, managing rural agriculture, and participating in community ceremonies. As the number of youth leaving the community is increasing, the number of elderly living alone increases, and thus they face difficulty maintaining a healthy lifestyle. Methods and materials In order to address the issue of the elderly living alone in a marginal community, individual interviews were conducted. The participants were questioned about their daily lives and their utilization of social support networks. The data was analyzed using the Modified Grounded Theory Approach (M-GTA), which focused on the process of utilizing social support. Results The results indicate that the elderly in the study receive substantial emotional support interacting with each other. However, declining support from relatives and/or neighbors in the community forces them to seek support from relatives who live outside the community or to give up seeking support all together. Conclusion The study suggests that it is necessary to provide reliable instrumental support for the elderly in the marginal community. Such support should be implemented in such a way that the elderly can choose among various resources while maintaining their desired lifestyles.

**PD7 764 THE FEMININE FACE OF SOCIAL SUPPORT OF ELDERLY CARDIAC PATIENTS.**

S. MEDEIROS\* (Institut Dante Pazzanese of Cardiology, Sao Paulo, Brazil)

The action of planning social support for elderly cardiac patients is related to the knowledge of their relationships, considering that most of them are dependent on other people at some level. Family support, in Brazil, is very common but who takes effective care of the old people, and what are their needs? The objective of this research was to identify the web of social support of cardiac patients in ambulatory treatment of a Cardiology Hospital. Methods and materials: Interviews were conducted with 300 patients as they came for their periodic consultations at the cardiogeriatric ambulatory program. Patients signed consent forms to participate in the research. The instrument to collect the information was the Elderly Relationship Map (ERM) validated by Brazilian research. This shows, graphically, 5 types of assistance functions (visit, companion, personal care, aid for home activities, financial support), the frequency of the assistance and who gives the care. The data was entered in an SPSS statistical package for analysis. Results: Daughters were the most frequent source of support (weekly basis): 60% of the visits; 62% for companion; 73% for personal care; 51% for home activities; 54% for financial support; Wives and granddaughters appear in second place especially for companion and personal care. Friends and neighbors (women) appear in 21% for visit and companion. Other family members are mentioned with less frequency in all the five functions. Conclusion: The extensive contribution of women in social support of older people shows that it is necessary to create policies for supporting these cares. The multidisciplinary team needs to know what the needs of women carers are for better planning of the treatment and rehabilitation of the elderly. The society is changing. The smaller number of children per family will create a big lack of assistance for the elderly, in a few years.

**PD7 765 MODIFICATION TO THE HOSPITAL PHYSICAL ENVIRONMENT: EFFECT ON OLDER ADULT RETENTION OF POST-DISCHARGE INSTRUCTION**

T. LOVE\* (Simon Fraser University, Vancouver, British Columbia, Canada)  
G. GUTMAN(1), B. CARMICHAEL(2), B. NGAI(2), M. LUI(2), K. TAVAKOLIAN(2), Y. CHUO(2), B. KAMINSKA(2) - (1) Simon Fraser University, Gerontology Research Centre (Vancouver, Canada); (2) CIBER -Computational and Integrative Bioengineering Unit, School of Engineering Science, Simon Fraser University (Vancouver, Canada)

Introduction: As part of a larger project, this study looked at the influence of the physical environment in acute care hospital patient rooms on learning/ retention of post-discharge instructions by older adults. Methods: Participants (n=36) were community-dwelling men and women aged 75+ who role-played being a hip fracture and a congestive heart failure patient. Each received one set of post-discharge instruction in a "typical" hospital room and second set in a modified room (reduced visual and auditory distraction, improved lighting, more home-like decor). Order of exposure to typical and modified rooms and to the two sets of instructions was counterbalanced. To ensure consistency, instructions were administered via 6-minute video played on a bed-side "TV". During instruction, a soundscape from a typical 4-bed hospital room simulated distractions faced by "real" patients receiving discharge instructions. Retention was tested after 15 minutes using a touch-screen response system and after 24 hours via telephone. Participants made qualitative assessments of the environment and their physical movements/fidgeting were recorded. Results: Significant interaction was found between room type, instruction type and order (Immediate Test:  $F(3,32)=19.99$ ,  $p<.000$ ,  $\eta^2 = .384$ , Delayed Test:  $F(3,32)=12.63$ ,  $p<.001$ ,  $\eta^2 = .283$ ). Subsequent analyses found that the oldest participants had significantly more difficulty learning the more difficult instruction set in the "typical" room. Movement/fidget data suggest participants were less stressed receiving instruction in the modified room. Participants overwhelmingly preferred the modified room and expressed comfort with video delivered post-discharge instructions and computerized testing. Conclusion: Modifications to patient bedrooms to reduce visual and auditory distraction and video-mediated delivery of post-discharge instructions are promising ways of improving retention, especially in older old persons (80+) who may be experiencing sub-clinical cognitive changes.

**PD7 766 ASSESSMENT: RESOURCES AND THEIR MEANING FOR CAREGIVERS**

C. MISCHKE\* (University of Applied Sciences, Saarbrücken, Germany)

Introduction: Family caregiving initiates changes in everyday life. Caregivers deal with the new situation in different ways and they feel more or less stressed. Actually there is little knowledge about possible causes for the stress experienced by the care givers. But there is an assumption that using varied coping strategies leads to differences in health outcomes and well-being. According to Antonovsky (1997) and Hobfoll (1989), this research asks which resources caregivers possess and use to deal with the unusual situation. In addition there is also a particular interest on resource engineering in the course of caregiving, especially loss and gain of resources. The aim of this research is to develop an instrument to identify the individual resources of caregivers. Methods and materials Development of an instrument: On the basis of a salutogenetic theoretical approach and a qualitative secondary analysis of interviews important resources for caregivers will be identified and transferred to a questionnaire. Testing: The instrument will be tested concerning validity and reliability. The sample consists of caregivers. The data collection was by face-to-face-interview. Results The testing of the new instrument reveals that it is possible to assess the resources of caregivers and allows an individual approach of resource assessment and their specific meaning for the caregiver's role and situation. Conclusions As caregiving is a phase of life with special stressors, the caregiver needs specific resources to cope with these requirements. The assessment could facilitate nurses to get to know more about the individual presence and use of resources (also (expected) loss and gain of resources) and their specific meaning for caregivers. This - in consequence -allows nurses to practice a target-oriented counseling to support caregivers in dealing with their situation.

**PD7 767 FAMILY CAREGIVER CAREER AND THEIR NEED FOR COUNSELLING – RESULTS FROM A QUALITATIVE STUDY IN SAARLAND**

E. BERKEMER\* (HTW des Saarlandes, University of Applied Sciences, Saarbruecken, Germany)  
C. MISCHKE(1), M. MEYER(1) - (1) HTW des Saarlandes University of Applied Sciences (Saarbruecken, Germany)

Introduction As the german population ages and individual lifespans increase, caregiving by family members has become a vital component of the health care delivery system. There has been a lot of research on long-term care focusing on the negative consequences of caregiving regarding physical and emotional strain, anxiety, exhaustion, and feelings like frustration and resignation. Existing care concepts for support and relief of the strain on caregiving are often not effective in the perspective of caregivers. The aim of our research was to identify preventive strategies for different stages in the caregiver career. The qualitative study explores and describes the perceptions of caregiver needs with regard to everyday home care. Methods and materials A qualitative research method was chosen because little is known about the needs for counselling in the different stages of home caregiving. We used semi-structured interviews. The total sample consisted of 30 primary

caregivers in Saarland. Interview were recorded and transcribed. The data analysis is based on the qualitative content analysis method following Mayring (2003). Results We distinguished three different stages in the caregiver career: entrance, enduring and exit stage. The results reveal different needs and changes in the caregiver career. The needs of primary caregivers are based particularly on the perceived burden by providing care, but also show additional needs which where independent from the perception of burden, for example a care check-up and guidance throughout the caregiving career. Conclusion A broader discussion and a greater understanding of improving a wider informal caregiving system with counselling and prevention, particularly to sustain and support family caregivers seems to be desirable and necessary. Caregiving is a complex process, influenced by the context of the care situation. According to different stages in the caregiver career we must make sure that we can improve the individual situation

**PD7 768 COMMUNICATION BETWEEN CAREGIVERS AND ELDERLIES WITH DEMENTIA IN HOME CARE IN BRAZIL**

R. SANTANA\* (Universidade Federal Fluminense, Marica - RJ, Brazil)  
N. FIGUEIREDO(2), M. FERREIRA(3), N. ALVIM(3), I. DOS SANTOS (4) -  
(2) Universidade Federal do Estado do Rio de Janeiro (Rio de Janeiro, Brazil);  
(3) Universidade Federal do Rio de Janeiro (Rio de Janeiro, Brazil); (4) Rio de Janeiro State University (Rio de Janeiro, Brazil)

Objectives: To describe the communication process between main caregivers and elderlies with dementia; To identify the strategies used by the caregiver to establish communication with the demented elderly; To characterize the limits and the possibilities of the communication strategies to its effectiveness; To analyze the factors that influence the caregivers communication effectiveness with the demented elderly. The adopted theory was the process of communication proposed by Berlo. The research was qualitative, applying the Creative-Sensible method (CSM), for the data production was used two Creativity and Sensibility Dynamics (CSD). The CSD makes possible the triangulation of the data collect techniques: group discussion, participant observation, and the Freire pedagogy critical-reflexive. The people involved were 25 main caregivers and 22 demented elderlies, the neurogeriatric center program located in Rio de Janeiro-Brazil. The data organization and treatment followed the steps proposed by the speech analysis. In the Category I is discussed: 'Communication establishment: the intentions and the way to reach the desired objectives', which has the following themes discussed: The communication intention; The message formation; The cognitive disorder; and the Strategies and its results. And in Category II is raised 'The determinants of effect in the fidelity of the caregiver-elderly with dementia communication', which discussed: intrapersonal characteristics; intrafamily characteristics; and social cultural characteristics. For better categories a transversal analysis of the caregiver-elderly had been made, highlighting each stage of the dementia and its particularities. The results discussion allowed us to defend the thesis that the communication between main caregivers and the elderlies with dementia is made by the intentionality expressed by the body senses influenced by the context characteristics.

**PD7 769 COPING STRATEGIES OF CHINESE ELDERLY MEN LIVING ALONE IN SINGAPORE**

L. THANG\* (National University of Singapore, Singapore, Singapore)

Despite a high proportion of co-residence in Singapore (66.3% in 2000), there are increasing number of elderly living alone in Singapore. This study focuses on exploring the coping strategies of older men living alone. Empirical evidences suggest that compared to older women, older men tend to have less affectionate family relationships, they are also more socially isolated. Moreover, activities organized for elderly tend to be female-oriented. Thus this study seeks to explore the concerns faced by older men living alone, their coping strategies and the significance of social units (family and elderly centres) in their lives. The study also concludes with policy and practice recommendations to enhance the well-being of elderly living alone and in general. The research adopts a qualitative method to explore the complexities of the trajectories and circumstances facing elderly individuals. Semi-structured in-depth interviews were carried out with 30 men above age 65, and also conducted with service providers of senior activities to understand programs for elderly and their impact on elderly living alone. The study shows that coping strategies of the respondents are differentiated according to their financial ability. Those with financial needs (group 1) tend to be proactive with obtaining financial assistance, such as to apply as recipients of public assistance and other cash and in-kin donations from religious and community organizations. For those not eligible for public assistance (group 2), they have to cope with part-time work and strategize their financial investments. In terms of social networks, group one tend to have lesser contacts with kin, and rely more on social workers and neighbors. Although the respondents are mostly single or divorced, those who have children raised questions on changing norms and issues confronting the dominant ideology of family care for elderly in Singapore.

**PD7 770 FAMILY CAREGIVER COPING IN END-OF-LIFE CARE FOR PEOPLE WITH DEMENTIA**

S. WASKIEWICH\* (University of Victoria, Centre on Aging, Victoria, Canada)  
K. STAJDUHAR(1) - (1) University of Victoria, Centre on Aging (Victoria, Canada)

Introduction: Care for individuals with dementia who live in the community is typically provided by family members. These family caregivers (FCGs) often remain actively

involved in providing care as the dementia progresses. Previous research has emphasized the burdensome and stressful nature of caregiving with much less attention given to the influence of positive coping on FCGs' ability to provide care. Despite this, little attention has been given to understanding what might influence FCG coping among those providing end-of-life care at home to people with dementia. Methods: The focus of this study was to understand the nature of caregiver coping in end-stage dementia through a qualitative investigation addressing the following research question: What factors influence why some FCGs cope with palliative and end-of-life caregiving better than others? Data were gathered through in-depth semi-structured interviews with 14 bereaved FCGs who cared for someone with dementia. This study was guided by an interpretive descriptive design. Purposive sampling was used and interviews were thematically analyzed. Results: Findings indicate that five factors influenced these FCGs ability to cope with providing end-of-life dementia care: (1) the caregiver's personality or approach to life; (2) relationship between the care provider and care recipient; (3) progression of the dementia; (4) health-care system; and, (5) support systems. These factors were both self-identified by participants as well as identified by the researcher through the analysis. Conclusion: Five factors were found that influenced FCGs coping. These findings will be discussed in relation to the broader literature on caregiver coping. The implications of these findings for informing policies and services to support FCGs will be discussed.

**PD7 771 MAKING SENSE AND FINDING MEANING: EVERYDAY NARRATIVES OF LIVING WITH DEMENTIA**

J. ROBERTSON\* (University of Stirling, Stirling, United Kingdom)

Introduction: This presentation of doctoral research examines narratives about living with dementia, by people with dementia and their caregivers. The aim of the study is to compare and contrast differing perspectives about the impact of ageing and dementia upon the lives of older people with dementia. Methods and Materials: A total of 50 interviews with six people with dementia and ten caregivers was carried out over two years. Narrative analysis was used to examine the content and structure of accounts of living with dementia. This enabled an exploration of different concepts and narrative constructions people draw upon to make sense of life with dementia. Results: Older people with dementia incorporate ageing and dementia into their continuing sense of self identity. Positive constructions of living with dementia involve the ability to lead a meaningful life that supports pre-existing social roles and relationships and active engagement within the family and community. The emphasis is on living an ordinary life while responding to challenges associated with cognitive impairment and social stigma. For caregivers, perceptions of a meaningful life depend on how the person's present identity is positioned relative to past social roles and relationships. Positive constructions assume continuity as opposed to a focus on disruption in the person's life. Perspectives are also influenced by how the person is perceived to conform to social norms. Conclusions: The narratives of people with dementia reflect their struggle to find meaning in terms of realising their sense of self within a social world that largely defines them as different and out of the ordinary. Caregiver narratives resonate with emotional difficulty, reflecting their struggle to make sense of a life that is not represented as essentially normal. For all, finding meaning in everyday life depends upon making sense of that life as normal and ordinary.

**PD7 772 PROVIDERS OF HELP WITH PHYSICAL DIFFICULTIES – WHO AND WHAT FOR? OBSERVATIONS FROM THE ENGLISH LONGITUDINAL STUDY OF AGEING**

E. BREEZE\* (University College London, London, United Kingdom)

Introduction: Informal care, especially from spouse and adult children, is a key element of provision of care in England, especially as the population ages. This presentation describes the sources of help people for specific types of daily activities experienced by people aged 55 years and over. Methods and Materials. Data taken from the third bi-annual set of interviews from the English Longitudinal Study of Ageing. Results weighted for non-response. 6949 men and women in the analysis sample of whom 762 men and 1149 women reported difficulties with at least one of: moving around the house; dressing and bathing; eating or preparing a hot meal; shopping or doing work around the house or garden; telephoning or managing money; taking medication. Those who reported receiving help were asked to select from a list of possible sources. Results: Over half of those with difficulty dressing or bathing and just over a third of those reporting difficulties moving round the house or garden did not receive help. For less common problems that predominantly affected the oldest people a fifth to a quarter did not receive it. Spouses were the predominant source of help except for women aged 75 and over and, for certain tasks, for men aged 85 years and over. The physical difficulties that attracted the highest percentage of children helping were shopping or working around the house and garden. Formal sources of help were only common among the older groups, particularly the oldest women. Conclusions: Help with difficulties came overwhelmingly from informal sources, particularly the respondent's spouse. Children may focus on helping with less intimate activities. However, substantial proportions of women with difficulties who were aged 85

years and older mentioned help from formal sources; this may reflect more severe difficulties and the lack of a spouse.

**PD7 773 DEVELOPMENT OF AN INTERVENTION PROGRAM FOR ALZHEIMER'S FAMILY CAREGIVERS FOLLOWING DIAGNOSTIC DISCLOSURE**

L. LÉVESQUE\* (Centre de recherche, Institut universitaire de gériatrie de Montréal, Montréal, Canada)

F. DUCHARME(1), L. BEAUDET(1), A. LEGAULT(1), M. KERGOAT(1) - (1) Centre de recherche, Institut universitaire de gériatrie de Montréal (Montréal, Canada)

The purpose of this qualitative study was to develop a pro-active psycho-educational intervention program for Alzheimer's family caregivers following diagnostic disclosure. Based on a theoretical model of role transitions and a participatory approach, the study comprised four steps: (1) exploring caregiver needs; (2) developing and validating a program proposal based on caregiver-expressed needs; (3) formalizing program through intervention mapping; and (4) testing and qualitatively evaluating the program. The psycho-educational program consisted of seven individual sessions aimed at fostering knowledge and skills required to ensure successful transition to the caregiver role. The approach used in this study can serve as a guide for the development of nursing intervention programs. Intervention mapping allowed, in particular, integrating theoretical and empirical elements in a formal intervention model.

**PD7 774 DIFFERENCES IN THE CARE-GIVING PATTERNS OF ADULT CHILDREN TOWARD THEIR PARENT. -CASES WHERE THE FATHERS HAD PASSED AWAY BEFORE THE MOTHERS-**

M. NAOI\* (Tokyo Gakugei University, Tokyo, Japan)

The purpose of this study to describe the differences in care-giving patterns of adult children toward their fathers and mothers. Moreover, this study consider not only the primary caregiver but every child who participated in any amount of care-giving, in light of the gradual change in the Japanese custom where the eldest son and his wife live together with his parents and support them. The randomly selected sample consists of people aged between 60 and 70 years who are residents of Tokyo and Iwate prefecture. Of the valid responses, 853 cases—in which both the parents were deceased and the father had passed away before the mother—were extracted for the purpose of this study. The respondents were asked about which person in the family had cared for the old, frail parents. The following findings were obtained: (1) Of the sample cases, 385 (45.1%) of the fathers and 511 (59.9%) of the mothers needed care at the terminal stage of their lives. (2) For those parents who required care, more than two family caregivers were typically indicated. (3) When the father was in need of care, about 25% of the mothers cared for them without the help of their children and about half of them with their children's help. (4) Among the children, the eldest son and his wife were most likely care for the father. Further, when the mother was in need of care, the eldest son and his wife were again most likely care for them; at this point, the care-giving patterns observed in adult children toward their fathers and mothers are similar. (5) Considering every child who participated in any amount of care-giving, daughters are seen to care for their mothers more than their fathers.

**PD7 775 PHYSICAL BARRIERS IN MARKETS FACED BY ELDERLY PEOPLE AND PEOPLE WITH DISABILITIES IN THAILAND**

B. KUTINTARA\* (King Mongkut's Institute of Technology Ladkrabang, Bangkok, Thailand)

P. SOMBOON(1), S. CHAENGSR(2), S. SUANLIM(2), K. PHANKONG(2), T. CHUMNANPRAI(2), W. SONSIRI(2), A. WONGMA(2) - (1) Ratchasuda College, Mahidol University (Nakhon Pathom, Thailand); (2) Department of Interior Architecture, Faculty of Architecture, King Mongkut's Institute of Technology Ladkrabang (Bangkok, Thailand)

Markets are public places which should be accessible to every customer including elderly customers and customers with disabilities. This exploratory study was aimed to indicate physical barriers in markets faced by elderly people and people with disabilities in Thailand. Researchers used an accessible checklist to evaluate physical environments of 11 food markets in Bangkok and other provinces around Bangkok including Nakhon Prathom, Nonthaburi, Samut Prakan, and Samut Sakhon. Physical barriers in these markets were observed and took photos during June 2008. Themes from the data were categorized and prioritized. Researchers found consistent physical barriers among these several markets. Major physical barriers were prioritized in three categories, accessible problems, safety problems, and communication problems. Physical barriers which led to accessible problems included no accessible parking space, narrow and obstructed walkways due to goods and product placements, steps without ramps, steep ramps without handrails, no accessible restroom, and squat toilets. Physical barriers which caused safety problems consisted of uneven, wet, and slippery walkways; floor drains without covers; huge pans with hot cooking oil placed close to walkways; protruding objects such as sharp pointed meat hangers; and counters with sharp edges. Physical barriers which related to communication problems included no signage for entrances, fire exits, restrooms, alarms, and directions; no price list; and unreadable signage due to letter size, letter color, signage placement, insufficient lighting, etc. Based on the findings, physical barriers presented in

this study could be harmful not only for elderly people and people with disabilities but also for everyone who were shopping in these markets. In conclusion, physical barriers in markets should be eliminated. Building codes should be enforced and inspected strictly in markets to ensure safety environments for customers. It is suggested that further research should focus on market alterations to serve needs of elderly people and people with disabilities.

**PD7 776 CROSS-CULTURAL DIFFERENCES IN FILIAL CAREGIVERS: CANADIANS, CHINESE, AND CHINESE-CANADIANS**

N. CHAPPELL\* (University of Victoria, Victoria, British Columbia, Canada)

L. FUNK(1) - (1) University of Victoria (Canada)

Introduction: Western and Eastern cultures vary considerably in their historic notions of filial responsibility. Western culture embraces individualism and independence; Eastern culture promotes filial obligation and respect. However, recent research in North American and Asia suggests that the traditional Eastern model of filial piety is changing in present-day society and that diasporic Asians may fall somewhere in-between the two, still different, cultures. There remains much that we do not know about caregivers within these cultures: how are they similar to or different from one another? Methods and materials: Three samples (Caucasian-Canadian, Chinese-Canadian, and Hong Kong Chinese) of filial caregivers were interviewed in-person (n = 315). All Chinese-Canadians were descendants from Hong Kong. Both sons and daughters were interviewed for on average an hour and a half. Using data on culture, socio-demographics, filial responsibility attitudes, and caregiving behaviours (ADLs, IADLs, companionship, and finances), cluster analyses compare types of caregivers. Results: Cluster analyses correctly classified 94.6% of the cases, with cultural group falling in distinct categories. Caucasian Canadians differ from Hong Kong Chinese caregivers in that they tend to be older, female, live apart from their parent, care for a parent in relatively better health, adhere less to attitudes of filial responsibility and piety, and provide ADL and IADL assistance but not financial support. Interestingly, Chinese-Canadians characterize two distinct groups where one group tends to be older, unemployed, provide help with more ADLs but not financial support, and the other group tends to be younger, employed, provide help with fewer ADLs but also provide financial help. Conclusion: Children who provide care to their elderly parents differ from one another in terms of socio-demographic characteristics.

**PD7 777 SPENDING PATTERNS OF FAMILY CAREGIVERS: IMPLICATIONS FOR AN UNCERTAIN ECONOMIC FUTURE**

D. WAGNER\* (Towson University, Towson, United States)

G. HUNT(1) - (1) National Alliance for Caregiving (Bethesda, United States of America)

Family caregivers in the US, as in other countries, provide approximately 80% of the long term services needed by older adults. Not only do these carers provide direct help and manage needed services, many family carers also pay for goods and services and cover living expenses for the older person. A recent US survey of caregivers (n=1000) suggests that more than half of the carers in the US spend more than 10% of their annual income for the benefit of the person they are helping. Respondents reported a range of strategies to manage the costs of caregiving including; deferred savings, increasing credit card debt, cutting back on leisure time and travel and spending less on basic necessities of life. The survey also revealed a disproportionate investment of time and money by those respondents least able to handle this investment. And finally, analysis suggests that perceived level of burden of the carers was highly correlated with their level of spending. This poster will provide details about the survey, place the findings in an international context, and outline its importance to our understanding of the effect of the global economic downturn on family carers and the long-term outcomes associated with the strategies employed by carers. Policy recommendations for carers on an international level will be proposed. Additionally, the correlation between perceived burden, health of the caregiver and spending will be reviewed in terms of sustainability of family care over time.

**PD7 778 THE FAMILY CAREGIVING DYAD: PERCEPTION OF CARE BY CAREGIVERS AND CARE-RECIPIENTS AND ITS ASSOCIATION WITH DEPRESSIVE MOOD AND SELF-RATED HEALTH**

V. SOSKOLNE\* (Bar-Ilan University, Ramat-Gan, Israel)

Introduction: Studies on family caregiving for frail or disabled older persons have primarily focused upon the perspectives of the caregivers. Fewer have focused on dyadic models of caregiving to assess the interactive nature of caregiving. This study aimed to assess congruence and discrepancies between the family caregiver and the older person's assessment of care stressors, burden and family care relationship, and to examine dyadic models of caregiving: the contribution of caregiving or care receiving variables to health outcomes for each member of the dyad. Methods and materials: This cross-sectional study is the first phase of a longitudinal study. Two hundred dyads of frail or disabled older care-recipients and spouse or adult child caregivers were interviewed face-to-face. Variables included sociodemographic background, caregiving stressors (ADL and IADL; frequency of care), appraisal of caregiving or care receiving burden, family care relationships (communication and decision making), depressive mood and self-rated health. Results: Caregiver and care recipient assessment were correlated, yet significant discrepancies were

found in assessment of care stressors, and family care relationships. Controlling for gender and kinship tie, different variables were associated with depressive mood and self-rated health of caregivers or care recipients. Depressive mood of each dyad member was significantly associated with the other's depressive mood and with own appraisal of care load. The care recipient's decision making about care was significantly associated only with own depressive mood or SRH but not with that of the caregiver's. Conclusion: The findings highlight the importance of understanding the perspective in family caregiving of non-demented care recipients. By identifying patterns of family care relationships that are amenable to change, interventions may be tailored to responding to the needs of both members of the dyad.

**PD7 779 DETERMINANTS AND ECONOMIC VALUATION OF FORMAL AND INFORMAL CARE FOR FRENCH DISABLED ELDERLY LIVING AT HOME**

B. DAVIN\* (Inserm U912 (SE4S), Marseille, France)

A. PARAPONARIS(1), P. VERGER(1) - (1) Inserm U912 (SE4S) (Marseille, France)

Introduction: Population ageing raises challenging issues about management and financing of long-term care. Although informal care is the main source of assistance, its economic value remains puzzling. The study aims at assessing its cost, and at identifying factors associated with the type of care (either informal, formal, mixed or no care at all) received by disabled elderly. Methods and materials: The analysis uses data from a French representative survey on disability, gathered in 1999 among people living at home. The sample is about 3,500 older persons aged 60 and over, who reported needing help with activities of daily living. A multinomial probit model is performed to determine factors associated with type of care. Cost of care is valued according to the proxy good method. Results: A third of disabled elderly do not receive any care. Among those who are helped, 55% receive informal care, 25% formal care, and 20% mixed care. The socioeconomic status plays an important role, and shows difficulties that some people face to access formal care services. The economic value of informal care would lie between 6.1 and 8.3 billion euro, and would represent more than 60% of the total cost of care. Conclusion: The public financing of care for disabled elderly still remains insufficient to cover the whole costs. It may have serious implications on the health of the elderly and their carers.

**PD7 780 SOCIAL ENGAGEMENT OF OLDER RURAL CANADIANS: CONSTRAINTS AND FACILITATORS OF CHOICE.**

J. ROZANOVA\* (Brown University , Providence, United States)

N. KEATING(1), H. NORTHCOTT(2), S. MCDANIEL(3) - (1) (Edmonton, Canada); (2) (Edmonton, Canada); (3) (Edmonton, United States of America)

Introduction: Social engagement in later life has advanced to the forefront of research and policy agendas as a pathway to aging well and resource for community development. By engaging in meaningful volunteer activities older adults are assumed to accumulate positive health outcomes while providing a service to their community. Yet underprivileged older adults may engage in helping one another or volunteer work not by choice but under conditions of duress and poverty. Methods and materials: Using a critical gerontology and a feminist political economy perspective, this paper examined whether or not older adults can choose the kind and extent of their social engagement. The data from 55 in-depth qualitative interviews conducted in 2004-2005 in three communities in rural Canada were analyzed using the method of constant comparison. Results: The analyses uncovered five factors that constrain or facilitate choices of social engagement for older adults. Two of these factors (profound engagement in care work and compulsory altruism) make older adults volunteer and help others to a greater extent than they would like, thereby crowding out other meaningful activities. The other three factors (individual resources; opportunities for social engagement; and barriers and facilitators around desired activities) selectively exclude some older adults from participating in activities they value while affording other older adults wider choices for social engagement. Conclusion: The intersectionality of gender and class determines whether these factors facilitate or constrain choices for social engagement in later life. As the market economy uploads the costs of onerous care work on persons disadvantaged by age, gender, and class characteristics, low-income older women from remote or declining rural communities experience the least choice and the most constraints to social activities they value. Meanwhile greater individual economic resources and social capital facilitate choices for social engagement for older adults from more privileged

**PD7 781 "MEMORIES ARE LIKE A DARK CLOUD": AN EVIDENCE-BASED AGED-CARE MODEL FOR OLDER SURVIVORS OF MASS TRAUMA**

W. YVONNE\* (La Trobe University, Melbourne, Australia)

K. TESHUVA(1), Y. WELLS(1) - (1) La Trobe University (Melbourne, Australia)

Introduction Clinical studies have shown that older people with a past history of mass trauma often require specialized attention in aged care environments. Few studies have identified successful ways to provide care for older people from such backgrounds. This project developed an evidence-based model for training aged care workers to provide services that are sensitive and responsive to the special needs of older trauma survivors. Methods and materials Qualitative research methods were used to investigate the experiences of both older trauma survivors using aged care services and staff providing this

care. The study focused on two groups of older survivors in Melbourne, Australia: Holocaust survivors and older Cambodians. Ten focus groups and 20 semi-structured interviews were conducted with direct care staff and managers from residential facilities and community care agencies. Twenty in-depth interviews were conducted with older survivors or their primary family carer. Interview data were analyzed for themes. Results Providing sensitive and responsive care for older survivors is complex and multi-faceted. It requires staff to understand both historical events and the uniqueness of each survivors experience. It also involves person-centered and culturally sensitive care. The core elements of the training model include: Knowledge (e.g., of the diversity in past trauma experiences and the impacts of trauma on older clients' lives and behaviors); Communication (e.g., developing trust), and Skills (e.g., in responding to distress and problem behaviors and avoiding triggers). Conclusion We are using the study's findings to develop staff training resources designed to improve aged care workers' responsiveness to the needs of older trauma survivors. The significance of the project for Australias aged care sector is highlighted by government figures showing that 70% of humanitarian immigrants in the last two decades had experienced torture or trauma.

**PD7 782 FAMILY PRACTICES AND INTRA-GENERATIONAL RELATIONSHIPS**

IN LATER LIFE: OLDER SIBLINGS

P. CHAMBERS\* (Keele University, Staffordshire, United Kingdom)

Research on the everyday experience of 'doing family' and 'being in' older families is rather scarce. Detailed information of the way in which individual and/or familial biography and cohort differences impact on the multiple roles and complex relationships that are played out within families is sorely lacking. Instead, the research focus has increasingly been on a welfare model of older families, particularly in relation to inter-generational relationships, in which 'family support' has been dominant. Whilst such research is unquestionably of vital importance, it has nonetheless been to the detriment of exploration and appreciation of the qualitative experience of family life for older people as they, and their families, age together. This paper by focusing on intra-generational 'family practices' in later life, with particular reference to the author's study of relationships between older siblings, argues for a more holistic approach to the study of older families. Biographical interviews were conducted with 20 older siblings. Secondary analysis of 20 narratives of later life widowhood was also undertaken, with specific reference to family relationships. Drawing on key themes that were elicited from the data, the paper addresses the following areas: personal and collective biography; ageing together; sibling relationships in later life as 'something special'. Being' or 'having' a sibling is potentially an important contributory to the maintenance of both identity and well-being at a time when identity may be perceived to be under threat. Significantly, it would seem also that for some older people their current relationship with siblings enables them to better manage their own ageing process and ultimately their own future mortality. By contrast, for others a lack of collective reminiscence, different perspectives on the past, or broken bonds impacts on well-being and perhaps makes the past, present and future even more uncertain.

**PD7 783 END-OF-LIFE PROCESS IN A NURSING HOME IN JAPAN BY CASE STUDY**

C. SHIMADA\* (Komonenosato care center, Itabashi-ku, Tokyo, Japan)

Introduction: In Japan, the number of deaths at places other than hospitals is increasing. My purpose is to describe the end-of-life process of elderly living in a nursing home. Methods: Case study of 22 elderly, who died between April 2007 and December 2008 in a nursing home in Tokyo. The cases were analyzed with following parameters: 1) the conditions diagnosed as 'end-of-life', 2) the physical changes until death, 3) medical treatments in the nursing home, etc. Additionally, a questionnaire was sent by mail to their families about satisfaction. Results: Mean age was 84 (72-98). Main diseases were Alzheimer's, cerebrovascular disorder, and schizophrenia. All had dementia. The number of years living in the nursing home was from 5 months to 11 years. End-of-life care started when swallowing had deteriorated in twelve cases. In four separate cases, swallowing deteriorated after acute care for serious disease. All families preferred a natural death course, so they did not request any medical treatment such as PEG. Six cases died suddenly, or were admitted to hospital because of acute change in physical conditions. The social worker or the nurse in the nursing home explained end-of-life care to the families before starting. Ten persons returned a questionnaire: two persons answered 'satisfied', and eight persons answered 'satisfied but imperfectly'. Discussion: End-of-life care in the nursing home started when swallowing function deteriorated. Nursing home care was selected by families who wished to die naturally. For satisfied end-of-life care, it is necessary for families to confront end-of-life decisions. Families must be informed of patient's conditions, and what care we can and cannot provide in a nursing home without a regular doctor or nurse on duty at night, in order to make appropriate choices.

**PD7 784 LONG-TERM CARE INSURANCE SYSTEM AND FACTORS RELATED TO STABLE CARE RELATIONS IN JAPANESE ELTERS**

R. TAKAHASHI\* (Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan)

R. CAMPBELL(1), S. LONG(2), Y. YAMADA(3), H. KODAMA(4), C. NISHIMURA(5), Y. SUDA(6) - (1) University of Tokyo (Tokyo, Japan); (2) John

Carroll University (University Heights, United States of America); (3) Japan Workers' Co-operative Union (Tokyo, Japan); (4) Akita University of Nursing and Welfare (Odate, Japan); (5) Tokyo Metropolitan Institute of Gerontology (Japan); (6) Toyo University (Japan)

**Introduction** The Japanese long-term care insurance (LTCI), initiated in 2000, is a mandatory program in which everyone over 65 is guaranteed utilization of care services and equipments. The system brought a tremendous expansion of care programs and facilities for the elderly, and influenced the relationship between care recipients and family caregivers. Methods and materials In 2003, we began to conduct semi-structured interviews with a total of 30 care recipient-family caregiver pairs in order to investigate the ways in which elder care was affected by the new system in a working class area of Tokyo and a farming community area in Akita, a northern prefecture with the second largest percentage of elderly in the country. The follow-up interviews were carried out each year through 2007. Sessions lasted from one to two and a half hours. Results The majority of care recipient interviewees were female (72%). Their ages ranged from 65 to 92 years old, with an average of 81 years. Although wives, daughters-in-law and daughters accounted for the majority of caregivers, families were purposively chosen so that we could interview people in a variety of relationships to the elderly person, including husbands and sons. Spousal caregivers, especially wives, expressed responsibility for taking the caregiver role and behaved protectively toward the care recipient. This often resulted in separating the couple from others and isolating them from the community. Utilization of LTCI services enhanced their openness to the community and provided respite time for caregivers. Daughters-in-law were exposed to stress from other family members as well as from care recipients. Solitude and sociability of care recipients helped to neutralize conflict among them. More husbands and sons engaged in care giving, but faced, in particular, housekeeping difficulties. Conclusion LTCI programs contribute to stimulating bidirectional and multidirectional.

**PD7 785 IS ELDER ABUSE WORSE IN DEVELOPING COUNTRIES? COMPARATIVE ANALYSIS BETWEEN BRAZIL AND USA**  
A. RUGGIO\* (University of Southern California, Manhattan Beach, United States)

**Introduction:** Elder abuse is a growing concern worldwide, the WHO revealed that between 4 to 6% of world older adult population are victims of some type of violence. Considering the differences in social-development among societies, the aim of this study is to identify if there are disparities in degree of violence against older adults according to nation developmental status. **Methods and Materials:** Data was collected from the results of two national studies , Elder Abuse Incidence Study,1998 from the US , and Violencia Contra a Pessoa Idosa (Violence Against The Elderly), 2007 from Brazil, and compared in three categories: type of violence inflicted against the elderly, the relationship between victim and perpetrator and gender of perpetrators. **Results & conclusions:** The higher type of variations were found in the category of type of abuse committed against the elderly, in Brazil the most prevalent type of abuse found was Financial Exploitation while in the USA, the most prevalent type of abuse reported was neglect, so that variation might have its bases in the developmental status of each nation, however to affirm that violence against the elder is worse in developing countries would be premature since there are no literature comparing violence based in developmental status, and there is some restrictions regarding the process of data collection in the Brazilian survey. This study suggest that elder abuse and its degree should be understood in order to raise awareness and research in developing countries regarding the theme of elder abuse and to begin a discussion of the effects that underdevelopment might have in violence against older adult populations.

**PD7 786 STAYING ACTIVE AND PROMOTING WELL-BEING AMONG THE ELDERLY: A STUDY OF OLD AGE HOMES IN INDIA**  
A. MISHRA\* (Indian Institute of Technology Roorkee, Roorkee, Uttarakhand, India)  
D. KAR(1) - (1) College of Engineering Roorkee (Roorkee, India)

The issue of physical and mental well being of the elderly population has caught the imagination of current social scientists in India. Not only academic scholars but also policy makers and voluntary organisations are, particularly, paying attention to those elderly persons who are residing in old age homes. It is due to the commonly held notion that the elderly find it difficult to adjust to the life in old age homes in the absence of any meaningful activity in later lives. In this paper, we intend to examine the life-satisfaction of the old age home residents within the framework of activity theory of aging. The theory states that engaging in some kind of activity or work facilitates elderly people to adjust to the later years of their life. The paper is based on the study of six old age home residents in coastal districts of Orissa, a province in India Primary data was employed for the purpose of this research. A semi-structured interview schedule was constructed to tap the subjective perception of the residents of the Homes in Orissa. We found that a majority of the residents expressed their satisfaction staying at the Homes. The reasons that they cited for their feeling of happiness was that the Homes took care of their basic requirements such as food, accommodation, shelter and medical facilities. The constant touch with friends, good friendship with the co-residents and engagement in activities within the Homes were also contributing factors towards their satisfactory lives in the Homes. The finding also corroborated the assumption of the activity theory that engaging in various roles, not only

improves the physical and mental health of the elderly but also instils in them a sense of self-esteem. **Keywords:** Elderly, Old age home, Activity, Satisfaction, India

**PD7 787 POLICY IN THE FACE OF RAPID CHANGE: THE CASE OF KOREA**  
H. YOON\* (Oregon State University, Corvallis, United States)  
H. JON(1) - (1) Hallym University (Chucheon, Gangwon-do, Republic of Korea)

South Korea is regarded as one of the economic tigers in Southeast Asia. Modernization has occurred at an unparalleled pace but it is creating a generational storm in the face of a silver tsunami. Korea is faced with strong cultural traditions that may be unable to keep up with 21st century aging. There are changing mores and changing policies as the country grows older at an extraordinary pace. The authors bring together findings from a major survey of unmet needs and integrate them with recent policy quandaries facing the elderly and the country as a whole. Having faced innumerable challenges in the past, Korea is ready to rise to the occasion and is funding a world class initiative at Hallym University to bring international scholarship, research, and applied knowledge to bear on looming difficulties. Working with top-ranked Korean gerontologists and a panel of international experts, the initiative points the way to viable intervention strategies relevant to the sweep of Asian Aging and aging in other developing countries. Presenting a conceptually grounded approach to policy research based on national and personal needs, this paper highlights recent efforts to break new ground.

**PD7 788 THE RELATIONSHIP BETWEEN HEALTH AND SES IN SOUTH KOREA**  
J. LEE\* (Ohio State University, Columbus, United States)

**Introduction:** The relationship between health and socio-economic status (SES) has not yet been established in developing countries, such as South Korea, while the lack of a social support program and the existence of large economic inequality suggest an even stronger health disparity across SES than that which exists in developed countries. **Methods:** We investigate this relationship, using multiple, objective measures of health and SES, including self-reports of doctor-diagnosed disease prevalence, clinical prevalence of diseases based on biological markers, and a physical performance measure of frailty. The samples are drawn from two newly available, nationally representative sets of data from the 2006 Korean Longitudinal Study of Aging and the 2005 Korean National Health and Nutrition Survey. **Results and Conclusions:** A strong health and SES gradient is found based on both self-reported and clinical prevalence of diseases, co-morbidity, and frailty. Among SES, the education gradient is particularly strong, and household income and net-worth are also significantly associated with individual health outcomes. We also examine whether retirement influences co-morbidity and frailty, using the mandatory retirement provisions of the Korean labor force to identify a pathway to retirement that is not a consequence of poor health outcomes. We find that mandatory retirement is not associated with subsequent co-morbidity and frailty, while poor health is the primary reason most frequently reported for retirement.

**PD7 789 A COMPARATIVE STUDY OF SOCIAL INCLUSION AMONG ELDERS WITH A DISABILITY IN SHANGHAI AND HONG KONG, CHINA**  
H. CHEN\* (The University of Hong Kong, Hong Kong, China)  
Y. WONG(1) - (1) The university of Hong Kong (Hong Kong, China)

**Introduction:** This study aims to understand the life circumstances and social exclusion experienced by older adults with disability in Shanghai and Hong Kong; it also aims to study how changes in social exclusion affect the quality of life of older adults with disability in the community of the urban Mainland China context and Hong Kong context. **Methods:** There are 460 older adults from one community in Shanghai, and 250 older adults from a compatible community in Hong Kong, participated in the questionnaire interview. Both the sampling processes in Shanghai and Hong Kong are representative despite the different interview approaches, as stratified sampling was employed in Shanghai while multi-step random sampling was employed in Hong Kong. **Results:** The quality of life of the older adults was significantly affected by their functional capacity and disability. This also implied that social environment was not inclusive for the older adults with disability in many ways. Neighborhood exclusion stood out to be the most significant form of social exclusions that the older adults with disability faced both in Hong Kong and Shanghai. Respondents of older adults with disability from Shanghai suffered more significant social exclusion in all forms of exclusions compared to older adults with no disability, especially in terms of basic services and financial exclusion. Furthermore, the social exclusion had a partially mediation relationship with disability and quality of life. **Conclusion:** Although disability is now more and more commonly understood as an element of human diversity, it is still quite ideal to consider the people with disability an inclusive body of the society. There are yet many environmental barriers as well as a mixed interplay of social conditions to fulfill community inclusion for this cohort. Suggestions on how to achieve an inclusive society especially for this cohort of people were discussed.

**PD7 790 HERBAL MEDICINES FOLLOWING THE ELDERLY PERSPECTIVE: FOOD, NOURISHMENT AND MEDICINE**  
C. SUMNGERN\* (Institute of Biomedical Science of Abel Salazar, University of Porto, Porto, Portugal)

Z. AZEREDO(1), A. KIJOA(1), R. SUBGRANON(2), N. SUNGVORAWONGPHANA(2)  
- (1) Institute of Biomedical Science of Abel Salazar, University of Porto (Porto, Portugal);  
(2) Faculty of Nursing, Burapha University (Porto, Thailand)

**Introduction:** From time immemorial, herbal medicines have been popular among the elderly and their families as typical traditional household medications. The understanding of how the elderly perceive and define herbal medicines will provide the appropriate manners to care for the elderly, themselves and/or by health care providers who can inform and encourage the elderly and providers to use the most beneficial herbal medicine.

**Methods and materials:** To depict how the Thai elderly use herbal medicine according to their basic perceptions, the questionnaire of the benefits of herbal medicine perception was used in this study on the Thai elderly (60 years and older) of 419 participants in different areas: rural, suburban, and urban. The elderly were chosen among those in Thai senior club in opportunistic random.

**Results:** Almost participants (97.4%) had known and used herbal medicines according to how they prepared them and why they used them. The study depicted that the Thai elderly used herbs in daily cooking because they perceived herbs as food and medicine as well. They also used herbs in form of fresh herbs (32.5%), herbal tea (21.5%), herbal hotpot (23.4%) and adaptogens (43.9%). They believed the adaptogens strengthen the body in non specific ways with the final goal of being more resistant to disease and stress. By the way, they did agree with high level that they thought herbal medicines could provide nourishment, cure diseases, relieve symptoms especially pain, and provide good health maintenance. They also thought that herbal medicines are useful and valuable as ancient Thai folk medicines.

**Conclusions:** Thai herbal medicines are a traditional medicine which has been current used in Thailand not only because of their cost but also of their accessibility and general acceptance by the Thai population.

#### **PD7 791 ELDERLY SERVICE NEEDS IN HONG KONG FROM THE USERS**

B. MAK\* (The University of Hong Kong, Hong Kong, Hong Kong)  
J. WOO(1) - (1) The Chinese University of Hong Kong (Hong Kong, Hong Kong)

**Aim:** To identify elderly service needs in Hong Kong from the users' perspective. **Background:** As Hong Kong population is ageing rapidly, it is important to identify the needs for care of the elderly. Although a wide variety of medical and social services have been provided to meet the needs of the elderly people, there has been little evaluation from the users' perspective regarding what the needs are and how well current service provisions match their needs. In recent years the importance of patient centred care has been emphasized, where patient's expectation of care have been given a central role in guiding and improving the provision of health. However few studies have been carried out with respect to services for the elderly. **Design:** To identify the service needs, a focus group study was conducted. Both service providers and elderly people were interviewed. **Method:** Data were collected by running eight focus group discussions. Interviews were transcribed and themes were identified. **Results & Discussion:** The study identified several areas for improvement in elderly services, covering adequacy and accessibility of medical services, coordination of health and social care, quality of long term care, negative perceptions, and training needs. Similar to other studies of what patients want of their health services in other countries, the themes of fast access, continuity of care and smooth transition, affordability, provision of information of available health and social services appear to be universal. **Conclusions:** In addition to other objective outcomes, changes in service provisions towards improvement should be evaluated from the users as well as professional care providers perspectives. The present study used the qualitative research method of focus group to provide an insight into the elderly service, generating rich information which could be used to inform elderly care service development.

#### **PD7 792 CHINESE ELDERLY PEOPLE'S PERCEIVED IMAGE AND SELF-IMAGE: AN EXAMINATION OF LOOKING-GLASS-SELF THEORY**

X. BAI\* (The University of Hong Kong, Hong Kong, China)  
N. CHOW(1) - (1) The University of Hong Kong (Hong Kong, China)

**Introduction:** Positive self-image is beneficial for elderly people to keep physical, psychological and social functioning health, thus exploring the determinants of self-image is fundamental to foster a positive ageing process. However, opinions are often divided on how the elderly would react to the common negative age stereotypes. Some insist that through long exposure, elderly people might internalize those stereotypes, whereas others contend that the downward comparison process may make negative stereotypes potentially benefit the elderly. Despite the extensive research on societal age stereotypes and self-image of the elderly in western societies, relatively little is known about the situation in China. To fill this context gap, this study sets out to unravel the relationship between Chinese elders' perceived image and their self-image in terms of their physical, psychological and social functioning dimensions in the framework of Looking-glass-self Theory.

**Methods and materials:** Employing multistage cluster sampling method, we conducted quantitative questionnaire surveys on 199 elderly people from both urban and rural areas in Wuhan. Data analysis took place in several stages using SPSS10.0. **Results and Conclusion:** This study, to some extent, supports the "internalization effect". Elderly people's self-image is found to be positively associated with their perceived image ( $r=0.38^{***}$ ) and shows different correlation coefficients in the dimensions of physical health, psychological status and social functioning. Moreover, such "internalization effect" is found to work differently for different categories of elderly participants. Male elderly

with higher socio-economic status are less likely to internalize perceived image as part of their self-image. The incremental OLS regression models further identifies educational level, chronic health conditions, perceived image in physical, psychological and social functioning domains as significant predictors of elderly people's self-image, with the final adjusted  $R^2 = 0.329$ .

#### **PD7 793 DEFINITIONS ABOUT QUALITY OF LIFE: BRAZILIAN OLDER ADULTS PERCEPTIONS**

L. PASKULIN\* (Federal University of Rio Grande do Sul, Porto Alegre, Brazil)  
F. CORDOVA(1), L. VIANNA(2), F. COSTA(1) - (1) UFRGS (Porto Alegre, Brazil);  
(2) UNIFESP (Sao Paulo, Brazil)

**Introduction:** The aim of this study to explore the older adults perceptions about the significance of the quality of life (QoL) and identify, as well, the most referred QoL categories. **Methods:** descriptive and cross-sectional study developed as a result of an open question: "What does QoL mean to you?". This question where applied to 260 community dwelling persons aged 60 or more, in a city in Southern Brazil. The software Qualitative Solutions Research NVivo (QSR NVivo) 2.0 was used to support the qualitative and quantitative content analysis. The pre-established categories were based on the facets from the Brazilian version of the WHOQOL-100 questionnaire and WHOQOL-OLD module. The project was approved by the Research Ethics Committee of the Federal University of São Paulo. **Results:** for the majority QoL signifies to have health. Following, the more representative categories were: positive feelings, personal relationships, food, financial resources and leisure opportunities. **Conclusions:** The findings reinforce the idea that QoL is a multidimensional concept and can be analyzed by subjective and objective parameters.

#### **PD7 794 PERCEPTION OF AGING EXPERIENCE BY SENECALESE WOMEN: A PHENOMENOLOGICAL STUDY**

A. SECK\* (Université Laval, Québec, QC, Canada)

**Introduction.** The aging of women has become an object of concern in developing countries (WHO, 1999). In Senegal, the number of aging women is progressively increasing. This requires reorganizing the health system to meet their health care needs (Couderc, 2004). Such a reform should take into account an understanding of aging, from the women's own perspective. The purpose of this study is to explore the meaning of aging experiences amongst senegalese women, living in the community. **Méthods and materials.** This qualitative study used a descriptive phenomenological approach. In-depth interviews, with ten women aged 60 years old or more, were realized, in Dakar. One open-ended question asked the women to describe their most significant aging experiences. **Results.** Giorgi's (1997) phenomenological method guided the data analysis and revealed eight meaningful findings reflecting the lived experiences of aging: 1) Being pleased about earning the privileged status of the aged woman, 2) Adopting new roles valued by the family and the community, 3) Being confronted with a physical vulnerability, 4) Facing obstacles to health care accessibility, 5) Facing greater psychological vulnerability, 6) Experiencing economical vulnerability, 7) Having to adapt to a lifestyle which varies between traditional and modern and, 8) Giving a main importance to religion. **Conclusion.** This study showed that aging is, for Senegalese women, a fulfilling experience, in spite of physical, psychological and economical vulnerability, which in turn, leads to an existential reflection. It also showed that aging women need appropriate social and health measures to promote the elders well-being.

#### **PD7 795 EFFECTS OF SOCIAL EXCLUSION ON DEPRESSIVE SYMPTOMS OF ELDERLY CHINESE LIVING ALONE IN CHINA**

D. LAI\* (University of Calgary, Calgary, Canada)  
H. TONG(1) - (1) Universtiy of Calgary (Calgary, Canada)

**Introduction:** The number of the elderly Chinese who are living alone in China increased has in recent years. However, research on depressive symptoms of older people living alone in China is limited. Social exclusion is an emerging concept to examine the disadvantaged groups and some evidence has shown the connection between social exclusion and an increased risk of mental health problems in later life. This research examined the effects of social exclusion on depressive symptoms in elderly Chinese in China. **Methods:** Data were obtained between August and October 2008 through face-to-face interviews, using a structured survey questionnaire, from a stratified proportional random sample of 228 Chinese aged 60 years and older who were living alone in one of the aging communities in Shanghai, China. Depressive symptoms were measured by a 15-item Chinese version of the Geriatric Depression Scale. **Results:** Over 30% of elderly Chinese that were living alone reported having symptoms that indicated that they had mild or above mild level of depression. When controlled for the demographics and health variables in hierarchical multiple regression, social exclusion variables represented by lower financial adequacy and lacking of social support were significantly related to more depressive symptoms. The social exclusion variables were more important than the health variables in explaining the variance in depressive symptoms. **Conclusion:** There is a relationship between social exclusion and depressive symptoms among the Chinese elderly living alone in Shanghai. Social policies and programs to reduce various forms of social exclusion

should be developed. In addition to providing better financial support, services to facilitate the development of better social support are also essential.

**PD7 796 THE ELDERLY LIFE ADJUSTMENT AND DEMAND FOR THE MENTAL SUPPORT IN TAIWAN**

S. TSENG\* (Chia Nan university of pharmacy and science, Tainan, Taiwan)

L. KUO(2) - (2) Department of General Education, Yuh-Ing Junior college of health care and management (Kaohsiung, Taiwan)

**Introduction:** Elder people have to adjust constantly for facing the sense of loss in the aging process. However, finding out the elderly' support demand is actually very important at the adjustment stage. This study attempted to explore the support demand of life adjustment among the elderly, and took the psycho-cognitonal prospective to search for the demand of management methods and information when the psychiatric problems arise. Methods and materials: The subjects were from the metropolitan area for the consideration of health related information accessibility. The healthy elderly who live in Kaohsiung city located on the Southern Taiwan were selected, and the sampling numbers depended on the elderly population's proportion of the 11 districts. The total numbers were 498 that exclude the cases of unqualified and incompletely data. Data collected by the questionnaire with face to face interview. Descriptive analysis indicated the elder samples need more supervised information of suffering experiences management, leisure activities plans and money management. Results: This result also showed that the elderly need someone to provide the information of the management methods about loneliness, depression and stress in life (the mean is 3.2). The multiple regression line pointed out that the more mental support needed the more information demand of self adjustment needed. Conclusions: The mental health maintenance for the elderly is urgent and vital. We suggested the policy of community mental health should increase the mental social services for the elderly.

**PD7 797 THE ELDERLY INFORMATION DEMAND FOR DISEASES AND SELF-CARE IN TAIWAN**

L. KUO\* (Yuh-Ing Junior College of Health Care and Management, Kaohsiung, Taiwan)

K. LIN-HUI(1), T. SU-FENG(2) - (1) Department of General Education, Yuh-Ing Junior College of health Care and management (Kaohsiung, Taiwan); (2) Department of Hospital and health administration, Chia Nan university of pharmacy and science. (Tainan, Taiwan)

**Introduction:** The prolonged life expectancy made the elders have to face more health problems led by the chronic diseases and physical function decline. It would be helpful for them to get the elder's health maintenance and self care ability in daily lives if the elderly' reorganization and awareness of health problem are improved. This study aims to explore the health related information that is required by the elderly, and to discover their actual demands for the knowledge of various diseases and self-care methods. Methods and materials: The subjects were from the metropolitan area for the consideration of health related information accessibility. The healthy elderly who live in Kaohsiung city located on the Southern Taiwan were selected, and the sampling numbers depended on the elderly population's proportion of the 11 districts. The total numbers were 498 that exclude the cases of unqualified and incomplete data. Data collected by the questionnaires with face to face interviews. Results: Results showed that most of the elderly live with family (82%), but over half of the participants' health was not good and had several diseases (53.4%). The majority participants demand more for self-care information than for the disease-related information, and the highest need was nutrition information (the mean was 3.3), the second and third needs were medication information (the mean was 3.2) and medical care information (the mean was 3.1). Conclusions: Since the health care information was so crucial for the elderly, the enhancement programs of primary geriatric medical services and home visit of primary health service of government were highly recommended.

**PD7 798 DEVELOPING USER-DRIVEN APPROACHES TO RESEARCH AND DEVELOPMENT FOR AMBIENT TECHNOLOGIES**

A. SIXSMITH\* (Simon Fraser University, Vancouver, Canada)

Emerging information and communication technologies (ICTs), such as "pervasive computing", "ubiquitous computing" and "ambient assistive living" have considerable potential for enhancing the lives of many older people throughout the world. However, research and development in this area has to deal with a number of challenges, not least being how should we explore, visualize and map out this uncharted area in order to exploit this potential. Important questions include: What are the important directions for research and development? How can we ensure that older people benefit from these technologies? How can we ensure that some people are not excluded from accessing these technologies? What are the potential disbenefits and how can these be avoided? How can we improve the design and development process to ensure that new technologies are "user-driven"? The paper draws on the author's experiences within a number of ICT development projects to develop a framework for user-driven R&D. INDEPENDENT examined technologies to enhance the quality of life of people with dementia. The Care in the Community project developed and tested a system for monitoring the health and well-being of older people living at home. A new EU-funded project SOPRANO will be developing technologies within the framework of "ambient assisted living". A key concern within this work is to move away from technology-push and problem-focused approaches

to researching technology and ageing to an approach that is driven by gerontological concepts and theories.

**PD7 799 INTERPROFESSIONNAL CONTINUITIES IN THE PROCESS OF DETERMINING THE INCAPACITY OF AN ELDERLY PERSON**

Y. COUTURIER\* (Université de Sherbrooke, Sherbrooke, Canada)

M. BEAUDRY(1), M. BEAULIEU(1), S. PHILIPS-NOOTENS(1) - (1) Université de Sherbrooke (Sherbrooke, Canada)

This abstract presents the results of an interdisciplinary research on the interprofessionnal practices encompassed in the process of determining the incapacity of an elderly person. This process may be deemed interprofessionnal since it is characterized by strong pragmatic continuities that compensate, in some measure, for some epistemological discontinuities relative to the idiosyncratic conception of the incapacity concept of each domain. This "interprofessionnal" deploys itself in favour of a reflexive and anticipatory practice notwithstanding the lack of a common working ground to the three professional groups involved. Practices of professional actors of the judicial, medical and psychosocial field were studied in the light of their continuities and discontinuities. We carried out 43 interviews with professionals of these three fields and proceeded to an interview of explanation on the practice with each of them. This specific type of interview aims at supporting a speech very near to the professional's effective practice by leading him to have access to what the cognitivists refer to as the concrete memory. These interviews led us to a set of thematic analysis that we are exposing here in order to allow us to focus on the main subject. This analysis has allowed us to understand how continuity was being constructed from the professional actors' point of view and also to modelize its insertion into the services' integration concept.

**PD7 800 AGENCY FOR INTEGRATED CARE: A SYSTEM APPROACH TO BRIDGING ACROSS CARE SITES IN SINGAPORE**

A. NG\* (National Healthcare Group, Singapore, Singapore)

C. TAY(1), L. WONG(1) - (1) National Healthcare Group (Singapore, Singapore)

Elderly often have complex needs, especially so for those who have just discharged from the hospital. Studies found that they are considered as "high risk" because they occupy almost two-thirds of hospital beds and are twice more likely to be admitted to hospital compared to the entire population. With a rapidly ageing population, it becomes more acute to contain the demand for hospital beds through timely and appropriate placement of patients to the community. While timely discharges for elder patients are desired, it has not been as smooth as it often hides the complex social, cultural and familial relations, and fragmented services that sustain the self-management patients. Furthermore, the construct of "community" is often treated as a monolithic entity which very often is not the case. This poster illustrates how Singapore has established a centralized body, Agency for Integrated Care (AIC) to integrate long term care (LTC) services in the community to tackle some of these issues. Result: To ensure safe and appropriate care of our elderly, Singapore Government has established AIC whose roles are: to coordinate referrals from hospitals to LTC services; oversee the hospital-community transition care and discharge planning; and provide hospitals with case management teams to optimize the transition of patients after discharge. Poster will illustrate its operations; how it has improved the coordination of patients from hospital to LTC services; and foster closer interagency collaborations. Preliminary results show that since its inception, AIC has coordinated more than 16500 nursing home, home care and day rehabilitation applications; reduced the waiting time to nursing homes; fostered interagency collaboration across 59 agencies; and improved access to services for patients. We hoped that this case study will illustrate how our approach to integrate services across levels of care can be used as a lesson for others.

**PD7 801 OUTPATIENT CARE FOR ELDERLY PEOPLE: A STUDY OF DEMAND AND OFFER.**

M. SCOCHE\* (Universidade Estadual de Maringá, Maringá, Brazil)

S. MARIA JOSE(1), S. ELIZABETH APARECIDA(2) - (1) Universidade Estadual de Maringá (Maringá, Brazil); (2) Unopar (Cascavel, Brazil)

The quick growing of elderly people in Brazil causes an important impact for the whole society, especially to the Public Health Politics. Therefore, the services from this area need to be prepared with required infrastructure to receive the demand of this age group, related to installation, specific programs and human resources not just in quantity but also in quality. The present work was carried out with the purpose of identifying the demand and the offer of public health service rendered to the elderly people from Cascavel-PR in 2007. 141 elderly who live in the surroundings of UBSs were interviewed to identify the potential demand and the functional capacity of elderly. In the first stage, it was carried out the demographic characterization of Cascavel, highlighting the evolution on the growth rate, elderly people distribution and epidemiological profile during 1990 to 2005. The results showed a higher growth of elderly people compared to general population, with predominance of the female gender, and more concentration of elderly in the urban zone. Most elderly (85.2%) claimed to present more than one chronic disease, with prominence of Arterial Hypertension and its complications, as well as going to the UBSs for medical attendance. The health services showed deficiencies such as: inexistence of workers with

graduation in geriatric and gerontology and delay in the schedule of medical appointments and exams. The relation between the offer of health service and the demand of elderly people unmasked, on one hand, the necessity of evaluation, local planning, reorganization of flow and the resolution of the produced service and on the other hand, the use and difficulties of elderly to accomplish the requested medical attendance.

**PD7 802 DEMENTIA CARE NETWORKS: FACILITATORS AND BARRIERS**

M. OTERO\* (Radboud University Nijmegen Medical Centre, Nijmegen, The Netherlands)  
I. DRASKOVIC(1), M. OLDE RIKKERT(2), M. VERNOOIJ-DASSEN(3) - (1) Scientific Institute for Quality of Healthcare, Alzheimer Centre Nijmegen, Radboud University Medical Centre, Nijmegen (Nijmegen, The Netherlands); (2) Department of Geriatrics, Alzheimer Centre Nijmegen, Radboud University Medical Centre, Nijmegen (Nijmegen, The Netherlands); (3) Scientific Institute for Quality of Healthcare, Alzheimer Centre Nijmegen, Department Primary and Community Care Centre for Family Medicine, Geriatric Care and Public Health, Radboud University Medica (Nijmegen, The Netherlands)

Introduction: Care for persons with dementia is complex and requires multidisciplinary collaboration within dementia networks. Dutch National Dementia Programme (NDP, 2005-2008) aimed at supporting the formation of regional dementia networks in order to provide multidisciplinary, co-ordinated and systematic dementia care. The present study explores facilitators and barriers in this process. Objectives: To gain insight into main facilitators and barriers for the successful formation and functioning of dementia care networks. Methods and materials: Focus group (FG) discussions were set up with the members of the three regional NDP-workgroups. In addition, two interviews were performed with participants from other two regions involved in this process. The discussions and interviews with different health professionals, managers and informal caregivers were audio-taped and transcribed. The content was coded using Atlas-ti programme. Results: Qualitative analysis of the FG discussion shows that some facilitators and barriers are region-specific, while others are common for all participating networks. Main common facilitators are client-centred approach of the NDP, and multidisciplinary cooperation. Main common barriers are lack of commitment at management/administration level, and competition between different dementia care providers. Incentives for competition, established by the government and the insurance companies do not serve the clients' best interest. However, our study also shows that despite the actual competition at organizational level, the professionals in direct contact with clients are inventive in getting around it, and finding good solutions for the clients. Conclusions: Client-centred approach, collaboration between health care professionals and the commitment at management/administration level are experienced as strong motivators and facilitators for the formation and functioning of dementia care networks. In order to improve the quality of care for people with dementia, incentives for competition should be replaced by the incentives for collaboration.

**PD7 803 MEDICAL AND SOCIAL HOME HEALTH CARE INTEGRATION FOR COMMUNITY DWELLING ELDERLY IN DEVELOPING COUNTRIES. EXAMPLE OF IRAN "PSGIDI".**

F. TEYMOORI\* (Laboratoire TIMC-IMAG, Grenoble, France)  
A. FRANCO(2), M. MOUSAVI(5), J. DEMONGEOT(1), M. SHIRAZIKHAH(4),  
A. BIGLARIAN(1) - (1) Laboratoire TIMC-IMAG Ecole EDICSE (grenoble, France);  
(2) University Hospital of Grenoble (France); (4) University of Social Welfare & Rehabilitation (Islamic Republic of Iran);

Context: Ministry of Health in Iran confirmed the health transition in I.R. Iran over the last few decades. Aging of the population, insufficiency of Health Services & Strategy for future dependency among old people besides special culture in Middle East Countries as Iran conducted us to do this study to design a new model of elderly care for helping their families as formal care giver & make aware local policy makers to see another shape of care for elderly except Iranian's Hospices. Method: We designed and established a new model of Integrated Home Health Care for elderly in Karaj, a city in the North of Tehran. In this model (French-influenced Programme de Soin Gérontique Intégrés à Domicile en Iran) comprehensive geriatric assessment of referred old people have been done by a multidisciplinary team at home. Kahrizak Charity Foundation for Disabled and Elderly as the biggest support NGO for elderly in Iran had chosen to collaborate with our Gerontologic Center. Results: 275 community dwelling elderly were evaluated by two multidisciplinary teams in their homes. After some qualitative and quantitative analysis, PSGIDI was effective at three levels: Micro, Meso and Macro levels. We proved old people performances on ADL, IADL, Nutrition, Cognition, Balance, Mood and behaviors of families as micro level results after one year intervention. Experience of Geriatric Interdisciplinary Team Working considered as meso level. Finally, financial help of social welfare organization to old people who benefit from geriatric home health care programs is established. It's a successful step at macro level. Conclusion: In developing countries the elderly remain a neglected population in health and social studies. Developing integrated

care networks by practicing of model projects is one of the most frequently applied strategies to highlight ageing as a problem of public health in the future.

**PD7 804 INDICATORS FOR TARGETING SERVICES TO COMMUNITY-DWELLING OLDER PERSONS**

C. GALAND\* (University of Montreal / Solidage, Montreal, Canada)  
F. BELAND(1), N. LEDUC(2) - (1) University of Montreal (Montreal, Canada);  
(2) University of Montreal (Montreal, Canada)

Introduction: A typology was previously established with 5 categories, regarding formal and informal sources of help used at different disability's levels in ADL/IADL [1st and 2nd regrouped informal or formal sources respectively to accomplish a single task. 3rd is composed of informal sources for multiple tasks. 4th used mixed sources and 5th involved formal sources only, both for multiple tasks]. The objective of this study is then to identify which indicators characterize the belonging of an elderly to each category. Methods and materials: Two different francophone samples, composed of 1500 community-dwelling elderly persons each, were considered for our analysis. Based on Pescosolido's social network model, we looked at five blocks of independent variables to identify our indicators. To do so, logistic regression was performed. In addition, we used multiple logistic regressions to define a predictive statistical model. Results: The principal indicators were found to be: Age, gender, living alone, numbers of chronic diseases and of disabilities. The increase in the number of pathologies, of functional limitations and disabilities was directly correlated with the belonging of an elderly to one of the five categories. Conclusion: These results clarify our understanding for the belonging of each elderly to the different categories. Also, Pescosolido's model (which is concerned by the effect of health on individual's networks) illustrates clearly the evolution of the relation between the health condition and the resources used through our different categories. Public policy can then be adapted to address specific needs and can better target proper services to community-dwelling older persons in relation with these indicators.

**PD7 805 CREATION AND ADEQUATE USE OF PERFORMANCE INDICATORS FOR THE VULNERABLE ELDERLY: THREE YEARS OF EXPERIENCE IN THE NETHERLANDS**

T. MELCHIOR\* (Inspectorate for Health Care, Den Bosch, The Netherlands)

Problem In the Netherlands, there was very little national information available about the quality of care for the elderly. Hence, it was difficult for clients, health care professionals or management to improve their care based on data and it was equally difficult to compare the quality of health care providers. For this reason several parties, such as the health care inspectorate, the Dutch patient organisation for the elderly and several professional health care boards, created a vision on quality and made a set of 40 performance indicators. Method In the last three years, more than 2000 health care organisations for the elderly (nursing homes and community care) measured performance indicators and filled in a questionnaire. All data was analysed and presented on the internet. Instruments Two kinds of instruments were used. Indicators gathered by the health care provider such as pressure ulcers, incidents of falling, failures in the providing of medication, depression and fixation. A patient survey will be based on the Consumer Assessment of Healthcare providers and Systems (CAHPS) with information on subjects such as the professionalism of the health care professional, the living conditions and the communication. Conclusions The data show us a range of outcomes. Especially the huge differences between the performance scores are interesting data to analyse. Learning objectives - After this presentation it will be possible to • Understand the impact of making performance indicators with different health care organisations. • Understand how to handle the data adequately (do's and don'ts). • Determine the success and risk factors for using performance indicators in care. • Understand how the Dutch Health Care Inspectorate is dealing with the results of the data to improve the quality of care.

**PD7 806 SUPPORTING ELDERS IN VARIED CULTURAL CONTEXTS: THE ROLE OF GOVERNMENTS, MARKETS, AND CIVIL SOCIETY IN SOCIAL POLICY**

M. MCCALL\* (Saint Mary's College of California, Moraga, CA , United States)  
T. ANME(1), C. HENNING(2), A. LOWENSTEIN(3), M. JEGERMALM(4),  
A. SCHARLACH(5) - (1) Tsukuba University (Tsukuba, Japan); (2) Jönköping University (Jönköping, Sweden); (3) Haifa University (Haifa, Israel); (4) Ersta Sköndal University College (Stockholm, Sweden); (5) University of California, Berkeley (United States of America)

As nations around the world face the common prospect of aging populations, they also encounter unique circumstances in their specific societies that provide the parameters within which they must strive to meet the needs of older citizens. In this presentation, we examine how the intersecting roles of a) government programs, b) the economic markets, and c) civil society factors (such as the individual, family, volunteer organizations, etc.) operate in 4 different countries (Israel, Japan, Sweden, and the United States) as nations work to adapt to aging populations. In addition, we will analyze how these three factors have changed over time (better to give a time frame, like the last two decades). For example, Japan's elderly have traditionally been taken care of by the family, with limited roles of government and market forces. However, in the last part of the 20th century, as the

government foresaw the coming changes in age and family structures, the role of the government drastically increased through programs such as the Golden Plan. More recently, with economic stresses, the roles of the market place and civil society, through neighborhood and other NGO organizations, have increased. In contrast, in the United States and in Israel, elder care has been more traditionally balanced between the government (playing a safety net role during the 20th century), the market (where an individual could purchase any service they desire), and the civil society (with many volunteer organizations playing a key role in helping elders). As an increasing number of nations try to design programs and policies that most efficiently and effectively address needs of older persons, we can learn from different societies how the interaction of the government, market, and civil society can create nations in which all can live and age well.

**PD7 807 TELEMEDICINE IN NURSING HOMES. NEEDS FOR RECOMMENDATIONS.**

A. FRANCO\* (Centre Hospitalier Universitaire, GRENOBLE, France)  
 P. LUTZLER(2), V. RIALLE(1), M. BENBADIS(1), M. LAILA(1), D. CELSE(3),  
 F. TEYMOORI(1) - (1) Clinique Vieillissement et Handicap, Université Joseph Fourier  
 (GRENOBLE, France); (2) Gériatrie, Centre Hospitalier (GRENOBLE, France);  
 (3) EHPAD L'Age d'Or (GRENOBLE, France)

**INTRODUCTION.** Telemedicine is a major potential solution to face the problem of perceived shortages of doctors and nurses (Krupinski al., Telemedicine and e-health 2008;14:117). But in Nursing Homes, quality of care, patient's rights and ethical and good practices must be preserved. **METHODS.** The authors propose recommendations to the professional actors and medical staff using telemedicine and videoconferencing between Nursing Homes and a secondary care geriatric hospital, as submitted in January 2009 to the French Society for Technologies for Autonomy and Gerontechnology (SFTAG). **RESULTS.** Privacy and medical secret must be protected, and the ethical principles of autonomy and benevolence are developed. Technical considerations are developed as regular weekly programmed links permitting preventive actions, and reducing the needs for acute or emergency sessions. Networking between Nursing Homes is encouraged. A good management permits also to enhance the educational and research activities. Legal responsibilities and financial aspects remain open and sometimes difficult issues. **CONCLUSION.** Telemedicine in Nursing Homes must be a current new tool for efficacy, safety and quality of care, but recommendations for good practices and ethical issues are needed.

**PD7 808 HEALTHY, DIGNIFIED, AND HAPPY ENVIRONMENT FOR THE AGED THROUGH INFORMATION TECHNOLOGY: A U-CARE PROJECT FOR THE AGED**

C. LIN\* (Chang Gung Memorial Hospital, Taipei, Taiwan)  
 W. KONG(1), C. CHUNG(2), C. MA(2), S. WU(2), W. SHIEH(2), C. LEE(2), C. LEE CHEN(1), S. CHI(1), Y. CHOU(1) - (1) Chang Gung Health and Culture Village (Taipei, Taiwan); (2) Chang Gung University (Tao-Yuan, Taiwan)

**Introduction:** The U-care project is an innovative model of care services to the aged in the Chang Gung Health and Culture Village, in coordination with the Chang Gung Memorial Hospital, the Chang Gung University, and the Ministry of Economic Affairs of ROC. Through the use of information technology, the U-care project aims to build a healthy, dignified, and happy environment for the aged as well as to slow the aging process and to enable a quick recovery, thus improving their quality of life. **Methods:** The U-care project uses information technology to develop five personalized health management service systems for the aged: (1) The personal health information management system consists of databases based on multiparameters from residents with a variety of conditions, including past histories, outpatient clinic prescriptions, diet and physiologic conditions. (2) The activities information management system can support mental care by analyzing the interactions between the aged, the communities, and the family. (3) The position and staff mobilization system can pinpoint the exact position of a resident in need of help using a Wi-Fi tag in the village. Staff members are then dispatched to help the resident. (4) The health status notification system is to monitor risk factors in advance so as to control chronic illnesses. This system also processes, analyzes, and detects physiologically significant events and provides suggestions to the staff and residents. (5) The function of the emergency medical information system integrates medical information during an emergency so as to ensure better management. **Results:** The results indicated that it is feasible to combine general care with medical services and information technology when providing care for the aged. **Conclusion:** There is potential to develop a new model of care services to the aged when general care is combined with medical services and information technology.

**PD7 809 TRUST-BUILDING WITH TRAUMATIZED OLDER CLIENTS: A CONCEPTUAL MODEL**

B. BEHNIA\* (Carleton University, Ottawa, Canada)

With the aging population, service providers are more likely to come into contact with older adults who are survivors of past traumatic events such as war, torture, genocide, incest, and rape. The overwhelming life-threatening experience of trauma could shatter survivors trust in others, including service providers. However, self-disclosure with professionals such as counselors, psychologists, and social workers us generally considered

to be a mechanism for coping with emotional stress. However, the pain and risk involved in self-disclosure make interpersonal trust essential. Self-disclosure makes one vulnerable on the good will and motivations of others. Therefore, in disclosing personal information, the individual considers the risks of being rejected, ridiculed, and exploited. Despite the acknowledgement of the importance of trust, there is little information o trust-building. A review of literature reveals the presence f three broad approaches to trust development, each emphasizing a component of a trusting relationship: the trustee's disposition to trust, the trustee's personal characteristics, and the characteristics of the trustee-trustee relationship. This paper contends that there approaches are helpful in explaining the 'initial trust', that is the trust that encourage the client to approach and initiate a relationship with a professional. However, to make oneself vulnerable and to disclose intimate information, the client and professional need to developing a level of trust deeper than the 'initial trust'. Drawing on the theoretical insights of symbolic interaction perspective, this paper presents a fourth approach to trust-building with traumatized seniors. In this approach, trust is conceived as the outcome of a complex process involving the interpretation of the situation in which clients and professional s find themselves. This paper identifies parameters used in defining the trustworthiness of professionals and offers suggestions on how professional could become more effective in building and maintaining trust.

**PD7 810 THE ACUTE-AGED CARE INTERFACE: EXPLORING THE DYNAMICS OF 'BED BLOCKING'**

L. GRAY\* (The University of Queensland, Brisbane, Australia)  
 C. TRAVERS (7), G. McDONNELL(1), T. BROE(2), S. DUCKETT(3),  
 P. ANDERSON(4), R. KARMELO(5) - (1) Adaptive Care Systems (Bronte, Australia);  
 (2) Prince of Wales Medical Research Institute (Randwick, Australia); (3) Queensland Department of Health (Brisbane, Australia); (4) Australian Institute of Health and Welfare (Canberra, Australia); (5) Australian Institute of Health and Welfare (Australia); (7) The University of Queensland (Australia)

**Introduction** In Australia, a limited supply of residential aged care (RAC) beds means that frail older people who cannot be discharged back into the community are often required to wait in the hospital setting for a bed to become available in a RAC facility. Pejoratively labeled "bed-blocking", this phenomenon is frequently cited as a major contributing factor to hospital "access block" restricting emergency and elective admissions to public hospitals. Although this issue is likely to intensify as the population ages, the extent and dynamics of the issue have not been comprehensively studied. Methods and materials Both primary and secondary data regarding the utilization patterns of hospital and RAC services by Australians aged 70 years and older were obtained in order to analyse service use and movements between services by this group. This analysis provided the foundation for a conceptual model to explain the dynamics underpinning the relationships at the nexus of the hospital and RAC sector. The model was progressively refined and developed through an extensive consultative process with experts in the field. Results A conceptual model of the dynamics at the acute-aged care interface was developed in which the pathway into permanent high care RAC is conceptualized as competing queues for available places by applicants from the hospital, the community and from within RAC facilities. The hospital effectively becomes a safety net to accommodate people with high care needs who cannot be admitted into RAC in a timely manner. Conclusion The model provides a useful tool to explore some of the issues that give rise to access-block within the Australian public hospital system. Access-block cannot be understood by viewing the hospital system in isolation from other sectors that support the health and well-being of older Australians.

**PD7 811 CARE MIX FOR THE ELDERLY LIVING ALONE IN JAPAN: WHO PROVIDES SUPPORT FOR THEM?**

M. YAMAGUCHI\* (Japan Lutheran College, Tokyo, Japan)  
 Y. SHIMIZU(1), M. SAITO(1), S. TAKEI(1) - (1) Sophia University (Tokyo, Japan)

**INTRODUCTION** As the number of the elderly living alone has been rapidly increasing in Japan, it is an emerging agenda to care for the elderly living alone in the community. Depending on their needs and care preference, a wide variety of care mix will be considered individually. The purpose of this study is to examine care mix for the elderly living alone, focusing on the combination pattern of formal and informal care. **METHODS** The subjects were 2,907 elderly living alone, randomly selected from residents' registration of Itabashi Ward of Tokyo in 2007. Home-visit structured interviews were completed for 1,391 elderly (65-95 of age). We measured the actual support for daily housekeeping and their preference for formal and/or informal care. **RESULTS** 1) The respondents who received some support from others for daily housekeeping was 17%. Of them, 53.3% received support only from home-helps. 2) Over eighty percents of those who were eligible for the Long-term Care Insurance (LTCI) services utilized home-help services. 3) Only 6.4% of the all respondents utilized some other social care services than LTCI services. 4) As for the preference for formal and/or informal care, 46.9% of respondents preferred only formal care, while 48.5% preferred both formal and informal care and 5.5% preferred only informal care. 5) As for the preference for informal carers, daughters, sons and other relatives were more preferred than daughters-in-law. 6) Logistic regression analysis indicated that filial support expectation and loneliness were significantly correlated to preference of only formal care. **CONCLUSION** These findings suggest that there are variation in care mix among Japanese elderly living alone. While most of them maintain their daily housekeeping activity without any help, they tend to

depend much on formal care when they need any help. Establishing appropriate care support network for them is needed.

**PD7 812 INFORMING POLICY AND SERVICE PROVISION IN THE CONTINUUM OF CARE: A CANADIAN INTERRAI STUDY**

N. JUTAN\* (University of Waterloo, Waterloo, Canada)

J. HIRDES(1), J. POSS(1), A. COSTA(1) - (1) University of Waterloo (Waterloo, Canada)

**Introduction:** As the Canadian population ages, the effectiveness of the continuum of care, the sustainability of the health care system, and the well-being of seniors, demands that services be carefully allocated and care provided in the least intensive care setting that can adequately meet a senior's needs. **Methods:** interRAI data was collected, including 367 supportive housing clients, 2267 home care clients, 832 long-term care clients and 425 complex continuing care clients. Clinical characteristics of clients in each setting were described. Clinicians were asked about the most appropriate care setting for each client. Using interRAI data and focus groups, a decision support algorithm was developed to assist clinicians in resource allocation. **Results:** Characteristics of clients varied between care settings with some substantial overlap, including depression, medical diagnoses, number of falls and daily pain. Staff ratings indicated that most clients were appropriately placed; however, in each setting there were clients who required a less intensive care setting, and a few who required a more intensive care setting. Moreover, seniors with common care needs were found to reside across the care continuum. The decision support algorithm combined a cognition score and a prioritizing system developed through interRAI, to assist clinicians in addressing the challenges of providing the right care to seniors in the right place at the right time. **Conclusions:** This research provides evidence to ensure sustainability of the health care system by exploring the most appropriate care setting in which to provide care to seniors. While most seniors are appropriately placed, some could have their needs met in a less intensive setting. Transitioning current residents, or adapting future eligibility/discharge criteria, may result in a cost savings to the Canadian health care system and an improvement in the quality of life of seniors.

**PD7 813 THE FEASIBILITY AND EFFECTIVENESS OF PREVENTIVE HEALTH SCREENING FOR COMMUNITY-DWELLING ELDERLY**

P. VAN BILSEN\* (Maastricht University, Maastricht, The Netherlands)

J. HAMERS(1), J. SCHOLS(1) - (1) Maastricht University (Maastricht, The Netherlands)

**Introduction** To address both the quality of life and cost concerns in an ageing society, preventing illness in and promoting the health of older people have become priority. Therefore, specific health screening centres in the Netherlands have been developed to detect unrecognized (health) problems and needs in community-dwelling elderly. The aim of this study was to investigate the feasibility and effectiveness of these centres and of similar preventive activities for community-dwelling elderly. **Methods** A study of relevant literature was performed after a search in PubMed, PsycINFO, Medline and Dutch databases, using the keywords: health screening, community-based, health promotion, intervention, elderly. The strategy also comprised reference tracking and consulting experts. Preventive health initiatives were included, if they offered in accordance with the activities of the Dutch centres: multidimensional health screening on a site (e.g. community-, health- or senior centre), tailor-made advice after screening including referral to relevant professionals and follow-up. **Results** Fourteen studies (7 national and 7 foreign) were included, covering several (types of) health programs in senior or community centres. These studies mainly using process evaluations, indicate that this type of preventive health screening is feasible. Elderly participants as well as health professionals involved were enthusiastic and convinced about the supplementary value of this type of preventive care. Furthermore, important risk factors like high blood pressure, overweight, mental health problems and social isolation were detected, managed and monitored in this target group. Effect evaluations on this type of preventive activities are clearly lacking. However, some studies have shown a reduction in disability risks, improvement in health status and maintenance of functional status. **Conclusion** Early detection of health risks and problems in combination with surveillance by health professionals might be beneficial for community-dwelling elderly. However, effect evaluations are needed.

**PD7 814 THE GERI-ED TEAM: A MODEL OF INTERDISCIPLINARY AND INTEGRATED CARE FOR FRAIL ELDERLY IN THE EMERGENCY DEPARTMENT OF A LARGE HOSPITAL IN NORTH AMERICA**

J. VERDON\* (McGill University, Royal Victoria Hospital, Montreal, Quebec, Canada)

K. BAIG(1), P. BARASSI(1), K. BROWN(1), N. PLAISIR(1), G. RAMSAY(1), M. SULLIVAN(1), A. TURNER(1), A. HUANG(1) - (1) McGill University Health Centre - Royal Victoria Hospital (Canada);

**Introduction:** Interdisciplinary care for the geriatric population is widely used in the health system, but rarely seen in the Emergency Department (ED). There are numerous challenges in providing such care in the ED, limiting its implementation. **Methods:** To describe the operational model and implementation of the GERI-ED team, an Interdisciplinary Care for elderly presenting in the ED of a large university affiliated hospital in North America, and its impact on continuity of care. **Results:** The GERI-ED team was initially implemented as a pilot project, and has been operational since. The core

team members are: geriatric liaison nurse, occupational therapist, physiotherapist, social worker and geriatrician. The team focuses on the high-risk geriatric population being seen in ED. The team uses different sources to identify these high-risk patients in this fast pace environment, including screening (all presenting with complaint of 'confusion', 'fall' and 'frailty'), referral from ED staff and/or contact from home care. The interdisciplinary work is achieved through a short daily round in ED ('huddle'), semi-standardised assessments adapted to the ED and ongoing interactions. Verbal communication and assessment in a timely fashion play a key role in the model. Interventions vary greatly, are tailored to the patient needs and integrate discipline specific recommendations. Appropriate referral and prompt transfer of information to inpatient teams and outpatient services assure the continuity of care. This model of care optimizes management of elderly presenting with non-specific complaints such as 'frailty' in ED. **Conclusion:** Interdisciplinary care for the geriatric population can be incorporated into the ED practice, the GERI-ED team being an operational example. Utilisation of such approach in ED addresses the complex needs of this rapidly growing group, and provides an integrated model of care. Research of impact of such model in ED, needs to be developed.

**PD7 815 QUALITY OF LIFE (QL) AND PATIENTS' SATISFACTION (PS) IN GERIATRIC PATIENTS ARE INDEPENDENT OF WHETHER THEY ARE RANDOMISED TO HOME VISIT BY THE GERIATRIC TEAM OR TO CONSULTATION IN THE OUTPATIENT CLINIC.**

L. MATZEN\* (Odense Universityhospital, Odense, Denmark)

**Intro:** To study if QL and PS were better in patients seen in their own home (PH) as compared to the outpatient clinic (OC). **Material and Methods:** 175 were randomised to first contact in PH and 176 in the OC. QL was measured by Euroqol-5d at first contact (EQ5d-1), and EQ5d-2 and PS were both measured 1 week after the end of the overall contact. EQ5d was converted to Danish norm-values. **Results:** Patients in PH and OC respectively: male/female 55/120 and 54/122, median age 81/ 83 years, Barthel-score 82/85 and MMSE 25/25. QL: Median EQ5d-1 (5%, 95%, N) in PH and OC 0,654 (0,040-1,000, 165) and 0,655 (0,027-1,000, 171) (ns) and EQ5d-2 0,708 (0,152-1,000, 129) and 0,708 (0,009-1,000, 136) (ns). QL increased in both groups ( $p < 0,001$ ). PS in PH and OC: 1: "Did you feel safe with the examinations and treatments offered to you?" (safe/very) 88,1%/91,1%. % answering "good/very good" to 2-6, 2: "Were informations given about your problems, examinations and treatments sufficient?" 74,1%/73,5%, 3: "How was your relationship to the physicians?" 86,0%/91,2%, 4: "How was the relationship to nurses, physio- and occupational therapists?" 90,9%/94,1%, 5: "Do you feel well informed about what to happen in the future?" 55,3%/59,6% and 6: "On the whole, was you satisfied with the treatment and nursing offered to you?" 87,4%/83,8%, PS-1 to PS-6 ns. **Conclusion:** QL increased significantly, PS could be better, but neither PS nor QL were higher in patients randomised to home visit by the geriatric team.

**PD7 816 DEMENTIA FRIENDSHIP CLUB: A TRIAL FOR DEVELOPPING A COMMUNITY SYSTEM FOR PEOPLE WITH DEMENTIA IN JAPAN**

S. IDE\* (Health Sciences University of Hokkaido, Ishikari, Hokkaido, Japan)

S. UCHIGASHIMA(1), Y. OKUBO(2) - (1) Health Sciences University of Hokkaido (Ishikari, Hokkaido, Japan); (2) Social Welfare Corporation Koseikai (Abuta-gun, Hokkaido, Japan)

The Dementia Friendship Club (DF-Club) is a non-profitable organization established in Japan. The purpose of this trial is to develop a community where social capital for people with dementia is well off. For here, social capital means belief, consideration, complementary interaction or active participation to the network for the people with dementia in community. In a community, people with dementia may be living in their house or in various types of facilities, and no matter how different it is, they all have their own life and life history. Not only that, they all have a right to enjoy their own life as well as others, as well as before they diagnosed, and as same as usual. Some used to enjoy watching ball game at a ballpark. Some used to go out for shopping. Some used to enjoy taking a walk in a park, however; some can no longer enjoy these activities like before; because of the disease they have. Their friend might have said, "I don't know how to take care of him when he behaves strangely in public". Or their family may say, "We don't have enough time to take her out with all the time". One of the major projects called DF-Supporter project is a support system for people with dementia who wants to go out and have leisure activities. The Club provides educational training program for community members who want to help people with dementia, and sends them as a friend volunteer. DF-Club is an independent club organization consisted by community members who care about people with dementia. At this moment, 3 major projects, such as DF-supporter, DF-Store, and DF-Work are running based on the original triangle system. The detail will be discussed at the poster site.

**PD7 817 TRANSACTIONS BETWEEN GENERATIONS. ELDERLY PERSONS GIVING AND RECEIVING OF ECONOMIC AND PRACTICAL HELP IN SWEDEN**

A. SAND\* (Social work, Örebro, Sweden)

Swedish family policies are integrated within general welfare policy where the state has acquired a significant responsibility for the welfare of individuals, independent of the family

he/she belongs to. Numerous social reforms, in particular retirement pensions, parental allowance and other social benefits for adults have led to less economic dependency between members of the family. Since economic support for the younger generation as well as the ageing has become a societal commitment, research has primarily been focused on public transfers whereas private economic transfers have not been given much attention, at least not in Sweden. In debates concerning the relations between the welfare state and the family one recurring statement is that in taking over the family responsibility, the state has contributed to the weakening of the sense of responsibility between generations in Swedish families. The paper draws on results from a survey covering 2666 individuals from 18 years in Sweden (44% men, 56% women, 579 of the respondents, or 22%, were 65 years old or more). The aim of the study was to explore economic support and help transferred between family members belonging to different generational categories, gender and family forms. Results show a considerable flow of resources between generations in Sweden. Through gifts, financial support and help with daily matters the elder generation continue to be important actors for the younger generation. The elderly generations help to children and grand children decrease by increasing age. Men give to a higher degree than women, help to children and grand children. Women receive to a higher degree than men help from children and grand children. I will present general results from the study regarding prevalence of support, attitudes to giving and receiving support, which motives are seen as legitimate and also motives for giving or receiving support.

**PD7 818 TRANSITIONS IN LIVING ARRANGEMENTS AMONG ELDERS IN TAIWAN: DOES HEALTH MAKE A DIFFERENCE?**

C. CHEN\* (Chinese Culture University, Taipei, Taiwan)  
J. LIANG(1) - (1) University of Michigan (Ann Arbor, United States of America)

The purpose of the research examined (a) how physical and mental health influence living arrangements among older Taiwanese, (b) whether these effects differ for married and unmarried people, and (c) to study more carefully the dynamic evaluation, we examined changes in various health status measures, as predictors of living arrangements. Data came from a national probability sample of more than 3,893 men and women 60 years or older in Taiwan. Four surveys of this sample were conducted over a period of 10 years, from 1989 to 1999. Multinomial logistic regression analyses were used to analyze the effects of demographic characteristics, socioeconomic status, health and marriage status on changes in living arrangements. Results indicate that living with married children among the Taiwanese elderly was the most stable arrangement during the 10-year period. Physical and mental health conditions were found to exert both direct and indirect effects on transitions in living arrangements. Furthermore, when the change in health between 1989 and 1999 was added to the prediction equation, there were strong relationships between changes in health and living arrangements, suggesting that people respond to significant changes in health status. The analysis also demonstrates the importance of using a dynamic model for studying the link between health and living arrangement if data from multiple observation points are available.

**PD7 819 LEARN, PLAY AND GROW: KNOWLEDGE IN INTERGENERATION RELATION**

M. CARRÉRA\* (Brazilian Gerontology / Geriatric Society, Recife/PE, Brazil)  
A. MARQUES(1), S. AUSTREGÉSILLO(2) - (1) UFPE (Recife/PE, Brazil); (2) UFPE (Recife/PE, Brazil)

Introduction: Nowadays the neglect, disrespect and lack of patience from younger people in relation to the elderly is growing and creating conflicts between generations and elderly exclusion. Such situation points to a reorientation to understand aging with the younger still in school, with elderly participation reinforcing positive values and attitudes related to the old age encouraging citizenship and solidarity. Objectives: Stimulate the learning of the 7 and 10 years old students to respect and value the elderly, live with a playful knowledge the culture and history of our people; rising the elderly self-esteem using their knowledge in intergenerational relation; create a learning book with games experienced during project implementation. Methodology: groups dynamic, awareness and training workshops for participants (counselor, professors for State Public School, students of the State Public School), workshops for small groups and circular discussion, workshops with students grandparents, intergenerational activities (grandparents, students, professors and counselors). Results: One hundred and eighty students from 1st to 4th grade, 10 professors of public schools, 141 grandparents participated in this study. As result the public school teachers training about intergeneration interaction; students learning about respecting and appreciation of the elderly person; living in a playful way about culture and history of our people, experienced by this elderly generation, rising their self-esteem, using their knowledge in the intergeneration relation, ending with preparing a learning book with children games, with grandparents help. Conclusions: This project awakened in the children "learn, play and grow" respect and solidarity to the elderly, as well as was helpful to self-esteem and improving older people life quality in an intergeneration interaction.

**PD7 820 GETTING RUDE - AN INTERGENERATIONAL PROJECT EXPLORING SEXUAL ISSUES OF OLDER PEOPLE IN HEALTH AND SOCIAL CARE.**

T. HAFFORD-LETCHFIELD\* (Middlesex University, London, United Kingdom)  
M. WEBSTER(1), P. AVERY(1), W. COUCHMAN(2) - (1) First Framework (London, United Kingdom); (2) London South Bank University (London, United Kingdom)

RUDE was developed in partnership between an older people's theatre company and a University providing professional qualifications in health and social care. Issues associated with sexuality, sexual health and older people's ongoing needs for intimacy when accessing services are often neglected within professional education. This can perpetuate the myth of the 'asexual' older person and their marginalisation in sexual health policy and practice. Practitioners need to develop the right knowledge, skills and attitudes to work with older people so that they can be in a position to promote their independence and dignity in a way that acknowledges human rights and needs for intimacy and sexual expression. Using theatre and drama, six students worked intensively with six older actors and directors and filmmakers over a period of two days to devise and produce short pieces of film as learning objects for professional education. The process was experiential and improvisatory utilising dramatic and creative participative methods. The younger student participants had no prior experience of acting or filmmaking and had minimal contact with older people as patients or service users beforehand. This paper presents a qualitative evaluation of the project. Argyris (1980) emphasises the importance of using real problems and the greatest possible involvement of participants in the learning process and the need to refrain from correct or incorrect responses. Emphasis on this type of learning is on the insight provided by personal experience and the immediacy of problem solving rather than relying on texts or knowledge. It seeks to involve personal and emotional participation from both parties during learning provided a means of confronting complex ethical issues arising in practice. There were a number of spin offs from the project which enhanced intergenerational understanding and exchange of knowledge and skills. Short clips of the material will also be shared.

**PD7 821 A MODEL OF INTERGENERATIONAL KNOWLEDGE: THE TECHNOLOGICAL ENCOUNTER BETWEEN CHILDREN AND OLD ADULTS AT SCHOOL**

T. GAMLIEL\* (Bar-Ilan University, Ramat-Gan, Israel)

Introduction The research concerns the technological intergenerational encounter between children (aged 11–12) and the elderly (aged 65–74). The latter are placed in schools as part of a "Multigenerational Connection program" run jointly by the Adult Education Division, the Ministry of Education Science and Technology Administration, and the Israel Internet Association, in which children instruct seniors in computer and Internet use and seniors impart their knowledge in their areas of formal schooling and life experience. The study is unique in that, for the first time, children, as possessors of proven ability to navigate knowledge, serve adults as the agents of socialization for a new cultural world. We claim that the Internet, the epitome of the generation gap but also an arena in which age and time do not exist, facilitates a unique investigation of intergenerational communications that has important educational and socio-psychological implications for both generations. Method and materials Data collection in a public primary school in Israel concluded observations of and participation in interactions in school, unstructured interviews, focus groups, feedback questionnaires, and contents of the program Web site. The data was subjected to a thematic analysis following the concept-indicator model Results According to Grounded Theory, a "Model of Knowledge" was developed. Based on diverse data the model sets forth four different types of encounters between children and old adults, and points to distinctive contributions of knowledge between them that reflect each side's relative control of knowledge. Conclusion The model offers a balanced approach towards the generations' typical needs, while teachers are primary agents of professional mediation between the generations. The intergenerational program has unique psychosocial and educational implications at individual and institutional levels. It also charges the concepts "authority", "productive aging", and "life span", with constructive meanings for the social images.

**PD7 822 GRANDPARENTS LATENT PROBLEMS IN TEHRAN: A SOCIO-DEMOGRAPHIC APPRAISAL OF AGEING IN IRAN**

M. TAGHI SHEYKHI\* (Al-Zahra University, Tehran, Islamic Republic of Iran)

The paper explores the quality of life and problems faced by the ageing and increasing grandparents in Iran. These people, under the rapidly changing circumstances, are having increasing problems with their health, income, medical treatments, old age care, housing etc. in which many issues remain hidden. Grandparents need to be more touched and heeded under the conditions that the family system is rapidly breaking down and as a result, a generation gap is appearing. The paper examines how increase in longevity and number of grandparents are paralleled. To do the present research, the author approached a number of sample families with grandparents. Likewise, relevant perspectives and literature have been consulted as evidence to conduct the research. Findings, show that the ageing grandparents highly need to be dealt with from different dimensions. The paper evaluates how social and economic conditions among grandparents are different from each other. However, the ageing grandparents have become very much vulnerable in recent decades. Keywords: Life expectancy. Grandparents. Vulnerability. Dementia. Quality of life.

**PD7 823 COMMITMENT TO CONNECTIONS: EXPLORING THE MEANING OF LEISURE IN GRANDPARENT-GRANDCHILD RELATIONSHIPS**

S. HEBBLETHWAITE\* (Concordia University, Montreal, Canada)

Introduction: Leisure plays an important role in the lives of families and specifically in grandparent-grandchild relations. While leisure has been shown to have a positive

influence on family relationships by enhancing communication and cohesion among family members, other studies have shown that family leisure may not be mutually satisfying for all family members. Given the trend of population aging, the relationship between grandparents and adult grandchildren emerges as an important yet understudied one, especially in relation to family leisure. The purpose of this interpretive study, therefore, was to explore the experience of intergenerational family leisure for grandparents and adult grandchildren. More specifically, this study examined the meaning of family leisure for grandparents and adult grandchildren. Methods: Fourteen dyads of grandparents and adult grandchildren were interviewed individually using semi-structured interviews and described their experience of intergenerational family leisure. Using grounded theory methods to analyze the interview data, the stories of the participants provided valuable insight into the meaning of leisure in the intergenerational relationship. Results: Grandparents and grandchildren participated together in a wide variety of leisure activities. These activities changed over time from more active leisure with a focus on play, to a more passive, relational leisure, emphasizing the emergence of a relationship among adults. Secondly, varied meanings were attached to the time spent together. Family leisure was more obligatory and was characterized as by sense of commitment. Individual leisure emphasized freedom of choice and intrinsic motivation. Conclusions: Grandparents and grandchildren developed strong bonds because of the knowledge they gained about each other through their leisure. Negative feelings associated with obligation were tempered by the value that both generations placed on the learning and bonding that occurred as a result of these experiences. Leisure, therefore, plays an important role in the increasingly important relationship between grandparents and adult grandchildren.

**PD7 824 LONG-TERM CARE: A NEW RISK FOR THE BRAZILIAN SOCIAL SECURITY SYSTEM**  
**M. PASINATO\*** (UERJ, Rio de Janeiro, Brazil)  
**G. KORNIS(1) - (1)** UERJ (Rio de Janeiro, Brazil)

Introduction: The main questions to be analyzed in the paper refer to the way the current social security systems have dealt with the complexity of the new demands imposed by the process of population aging; and how to articulate long-term care policies with the current framework of the Brazilian social security system. Methods & Materials: First we analyze the process of population aging and the surge of demand for long-term care within the social security systems; for this, experiences in three developed countries with very advanced aging processes were pinpointed so that different theoretical models were covered: Germany, Denmark and the United States. After doing so, we present the Brazilian legislation on elder protection and the situation of the Brazilian elders both in socioeconomic and familial terms. Finally we seek to summarize the advances, the possibilities and the challenges foreseen for the growing numbers of Brazilian elders, especially those with some kind of restriction in their functional or instrumental capacity to perform ADL. Results & Conclusions: The international experience indicates that costs involved in long-term elder care tend to become of great magnitude. Very high, these costs end up demanding a new distribution of responsibilities between the market, the State and the families in regard to financing the care relative to the new demographic pattern. In Brazil, the costs, whether tangible or not, involved in the activity of caring for/assisting the elderly tend to increase with the massive entrance of women in the labor market and with the changes in the gender contracts, suggesting growing obstacles for the families to meet the responsibility of taking care of their elderly. The challenge of financing this new social risk – long-term elder care – is aggravated by the unfavorable socioeconomic situation of poverty, exclusion and inequality in Brazilian society.

**PD7 825 INTRODUCTION OF SOCIAL INSURANCE FOR LONG-TERM CARE IN SOUTH KOREA: PROCESS AND CHALLENGES**  
**S. KWON\*** (Seoul National University, Seoul, Republic of Korea)  
**Y. PARK, S. KIM**

Introduction: Facing rapid aging of population, Korea introduces long-term care (LTC) insurance on July 1 2008. LTC insurance aims to ease the financial burden of the elderly related to long-term care and hopes to reduce the financial pressure that social admissions of the elderly put on health insurance system. This paper discusses policy process and key issues associated with the new LTC insurance in Korea. Methods and Materials: This study is based on the review of literature, government documents, and secondary data. One of the authors has participated in the policy process as a member of government committees. Results: Introduction of LTC insurance is driven by experts (academics) and government bureaucrats, like other social policy programs, which was made possible in an era of a rather progressive (former) government. Korean LTC insurance is a contribution-based (social insurance) financing mechanism supplemented by government subsidy, similar to health insurance scheme. Korean LTC insurance provides benefits-in-kind rather than cash benefits to cover long-term care of the elderly and age-related long-term care of the non-elderly. Private providers are a dominant form of long-term care delivery in Korea, and payment to those entrepreneurial providers and monitoring their behavior will affect the performance of the LTC insurance. Considering the interactions between health care, long-term care and welfare services, coordination among health insurance, LTC insurance and local governments is a key challenge. Conclusion: Introduction of long-term care insurance, as the fifth social insurance system, is a major change in the Korean welfare state. The performance of LTC insurance in Korea (i.e., quality of care, financial protection

for the aged, and fiscal sustainability) will depend on the key factors described in the paper.

**PD7 826 DOES THE PROVISION OF IADL SUPPORT SERVICES PREVENT OR PROMOTE DECLINE?**  
**T. ISHIBASHI\*** (School of Medicine, Keio University, Tokyo, Japan)  
**N. IKEGAMI**

Introduction: There has been controversy as to whether IADL support services provided by home-helpers should continue to be included as a public long-term care insurance (LTCI) benefit in Japan. On one hand, the government has claimed that providing these services accelerates the functional decline of elders and leads to unsustainable increases in expenditures from moral hazard. While on the other hand, some have claimed that home help services may prevent decline and are the services most sought by the elders. The aim of this study is to clarify whether IADL support services contribute to the functional decline of elders. Methods: The study used the cox proportional hazard model with the decline in the eligibility level as the outcome. Subjects were 3,096 elders who had been certified as being in the light disability levels (Support Level 1 or 2 in LTCI) in a suburban city of Tokyo. The mean follow-up period was 15.4 +/- 4.8 months. Results: Of the 3,096 certified, 44.0% actually used LTCI services, and 23.3% used IADL support services provided by home-helpers. Among the elders who used IADL support services, 9.8% declined in their level, which was significantly lower than the 16.0% for the rest (HR=0.54, 95%CI 0.43-0.69). However, when their decline rate was compared with the actual users of LTCI services, it was not statistically significant. The same trends could be observed when analyzed separately by gender. Conclusion: The results show that the provision of IADL services prevented, rather than accelerated, decline in function. Based on these results, the recent LTCI reform restricting the use of IADL support services should be reconsidered. Further analysis should be made by including factors such as the levels of family support and IADL function.

**PD7 827 10 YEARS OF LONG TERM CARE INSURANCE MODEL IN LUXEMBOURG: BENEFITS AND NEGATIVE ASPECTS FOR PATIENTS AND DOCTORS**  
**J. LENERS\*** (Long term care, Ettelbruck, Luxembourg)

In 1999 a compulsory long term care insurance was introduced in Luxembourg in order to generalize a new social model of care mainly to senior persons. Some general data on the elderly dependent population in Luxembourg will be shown, comparing them to the existing models in Germany and Austria. The systematic review over the years of the minutes of care allocated in the 3 three main domains (hygiene, dressing and walking, nutrition) shows a slight increase (now some 750 minutes per week) and the number of evaluations per year is about 4200. At least 14 percent are refused. The detailed differences between the home care allocated minutes and the one in the institutions will be presented, including the primary medical reason for the dependency (ICD 10). The legal framework was changed in 2006 and I will show some negative implications of this for all institutionalized residents. A detailed analysis of a mixed nursing home (140 beds) including patients with purely somatic diseases, compared to a group of elderly people with dementia and another one with psychiatric disorders shows a major difference in allocated minutes (from 82% up to 120% in comparison to the mean values in institutions). Another aspect of the care insurance for dependent people will be presented: individualized versus group activities and the negative evolution over the last years. A last but not the least aspect of the recently (December 2008) introduced legal framework for palliative care and euthanasia and their issue on dependent elderly patients will be discussed in conclusion!

**PD7 828 A COMPARATIVE STUDY OF LONG-TERM CARE INSURANCE IN JAPAN AND SOUTH KOREA - THE CHARACTERISTICS AND PROBLEMS-**  
**K. HWANG\*** (Nayoro City University, Nayoro City, Japan)  
**K. LEE(1), J. UM(2) - (1)** National Health Insurance Corporation (Daejeon, Republic of Korea); (2) School of Business and Management, Queen Mary, University of London (London, United Kingdom)

Japan has provided long-term care insurance for older persons since 2000, but South Korea just started it last year. Examining the literature, we analyzed both systems to clarify the characteristics and differences between the two countries. In general, Korea has many problems compared with Japan, resulting from insufficient preparation of infrastructure, such as funding schemes, service structures, and training facilities. Compared to Japan, the individual financial burden of care is significantly higher in Korea, which places a greater disadvantage on the poor. The central operating bodies in Japan are the municipalities, which are most closely linked with citizens but in Korea the National Health Insurance Corporation, which is an independent organization, manages the system and there is often insufficient cooperation between the NHIC and municipalities. Furthermore, only a limited number of serious cases in Korea can use the long-term care insurance system, because only three classes of benefits are used. By comparison, Japan has seven classes. In the Korean system people who receive class1 to class3 benefits are able to use services provided by the NHIC but people who are judged to be outside these classifications have to

use the services provided by their municipalities. Korea gives cash benefits to family caregivers but Japan has no such system even though many family caregivers have called for it. There are too many educational and training facilities in Korea due to a system that emphasizes job creation over professional development. Moreover, there is no national licensing system for care workers, as opposed to Japan where there is a move away from the home helper system towards a more stringent care worker system that requires both care-workers and care managers to be nationally certified. Results show that Korea has many issues to resolve in both respects of manpower and materials.

**PD7 829 WITH WRINKLED SKIN AND WORN-OUT SHOES. ELDERLY WORKERS' LABOR AND SUBSISTENCE IN MEXICO'S SHOE AND TANNING INDUSTRIES**

M. CONEJO NAVARRO\* (Universidad de Guanajuato, León Guanajuato, Mexico)  
M. HERNÁNDEZ MADRID(1) - (1) El Colegio de Michoacán, A. C. (Zamora, Michoacán, Mexico)

**Introduction:** Today, social conditions for the elderly are largely defined by their relationship to work. The phrase "Old Age" has social connotations linking it to an identity characterized by deteriorated abilities, redundancy and obsolescence in productive sectors, resulting in lowered expectations and a lower quality of life. **Objective:** To explore the meanings that work holds for the elderly and the subsistence strategies they develop. **Methods:** The study included 25 men and 10 women, ranging in age from 50 to 89, all living in León, Guanajuato, Mexico and employed –or once employed– in the shoe and tanning industries. Data was obtained through deep interviews lasting 2 or 3 sessions, including clinical histories. **Results and conclusion:** Of these subjects, 23 men and 9 women were still employed, despite chronic illness(es) that affect 17 of them (8 muscular-skeletal, 6 cardiovascular, 5 diabetes, including 2 blind individuals). Only 31% had welfare or medical benefits: on average a monthly pension of \$1,500 pesos (\$109 USD). All expressed that working was the best way to earn a living, as it brings self-esteem and social recognition. Half of the people worked in leather shoe manufacturing, mainly in jobs reserved for the more defenseless, or "old folks": as shoe polishers, janitors, night watchmen, garbage collectors and cleaning women; those who had disabling illnesses but no social benefits survived by begging. The system of labor relations as a means of gaining social recognition and power, the remuneration system, wage levels, functional abilities, gender and health are some of the factors that help explain the variety of configurations that characterize these elderly workers' survival strategies.

**PD7 830 A STUDY ON THE DETERMINANTS OF LABOR PARTICIPATION OF THE ELDERLY IN RURAL AND URBAN CHINA**

W. ZHANG\* (The Gerontology Research Institute of Renmin University , Beijing, China)

Employing the data from 1 % population sample survey of China in 2005, this paper conducted an empirical analysis on the probability of labor participation and income of the elderly people in rural and urban China. Age, marital and health status, educational attainment, benefits from social insurance were introduced into the Logistic regression models to analyze the probability of the labor participation of male and female elderly in rural and urban China respectively, and the OLS regression models were employed to analyze the payment for labor participation of the elderly. The regression results indicated that releasing economic pressure is predominant reason for the Chinese elderly to participate the labor forces, and active social participation attitude motivates urban elderly with high educational attainments continue to work. It is also be convinced that good health status has positive effects on the labor participation especially for male and rural elderly in China. The elderly with poor economic status are more likely to participant the labor forces, but only low payments can be paid for them. Rural and male elderly bear higher labor burden and economic pressure than other elderly in China.

**PD7 831 EXAMINING THE EFFECTS OF A HIGH-COMMITMENT SENIOR VOLUNTEER PROGRAM:A QUASI-RANDOMIZED EXPERIMENTAL DESIGN**

S. HONG\* (National University of Singapore, Singapore, Singapore)  
N. MORROW-HOWELL(1), S. MCCRARY(1) - (1) Washington University (St. Louis, United States of America)

**Introduction.** From the expansion of services for older adults' well-being, we evaluate the program effects of Experience Corps (EC) on older adults' health status through a 'quasi-randomized' experimental design to supplement a weak causality examination. Our investigation tests (1) whether volunteers' health status improve after participation in the EC program compared with non-volunteers' health status; (2) what characteristics of volunteers are associated with the longitudinal changes in health status. **Methods.** Using a nearest available Mahalanobis metric matching within calipers defined by the propensity score (Rosenbaum & Rubin, 1985) to reduce sampling selection bias, we selected a comparison group having homogeneous characteristics of the EC participants. For two years, 167 EC participants completed pre and post tests. Based on more homogenous sociodemographics and health status at baseline, the matched control subjects were selected from those who completed the 2004 and 2006 Health and Retirement Study and were never involved in volunteering activities for this period. To test the program effects of the EC, we used generalized estimating equations on difference scores in health outcomes.

**Results.** Compared with the HRS control group, the EC treatment group showed lower depression, better self-rated health, better perception of current health status compared to health status in the past year, and lower functional dependency. There was no significant difference in cognition status between two groups. In addition, those who were married and had higher income and education reported better self-rated health and lower depression. **Conclusion.** From this rigorous investigation to explain social causation between participation in volunteering and changes in health outcomes, we confirmed that the positive effects of the EC program on the health status of older adults reinforce the justification to support active aging policy and programs.

**PD7 832 THE DEVELOPMENT AND VALIDATION OF A COMPREHENSIVE AND THEORY DRIVEN MEASURE OF RETIREMENT PLANNING.**

F. ALPASS\* (Massey University, Wellington, New Zealand)  
J. NOONE(1), C. STEPHENS(1) - (1) Massey University (Palmerston North, New Zealand)

**Introduction:** International research suggests that retirement planning is associated with greater well-being in later life. However, to date no research has tested theories about how people plan for retirement or effectively assessed the different ways that people can prepare. This study utilises a process model to examine the psychological, health, lifestyle, and financial planning activities of New Zealand pre-retirees aged 50 to 60. **Methods and Materials:** According to a process model of planning, people must firstly develop an understanding of retirement issues, they then set specific goals, make a decision to start preparing, and finally undertake the behaviours necessary to meet those goals. Individual items for each of the four elements of retirement planning were developed to assess this model. Cross-sectional data was collected by questionnaire survey from a representative sample (N = 1,500) of the New Zealand population. **Results:** Structural equation modelling revealed four distinct elements of retirement planning and provided support for model. Correlations with key variables provided further support for the validity of this measure and helped to explain why some people plan while others do not. **Conclusions:** Findings suggest that retirement planning is a process that begins with an understanding of retirement issues and ends with the undertaking of specific preparatory behaviours. This information will help to direct social policy and promotional initiatives by indicating where people are at in terms of their retirement planning. These results will also suggest which groups of people would benefit most from such initiatives.

**PD7 833 THE INFLUENCE OF GENDER, HEALTH, EDUCATION, AND INCOME ON RETIREMENT SATISFACTION**

R. MAIDEN\* (Alfred University, Alfred, United States)  
B. HAYSLIP, JR.(1), P. MAIDEN(2) - (1) University of North Texas (Denton, United States of America); (2) Arc of Onondaga (Syracuse, United States of America)

Issues of the impact of culture and gender have become increasingly important as the world is faced with an aging population. A recent study in Denmark (von Solinge & Henkens, 2008) found that retirement satisfaction primarily related to access to key resources such as finances, health, and education. In the United States, the majority of research has been on examining the impact of similar parameters on male retirees. Very few studies have conducted research on women retirees. The purpose of this study was to explore the effects of gender, health, education, and income on life satisfaction for retired and nonretired individuals 60-years-old or older. Community residing adults (N = 496, 72% female, M age = 72.26, SD = 8.01) were assessed on variety of dimensions. In this paper, we will focus on selected set of factors that influenced well-being and retirement satisfaction. We performed an ANOVA on gender, retirement, and life-satisfaction controlling for income, education and health. The life-course ecological theory (Kim & Moen, 2001) predicts that there would be gender differences. Results revealed a significant finding for income, health, gender, and retirement on well-being, while education and age were not associated with life satisfaction. The means reveal that males and females have higher life satisfaction after retirement although overall females have less life satisfaction than males do either while employed or retired. The results support the life-course developmental model and underscore the influence of social role, culture and having resources on life satisfaction. The findings also suggest that women in this age cohort have a more difficult time adapting to retirement as compared to men, but both males and females seem to enjoy greater life satisfaction in retirement as compared to their employed counterparts. The implications of these findings for public policy are discussed.

**PD7 834 REVERSE MORTGAGES : AN OBJECT FOR SOCIAL SCIENCES**

A. GOTMAN\* (CERLIS - CNRS Université Paris Descartes, Paris, France)  
L. ASSIER-ANDRIEU(2) - (2) ISP - CNRS/Ecole Normale Supérieure de Cachan (Cachan,)

Reverse mortgages are being promoted in most advanced countries as a way to finance old age. If their advantages for public expenses seem obvious, at first, their implications for elderly people, family and intergenerational links are more questionable. Moreover, the

financial and juridical logic at stake in reverse mortgages puzzles the very link between kinship and society.

**PD7 835 SOCIAL WELLBEING, DIVERSITY AND COMMUNITY IN RETIREMENT HOUSING ENVIRONMENTS.**

S. EVANS\* (University of the West of England, Bristol, United Kingdom)  
R. MEANS(1) - (1) University of the West of England (United Kingdom)

**Introduction:** Assisted living facilities are increasingly popular in the United Kingdom and form a central plank of government housing policy for older people. They are particularly valued for their perceived ability to promote social interaction and a sense of community among residents from different socio-economic backgrounds and with a wide range of dependency needs. The recently published Housing Strategy for an Ageing Society sees such developments as a way of developing sustainable communities based on lifetime neighbourhoods. **Methods:** This paper reports on a study that explored residents' experiences of community and social interaction in a mixed tenure retirement village in the UK. Data were collected through semi structured interviews, needs assessment forms and a housing satisfaction questionnaire. **Results:** The findings suggest that a range of factors can impact on the opportunities for social interaction and the development of networks including the village layout, the provision of services and facilities, design of the built environment and connections with wider communities. Residents perceived themselves to be part of a community to varying degrees, but there was little evidence of cross-tenure interaction. Instead, social networks focussed on communities of interest within tenure. The findings are also viewed in the context of contemporary theories of community and place attachment. **Conclusion:** The paper concludes that the success of purpose built mixed communities for older people depends on understanding the complexities and subtleties of diversity and lifestyle aspirations.

**PD7 836 REPRESENTATIONS AND GOOD PRACTICES OF HEALTH PROFESSIONALS IN AGE MANAGEMENT**

M. FERREIRA\* (Universidade do Porto, Porto, Portugal)

It is currently notorious, in Portugal, an interest on the individuals' permanency in the labour market on the part of the State and other political agents. Our communication focuses on the results of a research project on the representations and practices of health professionals (medical doctors and nurses), aged between 55 and 65, regarding active ageing and transitions from employment to retirement. Based on two case-studies (hospitals in the city of Porto), we will also discuss the relations between those professionals' stances and the organizational contexts within which they work.

**PD7 837 "PLANNING TO RETIRE AND GROW OLD TOGETHER"**  
S. KEELING\* (University of Otago, Christchurch, Christchurch, New Zealand)

**Introduction:** Coupledom in retirement, mid and later life has received limited attention in New Zealand social research, despite the fact that the majority of people in the age cohort 55-70 years describe themselves as married or partnered. An increasing number of people establish new partnerships in middle or later life, negotiating living arrangements, social and family relationships, financial exchanges and transactions along the way. Partnership status, and changes in the ways individuals and couples experience linked, joint, parallel, convergent or divergent pathways through mid and later life merit careful research explication. **Methods:** Qualitative interviews were held with sixty participants in the national Health, Work and Retirement Study, at two phases of the study, with an interval of 18-24 months. In the second phase, spouses of participants were invited to take part in a separate interview exploring couples' perspectives on topics such as joint and/or individual planning surrounding the transitions between work and retirement. **Results:** The resultant interviews conducted with fifteen participants and their partners have been analysed in their pairs, based on full transcripts. This analysis found both congruence and divergence in the attitudes and reported behaviour within these couples. Factors described as having a significant influence in their joint and individual decision-making include health, employment and financial circumstances, and family relationships. **Conclusion:** Our findings suggest dynamic and fluid patterns in couples' handling of shared and individual threats to financial and health-related autonomy, in the context of transitions to retirement. It is increasingly important to make conceptual distinctions within studies of individuals and couples between aspects of gender, living arrangements, and age-related cultural expectations. Despite the methodological issues and potential ethical questions, exploring coupledom within social gerontology poses challenges for future research.

**PD7 838 A CROSS-NATIONAL ANALYSIS OF LABOR FORCE PARTICIPATION AND LIFE EXPECTANCY AMONG OLDER ADULTS**  
J. JOHNSON\* (Boston College, Chestnut Hill, MA, United States of America)

**Introduction** Productive aging is a new and evolving conceptual model that emphasizes the antecedents and consequences of productivity in later life. Proponents of productive aging claim that productive activity in later life is associated with a number of benefits for individuals, communities, and societies, but this assumption has not been widely tested at the country-level. In the context of an adapted model of productive aging, the study seeks

to identify the cross-national predictors of and relationship between one form of productivity (viz., labor force participation) and one aspect of well-being (viz., longevity) among older adults. Methods and Materials Random effects models with pooled cross-sections and path analysis was used to analyze potential relationships with data from several international data sources. The complete cross-national longitudinal dataset consists of variables measured at five time points (i.e., 1980, 1985, 1990, 1995, and 2000) for each of the thirty countries that belong to the Organisation for Economic Co-operation and Development. **Results and Conclusions** The results suggest some important sex differences. While financial and social factors are important predictors of older male labor force participation rates, education, health, and opportunities for self-employment and employment in the service sector are important predictors of older female labor force participation rates. Furthermore, while the predictors of older male and female longevity are similar, labor force participation is an important predictor of male life expectancy only. In light of the global trend toward longevity and the related potential pressure on countries to consider efforts to promote longer work lives, the results of the study can have major policy implications. In addition, the results are relevant to individuals interested in advocating for policy and programmatic changes that could enhance the well-being of older adults.

**PD7 839 CHILEAN PUBLIC HEALTH MODEL FOR ELDERLY CARE**

J. SILVA\* (Instituto Nacional de Geriatría, Santiago, Chile)  
A. VILLALOBOS(1), J. JÉREZ(1), C. BUSTOS(1), P. HERRERA(1), L. JEREZ(1) - (1) Instituto Nacional de Geriatría (Santiago, Chile)

Until 1995 the care for elderly in the Chilean public health system, only had geriatric specialty care at a secondary level in the National Geriatric Institute.(NGI) Taking into account the county's aging population process (13.4% 60 an over) and the fact that 80% of the elderly are registered in the Public Health System it becomes an urgent need to have a Model of care for the elderly at every level. **Method:** For to make the Model were studied for four years, the profile and need of outpatients attended in the first medical specialist consult and inpatients high medical, the sample was 8.571 and 4181 respective, all of them attended in NGI. Proposal Investigation to evaluate Chile's model for elderly health care based on maintenance of functionality (complementing curative paradigm). To achieve this first it was carried out an investigation to create a screening instrument to predict functional loss to be used at primary level (EFAM-Chile) and secondly a geriatric health check up was carried out in Primary Health Centres. Investigation to evaluate the appropriate specialised care model at the hospital level. To achieve this, first it was set up an out-patient geriatric clinic in the NGI. Results 1.-EFAM Chile was created and used nowadays at the national level: 450.000 sixty and over persons evaluated each year 2.-A geriatric evaluation was created and used nowadays at the national level: 450.000 persons sixty and over evaluated each year. Outpatient Geriatric Clinic Centre was created: 2.100 medical consults each year. Conclusion The Chilean Model of Elderly Care in the Health Public System has been set up. It has been based upon its own creations and adaptations, resulting in a HPC firmly set up throughout the country.

**PD7 840 THE AGE OF MIGRATION AND THE DIVERSITY OF OLDER MIGRANTS: CHALLENGES AND OPPORTUNITIES FOR SOCIAL GERONTOLOGY**  
S. TORRES\* (Linköping University, Norrköping, Sweden)

This presentation will shed light on what migration and ethnic relations researchers call 'the age of migration'. The aim is to delineate some of the theoretical and empirical opportunities that this new state of affairs poses to the field of social gerontology. Because this is an area with which not many social gerontologists are familiar, the paper will begin with brief presentations of what 'the age of migration' means and how the diversity of older migrants across Europe is challenging to think in a globalization- informed manner and with an inventory of research areas (such as the study of successful aging; life satisfaction, quality of life and the study of intergenerational relationships) that could benefit from expanding their gerontological imagination to include the specific challenges and opportunities that the migrant life course poses. The main argument will be that the social gerontological study of migration, ethnicity and culture is a profuse area of research and that there is an untapped potential for theoretical development and for the expansion of the gerontological imagination in launching empirically-interesting research about older migrants.

**PD7 841 ACTIVE AND HEALTHY AGING: SOCIALMEDICAL ASPECTS IN GERMANY**  
M. PENZ\* (MDK Bavaria, Munich, Germany)

**Introduction/background:** „Aging is primarily a social and only secondarily a biological fate“ (Mr. Thomae, Gerontology 1963). Specific treatment schedules are necessary for the elderly patients - especially for the oldest old patients- as well as prevention and rehabilitation. New basic conditions were introduced in Germany by the Health Care Reform in 2007 and the Long-Term Care Reform in 2008. In both reforms prevention and rehabilitation will become more important in the future. Life expectancy in Germany is continuously rising (actually: men 76 years, women 82 years), whereas in the same time the fertility rate is low. Demography is a cost factor in health care. Health risks are

increasing on elderly and oldest old people (falls, dementia, dentures system, incontinence). First of all secondary and tertiary prevention is important for these patients. Geriatric structures have to be adapted to these facts and have to include ambulatory and long-term care providers. Methods: - 60 Bavarian Geriatric Rehabilitation Hospitals were visited by a team of MDK geriatric medical doctors to evaluate the effectiveness and quality of geriatric rehabilitation in the years 2005 until 2008 - the evaluation included as well the geriatric complex treatment rehabilitation in geriatric hospitals and ambulatory treatment (intermediate results 2005 – 2008) - in another part of the study rehabilitation efforts in long-term care patients were evaluated Results/Conclusions/Discussion: Prevention and health care promotion are effective even in elderly and oldest old patients. It requires a qualified and adequate treatment provided by a geriatric team including socialmedical knowledge.

**PD7 842 NON-CONTRIBUTORY SOCIAL PENSION: A NECESSARY SCHEME TO BE DEVELOPED IN CHINA**  
X. JIANG\* (Renmin University of China, Beijing, China)

Although the elderly social security has played an important role for retirees in urban China and has improved their economic situation to be better guarantee, there are some problems in the system at present. Non-contributory pension is implemented through minimum living security, social relief, family planning bounty and a part collective (or village) pension in some more developed rural China. But in rural Chinese elderly, only very low percent can enjoy minimum living social security and social relief security. Although most urban poor elderly can get minimum living social security, their living standard is relatively lower than most other citizens. Furthermore most Chinese elderly have no enough individual wealth to support their later lives. As rapidly increasing of the elderly in China, total ratio of poverty will go up, if government can not implement effective policy to reduce poverty in the old aged. Considering above situation, the changes of demography and socio-economy, government should take more effective policy to promote the system of non-contributory pension for securing the elderly later living and for realizing real social equity. This paper selected data from the Sampling of Survey of the Aged Population in China conducted by China Research Center on Aging and the Yearbook of China Statistics by China National Bureau of Statistics, studied and analyzed the situation, problems and the reasons of non-contributory pension, the elderly economic status and the necessity of promoting non-contribution pension system in China. This study conclusion mainly shows that with the changes of demography and socio-economy, especially the transition of market economy, government should take more effective policy to promote the system of non-contributory pension for securing the elderly later living and for realizing real social equity.

**PD7 843 A LIFE COURSE PERSPECTIVE OF HOUSING AND HOMELESSNESS**  
L. MCDONALD\* (University of Toronto, Toronto, Canada)

Evictions, as markers of housing instability, call attention to the “housing affordability crisis.” Little is known about the extent or impact of evictions in Canada or internationally, but there is emerging evidence that they are sharply on the rise. The purpose of this exploratory research was to examine the individual and structural circumstances that contributed to eviction transitions in housing careers across the life course; to examine housing trajectories and if they spiralled into homelessness, and to examine the confluence of social policies operative during these transitions. Qualitative interviews (N=42) and secondary data analysis of evictions in Toronto Canada (N=1583) were carried out. A model predicting eviction status was estimated. Results indicated that the transitions from stable housing to unstable housing and back again, from threats of eviction to eviction orders, and from poorer housing to homelessness were entangled across the life course and stretched across generations. The study shows how housing policies can interact with life course events and other policies to produce negative and costly effects for the precariously housed, tenants and the state.

**PD7 844 IMMIGRANT CARE WORKERS IN HAWAII: DEVELOPING SOCIALLY-JUST WORKFORCE POLICIES AND COMMUNITY OPTIONS IN CARING FOR FRAIL OLDER ADULTS**  
C. BROWNE\* (University of Hawaii, Honolulu, United States)  
K. BRAUN(1) - (1) University of Hawaii (Honolulu, United States of America)

Introduction With the aging of the world's population comes the rising need for qualified direct long-term care workers; i.e., those who provide personal care to frail elders. In this presentation, we use Hawaii, the 50th state of the USA, as a case example to examine issues faced by nations that are growing increasingly dependent on immigrant women to provide this labor. We focus on the gendered processes inherent in population aging, globalization, and immigration, and their collective impact on the long-term care workforce for nations. Hawaii is unique in its population—it has attracted new residents from many areas of Asia and the Pacific. Individuals from the Philippines compose 15% of the State's population, and Filipinas are over-represented in health and long-term care jobs. In Hawaii, they have led the way for the development and management of two community-based long term care options. Adult Residential Carehomes (ARCH) are family homes that provide 24 hour residential care to 4-5 dependent adults with personal care needs. Geriatric Foster Homes

(GFH) also are family homes, but the greater disability of elders results in GFH caring for only 1-2 patients at a time. Shown to be cost effective for the state, these community-based options require long-term care workers to survive. Methods/Materials: We share results of two studies that examine Filipino care workers in Hawaii, and the role that culture, immigration, and poverty play in the choice of this work. Results/Conclusions: We raise policy and research implications and questions. Although we found that 95% of ARCH and GFH providers were Filipinas, results suggest that second generation women are not entering this work. Policy suggestions that address the contradictory effects of these trends to both developed and developing nations are presented.

**PD7 845 QUALITY OF LIFE & OLDER PEOPLE: THE CASE OF CYPRUS**  
C. PHELLAS\* (UNIVERSITY OF NICOSIA, NICOSIA, Cyprus)

Background This paper provides a critical approach to the conceptualisation and measurement of quality of life in social gerontology, and health and social care research. By drawing data from a two year research study among elderly people in Cyprus (funded by the Cyprus Research Council during the period 2007-2009) it describes the experiences of older people through their own personal accounts and representations in everyday life, popular culture and scientific research. Methods The data are collected by employing the Biographical/Life History approach (through a series of in-depth interviews) and subsequently are analyzed by applying (i) Multi-Dimensional Scaling –MDS) & (ii) Content analysis The participants are selected by non-probability means of sampling (Quota/Purposive) and would cover both urban and rural areas in Cyprus. Around 100 people (aged 55 and above-living at home and at elderly peoples' institutions) would be interviewed on the following domains relevant to the quality of life of older people: (a) Subjective satisfaction, (b) Physical environment factors, (c) Social environmental factors, (d) Socio-economic factors, (e) Cultural factors, (f) Health status factors, (g) Personality factors, (h) Personal autonomy factors Results & Conclusions The quality of life for elderly people in the 21st century will depend on a number of fundamental changes in the way that societies perceive and respond to human ageing. However, it would be difficult to change attitudes without making some inroad into the government's policies. The findings from this research project would hopefully (i) help to improve interventions by advising the policy makers on a national level, and (ii) provide a platform where knowledge from cross-cultural research on elderly could be exchanged and shared.

**PD7 846 EXPLORING OLDER WOMEN'S EXPERIENCES OF DOMESTIC ABUSE: IMPLICATIONS FOR POLICY AND PRACTICE DEVELOPMENT**  
J. MCGARRY \* (University of Nottingham , Derby, United Kingdom)

Introduction: There has been little exploration of the health needs of older women (60+ years) who have experienced domestic abuse. A number of reasons for this deficit have been reported, for example, barriers to disclosure (Acienro et al, 2001), failure of professionals to recognise domestic abuse as occurring in this age group and the way it has been subsumed under the generic term of elder abuse which homogenises older people rather than recognising individual differences, including gender (Hightower, 2002). The impact of domestic abuse for older women has been identified as encompassing a number of facets, for example, the long term effects of physical injury and the psychological impact of prolonged trauma (Women's Aid, 2007). The services that are currently available may not be appropriate for older women and it has also been suggested that older women may remain in abusive relationships through lack of practical knowledge of how and where to seek help (Pritchard, 2001). Health care professionals are currently ill equipped to meet the needs of older women who have experienced domestic abuse. This represents a significant gap in current care provision. Methods: A qualitative study involving semi-structured interviews (interview guide) with older women (60+ years) who have experienced domestic abuse (n=30). Analysis: Currently in progress and will be undertaken using an iterative approach incorporating ongoing preliminary analysis of data. Findings: Discussion and implications for service organisation and care delivery will be presented in light of findings. Conclusions: The UK and the wider international health community has an ageing population and it is therefore pivotal that health care professionals are able to understand the particular experiences and needs of older women affected by domestic abuse and that service provision which is responsive to these needs is developed effectively at both organisational and care delivery levels.

**PD7 847 TOWARD LONG-TERM CARE REFORM IN THE UNITED STATES: FINDINGS FROM A NATIONAL SURVEY OF SPECIALISTS**  
E. MILLER\* (Brown University, Providence, United States)  
V. MOR(1), M. CLARK(1) - (1) Brown University (Providence, United States of America)

Introduction The deficit of preparedness in meeting the needs of an aging population means that policymakers cannot afford to wait longer to improve long-term care (LTC) delivery, regulation, and financing. To facilitate reform, we conducted a survey of LTC specialists in the U.S. Methods The questionnaire addressed provider quality and challenges, financing and insurance, linking individuals and families to services, organizational change and innovation, workforce recruitment and retention, and quality improvement and regulation. It also collected basic demographic information. The survey

was distributed by Web-based format to 2,577 eligible individuals during September 2007–March 2008. Results There were 1,147 respondents completing the survey. These included consumer advocates (10.6%), provider representatives (25.9%), public officials (31.8%), policy experts (24.3%), and others (7.3%). Most worked in LTC for >15 years (59.3%); had family/friends served by the LTC system (88.6%); and were Masters- or doctoral-level educated (81.0%). Results reveal varying degrees of consensus regarding the desirability and effectiveness of strategies for improving access, quality, and oversight in LTC. Most, for example, believed LTC financing should be a shared responsibility; few felt that individuals or families should pay most (or even share) in the cost. But whereas consumer advocates were much more likely to favor more aggressive regulatory enforcement and higher staffing requirements as methods for improving quality; provider representatives were much more likely to favor increased payment rates. Conclusion Tapping into the perspectives of LTC experts is significant because those specializing in this area must be able to communicate the importance of the issue to policymakers and the general public. It is also important because identifying areas of agreement and disagreement among key stakeholders is an important first step toward promoting action where it might otherwise remain politically intransigent.

**PD7 848 SOCIAL POLICY AND SOCIAL WELFARE FOR THE ELDERLY**  
T. HARTONO\* (National Commission for Older Persons, Jakarta, Indonesia)

In 2000 the population of Indonesia was around 205 million. The structured proportion of older persons (OP) was 7.18% (14.4 million). In 2020, this will be doubled and estimated to reach 11.34% (28.8 million). The social economic condition of OP were low. The majority of OP still work to fulfill their livelihood, mostly in the agricultural and informal sectors due to their low education. The environmental health condition was poor, efforts to improve health and welfare was not optimal. To ensure the success of OP social initiatives, a coordinating body named The National Commission for Older Persons (NCOP) was established. It continuously analysis instruments of law, and evaluates state policy implementation as well as submit recommendation for presidential policy on the aged. The Social policy for the elderly base on the Law No. 13/98 on OP welfare among others: - Older persons have the same rights in the community, nation and state - Older persons have the right to improve their social welfare including: religious service, health, access to public facilities, legal, social protection and assistance - Older persons has the obligation to provide wise advice based on knowledge and experience - The government task is to direct, guide, and create situation to support the implementation of older persons welfare - Government, community and family are responsible for effort to improve older person social welfare. The result of NCOP studies on older person welfare: -The law, regulation and related ministerial decree on the welfare of OP has been existed but the implementation was limited. -To increase older person welfare, and decrease the number of neglected older persons several initiatives should be done.

**PD7 849 WHICH MEASURE OF QUALITY OF LIFE IS MOST VALID FOR USE WITH OLDER PEOPLE?**

A. BOWLING\* (University College London, London, United Kingdom)

Background There is policy interest in improving older people's health, activity and participation in society ('active ageing') and, in effect, adding quality to life (QoL). Assessment of the effectiveness of such policy requires the use of relevant and valid measures, based on a conceptually sound model. Aims The main aims of the study presented, funded by ESRC (via the New Dynamics of Ageing Programme), were to i) test a new measure of older people's quality of life (OPQOL), and ii) the robustness of the causal model underpinning it, dynamically as people age. The model and measure of QoL to be tested were developed from our earlier QoL Survey, funded by the ESRC Growing Older (GO) programme. Methods ONS Omnibus national face to face interview Survey; Ethnibus national face to face interview survey; follow-up of national QoL survey sample. Measures OPQOL, CASPE-19, WHOQOL-OLD, and items measuring personal psychosocial and socio-economic circumstances. Results The OPQOL, which was derived from lay views, achieved superior reliability and validity to CASPE-19 and WHOQOL-OLD when administered to three national samples of older people, including the ethnically diverse Ethnibus sample. Discussion The study has resulted in a superior, psychometrically sound, measure of quality of life in older people, for use in descriptive and evaluative research.

**PD7 850 HAS MODEL OF ATTENTION OF DIF TAMAULIPAS FOR THE ELDERLY**

P. LARA DE DEL COS\* (Sistema dif tamaulipas, Cd. victoria tamaulipas, Mexico)  
A. GONZALEZ(1), L. MARCOS(1) - (1) sistema dif tamaulipas (cd.victoriatamaulipas mexico, Mexico)

Between 2005 and 2023 the elderly population in Tamaulipas will increase from 233 thousand to 473 thousand. In Tamaulipas the System for Family Development (hereafter DIF) gathered the State institutions, civil associations and the elderly population to build a model of attention in order to help the elderly. After three years of working with this model, it has been shown that there is potential for a new possible social policy for the elderly. The model of attention for the elderly of DIF Tamaulipas highlights the following

actions: 1.To invite public and private sectors to join the new proposals for the construction of social assets. 2.To establish a coordination to develop the government and the civilian society's activities. 3.To create new social programs, facilities and institutional capacity. 4.To attend the stratified target population by indentifying their priorities on the degree of exclusion and vulnerability. A number of results have been achieved as part of this model. For example, in "Adopt a Grandparent" Program there are 12,500 people assisted by the government and civil society. The elderly registered in this program are currently benefited with a social security program and food support. The Goal is to assist 16,000 people by the year 2010. In the State's network of Club Houses, culture and entertainment are offered to more than 20 thousand people. Also, there are 11 Elderly Day Care Centers throughout the state of Tamaulipas. The project "Villas Vida Plena" residencies provides 300 elderly with a new way of housing, companionship and attention. Also, this model of attention includes an elderly card issuing program, which in a period of three years has enrolled 97,324 elderly who have access to discounts for products and services within 2500 businesses, will assure a better future for them.

**PD7 851 PARTICIPATION IN LOCAL GOVERNANCE: A MODEL FOR ENGAGING WITH DIVERSE SENIORS**

A. PETRIWSKYJ\* (The University Of Queensland, Brisbane, Australia)

Introduction Population ageing brings with it a range of new challenges and opportunities for local communities in Australia and across the developed world. It also brings an increasing, and increasingly diverse, population of older people whose needs and interests should be represented in local governance processes. Genuine and inclusive opportunities for participation are vital for what has become known as 'good governance'. There is therefore a need for a useable and evidence-based model for engagement with seniors in local governance. Methods and materials This paper discusses the development of a model for the effective engagement of a diverse range of seniors in local governance processes in Australia. A two-phase multi-method study conducted in a Queensland City that is poised to experience a dramatic population shift provides a case study to highlight a broad range of commonly experienced challenges in engaging older people in governance of ageing communities in Australia and internationally. Results Key points include that the factors impacting on older people's participation can be very broad and extend beyond a focus on practical or physical arrangements to include more abstract motivations and barriers. Second, many aspects of difference can impact on the ways people approach their role in governance. Diversity among older people is more than simply cultural and linguistic difference, incorporating a range of demographic and lifestyle factors. These findings contribute to a model for engagement that is based on responding to the motivations and barriers experienced by diverse seniors. Conclusion Providing opportunities for genuine and inclusive participation by a range of older people in local governance requires innovative approaches that incorporate broad aspects of diversity. The model presented here highlights key considerations that may be shared by local governments and their policy partners throughout the developed world.

**PD7 852 STEALTH PRIVATIZATION OF CARE FOR THE ELDERLY IN BRITISH COLUMBIA, CANADA**

A. DAVIDSON\* (University of British Columbia (Okanagan), Kelowna, Canada)

Introduction: The paper is a policy study of privatization examining health-related services for the frail elderly in the province of British Columbia, Canada. It comprises three case studies: (a) increasing government support for profit-oriented, user-pay medical services, (b) changes in eligibility criteria for public pharmaceutical insurance and (c) implicit and explicit privatization of home and residential care for elderly adults. The focus of the study is policy development under the current provincial government, elected in 2000. Methods: The paper employs institutionalist public policy theory through case study methods. Statistical data on funded beds, home nursing, home support services and pharmaceutical insurance are analysed. Specific policy directions are identified through analysis of budget documents, government reports and legislative and regulatory changes. Results: The paper demonstrates substantial shifts in policy orientation from universal, solidaristic toward selective, taxation minimizing approaches. It also attempts to quantify the significance of the boundary shifting from public-pay to user-pay within the sub-sector of services for elderly adults. Conclusion: The paper concludes that the initial conditions have now been established for substantial policy change and massive boundary shifting in the area of health and social care for elderly British Columbians.

**PD7 853 THE ESTABLISHMENT AND OPERATION OF THE PATIENT RESOURCE AND SUPPORT CENTER AT HADASSAH HOSPITAL**

S. HALEVY-LEVIN\* (Hadassah Hebrew University Medical Organization, Jerusalem, Israel)

J. JUREN(1), M. DALTRUFF(1), R. AVRAMOV(1) - (1) Hadassah Hebrew University Medical organization (Jerusalem, Israel)

The encounter with the hospital confronts patients and their families with a new reality. Hospitalization and medical treatments are destabilizing factors which require reorganization when the patient returns to the community. Many patients, especially the elderly and their families, are not aware of the opportunities for continuing care in the

community or what their eligibility for medical services. At the same time, patients and their families are often inundated with information distributed by representatives of private caretaking agencies, manpower companies and nursing homes who freely roam hospital wards, accessing patients, violating their privacy and disrupting departmental work. The information they disseminate serves to both confuse and exacerbate the difficulties which accompany hospitalization, overwhelming patients and complicating their decision-making. The Social Work Department Of Hadassah has thus identified a critical need for an easily accessible and comprehensive service that would provide assistance and assessment by trained personnel through relevant, updated information on rights, benefits and services for patients being discharged from hospital and their families. In response to these unmet needs, in February 2008, we began a pilot project that we called the Patient Resource and Support Center at Hadassah Ein Kerem. The Patient Resource and Support Center provides information to patients and their families on a broad range of issues pertaining to their hospitalization and rights available upon discharge. This information ranges from benefits and rights provided by diverse government and other health-related agencies, to sources of voluntary and professional assistance, and placement in diverse frameworks. The service is provided free of charge. The Center currently serves approximately 100 people per month, with potential to 250 - 500 a month. We feel that the project has great potential to prove worthy of replication in other hospitals not only in Israel but throughout the world.

**PD7 854 WITHOUT INTENTION: UNCOVERING THE HIDDEN ASPECTS OF RURAL RESPONSES TO HOMELESSNESS**

B. ELIAS \* (University of Toronto , Toronto, Canada)

Introduction Rural Homelessness exists as an important, but often invisible, social issue of our time (Clore, P., Milbourne, P., and Widdowfield, R., 2001) Canadian social housing policy has shifted dramatically in the 21st century and has been framed by the federal government's National Homelessness Initiative in an attempt to "involve community" in both policy development and service delivery decisions, particularly challenging when tackling thorny issues such as homelessness(Phillips, et. al., 2003, p.1). This paper will explore community responses to homelessness related to this federal initiative within a rural Canadian context from a social policy perspective. The research questions will focus on distinctive features of selected rural communities, community planning processes and how the hiddenness of homelessness, particularly that of older adults, is addressed. Methods A multi-method approach was adopted and includes a policy/literature review, focus groups with stakeholders and a case study conducted over a 7 year period which examines community action planning and factors such as deinstitutionalization and rural gentrification of housing stock occurring in the idyllic settings of "cottage country" in Canada. Findings will be compared to a similar ethnographic study carried out in a rural setting in the United Kingdom (Clore, P., 2002). Results Three selected community action plans revealed distinctive features of each rural setting and yielded some interesting outcomes that had a direct impact on the implementation of new social policy locally. However, the study concludes that exhaustive volunteer efforts over almost a decade have had disappointing results and that political action in the form of advocating for the creation of new national legislation to provide permanent housing for the homeless is now warranted. Keywords: rural homelessness and community action planning

**PD7 855 THE BLOSSOMING OF THE PATH TO MAINTAIN GOOD HEALTH**

L. DYALL\* (The University of Auckland, -, New Zealand)  
T. SKIPPER(1) - (1) University of Auckland (New Zealand)

Introduction Maori are the indigenous population of New Zealand. Only 3% of Maori is aged over 65 years of age. Those over 75years of age are seen and regarded by their whanau, hapu and iwi, as "taonga", or living treasures. They the spiritual being of their ancestors and the means by which traditional Maori knowledge, values and beliefs are transferred from one generation to the next. They are also recognised as the guardians of their people, and they connect to the future by the way of their grandchildren. Methodology A feasibility study has been undertaken in New Zealand, recruiting from 1% of the Maori and non Maori populations, to determine whether it is possible to design a quantitative study and recruit a group of Maori aged 75-79 years and for non Maori, 85 years of age to hear and record from their experience of living to this advanced age. The study has involved designing with elders, other researchers nationally and internationally, a lengthy qualitative questionnaire as well as undertaking bio medical measurements and assessment of participants' physical and general mobility. Results Data from the study will be shared Conclusion This paper will describe the journey, we have navigated with our elders and lessons learnt to implement this feasibility study and where we are now going. E kore e hekeheke he kakano rangatira. Our ancestors will never die, for they live on each of us.

**PD7 856 THE PUBLIC LIFE OF OLDER PEOPLE: NEIGHBOURHOODS AND NETWORKS**

P. GARDNER\* (New York Academy of Medicine, New York, United States)

Population aging and urbanization are major forces in the 21st century. The health of the urban elderly will be determined in part by their social and physical environments and policy makers, planners, community groups and healthcare organizations are asking "what

makes an age-friendly community"? The purpose of this research was to explore how neighbourhoods affect older people aging in place. The study objectives were to: a) understand neighbourhoods as the material places where public life occurs, b) understand networks as the social places of public life, and c) examine how these neighbourhoods and networks shape the experience of healthy aging. The study employed a critical geographical gerontology research framework and a methodology called 'friendly visiting' which combines ethnography, narrative and case study research and utilized participant observation, visual methods and innovative interview techniques. The qualitative data were analyzed using grounded theory and an adapted coding strategy that integrated the textual, visual, and auditory data to highlight theoretically-informed themes that characterized participant's perceptions and experiences of their neighbourhoods. Results provide insight into the micro-territorial functioning of neighbourhoods for older residents where key sites for informal public life – "third places" – are revealed. Third places (e.g., parks, streets, coffee shops) are important material and social places for older populations: preparing for, journeying to, and engaging in these public sites promotes healthy aging by providing opportunities for engagement in life and facilitating social networks. Findings reveal that neighbourhoods – and in particular informal public spaces within these local environments – are significant places of aging that impact the well-being of older people aging in place. Results advance healthy aging and aging and place research, contribute to gerontological methodologies, and have implications for healthy public policy and practice in areas such as health promotion and age-friendly community initiatives.

**PD7 857 TRACKING PROFILE AND PREDICTORS OF ADMISSIONS TO NURSING HOMES IN SINGAPORE**

C. TAY\* (National Healthcare Group, Singapore, Singapore)  
A. NG (1), L. WONG(1) - (1) National Healthcare Group (Singapore , Singapore)

Introduction: Like other developed countries, Singapore is confronted with a rapidly ageing population, lower "old age dependency" ratio and smaller families. With a graying population, aged-related chronic diseases and functional disabilities will be expected to grow. Inevitably, more elderly will either have to cope on their own, or institutionalization may be the obvious alternative. These will lead to an increase in demand for residential-based facilities. This poster presents data from Agency of Integrated Care (AIC) aiming to understand the profile of patients requiring nursing home and have a better understanding on the predictors of nursing home admission. Method: One of the roles of AIC is to coordinate referrals and admissions to nursing homes. For this poster, we mined data of all patients admitted to a government-funded nursing home from 2001 to 2007, which includes: demographics, functional status, diagnosis, cognitive status, social information, caregiver support and nursing care. From these, we performed descriptive and trend analysis to understand how patients requiring admissions to nursing homes have changed; and regressions to understand if and how the predictors of nursing homes have changed. Result: Since AIC started coordination of referrals to government-funded nursing homes in 2001, we have more than 10000 applications. Preliminary data from the west has shown patients admitted to nursing homes tend to be older, sicker and more dependent. Also observed are the changes in acuity and social circumstances of the elderly. Contrary to government's philosophy of self help, we observe a greater number of families who are unable to cope with the functional decline of their elderly are requesting for nursing home admissions. Conclusion: With the growing acuity of the patients and changing family structure, Singapore Government may have to rethink on its most basic philosophy and support her citizens.

**PD7 858 THE EFFECT OF HOME CARE ON THE ABILITY TO PERFORM THE ACTIVITIES OF DAILY LIVING AND THE WELL-BEING OF OLDER PEOPLE**

E. HANSEN\* (AKF, Danish Institute of Governmental Research, Copenhagen, Denmark)  
V. CHRISTENSEN(1), E. HEINESEN(1) - (1) AKF, Danish Institute of Governmental Research (Copenhagen, Denmark)

Introduction. With the considerable changes in population age-profiles, the preventive care of older people is becoming more and more important. We analyse the long-term effect of the provision of home care in Denmark on the recipient's ability to perform the activities of daily living (ADL) and upon aspects of their well-being. Methods and materials. Using regression analysis on a set of Danish longitudinal data featuring people aged 67-77 we estimate the effect of home care while controlling for initial health, including initial ADL ability and well-being, along with demographic and socioeconomic conditions. The study included 1,317 people aged 67-77 in 1997 who participated in interviews in 1997 and follow-up in 2002. Results. We find no effect of home care on ADL ability in women; results for men, however, indicate a negative association. The provision of home care has an insignificant effect on women's well-being, but a positive effect for men incapacitated beyond a certain degree. We find that help from relatives and friends is correlated with a subsequent lower ADL ability in men but not in women. We find no correlation between help from relatives or friends and subsequent well-being. There appears to be a positive effect on subsequent ADL ability for women who consider that they need (more) home care. Conclusion. The results indicate a need for supplementary efforts to protect against

the disablement process, and that help should be granted on the basis of a careful assessment of older people's actual ability to perform daily chores.

**PD7 859 DIGNITY AND RESPECT IN OLDER AGE: LESSONS FROM RESEARCH ON BLACK AND MINORITY ETHNIC COMMUNITIES**

A. BOWES\* (University of Stirling, Stirling, United Kingdom)

G. AVAN(1), M. SHERRY BIEN(1) - (1) University of Stirling (Stirling, United Kingdom)

Introduction Drawing on research on the views and experiences of older people from black and minority ethnic (BME) groups, this paper identifies and discusses the key issues for minority older people's dignity and respect in older age. We discuss people's understandings and expectations for their care and support, and consider how well these are addressed in relation to the avoidance of abuse and neglect. Methods The research included an audit of good practice in addressing mistreatment of older people from black and minority ethnic groups; interviews with older people and family care givers from four minority ethnic categories (South Asian, Chinese, African Caribbean and White European) in the UK; focus groups which explored the 'fit' between service user needs and service provider approaches. Results Facilitators for dignity and respect for older BME people included the strength of family support and the commitment to family care; the strong BME voluntary sector; aspects of current policy; and some examples of good practice by services. Barriers to dignity and respect were however strong and included a limited response from statutory services; failure to engage with BME communities, exclusionary processes preventing access to services; low expectations; the marginalisation of BME voluntary sector services. Conclusions There are many obstacles in the way of BME older people being assured of dignity and respect in older age, especially where support and care from services is needed. However, the research identified some areas of good practice including good outreach work with local BME communities; some specialist services grounded in community action; open discussion of issues of mistreatment.

**PD7 860 INTERNATIONALISATION OF ELDERLY CARE AND WELFARE AND CARE FOR OLDER MIGRANTS**

Y. WITTER\* (Aedes-Actiz Kenniscentrum Wonen-Zorg, Utrecht, The Netherlands)

For my final thesis (European Masters of Gerontology) I am doing a research about the internationalisation of elderly care. Are housing corporations and care organisations planning to operate abroad? What kind of services will they provide? In which countries (for example countries like Surinam, Turkey and Morocco, the Dutch Antilles als a lot of people from that countries migrate to the Netherlands)? What obstacles do they face? And do older people in that countries do benefit of this as well? On the other hand, I will investigate if older migrants will return to their country they came from. And if they do so, I would like to know what reasons they have to migrate back. What services do they need? Why are they what to go back to their roots? I use the oral histories as the main source of the data. So I have already been talking to housing and care organisations and I spoke several older migrants. I went to the Dutch Antilles to speak to older persons, to housing and care and welfare organisations. As a professional I work for the national Knowledge centre of Housing and Care, initiated by two branche-organisations ActiZA (care organisations) and Aedes (housing corporations). The results of this research can be used by those two sectors but it is also interesting for older migrants and their self-organisations. I like to compare the Netherlands to 2 other European countries.

**PD7 861 AGEING WELL IN AUSTRALIA: THE ROLE OF COMMUNITY ENGAGEMENT AND COLLABORATION**

J. EVERINGHAM\* (The University of Queensland, Brisbane, Australia)

J. WARBURTON(2), M. CUTHILL(1), H. BARTLETT(3) - (1) The University of Queensland (Brisbane, Australia); (2) La Trobe University (Albury-Wodonga, Australia); (3) Monash University (Australia)

Introduction The ageing of the population highlights an increasing need to include the preferences and resources of older people in community-building strategies. In some contexts, such as Australia, local governments are developing ageing strategies to help address the diverse needs of a rapidly ageing population. However, many local responses do not recognise the role that older people themselves can play in ensuring that their communities enable people to age well. Methods This paper reports on a project that engaged older people in two contrasting communities in identifying ways they could work together to make their communities more age-friendly. As well as including the 'voice' of older people, the action involved collaboration between older people, local government and relevant organisations. The research was conducted in three sequential phases 1) identifying the local context and ageing issues (mainly through interviews); 2) brainstorming and goal-setting (in community workshops), and 3) interactive action planning by working action groups over 12 month period. Results The research identifies key factors influencing the effectiveness of collaborative, community-based approaches to building an age-friendly environment. Results also highlight some of the challenges faced when older people work with others in local networks on these issues. Further, they contrast the forms of engagement and degrees of collaboration developed in communities characterized by ageing-in-place, and "seachange" mobility. Conclusion To optimize

people's opportunities for health, participation and security as they age, it is essential that approaches to governance are inclusive and supportive of older people. They need to be adapted depending on the context in which collaboration occurs, including the nature of the community and existing levels of cohesion. This paper presents some Australian evidence supporting the development of flexible, collaborative approaches, based on engagement of older people themselves and strengthening networks.

**PD7 862 CHALLENGES FACED BY SERVICE PROVIDERS WORKING WITH IMMIGRANT SENIORS IN WESTERN CANADA**

E. SHIZHA\* (Wilfrid Laurier University , Brantford, Ontario, Canada)

E. MAKWARIMBA(1), M. STEWART(2) - (1) University of Alberta (Edmonton, Alberta, Canada); (2) University of Alberta (Edmonton, Alberta, Canada)

Introduction: Despite growing interest in aging and ethnicity, most research has overlooked challenges experienced by senior immigrants and their support needs. Little is known about how migrant elders from different countries of origin adapt following immigration late in life or about challenges faced by service providers in meeting the support needs, and preferences of immigrant seniors. Consequently, this study examined the challenges faced by service providers from various organisations in reorienting available resources and programs to provide support for the new elderly immigrants in Western Canada. Methods: Group interviews were conducted with service providers and policy makers (n=25) in Alberta to ascertain their views on the availability and appropriateness of services for immigrant seniors. Service providers were selected from agencies/ organisations in health and health-related sectors that provide services to immigrant seniors, and recruitment was facilitated by a Community Advisory Committee. The service providers were purposively sampled to represent different health-related disciplines (e.g. nurses, physicians, social workers, psychologists). Group interviews were tape recorded and transcribed verbatim. Data were subjected to thematic content analysis, while inductive analysis was used to create a coding framework and recurrent themes were systematically compared to identify substantive categories and potential theoretical codes. Results & Conclusion: Service providers faced high costs of programmes and equipment for activities, lack of culturally appropriate services to offer immigrant seniors, and lack of financial and human resources. Other challenges include failure to determine the exact support and service needs of immigrant seniors, unclear mandate or geographical coverage of their activities, and lack of intersectoral collaboration among service providers. Integrative strategies in policies and multicultural programmes are desired for overcoming the barriers encountered in assisting immigrant seniors. Advocacy should be conducted for government policies that can alleviate poverty among immigrant seniors.

**PD7 863 NEXUS OF AGING, IMMIGRATION, AND MULTICULTURALISM IN SOUTH KOREA: LESSONS FROM THE 1992 LOS ANGELES RIOTS**

B. KIM\* (University of California at Los Angeles (UCLA), Los Angeles, United States)

F. TORRES-GIL(1) - (1) University of California at Los Angeles (UCLA) (Los Angeles, United States of America)

Purposes: As population rapidly ages, the economically productive population has greatly decreased in South Korea. With this demographic transition, the country is witnessing a steady inflow of immigrant workers from neighboring nations. It is therefore essential for South Korea to receive these workers in order to maintain an adequate workforce. However, Koreans' inexperience in coexisting with foreigners has caused social and cultural discrimination against the immigrant workers. This study explores socio-cultural features that trigger tensions and conflicts between Koreans and immigrants. The study also reviews an instructive example of social integration, which assimilated Korean immigrants with mainstream Americans following the 1992 riots in Los Angeles. Method and Results: Using a qualitative research methodology, the study explores four factors that tend to trigger racial tensions between native Koreans and immigrant workers: 1) social exclusion of foreigners; 2) cultural values stressing the nation's homogeneity; 3) discrimination of immigrants; 4) lack of experience in multiculturalism. The study also examines the 1992 Los Angeles riots and its immediate aftermath as an example of racial conflict and integration using three categories: 1) the historical background of immigration in Los Angeles; 2) causes and effects of the riots; 3) efforts to overcome and minimize racial segregation. Finally, this study argues that following the example in Los Angeles, racial tensions in South Korea can be minimized through multi-ethnic coalition building as well as education on multiculturalism. Implications: This study presents three policy implications. First, the study suggests implementing a program of multicultural education in South Korea. Second, South Korean society needs to support national policies that address challenges caused by the growing immigration of foreign workers. Finally, major government assistance including job training, housing support, health care and welfare can improve living conditions of immigrant workers.

**PD7 864 SOCIAL RESULTS AND LESSONS LEARNED FROM A HEALTH PROMOTION PROGRAMME FOR THE ELDERLY IN RURAL THAILAND**

W. BOONCHALAKSI\* (Institute for Population and Social Research, Mahidol University, Nakhonpathom, Thailand)

P. MUENSAKDA(1) - (1) Institute for Population and Social Research, Mahidol University (Nakhonpathom, Thailand)

Good health does not occur automatically. It requires good preparation and the right form of promotion. The objectives of the study are 1) to promote the elderly in rural Thailand with good physical and mental health, 2) to research and develop a health promotion programme for the elderly through collaboration with health-center staffs at sub-district level, and 3) to promote health centers at the sub-district level to become main supporters in health promotion. The participatory action research was used to assess the effectiveness of community-based interventions in implementing a health promotion programme for the elderly. Two health centers at sub-district level were selected and qualitative techniques were employed. Through the use of a systematic approach and attentive evaluation, the results from the evaluation at the end of the project covered 300 elderly samples indicated that more than 90 percent of the elderly were satisfied with the health promotion activities. They wanted to prolong the programme and needed not to change any activities. Changing in their health behaviors were also found, the elderly came out to jog along the village's roads in the morning and were no longer shy to exercise at home. These had never happened before. Moreover, the main outcomes of the programme were the setting up elderly clubs at the two sites. This indicated the empowerment of the community and the local administration offices agree to provide financial support for the programme in the consecutive years. The lessons learned from the study are good health would reduce the expenses to be paid for the medical treatment and stimulation for self health care should be promoted in rural area because good health would bring happy life which in turn resulted in the happiness of the family and the community as well.

**PD7 865 BEREAVEMENT NEEDS AMONGST OLDER PEOPLE – A NEGLECTED POLICY AREA?**

J. CROXALL\* (Swansea University, Swansea, United Kingdom)

S. HILLCOAT-NALLETAMBY(1) - (1) Swansea University (Swansea, Wales, UK, United Kingdom)

**Introduction** This paper draws on a PhD study which examines whether older people's needs for support are being met during times of bereavement. Using a qualitative approach, the study explores their experiences of bereavement, and their perceptions of the adequacy of public, private (including family and friends) and voluntary sector agents in responding to their needs. Although research has long shown the pivotal role that social support plays in promoting well-being during periods of bereavement, the study argues that older people's needs for support during these times represent a neglected area in contemporary social policy agendas. Current UK policy discussion (e.g. Transformational Government Strategy, 2005; Varney Review, 2006; Local Government White Paper, 2006; Age Concern, 2008) also suggests that this has been the case. **Methods** This paper presents the findings of a literature review which examines existing knowledge of older people's needs in times of bereavement; developments or changes to service provision for this particular group over the past century; and the relevance of concepts of 'social need'; 'social support' and 'social networks' to this field. **Results** Preliminary analysis of qualitative interviews with bereaved older people and service providers suggests that social isolation and loneliness are dominant concerns which remain unaddressed. **Conclusion** The study thus far points to the need for formalized support for older people during bereavement, particularly because of broader social changes which affect the potential availability of traditional informal sources of support, notably the family.

**PD7 866 "WHAT CONTRIBUTE TO QUALITY OF LIFE IN OLD AGE?" PERSPECTIVES OF OLDER TAIWANESE**

L. CHANG\* (Chung-Shan Medical University, Taichung City , Taiwan)

G. CHIO(1), J. WANG(2), H. MAO(1), S. WU(1) - (1) National Taiwan University (Taipei, Taiwan); (2) Chang Jung Christian University (Tainan , Taiwan)

**Introduction.** With population aging, extensive research has been devoted to understanding Quality of Life (QOL) in old age. QOL is recognized as a multi-dimensional concept. There is yet limited understanding of the interaction among its dimensions. Such a dynamic perspective is important to our understanding of how seniors perceive QOL as they face continuous personal, societal, and cultural changes. This study is to investigate how seniors considered QOL in old age, the meanings they attributed to the various dimensions of QOL, and how these meanings were situated in their special personal and cultural contexts. **Methods.** The study adopted a qualitative design. 20 seniors who were 65 and older in central Taiwan participated in taped in-depth interviews and participatory observations. The interviews were transcribed in verbatim. The transcripts were analyzed, following the principles of thematic analysis, with the assistance of Atlas.ti software. **Results.** The narratives of the seniors' about lives, aging experiences and expectations for future reveal their desire for an ideal state of "free from worry," what they considered central to "having a good life in old age." The theme brings together the multiple QOL dimensions, including "physically healthy," "independent in daily living," "supported by family," and "economically independent." The meanings associated with each dimensions were intricately inter-related. The meanings and the core themes of the narratives also reflect the seniors' attempts to make sense of their experiences and to reach a sense of "having no worry" amid the rapid personal, societal, economic, and cultural changes, for example, the changes in concepts of traditional filial piety. **Conclusions.** The holistic and dynamic construction and evaluation process of QOL revealed in the narratives reflected

the close linkage among dimensions of QOL. A culturally-relevant perspective that values individual perspective contributes to the understanding of QOL in old age.

**PD7 867 HEALTH STATUS AND HEALTHCARE EFFECT OF GRANDPARENTS IN GRANDPARENTS AND GRANDCHILDREN FAMILY**

Y. CHO\* (Chodang University, Chunnam province, Republic of Korea)

Y. PARK(1) - (1) Chodang university (Chunnam Province, Republic of Korea)

Grandparents-grandchildren(GP-GC) family have been increased by from 1995(35,194 households) to 2005(58,101 households) in Korea. These pattern is markedly increased in the rural area of Korea. GP-GC family have many severe problems such as poverty, health problem from aging of grandparents, lack and stress of childcare, retardation of growth and development of children, exposure in crime, and remedial classes etc.. Therefore this family should required several services. Intervention programmes for GP-GC family was demonstrated by nurse/social worker using electronic voucher per week a day(3hrs.). Contents of service were consultation, information, health prevention and maintenance(exercise, play, examination), giving a learning for children and chores. Purpose of this study was to get health status and childcare effect of grandparents through intervention service of the GP-GC family. The interview survey was performed in January 2008 with a structured questionnaire to 110 grandparents of GP-GC families who served intervention programs and lived in Muan-Gun of Chunnam Province. The questionnaire composed of grandparents childcare stress, ADL, IADL, health status and depression status. research method used Chi-squire method and t-test. The average age of grandparents was 68.9( $sd=8.2$ )years old. 70.6% of grandparents have chronic disease(arthritis, hypertension, DM, incontinence, cancer etc.) and 54.7% of grandparents about subjective Health status was not good. ADL, IADL and depression of grandparents were good status and slightly promoted. Childcare stress of grandparents was very high, but grandchildren perceived childcare attitude of grandparents were significantly lower in served GP-GC family than not served GP-GC family. Intervention program for GP-GC family changed the childcare attitude and health status of grandparents. These results suggest the need for intervention programs with childcare service and health management about grandparents.

**PD7 868 MIGRANT CARE WORKERS, OR MIGRANTS WORKING IN LONG TERM CARE: A REVIEW OF THE AUSTRALIAN EXPERIENCE**

A. HOWE\* (Independent Consultant Gerontologist, Balwyn, Australia)

The role of migrant workers in aged care is of particular relevance to Australia where 25% of the total population are overseas born, two thirds of them in countries where English is not the main language. Issues of interest arise with regard to meeting the demands of the aged care workforce in general, and responding to the particular cultural and linguistic needs of post war immigrants who are now reaching old age in increasing numbers. This paper begins with an account of the overseas-born components of the aged care workforce drawing on data from a comprehensive survey of the residential and community care sectors conducted in 2008. Comparisons with the total female workforce show that overseas-born workers are over-represented in aged care. Answers to the question as to whether these workers are migrant care workers or longstanding migrants are then sought with reference to migration policies, long term care financing arrangements, worker recruitment and training and credentialing, the four factors identified as shaping international flows of migrant care workers in the six nation study carried out by the American Association of Retired Persons Public Policy Institute in 2005. The way in which these factors play out in Australia means that while migrants are an important element of the aged care workforce, the great majority of overseas-born workers are longstanding migrants who have trained and gained qualifications in Australia. There is little evidence to show that aged care provides a pathway into the workforce for low skilled migrants or that others are working below their skill level. Migrants entering Australia specifically as care workers are not identifiable as either a problem in terms of disadvantage in employment conditions and lack of permanent residence, nor do they offer a solution to shortages in the aged care workforce.

**PD7 869 EMPLOYMENT STATUS AND EMPLOYMENT DEMANDS OF CERTIFIED SOCIAL WORKERS IN THE GERIATRIC SETTING UNDER THE LTCI IN JAPAN**

H. ISHIKAWA\* (Kwansei Gakuin University, Nishinomiya, Japan)

Y. NAKATANI(1), M. TOIOU(2), N. OKADA(3), Y. WATANABE(4) - (1) Japan Women's University (Kawasaki, Japan); (2) Komazawa University (Setagaya-ku, Japan); (3) Hokusei Gakuen University (Sapporo, Japan); (4) Health Science University (Fujikawaguchi-machi, Japan)

**Purpose:** Although twenty years has passed since the national government in Japan started a system of certifying social workers, their working environment has not developed sufficiently. The purpose of this study is to describe and examine the employment status and the demands for employment of certified social workers who are working in the field of geriatric setting. **Methods:** There were two data sets in this study: one was the data for the care management centers and the other was for the day/day care centers. Subjects were selected randomly from the WAMNET list. The survey was conducted by mail from

February through May, 2007. There were 273 respondents for care management centers and 293 respondents for day/day care centers. Results: Employment rates of CSW in care management centers under LTCI in Japan were only 3.6% and 2.9% for day/day care centers. However, most of the respondents recognized that there were many needs and tasks which CSW can best deal with or solve. Moreover, more than 60% of the respondents showed that they greatly utilized their certification and knowledge when they hire new professional staff. Conclusion: Even though the result of this study suggested that CSW are not fully employed in the geriatric setting in Japan, the employment demands of CSW is quite high. It was clearly shown that there was a big gap between the actuality and demands. It is necessary for CSW themselves, administrators of service providers, and the national and local governments to work together to fill this gap.

**PD7 870 CADENZA, A JOCKEY CLUB INITIATIVE FOR SENIORS**  
P. CHAN\* (The University of Hong Kong, Hong Kong, Hong Kong)

Introduction In 2006, The Hong Kong Jockey Club Charities Trust launched a five-year project: "CADENZA: A Jockey Club Initiative for Seniors". The initiative is meant to nurture and develop innovative approach in understanding ageing, promoting positive image of the elders and meeting the need of the future old. Faculty of Social Sciences, The University of Hong Kong and Faculty of Medicine, The Chinese University of Hong Kong are project collaborators. Objectives and Programmes Its objectives are to revolutionise the way society views its elders; promote innovative approaches in improving and quality of life and quality of care of the elderly; train different levels of professionals, formal and informal caregivers; and encourage academic leadership in gerontology. The above objectives are accomplished through research training workshop and research projects; training of professionals, front-line workers, care givers and the general public; innovative and sustainable community projects; and public awareness. Results Today, 30+ research projects are underway or have been completed. 1,000+ professionals, formal and informal caregivers have been trained. Two symposia were organized in 2007 and 2008 respectively with 1,000 overseas and local experts participated. Four innovative community projects have been funded with a total amount of more than HK\$1,000K, and a number of creative service ideas are being considered. A territory wide public awareness program through radio and TV has been launched covering 6 major themes: (i)health promotion and maintenance, (ii)health and social services, (iii)living environment, (iv)financial and legal issues, (v)quality of life and quality of dying, and (vi)age disparities. Conclusion CADENZA is an exemplary funding model for promoting interdisciplinary collaboration in gerontology, involving academia and service providers. Funding bodies world wide may consider its funding mode in supporting innovative and sustainable initiatives for the betterment of the older population.

**PD7 871 THE HAUSGEMEINSCHAFT (HOUSING COMMUNITY) AS INNOVATIVE APPROACH IN NURSING HOME CARE**  
J. WILBERS\* (ProjectCare, Frankfurt, Germany)  
S. RE(1), H. WINTER(1) - (1) ProjectCare (Frankfurt, Germany)

The Hausgemeinschaft (Housing Community - HG) was first described in Germany by Winter (1995). According to his terminology HGs represent the 4th generation of nursing home concepts (1st generation: shelter, 2nd generation: hospital like, 3rd generation: residence dominated by care) HGs are a special type of household consisting of a limited number of people needing care. About 100 out of 10,000 nursing homes in Germany have already switched to HG. The number is rising. The concept and different assessment reports are analyzed to what extend HGs have advantages to conventional nursing homes and which problems occur with the implementation. It is shown that HGs lead to a higher autonomy of the residents, a better satisfaction of staff and relatives, and an improved image of the nursing facility. Main problems are the training of the staff because of the different operational and organizational structure. Furthermore some problems with the legal framework of nursing homes occur e.g. hygiene regulations, fire protection requirements or guidelines of the long-term care insurance. It is concluded that HGs can be regarded as an innovative approach in nursing home care if operations and organization are intensely planned and controlled. HGs are not appropriate for all nursing home residents but a great number could benefit.

**PD7 872 OLDER PEOPLE AND DOMESTIC PHONES: DOES THE MARKET ANSWER THE NEEDS OF HONG KONG'S SILVER POPULATION?**  
K. LO\* (The Hong Kong Polytechnic University, Hong Kong, China)  
L. YAP(1), M. WONG(1), C. LAI(1) - (1) The Hong Kong Polytechnic University (Hong Kong, Hong Kong)

Introduction The Hong Kong population is ageing rapidly. It is estimated that by the year 2036, people aged 65 or above will soar to 26.4% from the current 12.4%. Domestic phone plays an important role in enhancing connectedness and reducing isolation in the older population. Since ageing is associated with some physical and cognitive functional losses, aged people demand domestic phone that can meet their special needs. This study examined the current domestic cordless phones available on the local market for their elder-friendly features. Method and materials The elder-friendly features used in this study were identified from the findings of an earlier study (Lo, Yap and Lai, under review)

wherein local elderly people's preferences of domestic phone features were solicited. The most wanted features were prioritized accordingly. In the present study, domestic cordless phones from local major retailers were examined. Their elder-friendly features and prices were cross-checked against that of elder people's plea. Results Out of a total of 35 searched domestic phone samples, 26 embraced 1 to 5 elder-friendly features, 6 samples had 1 identified elder-friendly features, 13 had 2, and only 1 phone searched carried the maximum of 5 elder-desired features but with a price of HK\$1600. The market niche identified in this study is therefore a phone that would include more practical non-fancy elder-friendly features, at a relatively affordable price. Conclusion Having known that a domestic phone can indeed facilitate seniors' social networking and thus enhance their quality of life, the findings of this study serve as a quick reference for those who care for the well-being of the seniors in developing a market-niche domestic phone which can answer the unique needs of the silver population.

**PD7 873 THE FLEMISH ELDERLY CARE STUDY. CARE PATHWAYS OF ELDERLY PERSONS WITH COGNITIVE PROBLEMS AND/OR DEPRESSION**  
M. DEMAERSCHALK\* (K.U. Leuven, Leuven, Belgium)  
A. DECLERCQ(1) - (1) K.U. Leuven, LUCAS (Leuven, Belgium)

Introduction The Flemish elderly care study is a large-scale longitudinal study from the Flemish Policy Research Center Welfare, Health and Family. It focuses on pathways of care of elderly persons with cognitive problems and/or depression. Methods VoZs aims to yearly interview 3600 elderly persons who live in eight Flemish regions for a period of (at least) four years. Primary health and social care organizations select the respondents by means of a screening instrument for cognitive problems and depression. All clients aged 65 years or older, who speak Dutch and who live in one of the 8 regions, are screened. Those who score positive, are encouraged to participate in the study, as is their primary care-giver. Following the screening, those who wish to participate, are interviewed by means of a structured questionnaire. Results A purpose of the study is to map pathways of care and the factors which reinforce or weaken the demand for care. Other research goals are to determine (1) the time-interval between the first use of care and the admission in residential care (or death) and (2) the factors which influence the pathway of care and the length of the interval. As more and more research stresses and demonstrates the importance of the socio-demographical and the geographical context on the need for and demand of care, VoZs not only aims at examining the influence of individual characteristics of the elderly person and the caregiver (for which there is ample evidence in the literature, but also the influence of particular municipal and regional characteristics. Conclusions Because of its broad scope, the longitudinal character and the fact that individual as well as regional characteristics are part of the research, it is quite innovative. The results are relevant for local, regional and national policies.

**PD7 874 THE RETENTION OF OLDER PARTICPANTS IN LONGITUDINAL RESEARCH STUDIES**  
A. TINKER\* (King's College London, London, United Kingdom)

Background Retaining participants in longitudinal research studies is crucial if the findings are to be valid. If people drop out then the sample no longer becomes representative. Response rates for studies; especially involving older people are dropping. This multidisciplinary research which took place in 2008 examines what factors encourage older people to remain as participants or discourages them from continuing to participate in health related longitudinal or panel studies. Methods and findings The first part was a literature survey which revealed that there were many reasons for drop out including too time consuming, questionnaire being intrusive and dislike of some of the medical exams. Questionnaires were then sent to the 38 studies identified in this literature and 20 replied. Various ways of encouraging participation were found. The second part of the study was secondary analysis of participants in the Whitehall 11 Study (a study of 10,308 civil servants which started in 1985). It was found that attrition was associated with being female, older, not being married, having a lower occupational grade, being in unfurnished property and having a lower educational level. This was followed by focus groups and telephone interviews. Positive things associated with being a participant included particularly having a free medical examination. Dislikes included some aspects of the tests (particularly the cognitive ones), a lack of understanding why some of the tests were carried, dislike of the questionnaire and the repetitiveness of some. Reasons for continued participation ranged from the value of the medical examinations, the prestige of the study and 'giving something back'. Conclusion A series of recommendations are made which are both practical, such as continuing with the offer of home visits, a comfortable environment and sensitive caring staff to wider issues about the desire for more knowledge about the whole study.

**PD7 875 PERSPECTIVES ON TRANSPORTATION: BUILDING ON THE AGE-FRIENDLY CITIES PROJECT - A "WHO" INITIATIVE**  
J. LOVE\* (University of Victoria, Victoria, Canada)  
H. TUOKKO(1), E. GALLAGHER(1) - (1) University of Victoria (Victoria, Canada)

Introduction- The transportation options of older adults are under scrutiny as the number of older adults will increase significantly in the coming years. As part of the World Health

Organization's (WHO) "age-friendly community initiative, our research investigated the role that transportation plays in an "age-friendly" community in Saanich, British Columbia (BC) Canada. Methods-Focus group data, collected as part of the Age-friendly Cities project in Saanich, BC were reanalyzed to specifically examine information on transportation and older adults. There were two focus groups of older adults 60-74 years (young-old), two focus groups of older adults over age 75 (old-old), and four groups of stakeholders (i.e., policy makers, business owners). One additional two-hour focus group of stakeholders was conducted that was devoted entirely to the topic of transportation. This qualitative data was analyzed within the Developmental Systems Perspective (DSP) theoretical framework. This perspective integrates both individual and contextual levels of analysis that promote positive development for the population, emphasizing the importance of scholarly and community partnerships in research. The practice of fostering bidirectional relationships between practice and research has the potential to contribute to positive policy changes and social interventions. Results-It was apparent that the transportation needs of young-old adults were different than old-old adults. It was also evident that there was a need for stakeholders to better understand what the physical environment was like for older adults. Conclusion-Although there is a great deal of information available on older adults and transportation, little is known about the perspective of the stakeholder. The DSP provides a framework for better understanding the developing needs of older adults and the characteristics that make a community age-friendly. This information might be to implement more age-friendly transportation policies and programs.

#### **PD7 876 EXTRA CARE BUILDING TYPOLOGY IN THE UK**

A. LEWIS\* (University of Sheffield, Sheffield, United Kingdom)  
 R. DARTON(2), J. HOLDER(2), K. MCKEE(1), A. NETTEN(2), A. ORRELL(1),  
 J. TORRINGTON(1) - (1) University of Sheffield (Sheffield, United Kingdom);  
 (2) University of Kent (Canterbury, United Kingdom)

Introduction A problem posed by the worldwide phenomenon of an ageing population is how to enable people to retain their independence in later life. One strategy adopted by the UK Government is to promote extra care housing. Comprised of self-contained living units, extra care schemes are popular as they offer independence to people with high care needs who might otherwise require communal residential care. Currently there is little empirical evidence to show what constitutes good practice in extra care design. The EVOLVE project, funded by the Engineering and Physical Sciences Research Council and run by Sheffield University in collaboration with PSSRU University of Kent, aims to develop an evidence-based evaluation tool that can be used throughout the life-cycle of a building, from the design stage through to the experience of the building in use. As part of the tool's development, a building study was conducted to determine what types of building have been created by the extra care initiative. This paper will describe the wide range of extra care building typologies currently in use in the UK. Methods and Materials Plan drawings for fifty-seven schemes were collected from a variety of sources including housing providers, architects and the existing literature. Eight of these schemes were visited and extensive photographs taken. Schemes were then studied to identify similarities and differences. Results A wide range of typologies exist, from bungalows to high rise apartment blocks. There are some key similarities between schemes, especially in the design of individual apartments. However there is much disparity in the provision of facilities and in the overall layout of schemes. Conclusion The wide range of typologies in use suggests there is currently no universal agreement about what constitutes good design in extra care, and consequently this area merits further investigation.

#### **PD7 877 CARING FOR OLDER PEOPLE: A COMPARISON OF ARRANGEMENTS IN ENGLAND AND NEW ZEALAND**

H. ARKSEY\* (University of York, York, United Kingdom)  
 KOOPMAN-BOYDEN(1) - (1) University of Waikato (New Zealand)

Community care of older people is an increasingly significant issue for governments worldwide in the light of demographic changes and ageing populations. Comparing policy measures and developments in different countries helps identify policy innovations, convergences and divergences, and has the potential for shared learning by governments. This presentation draws on relevant policy and service documents, and research evidence, in focusing on different aspects of social care models for older people in England and New Zealand, including: funding streams and commissioning arrangements; charging policy; range and scope of service infrastructure; co-ordination of services; quality control; access routes, eligibility criteria and assessment procedures; and the recognition and role of carers. The analysis investigates the advantages and disadvantages of the English and New Zealand models of social care in terms of 'higher order' outcomes, such as choice and control, citizenship, equity and opportunities to participate in society. For example, cash allowances (including direct payments and individual budgets) are becoming increasingly common in England (replacing services in kind) and have the potential to improve choice and control for older people. At the same time however, this mode of social care can involve carers in additional administrative work. The presentation notes that carers' contributions are recognised in both countries, with a greater emphasis on supporting carers' economic independence in England. Both countries offer home care and personal care, but arguably New Zealand offers more home care than England. However, the move in both countries towards 're-ablement' or 'restorative' services blurs this distinction. Thus

this presentation will show how the comparison of models of social care in England and New Zealand helps identify where there are opportunities for policy makers to learn from each other to improve the delivery and outcomes of social care for older people and their carers.

#### **PD7 878 THE DESIGN OF EXTRA CARE HOUSING: MEETING THE UK NATIONAL STRATEGY FOR HOUSING IN AN AGEING SOCIETY?**

A. ORRELL\* (University of Sheffield, Sheffield, United Kingdom)  
 S. BARNES(1), R. DARTON(2), J. HOLDER(2), A. LEWIS(1), K. MCKEE(1),  
 A. NETTEN(2), J. TORRINGTON(1) - (1) University of Sheffield (United Kingdom);  
 (2) University of Kent (United Kingdom)

Introduction Specialised housing models incorporating care services, such as extra care housing schemes, are seen as enabling older people to maintain a high quality of life (QoL) despite increments in frailty that accompany ageing. The success of extra care housing is likely to be dependent on excellent building design. EVOLVE: evaluation of older people's living accommodation is an EPSRC funded study of the relationship between building design and QoL in occupants of extra care housing schemes. This paper reports data drawn from focus groups of extra care housing occupants exploring their views on the architecture and design quality of their schemes. Methods and materials Five extra care schemes in England were purposively sampled. Focus groups were held in each scheme with residents and relatives in order to identify good and bad design features of extra care housing. In total 35 people participated in six focus groups. Focus group transcripts were analysed using content analysis. Results Residents were in agreement that provision of a wet room, a communal lounge and CCTV were good design features as they enabled personal realisation, social inclusion and a feeling of security. Furthermore, residents agreed that a lack of accessibility around the schemes was indicative of bad design. Residents complained about the location and number of lifts, weight of fire doors in corridors and wheelchair users found many thresholds too high. Many, but not all, residents complained about several aspects of the design of their living accommodation, including kitchen layout and accessibility. Other problems included overheating, poor ventilation and the inability to control room temperatures. Conclusions Poor design features impact on the ability of older people to lead active and independent lives. To provide an enabling environment, the design of extra care housing needs to be better aligned with the specific needs of occupants.

#### **PD7 879 ELDERY PROFILE AT HEALTH SERVICE: NECESSITY OF ATTENTION IN RIGHTS PERSPECTIVE. SOCIAL SERVICE AT CLINICAL HOSPITAL OF UNICAMP**

A. CAMARGO\* (Campinas University, Campinas/SP, Brazil)  
 M. CAMILO(1), C. LIMA(1), M. ROVARIZ(1), W. MORAIS(1), E. DIAS(1),  
 M. ARAÚJO PINTO(1), J. OLIVEIRA(1), M. CHESCHINI(1), R. SARTORI(1) -  
 (1) Campinas University (Campinas/SP, Brazil);

Introduction:This work was achieved by the experience of Social Service Professionals, which works at Clinical Hospital Campinas University, using as reference the changing in demographic profile of population, principles of Public Health System (SUS) and the Eldery National Policy.Method:The data, which was chosen by the group in order to unify and qualify the attendance, were extracted from interview file.They concern soci- al insertion,social family net (relationships), accessibility to health service, assistance, retirement fund, autonomy and physical activities.The sample was consisted by 36 questionnaires, concerning a implantation period of 6 months. Results: 25% belong to age range from 70-75; 61% are female; 44% are widows; 25% are married; 11% are single; 61% are in elementary school; 22% are illiterate; 61% are retired; 66,5% sleep alone; 83% can walk; 61% do their hygienic skills by their own; 50% receive their retirement at the bank; 66,5% have a care taker; 86% use the public health net; 66,5% are not inserted in family healthy program; 77,5% are sedentaries; 61% have no leisure; 52,5% have no knowledge about the elderly laws.Conclusions: The sample population has low level of education, high level of illiterates, which drives to difficulties in accessing to information. This can cause difficult ties in procedures comprehension, laboratories test results, medication instructions and other issue related to elderly care as:suitable communication, affection and qualified services. The lack of knowledge of Eldery Estateute shows the necessity of information about their rights which leads to be prioritized in day-by-day professional activities. Because of this,this work group have elaborated educative material,have created integrated committees,organized thematic activities about rights, social protection,violence, discrimination, necessary care and special orientation to elderly and their relatives.

#### **PD7 880 THE PERCEPTIONS OF THE ADMINISTRATORS OF NURSING CARE INSTITUTIONS TOWARD ACCEPTING FOREIGN NURSING CARE WORKERS**

N. TSUKADA\* (Nihon University , Tokyo, Japan)

Introduction: In August 2008, Japan opened her nursing care labor market for foreign workers for the first time in history, and 208 young people from Indonesia arrived in Japan. They are currently learning the Japanese language and will be assigned to nursing care institutions in February 2009. The purposes of this nationwide mail survey, funded by the

Mitsubishi Foundation, of both administrators and nursing care workers of nursing care institutions were to explore how they perceive accepting foreign workers in their institutions and to find out what kinds of preparations are needed, if they decide to accept them. Methods and materials: Data were collected in March 2008, and 689 responses from administrators and 609 responses from nursing care workers were obtained, and the response rates were 29.7% and 28.5%, respectively. Results: Preliminary analyses revealed that about 67% of the administrators responded that they would accept foreign workers either actively or reluctantly, while 78% of the nursing care workers responded similarly. Among those administrators who would accept foreign workers, "personality of foreign workers (59%)" was cited as the most important quality, followed by "Japanese proficiency (50%)" and "attitudes toward work (48%)." Moreover, almost all administrators(99%) showed their concerns about hiring foreign workers, and their biggest concern was "the communication with older people, their family members and colleagues (90%)." Then, "the misunderstanding and troubles caused due to different values, living and eating habits and religions (80%)" and a lack of "the Japanese writing and reading abilities (72%)" followed. Conclusions: Many different programs need to be prepared in advance in order to accept foreign nursing care workers. Personal help (e.g., food menu and counseling) could be handled by the accepting institutions, while large-scale programs, including the Japanese educational programs and housing programs, should be handled by prefectural governments.

**PD7 881 POLITICS OF MANAGERIALISM IN ELDERCARE – INDIVIDUAL NEEDS OF THE ELDERLY ARE SUBORDINATED STRUCTURAL GUIDELINES**  
K. ANDERSSON\* (Umeå University, Umeå, Sweden)

**Introduction** The function of public home care service is to tend to the daily needs of the elderly concerning individual care of the home and the body when the elderly cannot manage on their own. The Swedish welfare state, and public eldercare of today in particular is under transformation in many respects. Organisational restructuring, such as downsizing, mainly influenced by New Public Management are some of the factors that have affected home care service. The managerial reform which distinguishes the administration of care from the actual care work, involves a special professional group, care managers, whose tasks are concentrated around needs-assessment practices. **Methods and materials** The managerial reform is the applied organising model in the investigated municipality in one of the bigger towns in Northern Sweden. The empirical material consists of qualitative in-depth interviews with six female care managers. The care managers' arguments are analysed discursively with focus on how they describe the needs-assessment procedure and how they refer to the elderly's needs. **Result** The analysis reveals that it is not the individual elderly person's social needs that are focused on to begin with. Repeated reference is made to municipality's finances, and this constitutes the guiding principles applied by care managers. The care managers appeared to comprise a homogenous group since they tended to agree about the guidelines in the needs assessments. **Conclusion** The care managers seem to estrange themselves from the social needs of the elderly when presenting their arguments in the needs assessments. There is often an ambition to find other solutions to the elderly's needs in order to economise with the municipality's resources. In that respect individual needs are subordinated structural organisation, which has consequences for the care given to the elderly people.

**PD7 882 NOVOCERONTS AND THEIR HOUSING PREFERENCES! RESEARCH OF A HOUSING-ASSOCIATION ABOUT LIVING OF ELDERLY PEOPLE TOMORROW**  
K. SMID\* (University of Applied Sciences Windesheim, Zwolle, The Netherlands)

**Introduction:** Many (elderly) people in the Netherlands live in apartments and homes developed by housing-associations. These housing-associations aim to develop adequate housing for people with limited finances. In preparing for the future housings associations are faced with three questions: 1. What are the wishes of the new elderly/ novogeronts, within 10 or 15 years? 2. What does that mean for the way of living with respect to: - quality of housing (type housing, facilities, parking, relationship with caregivers, volunteers, etc.) - quantity: how many houses of which type are needed? 3. How can novogeronts participate in planning, building and living together with caregivers? **Methods:** Methods used are: desk-research, survey and interviews among future novogeronts. Desk-research is executed with national studies on housing of elderly people. In the survey novogeronts of tomorrow (=the current renters of single apartments and family-homes) are interviewed by questionnaires on their preferred housing in the future (10 or 15 years). Topics include: environment in relationship to shopping, transport, home equipment, ways of living together with other novogeronts or caregivers and services. Data-analyses include frequencies, means and cross tabs. In the qualitative study interviews with sub samples of the survey respondents provide depth and context to the survey data (individual and group focus interviews). **Results and conclusions:** Based on these quantitative and qualitative data the researchers develop recommendations to the housing-associations for future planning of housing for the new elderly: quality, quantity and client involvement.

**PD7 883 THE DISTINCT NEEDS OF LONG-TERM CARE RESIDENTS WITH AND WITHOUT SIGNIFICANT COGNITIVE LOSS OVER TIME**  
K. THEURER\* (Simon Fraser University, Vancouver, British Columbia, Canada)  
N. O'ROURKE(1), S. CASPAR(1), G. GUTMAN(1), M. COOK(2), P. KASPROW(2), Y. BACHNER(3) - (1) Simon Fraser University (Vancouver, BC, Canada); (2) New Vista Society (Burnaby, Canada); (3) Ben-Gurion University of the Negev (Beer Sheva, )

The majority of research within long-term care (LTC) has emphasized the physical health of residents, has been cross-sectional in design and has focused almost exclusively on residents with dementia. Few longitudinal studies have followed participants over intervals longer than 1 year. In contrast, the current study set out to examine the experience of LTC residents with and without significant cognitive loss over a 2-year period comparing the psychological well-being of groups over time. Significant Group x Time interaction effects were observed between residents with and without significant cognitive loss in life satisfaction and depressive symptomatology. Results of this study underscore the need for longitudinal measurement in LTC research, the use of multivariate statistical procedures and the need to identify and meet the distinct needs of residents with and without significant cognitive loss.

**PD7 885 A LIFE-COURSE, MIXED METHOD ANALYSIS OF SOCIAL CLASS AND DIABETIC OUTCOMES OF OLDER ADULTS**

E. NICKLETT\* (University of Michigan, Ann Arbor, United States)  
R. ANSPACH(2), J. LIANG(1), J. SHIM(2) - (1) University of Michigan Department of Sociology (Ann Arbor, United States of America); (2) University of Michigan Department of Health Management & Policy (Ann Arbor, United States of America)

**Background:** We examined disparities in health outcomes by social class among older adults with diabetes. Using trajectory analysis, we aimed to (1) determine differential health decline associated with socioeconomic status; and (2) examine the correlates of this relationship proposed examined in cross-sectional research (insurance trajectories and health behaviors/adherence to the diabetic regimen). **Methods:** Using a mixed-model approach, we examined trajectories 14-year Health and Retirement Study data (n=1903) on health outcomes (self-reported global measure and ADLs/IADLs) with three measures of social class: (a) educational attainment; (b) reported childhood SES; and (c) an income/wealth composite variable. We triangulated qualitative and life history calendar data from a small, community-based sample of older adults with diabetes (n=30) to elaborate on trajectory shapes by measures of social class and to examine the causal pathways underlying relationships between different indicators of socioeconomic status and transitional health outcomes. **Results:** Controlling for race/ethnicity, sex, and age, more education, higher reported socioeconomic status during childhood, and greater income/wealth were, for the most part, significantly negatively associated with sharper rates of health decline among diabetics ( $p<.05$ ). Over time, those without a high school degree had 70% decreased odds of better health than high school graduates. College graduates were 187% more likely than high school graduates to report better health. Triangulation with qualitative and life history calendar data confirmed these three findings, preliminary analysis suggests that while insurance status and health behavior/regimen adherence explains a portion of this difference; however, the association remains controlling for those covariates. More specifically, early life conditions, exposure to stressful life circumstances, and less favorable experiences with the health system, and views of health-promoting activities and resources and "luxuries" each arise as themes related to sharper decline in health.

**PD7 886 DEVELOPING RESEARCH MINDEDNESS WITHIN SOCIAL WORK PRACTICE**

A. MURRAY\* (Swansea University, Swansea, United Kingdom)  
J. PHILLIPS(1) - (1) Swansea University (United Kingdom)

Current policy acknowledges the significance of 'evidence-based' social work practice (e.g. The Strategy for Older People in Wales, 2008-2013). The often problematic relationship between research and social work has however been well documented. This paper introduces a project aimed at developing research activity amongst social work within two Welsh, local authorities and is linked to an existing piece of research exploring the development of preventative services for older people in Wales. Within this context, it is argued that creative social work practice should be 'research reliant'. This presentation will consider the development and implementation of a model promoting 'research mindedness' amongst social work practitioners. Social workers were brought together within each agency to consider the tasks implicit in their developing 'research mindedness'. Discussion was focussed upon the currently perceived relationship between research and social work and the justifications for research use. Participant observation and staff interviews were used to obtain information regarding initial levels of and attitudes towards research involvement amongst members of the group and to evaluate the project as it progressed. A grounded analysis of findings was undertaken and used to develop the specifics of the 'research-practitioner' model. Difficulties were encountered in terms of implementing the model, particularly in terms of engaging social workers. Practitioners expressed concerns about the additional time needed to participate in research activity. Findings suggest the potential for capacity related issues to significantly influence the level of research engagement amongst social work staff. This paper will evaluate the impact of the model overall (through identifying increases in research activity and understanding). Analysis of findings will support a clearer understanding of the factors that both support and inhibit the development of evidence based social care.

**PD7 887 ADVERSE EFFECTS OF PUBLIC MANAGEMENT IN THE FIELD OF ELDER CARE**

K. ÖSTMAN \* (The Institute for evidence based social work practice , Stockholm , Sweden)

**Introduction** The starting point in this study is that the knowledge base of elder care doesn't fit easily with either the normative ideals of the public sector, nor with care managers' ambition to develop a professional knowledge base that can be separated from political decision making. Elder care research has shown that political decisions on values, preferences and entitlements are crucial for the effectiveness of interventions and therefore an unavoidable part of elder care practice. Methods and materials In this study public management solutions in Swedish practice are used to develop a theoretical discussion on elder care professionalism based on 1) intervention research that has highlighted the importance of taking the clients' values into account in order for work practices to produce good effects 2) examples of decision making in Swedish elder care on how intervention research is used in practice. Results Policy makers are adjusting management solutions to the organisational ideal of separating political and professional decision making. Precedence can't be given to contextual and ethical logics of care work even though this is documented as effective in intervention research and has high legitimacy among care managers. The normative ideals of the public sector support care managers striving for a professionalism that can be separated from political decision making. This has consequences for the effects of work practices for clients. Conclusion Public management solutions serve care managers' interest of professionalization rather than their ability to use the knowledge base of elder care in order to produce good effects for clients. The political character of professionalization needs to be addressed by methodological developments of elder care research and deliberative approaches to elder care practice.

**PD7 888 CAN THE CONCEPT OF**

S. MOFFATT\* (Institute of Health and Society, Newcastle upon Tyne, United Kingdom)  
P. HIGGS(1), I. REES JONES(2) - (1) University College London (London, United Kingdom); (2) Bangor University (Bangor, United Kingdom)

**Introduction:** In the UK, as in many other advanced welfare states, the state mechanisms that formerly operated to provide security in later life are subject to challenge and change. At the same time, achieving security in old age is increasingly seen as an individual responsibility with many different possible outcomes. Many older people who were the beneficiaries of a universalist approach to health and social security across their life course now face markedly different approaches to health and social care provision and pension entitlement as well as forms of social security based around consumerist modes of delivery. This paper will outline the experiences of people with long-term health conditions aged over 60 living in North East England and examine the reasons why they did not claim their full UK state benefit entitlements. Methods: 25 people aged over 60 were purposively sampled from a larger quantitative study on health and welfare benefits from four family doctor practices in Newcastle upon Tyne. Semi-structured interviews were undertaken with participants to establish whether they were receiving their full state benefit entitlement and to assist those who were not. Results: Fourteen of the 25 participants were entitled to, and received, a financial award (median income gain £57, €84, \$101), yet prior to the study none of these participants were aware of their entitlements, nor actively claiming them. Conclusions: We suggest that the apparent lack of take up of entitlements among this group of older people can be conceptualised in terms of a generational 'welfare habitus' which helps explain how the relations of social structure and individual practice accumulate over the lifecourse to influence the ways in which people interact with the welfare system in later life.

**PD7 889 RACIAL AND ETHNIC DISPARITIES BETWEEN RESIDENTS AND CAREGIVERS AND ABUSE AND NEGLECT IN MARYLAND NURSING HOMES**

C. THOMAS\* (Westat, Rockville, United States)  
P. SILVA(1), G. SIMPSON(2) - (1) Westat (Rockville, United States of America); (2) Morgan State University (Baltimore, United States of America)

**Introduction** Studies of nursing homes have not taken account of the full set of factors that affect the extent to which long-term residents are free from abuse and neglect and are satisfied with their living conditions. Research tends to focus narrowly on only a few circumstances that influence the functioning of nursing homes, such as staff characteristics, type of institution, or kinds of residents, but neglects issues such as race and ethnic disparities between residents and staff. Because many residents are not able to speak effectively for themselves, true rates of abuse and neglect are unknown. Methods and materials We have conducted a pilot study of two nursing homes in Maryland in preparation for a representative, state-wide study to measure the levels of satisfaction and the extent to which residents experience abuse and neglect, and important underlying factors such as race and ethnicity of residents and caregivers. Maryland, compared to other states, has one of the highest proportions of Black nursing home residents. The study involves interviewing nursing home administrators, nurses, nursing assistants, and residents or their family members. We have tested survey instruments and reviewed procedures for conducting the study. Results Pilot study participants have recommended that we: o Obtain endorsements from key state officials to persuade reluctant nursing homes to participate. o Visit each home to explain the study purposes and plans for data

collection. o Design questionnaires to follow the format and measurement units of reports that administrators already complete for state and federal agencies. o Do not offer cash payments or gifts, except, perhaps, for Nursing Assistants. o Report the study results to administrators and staff and conduct training at the nursing home on lessons learned. Conclusions A study of nursing homes, focusing on resident satisfaction, racial disparities and abuse and neglect, is feasible.

**PD7 890 UNDERSTANDING AND INTERPRETING THE SUGGESTED MODELS FOR GROWING OLD IN PUBLIC POLICY: MAKING THE INVISIBLE VISIBLE**

A. GRENIER\* (McGill University, Montreal, Canada)  
S. BIGGS(2) - (2) Kings college London (London, United Kingdom)

**Introduction:** Issues of late life are currently subject to debate and policy reform that can impact the shape of what it means to be old in Western society. However, at present, there is a limited understanding of the models that underlie policies on aging and how policy responses contribute to shaping the social expectations of late life. Methods: In this paper we use theoretical approaches derived from cultural studies and object relations (psychodynamic) to examine trends in contemporary policy that are visible and less visible. Drawing on the archaeology and genealogy of Foucault and the unthought and unintended of Bollas, we will clarify some of the steps needed to operationalize the discussion around the hidden or subjugated messages within international, national and local policy discourse on aging. Results: The paper outlines a guideline for approaching policy texts on aging. To better illustrate our method and highlight the more overt and unexpressed messages within policy documents we will provide illustrations of change over time and geographic difference. Within each, we ask ourselves why these shifts are occurring, why now, and reflect on the implications of each. Conclusion: Making the invisible visible through this type of analysis may lead to approaching and understanding the ways in which ageing and notions of late life are shaped and sustained by public policy. It may then lead us toward developing policy models that better reflect the diversity of older people's lived experiences.

**PD7 891 IS LESS SOCIAL PARTICIPATION BY OLDER PEOPLE ASSOCIATED WITH LOWER SUBJECTIVE WELL-BEING?**

C. VAN CAMPEN\* (Netherlands Institute for Social Research / SCP, The Hague, The Netherlands)  
J. IEDEMA(1) - (1) Netherlands Institute for Social Research / SCP (The Hague, The Netherlands, )

**INTRODUCTION:** In many countries, governments pursue a policy of offering older persons greater opportunities for participation in society, based on the assumption that this will also improve their subjective well-being. Currently, however, it is not known whether this assumption is valid. **METHODS:** In this study we relate the social participation and the subjective well-being aspects of both older and younger persons to an array of social and health-related determinants. Linear structural equation modelling of data of a sample selection of the Dutch population is analysed. The sample size is 5,826, including 847 respondents of 65 years or more. **RESULTS:** In terms of social participation, older people participate less in work, cultural and leisure activities than younger people. When it comes to subjective well-being, we find that older people with physical disabilities are more likely to lag behind in perceived physical health than in mental health and happiness. In a multivariate model relating objective participation to subjective health and happiness, correlations are much weaker than expected. We find that the severity of physical disability, in interaction with age groups, plays a central mediating role in explaining the associations. **CONCLUSION:** It is striking to find that social participation, perceived health and happiness are much less closely related than is often assumed. Their determinants differ widely in nature and strength. The empirical model leads to rejection of the hypothesis that more participation by older people is associated with higher subjective well-being.

**PD7 892 UNDERSTANDING THE EVERYDAY EXPERIENCES OF LOSS IN LATE LIFE**

I. FERRER\* (McGill University, Montreal, Quebec, Canada)  
A. GRENIER(1) - (1) McGill University (Montreal, Canada)

**Intro:** Normative ideas of age and stage-based transitions are inherent within research and thinking about aging. However, while larger conceptual and practice models take experiences such as decline for granted, they reflect less on the ways in which older people may interpret and subjectively interpret decline. In particular, how issues of loss and depression may impact older people's late life transitions. Most research tends to focus on acute loss and depression rather than the ways in which loss and depression may be experienced across the lifecourse and thereby integrated into older people's assessments of their lives. **Method:** This poster discusses the theme of loss identified within data from the Late Life Transitions Project; a Social Sciences and Humanities Research Council funded research project. This poster reflects on 30 qualitative interviews conducted with community-residing seniors from diverse social backgrounds in Montreal. Data were collected and analyzed using narrative analysis with the intention of better understanding the types of loss that older adults encounter on a daily basis. **Results:** Findings presented are

related to the types of loss, responses/reactions, and coping strategies used to integrate loss into experiences of aging. Our results suggest that older people's everyday experience of loss center on the loss of spouse, shifting identities and cognitive decline. Narrative excerpts will be used to illustrate the discussions made by older people as they situate themselves, and address their everyday experience of loss in later life. Conclusions: Such discussions inform professional understandings of loss in late life, and may provide guidance to plan interventions that are more relevant to older people's experiences. More importantly, they frame experiences of loss and decline along the normative ideas of age and stage based transitions, giving us better insight on older people's experiences in late life.

**PD7 893 HOW DO ELDERLY PEOPLE LIVING AT HOME PERCEIVE ASSISTANCE IN MEDICINE MANAGEMENT?**

Å. CRAFTMAN\* (Karolinska Institutet, Stockholm, Sweden)  
E. VON STRAUSS(1), M. WESTERBOTN(2) - (1) Karolinska Institutet (Stockholm, Sweden); (2) Sophiahemmet University College (Stockholm, Sweden)

Introduction. Aging is frequently accompanied by chronic conditions and multimorbidity, resulting in higher use of medication. Furthermore, a majority of elderly persons live at home, and often have cognitive, visual or physical limitations that may decrease their ability to take medicines accurately, which makes taking prescribed drugs a complex task. The aim of this study was to describe the elderly person's perception in achieving assistance with their medication, and how this influences their autonomy. Methods and materials. This qualitative study involved audio-taped interviews with 25 persons aged 85+ years. Inclusion criteria were: being cognitively intact (Mini-Mental State Examination >23), living at home, and taking medicines regularly. Data was collected in Stockholm, Sweden, in May-June 2005, and analysed using content analysis. Results. Findings revealed that most participants who received help with their medication management were very pleased with that help. However, lack of trust in the medical service, was also described by some of the elderly persons. This distrust lead them to not follow their medical treatments. The most important components for older people were to have good cognitive ability, to be independent, and to get support with their medicines from a close person as a back up. Conclusion. The results indicate that even though a majority of the participants were very pleased with their medicine management, there was, however, a need for assistance in delivering the medicines to their homes. To observe the life of an older person as a whole is important in nursing care, so that the person's behaviour can be understood, since how older people manage to handle their medicines may have an impact on their autonomy and on health-care resource utilisation. Without proper medication many of them would not function well and would not be able to remain at home.

**PD7 894 SOCIAL CAPITAL AMONG THE ELDERLY: IMPLICATIONS FOR PHYSICAL AND MENTAL HEALTH**

J. NORSTRAND\* (Boston College, Chestnut Hill, United States of America)  
A. GLICKSMAN

Introduction: The importance of aging in place is becoming increasingly acknowledged as growing number of people reach old age. However, we still have limited understanding of how the social environment impacts the elderly. Goal: This paper examined the relation of individual level social capital, defined as the perception of neighborhood, to health outcomes, (self-rated health and depressive symptomatology). Method: Community health survey collected in 2006 by the Public Health Management Corporation provided a sample of 3219 elderly (60 years and over) living in Philadelphia and 4 surrounding counties. Factor analysis and summary scores provided three social capital constructs (neighborhood, social networks and participation). Step-wise linear regression modeling was carried out with socio-demographic predictors (age, sex, education, minority status) in first step and three social capital constructs in the second step. Results: Neighborhood and participation social capital constructs were unique predictors of physical health outcomes whereas neighborhood and social network social capital constructs were unique predictors of mental health outcomes even when socio-demographic indicators were accounted for. Regression models explained 13% and 9% of the variance for both physical and mental health outcomes, respectively. Conclusions: Findings suggested that key aspects of social capital were important for both physical and mental health among the elderly. As little has been done looking at social capital among older adults, this study furthers our understanding of how older persons relate to their social environment in terms of physical and mental health.

**PD7 895 WHY IS EVERYONE AT THIS CLINIC AGED 30 TO 40? USING LIFE COURSE PERSPECTIVE TO UNDERSTAND HOMELESSNESS**

A. OUDSHOORN\* (The University of Western Ontario, London, Canada)  
C. WARD-GRIFFIN(1), H. BERMAN(1), C. FORCHUK(1), B. POLAND(2) - (1) The University of Western Ontario (London, Canada); (2) University of Toronto (Toronto, Canada)

Introduction: In a study of a homeless clinic in Ontario, Canada we were intrigued to find that a strikingly significant majority of the homeless clients were aged 30 to 40. In this presentation we will use Elder's Life Course Perspective to help understand the observed phenomenon. This observation challenges the notion that homelessness is entirely of one's

own making, otherwise the age demographics of homeless clients would mirror the general population, and points more towards what Elder terms Institutionalized Pathways. Methods: In this study we conducted a critical ethnography of a community health clinic for people who are experiencing homelessness. To do so, we utilized multiple, concurrent methods, including in-depth interviews with homeless clients of the centre. These interviews, based on a semi-structured, narrative-focused design, provided us with insight into the life histories of homeless persons from a variety of backgrounds. Findings: Elder's Life Course Perspective involves three components of 'Institutionalized pathways and social aggregates', 'Personal life course', and 'Developmental or aging trajectory'. Although 'Personal life course' played a role in individuals' pathways into homelessness, the narratives that homeless participants told shed much more light on oppressive structures. Particularly, what Elder terms 'Institutionalized pathways' involved stagnant social assistance rates, national housing policy changes, a service gap after the age of 25, and changes to the mental health care system. In this presentation we will explore these Institutionalized pathways and suggest an explanation for the limited age demographic of homeless persons in Ontario, Canada that involves the intersectionality of other factors beyond biological age. Conclusion: Particularly, Life Course Perspective offers a means to conceptualize homelessness in a way that involves an understanding of oppressive social structures, in addition to personal agency.

**PD7 896 ELDER ABUSE: A CANADIAN APPROACH TO MEASURING PREVALENCE**

C. WALSH\* (University of Calgary, Calgary, Canada)  
G. DAOUST(1) - (1) Faculty of Social Work, University of Calgary (Canada)

A recent Expert Roundtable on Elder Abuse in Canada identified the critical need to collect data on the prevalence and incidence of elder abuse to inform policy development. International estimates of elder abuse vary; Canadian data is almost non-existent. The lack of empirically tested standardized instruments is a critical impediment to this aim. This presentation discusses the development and validation of The Elder Abuse Questionnaire. Methods: Fifteen focus groups which provided conceptualizations of elder abuse from less frequently heard older adults and care providers and a survey of published instruments served as a foundation for developing a culturally-appropriate instrument that includes a broad range of types of abuse. The pilot instrument was assessed by community residing older adults (n=50) with and without victimization histories in group and individual interviews. Test-retest reliability of the instrument is currently being assessed by calculating intraclass correlation coefficients for each of the items at two week intervals with questionnaires administered to older adults (n=125) in four urban centres across Alberta, Canada. Internal consistency reliability and homogeneity of the questionnaire will be calculated for each of the major forms of abuse with Cronbach's alpha. Criterion validity is assessed through Kappa coefficients comparing clinical assessment for the presence or absence of each of the major domains of elder abuse with the questionnaire self-report of abused older adults (n=50). This sample is also used to assess construct validity by comparing the presence or absence of each of the major categories of abuse on instrument to the Vulnerability to Abuse Screening Scale (VASS) using a two-way Anova. Results: Psychometric properties of the instrument will be presented. Conclusion: This instrument is intended to provide population-based estimates of the prevalence and determinants of elder abuse to inform policy, service and research.

**PD7 897 SOCIAL DETERMINANTS OF OLDER ADULTS KNOWLEDGE OF COMMUNITY SUPPORT SERVICES**

M. DENTON\* (McMaster University, Hamilton, ON, Canada)  
T. JOSEPH(1), J. PLOEG(2), J. LILLIE(1), B. HUTCHINSON(2), N. AKHTAR-DANESH(2), K. BRAZIL(2), J. MILLEN PLENDERLEITH(2) - (1) University of Guelph (Guelph, Canada); (2) McMaster University (Hamilton, Canada)

Introduction: Community Support Services (CSSs) have been developed in Canada and other Western nations to enable persons coping with health or social problems to live in their own homes. This paper addresses to what extent is knowledge of CSSs structured by the social determinants of health. Methods: In a telephone interview, 1152 older adults were read a series of vignettes and asked if they were able to identify a CSS they may turn to in each situation. Binary logistic regression was used to determine factors related to knowledge of CSSs. Results: Significant determinants of knowledge of CSSs include: age, with older age groups having slightly less knowledge of CSSs; gender, with females more likely to have knowledge of CSS; and income, with higher income groups having a greater likelihood of knowledge than lowest income levels. Perceived social support increases the odds of having knowledge of CSSs. Both membership in organizations and number of information sources that a person could name are significant predictors of the odds of having knowledge of CSSs. Conclusion: Our results confirm and update the literature, especially with regard to gender. Further, these research results underscore the breadth and depth of the social determinants of health as important indicators of people's differential ability to exercise some control over the health futures of themselves and the people they care for. Thus, in a health promotion model where good health is more than the absence of disease, what matters is the ability to marshal resources to maintain independence in an interdependent social support network. People who have scored highly on the social

determinants of health are best positioned to be able to independently call on CSSs when in need.

**PD7 898 DEVELOPMENT OF PROTOTYPE RESIDENCE UNITS OF FEE-CHARGED WELFARE HOUSING FOR THE AGED IN KOREA**

T. KIM\* (Major of Architectural design, Jeju-Shi, Jeju Special self-Governing Province, Republic of Korea)

This study brings a focus on the development of prototype residence units of fee-charged welfare housing for the aged through a comparative analysis in Korea and Japan. Accordingly, its purpose is to develop the prototype residence units on the basis of fundamental data collected from the plan of fee-charged welfare housing for the aged in Korea in terms of its construction scale and functional features. As for data from Japan, architectural plans or brochures were collected from 32 out of 100 institutions that had been selected out of 270 fee-charged welfare housing institutions for the aged in Japan. As for data from Korea, plans from 7 out of 8 institutions were analyzed. Its data and analysis are as follows. First, the area of each section of an institution was calculated after its scale was adjusted in order to have a more accurate analysis on the scale of each section of the institution. And the feasibility of data was examined by comparing the area with the gross floor area stated in the publication of Japan Fee-Charged Housing for the Aged. The analysis of data is composed of the appropriate area of a housing unit, composition of its space, comparison of its rooms and study on its appropriate area. According to the result of the analysis, Prototype A ( $50m^2$ ) and Prototype B ( $65m^2$ ) were recommended in consideration of its appropriateness, spatial function, and circumstances in Korea. Type A ( $50m^2$ ) has a bedroom, kitchen, dining room and bathroom designed for one aged couple or one aged person. Type B ( $65m^2$ ), in contrast to Type A, is spacious and composed of 2LDK that can be converted appropriately. And also we will propose amendment of welfare law for the aging in Korea to be spread prototype Residence Units.

**PD7 899 FEARS AND FEARS COME TRUE: THE EXPERIENCES OF OLDER CARE RECIPIENTS OF LIVE-IN FOREIGN HOME CARE AND THEIR FAMILY MEMBERS**

L. AYALON\* (Bar Ilan, Ramat Gan, Israel)

**OBJECTIVES:** Foreign home care services provided to frail older adults by individuals from the developing world is a global phenomenon. This study evaluated the challenges associated with live-in foreign home care from the perspective of older care recipients and their family members. **METHODS:** Qualitative interviews with twenty-three family members and seven older care recipients. Interviews were analyzed thematically. **RESULTS:** Three main themes were identified. The first theme concerned the intense fears associated with witnessing the decline of the older care recipient and the subsequent employment of a foreign home care worker. The second theme concerned the actual negative experiences within this caregiving setting, whereas the third theme concerned ways family members and older care recipients coped with these challenging experiences. **CONCLUSIONS:** A major challenge to this caregiving arrangement is the establishment of trust. Yet, many experienced violations of trust that resulted in abuse and neglect, which further intensify fears and concerns about this caregiving arrangement. The same coping methods used to maintain this arrangement, despite fears and concerns are the ones responsible for maintaining the older care recipient in an abusive situation.

**PA8 001 NEURONO-GLIAL LIPOFUSCINO- AND CEROIDO-LYSIS - NEW BRAIN LONGEVITY WAYS IN ANTI-AGING MEDICINE**

D. RIGA\* (Al Obregia Clinical Hospital of Psychiatry, Bucharest 8, Romania)

S. RIGA(1), V. PAIS(2), L. DANAILA(2), D. MOTOC(3), L. MOS(3), F. SCHNEIDER(3) - (1) Dept Stress Res & Prophylaxis, Al Obregia Clinical Hospital of Psychiatry (Bucharest, Romania); (2) Dept Vasc Neurosurg, Natl Inst Neurol & Neurovasc Dis (Bucharest, Romania); (3) Center Appl Physiol & Mol Biol, V Goldis Western University (Bucharest, Romania)

Introduction Lipopigments (LPs) - lipofuscin and ceroid - the main hallmark of brain vulnerability, chronic distress, senescence and connected pathology, progressively accumulate during ontogenesis, in both neurons and glia of mammalian brains. Therefore, neuronal and glial lipofuscino- and cerido-lysis, followed by glial LPs taking over, processing and transport, with capillary elimination can represent an efficient anti-aging and regenerative therapy. Methods Different rat brain regions of CO (control old) and TO (treated old) groups were investigated by qualitative and quantitative microscopy (light, fluorescence and electron microscopy). TO group received for 2 months a specific and original (patented) anti-aging and rejuvenation therapy (AA-R T), with synergistic neurometabolic, antioxidative, lipofuscino(cerido)-lytic, neurovascular and nootropic actions. Results In CO group, neurons and all types of glia (astrocytes, oligodendrocytes,

but especially microglia) are filled with important LPs storages, having regional specificity. Thus, the glial paradox appears in brain senescence and aged-related pathology. Neuroglia - mitotic cells (having moderate-to-high rate of divisions) are overloaded with LPs conglomerates, up to 90% (characteristic of neurons - post-mitotic cells), other than phagocytic-degraded neuronal apoptotic bodies. In this way, the glial systems play an important role in the collection of neuronal LPs. Owing to the transporting properties, and migration capacity of microglia, glial cells deposit the LPs clusters in pericapillary areas. These natural purge mechanisms are activated and completed by AA-R T long term administration. In addition, neuronal and glial LPs suffer qualitative (disruption and dissolution) and quantitative (reduction) changes, with regional peculiarity. Moreover, therapeutic-activated glia (particularly microglia) turn into brain garbage (LPs) collectors, processors and transporters, with final elimination from endothelial cells into capillary lumen. Conclusion AA-R T represents a new prospect in the deceleration of normal and pathological cerebral aging, with increase of neuronal health and longevity.

**PA8 002 BRAIN AND SPLEEN OF LONG-LIVING MICE SHOW SIMILAR PROTEIN OXIDATION MARKERS TO THOSE IN ADULTS**

M. DE LA FUENTE\* (Hospital Universitario La Paz, Madrid, Spain)

A. LORENA(3), A. NAUDÍ(1), R. PAMPLONA(1), A. HERNANZ(2) - (1) Department of Experimental Medicine, Faculty of Medicine, University of Lleida (Lleida, Spain); (2) Department of Biochemistry, Hospital Universitario La Paz (Lleida, Spain); (3) Department of Animal Physiology II, Biology Faculty, Complutense University (Lleida, Spain)

**Introduction:** The aging process is result of an oxidant/antioxidant imbalance and accumulation of oxidative end-products that leads to functional loss. Thus, aging is accompanied by impairment of the nervous and immune systems, as well as of their bidirectional communication. This could explain the loss of homeostasis, and the age-related morbidity and mortality. In this context, it is of great interest to study the oxidation levels in long-living subjects, to understand why those individuals achieve very old age in good health. **Methods:** Adult ( $28\pm 4$  weeks), old ( $76\pm 4$  weeks) and very long-living ( $128\pm 4$  weeks) Balb/c female mice were used. They were sacrificed, and brain and spleen were removed. Specific markers of protein oxidation, lipoxidation and glycoxidation, namely glutamic semialdehyde (GSA), aminoacidic semialdehyde (AASA), carboxyethyl-lysine (CEL), carboxymethyl-lysine (CML) and malondialdehyde-lysine (MDAL), were measured by gas chromatography-mass spectrometry. **Results:** The results showed similar protein oxidation in both brain and spleen from adult and long-living animals, with the exception of AASA in proteins from brain, which was decreased in the long-living as compared to adults. Conversely, all oxidative markers in brain were increased in the old age with the exception of AASA. These changes with age were less marked in spleen, where all protein alteration markers showed an increasing trend, which was significant only in the case of MDAL. Conclusion: Controlled protein oxidation in brain and spleen, leading to preserved function, could be a key mechanism for the achievement of healthy aging and longevity. Accumulation of oxidized proteins over time occurs earlier in brain than in spleen, which might show that the nervous-immune impairment that takes place during ageing could begin in the brain. Support: MICINN (BFU2008-04336) and UCM Research Group (91037ENEROINN) grants. RETICEF (RD06/0013/0003).

**PA8 003 CHANGES IN CHYMOTRYPSIN- AND CASPASE-LIKE ACTIVITIES OF THE 20S PROTEASOME WITH AGING AND LONGEVITY**

M. DE LA FUENTE\* (Complutense University of Madrid, Madrid, Spain)

S. RATTAN(1), L. ARRANZ(2) - (1) Aarhus University. Danish Centre for Molecular Gerontology (Aarhus, Denmark); (2) Complutense University (Madrid, Spain)

Damage to macromolecules that occurs with aging is corroborated by accumulation of oxidative end-products, such as oxidized proteins, which leads to functional loss. In addition to increased protein oxidation over time, decreased protein turnover could also take place and contribute to this accumulation of oxidatively modified proteins. The 20S proteasome is the complex in charge to actively recognize and degrade these products. However, controversial results have been described on the changes in its activity with age. Moreover, it is of great interest to study the 20S proteasome activity in long-living subjects, for understanding why those individuals achieve very old age. **Methods:** Balb/c female mice of different ages: adult (30 weeks), old (80 weeks) and long-living (130 weeks) animals, were used. They were sacrificed, and heart, liver, lungs, kidneys, axillary nodes and peritoneal leucocytes were obtained. Chymotrypsin- and caspase-like activities of the 20S proteasome were investigated by enzymatic fluorometric kinetic assay. The results demonstrate better preservation of both enzymatic activities in long-living than in old subjects, with respect to the adults. Changes in old age show interesting particularities depending on the organ or even the enzymatic activity considered. Whilst the activity of the 20S proteasome decreases in heart and lungs, other localizations show no changes (axillary nodes) or even increased function (liver, peritoneal leucocytes). In kidney, chymotrypsin-like activity decreases with age, whereas caspase-like activity increases. Conclusion: The aging process is not linked to a general decrease in the 20S proteasome activity. Nevertheless, the changes in this activity could contribute to the accumulation of oxidized proteins in certain localizations. Moreover, the maintenance of adult-like activity of the 20S proteasome seems to be a marker for achievement of healthy

aging and longevity. Funding: MICINN(BFU2008-04336), UCM Research Group(910379ENEROINN), RETICEF(RD06/0013/0003).

**PA8 004 THE LONGEVITY OF SPONTANEOUS DWARF RAT (SDR) AND A POSSIBILITY OF A NEW ANIMAL MODEL FOR AGING RESEARCH**

T. SHINKAI\* (Tokyo Metropolitan Institute of Gerontology, Tokyo, Japan)  
K. KAZUNAO(1), K. TAKAO(1), T. SHOICHI(1), S. TORU(1), M. SHIGENOBU(1),  
K. HIROSHI(2) - (1) Tokyo Metropolitan Institute of Gerontology (Tokyo, Japan);  
(2) University of Human Arts and Science (Saitama, Japan)

Spontaneous Dwarf Rat (SDR), a dwarf rat strain derived from Sprague-Dawley (SD) rats, is an experimental model for pituitary dwarfism and has growth hormone (GH) deficiency. The body weight of SDRs reduces to one-third that of normal SD rats. There are a few articles that dwarf mice (e.g. Snell and Ames mouse) have a tendency to prolong their lifespan. In order to reveal the relationship between the dwarf rat and longevity, we investigated lifespan, various hormones associated with metabolism and age-related diseases in SDRs. The mean lifespan of SDRs were 29.3 ± 3.3 months in male and 26.8 ± 5.3 months in female. They were increased by 20-40% in males and 10-20% in females, comparing to the reported longevity data of SD rats. The concentration of GH was significantly lower in SDRs than in SD rats. Both IGF-1 and insulin levels were also decreased compared to SD rats. Moreover, the concentration of thyroxin showed 70% reduction from SD rat level. Comparing to the reported pathological data of SD rats, the pathology of SDRs was characteristic in pituitary and mammary tumor decreases, severe chronic nephropathy decrease, and incisor malocclusion and cerebral hemorrhage appearances. The greater part of chronic nephropathy cases was of mild degree. Our findings suggest that changes of these metabolism-associated hormone levels and decrease of age-related diseases may prolong the lifespan of SDRs. Therefore, SDRs, with different characters in endocrinology, longevity, and pathology from those of SD rats, are considered to have a possibility of a new animal model for an aging research.

**PA8 005 COMPARISONS OF CHARACTERISTICS OF "DELAYER" AND "SURVIVOR" AMONG CHINESE OCTOGENARIANS IN TAIWAN**

L. LIU\* (Center for Geriatrics and Gerontology, Taipei Veterans General Hospital, Taipei, Taiwan)  
L. CHEN(1), S. HWANG(1), C. LAN(2) - (1) Center for Geriatrics and Gerontology, Taipei Veterans General Hospital (Taipei, Taiwan); (2) National Yang-Ming University Institute of Health Welfare and Policy (Taipei, Taiwan)

Introduction Longevity studies used to classified older people into "escaper", "delayer" and "survivor", which represent different characteristics in the follow-up. Similar studies in Taiwan are lacking. The main purpose of this study is to compare clinical characteristics of Chinese octogenarians and to evaluate clinical outcomes among them in one-year follow-up. Methods and Materials Residents aged over 80 years of Banciao Veterans Care Home were invited for study and were enrolled when they were fully consented. Inter-RAI Minimum Data Set Nursing Home 2.0 Chinese version (MDS-NH 2.0) was implemented for all participants. "Delayer" and "survivor" were defined according to their disease history. Physical functional status, cognition and mood were compared between both groups. Clinical outcomes (mortality, hospital admissions and emergency department visit) were compared. Results In total, 336 residents were enrolled (mean age= 84.4 ±4.0 years, all males) for study. Overall, 108 participants (32.1%) were delayers and 228 (67.9%) were survivors. Delayers were more physically independent than survivors (96.3% vs. 88.2%, P=0.15). However, comparisons of age, cognition (evaluated by mini-mental status examination) and depressive moods (evaluated by geriatric depression score) between groups were similar. In clinical outcome evaluation, delayers were less likely to be hospitalized (0.3±0.04 vs. 0.43±0.03, P=0.02). However, the comparisons between one-year mortality and emergency department visit were similar. Conclusions Among Chinese octogenarians in a veterans care home in Taiwan, delayers were more physical independent and less likely to be hospitalized in 12-month follow-up. However, mental status, mortality and emergency department utilization were similar. A long-term cohort observation study is needed to clarify the roles of delayers and survivors in longevity study.

**PA8 006 PARENTAL LONGEVITY INFLUENCES ON MORTALITY TRAJECTORIES IN HUMANS**

L. GAVRILOV\* (University of Chicago, Chicago, United States)  
N. GAVRILOVA(1) - (1) NORC and the University of Chicago (Chicago, United States of America)

Introduction. Positive effects of paternal and maternal longevity on offspring's lifespan are well established. However little is known about effects of parental longevity on the shape of offspring's mortality trajectories. Methods and materials. To address this problem, we studied familial transmission of human lifespan from parents to offspring using particularly reliable and complete data on European aristocratic families for extinct birth cohorts (born 1800-1880). Mortality of four categories of offspring was analyzed: (1) having long-lived parents (both parents lived 80 years or more); (2) having short-lived parents; (3) having long-lived father and (4) having long-lived mother. The cutpoint (80 years) was selected based on our previous results showing significantly higher heritability of lifespan after

parental age equal to 80 years. Parameters of Gompertz model were calculated for adults survived to age 40 years and over using Stata streg procedure. Results. Mortality in all groups of offspring demonstrates a convergence at older ages for both sexes. The intercept parameter of Gompertz model is increasing and the alpha parameter (actuarial aging rate) is decreasing with decreasing longevity of parents. The lowest intercept parameter and the highest actuarial aging rates are observed for sons and daughters of long-lived parents. Offspring with one long-lived mother and one long-lived father have intermediate values of intercept and slope Gompertzian parameters. Conclusion. Although children of long-lived parents have lower mortality at younger ages, their actuarial aging rate is consistently higher compared to the children of short-lived parents. Thus, the familial advantage in lifespan practically disappears at ages over 100.

**PA8 007 SOME BIO-GERONTOLOGICAL PECULIARITIES OF LONG-LIVERS IN AJARA REGION OF GEORGIA**

R. KHUKHUNAISHVILI\* (Shota rustaveli state university, Batumi, Georgia)  
M. KORIDZE(1), M. NAGREVADZE(1), N. ZOSIDZE(1), I. CHARKVIANI(1) - (1) Shota rustaveli state university (Batumi, Georgia)

The phenomenon of longevity is greatly dependent upon the natural and social environment rather than being only genetically determined. Therefore, the investigation of the issue requires a comprehensive approach. At present, under way is an energetic research to identify age biomarkers of different types, to study age-related diseases, etc. Long-livers over 90 years of age in Ajara region (Southern Georgia), 60 persons in total, of whom 47 were women, were studied. Investigated were the long-livers' genealogy, gender ratio and reproductive capacity, also studied was the spread of blood group antigenic markers in long-livers. According to literary data, the frequency of the ABO system marker genes is definitely associated with the age dynamics. The first-group carriers are less liable to dangerous diseases currently spread in the world. An experiment to reveal an association of blood group antigens with longevity was carried out. Blood group antigens used to be studied by means of an immunochemical technique. Incidence of the said antigens in long-livers was compared to the respective indicator in the Adjarian population. It can be said that the longevity of the people under study is genetically conditioned, since 76% of them had one long-liver (91 year of age and over) parent. The genealogical method established that the absolute majority of the investigated long-livers are from numerous families and that about third of them are the fourth child of the family. All the studied had a stable partner during a long-term and happy matrimony. The most stressful event in their lives they consider the decease of the spouse. Irrespective of the fact that both very early and late marriages are observable in the long-livers, 66% of them created a family at the age between 18 to 30 years of age. Given local traditions, it implies the first sexual intercourse, especially in women. Notwithstanding the fact that the region is traditionally known for families having many children, 52% of the studied long-livers have less than three children, 80% of which are between 60 to 77 years of age. Particularly noteworthy is that the last delivery in long-living women is fixed at the age over 40 years. The incidence of phenotypic variants in blood group antigens in long-livers differs from the indicator generally found in the population; in long-livers, prevail the individuals – carriers of blood group O(I) -56% A(II) 36%; in the general population the persons – carriers of the said blood group constitute – O(I) -47%, A(II) -26%. The investigated group of long-livers lives in a relatively safe environment though under rather hard social conditions. They are distinguished for cheerfulness, are joyful and well-disposed. It can be said that their longevity to a great extent is conditioned by the hereditary factor; a favorable effect is also rendered by the presence of a stable partner and family environment, as well as the reproductive period length. As regards the frequency/incidence of blood group antigens, we can, based on the study data, conclude that the O(I) and A(II) blood antigens are in a definite correlation with longevity.

**PA8 008 METHYLATION STATUS AND AGEING; FINDINGS FROM THE BELFAST ELDERLY LONGITUDINAL FREE-LIVING AGEING STUDY (BELFAST)**

I. REA\* (Queens University Belfast, Belfast, United Kingdom)  
M. DALLET(1), S. MCNERLAN(2), A. MURPHY(1), K. MILLS(1) - (1) Queens University Belfast (Belfast, United Kingdom); (2) Belfast City Hospital (Belfast, United Kingdom)

Introduction: DNA methylation helps stabilise chromatin and silences genes, whereas hypomethylation may lead to genomic instability and enhanced gene promoter activity. Because epigenetic alterations in gene expression, that do not involve coding sequence modifications, can accumulate with age and are associated with some age-related disorders, including cancer, we assessed the degree of global methylation and methylation of the P16 suppressor gene in healthy octo/nonagenarians from the Belfast Elderly Longitudinal Free-living Ageing Study (BELFAST). Methods: We used bisulfite treatment of DNA and simultaneous PCR of multiple DNA repetitive elements, as a measure of global methylation (Line 1) and methylation of P16, a tumour suppressor gene, in DNA separated from 40 subjects (70- 99 years), from the BELFAST study and compared these with 36 patients (70-89 years) with leukaemia. Results: There was almost 90% global methylation for octo/nonagenarian subjects, with no difference between subjects aged 80-90 years and 90-99 years, nor between the sexes with a good degree of homogeneity. Comparative 70 year old patients with leukaemia had =/ <70% global methylation. By contrast P16, the tumour repressor gene, was only 2% methylated in BELFAST

octo/nonagenarians compared with 12% in older leukaemic subjects. Cluster analysis separated BELFAST octo/nonagenarians completely from leukaemic subjects. Conclusions: Octo/nonagenarians in the BELFAST study showed a high degree of global methylation suggesting genomic stability. The lower methylation of P16 could suggest a more active tumour suppressor role in the 'old old' subjects. Understanding better the signatures in global and candidate gene methylation status may help guide us to pathways underlying the mechanisms for good quality ageing and longevity.

#### **PA8 009 BENEFICIAL METABOLIC PROFILE MARKS FAMILIAL LONGEVITY AT MIDDLE AGE**

D. VAN HEEMST\* (Leiden University Medical Center, Leiden, The Netherlands)  
R. WESTENDORP(1), M. ROZING(1), M. FROLICH(1), S. MOOIJJAART(1),  
B. GERARD-JAN(1), B. MARIAN(1), H. BASTIAAN(1), D. ANTON(1), S. ELINE(1) -  
(1) LUMC (Leiden, The Netherlands)

Introduction-Research in model organisms has identified conserved pathways, most notably insulin/IGF-1 signaling, whose modulation can dramatically extend lifespan, but their relevance for human healthy longevity is controversial. We aim to identify early beneficial features of human longevity. Methods and Materials-Research on human longevity is difficult because so few people reach old age, and when they do, proper controls are lacking. We therefore designed the Leiden Longevity Study, in which we recruited 420 Caucasian families together constituting a cohort of 991 nonagenarian siblings with exceptional familial longevity, 1365 of their offspring, and 621 of the partners thereof. Results-Compared to the group of their partners, the offspring of nonagenarian siblings displayed, already at middle age, a lower prevalence of myocardial infarction (2.4% vs 4.1%, p=0.03), hypertension (23.0% vs 27.5%, p=0.01), diabetes mellitus (4.4% vs 7.6%, p=0.004), use of cardio-vascular medication (23.0% vs 28.9%, p=0.003) as well as lower blood pressure (139.1 vs 144.5 mmHg, p=0.04), lower serum levels of glucose (p<0.001), insulin (p=0.03), LDL- over HDL-cholesterol ratio (p=0.02) and triglycerides (p=0.03) and higher homeostasis model assessment of insulin sensitivity (0.79 versus 0.65, p=0.01). Serum levels of free triiodothyronine (fT3) were also lower in the group of offspring compared to partners (p=0.04), but not the ratio of insulin-like growth factor-1 over insulin-like growth factor binding protein 3 (IGF-1/IGFBP3). Conclusions-We identified insulin sensitivity but not IGF-1 signaling as an early beneficial feature of human familial longevity. Moreover, our data hint at a role of the thyrotroph axis in its regulation.

#### **PA8 010 G-2548A AND G19A LEP, AS WELL AS K109R, Q223R, K656N LEPR POLYMORPHISMS ARE ASSOCIATED WITH HEALTHY EXTREME LONGEVITY**

M. ROSZKOWSKA-GANCARZ\* (Medical Centre of Postgraduate Education, Warsaw, Poland)  
A. KURYLWICZ(2), M. AMBROZIAK(1), J. POLOSAK(1), P. DOBOSZ(1),  
M. OWCZARZ(3), M. MOSSAKOWSKA(3), M. PUZIANOWSKA-KUZNICKA(2) -  
(1) Medical Centre of Postgraduate Education (Warsaw, Poland); (2) Medical Research Center Polish Academy of Sciences (Warsaw, Poland); (3) International Institute of Molecular and Cell Biology (Warsaw, Poland)

Introduction: The length of life depends on the rate of aging and on the presence or absence of age-related diseases, such as cardiovascular disease, type 2 diabetes, and cancer. The risk of their development depends on multiple environmental and genetic factors, including possession of certain variants of various genes. Leptin (LEP) and LEP receptor (LEPR) co-regulate lipid and glucose metabolism. We hypothesize that certain LEP and LEPR polymorphisms might influence health and longevity. Materials and methods: Genomic DNA was isolated from blood mononuclear cells of 148 centenarians, as well as of 414 young controls and of 209 myocardial infarction controls. Genotypes of the G2548A and G19A LEP, as well as K109R, Q223R and K656N in LEPR functional polymorphisms were assessed by RFLP method and correlated with clinical data (non-parametric Mann-Whitney U test). Results: Centenarians possessing the AA genotype of the Q223R LEPR polymorphism had a significantly lower fasting glucose level than the GG and AG+GG carriers (p=0.006 and p=0.0016, respectively). In addition, centenarian carriers of the K656N GG and GG+GC variants had significantly higher HDL level than CC genotype carriers (p=0.03 and p=0.043, respectively). The GG genotype of the G-2548A LEP promoter polymorphism was significantly more frequent (p=0.025), while AA genotype of the K109R LEPR polymorphism was significantly less frequent (p=0.049) in centenarians compared to young controls. We also found that GG and GA genotypes of the G-2548A and AA genotype of the G19A LEP polymorphisms were significantly more frequent (p=0.048), while AA genotype of the K109R LEPR polymorphism was significantly less frequent (p=0.047) in centenarians than in young myocardial infarction sufferers. Conclusion: We conclude that certain variants of LEP and LEPR might influence the length of life, and have an impact on the risk of myocardial infarction.

#### **PA8 011 DETECTING SENESCENCE IN ARCTICA ISLANDICA: THE OLDEST SPECIES KNOWN TO SCIENCE**

I. RIDGWAY\* (Bangor University, Anglesey, United Kingdom)  
C. RICHARDSON(1) - (1) Bangor University (Anglesey, United Kingdom)

Introduction The ocean quahog, *Arctica islandica* is not just the oldest living bivalve, it is also the oldest non-modular, non-colonial animal known to science. With the maximum

life span potential ever increasing and currently standing in excess of 400 years the clam has recently gained interest as a potential model organism for ageing research. The biology, demography and pathology of *A. islandica* is being investigated as part of an ongoing research project which involves a collaboration between marine biologists, demographers and biogerontologists. The aim of this work is to develop the species as a novel model species for ageing research. Although it has gained recent attention from ageing researchers the type of senescence experienced by the species is still to be determined. We will discuss what is known about the biology of *A. islandica*, observed age-associated changes and previous ageing research undertaken on the species and discuss future directions for ageing research with *A. islandica*. Methods Through a combination of approaches including investigating age associated changes on the histology of organ systems, analysis of cellular proliferation rates, resistance of cell cultures to stress, ability to establish cell cultures and demographic analysis of discrete populations we will investigate ageing in *A. islandica*. Results Whilst the investigation is on going preliminary results suggest that reproduction does not decline with age, in fact it increases with the size of the animal which demonstrates indeterminate growth. Demographic analysis provides no evidence of increasing mortality rates with age. Conclusion The type of senescence experienced by *A. islandica* is still to be confirmed. Early results suggest it is a candidate for negative senescence as reproduction appears to increase with size, and therefore age. Investigations into age associated changes in functionality are on going and will be instrumental in determining the type of senescence experienced.

#### **PA8 012 ENHANCED GLYCOGENESIS IS CRITICALLY INVOLVED IN SENESCENCE**

G. YOON\* (Ajou University School of Medicine, Suwon, Republic of Korea)  
Y. SEO(1), H. JUNG(3), Y. KIM(1), H. CHUNG(2), I. LIM(1) - (1) Ajou University School of Medicine (Suwon, Republic of Korea); (2) Pusan National University (Pusan, Republic of Korea); (3) Dept. of Molecular Science & Technology, Ajou University (Suwon, Republic of Korea)

The responses of glycogenesis to physiological or environmental stimuli have often been implicated in age-related diseases. However, it is not clear whether the glycogenesis is directly related to aging process. In the present study, we investigated the involvement of enhanced glycogenesis in cellular senescence and its relevance to organismal aging process. Glycogen accumulation, glycogen synthase (GS) activation, and glycogen synthase kinase 3 (GSK3) inactivation commonly occurred in diverse cellular senescence models, including the liver tissues of aging F344 rats. Subcytotoxic concentrations of GSK3 inhibitors (SB415286 and LiCl) were sufficient to induce cellular senescence with increased glycogenesis. Interestingly, the SB415286-induced glycogenesis was irreversible, as were increased levels of reactive oxygen species and gain of senescence phenotypes. GSK3 inactivation using siRNA and dominant negative GSK3beta mutant (K85A) also effectively induced senescence phenotypes, and GS knockdown significantly attenuated the stress-induced senescence phenotypes. Taken together, these results clearly demonstrate that augmented glycogenesis is not only common, but also directly linked to cellular senescence and aging, suggesting GSK3 and GS as novel modulators of senescence, and providing new insight into the metabolic backgrounds of aging and aging-related pathogenesis.

#### **PA8 013 AGING ALTERS THE ABILITY OF THE SKIN TO RESIST TO PRESSURE-INDUCED ISCHEMIA IN HUMANS**

M. GAUBERT-DAHAN\* (HOPITAL BRETONNEAU, PARIS CEDEX 18, France)  
B. FROMY(1), D. SIGAUDO-ROUSSEL(1), G. BERRUT(2), J. SAUMET(1) - (1) FRE CNRS 3075-Interactions Neurovasculaires-Université Claude Bernard LYON 1 (Lyon, France); (2) CHU Nantes-Pôle de Gériatrie (Nantes, France)

Introduction: The aged skin is particularly exposed to pressure ulcers in contrast to healthy skin that is protected from pressure-induced ischemic damage because of the presence of pressure-induced vasodilation (PIV) that relies on small nerve fibers and endothelial function. Since aging alters both nervous and vascular systems, the aim of this study was to test the ability or inability of the cutaneous blood flow to adapt to local applied pressure by assessing PIV in non-neuropathic and neuropathic older subjects compared to young subjects. Methods: We studied 34 subjects divided according to their age (20-35 or 60-75 years) and the presence of peripheral neuropathy diagnosed by the neuropathy symptom scores. Laser Doppler flowmetry was used to evaluate the cutaneous responses to local pressure application at 11.1 Pa/s (PIV), acetylcholine and local heating (44°C). Quantitative sensory tests were used to evaluate the sensory nerve fiber function. Results: The non neuropathic older subjects had an impaired PIV compared to young subjects and the neuropathic older subjects were totally deprived of PIV, leading to an early pressure-induced cutaneous ischemia. The non neuropathic older subjects had a functional abnormality of small sensory fibers, whereas the neuropathic older subjects had a severe sensory deficit affecting both small and large sensory fiber function. The cutaneous endothelium-dependent responses to acetylcholine and local heating were equally reduced in both groups of older subjects, showing a comparable endothelial dysfunction. Conclusions: The ability of the skin to adapt to localized pressure is impaired in older subjects and is related to the severity of the sensory fiber dysfunction. These results suggest that an aggressive preventive care should be focused on the older subjects

presenting a sensory deficit at admission, since these subjects would be particularly at risk for pressure ulcer occurrence.

**PA8 014 STUDY OF A MODEL OF SUCCESSFUL AGING: THE LOU/C/JALL RAT STRAIN.**

P. DUTAR\* (INSERM U894, Paris, France)

A. STEPHAN(1), M. KOLLEN(1), P. SINET(1), A. FAIVRE-BAUMAN(1), C. LOUDES(1), J. ALLIOT(2), J. EPELBAUM(1), A. JOUVENCEAU(1), B. POTIER(1), J. BILLARD(1) - (1) Centre de Psychiatrie et Neurosciences, INSERM U894 (Paris, France); (2) Laboratoire de Neuroendocrinologie du Vieillissement, Université Blaise Pascal (Aubière, France)

**INTRODUCTION:** Aging is commonly associated with physiological alterations and apparition of cognitive deficits. The goal of our study was to evaluate the aged-related memory deficits and the underlying mechanisms in two strains of rats: 1) The Sprague-Dawley rats (SD) considered to age normally with apparition of aged linked pathologies such as obesity, insulino-resistance, and 2) The Lou/C/Jall (LC), known for its metabolic characteristics, and considered to have increased longevity without obvious physiological alterations. **MATERIAL & METHODS:** "Young" (3-4 months old), "old" (24-25 months old) and "senescent" (28 months-old) SD and LC rats were used. Their properties were compared using behavioral tasks, electrophysiological and biochemical approaches. **RESULTS:** We first tested the mnesic capacities using the object recognition task. Old LC rats were never impaired whatever the delay of retention whereas SD rats were memory-deficient. Synaptic plasticity in neuronal networks was then studied in the same rats by extracellular recordings performed in hippocampal slices. Long Term Potentiation, considered as a neuronal substrate of memory, was significantly impaired in aged SD rats but not in LC rats. Western Blot analysis of hippocampal tissues showed a decrease in NR2A subunits of glutamatergic receptors in aged SD and LC rats and a decrease in NR2B and GluR1 subunits in aged SD only. Other parameters such as the hippocampal content of the amino acid D-serine (mandatory for the expression of synaptic plasticity), or astroglial glutamate transporters (GLAST and GLT-1) significantly affected in SD, remained unchanged in aged LC. These last data indicate a preservation of astroglial function in LC strain during aging. **CONCLUSION:** Altogether, the results support the Lou/C/Jall strain as a model of healthy aging, not only when considering its preserved metabolism, but also in term of cognitive, synaptic plasticity and astroglial functions.

**PA8 015 INCREASE OF XANTHINE OXIDASE ACTIVITY IN SEVERAL**

**ORGANS FROM TRIPLE-TRANSGENIC ADULT MICE FOR ALZHEIMER DISEASE**

A. HERNANZ\* (Hospital Universitario La Paz, Madrid, Spain)

L. GIMÉNEZ-LLORT (1), C. VIDA(3), M. DE LAS CASAS-ENGEL(3), M. DE LA FUENTE(3) - (1) Autonoma University of Barcelona, Institute of Neuroscience (Barcelona, Spain); (3) Biology Faculty, Complutense University of Madrid (Madrid, Spain)

**Introduction:** Alzheimer's disease is a neurodegenerative disorder accompanied by inflammation and oxidative stress, which has been scarcely studied at peripheral level. In previous studies, we have observed a premature neuroimmunoendocrine aging in a triple-transgenic 3xTgAD mouse model for Alzheimer's disease. Therefore, oxidative stress (increase of oxidants and decrease of antioxidants), which has been proposed as the main cause of aging, may play a dual important role among the biological processes underlying the onset and progress of the disease in this animal model. In the present work, we have investigated the xanthine oxidase activity (XO), as a good marker of oxidant state, and the total anti-oxidative capacity (T-AOC) in several peripheral organs of adult 3xTg-AD mice at early stages of AD, when all cognitive and electrophysiological deficits are already observed but only intraneuronal  $\beta$ A is detected. **Methods:** Tissues homogenates from liver, thymus, lung, spleen, kidney and heart of 6 month old female adult 3xTgAD and Non-TgAD mice were studied. XO activity as well as T-AOC were evaluated. **Results:** In general, XO activity was increased in transgenic mice with respect to the Non-TgAD control group in all organs studied, the differences being highly significant in heart, spleen and thymus. However, we have also seen that the total antioxidant capacity did not show any differences between genotypes in the organs analyzed. **Conclusion:** 3xTgAD adult mice show an oxidation state, measured by the increase in XO activity at peripheral level, which is not linked to changes of total antioxidant capacity. The results suggest the relevance of oxidative stress at early stages of the disease and its relation to their premature neuroimmunoendocrine aging. **Support:** Fundació LaMarató 2006-062930, SAF2006-13642, UCM Research Group (910379ENEROINN), MEC (BFU2005-06777) and MICINN (BFU2008-04336) grants. **PA8 016 PUTATIVE ROLE OF A NOVEL P53-DEPENDENT CELLULAR SENESCENCE RELATED GENE, TARSH IN TUMOR SUPPRESSION.**

M. MARUYAMA\* (National Institute for Longevity Sciences, NCGG, Obu-city, Aichi, Japan)

T. WAKOH(1), K. TERAUCHI(2), M. SUGIMOTO(1), J. SHIMADA(2) - (1) Department of Mechanism of Aging, National Institute for Longevity Sciences, National Center for Geriatrics and Gerontology (Obu-city, Aichi, Japan); (2) Department of Cardiovascular

and Thoracic Surgery, Graduate School of Medical Science, Kyoto Prefectural University of Medicine (Kyoto, Japan)

Normal primary culture cells represent irreversible arrest of proliferation, namely cellular senescence, with distinctive morphological changes after serial cell divisions. Recent studies show that cellular senescence plays as a primary role to repress the cancer formation, producing apoptosis and even lead to ageing *in vivo*. We have characterized that murine TARSH (target of NESH-SH3/Abi3bp) as a cellular senescence related gene because of its transiently robust induction in the early phase of mouse embryonic fibroblasts (MEFs) replicative senescence and its gene expression was suppressed in human lung carcinoma specimens and thyroid carcinomas. However, little is known about the molecular mechanism underlying the regulation of TARSH in tumorigenesis. In this report, to elucidate veiled physiological function of TARSH in replicative senescence and trigger of tumor suppression, we carried out the retrovirus produced short hairpin RNA (shRNA)-mediated TARSH gene knockdown in MEFs. We analyzed the effect of TARSH deficiency in cell cycle, proliferation, apoptosis, and genome instability followed by tumorigenesis. We demonstrated that TARSH-suppressed MEFs were drastically inhibited their proliferation in a p53-dependent manner. We also found that TARSH expression was necessary for cell cycle progression since its decline preciously represented the accumulation of G0/G1 population with a concomitant activation of a cyclin-dependent kinase inhibitor, p21<sup>Cip1</sup> whose expression was tightly controlled by p53. Interestingly, reduced TARSH expression induced caspase-3-mediated apoptosis in a p53-dependent manner. Moreover, we noted that TARSH depletion frequently represented aberrant number of centrosomes, which probably causes aneuploidy as the hallmark of the cancer. TARSH is involved in the maintenance of genome stability in concert with p53-dependent cell cycle regulation. Therefore, in TARSH-absent condition, genome instability was induced by centrosome amplification in addition by growth arrest and consequently binucleation or multicentrosome were evoked.

**PA8 017 AGE AND BODY MASS INDEX CONTRIBUTION TO STANCE CONTROL**

D. ABRAHAMOVÁ\* (Institute of Normal and Pathological Physiology, Slovak Academy of Sciences, Bratislava, Slovakia)

F. HLAVACKA

Introduction Human balance control change with age, resulting in an impaired ability to maintain stance and to move independently. Advancing age usually brings physiological changes in muscle properties, declined function and deficits in the sensory systems and functional impairments in mobility. Another important limitation related to balance control is body weight. Today, the obesity is a common problem which is associated with many serious complications that affect and impair quality of life. The aim was to investigate age-related changes in balance control and the relative contribution of body mass index (BMI). Materials and methods We examined 80 healthy subjects (20-82 year; 23 men, 57 women) with characteristic: age (mean year  $\pm$  SD)  $47.28 \pm 20.92$ , BMI (kg/m<sup>2</sup>)  $23.45 \pm 3.23$ . Body sway was measured during four conditions of quiet stance: stance on a firm and on a foam surface with eyes open and closed. The duration of one trial in each condition was 50 seconds. The balance control was assessed by CoP (center of foot pressure) parameters. Results The results showed that age, BMI and sensory deficit are related to gradual increase of CoP parameter values. The largest increase of body sway was observed during stance on foam surface with eyes closed and the most complex view on postural steadiness was provided by root mean square (RMS) parameter. There were a strong correlation between age and RMS and also between BMI and RMS. Conclusions Increased body sway and slight balance impairment due to age, conditions with sensory deficit and BMI are manifested by significant increase of the CoP parameter values. The findings are in accordance with earlier age-related studies and with fact that body weight may be an important risk factor for balance impairment and falling. Acknowledgements: Supported by European grant FP6 SENSACTION-AAL.

**PA8 018 HOMOCYSTEINE AND INFLAMMATION AS MAIN DETERMINANTS OF OXIDATIVE STRESS IN THE ELDERLY**

G. BAPTISTA\* (Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1, Montpellier, France)

E. VENTURA(3), R. DURANT(1), A. JAUSSENT(4), M. PICOT(4), A. DUPUY(2), J. CRISTOL(3), C. JEANDEL(1) - (1) Centre de Gérontologie Clinique Antonin Balmes, CHU Montpellier, Université Montpellier 1 (Montpellier, France); (2) Biochemistry Department, Lapeyronie Hospital, CHU de Montpellier (Montpellier, France); (3) EA 4188, Nutrition Humaine, Biodisponibilité et Athérogénèse, Institut Universitaire de Recherche Clinique, Université Montpellier I (34295, France); (4) Biostatistics Department, Arnaud de Villeneuve Hospital, CHU Montpellier (Montpellier, France)

Introduction Oxidative stress is commonly observed in the elderly and could be involved in age-related diseases. However, the determinants of superoxide anion overproduction are not clearly understood. Methods and materials Superoxide anion production was evaluated using a lucigenin-based chemiluminescence method in 478 elderly subjects (304 women, 174 men;  $79.5 \pm 7.1$  years). Homocysteine (Hcy) metabolism (homocysteinemia, vitamin B12, plasma, and erythrocyte folates), inflammation (CRP, fibrinogen,  $\alpha$ -1 acid glycoprotein), lipid parameters (total cholesterol, triglycerides, HDL and LDL cholesterol),

and nutritional parameters (albumin, transthyretin) were determined. Results The results show that HCY levels ( $p < 0.001$ ) and superoxide anion production ( $p = 0.04$ ) increase with aging, but CRP does not. Highest HCY ( $> 20 \mu\text{M}$ ) (OR 1.83 (1.09–3.07),  $p = 0.02$ ) and CRP over 5 mg/L (adjusted OR 2.01 (1.15–3.51),  $p = 0.01$ ) are the main determinants in superoxide anion production in the elderly. These clinical data are confirmed in an *in vitro* study using THP-1 monocyte-like cells. Incubation with HCY thiolactone (HTL) ( $0$ – $200 \mu\text{M}$ ) and LPS ( $0$ – $20 \text{ ng/ml}$ ) dramatically enhances NADPH oxidase expression and activation. Moreover, a synergic action was evidenced for low concentrations of HTL ( $20 \mu\text{M}$ ) and LPS ( $5 \text{ ng}$ ). Conclusion Taken together, the clinical data and *in vitro* experiments support the hypothesis that moderate homocysteineemia and low-grade inflammation synergically enhance NADPH oxidase activity in the elderly.

**PA8 019 LOSS OF REDUNDANCY IN OLDER ADULTS REFLECTED BY A CHANGE IN THE SLOPE OF THE FRAILTY INDEX WITH AGE.**

K. ROCKWOOD\* (Dalhousie University, Halifax, Canada)

M. ROCKWOOD(1), A. MITNITSKI(1) - (1) Dalhousie University (Halifax, Canada)

Background. We tested the proposition, based on the reliability theory of aging, that deficit accumulation in aging systems results in loss of redundancy, which can be reflected as a slower rate of aging as deficits accumulate to approach a limit. Methods. Data came from the 2305 people, aged 70+ years at baseline, who participated in the clinical sample of the second wave of the Canadian Study of Health and Aging. We evaluated changes in the slope of the relationship between age and the Frailty Index at differing levels of deficit accumulation, as a measure of system redundancy / reserve, and estimated the limit to deficit accumulation in relation to age. Results. An age-invariant limit to deficit accumulation was demonstrated at about 0.7. The rate of deficit slowed from 0.04 amongst the fit to 0 amongst the most frail. The slope of the mean value of the FI in relation to age in community dwelling people older adults was 0.03; in institutionalized people, it was 0. The intercept of the 0-slope line in institutionalized people was 0.4, vs. 0.55 in community-dwelling older adults. Conclusion. As predicted by the reliability theory of aging, the rate of deficit accumulation slows with increasing frailty. A Frailty Index derived from data routinely collected as part of a Comprehensive Geriatric Assessment can estimate loss of redundancy in elderly people.

**PA8 020 FATIGUE DEFORMATION OF DNA AND CELL STRUCTURES IS THE KEY MECHANISM OF AGEING**

V. KISEL\* (Institute of Solid State Physics, Russian Acad. of Sci., Chernogolovka, Russian Federation)

Literature data irrefutably evidence for the deformation origin of physiological, physical and chemical stress effects on biological tissues (BT), cells growth and proliferation, differentiation, diseases and ageing, which is irresistibly identical to the stiffening or softening deformation of solids with the appropriate production of lattice defects with various dimensions (reactive oxygen species, ROS, in mitochondria of BT stimulate oxidative stress in cells, etc.). Our comparisons of the mechanisms of plasticity (MP) in living BT under arterial blood pressure alterations (this work), oscillating metabolic transformations and stresses, in various states of different materials under load [1] show that MP are strictly the same on atomic-to-cosmic scale lengths. This is the irrefutable argument in proof of the new paradigm [1] of the decisive role of MP and phase mismatch-interface stresses in or between gene chemical compartments, genes, growing and differentiating cells, in each stage of their phase transition modes: biochemical reactions, the origin, development and medical treatment of endogenous diseases, kinetics of ageing and growth of robust and cancerous cells, adaptation, origin of species and populations, etc. In terms of this paradigm the ageing of BT is a typical fatigue mechanical deformation of cells up to their stiffening and fracture (apoptosis). Softening of BT with physical, biochemical, physiological, etc. methods changes the mechanical fatigue limit of the materials, increase the longevity (life span) of BT and the rate of their hardening/ageing. And this is in line with the epidemiological, clinical and experimental investigations, tumor growth, etc. [1]. 1. Kisel V. P., Kisel N.S. Proc. 2nd Int. Conf. "Functional foods for chronic diseases", Nov.15–16, 2005, Dallas, USA. Ed. by D.M. Martirosyan, Richardson, TX, USA, 2006, pp 213 – 234.

**PA8 021 DO HISTORICAL CHANGES IN HUMAN MORTALITY REPRESENT CHANGES IN INTRINSIC AGEING?**

E. MILNE\* (Newcastle University, Newcastle upon Tyne, United Kingdom)

Introduction: A new approach to mortality modelling (Milne EMG: The natural distribution of survival. *J. Theor. Biol.* 2008, 255:223–360) suggests mortality rates arise from interaction of two distinct risk categories, characterised by two parameters: rate of functional redundancy decay ('a') and level of interactive hazard ('k'). Effects of interventions considered to alter intrinsic ageing (dietary restriction, heat, oxygen tension) are expressed within this model exclusively as parameter 'a' changes in various species. Methods: National cohort and period human mortality data recorded in the Human Mortality Database were used to test the hypothesis that historical variations in human mortality reflect alterations exclusively in interactive risk (i.e. parameter 'k' changes), and not changes in intrinsic ageing rate (parameter 'a'). Results: From 1751 to 1900, birth

cohorts died out in accordance with the hypothesis. Variation in parameter 'k' also diminished over time. Deviations from the historical pattern, notably in women, appeared in cohorts from the early 20th century, and were mirrored in 20th century period data, but did not fit a pattern of intrinsic ageing change. Instead, with respect to predicted patterns, they displayed downward displacement of mortality rates from middle to old age, disappearing in the latter years of life. Conclusion: Historical data, analysed thus, are consistent with the hypothesis of an unchanging rate of human intrinsic ageing, and a falling level of interactive hazard, whose decreasing variation may reflect falling societal inequalities. The timing and pattern of 20th century deviation from predicted patterns appears consistent with exposure to increasingly effective health and social care and may reflect what Oshansky termed 'manufactured time'. The significance of this observation is that, if historical changes in human mortality do not reflect changes in intrinsic ageing, then causes of mortality that have changed cannot, themselves, be causes of intrinsic ageing.

**PA8 022 FEASIBILITY AND ACCEPTABILITY OF MUSCLE BIOPSY IN EPIDEMIOLOGICAL STUDIES: FINDINGS FROM THE HERTFORDSHIRE SARCOPENIA STUDY**

H. PATEL\* (UNIVERSITY OF SOUTHAMPTON, SOUTHAMPTON, United Kingdom)  
H. SYDDALL(1), M. HELEN(1), C. CYRUS(1), A. AVAN(1) - (1) Medical research council epidemiology resource centre, University of Southampton, Southampton general hospital (Southampton, United Kingdom)

Introduction Sarcopenia is associated adversely with disability, morbidity and mortality but understanding of its aetiology is limited. Epidemiological study findings suggest developmental influences may be important as associations have been seen between birth weight and both adult muscle mass and strength. Our aim was to ascertain the feasibility and acceptability of obtaining muscle tissue from older people, with known birth weight in the context of an epidemiological study to identify cellular mechanisms underlying the association between low birth weight and sarcopenia. Methods 105 men with documented birth weight participating in the Hertfordshire Sarcopenia Study consented for detailed physiological quantification of muscle mass, strength and a biopsy of the vastus lateralis using the Weil-Blakesley conchotome. Muscle tissue was processed for immunohistochemical, electron microscopy and molecular studies. Acceptability was ascertained by questionnaire and a pain Visual Analogue Scale (VAS). 100mm on the scale indicated severe pain. Results 102 out of 105 participants had a muscle biopsy. Three participants who did not have a biopsy were on treatment that may have influenced wound healing. 93 participants provided feedback. The median pain VAS score during the procedure was 7mm (Interquartile range [IQR] 1–34), 4mm (IQR 0–16) one day after the procedure and 1mm (IQR 0–4) 7 days after the procedure. 60 (64%) participants were back to their normal levels of activity one day after the procedure. 85 (91%) found this procedure acceptable and would have the procedure again. There were no serious wound complications. Conclusion Muscle biopsy is both feasible and acceptable in epidemiological studies when appropriate clinical and research expertise is available. The availability of biopsy tissue will allow myofibre and capillary quantification as well as investigation of anabolic and catabolic molecular pathways contributing to sarcopenia. This study has considerable potential to inform the development of beneficial life course interventions for sarcopenia.

**PA8 023 BDNF IN THE BRAINSTEM DORSAL VAGAL COMPLEX: A ROLE IN AGE-RELATED DYSREGULATION OF FOOD INTAKE?**

P. GAUDREAU\* (University Aix-Marseille-3, Marseille, France)  
S. SEGURA(1), S. MAHAUT(1), K. BEDARD(2), J. BEDARD(2), C. TARDIVEL(1), B. LEBRUN(1), G. FERLAND(3), E. MOYSE(1) - (1) Université Aix-Marseille-3 (Marseille, France); (2) Centre Hospitalier de l'Université de Montréal (Montréal, Canada); (3) Institut de Gérontologie de l'Université de Montréal (Montréal, Canada)

Introduction. The dorsal vagal complex (DVC) mediates the satiety reflex, which is modulated by circulating hormones and neural drive from hypothalamus. Brain-derived neurotrophic factor (BDNF) is an anorexigenic signal downstream of the satiety-controlling hormone leptin, both in the DVC and hypothalamus. Its expression decreases in the aging forebrain. The present study was aimed at identifying changes in BDNF signalling in the DVC of aged rats and examining the effect of a long-term moderate caloric restriction (LTMCR). Methods and materials. Nineteen to 20-month-old male Sprague Dawley rats either fed ad libitum (AL) or subjected to a 40% caloric restriction, from 8 months of age until death, were used ([www.rqr.com](http://www.rqr.com)) and compared with 2-month-old AL rats. BDNF content of DVC and serum concentrations of BDNF and leptin were determined by immunoassays. BDNF immunohistochemistry was performed on fixed sections of rat brains. BDNF and leptin receptor mRNA levels were assessed by real-time RT-PCR. Results. BDNF protein content of the DVC increased 2-fold in AL aged rats compared with young AL rats and old CR rats. In contrast, serum BDNF concentration was not different among the three groups. Serum leptin level was increased 10-fold in AL aged rats compared with young AL and old CR animals. TrkB and p75 BDNF receptor mRNA levels were increased 1.7–2-fold in aged AL rats, while truncated forms were not altered. LTMCR did not regulate BDNF receptor levels. Neither aging nor LTMCR affected ObRb leptin receptor mRNA levels. Finally, daily food intake was not altered in old AL rats compared with younger rats. Conclusion. The increase of BDNF/BDNF receptor levels in

the DVC and leptin concentration in the serum of AL rats, and the maintenance of youthful levels of BDNF and leptin in CR rats, suggest the development of a resistance to the leptin-BDNF-dependent satiety effect in aging.

**PA8 024 INDUCTION OF CELLULAR SENESCENCE BY PHOSPHOLIPASE A<sub>2</sub> IN HUMAN FIBROBLASTS THROUGH AN ROS-MEDIATED P53 PATHWAY**

J. KIM\* (College of Medicine, Daegu, Republic of Korea)

H. KIM(1), K. KIM(2), S. KIM(2), S. BAEK(1), H. KIM(1), C. LEE(1) - (1) Department of Biochemistry and Molecular Biology, College of Medicine, Yeungnam University (Daegu, Republic of Korea); (2) Aging-associated Vascular Disease Research Center, College of Medicine, Yeungnam University (Daegu, Republic of Korea)

**Introduction:** Secretory PLA<sub>2</sub> (sPLA<sub>2</sub>) is involved in various cellular physiological and pathological responses, especially in inflammatory responses. Accumulating evidence suggests that inflammation is an underlying basis for the molecular alterations that link aging and age-related pathological processes. However, the involvement of sPLA<sub>2</sub> in cellular senescence is not clear. **Materials and Methods:** Cellular senescence in human dermal fibroblasts (HDFs) induced by sPLA<sub>2</sub> treatment was measured by senescence-associated  $\beta$ -galactosidase (SA- $\beta$ -gal) activity staining, p53/p21 Western blotting, and cell cycle analysis. ROS levels were detected with dihydrorhodamine 123 or lucigenin. The levels of p53 or p16 mRNAs were knocked down with p53 or p16 shRNA retroviral vectors. **Results:** sPLA<sub>2</sub> treatment induced cellular senescence in HDFs. sPLA<sub>2</sub>-induced senescence was observed in p16-knockdown HDFs and p16-null mouse fibroblasts, but not in p53-knockdown HDFs and p53-null mouse fibroblasts. Treatment with sPLA<sub>2</sub> increases ROS production, and an antioxidant, N-acetylcysteine, inhibits sPLA<sub>2</sub>-induced cellular senescence. **Conclusion:** These results suggest that sPLA<sub>2</sub> plays a role in cellular senescence in HDFs during inflammatory response by promoting ROS-dependent p53 activation and might therefore contribute to inflammatory disorders associated with aging.

**PA8 025 DIFFERENTIAL RESPONSE TO AIN-93 DIET IN SENESCENCE ACCELERATED MOUSE (SAM) P8 AND R1 STRAINS**

R. TAKAHASHI\* (Faculty of Pharmaceutical Sciences, Toho University, Funabashi, Chiba, Japan)

Y. FUKUI(1) - (1) Faculty of Pharmaceutical Sciences, Toho University (Funabashi, Chiba, Japan)

The senescence-accelerated mouse (SAM) is an animal model of accelerated aging established by T. Takeda et al. SAM consists of series of SAMP (prone) and SAMR (resistant) lines. SAMP8 strain has much shorter life-span by approx. 50% than control strain, SAMR1. The AIN casein-based diets are frequently used not only for nutritional studies but also for toxicologic and gerontologic research as well. However, various adverse effects of the high casein diet have been reported. In this study, we investigated the effects of AIN-93 casein-based diets on growth and survival of SAMP8 and SAMR1 mice. Four different mouse strains (SAMP8, SAMR1, C57BL and DBA/2, all male) were used in this experiment. The mice of each strain were divided into two groups at the age of 4 weeks and fed with standard diets (CRF-1 or CE-7) or with AIN-93G/M casein-based diets for 12-weeks or through their usual life-span. Although the body weight of both AIN-93 and standard diet groups increased during the 12-week period, more rapid weight gain was observed in SAMR1 mice fed AIN-93. No significant difference was observed in liver between two diet groups within each strain except SAMR1. There was no significant difference in the weight of lean tissues (epididymal and mesenteric WAT and BAT) between two diet groups in SAMP8, C57BL and DBA/2. However, SAMR1 fed AIN-93 shows a remarkable increase in the weight of lean tissues compared with the standard diet group. Although no significant difference in average life span of SAMP8 between two diets, the life span of SAMR1 fed AIN-93 was shorter than the corresponding group fed the standard diet. The SAMR1 strain respond more strongly to AIN-93 casein-based diets than SAMP8, C57BL and DBA/2, including body weight and growth, and the accumulation of lean mass tissues.

**PA8 026 INCREASE OF MEGALIN AND CUBILIN IN THE KIDNEY GLOMERULI OF SENESCENT RATS WITH PROTEINURIA**

K. ODERA\* (Faculty of Pharmaceutical Sciences, Toho University, Funabashi, Chiba, Japan)

R. TAKAHASHI(1) - (1) Faculty of Pharmaceutical Sciences, Toho University (Funabashi, Chiba, Japan)

A progressive deterioration of renal structure and function occurs during aging. Age-related albuminuria is due to increased permeability of the glomerular basement membrane and/or decreased resorption of albumin at proximal tubules. We previously found that the amount and distribution endocytic receptors, megalin and cubilin, were changed in the kidney of rats with age. Both receptors predominantly express in the proximal tubules but not in glomeruli of rat kidney. In this congress, we reported that both megalin and cubilin are increased in the kidney glomeruli of senescent rats with proteinuria. The distributions of megalin and cubilin in the kidney were determined by immunohistochemical analysis using affinity purified antibodies. The glomeruli were isolated by a sieving method.

Megalin and cubilin levels of glomeruli were determined by an immunoblot analysis. Immunohistochemical studies showed that the amounts of both receptors especially megalin, began to increase with age in the capillary wall and cells such as epithelial cells and endothelium. To confirm the presence of megalin and cubilin in the glomeruli shown by immunohistochemical studies, an immunoblot analysis was carried out on the isolated glomeruli from young and old kidneys. Weak but significant immuno-reactive signals were detected in the glomerular fractions. The signals for both receptors increased with age. The amounts of endocytic receptors, megalin and cubilin were increased in the kidney glomeruli of senescent rats that exhibited proteinuria.

**PA8 027 CAVEOLAE-MEDIATED ENTRY OF S. TYPHIMURIUM INTO SENESCENT HOST CELLS**

K. CHO\* (Chonnam National University Medical School, Gwangju, Republic of Korea)

Elderly individuals have an increased susceptibility to infections due to age-related anatomical, physiological and environmental factors. However, the mechanism of ageing dependent-susceptibility is not well known. Here, we found that entry of *S. typhimurium*, which can cause a variety of diseases in humans and animals, was increased in nonphagocytic senescent host cells. In addition, we showed that caveolae might involve in entry of salmonella in senescent host cells. When caveolae structures were disrupted by methyl-beta-cyclodextrin, invasion level of *S. typhimurium* was remarkably decreased in senescent cells. To confirm the specific role of caveolae, we used lentiviruses to express siRNA of caveolin-1 and full length of RFP-conjugated caveolin-1. When we down-regulated caveolin-1 by siRNA in senescent cells, *S. typhimurium* invasion was decreased like that of young cells. In contrast, the over-expression of caveolin-1 in HeLa cells lead to increase of invasion levels of *S. typhimurium* like inducible senescent HeLa cells. Moreover, caveolin-1 was highly expressed in aged target organs to infection of *S. typhimurium*. These results suggested that high levels of caveolae in aged host cell might be related with increased susceptibility to infections in elderly individuals.

**PA8 028 INVESTIGATING THE ROLE OF LAMIN A IN WIEDEMANN RAUTENSTRAUCH SYNDROME**

H. ARBOLEDA\* (Universidad Nacional de Colombia , Bogota, Colombia)

N. RAMIREZ(1), L. OLIVOS (2), C. GUEVARA (1), L. MORALES (1), G. ARBOLEDA(1), J. YUNIS(1) - (1) Instituto de Genetica - Universidad Nacional de Colombia (NA, Colombia); (2) Instituto de Investigaciones Biomedicas - Universidad Nacional Autonoma de Mexico (NA, Mexico)

Wiedemann-Rautenstrauch syndrome (WRS) is a rare autosomal recessive disease with features of premature aging recognizable at birth. Our previous work in four clinically well-defined patients suggest that LMNA/C mutations are not associated with WRS; but we cannot discard the hypothesis that another gene associated with Lamin A metabolism may be responsible for WRS. In order to evaluate this hypothesis skin biopsies were obtained from a 13-year-old female and a 20-years-old boy both diagnosed with WRS and a 20-years-old unaffected boy. Fibroblasts from an Hutchinson Gilford Progeria Syndrome patient (HGPS, 1824 C-T) were obtained from the Coriell Institute Repositories. All different biopsies were used to establish primary cell cultures. We culture all primary fibroblasts in MEM (supplemented with sera, glutamine and antibiotics) to maintain them as close to physiological conditions as possible. Upon reaching confluence cells were passaged 1:3 with weekly medium change. The passage number of each cell type was recorded. Immunofluorescence microscopy was used to determine the variation in nuclear morphology between WRS, HGPS and control fibroblasts. We also perform immunoblotting to investigate the level of progerin, if any, in the different fibroblast groups. Representative data from WRS, HGPS and unaffected control cells show that only HGPS cells have a significantly high number of cells with an irregular shape of the nuclear envelope. In contrast, WRS cells have small nuclei compared with HGPS or Control cells. Analysis of Lamin A/C expression detects an additional band with retarded electrophoretic mobility in HGPS cells extracts (progerin) but not in one WRS or in the control cell extracts. The results suggest that expression of anomalous Lamin A is not related with WRS pathology direct or indirectly, however it could be a nuclear gen related with nuclear volume that could be responsible or reflects the anomaly observed in this neonatal progeroid syndrome.

**PA8 029 ANDROGEN RECEPTOR-MEDIATED ACTIVATION OF ENDOTHELIAL NITRIC OXIDE SYNTHASE VIA PI3K/AKT AND ERK SIGNALING**

J. YU\* (University of Tokyo, Tokyo , Japan)

M. AKISHITA(2), M. ETO(2), S. OGAWA(2), K. IIJIMA(2), S. KATO(3), Y. OUCHI(2), T. OKABE(1) - (1) Department of Integrated Traditional Medicine, Graduate School of Medicine, University of Tokyo (Tokyo, Japan); (2) Department of Geriatric Medicine, Graduate School of Medicine, University of Tokyo (Tokyo, Japan); (3) Institute of Molecular and Cellular Biosciences, University of Tokyo (Tokyo, Japan)

**Background:** Epidemiological studies have shown that androgen deficiency in elderly men is associated with the higher incidence of cardiovascular disease and endothelial dysfunction. Although vasodilator action of testosterone has been reported, its action on endothelial nitric oxide synthase (eNOS) is not known. We therefore investigated the effect

of testosterone on eNOS activity and its molecular mechanism using human aortic endothelial cells. Methods and Results: Human aorta endothelial cells (HAEC) were cultured in steroid-deprived phenol red-free medium. Physiological concentrations of testosterone (1-100 nmol/L) augmented nitric oxide (NO) production, as measured by DAF-2 fluorescence, at 10-30 min. NOS activity as measured using the L-arginine/L-citrulline conversion assay and nitrite/nitrate production as determined by a nitrite assay were twice increased by testosterone compared to vehicle. In parallel, testosterone rapidly increased the phosphorylation of eNOS (Ser1177) in a concentration dependent manner, peaking at 30 min after stimulation. eNOS activation by testosterone was associated with the phosphorylation of Akt and ERK1/2, and was partially blocked by an Akt inhibitor, SH-5 and a PI3K inhibitor, wortmannin and by a MEK inhibitor, PD98059, suggesting that both PI3K/Akt and ERK pathways are involved in the signaling of eNOS activation by testosterone. The effects of testosterone on eNOS activation and NO production were abolished by androgen receptor (AR) antagonists, nilutamide and flutamide, or by siRNA for androgen receptor, but were not inhibited by estrogen receptor antagonist ICI 182780 and transcriptional inhibitor actinomycin D, suggesting the nongenomic activation of eNOS via androgen receptor. Coimmunoprecipitation study demonstrated that, in a ligand-dependent manner, testosterone increased AR-associated p85 $\alpha$ . Conclusions: These results indicate that the nongenomic signaling of androgen receptor triggered by testosterone induces a rapid activation of eNOS and subsequent NO production via PI3K/Akt and MEK/ERK pathways in vascular endothelial cells.

#### **PA8 030 AGE-RELATED CHANGES IN THE CENTRAL REGULATION OF ENERGY METABOLISM IN RATS**

M. BALASKO\* (University of Pecs, Medical School, Pecs, Hungary)  
E. PETERVARI(1), A. GARAMI(1), S. SOOS(1), M. SZEKELY(1) - (1) Department of Pathophysiology and Gerontology, Medical School, University of Pecs (Pecs, Hungary)

Introduction: Long-term body weight (BW) regulation shows two characteristic age-related trends: obesity of the middle-aged, and anorexia of aging (sarcopenia). These observations suggest regulatory changes in energy balance. Methods and materials: The effects of intracerebroventricular (ICV) administration of neuropeptide Y (NPY), corticotropin-releasing-factor (CRF) or alpha-MSH were recorded on food-intake (FI) and BW in various age-groups of male Wistar rats. FI was recorded in a Feedscale system (Columbus), body temperature (Tc), activity (ACT), heart rate (HR), feeding frequency (FF) and feeding duration (FD) in a biotelemetric (MiniMitter) system. ANOVA repeated measures were used for statistical analysis. Results: Central injection of NPY increased, while CRF suppressed FI. Both effects were attenuated in the 24 or 12 months-old rats vs. the 3 months-old age-group. The anorexigenic effect of ICV alpha-MSH-injection was minimal at 1.5-months, very pronounced in 3-4 months-old rats, then at ages of 6 and 12 months it decreased, to become maximal in the oldest (24-26 months-old) group. The alpha-MSH-infusion induced transient anorexia and BW fall at 4-months, while in 24-months-old rats a sustained and pronounced fall in FI and BW developed. In old rats both the initial FF and its fall to alpha-MSH-infusion were lower than in young ones. FD decreased similarly in both groups. In old rats HR exhibited a more pronounced and lasting elevation (suggesting a rise in metabolic rate) than in young animals, and a similar transient rise in daytime Tc as in the young groups. Conclusions: The effects of central regulatory peptides show age-related alterations. The catabolic effects of alpha-MSH were different depending on age: the pronounced effect in the young adult group gradually decreased, but reached again a peak in the old animals. Such changes might contribute to the explanation of both obesity in the middle-aged and sarcopenia in the old. (OTKA 49321, ETT 271/2006)

#### **PA8 031 ACCUMULATION OF OXIDIZED MACROMOLECULES DOES NOT PRECEDE THE ONSET OF AGE-RELATED NEURAL DEFICITS.**

A. BILKEI-GORZO\* (University of Bonn, Bonn, Germany)  
A. PIYANOVA(1), Ö. ALBAYRAM(1), A. ZIMMER(1) - (1) University of Bonn (Bonn, Germany)

Introduction The increasing amount of oxidized macromolecules in ageing humans and animals is thought to contribute to sensory and cognitive deficits at higher age. The observation that the brains of patients suffering from dementia display an increased oxidative damage, as well as the therapeutic effects of anti-oxidants in memory disturbances suggest that oxidative damage is a primary cause of age-related deficits in neural functions. Previously we reported that animals lacking CB1 receptors show an early onset age-related cognitive deficits. Therefore we asked whether an increased oxidative damage of neurons contribute to the ageing-phenotype in the absence of CB1 signalling. Materials and Methods Partner recognition and hearing abilities of wild-type and null mutant mice were compared in different age-groups. The amount of oxidized lipids and proteins was measured in the brains after the behavioural tests. Results Cnr1-/- animals showed an early onset of reduction in partner recognition. Furthermore, they lost the reactivity to higher sound frequencies. Interestingly, the amount of oxidized macromolecules was age-dependently lower or similar, but never higher in the knockouts compared to the wild-type animals. Only a very moderate increase in the amount of oxidized proteins but not in lipids was observed at the onset of reduction in neural functions in both strains. Conclusion Increased oxidative damage does not contribute to the ageing phenotype of Cnr1-/- mice. There is no massive increase in the amount of oxidized

macromolecules preceding the neural deficits, suggesting that oxidative damage does not contribute to the initiation of age-related memory/sensory disabilities in ageing wild-type or Cnr1-/- animals.

#### **PA8 032 PVF2, A PDGF/VEGF-LIKE GROWTH FACTOR, CONTRIBUTES TO AGE- AND OXIDATIVE STRESS-ASSOCIATED CHANGES IN DROSOPHILA MIDGUT STEM CELLS**

M. YOO\* (Pusan National University, Busan , Republic of Korea)  
N. CHOI(1), J. KIM(1), D. YANG(1), J. PARK(1), Y. KIM(1) - (1) Department of Molecular Biology, College of Natural Science, Pusan National University (Busan, Republic of Korea)

Age-associated changes in stem cell populations have been implicated in age-related diseases, including cancer. However, little is known about the underlying molecular mechanisms that link aging to the modulation of adult stem cell populations. Drosophila midgut is an excellent model system for the study of stem cell renewal and aging. Here we describe age-related changes in the number and activity of intestinal stem cells (ISCs) and progenitor cells in Drosophila midgut. We determined that oxidative stress, induced by paraquat treatment or loss of catalase function, mimicked the changes associated with aging in the midgut. Furthermore, we discovered an age-related increase in the expression of PVF2, a Drosophila homologue of human PDGF/VEGF, which was associated with and required for the age-related changes in midgut ISCs and progenitor cell populations. Taken together, our findings suggest that PDGF/VEGF may play a central role in age-related changes in ISCs and progenitor cell populations, which may contribute to aging and the development of cancer stem cells.

#### **PA8 033 REVISITING THE METABOLIC SCALING HYPOTHESIS: DATA FROM THE BALTIMORE LONGITUDINAL STUDY OF AGING**

C. RUGGIERO\* (Institute of Gerontology and Geriatrics , Perugia, Italy)  
M. GRISWOLD(1), E. METTER(1), A. CHERUBINI(2), S. LING(3), D. MULLER(4), T. HARRIS(5), L. FERRUCCI(1) - (1) Longitudinal Studies Section, Clinical Research Branch, National Institute on Aging, NIH (United States of America); (2) Longitudinal Studies Section, Clinical Research Branch, National Institute on Aging, NIH (United States of America); (3) Institute of Gerontology and Geriatrics, Department of Clinical and Experimental Medicine, University of Perugia (Italy); (4) Advance Studies of Translational Research in Aging Unit, Clinical Research Branch, National Institute on Aging, NIH (United States of America); (5) Laboratory of Clinical Investigation, Longitudinal Studies Section, National Institute of Aging, NIH (United States of America)

Introduction: several inter-species and intra-species investigations evaluated the relationship between resting metabolic rate (RMR) and body mass (M), which is expressed as an allometric equation of the form  $RMR=aMb$  where 'a' is a constant, 'b' is a metabolic scaling exponent (MSE). Throughout phylogeny, the MSE is considered a universal evolutionary feature of living organisms, and the value of the MSE has been vigorously disputed being 0.66 or 0.75. Up to now there is no conclusive evidence in spite of intensive study, particularly in humans. We investigate the relationship between RMR and M and the value of the metabolic scaling in men and women at baseline and across their lifespan. Methods and materials: 1,227 participants from the Baltimore Longitudinal Study of Aging evaluated every two years from 1958 to 1982. Height and weight are measured, body mass index is determined as kg/m<sup>2</sup>. RMR is estimated by indirect calorimetry and expressed as kcal/m<sup>2</sup>/hr. Three ten-minute samples of expired air are analyzed for O<sub>2</sub> by the paramagnetic method (Beckman Paramagnetic O<sub>2</sub> analyzer model G-2) and for CO<sub>2</sub> by infra-red absorption (Beckman Model LB-1). Results: 3,141 evaluations collected over an average follow-up of 19 years. The RMR is proportional to M<sup>0.62</sup> in men and M<sup>0.38</sup> in women. The effect of age on the MSE is almost negligible in both sexes at baseline (in men b1=-0.001, 95%CI:-0.002, -0.0001, and in women b1=-0.002, 95%CI:-0.003, -0.001) and it remains almost unchanged when the longitudinal data are analyzed in men (b1=-0.002, 95%CI:-0.0029, -0.0018). Conclusion: the MSE is 0.62 in men and 0.38 in women and it does not change across their lifespan. These findings challenge about 70-year-old paradigm suggesting that the MSE 0.75 is universally applicable in all living organisms, and question the notion that the 0.75 is justified by the fractal nature of nutrient supply networks.

#### **PA8 034 XPD AND WRN mRNA IS REDUCED WHILE THEIR PROMOTERS METHYLATION IS UNALTERED IN BLOOD MONONUCLEAR CELLS OF CENTENARIANS**

J. POLOSAK\* (Medical Centre of Postgraduate Education, Warsaw, Poland)  
M. ROSZKOWSKA-GANCARZ(1), P. DOBOSZ(1), M. OWOCZARZ(2), M. PUZIANOWSKA-KUZNICKA(3) - (1) Medical Centre of Postgraduate Education (Warsaw, Poland); (2) International Institute of Molecular and Cell Biology (Warsaw, Poland); (3) Medical Research Center, Polish Academy of Sciences (Warsaw, Poland)

Introduction: It is suggested that normal aging is associated with inefficient DNA repair, among others. This might be a result of various mechanisms, including altered expression and/or function of proteins involved in this process. A decrease of global methylation and hypermethylation of CpG islands located in the promoters of selected genes are observed

in aged cells. Hypermethylation of the promoter results in transcription inhibition. Until now, expression and methylation of XPD and WRN were not analyzed with respect to age progression. Materials and methods: Total RNA and genomic DNA were isolated from blood mononuclear cells of young (Y, age range 22-37 years) and middle age (M, age range 65-69 years) controls, as well as of near-centenarians and centenarians (C, age range 89-102 years). 1. XPD and WRN expression assessment: Each RNA was reverse-transcribed with random hexamers and subjected to real-time PCR with XPD and WRN-specific sets of primers. 2. Methylation assessment: Genomic DNA was bisulfite-modified, PCR-amplified with XPD and WRN promoter-specific primers, and cloned into the pGEM-T vector. 3 clones were sequenced from each person's sample. Results: We found that the amounts of XPD and WRN mRNA were significantly lower in blood mononuclear cells of C compared to younger age groups. However, methylation of the XPD and WRN promoters was not significantly changed in age-related manner. Conclusion: We conclude that the significant decrease of the amounts of XPD and WRN mRNAs in blood mononuclear cells of near-centenarians and centenarians is not a result of hypermethylation of the XPD and WRN promoters.

#### **PA8 035 CENTROSOMAL HYPOTHESIS OF CELLULAR AGING AND DIFFERENTIATION: NEW DATA**

K. CHICHINADZE\* (I. Beritashvili Institute of Physiology, Tbilisi, Georgia)  
J. TKEMALADZE, A. LAZARASHVILI

A number of aging theories attribute initiation of aging processes to DNA. However, there are a lot of data, which suggest that epigenetic, cytoplasmic factors may be of crucial importance. The cloning phenomenon would not be possible if "aging factors" were within the cell nucleus, because the age of cells of a cloned organism would be the same as the age of a cell donated nucleus. The process of nucleus "reprogramming" suggests existence of a structure, which anew "winds up" a cell clock and initiates the processes of cell differentiation. We considered the centriole might be such a structure (Tkemaladze, Chichinadze 2005a, b). That publication was followed by new data, confirming our concept. In particular, we suggested that small interfering RNA (siRNA) and microRNA might be involved in the processes of information storage and reproduction. At the time of our publication there were no data on nucleic acids in centrosome but in 2006 five different RNAs (named cnRNA – centrosomal RNA) were extracted from the oocytes of shellfish *Spisula solidissima*. Analysis showed that cnRNA was not a part of nucleus genome. If cnRNA is shown to possess the same regulatory function as siRNA and miRNA, i.e. regulation of gene expression on posttranscriptional level, it will be valuable evidence confirming our concept. Another study showed that those daughter cells of germinative stem cells of males of *Drosophila melanogaster*, which differentiates, contain daughter centrosome, while those, which retain stem features, contain the centrosome of the mother cell (Spradling, Zheng, 2007). The authors of that article themselves put the question: is centrosomal inheritance a clue for stem cell features, which has been searched for so long time? That research confirms our concept on centrosome as a structure, which determines the process of cell differentiation.

#### **PA8 036 INSULIN-LIKE GROWTH FACTOR- 1 AND INSULIN RESISTANCE AS RISK FACTORS FOR ALZHEIMER DISEASE**

A. VILORIA\* (Hospital clinico san carlos, Madrid, Spain)  
Y. R(1), M. R(1), R. M(1), G. P(1), R. JM(1) - (1) hospital clinico san carlos madrid (madrid, Spain)

Aims: To identify the role of the insulin-like growth factor 1 (IGF-1), fasting insulin and homeostasis model assessment estimate of insulin resistance (HOMA-IR) in the development of Alzheimer Disease (AD). Method: Descriptive study. Elderly control subjects, patients with mild cognitive impairment (MCI) and Alzheimer disease (NINCDS-ADRDA criteria) were included. With a blood test, we determined the IGF-1, fasting insulin and HOMA serum levels. We assessed demographic data, medical history (diabetes mellitus, high blood pressure, dyslipidemia), functional status (Katz index for basic activities of daily living) and Lawton index for instrumental activities of daily living and cognitive scale (Minimetal State Examination:MMSE). Statistical analysis SPSS 14.0. p: 0.05 Results: Sample: 48 subjects were included (control subjects: 16, MCI: 6, AD: 26 (GDS 4: 21 subjects, GDS 5: 5). Main age: 78 years (65-90). Significant differences in GF-1 serum levels were found between control group and AD group ( $p < 0.001$ ), with lower levels in AD group, and although no significant, we found differences between control group and MCI group ( $p < 0.06$ ). Related to HOMA levels, statistical significant differences were observed when compared Control vs AD group ( $p < 0.004$ ) with lower levels in subjects with AD, and control vs MCI group ( $p < 0.002$ ). No statistical differences were observed in MCI vs AD group for any of the parameters. Conclusions: 1. IGF1 serum levels are lower in patients with MCI or AD than in subjects without cognitive impairment. 2. Insulin resistance (fasting insulin and HOMA) in MCI and AD is lower than in control subjects. 3. The findings of this study suggest that low levels of IGF-1 and insulin resistance could

be consider as a risk factor for the development of mild cognitive impairment and Alzheimer Disease.

#### **PA8 037 OXYS RATS AS ANIMAL MODEL OF AGE-RELATED MACULAR DEGENERATION: POTENTIAL FOR PATHOGENESIS AND THERAPEUTIC APPROACH**

A. MARKOVETS\* (The Institute of Cytology and Genetics SB RAS, Novosibirsk, Russian Federation)  
A. FURSOVA(1), N. KOLOSOVA(1) - (1) The Institute of Cytology and Genetics SB RAS (Novosibirsk, Russian Federation)

Introduction Pathogenesis of age-related macular degeneration (AMD), the leading cause of blindness in the world, is associated with oxidative stress and neovascularization but exact mechanism remains poorly understood. Recently we showed that accelerated-senescence OXYS rats strain is a suitable model for AMD and can be used for study of AMD pathogenesis and trial of new therapeutic approaches. Here we studied the connection of chorioretinal dystrophy (CRD) in OXYS rats with vascular endothelium growth factor (VEGF) gene expression and the effect of mitochondria-targeted antioxidant SkQ1 (10-(6?-plastoquinonyl) decyltriphenylphosphonium) on these parameters. The distinctive feature of this type of antioxidants is the ability to penetrate and to accumulate in mitochondria - the main source of reactive oxygen species in cells. Materials and methods OXYS rat's retinas were examined ophthalmoscopically and VEGF gene expression was studied. SkQ1 was supplemented with diet (from 1.5 to 3 months, 250 nmol/kg) or given in eye's drops (from 9 to 11 months, 250 nM). Results CRD signs were registered in 21-25% of 1.5 month-aged OXYS rats and incidence reached 100% at 3-4 months. VEGF expression level was twice lower ( $p < 0.002$ ) at 3 month-aged OXYS rats and negatively correlated with degree of CRD ( $r = -0.61$ ). To the age of 12-14 months clinical CRD symptoms increased simultaneously with choroidal blood flow reduction and ischemia development. VEGF expression was similar in OXYS and Wistar rats and positively correlated with retina injury ( $r = 0.69$ ). SkQ1 supplementation with diet prevented CRD development in OXYS rats and increased VEGF expression in 3 month-old OXYS rats. SkQ1 eye's drops reduced CRD signs and decreased VEGF expression ( $p < 0.019$ ) at 12 months. Conclusion We suggest that CRD development in OXYS rats is associated with changes of VEGF gene expression, as it is known for humans. Mitochondria-targeted antioxidant SkQ1 has prophylactic and therapeutic effects on CRD in OXYS rats improving expression of VEGF gene.

#### **PA8 038 MITOGENIC RESPONSE OF SENESCENT HUMAN DIPLOID FIBROBLASTS TO LPA AND ACI**

J. RHIM\* (Seoul National University College of Medicine, Seoul, Republic of Korea)  
E. YEO(2), S. CHO(1), H. CHOI(1), Y. SON(1), S. LEE(1), S. KIM(1), S. PARK(1) - (1) Seoul National University (Seoul, Republic of Korea); (2) Gachon University (Seoul, Republic of Korea)

Introduction: In a previous study, we showed that a phospholipid growth factor lysophosphatidic acid (LPA) as well as adenylyl cyclase inhibitor SQ22536 (ACI) increase proliferative potential of senescent human diploid fibroblasts (HDFs). The present study was designed to elucidate the molecular mechanism underlying LPA- and ACI-induced proliferation of senescent HDFs. Since the AMPK activity, as measured by the level of phosphorylated AMPK $\alpha$  on Thr172, increases during cellular senescence and phosphorylation of p53 on Ser15 by AMPK is required for p21waf1/cip1 expression, we compared the phosphorylation status of AMPK and p53, and the expression level of p21waf1/cip1 after treatment with LPA and ACI. Methods and materials: Cell cycle was analyzed by flow cytometry. Confocal immunofluorescent staining was performed in cultured young and senescent HDFs, immunohistochemistry in biopsy samples of human skins, and Western blotting in the cell lysates. Results: Both LPA and ACI induced senescent cell proliferation by increasing S phase entry. The active form of AMPK (p-Thr172-AMPK $\alpha$ ) increased in senescent HDFs and aged human back skin cells. LPA increased phosphorylation on Ser485/491 and reduced the accessibility of the Thr172 phosphorylation site thereby inhibiting its catalytic activity, presumably by activating cAMP-dependent protein kinase (PKA). However, ACI reduced phosphorylation of AMPK on Thr172 and decreased its catalytic activity by reducing the protein level of tumor suppressor serine/threonine protein kinase LKB1. The levels of p-Ser15-p53 and p21waf1/cip1 were also decreased by both LPA and ACI treatment of senescent cells. Conclusion: Both LPA and ACI inhibit the catalytic activity of AMPK by differently regulating phosphorylation status of AMPK, increasing senescent cell proliferation.

#### **PA8 039 THE NUCLEAR RECEPTOR RORALPHA AS A NEW ASTROCYTIC CONTRIBUTOR TO BRAIN AGING INFLAMMATORY PHENOTYPE**

B. VERNET-DER GARABEDIAN\* ( UMR 7102, UPMC Université Paris 6/ CNRS, Paris, France)

J. NATHALIE, J. SARAH, G. VANESSA, M. JEAN

The nuclear receptor RORalpha and the interleukin-6 (IL-6) are both widely expressed in the organism and implicated in the pathogenesis of several age-associated diseases. RORalpha exerts multiple functions including down-regulation of inflammatory processes

in the periphery and neuroprotection against age-related neuronal death in the central nervous system (CNS). IL-6 is an inflammatory mediator displaying neuroprotective property. The overlapping of the effects of RORalpha and of IL-6 suggests a link between them, despite their different subcellular localization in the brain. IL-6 is mainly produced by astrocytes and RORalpha has been until now considered as exclusively neuronal. We hypothesized that RORalpha is also expressed in astrocytes, key cell mediators of CNS inflammation and we investigated the relation of RORalpha with astrocytes and IL-6. We used the staggerer mutant mice that express a loss of function mutation in the Rora gene. We performed comparative studies of wild-type and homozygous staggerer astrocyte cultures and used immunohistochemical analysis, real-time RT-PCR, IL-6 detection assay, sequence analysis, reporter gene and electrophoretic mobility shift assays (EMSA). We show that RORalpha is expressed in astrocytes and that this expression is up-regulated by proinflammatory cytokines. We also identified the Il-6 gene as a RORalpha target and demonstrated that RORalpha exerts bi-directional control of Il-6: direct transactivation to maintain basal IL-6 expression and indirect repression via inhibition of the NF- $\kappa$ B pathway in an inflammatory context. Thus RORalpha contributes to maintain IL-6 homeostasis in the brain. IL-6 is among inflammatory mediators that increase with age in healthy subjects. Depending of when and how IL-6 is applied in animal models, it can either promote neuronal survival or trigger neurodegeneration and cell death. The link we provide between RORalpha, IL-6 and astrocytes adds to the growing role of astrocytes in aging and related disease in the brain.

#### **PA8 040 CELLULAR STRESS RESPONSES OF HUMAN SKIN FIBROBLASTS REFLECT DIFFERENCES IN HUMAN LONGEVITY**

P. DEKKER\* (LUMC, Leiden, The Netherlands)  
A. MAIER(1), D. VAN HEEMST(1), C. DE KONING-TREURNIET(1), J. BLOM(1), R. DIRKS(1), H. TANKE(1), R. WESTENDORP(1) - (1) LUMC (Leiden, The Netherlands)

Introduction: Aging is the result of the accumulation of damage, caused by intrinsic as well as extrinsic sources. In humans, cellular responses to stress have not been related to longevity so far. Here, we investigated the relation between cellular responses to stress in fibroblasts from donors with different chronological age and different genetic background. Materials and methods: Fibroblast were isolated from subjects from the Leiden 85-plus Study for the contrast in chronological age (20y, n=10, vs. 90y, n=10) and from the Leiden Longevity Study for the contrast in genetic background (offspring of long-lived siblings, age 60y±9, n=40, vs. the general population, age 61±8 years, n=40). Fibroblasts were exposed to rotenone and hyperglycemia. Senescence was assessed by measuring Senescence Associated- $\beta$ -galactosidase (SA- $\beta$ -gal) activity by flow cytometry. Apoptosis/cell death was measured with the Annexin V-assay and cell-cycle analysis (Sub-G1 content). Results: Cells from old subjects showed higher baseline levels of SA- $\beta$ -galactosidase activity ( $p=0.022$ ) and higher stress-induced increases (rotenone:  $p=0.009$ , hyperglycemia:  $p=0.100$ ). Cells from old subjects showed higher baseline levels of apoptosis/cell death (AnnexinV+/PI+ cells:  $p=0.100$ , Sub-G1:  $p=0.085$ ) but lower stress-induced increases (only for Sub-G1:  $p=0.071$ ). Cells from offspring did not show different SA- $\beta$ -galactosidase activity and apoptosis/cell death, but did show lower stress-induced increases for SA- $\beta$ -galactosidase activity (rotenone:  $p=0.125$ , glucose:  $p=0.003$ ) and more apoptosis/cell death (Annexin V+/PI- cells:  $p=0.072$ , AnnexinV+/PI+ cells:  $p=0.035$ , Sub-G1:  $p=0.161$ ). Conclusion: Cells from old subjects show more SA- $\beta$ -gal activity under non-stressed conditions and are less prone to undergo apoptosis in response to stress. Under conditions of stress, cells derived from offspring from long-living siblings show less SA- $\beta$ -gal activity and more apoptosis/cell death than cells from their partners. Differences in cellular responses to stress thus represent potential biomarkers for human longevity.

#### **PA8 041 IMPROVING EFFECTS OF GROWTH HORMONE TREATMENT ON 5-HT SYNTHESIS AND PERFORMANCE OF RADIAL MAZE TASK**

S. ESTEBAN VALDÉS\* (University of Balearic Islands, Palma de Mallorca, Spain)  
P. BARCELÓ CALDENTEY(1), C. GARAU GARCCÍA(1), S. APARICIO(1), C. NICOLAU LLOBERA(1), R. RIAL PLANAS(1) - (1) Neurophysiology UIB (Palma de Mallorca, Spain)

Introduction: Cognitive function declines with age. Both growth hormone (GH) and serotonin play a role in adult memory processing, and hippocampus could be a target for these effects. The present study aims to assess the effects of chronic treatment with growth hormone (GH) on brain serotonin (5-HT) synthesis and working memory in aged rats. The accumulation of 5-hydroxytryptophan (5-HTP) after decarboxylase inhibition was used as a measure of the rate of tryptophan hydroxylation in the brain *in vivo*. Previously, rats were tested in the 8-arm radial maze after GH treatment. The modulation of tryptophan hydroxylation and working memory test were assessed also in young rats for comparisons. Methods: Male young (3 months, n=12) and aged (20 months, n=12) Wistar rats were used. Animals were maintained under controlled conditions (22 °C, 70% humidity, 12/12 LD cycle). Aged rats received GH (1 mg/kg, s.c., twice daily for 4 weeks). Control rats received equal volumes of saline vehicle. After the treatments, to test radial maze memory task, trials were judged complete when rats had chosen all 8 baited arms or spent 20 minutes in the trial. After that, rats were sacrificed by decapitation and hippocampus and striatum samples analyzed by HPLC with electrochemical detection. Results: Tryptophan hydroxylation decreased significantly in the hippocampus (48%) and striatum

(44%) of aged rats indicating an impairment in serotonin synthesis with age. However, when aged rats were repeatedly treated with GH, an important increase in tryptophan hydroxylation in hippocampus (118%) and striatum (163%) was observed. These observations correlated with an impairment of task performance in radial maze in aged controls and an improvement in the rats treated with GH. Conclusion: The 5-HT enhancing properties of GH might explain, at least in part, the cognitive improving effects of chronic GH treatment in aged rats. Supported by SAF2007-66878-CO2-02 from MEC.

#### **PA8 042 RESTORATIVE EFFECTS OF GROWTH HORMONE TREATMENT ON CEREBRAL DOPAMINE SYNTHESIS AND MOTOR COORDINATION**

P. BARCELÓ CALDENTEY\* (University of Balearic Islands, Palma de Mallorca, Spain)  
D. MORANTA(1), M. FIOL(1), A. GAMUNDÍ(1), R. RIAL PLANAS(1), S. ESTEBAN VALDÉS(1) - (1) Neurophysiology UIB (Palma de Mallorca, Spain)

Introduction: During the normal process of aging, alterations in dopaminergic functions are known. The aim of the present study was to assess the effects of chronic treatment with growth hormone (GH) on dopamine synthesis and motor ability (rota-rod) in aged rats. The accumulation of 3,4-dihydroxyphenylalanine (DOPA) after decarboxylase inhibition was used as a measure of the rate of tyrosine hydroxylation *in vivo*. Also young rats were assessed for comparisons. Methods: Male young (3 months, n=12) and aged (20 months, n=12) Wistar rats were used. Animals were maintained under controlled conditions (22 °C, 70% humidity, 12/12 LD). Aged rats received GH (1 mg/kg, s.c.) or saline twice daily for 4 weeks. After treatments, all animals were evaluated for motor ability and balance by using rota-rod. The rats were given prior training sessions to acclimate them to rota-rod apparatus. Rats were placed on the rotating rod and the length of time on the rod was taken as measure of competency. Each rat performed 5 separate trials and the results were averaged. After that, rats were sacrificed by decapitation and samples of striatum analyzed by HPLC with electrochemical detection. Results: Tyrosine hydroxylation was decreased significantly in the striatum of aged rats (34%) indicating impairment in dopamine synthesis with age. However, when aged rats were treated with GH, an important increase in tyrosine hydroxylation in striatum (55%) was observed. When control aged rats were tested using rota-rod impaired their skill and increased the number of falls compared to the young control group. However GH treatment resulted in significant improvement in fall off time as compared to control aged rats. Conclusion: The results indicate that repeated treatment with growth hormone might aid to improve the descent in dopamine neurotransmission and motor coordination that normally occurs as a consequence of aging. #### **PA8 043 HYDROGEN-RICH PURE WATER PREVENTS SUPEROXIDE FORMATION IN BRAIN OF VITAMIN C-DEPLETED SMP30/GNL KNOCKOUT MICE**

Y. SATO\* (Faculty of Pharmaceutical Sciences, Toho University, Chiba, Japan)  
R. TAKAHASHI(1), A. ISHIGAMI(1) - (1) Department of Biochemistry, Faculty of Pharmaceutical Sciences, Toho University (Chiba, Japan)

Introduction Hydrogen is an established anti-oxidant that prevents acute oxidative stress. To clarify the mechanism of hydrogen's effect in the brain, we administered hydrogen-rich pure water ( $H_2$ ) to senescence marker protein-30 (SMP30)/gluconolactonase (GNL) knockout (KO) mice, which cannot synthesize vitamin C (VC). In this study, we found that hydrogen-rich pure water scavenges superoxide in the brain slices from VC-depleted SMP30/GNL KO mice. Methods and materials SMP30/GNL KO mice were divided into groups with free access to either hydrogen-rich pure water ( $H_2$ ), VC water (VC), or pure water ( $H_2O$ ) for 33 days. The  $H_2$  group drank hydrogen-rich pure water the VC group drank pure water containing VC (1.5 g/L), whereas the  $H_2O$  group drank pure water without  $H_2$  and VC. Total VC was measured by using a high-performance liquid chromatography (HPLC)-electrochemical detection method. Superoxide anion radical formation in brain slices was estimated by a real-time biophysics imaging system. Results Total VC levels in the brain from ingestion of  $H_2$  or  $H_2O$  groups were 6% lower than those of VC group. Superoxide anion radical formation in the group given  $H_2$  was a 27.2% lower than that in the  $H_2O$  administration group. Conclusion Hydrogen-rich pure water acts as antioxidant that prevents superoxide anion radical formation in the VC-depleted brain *in vivo*. This study indicates that intake of hydrogen-rich pure water has beneficial effects that increase resistance to the excessive oxidative stress prevalent in many states of physiologic degeneration.

#### **PA8 044 ASSESSMENT SCALES AND CONSENSUS GUIDELINES ENCODED IN FORMAL LOGIC**

P. EKLUND\* (Umeå University, Umeå, Sweden)

INTRODUCTION We discuss computerized assessments and guidelines, with formal logic for vague reasoning. The formal structures describe information structured e.g. within DSM-IV, NINCDS-ADRDA, assessment scales and ICF. METHODS AND MATERIALS The architecture related to decision making is the following: - text based assessment scales and consensus guidelines - guidelines and rules written in formal logic - logic based on terms and principles of logical consequence - signatures (operator domains) producing the terms of the logical language - ground category defining notions of 'sets of objects' For

example, by "Alzheimer's disease with cerebrovascular disease" we usually mean patients fulfilling the clinical criteria for 'possible' AD and who also present either clinical or brain imaging evidence of relevant CVD. Qualifications like 'possible' need to be situated in a signature, and the ground category must be selected. In the Cornell scale for depression in dementia, the variable "lack of energy" as a physical sign is assigned the value of either '0', '1' or '2', where '0' is attached with the "meaning" 'absent' and scores '1' and '2' are reserved for changes occurring accutely. In this example 'lack of energy' is internalized for the CSDD scale, and is then, intentionally or not, unrelated e.g. to ICF's b1300 on energy levels. RESULTS We present a formalizations of logic based on ground categories involving lattice-values sets. We also demonstrate software architectures involving methodology for database management and client/server scenarios. We merge assessment scales as used within multi-professional municipality observe-assess-decide groups with consensus guidelines as used e.g. within early clinical diagnosis of dementia in processes of dementia investigations. CONCLUSION We have presented paradigms for non-classical substitution showing the underlying categories. The distinction between set-theoretic operations and operations on lattice-valued sets are presented within underlying ground categories.

#### **PA8 045 MANOMETRIC DISORDERS IN ELDERLY PATIENTS.**

J. RIBERA CASADO\* (Hospital Clínico San Carlos, Madrid, Spain)  
F. SORIA(1), Y. SÁNCHEZ(2), C. DE LOS RIOS(2), F. CANGA(2), C. GREGORIO(2) - (1) Hospital Clínico San Carlos (Madrid, Spain); (2) Hospital Universitario 12 de Octubre (Madrid, Spain)

Introduction: Description of pHmetry and manometry findings in patients 65 years or older seen in a Gastroenterology Service is necessary to study the spectrum of esophageal disorders in this patients. Methods and Materials: Observational and descriptive study, in 84 patients 65 years and older who attended at consult of Gastroenterology between January 2007 and November 2008. We recorded; demographic data, manometric and phmetric results in 73 of these patients. Results: Mean age 72,09 years ( $\pm 4.5$ ); 65,48% female. Reason for the evaluation: to discard motor disorder related to gastroesophageal reflux in patients with typical symptoms (53,57%), study of esophageal dysphagia not related to other symptoms (15,48%), pre-surgical evaluation (10,71%), positioning of pHmetric electrodes (7,14%). Manometry was normal in 13 patients (15,48%). 29 patients presented upper esophageal sphincter disorders (hypotensive 75,86%). In esophageal body we observed: nonspecific esophageal hypomotility (37,74%), ineffective esophageal motility (28,30%), nonspecific esophageal hypercontraction (11,32%), diffuse esophageal spasm (11,32%). Disorders of lower esophageal sphincter in 37 patients: hypotensive (83,78%). We observed registers compatible with hiatus hernia in 38 patients (45,24%). We performed esophageal phmetry in 73 patients. There were no statistical relation between pathologic gastroesophageal reflux and hiatus hernia ( $p = 0,814$ ). However there were relation between reflux and hypotensive lower esophageal sphincter ( $p = 0,008$ ). Conclusions: 1.- Is very important to consider the use of manometry and pHmetry studies in elderly patients because up to 84,52% of such patients seen had any manometric disorder, which can be related to potential benefits in diagnosis, treatment and follow up. 2.- Hypotonic lower esophageal sphincter is related with lower gastroesophageal reflux in elderly patients however there were no statistical relation with hiatus hernia. In this way hypomotility can be related not only with reflux but also other pathologies seen in elderly patients such as dysphagia or alimentary impastation.

#### **PA8 046 DOMAIN-SPECIFICITY OF NEUROPSYCHOLOGICAL TEST ASSOCIATED WITH APOE ε4 IN ELDERS WITH MILD COGNITIVE IMPAIRMENT**

B. NAM\* (KONKUK UNIVERSITY HOSPITAL, CHUNGIU, Republic of Korea)  
S. MOON(1), J. SEO(1), T. KIM(1), B. HONG(1) - (1) KONKUK UNIVERSITY HOSPITAL (CHUNGIU, Republic of Korea)

Introduction: This study was aimed to elucidate the association between Apolipoprotein E(APOE) ε4 and neurocognitive function using neuropsychological test in community-dwelling elderly samples with mild cognitive impairment(MCI). Methods: Total 236 samples aged 75 and under diagnosed with MCI in the recent year and completed the Korean version of the Consortium Establish a Registry for Alzheimer's Disease (CERAD-K) neuropsychological assessment protocol, were recruited. Genomic DNA was extracted from the venous blood and APOE genotyping was done in this group. Their cognitive performance was compared by the occurrence of the APOE ε4 allele. Results: The impact of ε4 allele was significant in the Word List Recall Test(WLRT,  $F=5.764$ ,  $df=1$ ,  $p=0.021$ ) in community-dwelling elderly samples aged 75 years and under. Conclusion: The conclusion to be drawn here is that community-dwelling elderly samples with ε4 allele in MCI had a significantly lower performance on the WLRT in the CERAD-K neuropsychological test batteries. Therefore, we can predict that MCI samples with ε4 allele may have significant lower performance in delayed recall than immediate recall, especially in verbal episodic memory in community-dwelling elderly samples aged 75 and under. Key words : MCI, Apolipoprotein E(APOE), CERAD-K, Neuropsychological test.

#### **PA8 047 USE OF VARIABILITY, SPEED AND ACCELERATION PARAMETERS TO EVALUATE POSTURAL BALANCE IN OLD VS YOUNG INDIVIDUALS**

M. GRØNBECH JØRGENSEN\* (Aalborg Hospital / Aarhus University Hospital , Aalborg, Denmark)

A. HOLSGAARD-LARSEN(3), P. CASEROTTI(2), O. B.F. NIELSEN(1), P. AAGAARD(3) - (1) Geriatric Department and Fall Clinic, Aalborg Hospital / Aarhus University Hospital (Aalborg, Denmark); (2) National Institute on Aging, National Institute of Health (Aalborg, United States of America); (3) Institute of Sports Science and Clinical Biomechanics, University of Southern Denmark (Aalborg, Denmark)

**INTRODUCTION:** Poor postural balance control (stability) is one of the major risk factors for falling. If individuals at risk of falling are to be identified at an early stage, good knowledge and sensitive measurements of postural stability are essential. In addition, in order to develop effective intervention strategies such knowledge is of major importance.

However, no single postural stability parameter has effectively been able to identify individuals at risk of falling. Hence, there is a strong need for development and identification of sensitive postural sway parameters in various demographic groups. The aim of this study was to explore differences in postural stability between physically active old (O) and young (Y) women using newly developed sway parameters.

**METHODS AND MATERIALS:** Center of pressure (CoP) excursion was measured (100 Hz) by force plate (AMTI) analysis in old ( $72.5 \pm 6.3$  years) and young ( $25.8 \pm 1.6$  years) women during static 2-leg (bilateral) and 1-leg (unilateral) standing (15-s) with eyes opened. **RESULTS:** O demonstrated elevated CoP sway length, mean velocity, sway area, confidence ellipse area, velocity and variability in the medio-lateral and anterior-posterior plane compared to Y ( $p<0.0001-0.01$ ). Further, CoP acceleration was greater in O than Y ( $p<0.0001-0.01$ ) except in the M-L direction during 2-leg stance. An elevated ratio of bilateral-to-unilateral CoP velocity was observed in O compared to Y ( $p<0.01$ ), indicating that O had greater relative impairment in unilateral postural stability compared to stable bilateral stance. **CONCLUSION:** Postural sway parameters were identified (COP M-L & A-P velocity, acceleration, variability and ratio) that could effectively demonstrate differences in postural balance control between physically active old and young women.

#### **PA8 048 OXIDATIVE DNA DAMAGE IN PERIPHERAL LYMPHOCYTES OF PATIENTS WITH ALZHEIMER DISEASE**

P. GIL\* (Centro de investigaciones biologicas CSIC, Madrid, Spain)  
G. R(1), C. C(1), C. A(2), Y. R(2), G. P(2), M. C(2) - (1) Centro de Investigaciones Biologicas CSIC (Madrid, Spain); (2) Hospital Clinico San Carlos Madrid (Madrid, Spain)

Introduction: Oxidative stress is increasingly believed to be involved in a number of neurodegenerative disorders. In this work, we investigated oxidative DNA damage and antioxidant capacity in patients with Alzheimer disease. Material and methods: The study was performed in 12 patients affected by Alzheimer disease (AD) diagnosed by the Department of Geriatrics, San Carlos Clinic Hospital of Madrid. We also analysed, as a control group, 11 individuals of both sexes who were aged-matched with AD patients. The SCGE (Single Cell Gel Electrophoresis or Comet Assay) was used to asses DNA damage in lymphocytes. This method detects strand breaks and alkali-labile sites in single cells, using Tail DNA%, Comet length and Tail moment as DNA damage parameters. Antioxidant capacity assay was performed in plasma by FRAP method. Bilirubin was also assessed in plasma. Results: Significant differences ( $P<0.01$ ) were observed in DNA damage between AD patients and controls: TailDNA%,  $4.11 \pm 0.21$  vs.  $2.02 \pm 0.11$ ; Comet Length in  $\mu\text{m}$ ,  $44.78 \pm 1.69$  vs.  $24.53 \pm 0.98$ ; Tail moment in arbitrary units,  $3.54 \pm 0.27$  vs.  $1.00 \pm 0.09$ , all data expressed as mean $\pm$ SEM (Standard Error of the Mean). After  $\text{H}_2\text{O}_2$  treatment of lymphocytes, oxidative DNA damage increase in both AD patients and control and we obtained significant differences ( $P<0.01$ ) between AD patients and controls (Tail DNA%,  $6.92 \pm 0.38$  vs.  $5.32 \pm 0.42$ ; Comet Length in  $\mu\text{m}$ ,  $63.82 \pm 2.48$  vs.  $49.35 \pm 2.31$ ; Tail moment in arbitrary units,  $7.30 \pm 0.62$  vs.  $4.41 \pm 0.41$ , all data expressed as mean $\pm$ SEM. Significant differences ( $P<0.001$ ) were, also, observed in plasma antioxidant capacity between AD patients and controls ( $0.43 \pm 0.04$  vs  $0.64 \pm 0.04$  mmol Trolox equiv./L). In AD patients a negative significant correlation was found between bilirubin and Tail moment increase ( $r=-0.972$ ,  $P<0.05$ ). Conclusion: Oxidative stress plays a key role in the process of neurodegeneration. AD patients have an elevated DNA damage caused by oxidative stress and decreased levels of some plasmatic antioxidants, such bilirubin, could increase the risk of DNA damage generation.

#### **PA8 049 CCN3 INHIBITS NEOINTIMAL HYPERPLASIA THROUGH MODULATION OF SMOOTH MUSCLE CELL GROWTH AND MIGRATION**

T. SHIMOYAMA\* (Chiba University Graduate School of Medicine, Chiba, Japan)  
M. TAKEMOTO(1), M. KOSHIZAKA(1), M. FUJIMOTO(1), Y. TSURUTANI(1), S. OHNISHI(1), Y. SAITO(1), K. YOKOTE(1), . (1) - (1) Chiba University Graduate School of Medicine (Chiba, Japan)

Introduction: Elderly person are at a particularly high risk for cardiovascular events. However, the precise pathogenesis of atherosclerosis has not been fully understood. CCN3 belongs to CCN family, which constitutes multifunctional secreted proteins that act as matrixcellular regulators. We investigated the patho-physiological roles of CCN3 in the vessels. Materials and Methods: Rat smooth muscle cells (VSMC) proliferation was quantified by BrdU incorporation and the migration was examined using a chemotaxis chamber. CN3 knockout mice were created and vascular phenotypes, as well as the neointimal hyperplasia induced by photochemically-induced thrombosis, were investigated. Results: CCN3 suppressed the VSMC proliferation induced by fetal bovine serum (FBS), as well as by  $\beta$ platelet-derived growth factor-BB. The neutralizing antibody

for TGF- did not affect the growth inhibitory effect of CCN3. Moreover, CCN3 enhanced the mRNA expression of cyclin-dependent kinase inhibitors, p21 and p15, in VSMC. Gamma secretase inhibitor, an inhibitor of Notch signaling, inhibited the enhanced expression of p21 induced by CCN3. CCN3 also dose-dependently inhibited the VSMC migration induced by FBS. Finally, no obvious vascular phenotype was found in the CCN3 null mice. However, the histopathological evaluation of the arteries 21 days after the injury revealed a 6-fold enhancement of neointimal thickening in the null mice compared with controls. Conclusion: CCN3 suppresses neointimal thickening through the inhibition of VSMC migration and proliferation. Our findings indicate the involvement of CCN3 in vascular homeostasis, especially upon injury, and the potential usefulness of this molecule in the modulation of atherosclerotic vascular disease.

#### **PA8 050 NETAGE: AN ONLINE DATABASE AND NETWORK ANALYSIS TOOLS FOR BIOGERONTOLOGICAL RESEARCH**

R. TACUTU\* (Ben-Gurion University of the Negev, Beer-Sheva, Israel)  
A. BUDOVSKY(1), V. FRAIFELD(1) - (1) Ben-Gurion University of the Negev (Beer-Sheva, Israel)

Introduction: The increasing amount of data on genes associated with aging, longevity, and age-related diseases (ARD) calls for a common platform for their integration and analysis. We have recently shown that the human longevity-associated proteins and the proteins involved in major ARDs act in a cooperative manner and could be organized as scale-free protein-protein interaction (PPI) networks (Budovsky et al., Mech. Aging Dev., 2007, 2009; Wolfson et al., Int. J. Biochem. Cell Biol., 2009). We have also shown that the network-based approach could be especially useful for predicting longevity-promoting targets. Systematic application of this approach for biogerontological purposes requires (i) a repository for networks associated with aging, longevity and ARDs, and (ii) the development of special tools for their analysis. Methods and materials: All data used for the construction of networks were automatically retrieved and processed from publicly available databases. Methods of computational biology and bioinformatics were used for network handling and analysis. Results: First, we extended our previous PPI network model by including microRNA-regulated gene expression. Using this model we created highly annotated networks for aging, longevity, and major ARDs. This was done by developing YABNA (Yet Another Biological Networks Analyzer), software program for creating, modifying, analyzing, and managing the networks. Finally, the constructed networks have been organized as a database which is now publicly available through the NetAge website. NetAge provides visualization and analytic tools, including node browsing, orthology information, microRNA and gene expression data, local or global network topology analysis as well as different kinds of simulations. Conclusions: The NetAge database will promote incorporation of a network-based approach into biogerontological studies, thereby contributing to the progress of systems biology of aging. Supported by the European Union FP7 Health Research Grant number HEALTH-F4-2008-202047.

#### **PA8 051 ARTIFICIAL ATMOSPHERE: EFFECTS ON GASEOUS EXCHANGE, STRESS RESISTANCE AND LIFE SPAN**

V. BEZRUKOV\* (Institute of Gerontology, Kiev, Ukraine)  
A. TIMCHENKO(1), N. UTKO(1), D. TOLSTUN(1), K. MURADIAN(1) - (1) Institute of Gerontology (Kiev, Ukraine)
