Inverse relationship between metabolic rate and life span is a fundamental and well-documented fact. The relationship, however, is poorly studied in direct experiments, e.g. in artificial atmosphere (AA) with altered content of oxygen or other gases. The present study was undertaken in order to modulate life span and stress-resistance by elevated or declined content of atmospheric oxygen, carbon dioxide and noble gases - a problem actual not only in gerontology, but in medicine, submarines, space explorations, etc. Methods. Imagoes of *D. melanogaster* were kept in hypoxia, hyperoxia or hypercapnia modeled by supplementation of oxygen, carbon dioxide, nitrogen, helium and argon. The renewal of AA and feeding medium was carried out on the 'every other day' basis. The oxygen and carbon dioxide content was monitored by a gaseous analyzer. Results. Two identical series of experiments were performed during the winter-spring and spring-summer seasons. In both series we observed a dose-dependent decrease of the mean life span at the hyperoxia and extended life span at the hypoxia or hypercapnia. All in all, longevity inversely correlated with the oxygen consumption, i.e. animals exposed to hyperoxia demonstrated higher rates of oxygen consumption and shorter life span and vice versa. In assessment of the stress-resistance, survival at the heat shock (38°C, 30 min) was increased in hypercapnia and decreased in hyperoxia treated flies, whereas at exposure to 15% hydrogen peroxide the survival was several folds higher at both hypercapnia and hyperoxia. At the alkaline feeding medium (pH=11.8), no significant effects of hyperoxia or hypercapnia on survival were observed. Conclusions. AA can modulate gaseous exchange rate, stress-resistance and life span of drosophila.

#### **PA8 052 ORION: EFFECT ON GASEOUS EXCHANGE, ANTIOXIDANT DEFENSE, STRESS-RESISTANCE, DEVELOPMENT AND LIFE SPAN**

K. MURADIAN\* (Institute of Gerontology AMS Ukraine, Kiev, Ukraine)  
O. ZHUKOVSKIY(2), V. RAZUMENKO(4), V. POLYAKOV(2), A. ORLOVSKIY(3), G. SOLYANIK(3), V. BEZRUKOV(1), N. UTKO(1), A. TIMCHENKO(1) - (1) Institute

of Gerontology AMS Ukraine (Kiev, Ukraine); (2) International Charitable Funding (Kiev, Ukraine); (3) Institute of Oncology AMS Ukraine (Kiev, Ukraine); (4) Institute of Neurosurgery AMS UKraine (Kiev, Ukraine)

Orion is a multicomponent drug with impressive anti-cancer effects shown in mouse and human cell cultures and clinical investigations initiated in Institute of Oncology AMS Ukraine since 2007. The authors cherish an idea that Orion could also possess stress-endurance enhancing and longevity-promoting effects. Methods. Orion was supplemented to the feeding medium of *D. melanogaster* in a wide range of concentrations and initial age of flies. Body Vo<sub>2</sub>, Vco<sub>2</sub>, pH, SOD and catalase activity and age-dynamics of survival were determined. Stress resistance was assessed by monitoring survival at the heat-shock, hyperoxia, hypoxia, hypercapnia, acidic (pH=1.6) or alkaline (pH=11.8) feeding mediums, peroxide supplementation, starvation, etc. Results. In optimal concentrations, Orion ameliorated survival of larvae and pupae, increased life span and stress resistance of imagoes. In contrast to the most life span extending treatments, e.g. antioxidants, longevity-promoting effect of Orion was higher when applied in the advanced ages (over 50-60 days). In such experiments, the so-called remaining mean life span could be extended by several folds. Specific anti-aging effects of Orion were also apparent when considering the longest-lived flies. Orion-treated animals could often reach 110-120 days of age (the longest championing up to 127 days), whereas control flies lived no more than 85-90 days. Orion did not significantly change body Vo<sub>2</sub>, Vco<sub>2</sub>, pH, SOD or catalase activity. In the stress-endurance tests, the drug increased survival at the heat shock and pH-related stresses but demonstrated little positive effects in the ROS-associated treatments (peroxide or 100 % oxygen). Most importantly, anti-aging effects of Orion could be inferred from the preliminary clinical investigations aimed to assess the functional status and biological age of patients before and after three weeks of the drug treatment.

#### **PA8 053 IMMUNE RISK PHENOTYPE BUT NOT CMV STATUS IS ASSOCIATED WITH NOSOCOMIAL INFECTION IN ELDERLY IN-PATIENTS.**

A. PLONQUET\* (Henri Mondor's Hospital, Créteil, France)  
C. MILLOT(1), F. TAHMASEBI(1), C. BRISACIER(1), P. BORIES(2), K. LE DUDAL(3), S. BASTUIJ-GARIN(4), E. PAILLAUD(1) - (1) Albert Chenevier's Hospital, Dpt. of internal and geriatric medicine (Créteil, France); (2) Hotel Dieu Hospital, Dpt. of Biology (Paris, France); (3) Henri Mondor's Hospital, Centre d'Investigation Clinique (Créteil, France); (4) Henri Mondor's Hospital, Dpt. of clinical research and public health (Créteil, France)

Introduction: The immune risk phenotype is predictive of shorter survival of elderly patients and is comprised of CMV positive serology, increased CD8+T-cells, increased percentage of CD28- CD8+ T-cells. Objectives. To determine the immune risk phenotype and its association with nosocomial infections (NI) in elderly patients. 6 Methods and materials : 252 hospitalised elderly adults aged 85.2 ± years old were immunologically assessed on admission in geriatric units by measurement of percentages and absolute values (AV) of CD4+, CD8+T, NK and B cells, as well as of CD8 and CD4 naïve (CD45RA+CD62L+) /memory (central CD45RA-CD62L+ and peripheral CD45RA-CD62L-) /terminal effector T cells (CD45RA+CD62L-, or CD28- for CD8+T cells) by flow cytometry, using 5-color fluorescence labelling. During two months after admission, patients'progress was closely monitored, particularly for the detection of NI. Results: the incidence rate of NI was 39.4%. The most common infection site was pulmonary tract (n=64). The immune status of the population was studied by comparing two groups defined according to the absence (group I, n=155), or presence of one or more NI (group II, n=97). High levels of CD8+ T cells (% p=0.012, AV p=0.0066), and among them high levels of peripheral memory cells (% p=0.004, AV p=0.014), and terminal effector CD28- T cells (% p=0.0050, AV p=0.0015) correlated with NI. CMV positive serology was associated with elevated levels of total CD8+ T cells, CD8+ memory and terminal effector CD8+ T cells but not with infection. Conclusion: the immune risk phenotype is associated with an increased risk of infection and with positive CMV serology in the elderly hospitalized patient, but the latter did not correlate the occurrence of infection in our series.

#### **PA8 054 BENEFICIAL EFFECTS OF EGB 761 ON TARDIVE DYSKINESIA INDUCED BY HALOPERIDOL IN RATS.**

B. SPINNEWYN\* (Ipsen Innovation, Les Ulis, France)  
C. CHARNET(1), A. MICHEL(1), C. PIERRE-ETIENNE(1) - (1) Ipsen Innovation (Les Ulis, France)

Introduction Oxidative stress, glutamate toxicity and mitochondrial impairment may contribute to the pathophysiology of tardive dyskinesia (TD) whose risk increases with advancing age. Tardive dyskinesia is a syndrome characterized by abnormal involuntary movements (AIMs), often of the orofacial region, produced by long-term treatment with antipsychotic drugs such as haloperidol. The free-radical scavenger properties of EGb 761 and its ability to protect mitochondrial function prompted us to determine whether it could prevent TD. Methods and Materials Haloperidol (2 mg/kg/day) was administered chronically to rats using an Alzet pump implanted subcutaneously for 28 days. This treatment led to the development of abnormal oral movements, referred to as vacuous chewing movements (VCMs) and tongue protrusion that were consistently observed after Alzet pump implantation. Four randomized groups of 11 rats were assigned to the following oral treatments: water (control) and EGb 761 50,100 and 200 mg/kg/day. Haloperidol and EGb

761 treatments were initiated at the same time. The behavioural assessment was then regularly performed from day 8 to day 31. Results Eight days after the implantation of pumps, haloperidol treatment significantly increased the VCMs and tongue protrusions in rats as compared to sham-operated animals. Treatment with 100 and 200 mg/kg EGb 761 significantly decreased VCMs score (40 to 50 %) and tongue protrusion (50 to 60%). This effect was significant from 3 weeks after the treatment initiation to the end of the experiment. Conclusion The results show that chronic treatment with EGb 761 when co administered mitigates the development of the orofacial tardive dyskinesia induced by the neuroleptic agent in rats. These data support a beneficial effect of adding EGb 761 to patients treated by neuroleptics who show signs of extrapyramidal side effects due to their treatment.

#### **PA8 055 EGB 761 PROVIDES MEMORY RECOVERY IN A MODEL OF VASCULAR DEMENTIA IN GERBILS.**

M. ROCHER\* (Ipsen Innovation, Les Ulis, France)

B. SPINNEWYN(1), D. CARRE(1), J. SCHULZ(1), B. PIGNOL(1), M. AUGUET(1), P. CHABRIER(1) - (1) Ipsen Innovation (Les Ulis, France)

Introduction The objective of the study was to test the efficacy on memory recovery of EGb 761 on a model of vascular dementia induced by global cerebral ischemia in gerbils. This rodent model shows long-term cognitive impairments and those deficits are correlated with the patterns of ischemic lesions. Methods and materials Under isoflurane anaesthesia, the common carotid arteries of gerbils were occluded for 5 minutes. Gerbils were allowed to recover for 24h and then locomotor activity was quantified. Twenty one days after reperfusion, gerbils were tested for impairments in spatial memory using the object placement test. EGb 761 (60 mg/kg) and its vehicle were administered orally 3h after the occlusion and every day until sacrifice. Hippocampal damage was determined by counting the number of viable CA1 pyramidal neurons. Oxidative stress and expression of amyloid precursor protein (APP) and glial fibrillary acidic protein (GFAP) were evaluated by immunocytochemical analysis. Results No difference in time exploring each object was found among groups, thus excluding the possibility of different exploratory activity of the animals. A clear treatment difference in the memory performance of gerbils was observed; sham-operated discriminated between the old and the new location with a memory index of  $0.54 \pm 0.14$ , whereas animals subjected to ischemia did not ( $0.02 \pm 0.19$ ). Treatment with EGb 761 induced a significant spatial memory recovery ( $0.37 \pm 0.15$ ), an increased the number of living pyramidal neurons. Conclusion This study shows that EGb 761 provides in vivo neuroprotection and memory recovery against global cerebral ischemia, even when administered after the insult in gerbils. These data support further evidence of the efficacy of EGb 761 in the treatment of cognitive symptoms of vascular dementia in patients.

#### **PA8 056 INVOLVEMENT OF AKT-FOXO3A SIGNALING IN TOLL-LIKE RECEPTOR 9-MEDIATED ANTI-APOPTOSIS**

S. BAEK\* (Yeungnam University, College of Medicine, Daegu, Republic of Korea)

E. LIM(1), J. LEE(1), Y. HWANG(1), B. CHIN(1), J. KIM(1) - (1) Yeungnam University, College of Medicine (Daegu, Republic of Korea)

Introduction: FoxO3a transcription factor plays an important role in longevity and tumor suppression by upregulating target genes involved in stress resistance and apoptosis. Toll-like receptors (TLRs) recognize a set of conserved molecular structures called pathogen-associated molecular patterns, which allow them to sense innate and adaptive immune responses. In this study, we investigated the role of FoxO3a transcription factors in TLR9-mediated anti-apoptosis of macrophages. Methods and Materials: The apoptotic nuclei were quantified by flow cytometry or annexin-V staining. To determine the subcellular localization of FoxO3a in cells, we used nuclear fractionation and Western blot analysis to detect the amount of FoxO3a in nuclei and cytoplasm. Real-time RT-PCR was performed using a Light Cycler 1.5. Cells were nucleoporated and allowed to knock-down the TLR9 mRNA using siRNA. Results: Stimulation of macrophages with TLR9 agonist prevented apoptosis induced by serum deprivation through increased expression of FLICE-like inhibitory protein (FLIP) and decreased expression of tumor necrosis factor-related apoptosis-inducing ligand (TRAIL). Inhibition of TLR9 by siRNA or an inhibitor suppressed CpG ODN-mediated anti-apoptosis. Analysis of signaling pathways revealed that the anti-apoptotic effect of CpG ODN required phosphorylation of FoxO3a and translocation from the nucleus to the cytosol of FoxO3a. Overexpression of FoxO3a increased apoptosis by serum deprivation and CpG ODN blocked these effects through FLIP and TRAIL expression. In addition, Akt activation was involved in CpG ODN-induced phosphorylation of FoxO3a, expression of FLIP and TRAIL, and anti-apoptosis. Conclusion: The results demonstrate the involvement of Akt-FoxO3a signaling in TLR9-mediated anti-apoptosis and indicate that FoxO3a is a distinct transcription factor for FLIP and TRAIL regulation. The effective control of FoxO3a by TLR9 stimuli is likely to be important to regulate aging and age-dependent diseases, including atherosclerosis and cancer. This work was supported by KOSEF grant (R01-2007-000-20087-0) and by the MEST grant (R13-2005-005-01003-0).

#### **PA8 057 MITOCHONDRIAL DNA REJUVENESCENCE: RESISTANCE IS NOT FUTILE.**

A. SAFDAR\* (McMaster University, Hamilton, Canada)

M. TARNOPOLSKY(1) - (1) McMaster University (Hamilton, Canada)

INTRODUCTION: The role of mitochondrial abnormalities and mitochondrial DNA (mtDNA) deletion mutagenesis in the etiology of skeletal muscle fiber loss with aging has

been extensively characterized. We previously reported that satellite cells do not accumulate aging-associated mtDNA deletions, and that resistance exercise (RES) training resulted in "mitochondrial gene shifting" and improved mitochondrial oxidative capacity in the skeletal muscle of older adults. To delineate the protective mechanism underlying this effect, we investigated the influence of 6 months of RES training in 16 older adults ( $70 \pm 5$  y, female = male) on the phosphorylation-mediated activation of Akt/mTOR/PGC-1α (ATP) signalling cascade – central regulators of cellular protein synthesis, mitochondrial biogenesis, and skeletal muscle hypertrophy. METHODS and MATERIALS: We analyzed muscle biopsies taken from the vastus lateralis before and after training for protein content of PGC-1α, and total and phosphorylation status of p38 mitogen-activated protein kinase (p38 MAPK), and p44/42 MAPK (ERK1/2), MAPK-interacting kinase 1 (Mnk1), protein kinase B (Akt), tuberin (TSC2), mammalian target of rapamycin (mTOR), 90 kDa ribosomal S6 kinase (p90 RSK), ribosomal protein S6 (rpS6), and AMP-activated protein kinase (AMPK), and satellite cell content. RESULTS: RES training increased protein content of PGC-1α (40%) and phosphorylation status of ERK1/2 (76%), Mnk1 (56%), Akt (76%), TSC2 (68%), mTOR (54%), p90 RSK (40%), and rpS6 (85%), and satellite cell content (19%) ( $P < 0.05$  for all). CONCLUSION: We conclude that the RES training-induced activation of the ATP signalling cascade promotes mitochondrial oxidative capacity, cellular proliferation, survival and anabolic processes concomitantly resulting in hypertrophic- rejuvenescence of the skeletal muscle in older adults. We propose that RES training is a viable therapy for attenuating and/or "reversing" mitochondrial abnormalities associated with sarcopenia. (Funded by the Canadian Institutes of Health Research – Institute of Aging, and Mr. Warren Lammert and Ms. Kathy Corkins).

#### **PA8 058 INFLUENCES OF AGEING AND THE LIFE-EVENTS ON THE OLDER WOMAN'S WEIGHT**

K. ARAI\* (Institute of Aging and Development, Machida-shi, Tokyo, Japan)

A. KAZUKO (1), Y. JIN (2), H. HIROSHI (1), S. YOSHIO (1) - (1) Institute of Aging and Development, Oberlin University (Machida-shi, Tokyo, Japan); (2) The Dia Foundation for Research on Ageing Societies (Machida-shi, Tokyo, Japan)

Objective: It is said that gain and loss of weight is a barometer for health condition. The purpose of this study is to find out if there are any influences of aging and the life-events on the older woman's weight. Subject: One case who measured her height and weight twice a day, at the hour of rising and before bed time for 15 years continuously. Methods: Data was analyzed how the height and weight changed according to aging and some life-events happened during 15 years. The life events were 1) retirement and going abroad to study, 2) environmental changes there, 3) entering the graduate school, 4) again environmental changes there, 5) then returning to Japan. The measuring instrument was the KDS digital height, weight, sitting height machine DST210. Results: 1. The change of height and weight by aging. The height gradually decreased and weight increased for 15 years. 2. The change of weight by life-events. 1) The weight was decreasing after retirement and going abroad. Then 2~3 years later, weight was increasing. 2) The weight was again decreasing after the entrance to the graduate school. Then, returning to Japan, the weight was increasing steadily. It was considered that going abroad to study after the retirement at 60 gave the subject a great deal of psychological stress. When the subject entered the graduate school, the stress became strong again. When the subject became accustomed to the life of study abroad, and returning to Japan, the stress was relieved. Conclusion: It is suggested that the height decrease by aging. While, changes of weight can not be explained only by aging: it is suggested that life-events, relating to the stresses, influence on them, negatively or positively.

#### **PA8 059 RHOA REGULATES AMYLOID- $\beta$ (A $\beta$ ) BINDING VIA $\beta$ 2-INTEGRIN, AND SUPEROXIDE PRODUCTION IN BV2 CELLS IN RESPONSE TO fA $\beta$**

J. PARK\* (Hallym University, Chuncheon, Republic of Korea)

Y. JEON(1), M. MOON(1), J. LEE(1), J. KIM(1), S. KIM(1), Y. KIM(1) - (1) Hallym University (Chuncheon, Republic of Korea)

Introduction: Amyloid- $\beta$  (A $\beta$ ) is one of the main factors to cause Alzheimer's disease. Although fibrillar A $\beta$  (fA $\beta$ ) activates microglial cells that release toxic compounds including reactive oxygen species to induce partial neuronal death, the receptor for fA $\beta$  which transmits its signal and the mechanism of interaction between A $\beta$  and microglia via a specific receptor remain unclear. Methods and Materials: We examined the interaction of microglial cells (BV2) and fA $\beta$  on a gelatin-coated plate. To find specific receptor for fA $\beta$ , several type of antibodies were administered, which neutralize specific receptor for fA $\beta$ . To reveal implication of RhoA in these processes, Tat-C3 toxin (Rho inhibitor) was administered to the cells, and si-RhoA, and various types of RhoA constructs were transfected into BV2 cells. Results: The interaction of cells to fA $\beta$  was markedly enhanced by RhoA inactivation induced by Tat-C3, dominant negative RhoA, and si-RhoA, whereas lysophosphatidic acid (LPA) reduced it. To identify the receptor for M $\alpha$ L, - $\alpha$ fA $\beta$ , we added antibodies such as anti-CD36, -SR-A, -integrin M $\beta$ 2 to the cells to mask receptors: among them M $\alpha$ L $\beta$ 2, and - $\alpha$ - $\beta$ 1, - $\beta$ 2, -anti- $\beta$ 2-integrin antibody mostly suppressed cell binding to fA $\beta$ . In addition, anti- $\beta$ 2-integrin antibody also suppressed the increased

interaction between BV2 cells fA $\beta$ . Conclusion: RhoA regulates interaction between cells and fA $\beta$ : RhoA inhibition stimulates  $\beta$ -integrin-mediated cell interaction to fA $\beta$ .

**PA8 060 GENE EXPRESSION PROFILE IN MOUSE HIPPOCAMPUS FOLLOWING LOSS OF MOLAR TEETH**

M. TAKATSU\* (Nihon University, Tokyo, Japan)

K. KOMAKI(2), M. TSUCHIYA(2), T. OHI(2), N. GIONHAKU(1) - (1) Nihon University (Tokyo, Japan); (2) Tohoku University (Sendai, Japan)

Introduction: It has been demonstrated that loss of molar teeth cause deficits in spatial memory accompanied with various pathological changes in rodents, but the molecular basis of the effect is not well understood. To investigate changes in gene expression in the hippocampus of aged mice following the loss of molar teeth, DNA microarray analysis was performed. Methods and materials: 18-month-old male C57BL/6J mice were deeply anesthetized and all of their upper molar teeth were extracted. The control animals were treated with anesthesia alone. They were bred and maintained for 4 months under conventional conditions and total RNA was extracted from the hippocampal tissue at 22 months of age. Equal amounts of cRNA from 5 mice in each condition were combined and hybridized to Affymetrix GeneChip Mouse Genome 430A 2.0 arrays, which contains 22,600 probe sets representing transcripts of about 14,000 kinds. The results of microarray analysis were analyzed by bioinformatics. Results: Significantly changes in expression following tooth extraction were observed in 90 genes: 21 genes were up-regulated and 69 genes were down-regulated. Some of these genes are already known to be involved in the functions or diseases of the nervous system, such as neurotransmission, neuron development, risk factor of schizophrenia, etc. In particular, Ryr1 and Gria2 (AMPAR) genes, which were down-regulated by loss of molar teeth, were reported to be involved in signaling pathway in long-term depression (LTD) of spatial working memory in hippocampus. Conclusion: These results suggest that loss of molar teeth could affect various events in the central nervous system at gene expression level. Moreover, it is suggested that loss of molar teeth can induce the impairment of hippocampal LTD in aged mice through the alteration of gene expression.

## Track B – Health Sciences and Geriatric Medicine

**PB8 061 THE FREQUENCY OF ANXIETY IN PATIENTS WITH A FIRST TIME DIAGNOSE OF MILD DEMENTIA**

M. HYNNINEN\* (University of Bergen, Bergen, Norway)

M. BREITVE(1), A. RONGVE(1), D. AARSLAND(2), I. NORDHUS(3) - (1) Department of old age psychiatry, Haugesund hospital (Norway); (2) Department of clinical medicine, University of Bergen (Norway); (3) Faculty of psychology, University of Bergen (Norway)

Introduction: Although anxiety may cause considerable suffering to patients with dementia and their carers, relatively little is known about its features in this group of patients. This study aimed at examining the frequency of anxiety among patients diagnosed with mild dementia for the first time. Methods and materials: From March 2005 to March 2007, outpatients referred to clinics in geriatric medicine and old age psychiatry in Western Norway were screened for participation in a dementia study (DEMVEST). All 196 included patients were diagnosed with dementia (DSM-IV criteria) for the first time and had a MMSE score > 19. Dementia subtype diagnoses were based on established criteria. Anxiety was assessed based on information from both caregivers (NPI Anxiety subscale) and patients (anxiety item from the MADRS). Results: Based on caregiver ratings, 21% of the total sample had clinically significant anxiety, and an additional 20% had subclinical anxiety. One third of the patients reported feeling anxious at least from time to time. There was a weak but significant correlation between caregiver and patient ratings of anxiety ( $p=.036$ ). Female sex ( $p=.042$ ) and lower education ( $p=.028$ ) were significantly associated with higher levels of anxiety, whereas age, duration of illness or MMSE scores were not. Anxiety was most frequent in patients with Dementia with Lewy bodies and least frequent in patients with Vascular dementia (53% vs. 36% on the NPI subscale, 49% vs. 18% on the MADRS item). Conclusion: These data suggest that anxiety is common among patients with first time diagnosed mild dementia, particularly in patients with Dementia with Lewy bodies. Changes in the frequency and severity of anxiety over time as the disease progresses should be examined in future studies.

**PB8 062 CLINICAL CONSEQUENCES OF ANXIETY IN MILD ALZHEIMER'S DISEASE AND DEMENTIA WITH LEWY BODIES**

M. BREITVE\* (University of Bergen, Bergen, Norway)

M. HYNNINEN(1), A. RONGVE(2), D. AARSLAND(3), I. NORDHUS(1) - (1) Faculty of Psychology, University of Bergen (Norway); (2) Department of old age psychiatry, Haugesund hospital (Norway); (3) Department of clinical medicine, University of Bergen (Norway)

Introduction: Alzheimer's disease (AD) and Dementia with Lewy bodies (DLB) are two of the most common types of degenerative dementia in elderly. Previous research has

demonstrated differences in the cognitive and neuropsychiatric profiles of DLB and AD patients. However, relatively little is known about the role of anxiety in the subtypes of dementia. This study aimed at assessing anxiety among patients with AD and DLB and examining its relationship to MMSE scores, functional ability and caregiver distress in the two groups. Methods and materials: Throughout a period of two years, outpatients referred to clinics of geriatric medicine and old age psychiatry in Western Norway were screened for participation in a dementia study (DEMVEST). The current study sample comprised 167 patients diagnosed for the first time with mild dementia (129 with probable AD, 38 with probable DLB) and MMSE >19. In this cross-sectional study, anxiety was assessed with the NPI anxiety subscale, functional ability with the Rapid Disability Rating Scale-2, and caregiver distress with the Relative Stress Scale. Results: 53% of the DLB and 39% of the AD patients had anxiety on the NPI subscale. The differences between the groups in anxiety frequency and severity (5.32 vs 4.22) were not significant. The groups did not differ in their MMSE total scores, nor were the MMSE total scores associated with anxiety. Patients with DLB performed significantly better than patients with AD on the MMSE subtest for memory and the subtests scores were related to anxiety severity ( $r=-.49$ ,  $p=.030$ ). Although caregiver distress and impairment in functional ability were higher among the DLB patients, they were not associated with anxiety. In the AD group, high anxiety was associated with lower functional ability ( $r=-.43$ ,  $p=.006$ ) and higher caregiver distress ( $r=.40$ ,  $p=.007$ ). Conclusion: Anxiety seems to have more severe consequences for AD patients than DLB patients.

**PB8 063 CAN PSYCHOMOTOR DECLINE ON SPEECH PRODUCTION IN MILD ALZHEIMER'S DISEASE BE DUE TO REDUCED CEREBELLAR GRAY MATTER?**

C. RODRIGUEZ-ARANDA\* (University of Tromsø, Tromsø, Norway)

R. BAKKEN- ARNESEN(1), C. JOTA(1), P. ELDEVIK(2), S. JOHNSEN(2), S. SPARR(2), K. WATERLOO(1), T. VANGBERG(1) - (1) University of Tromsø (Tromsø, Norway); (2) University Hospital of North Norway (Tromsø, Norway)

Introduction: Increasing data indicates that important declines on psychomotor functions occur at the early stages of Alzheimer's disease (AD) and prior to serious cognitive impairment. These changes are mainly related to complex motor functions requiring the involvement of mental capacities for their execution such as in walking or speech articulation. Strong evidence suggests that the cerebellum may play a crucial role on these functions. Because little is known about psychomotor changes on speech production in mild AD and its relationship to the cerebellum, the present study seeks to evaluate different aspects of word generation and the extent to which speech articulation measures correlate to gray matter volume in the cerebellum. Methods and materials: Participants were 20 healthy elderly and 20 mild AD patients. A comprehensive test battery was utilized to assess cognitive capacity. From the battery, four verbal tasks were digitally recorded and further employed for the analysis of psychomotor parameters in word production. Spectrographic analyses were performed on the sound waves of the recorded data. Reaction times (RT), word articulation time and voice intensity were quantified. Structural MRI scans suitable for voxel based morphometry were collected. For each subject the cerebellum was extracted and normalized to a custom template. A linear regression analysis was performed between the gray matter segments and speech scores. Results: Spectrographic results show declines in word production in the AD group in terms of RT, word articulation and principally on voice intensity. AD patients scored lower in speech performance and cognitive tasks than controls though, speech declines were more regular. Pilot analyses of MR images show positive correlation between speech data and gray matter volume in the lateral area of the cerebellum. Conclusion: Results suggest that psychomotor decline on speech production are identifiable changes present in mild AD that relates to cerebellar structural changes.

**PB8 064 EARLY VERSUS LATE-ONSET DEPRESSION IN A PROSPECTIVE AGEING STUDY IN GERMANY**

J. SCHRÖDER\* (University of Heidelberg, Heidelberg, Germany)

J. PANTEL(2), P. SCHÖNKNECHT(3) - (2) University of Frankfurt a. M., Department of Psychiatry and Psychotherapy (Frankfurt a. M., Germany); (3) University of Leipzig, Department of Psychiatry (Leipzig, Germany)

Introduction: Depressive disorders are a frequent condition in the elderly. The age of onset determines two different clinical features, one of them, the late onset depression (LOD) has been associated to an increased risk for developing a Mild cognitive impairment (MCI) or dementia. In this study we investigated if this association applies for a representative community sample in Germany too. Methods and materials: Prevalence of affective disorders was investigated in 500 community-dwelling subjects from the birth cohort 1930/32 of the Interdisciplinary Longitudinal Study on Adult Development and Aging (ILSE). Participants were carefully screened for physical and mental health. In all subjects, the structured clinical interview according to DSM-III-R (SCID) and neuropsychological test batteries were applied. The first examination wave (t1) was conducted in 1994-95, t2 in 1998-99 and t3 in 2005-08. MCI was diagnosed according to the ageing associated cognitive decline criteria of the IPA working party. Subjects were also classified by age of onset of depression: early-onset depression (EOD) <65 years or LOD  $\geq$ 65 years. All diagnoses were result of a consensus conference under supervision of senior consultant in old age psychiatry. Results: 381 participants (189 females, 192 males) of the cohort were re-examined in t3, 60 of them had at least one major depressive (MD) episode until t3

yielding a lifetime prevalence rate of 15.7% (EOD= 12.3% and LOD=3.4%). Within the subjects with an MD, patients with LOD were more likely to have a MCI (58%) in comparison to subjects with EOD (27%;  $\chi^2= 4.0578$ ,  $p<0.05$ ). Conclusion: These results support the hypothesis of LOD as a risk factor for MCI and are in concordance with previous studies.

**PB8 065 BRAIN PERfusion CHANGES IN RELATION TO MTL ATROPHY IN AMCI: DEAFFERENTATION AND PLASTICITY?**

E. BARBEAU\* (APHM & Université de la Méditerranée, Marseille, France)

 Magnétique Biologique et Médicale (CRMBM), UMR CNRS 6612, Faculté de Médecine,  
 Université de la Méditerranée Aix-Marseille II, Marseille, France (France)

Introduction. Cortical atrophy is correlated with the progression of neuropathological lesions within the medial temporal lobes (MTL) in Alzheimer's disease (AD). On the opposite, hypoperfusion and hypometabolism begin by posterior cortices, particularly in the posterior cingulate cortex whereas no neurofibrillary tangles are reported in these areas at early stages. Our aim was to determine which local and remote functional changes result from MTL volume loss at the predementia stage. Methods and Materials. To investigate this issue, we studied the relationship between entorhinal and hippocampal MR volumes and whole-brain SPECT perfusion through voxel-based SPM correlative analysis in 19 amnestic MCI (aMCI) patients with a memory profile suggestive of early AD ( $p < 0.005$ ). Results. Right MTL atrophy was positively correlated to remote posterior perfusion of the posterior cingulate cortex, and negatively correlated to remote anterior perfusion of the right medial and dorsolateral prefrontal cortex. There was no local correlation between volumes and perfusion within the MTL. Conclusion. These findings provide further insight into functional changes that result from MTL volume loss during the predementia stage of AD. The positive correlation between MTL volumes and posterior cingulate perfusion may reflect the deafferentation of a temporo-cingulate network due to mediotemporal degeneration. The paradoxical negative correlation between MTL volumes and prefrontal perfusion may result from recruitment of an alternative anterior temporo-frontal network, through a possible compensatory perspective.

**PB8 066 COGNITIVE DECLINE AND INFLAMMATORY STATE**

D. MARIETTI\* (Università degli studi di Siena, Siena, Italy)

 G. PERUZZI(1), G. DE PADUANIS(1) - (1) Università degli studi di Siena (Siena, Italy)

Introduction. The involvement of inflammatory mediators in the development of neurodegenerative diseases such Alzheimer Disease (AD) has been largely studied with not univocal results. Methods and Materials. We have studied blood levels of interleukin-1 $\beta$  (IL-1 $\beta$ ), interleukin-6 (IL-6) and tumor necrosis factor  $\alpha$  (TNF- $\alpha$ ) in 29 Mild Cognitive Impairment (MCI, of which 17 amnestic and 12 multiple domain type), 16 AD patients and 21 control subjects. We used Diaclone kit for ELISA to measure the levels of these cytokines. The statistical analysis was made using SPSS for Windows. Results. We found a statistically significant reduction of IL-6 levels between AD and MCI as compared to control subjects; considering separately the two different MCI types, there was a significant decreasing of IL-6 between multiple domain MCI as compared to control group. Conclusions. Our results show a reduction of the inflammatory state and immune system activation in patients with MCI and AD.

**PB8 067 DEMENTIA PREVALENCE AMONG ELDERLY KIEV RESIDENTS AND**

**COGNITIVE FEATURES OF MILD/MODERATE VAD AND AD**

N. BACHINSKAYA\* (Institute of Gerontology, Kiev, Ukraine)  
 B. VLADISLAV(1), P. KIRA(1), K. VICTOR(1), F. NATALIA(1) - (1) Institute of  
 Gerontology (Kiev, Ukraine)

Purposes, Subjects and Methods: (1) To assess the prevalence of dementia among Kyiv inhabitants of 60 and older, we examined the randomized sample of inhabitants of three Kiev districts being characterized by populational stability (n=504). The respondents were interviewed in their homes using MMSE and LIEPAD - Quality of Life Questionnaire. (2) To assess the specificities of cognitive profile (MMSE, HDS, ADAScog, GDS, HIS) and qEEG in the patients with vascular (VaD) and Alzheimer (AD) type dementia, mild and moderate stages (n=80), of them: 43 with AD and 37 with VaD. Forty subjects were control. Results: Based on the population screening criteria, the dementia prevalence among Kyiv inhabitants aged 60+ was 10.4%. With increasing age, the number of demented subjects increased. Education, the number of years of study and mental type of work influenced positively the elders' cognitive status. Decline of cognitive status had a negative impact on their quality of life. As to the neuropsychological profile of AD versus VaD patients, both at mild and moderate stages, the prevalent impairment was found in the episodic memory. In VaD patients there was more prevalent impairment of executive

functions. In parallel, the prevalent relative intensity of theta-rhythm and the decreased relative intensity of alpha-rhythm, being more pronounced in the hippocampus projection areas, were found on the qEEG in the patients with AD compared to VaD patients. Alpha/theta coefficient was also informative in the former. Differences between neuropsychological profile and brain functional activity (qEEG data) were less pronounced in patients with AD and VaD with an increasing dementia severity.

**PB8 068 PREVALENCE OF TREATMENT WITH BENZODIAZEPINES IN A GERIATRIC'S DAY HOSPITAL DETECTED ON FIRST ADMISSION FOR CLINICAL EVALUATION OF MEMORY DISORDERS**

H. ISMER\* (Centre Hospitalier Departemental de Bischwiller, Bischwiller, France)

 (1) Centre Hospitalier Departemental de Bischwiller (Bischwiller, France)

Introduction: Many drugs can disturb memory functions. Benzodiazepines (BZD) are well known to be cause of amnesia with consequent cognitive impairment. Elderly patients are often polymedicated including benzodiazepines. Objectif of the study: The aim of this study is to evaluate the prevalence of treatment with benzodiazepines in patients admitted in a day hospital for assessment of memory disorders. Methods: Prospective study in a geriatric's day hospital on all patients admitted for memory disorders during one year (january to decembre 2008). We identified all patients treated with benzodiazepines, type of BZD, time of treatment and indication. Associated other psychotropic drugs are considered. Results: In 152 patients (all with MMSE of Folstein less than 28), 25 % are treated with BZD, 50 % of these drugs are long acting. 88 % of them take this treatment daily without interruption for more than one month. The indication is: anxiety 46 %, insomnia 28 %, agitation 12.8 %. Discussion: The prevalence of a treatment with benzodiazepines in our patients admitted for memory disorders is very important (25 %). In our memory assessment this kind of treatment may influence the neuro-psychological tests with difficulties to interpretate. These treatments are often prescribed for long periods (and longer than the indicated period). In our daily clinical practice we realised that it is very difficult to interrupt the treatment or to reduce the dosage in elderly patients. Conclusion: The prevalence of a treatment with benzodiazepines in elderly patients seen in memory consultation is very important (25 %). These drugs can worsen memory troubles already present and consequently complicate cognitive assessment. It seems important to reduce benzodiazepine prescription in association with the general practitioner of the patient.

**PB8 069 EFFECT OF DONEPEZIL ON RADIOLOGICAL AND CLINICAL MARKERS IN PATIENTS WITH AMNESTIC MILD COGNITIVE IMPAIRMENT: A RANDOMIZED, PLACEBO-CONTROLLED TRIAL**

INTRODUCTION Several studies have demonstrated that the acetylcholinesterase inhibitor Donepezil has a beneficial symptomatic impact on patients affected by Alzheimer's disease (AD), not only on cognitive aspects, behaviors, but also on global functioning and on daily living activities, particularly in mild AD. The main objective of this study is to examine the effect of Donepezil on hippocampus volumes, a MRI marker of the disease progression, in a sample of patients with mild amnestic cognitive disorders evoking pre-demential stage of AD. METHODS AND MATERIAL: In this double-blind, randomized, placebo-controlled, two-parallel groups study, the objective is to enroll 240 patients that will receive 52 weeks of treatment with donepezil (10mg/d) or placebo. To be eligible, patients must meet all following criteria: (1) amnestic syndrome of temporal type measured by the Free and Cued Selective Reminding Test (free recall< $\text{or } =17$  or total recall<40 ), (2) preserved activities of daily living, and (3) global clinical dementia rating stage of 0.5. Subjects will be required to have structural brain MRI scan prior to baseline visit validated by a central reading structure. A second MRI will be realized at the final visit (12 months) or in case of premature withdrawal after 6 months. The primary outcome measure is the change from baseline in hippocampus volumetry (left+right) measured at MRI, using a semi-automatic segmentation technique. Secondary outcome of interests include evolution of neuropsychological performances and change in other brain MRI markers. RESULTS 28 French clinical sites and 24 MRI centres are involved in the study, inclusion objectives will be reached in April 2009. A full description of the sample and a comparison of treated and placebo arms for baseline radiological and clinical characteristics will be provided. CONCLUSION This study will allow evaluating the impact of Donepezil on MRI markers at early stage of AD disease.

**PB8 070 GROUP DIFFERENCES IN RESPONSE PATTERNS ON A MEASURE OF CONVERSATIONAL SKILLS IN DEMENTIA**

**Introduction** Communication problems associated with dementia of the Alzheimer's type (DAT) have serious negative consequences on family caregivers. Despite recent advances in our knowledge of communication in DAT, several questions remain unanswered regarding strategies to minimize communication difficulties. The purpose of the current study was to examine differences in family caregiver responses on an empirically derived 74-item questionnaire on communication and DAT called the Perception of Conversation Index – Dementia of the Alzheimer type (PCI-DAT) by clinical stage. Methods and materials A total of 113 family members completed the PCI-DAT. They rated the communication skills of their relative (n = 84 with DAT; n = 29 controls) along five domains. The 113 family members were divided into clinical stage DAT and control groups: 44 early stage (EDAT), 22 middle stage (LDAT), 18 late stage (LDAT), and 29 normal controls. Results Discriminant correspondence analysis (DCA) was conducted to find group differences in response patterns on the PCI-DAT. DCA performs a principal components-type analysis. DCA identified 2 factors accounting for 98% of the variance in the data. Factor 1 represents differences in response style between the control and all DAT groups. Factor 2 represents differences between the DAT groups. The significance of the differences between groups was tested using computationally derived confidence intervals. The control group was significantly different from all DAT groups ( $p \leq .05$ ) and the EDAT group was significantly different from the LDAT group ( $p \leq .05$ ). Conclusion Reliable group differences in response patterns on the PCI-DAT were found. The difference between the control and DAT groups reflects presence/absence of dementia. The lack of reliable differences between the MDAT vs. EDAT and LDAT groups reflects the continuous rather than dichotomous nature of DAT progression. Patterns of performance on the PCI-DAT that differentiated groups will also be discussed.

**PB8 071 PREDICTORS OF RAPID COGNITIVE DECLINE AMONG DEMENTED SUBJECTS AGED 75 OR MORE: ("SUJET AGÉ FRAGILE – EVALUATION ET SUIVI" COHORT – SAFES)**

S. VIATONOU\* (University of Reims Champagne-Ardenne, Reims, France)  
I. MORNONE(1), R. MAHMOUDI(2), P. LANG(3), F. BOYER(1), G. SCHWEBEL(2),  
T. VOISIN(4), D. SOMME(5), F. BLANCHARD(1), J. NOVELLA(1) - (1) University of

Teaching Hospitals (Reims, France); (3) Geneva Medical Scholl and University Hospitals  
(Geneva, Switzerland); (4) Toulouse Teaching Hospitals (Toulouse, France); (5) Public  
Assistance, Hospitals of Paris (France)

**Objectives:** To identify factors predictive of rapid cognitive decline (RCD) among elderly subjects aged 75 or over suffering from dementia. **Methods:** The analysis concerned 250 patients drawn from the "Sujet Agé Fragile – Evaluation et Suivi" (SAFES) cohort, presenting a dementia syndrome at inclusion and followed up for at least one year. RCD was defined as the loss of at least 3 points on the Mini-Mental State Examination (MMSE) in the follow up period of 12 months. All patients underwent a standardised geriatric evaluation. Logistic regression was used to identify factors predictive of RCD. **Results:** In the study sample, 84 patients (33.6%) presented RCD. The factors identified in multivariate analysis as predictive of RCD were: high level of education ( $OR=7.8$ ,  $95\%CI=[1.9-31.2]$ ,  $p=0.004$ ), risk of depression ( $OR=1.8$ ,  $95\%CI=[1.02-3.18]$ ,  $p=0.048$ , and the initial MMSE score ( $OR=1.1$ ,  $95\%CI=[1.0-1.2]$ ,  $p=0.002$ ). Among subjects with a main caregiver (n=177), the predictive factors were malnutrition or risk thereof ( $OR=4.2$ ,  $95\%CI=[1.3-14.1]$ ,  $p=0.02$ ), risk of a fall ( $OR=2.6$ ,  $95\%CI=[1.1-6.1]$ ,  $p=0.03$ ), caregiver burden ( $OR=2.6$ ,  $95\%CI=[1.1-6.4]$ ,  $p=0.04$ ) and initial MMSE score ( $OR=1.1$ ,  $95\%CI=[1.0-1.3]$ ,  $p=0.004$ ). **Conclusions:** As soon as dementia is diagnosed in elderly subjects, information should be collected about the subject's socioeconomic status, nutritional status, risk of falling, mood state, and caregiver burden. This would enable the provision of appropriate therapeutic care, and make it possible to adapt follow-up in case of a risk of accelerated cognitive deterioration.

**PB8 072 A PACHYMEMINGITIS ASSOCIATED WITH A WALDENSTROM DISEASE, PRESENTING AS AN ACUTE CONFUSIONAL STATE**

S. SHAHKARAMI\* (Hôpital Broca, Paris, France)  
J. PROST(1), J. DE ROTROU(1), P. BOUCHACOURT(1), J. IGHIL(1), O. HANON(1),  
A. RIGAUD(1), E. DURON(1) - (1) Hôpital Broca (Paris, France)

**Introduction** We report a case of a pachymeningitis associated with a Waldenstrom disease presenting as a confusional state. Clinical case An 80 years old woman with a past history of breast cancer was admitted to the geriatric ward for confusional state without any fever and rapidly progressive walking disorder. The physical and cognitive examination disclosed a temporo-spatial disorientation associated with a persecution delirium, a static and kinetic cerebellar syndrome, and a central vestibular syndrom. The cerebral MRI highlighted a pachymeningitis with gadolinium enhancement without intraparenchymatous lesion. An IgM monoclonal dysglobulinemia was disclosed in the blood sample and the cerebro-spinal fluid examination found an aseptic lymphocytic meningitis associated with monoclonal IgM. All immunological and carcinological assessments were in normal ranges. The osteo-medullary biopsy confirmed Waldenstrom disease diagnosis. Discussion Pachymeningitis are usually idiopathic, of infectious origin, auto-immune or

metastatic. The finding of a monoclonal IgM in the cerebro spinal fluid suggests the existence of an infiltration of the leptomeninges by the immunocytome. Conclusion We thus report an exceptional case of a pachymeningitis associated with a Waldenstrom disease, revealed only by central neurological symptoms.

**PB8 073 COGNITIVE TESTING IN GERIATRICS MOBILE TEAM**

J. LAGRANDEUR\* (CGU Ambroise Paré, Boulogne Billancourt, France)  
W. MOUSSOUS(1), T. CUDENNEC(1), S. MOULIAS(1), L. TEILLET(1) - (1) CHU  
Ambroise Paré (Boulogne Billancourt, France)

The aim of the geriatrics mobile team (GMT) is to provide a geriatric evaluation adapted to the frail elderly population in hospital wards. **Problems.** Screening for cognitive disorders is one of the essential missions of the GMT. In France only 50% of cognitive disorders are diagnosed most often at a moderately severe stage. The purpose of the GMT is not doing an etiologic diagnosis of these disorders, but to detect them whatever the stage (memory complaints, MCI, Alzheimer disease or confusion). **Helping the medical staff to take care of the patient.** Ladders and feasibility. Many validated scales exist for the detection of cognitive impairment. They are not all easy to use by GMT. After several years of decline, by comparing their sensitivity and specificity, it appears that the Mini Mental State (MMS), the test of the clock, and the Codex have seemed more appropriate to the testing. The latter two have the advantage of being faster to achieve (3 minutes). An assessment of autonomy and executive functions by the ADL and IADL is also necessary. **Limits.** However, cognitive testing by GMT have limits, related to the patient as the socio-cultural level or the reason for hospitalisation. There are also limitations related to the tests themselves, whose results are not necessarily synonymous with pathology. The cognitive screening in GMT is subject to several constraints. The time of the evaluation must be short in order to respond to numerous requests. The impossibility in this period to establish a definite diagnosis do not help to start a specific treatment. The GMT must adapt itself to the specificities of each ward. **Conclusion.** The GMT is an adaptable structure for the detection of cognitive impairment in hospital by its multi-disciplinary approach, repeated assessments, the use of simple, rapid reproducible sensitive and specific tests. The GMT try to interest the non geriatric medical staff to cognitive impairment to improve the global care.

**PB8 074 RETROSPECTIVE ANALYSIS OF THE RELATION BETWEEN ALZHEIMER'S DISEASE AND PRESBYCUSIS**

R. MAHMOUDI\* (University of Reims Champagne-Ardenne, Reims, France)  
P. PRIEUR(1), M. DRAMÉ(2), A. BATALLA(1), E. TOUSSAINT(1), M. KACK(1), F.  
ANTOINE(1), R. BACHELET(1), G. SCHWEBEL(1), F. BLANCHARD(2), J.  
NOVELLA(2) - (1) Reims Teaching Hospitals (Reims, France); (2) University of Reims  
Champagne-Ardenne, Faculty of Medicine, (Reims, France)

**Objectives:** To evaluate the association between Alzheimer's disease (AD) and presbycusis **Methods:** Case-control study of 28 AD patients and 28 controls who had consulted in the neurology-geriatry outpatient's clinic between 1 January 2006 and 31 December 2007 for memory problems. The cases and controls were matched for age ( $\pm 1$  year) and sex. The following data were recorded: socio-demographic characteristics, associated comorbidities, level of autonomy (Lawton's and Katz's scales), nutritional status (MNA), cognitive (MMSE) and auditive evaluation (tonal liminar audiometry). Presbycusis was defined as mild for a hearing loss of 21-40 dB, and moderate when hearing loss was 41 dB or more. The strength of the associations was assessed by conditional logistic regression. **Results:** Average age of the study population was  $75.6 \pm 8.4$  years, with a majority (89.3%) of women. Average MMSE score was  $26 \pm 3$  for the controls, and  $21 \pm 5$  among the cases. Fifty subjects presented presbycusis (89.3%). Two cases and four controls had normal hearing. In total, 26 cases of presbycusis were observed among the cases: 10 mild (38.5%) and 16 moderate (61.5%). Among the controls, there were 17 mild cases (70.8%) and 7 moderate (29.2%). After adjustment for initial MMSE score, the multivariate analysis showed that the cases were more likely to suffer presbycusis than the controls, irrespective of the degree of severity of the hearing loss ( $OR=2.1$ ;  $p=0.61$ ,  $95\%CI[0.1-33.2]$ ). Among subjects suffering from presbycusis, AD was more often observed in case of moderate presbycusis than in the presence of mild presbycusis:  $OR=1.29$  ( $p=0.11$ ,  $95\%CI[0.6-311.8]$ ). **Conclusion:** This study shows the relation between Alzheimer's disease and presbycusis, in the occurrence or even acceleration of cognitive decline in AD. A prospective study with longitudinal follow-up would make it possible to gain greater insights into this association.

**PB8 075 DIFFERENCES IN TOTAL SCORE FOR THE MINI MENTAL STATE EXAMINATION DUE TO DIFFERENT BASELINE TIMES OF TESTING.**

K. KRISTIANSEN\* (Diakonhjemmet Hospital, Asker, Norway)  
F. DAHL(2), L. TANUM(1) - (1) Diakonhjemmet Hospital (Oslo, Norway); (2) Helse Sør-Øst Kompetansesenter for helseforskning (Lørenskog, Norway)

**Introduction** The Mini Mental State Examination is a widely used screening instrument for cognitive impairment and dementia. Patients admitted to a psychogeriatric hospital, are tested with the MMSE during their three first days. Procedural conditions during the examination are of importance for the patient's possibility of fully showing his or her potential during psychometric examination (Lezak 2004). The objective of the present

study was to investigate possible differences in total score on the MMSE on admission to psychogeriatric hospital due to baseline time of testing. Methods and materials This is a prospective and randomized study on the use of MMSE, where one group of patients was tested on the first day of admission (n=28) and the other (n=26) was tested on the third day of admission, both times called baseline. Both groups were tested again on the seventh day of admission. Change in MMSE scores were calculated for both groups, and mean deltas were compared using non-parametric statistical methods. Results The difference in delta values between the two groups were not statistically significant ( $p=0.086$ ) when using Mann-Whitney U-test (non-parametric). The mean change in MMSE-score from baseline to day seven was 0.79 (range -5.10; KI-0.35,1.92) points in the first day group and -0.58 (range-5.3; KI-1.37,0.22) in the third day group. A clinical relevant change was set to three points. Conclusion The mean change in score between baseline and seventh day was 0.79 in the first day group and -0.58 in the third day group. The difference in delta between the two groups was not statistically significant ( $p=0.086$  Mann-Whitney). With a clinical relevant change in MMSE score set to three points, the choice for baseline time for testing showed to be of limited clinical importance when using the MMSE on admission to a psychogeriatric hospital.

**PB8 076 COGNITIVE ASSESSMENT IN GERIATRIC POST EMERGENCY UNIT**  
C. HEIN\* (Gerontopole, Toulouse, France)  
A. PIAU(1), A. JACQUINOT(2), F. NOURHASHEMI(1), B. VELLAS(1) - (1) Gerontopole (Toulouse, France); (2) Centre Hospitalier de Loches (Loches, France)

Introduction: The prevalence of cognitive alteration among geriatric patients admitted after transition from Emergency Room is unknown. The objective of this study was to evaluate the feasibility and the methodological limits of cognitive assessment in a geriatric in patient unit in the Toulouse University Hospital. Method : Our study was retrospective and trans sectional. 575 patients were assessed during nine months with the Mini Mental Status Examination (MMSE). Their mean age was 85.3, 74 % were living in the community. Reasons for hospitalization were mainly respiratory or urinary tract infections (20.5%), cardio vascular diseases (17.2%), neuro psychiatric disorders (15.3%). Results : Three hundred and twenty patients (56.2 %) underwent MMSE, the mean score was 18/30. Our cognition assessment pointed out that 64.9% had pathological results. One third of patients was already diagnosed with dementia. Acute cognitive alteration or delirium was the first reason for MMSE not to be performed. Predictive factors of non assessment with MMSE were a poor nutritional status and a loss of ADL abilities. Among patients without medical history of dementia, the mean score was 22/30. Most de novo detected patients with cognitive alteration (n:94) had a mean score between 20 and 23/30. Although the general practitioner were informed, only 38.3% of them were reevaluated later with the MMSE. Conclusion : Screening for cognitive alteration is feasible in geriatric post emergency unit. It allows diagnosing mild cognitive alteration in this population. Delirium detection needs to be associated. It seems that other screening tests could be shorter and easier to perform in post emergency unit, their sensibility and specificity could be evaluated in further studies. Nevertheless assessment of cognitive status could improve the medical management of these patients and can optimize their discharge.

**PB8 077 BASELINE CHARACTERISTICS OF PATIENTS RECEIVING INSURANCE COVERAGE OF CHOLINESTERASE INHIBITORS FOR ALZHEIMER DISEASE UNDER A POLICY OF 'COVERAGE WITH EVIDENCE DEVELOPMENT'**  
G. HSUUNG\* (University of British Columbia, Vancouver, Canada)  
C. JACOVA(1), C. GREEN(2), D. HOSICK(3), R. MATTSON(3), K. RABHERU(4), P. LEE(1), L. BEATTIE(1), M. MACLURE(2), N. CHAPPELL(2) - (1) University of British Columbia (Vancouver, Canada); (2) University of Victoria (Canada); (3) BC Ministry of Health Services (Canada); (4) University of Ottawa (Ottawa, Canada)

Introduction: Studies of long-term effectiveness of cholinesterase inhibitors (ChEIs) are limited. In 2007, the provincial drug insurance plan (PharmaCare) of British Columbia (BC) Canada launched the Alzheimer Drug Therapy Initiative (ADTI), with coverage of ChEIs for mild-to-moderate Alzheimer Disease (AD) patients, defined with a Standardized Mini-Mental State Examination score (SMMSE) of 10 to 26 and a Global Deterioration Scale (GDS) between 4 and 6. The 'coverage-with-evidence-development' policy stipulated that studies of ChEI effectiveness be conducted simultaneously. Objective: To assess whether the covered population conforms with policy expectations enough to develop generalizable evidence of ChEI effectiveness. Methods: Administrative data from PharmaCare application forms including SMMSE, GDS, previous ChEI use, and demographic data were compared with census and AD prevalence data. Results: In the first year of the ADTI, 4156 patients received coverage. At 12 months, 70% remained on coverage and had prescriptions filled, while 11.9% were approved for coverage but never got prescriptions filled, and 4.4% were deceased. 5437 used ChEIs without PharmaCare coverage. Census and prevalence data indicate coverage reached approximately 25% of clinically eligible patients. The composition of dementia patients on coverage were 66% AD, 28% AD plus vascular dementia, 5% AD plus Parkinsonian features, and 1% AD plus other features. The mean SMMSE at initial coverage for both naïve (43%) and non-naïve patients were 20.2 with a GDS of 4.5. Among patients who had taken ChEIs for over 2 years, the mean SMMSE was 18.1 and mean GDS 4.7. Conclusion: Distributions of patient characteristics are consistent with expectations, particularly the greater proportion of mild cases. Low enrollment may be due to (1) PharmaCare coverage beginning only after a

family's annual eligible drug expenditure exceeds an income-adjusted threshold,(2) physicians' lack of knowledge or skepticism of ChEI effectiveness, or reluctance to test patients and submit PharmaCare application forms.

**PB8 078 EFFECT OF ETANERCEPT IN AN INTRACEREBROVENTRICULAR STREPTOZOZOCIN MODEL OF ALZHEIMER'S DISEASE IN RATS**  
K. ELCIOGLU\* (Istanbul University, Istanbul Medical Faculty, Istanbul, Turkey)  
L. KABASAKAL(1), M. KARAN(2) - (1) Marmara University, Faculty of Pharmacy (Turkey); (2) Istanbul University, Istanbul Medical Faculty (Turkey)

Introduction: Alzheimer's disease is a neurodegenerative disease accompanied with dementia. Rats treated with intracerebroventricular (i.c.v.) streptozotocin (STZ) are used as an experimental model of Alzheimer's disease. This model proposes that central STZ administration induces brain pathology and behavioral alterations resembling those in Alzheimer's disease patients. It is thought that inflammatory reactions are potential culprits in memory impairment and Alzheimer's disease. In this study, we aimed to investigate the beneficial effects of tumor necrosis factor alpha (TNF-alpha) antagonist etanercept in the ICV STZ induced cognitive deficits. Materials and methods: The experiments carried out on male Sprague-dawley rats weighing 250-300 g. Rats divided into two groups: the sham-operation group and the bilateral i.c.v. injection of STZ (3 mg/kg) group. The rats were treated with STZ twice, on days 1 and 3. The learning and memory behaviour was assessed using passive avoidance and Morris water maze tests. After confirmation of acquisition impairment with these tests, animals were divided into 2 subgroups. While the first group received no treatment, the second group treated with i.c.v. etanercept (0.3 mg/kg) for 10 days starting from the 25th day after STZ injection. The Morris water maze test was reapplied on the 35th day after STZ injection and then all the animals decapitated. Results and conclusion: ICV-STZ induced rats showed less cognitive performance in MWM and passive avoidance tests than the sham-operation group. On the other hand i.c.v. STZ used rats treated with etanercept were found to have a higher performance in cognitive tests than the animals injected i.c.v. STZ, but the differences were not statistically significant. These results show that TNF-alpha antagonist etanercept might be a potential agent in the treatment of cognitive impairment in Alzheimer's disease.

**PB8 079 SACCADIC EYE MOVEMENTS AND COGNITION IN OLDER ADULTS**  
A. GARCIA\* (Queen's University, Kingston, Ontario, Canada)  
M. SCHRIBER(1), A. HEMRAJ(1), A. PEITSCH(1), D. MUÑOZ(1) - (1) Queen's University (Kingston, Canada)

Introduction: Since saccadic eye movements (SEM) involve focused attention (FA) and reflect brain function, we investigated the relation between SEM parameters, scores of focused attention and cognitive status in cognitively normal older adults, patients with amnestic Mild Cognitive Impairment (MCIA) and mild Alzheimer's disease (AD). Methods: 73 normal older adults, 20 patients with MCIA and 20 patients with mild AD completed the pro and anti-saccade SEM paradigms and the following psychometric battery as appropriate: Stroop, Mattis Dementia Rating Scale (DRS) Wisconsin Card Sorting Test (WCST) California Verbal Learning Test (CVLT) Montreal Cognitive Assessment (MoCA) and Mini-Mental State Exam (MMSE). Results: In the normal group, saccadic reaction time (SRT) and coefficient of variation (CV) in anti-saccade, inversely correlated with the Stroop scores ( $p<0.005-0.05$ ) but not with the WCST. Z-scores correlated with the anti-saccade CV only at the expense of the Stroop score. Anti-saccade errors correlated negatively with the Stroop scores ( $p<0.001-0.01$ ) and positively with errors in the WCST ( $p<0.01-0.05$ ). Demographics and MMSE scores of MCIA and AD patients did not differ. Stroop scores inversely correlated with anti-saccade errors and CV in the AD group, but not in the MCIA group. Compared to cognitively normal older adults, patients with MCIA had significantly more errors and longer SRT in the anti-saccade paradigm only. Mild AD patients had significantly larger SRT, CV and errors in the pro and anti-saccade paradigms. AD patients had significantly larger CV (pro and anti-saccade) and pro-saccade errors than patients with MCIA. Conclusion: 1) SEM parameters correlate with FA scores in cognitively normal older adults. 2) Compared to normal, both AD and MCIA patients have more anti-saccade errors. 3) Patients with AD have larger CV (pro and anti-saccades) and pro-saccade errors when compared to normal and to MCIA. 4) SEM can distinguish between patients with MCIA and mild AD.

**PB8 080 INVOLVEMENT OF LIPOPROTEIN (A) PHENOTYPES IN THE ETIOLOGY OF CEREBRAL WHITE MATTER LESION**  
I. TOSHIHIKO\* (Tokyo Medical University, Tokyo, Japan)  
T. NAKAI(1), T. UMAHARA(1), S. KOYAMA(1), H. KANETAKA(1), H. ARAI(2) - (1) Tokyo Medical University (Tokyo, Japan); (2) Yuyukenomura Hospital (Nagaoka, Japan)

Background and purpose: Lipoprotein (a) [Lp(a)] is well-known as a risk factor for atherosclerosis, however, the association between Lp(a) phenotypes and the etiology of cerebral white matter lesion, so-called leuko-araiosis, demonstrated by MR image with geriatric syndrome remains unclear. Methods: We conducted a study in 113 elderly patients with neuropsychiatric disorder by assessing of MR images and determining of Lp(a) phenotypes. They were divided into 4 groups according to the Fazekas scale for grading leuko-araiosis, and we compared the distribution of Lp(a) phenotypes and

background factors in each group. Results: Alzheimer's disease and cardioembolic stroke were frequently seen in groups with mild leuko-araiosis, whereas the frequencies of vascular risks, previous history of stroke and vascular dementia were high in group with severe leuko-araiosis. Multivariate analysis showed strong association of S4 homozygote of the Lp(a) phenotype to severe leuko-araiosis, indicating the S4 homozygote as an independent factor for severe leuko-araiosis as well as hypertension, a high level of Lp(a) of 40mg/dl or more. Among all patients, a high Lp(a) level and S4 homozygote, showing a low level of Lp(a), were seen in 20.4%, respectively. Conclusion: This contradictory finding that the high levels of Lp(a) and S4 homozygote was both associated with severe leuko-araiosis indicated the possibility of different mechanisms for developing white matter lesions.

**PB8 081 EFFECT OF DANCE-BASED EXERCISE PROGRAM ON MOBILITY AMONG OLDER ADULTS WITH DEMENTIA**

H. IVA\* (Centre of Gerontology, Prague, Praha , Czech Republic)

H. VANKOVA(1), B. JURASKOVA(2), D. HRNCIARIKOVA(2), P. VELETA(1), K. MACHACOVA(3) - (1) Centre of gerontology, Prague (Praha, Czech Republic); (2) Faculty of Medicine in Hradec Kralove, Charles University (Hradec Králové, Czech Republic); (3) Faculty of Physical Education and Sport, Charles University in Prague (Praha, Czech Republic)

Introduction Dance therapy is a therapeutic use of dance and movement which plays an important role in the process of promoting emotional, social and physical integration of human beings. We would like to present our experience with the Exercise Dance for Seniors (EXDASE) program for people with dementia. We conducted a randomized controlled trial to measure the effect of EXDASE program on mobility among older residential home residents in the Czech Republic. Methods and materials Twenty eight participants (mean age 83years; SD 8.6) were randomly assigned into an experimental or control group. All of them scored in the range of dementia in Mini Mental state examination (mean MMSE 19.8; SD 4.5). Participants in the experimental group completed three months dance-based exercise program designed for older adults with functional limitations. Mobility was assessed using chair-stand-test, 2-minute step test, chair sit-and-reach test, and timed up-and-go test before and after the intervention. Paired sample t-test statistic was used to calculate pretest to posttest differences in performance. Results Participants in the experimental group performed better in posttest compared to pretest and participants in the control group showed further decline in all measures. In the experimental group, we found a significant improvement in chair stand test ( $p=0.039$ ), the chair sit-and-reach test ( $p<0.01$ ), and the timed up-and-go test ( $p<0.01$ ). There was a significant decline in the 2-minute step test ( $p=0.46$ ) and the timed up-and-go test ( $p=0.033$ ) in the control group. Conclusions The findings indicate that the EXDASE program may help maintain or even improve mobility in a sample of low-functioning institutionalized older adults with dementia. This research project was supported by the grant 8487-3/2005 of the Ministry of Health of the Czech Republic and the institutional research plan MSM 0021620843 of the Faculty of Humanities, Charles University in Prague.

**PB8 082 TRANSCULTURAL ADAPTATION AND PSYCHOMETRIC VALIDATION OF A FRENCH-LANGUAGE VERSION OF THE QOL-AD**

A. WOLAK\* (University of Reims Champagne-Ardenne, Reims, France)

D. JOLLY(1), L. DI POLLINA(2), M. COLLART(3), A. PARENT(4), J. ANKRI(5), J. AQUINO(6), I. MORRONE(1), E. TOUSSAINT(1), F. BOYER(1), J. NOVELLA(1) - (1) University of Reims Champagne-Ardenne, Faculty of Medicine, EA 3797 (Reims, France); (2) Geneva Medical School and University Hospitals (Geneva, Switzerland); (3) Troyes Hospital Centre (Troyes, France); (4) Epernay Hospital Centre (Epernay, France); (5) Public Assistance, Hospitals of Paris (France); (6) Clinique de la Porte Verte (France)

OBJECTIVES: The aim of this study was to assess the psychometric properties and the transcultural adaptation into French of the QoL-AD (Quality-of-Life in Alzheimer's disease). METHODS: Patients were recruited from six French hospitals and one Swiss hospital. Patients and proxy gave each an informed consent. A total of 120 patient-proxy pairs were recruited in six French hospitals and one French-speaking Swiss hospital to take part in the study. The patients presented mild to moderate Alzheimer's disease (MMSE  $\geq 10$ ). The QoL-AD includes 13 items and was administered by an interviewer for patients and was self-administered for caregiver proxies. Thus the psychometric validation enabled the study of feasibility, acceptability, convergent and discriminant validity, and reliability of the instrument. RESULTS: Patients were on average 82 years (SD=6) with a majority of women (64%). Proxies were mainly women and were on average 66 years (SD=15). The questionnaire was filled out on average in 8 minutes (SD=4) by patients and in 6 minutes (SD=4) by proxies. Principal components analysis revealed no evident multidimensionality. The French version of the QoL-AD showed good internal consistency (Cronbach's alpha coefficient  $\geq 0.70$ ) and good reliability ( $ICC > 0.80$ ) at a two-week interval, for patient and caregiver questionnaires. Convergent validity as indicated by correlation between the QoL-AD (disease-specific instrument) and the dimensions of the Duke Health Profile (generic instrument) was also good for eight dimensions in the Duke profile ( $p<0.05$ ). Discriminant validity showed a significant difference for depression ( $p=0.0025$ ) and did not show significant difference for two groups of dementia ( $p=0.11$ ). CONCLUSION: There is now a validated French version of the QoL-AD available,

following transcultural adaptation according to international recommendations, which possesses good psychometric qualities.

**PB8 083 FROM WALKING AREAS TO HEALING GARDENS FOR ALZHEIMER PATIENTS: METHODOLOGICAL PRINCIPLES OF DESIGN.**

T. JONVEAUX\* (Nancy University Hospital , NANCY, France)

R. FESCHAREK(2), A. POP(1), O. POTTIER MOUTON(1), L. DEMARCHE(1), L. ZIADE(1) - (1) Centre Paul Spillmann, Centre Mémoire de Ressources et de Recherche Service de Neurologie (Nancy, France); (2) Fescharek design and sculpture (Marburg Lahm, Germany)

INTRODUCTION How adapted are nursing homes to Alzheimer patients care? How to design a secured healing garden for our establishment which treats patients with moderate or severe Alzheimer disease with frequent psychological and behavioral symptoms, often following a degradation of their physical health? MATERIALS AND METHODS We conducted two enquiries: one carried out in 21 geriatric homes in Lorraine about their gardens, one including a total of 55 nursing staff, patients and families in our establishment. The aim was to know more precisely about their experience, their needs and their desires in relation to the anticipated creation of a healing garden. RESULTS 90 % of the 21 participating establishments host patients with Alzheimer's disease and all have gardens. 62 % have specific adaptation to residents suffering from reduced mobility. Concerning Alzheimer patients, the only specific adaptation is a secured outdoor area, present in 38 % of the participating establishments. In none of them, any specific adaptation of the green space was part of the nursing concept. With the results of the second enquiry our team put together established concepts of non-pharmacological therapies, published data from existing healing gardens in a points-to-consider document about the state of the art for healing gardens. The design integrates an artistic approach in order to integrate specifically designed sculptures, which would stimulate patients in a targeted fashion, would invite all visitors including children to experience and enjoy sculptures by offering an interactive approach. Together with specialized staff, these sculptures are planned to be used for interactive therapeutic approaches. CONCLUSION This prompts us to offer a methodology which could help designers of healing gardens to even more specifically address the needs of Alzheimer patients, their families and the nursing staff and enhance the therapeutic potential of these green spaces.

**PB8 084 TOWARDS AN AGING SPECIFIC COGNITIVE PHENOTYPE**

D. ROYALL\* (University of Texas Health Science Center at San Antonio, TX, San Antonio, TX, United States of America)

R. PALMER(2) - (2) Department of Family & Community Medicine /UTHSCSA (San Antonio, TX, United States of America)

Introduction: Normative aging may not reflect the effects of "Aging Proper." We used growth mixture modeling (GMM) to demonstrate homogeneous aging subpopulations with discriminable cognitive trajectories, and argue that only one reflects Aging Proper. Methods and Materials: GMM was applied to six cognitive measures in 547 non-institutionalized septuagenarians followed up to 3 years. Minimal cognitive change was attributed to "Aging Proper". More aggressive change was attributed to "Aging et alia" on the assumption that aging is a universal process that represents the least possible influence on longitudinal cognitive change. Intraclass change in multiple cognitive measures was used to construct a multivariate "Aging Specific Cognitive Phenotype (ASCP)". Results: For each measure, multi-class models fit better than single-class models. The members of the Aging Proper trajectory class were highly concordant across measures. The ASCP was characterized by simultaneous decline in visuo-spatial function and improvement in verbal fluency. In contrast, "Aging et alia" was characterized by rapid declines in memory and executive function. "Aging Proper" had improved 10-year survival (Chi<sup>2</sup>: df 1;  $F = 14.57$ ,  $p < 0.001$ ), and lower rates of institutionalization after 10 years (at a mean age = 88.8 yr!) than "Aging et alia" (Chi<sup>2</sup>: df 1;  $F = 4.29$ ,  $p = 0.04$ ). Conclusion: Our data suggest that simultaneous decline in visuospatial function coupled with improving verbal fluency best describes the ASCP. They also suggest that Aging Proper is not associated with decline in memory task performance. Thus, previously reported age-related declines in memory are more likely to represent the effects of comorbid disease and not aging per se. A singular advantage of our method is that it associates each individual in the dataset with a specific trajectory class. Thus, for the first time, biomarkers can be associated with an aging specific cognitive phenotype.

**PB8 085 IMPACT OF MILD COGNITIVE IMPAIRMENT ON DRIVING SAFETY – EXPLORING THE EVIDENCE**

M. TRUONG\* (McGill University, Montreal, Canada)

N. KORNER-BITENSKY(1), M. MAN-SON-HING(2), G. NAGLIE(3), S. MARSHALL(4), D. BENOIT(5) - (1) McGill University (Montreal, Canada); (2) Ottawa Health Research Institute (Ottawa, Canada); (3) Toronto Rehabilitation Institute (Toronto, Canada); (4) University of Ottawa (Ottawa, Canada); (5) Constance-Lethbridge Rehabilitation Centre (Canada)

Introduction: Mild cognitive impairment (MCI) is a syndrome characterized by a cognitive decline greater than expected for age. MCI is classified into four subtypes based on the

presence or absence of memory impairment and the impairment of only one or more than one cognitive domain. People with MCI preserve their ability to complete basic activities of daily living but may show minimal impairment in completing instrumental activities of daily living. As such, there is growing concern that MCI may affect fitness-to-drive. The objectives of this study are: to describe cognitive-related impairments and how these may potentially impact on driving safety; and, to identify psychometrically sound screening tools enabling health care professionals to better identify those with MCI who require a comprehensive pre-road and on-road assessment. Methods and materials: A structured analysis of the current literature on MCI, on cognitive abilities required for safe driving, on the link between affected abilities and driving behaviours, and on potential screening tools for at-risk drivers was completed. Results Cognitive functions that are impaired in each MCI subtype will be presented with a specific emphasis on the relationship between each type of cognitive impairment and its impact on driving. Psychometric properties of useful screening tools that identify affected domains in drivers with MCI will be discussed. Conclusion The theoretical analysis of the relationship between the cognitive impairments of MCI subtypes and the task of driving suggests that safe driving may be compromised in those with MCI. To date, this is an under-explored area of healthcare screening. A scientific framework is required that permits those with MCI to continue to drive while they are safe but, under a "best practice" model that ensures safety of the individual and of society.

**PB8 086 PATTERNS OF LOSSES OF BASIC ACTIVITIES OF DAILY LIVING IN ALZHEIMER PATIENTS. THE FRENCH COHORT REAL**

L. LECHOWSKI\* (Hôpital Sainte-Périne APHP, Paris, France)  
M. LE CRANE(1), B. DENIS(1), S. VAN PRADELLES(1), L. D'ARAILH(1), Z. SERIDI(1), F. MULLER(1), D. TORTRAT(1), L. TEILLET(1), B. VELLAS(2) - (1) Hôpital Sainte-Périne APHP (Paris, France); (2) Pole de Gériatrie CHU Toulouse-I (Toulouse, France)

Introduction: Functional decline in Alzheimer's disease (AD) patients is an important factor affecting quality of life, carries a high burden for caregiver, and places AD among the most costly diseases in terms of healthcare in Western countries. Little is known about progression of disabilities. A previous study in the French REAL cohort determined a leading pattern for losses of the 8 instrumental activities of the daily living of Lawton scale in AD women. The aim of the present study was to determine patterns of losses of abilities in the 6 Basic Activities of Daily Living (BADL) in men and women of the REAL cohort. Methods and material: Sixteen French university hospitals included in the non-interventional REAL cohort, from April 2000 to June 2002, 199 men and 488 women with mild to moderately severe AD (Mini-Mental State Examination scores between 10 and 26 at inclusion). Mean age of patients was 77.8 years. Data at inclusion were analyzed. The 6 BADL were assessed with the Lawton scale. Patterns of losses of abilities in the 6 BADL were described using Lawton binary quotation: 1 for full autonomy to perform an activity, 0 otherwise. Results: At inclusion data were complete, and for the majority of women (53%) the order of losses in BADL was physical ambulation, grooming, bathing, dressing, toilet and feeding. For 47% of men the order of losses was lightly different: physical ambulation, dressing, grooming, bathing, toilet and feeding. Conclusion: In this study the losses of the 6 BADL assessed with Lawton binary quotation followed 2 lightly different patterns for about half men and women. Lawton scale appears to us a very useful tool for the assessment and follow-up of such AD patients.

**PB8 087 TASK DIFFICULTY AFFECTS GAIT VARIABILITY DURING DUAL-TASK IN HEALTHY YOUNG AND OLDER ADULTS**

L. DECKER\* (University of Nebraska at Omaha, Omaha, United States)  
S. MYERS(1), C. RODRÍGUEZ-ARANDA(2), J. POTTER(3), N. STERGIOU(4) - (1) University of Nebraska at Omaha (Omaha, United States of America); (2) Universitetet i Tromsø (Tromsø, Norway); (3) University of Nebraska Medical Center (Omaha, United States); (4) University of Nebraska at Omaha (Omaha, United States)

Introduction. The attentional demands for regulating gait variability are typically examined with the dual-task paradigm. However, the level of difficulty of the concurrent cognitive task may influence gait control especially in the elderly. The present study investigates gait variability of healthy young and elderly individuals under conditions of different levels of dual-task demands. Methods and materials. Ten young and ten older adults walked on a treadmill at their self-selected pace under five conditions: without cognitive loading (control) and while performing a secondary task (dual-tasks): naming, reading (low demanding tasks), semantic fluency, phonemic fluency (high demanding tasks). Lower limb kinematics were recorded for 3 minutes of continuous walking for each condition. Temporal organization of gait variability was evaluated with the largest Lyapunov exponent (LyE) for each joint. Results. LyE values were significantly decreased at the ankle joint for both groups while performing the phonemic fluency task in comparison with control. No other differences were found between control and the rest of the dual-task conditions. The elderly group had significantly higher LyE values in comparison to the young at all joints for all conditions. No significant interactions were found between condition and group. Conclusion. Our findings support the idea that the difficulty of the cognitive task is important in shaping the relationship between cognition and gait control. Concurrent performance of the most difficult task resulted in reduced gait variability. This may be due to the task requirements that involve switching between letters, therefore,

demanding a high degree of flexibility, a key indicator of the integrity of executive function. The impact of phonemic fluency on gait variability might be more prominent in elderly patients given that pathological aging is primarily accompanied by a decrease in executive function.

**PB8 088 PSYCHOMETRIC CHARACTERISTICS OF THE RIVERMEAD BEHAVIOURAL MEMORY TEST (RBMT) AS AN EARLY DETECTION INSTRUMENT FOR DEMENTIA AND MCI IN BRAZIL**

M. YASSUDA\* (University of São Paulo, São Paulo, Brazil)  
M. FLAKS(1), F. PEREIRA(1), L. VIOLA(1), C. MEMORIA(1) - (1) University of São Paulo (São Paulo , Brazil)

The Rivermead Behavioural Memory Test assesses everyday memory through ecological tasks which mimic daily challenges. It has been shown to correlate well with observed daily impairment and to differentiate normal aging from dementia. The objective of this study was to examine the validity of the RBMT as a memory assessment tool in a sample of Brazilian older adults with different degrees of memory impairment. Taking into account clinical, neuropsychological, and neuro-imaging data, participants were classified into normal controls (NC) (n=89), mild cognitive impairment (MCI) (n=90), and Alzheimer's Disease (AD) (n=82), according to Petersen's (1999) and NINCDS-ADRDA criteria. For RBMT profile scores, analyses revealed that internal consistency (Cronbach's  $\alpha$ ) was high for the DA group (0.84) and moderate for the MCI (0.61) and Control (0.62) groups. For the total sample internal consistency was high (0.91). ANCOVAs (controlling for educational differences) revealed statistically significant differences between the three groups ( $p < 0.001$ ). Spearman correlations between RBMT and CAMCOG memory subtest scores were significant for the DA group (0.76) and for the MCI group (0.36). For participants with less than eight years of education, ROC curve analyses (scores ranging from 0 to 24) indicated that 16.5 differentiated NC from DA (96% sensitivity, 84% specificity), 20.5 differentiated NC from MCI (84% sensitivity, 73% specificity), and 12 differentiated MCI from DA (80% sensitivity, 89% specificity). Results suggest that the RBMT can be an appropriate neuropsychological instrument to identify memory decline in Brazilian older adults.

**PB8 089 SUDDEN DYSORTHOGRAPHIA AND DYSLEXIA IN A 70 YEARS OLD FEMALE: VASCULAR, ALZHEIMER'S OR POSTERIOR CORTICAL ATROPHY?**

C. BRODEUR\* (Sherbrooke Geriatric University Institute, Sherbrooke, Québec, Canada)  
H. IMBEAULT(1), T. FÜLÖP(1), S. HÉROUX(1) - (1) Sherbrooke Geriatric University Institute (Sherbrooke, Canada)

INTRODUCTION : A 70 years old woman comes to the office complaining of visual problems and difficulties with reading and writing. These symptoms appeared abruptly and are progressing since. She has difficulties in everyday life, such as driving her car or dialing a phone number. Moreover, she has some memory and language difficulties and symptoms suggesting dressing apraxia. METHODS : An exhaustive workup has been done : blood tests, neuroimaging and consultations with different professionals. RESULTS : No deficits of the afferent visual system are demonstrated in neuro-ophthalmology (2006). The cerebral PETscan (2006) shows a hypometabolism in the temporo-occipital region, suggesting an ischemic sequel. Nonetheless, the MRI that was done demonstrated leukoaraiosis but no signs of stroke. With the speech therapist evaluation (2008), we can objectivise that the patient has a mild difficulty with lexical access, a dyslexia related to visual agnosia and a surface dysorthographia. No semantic problems are present. In the neuropsychological evaluation (2008), visual agnosia is the main finding. A simultagnosia is also suspected. A visuoconstructional apraxia, an ideomotor apraxia and acalculia are noted. Moreover, memory problems and mild signs of subcortical-frontal dysfunction are present. The insight is preserved. CONCLUSION : How to explain this atypical case, dominated by a posterior cortical dysfunction? A vascular etiology was suspected since there was leukoaraiosis and subcortical-frontal dysfunction. But the absence of parietal or occipital brain lesions on MRI, in face of so important apraxia and agnosia, makes this diagnosis less likely. Moreover, the perceptual and reading problems are progressive, not typical of vascular etiology. The hypotheses of a posterior cortical atrophy or of an atypical Alzheimer's disease were also evoked. The differential diagnosis between these two diseases will be discussed, since there can be overlap of signs and symptoms, particularly when the disease progresses since a few years.

**PB8 090 IS THE 'DELIRIOUS ABOUT DEMENTIA' COGNITIVE SCREENING ALGORITHM FEASIBLE ON AN ACUTE CARE OF THE ELDERLY WARD? A HOSPITAL-BASED STUDY.**

R. O'TOOLE\* (Royal United Hospital Bath, Bath, United Kingdom)  
N. JOHN(1), S. MACKENZIE(1) - (1) Royal United Hospital (Bath, United Kingdom)

Introduction The UK Government's 'National Dementia Strategy' is expected in February 2009 with recommendation 6 being 'Improved quality of care of dementia patients in general hospitals.' Pre-existing and incident cognitive impairment may present during the treatment of an unrelated medical problem and cognitive assessment is key. The Cognitive Screening algorithm was developed as part of a consensus statement by the British Geriatric Society and the Royal College of Psychiatrists – 'Delirious about Dementia', designed for routine use by any medical professional. Our aim is to investigate if the

algorithm is feasible and practical on an acute Care of the Elderly ward. Method 18 bedded ward with average length of stay between 7 and 10 days. 33 non-consecutive patients mean age 84.27 years ( $\pm$ SD6.36). Patients were excluded if too ill medically, palliative or had no next of kin to complete the questionnaire. The assessment, carried out by junior doctors, involved screening with the Mini Mental State Examination (MMSE) and CLOX1 test, followed by the Confusion Assessment Method (CAM) if indicated by the algorithm. Relatives were asked to complete the Informant Questionnaire on Cognitive Decline in the Elderly (IQCODE). Results Mean (95% CI) times in minutes to complete the tests were MMSE 13.6(12-15.2),CLOX1 2.6 (1.82-3.8), CAM 1.3 (0.91-1.69). Most practical issues involved the IQCODE,such as generating family anxieties,difficulties distributing to family members or no available next of kin. Conclusion The Cognitive Screening algorithm is feasible and practical but has implications when used on a busy Care of the Elderly ward. The time taken to carry out the algorithm is negligible; however the IQCODE requires significant extra input time. This has resource implications in terms of assessors' time and further studies are required to assess whether this translates into meaningful benefit for patients or the service.

**PB8 091 IS AMNESTIC MILD COGNITIVE IMPAIRMENT A DIFFERENT CLINICAL ENTITY FROM NON-AMNESTIC MILD COGNITIVE IMPAIRMENT?**  
L. WEE-SHIONG\* (Tan Tock Seng Hospital, Singapore, Singapore)  
P. CHAN(1), M. CHONG(1) - (1) Tan Tock Seng Hospital (Singapore, Singapore)

Background: Mild cognitive impairment (MCI) is a heterogeneous entity encompassing different subtypes that are defined based upon psychometric profile. It is unclear whether these psychometrically-defined subtypes represent clinically meaningful entities. We sought to determine whether there are distinguishing features in clinical data (obtained by history and physical examination) and vascular risk profile between amnestic MCI (aMCI) and non-amnestic MCI (naMCI) subgroups in a memory clinic sample of predominantly Chinese ethnicity. Methods: We classified 41 MCI subjects (mean age: 72.9 $\pm$ 1.1 years; 53.7% females) who fulfilled the 2004 International Working Group criteria into aMCI (n=25) and naMCI (n=16) based upon neuropsychological profile. We compared the following parameters: baseline demographics, cognitive features, functional independence, physical examination findings, vascular risk factors, neuroimaging findings and diagnosis of vascular etiology (v-MCI). Results: Consistent with the psychometric definition, subjects with aMCI performed worse in tests of episodic memory ( $P<.01$ ) but there was no significant difference in non-amnestic domains in neuropsychological test performance. Both groups did not differ in age, gender and educational attainment. Compared to naMCI, aMCI subjects were more likely to display impaired insight; they were also less likely to self-endorse cognitive difficulties despite a higher prevalence of informant-endorsed memory difficulties. aMCI subjects scored lower in instrumental activities of daily living and were more likely to exhibit frontal lobe signs. With regards to vascular risk profile, naMCI subjects showed a higher frequency of hyperlipidemia ( $P=.02$ ) and a trend towards lower frequency of diabetes mellitus ( $P=.15$ ); comparable Hachinski Ischemic Index score; higher frequency of subcortical infarcts ( $P=.01$ ) but not white matter lesions; and higher frequency of v-MCI diagnosis (75% vs 40%,  $P=.03$ ). Conclusion: Our findings suggest the presence of unique clinical characteristics and vascular risk profile between psychometrically-defined aMCI and naMCI subtypes. Longitudinal follow up would be useful to determine if these subtypes predict progression to dementia.

**PB8 092 OVERVIEW OF THE AUSTRALIAN DEMENTIA OUTCOMES MEASUREMENT SUITE (DOMS) PROJECT**  
S. JAN\* (University of Wollongong, Wollongong, Australia)  
N. MAROSSZEKY(1), E. SANSONI(1) - (1) University of Wollongong (Wollongong, Australia)

Introduction: This paper summarises the findings of the Australian Dementia Outcomes Measurement Suite (DOMS) project. This project commissioned by the Australian Government aimed to develop a tool-kit of instruments for the assessment, screening and outcomes monitoring of dementia conditions in Australia, across acute care, primary and community care, residential care, specialist care and research settings. This paper uses the example of Dementia Staging and Descriptive Instruments but other areas selected for investigation included: Health Related Quality of Life (HRQOL); Cognition; Social Isolation; Associated Behavioural and Mental Symptoms; General Functioning; Economic Utility Measurement; and Patient and Caret Satisfaction with health services. Methods and materials: Following an exhaustive literature review a database of instruments was constructed. We then used a two stage review process using psychometric criteria, academic literature impact measures, clinical feedback and practical considerations (e.g. cost, administrator training and assessment time) to produce a set of 5 or 6 instruments for each outcome area. A detailed psychometric review then evaluated these instruments combined with specialist and clinical consultation to produce a final tool-kit of instruments with practice recommendations. Results: There were 844 potential instruments identified for dementia conditions across the selected health outcomes topics areas. This detailed review led to a number of recommended instruments that clinicians and researchers should consider using in their everyday practice. For instance, for Dementia Staging and Descriptive Instruments we recommended the Global Deterioration Scale / Functional Assessment Staging (GDS / FAST) for its ease of use and the Clinical Dementia Rating Scale (CDRS) for a more detailed assessment and the Dementia Severity Rating Scale

(DSRD) for proxy rating. Conclusions: The findings of this psychometric review project, especially in regard to improved and standardised dementia assessment, have a number of important resource and practice implications for routine outcomes measurement of dementia conditions in Australia.

**PB8 093 NEURAL CORRELATES OF FOCUSED ATTENTION IN COGNITIVELY NORMAL OLDER ADULTS**

J. BOWES\* (Queen's University, Kingston, Canada)  
S. KLAR(1), P. STROMAN(1), I. JOHNSRUDE(1), A. GARCIA(1) - (1) Queen's University (Kingston, Canada)

Introduction. Age-related declines occur across a range of cognitive domains. Impaired attention can hinder information processing at multiple levels and may explain some aspects of the functional decline in aging. An inefficiency of the inhibitory system can lead to deficits in focused attention and other cognitive functions. Methods. Twenty-one cognitively normal older adults underwent full cognitive assessment and a verbal Stroop task paradigm using functional MRI. High-resolution structural scans and T2\*-weighted functional scans were acquired. In Series 1, subjects were presented with colour words printed in black ink and asked to read the word aloud. In Series 2 through 4, subjects were presented with colour words printed in an incongruent ink colour and asked to either read the word or say the colour of the ink. Series 2 had four blocks of the congruent condition followed by four blocks of the incongruent condition. Series 3 and 4 had eight blocks of alternating congruent and incongruent conditions. Functional data were analyzed using SPM5. Blocks performed with at least 75% accuracy were analyzed to detect anatomical areas with significant signal intensity differences between the congruent and incongruent conditions. Results. Subjects made an average of 2.90 and 4.86 errors in the congruent and incongruent blocks, respectively. Random effects analyses across all subjects found the left supplementary motor area, bilateral inferior frontal gyrus, bilateral precentral gyrus, left insula and right superior frontal gyrus significantly activated ( $p<0.05$ , uncorrected). Conclusion. Our results are consistent with previous findings in Stroop-fMRI studies of older adults. A greater number of errors in the incongruent than the congruent condition reflect increased interference. The paradigm used in the current study demonstrates that verbal responses elicit similar brain activation patterns to manual responses. Verbal responses may be a more appropriate modality for older adults and in the study of patient populations.

**PB8 094 MEDICATIONS AT RISK FOR MEMORY IMPAIRMENT IN ELDERLY**

M. FORTIN\* (Centre hospitalier affilié universitaire de Québec, Québec, Canada)  
I. ROUCH(2), C. GÉDÉON(1), S. GENTHON(1), V. DAUPHINOT(2), M. BONNEFOY(1), P. KROLAK-SALMON(2) - (1) Centre Mémoire Ressource Recherche de Lyon, Médecine gériatrique, Centre Hospitalier Lyon Sud (Pierre Bénite Cedex, France); (2) Centre Mémoire Ressource Recherche de Lyon, Médecine Gériatrique, Hôpital des Charpennes (Villeurbanne, France)

Introduction: In the last 20 years, a growing number of medications frequently prescribed to elderly patients have been identified to have weak but real anticholinergic properties. Those drugs are frequently not recognized as anticholinergic by the clinicians. Few epidemiological studies have been done to evaluate their impact on verbal episodic memory with sensible and specific neuropsychological test. Method: This retrospective, cross-sectional study included 134 consecutive outpatients who attended the day care memory unit of Centre Hospitalier Lyon-Sud (Lyon, France) between January 2005 and January 2008. To evaluate specifically verbal episodic memory, we used the French version of the Free and Cued Selective Reminding Test (FCSR). Furthermore, we performed a research in MEDLINE database (1973-2008) to retrieve studies that identified and/or quantified anticholinergic activities of different drugs. A list of 279 drugs has been built after critical review of the literature. Results: Medications that we identified to have anticholinergic properties selectively impair verbal episodic memory as demonstrated by the FCSR. Total immediate recall score was respectively 36, 35 and 28 in the groups with 0, 1 and 2 or more anticholinergic treatment. Those differences were statistically significant in a multivariate analysis ( $p=0.03$ ). The same results were obtained for total immediate free recall, total delayed recall and free delayed recall. Conclusion: This study could be considered as a warning for clinicians who work with elderly patients with cognitive disorders. A record of all medications should be carefully obtained and attention should be paid to possible anticholinergic compounds. The exhaustive list of anticholinergic drugs created in this study could be a useful clinical tool for clinicians.

**PB8 095 INVESTIGATION OF ACTUAL CONDITIONS OF DEMENTIA SYNDROME SENIOR CITIZEN WHO USES CLOCK DRAWING TEST**

N. KIMURA\* (AichiGakusen College, Aichi,Nishikamo,Miyoshi-Town , Japan)

Introduction: Dementia senior citizens increase with aging of the population rapidly. The repressiveness changes of the brain such as the Alzheimer type dementia increase. We use the clock drawing inspection as a standard to discover dementia early and report it here because I carried it out as for the local health center, the thing of the cooperation of the medical institution. Methods and materials:We called the old man society about enlightenment activity of the dementia. For an applicant, we carried out a screening test of the dementia discovery with the community health nurses of the health center. The

standard to use for screening did clock drawing with inspecting it. The marking method assumed it the method that we proposed of Dr Kono. The result returned each one it while talking on the spot. The community health nurse of the health center visited it for the senior citizen who came to need follow later. Results: 183 participants (male 67 people, woman 116 people), average age 74.36 years old, age standard deviation 6.04 years old As a result of clock drawing inspection, 42 senior citizens who came to need follow equal to or less than 8.5 points were (23.0%). The breakdown of the score was 8.5 points 32 (17.5%), 8 points of 3 (1.6%), 7.5 points 2 (1.1%), seven points of alone (0.5%), 6.5 points alone (0.5%), 5points of alone (0.5%), 3 points of 2 (1.1%). Conclusion: The onset rate of the dementia in Japan is 7~8%. We can carry out the clock drawing inspection in a short time in a group and think that We are useful as a standard to discover the dementia that is hard to have a difference by an enforcer early.

**PB8 096 NEW FRENCH RECOMMENDATIONS OF HAS ON ALZHEIMER'S DISEASE: AN OVERVIEW OF DRUG PRESCRIPTIONS IN A GERIATRIC HOSPITAL.**

M. SEUX\* (Pharmacy department GH Broca- La Collégiale- La Rochefoucauld, Paris, France)  
J. FINZI(1), F. CHEDHOMME(1), A. CHAHWAKILIAN(2), A. CHEVALLIER(1) - (1) Pharmacy department GH Broca-La Rochefoucauld-La Collégiale (Paris, France); (2) Clinical Geriatric department GH Broca-La Rochefoucauld-La Collégiale (Paris, France)

Introduction On March 2008, the French institution "Haute Autorité de Santé" (HAS) published its conclusions about drugs management in Alzheimers disease (AD) treatments. HAS recommended the use of monotherapies, with the greater recommended dose, whatever the age and the Mini Mental Score Evaluation (MMSE) of patients. According to this guidelines, we observed clinical practices in our Hospital. Methods and materials All the patients receiving cholinesterase inhibitor or memantine were collected on one day with our Software Phedra®. Medical records were reviewed using standardized check-lists with 12 items. Results Less of 20% of hospitalized patients (108/600) received an AD treatment (average age 86.3 years). The mean MMSE was 13, unfeasible for 25% and unfound for 7%. 88% of patients received a monotherapy [memantine 45%, donepezil 20%, galantamine 16%, rivastigmine 7%] and 12% received a bitherapy using memantine. About monotherapy, 95% of patients were in maintenance dose. 33% were below the maximum recommended dose. 5% were in initiation phase. For 23% of the patients, the maximal dose was never tried. When drug was prescribed before hospitalization, the maximal dose was reached in 75% of the cases. The dose graduating has been made for 37% of them in our hospital. 63% were already at the maximal dose. When treatment was initiated during hospitalization 56% prescriptions reached it. Conclusion Epidemiological data estimate that the mean rate of AD geriatric patients is near to 50% assuming some patients in our hospital don't receive treatment. HAS guidelines were not followed in 32% (bitherapies and prescriptions whose maximum dose was never tried) justifies amelioration of our practices. Moreover, regular re-assessment of treatment seems useful. When patients are placed in medical institution, an assessment is systematically done. It could explain the greater number of maximum doses reached. Building a prescription tool linked to the monitoring indicators seems necessary to optimize the drug management in Alzheimer's disease treatment.

**PB8 097 ALZHEIMER'S DISEASE: FUNCTIONAL CAPACITIES AS MARKERS OF DISEASE PROGRESSION AND TREATMENT EFFICACY**

D. PEROTTA\* (Centro Regionale Alzheimer, A.O. "G. Salvini", Passirana (MI), Italy)  
F. FALVO(2), L. CRAVELLO(3), M. MUSICCO(3), C. TENCONI(1), S. FELLER(1), C. PETTENATI(1) - (1) Centro Regionale Alzheimer, A.O. "G. Salvini" (Italy); (2) U.O. Geriatria, Presidio di Sant'Angelo Lodigiano, A.O. (Italy); (3) I.R.C.C.S. Fondazione Santa Lucia (Italy)

**INTRODUCTION.** Measuring functional status is an important part of assessment in demented patients. It has been demonstrated that patients tend to rate their own function higher than nurses, whereas family members tend to rate it lower. Disadvantages of self-reported or proxy-reported measures might be overcome by using performance-based measures. The Direct Assessment of Functional Status (DAFS) scale is an objective and well-validated measure functional capacities. **METHODS AND MATERIALS.** 331 consecutive patients with Alzheimer's Disease (AD) and 50 consecutive subjects with Mild Cognitive Impairment (MCI) were evaluated. In all patients cognitive functioning was assessed with the Mini-Mental State Examination (MMSE), the DAFS scale and the basic (BADL) and instrumental (IADL) activities of daily living were used to measure functional status. 78 AD patients treated with cholinesterase inhibitors (AchEI) have been revalued after one year. **RESULTS.** A significant correlation between MMSE and DAFS was found in patients treated with AchEI both at the beginning (T0) of the therapy and after one year (T1) of treatment. Also subjects with MCI showed a correlation between DAFS and MMSE; this correlation remained even in subjects with IADL=8 (complete autonomy described by care-giver). Finally the DAFS seemed to better describe the disease progression after one year of therapy than the MMSE, in fact a strong correlation between T0 DAFS score and delta DAFS (T1-T0 score) was found. **CONCLUSIONS.** The DAFS has a great correlation with MMSE after one year of therapy with AchEI and it is more sensitive to intercept possible worsening of the disease. This makes it a good tool to appraise the progression of illness in treated patients. Even patients with MCI might show

subtle changes in functional status and the DAFS could represent a more sensible tool than IADL to identify the presence of disability in an early stage of the disease.

**PB8 098 SHORT TERM MORTALITY ACCORDING TO COGNITIVE STATUS IN ACUTELY ILL ELDERLY PATIENTS**

I. SLEIMAN\* (Poliambulanza Hospital, Brescia, Italy)  
R. ROZZINI(1), A. RANHOFF(2), S. BOFFELLI(1), A. MORANDI(1), M. TRABUCCHI(2) - (1) Poliambulanza Hospital (Brescia, Italy); (2) Geriatric Research Group (Brescia, Italy)

**Introduction:** Few data describe the causes of hospitalization and prognosis in patients affected by different type of cognitive impairment. Aim of the study is to evaluate characteristics, causes of admission, and prognosis of acutely ill hospitalized elderly according to the type and severity of cognitive impairment. **Methods:** A prospective study of 2807 patients aged 65 years or above admitted between February 2005 and February 2008 to a Geriatric Unit (Poliambulanza Hospital). Demographics, main diagnosis, comorbidity, APACHE II score, IADLs, BADLs and number of drugs were collected. Diagnosis of Alzheimer dementia (AD) and Vascular dementia (VaD) were carried out according to current guidelines. Presence of Mild Cognitive Impairment (MCI) and Mild Vascular Cognitive Impairment (MCI-V) were also evaluated. For the aim of the study, patients were assigned to five groups: a) 970 patients (34.6%) cognitively normal, b) 569 (20.3 %) patients with MCI, c) 232 (8.3%) with MCI-V, d) 705 (25.1%) with AD and e) 331 (11.8%) with VaD. **Results:** Infectious diseases were more frequent in patients with severe rather than mild cognitive impairment; moreover there were more frequent in those affected by vascular disease. The same figure was observed for APS and serum C reactive protein. The mortality rate progressively increased according to the severity of cognitive impairment; patients with cognitive impairment due to vascular disease have a higher mortality rate (no dementia 5.4%, MCI 6.5%, MCI-V 7.3%, AD 13.6%, VaD 19.3%). **Conclusion:** cognitive impairment confer a higher risk of 3-month mortality in elderly patients hospitalized for an acute disease. Those with cognitive impairment due to vascular disease have a higher probability to be admitted with an infectious disease and with a higher physiologic derangement than those with a degenerative impairment.

**PB8 099 DONEPEZIL, MIRTAZAPINE AND NIGHTMARE**

J. KIM\* (WonKwang University Sanbon Hospital, Gunpo, Republic of Korea)

**Objective:** Donepezil appears to be a very safe medication when used in selected patients with mild to moderate Alzheimer disease. Nightmares (unpleasant dreams) are reported complication of donepezil therapy and treated easily by administrating the dose in the morning. We experienced 1 case of nightmare which was treated not by administrating schedule change but by reducing the dose, and recurred by co-administration of mirtazapine Case: 84-year-old male patient was presented with 2-year history of cognitive impairment. He had a MMSE score of 22/30. After a complete dementia workup, he was diagnosed with Alzheimer disease using the DSM-IV criteria, and he was prescribed 5mg of donepezil to be given in the morning. After 4 weeks, he felt better, but his cognitive function was not improved. The dose of donepezil was increased to 10mg. 2 weeks later, in routine follow-up he complained of lots of unpleasant dreams. The dose of donepezil was reduced to 5mg. His dreams were reduced, and the contents of dreams were similar to those of his previous healthy state. 4 months later, He complained of dysphoria and insomnia, and 30mg of mirtazapine was started orally every night. After 1 month, he again complained of many unpleasant dreams and the dose of mirtazapine was reduced to 15mg. 1 month later, he continued to complain of unpleasant dreams then mirtazapine was discontinued. After 2 months, although there was no obvious cognitive improvement on the medication, his global function became better, and his son and daughter-in-law were satisfied with his state. **Discussion:** Like other dreams, nightmares almost always occur during REM sleep and usually after a long REM period late in the night. There is a convergent data suggesting the involvement of brain stem cholinergic neurons in the regulation of REM sleep, and acetylcholinesterase inhibitors decrease REM latency and increase REM density. According to these data, the mechanism of nightmare might be cholinergic enhancement in the brain. In this case, nightmares may be related to the plasma level of donepezil. 1) Unpleasant dreams were appeared in the 10mg of donepezil and disappeared when the dose of donepezil was reduced to 5mg. 2) They reappeared with co-administration of mirtazapine and disappeared when mirtazapine was stopped. Donepezil is highly protein-bound and metabolized by the liver via the cytochrome P450 2D6 and 3A4 isoenzyme. Inhibition of cytochrome P450 system may lead to elevated plasma levels of co-administered drugs that metabolized by this enzyme. An elevated plasma level of donepezil may in turn increase the risk for more adverse reactions. However, there emerges one more question that why nightmare occurs even though mirtazapine is reported to suppress REM sleep. Even though this mechanism is unknown, mirtazapine itself cause nightmare. This may be due to REM rebound. Because mirtazapine suppresses REM sleep early at night, it might rebound REM sleep late in night. Because this patient had nightmares with 10mg of donepezil, his acetylcholine receptor is thought to be in supersensitive to acetylcholine. His supersensitive acetylcholine receptor and this rebound may result in synergy to make nightmare. **Conclusion :** In the dementia patients who is

prescribed donepezil, mirtazapine etc., we should consider the side effects and alert the drug-drug interactions by careful evaluation.

**PB8 100 CLINICAL AUDIT OF DEMENTIA CARE: A QUALITY IMPROVEMENT INITIATIVE – PRELIMINARY RESULTS**

M. JOSHIPURA\* (University of Toronto, Mississauga, Ontario, Canada)

B. LIU(1), T. IZUKAWA(2), B. GOLDLIST(3), M. NICULA(4), M. NORRIS(5), M. ZORZITTO(6), J. LEE(7) - (1) Sunnybrook Health Sciences Centre (Toronto, Canada); (2) Baycrest Hospital (Toronto, Canada); (3) University Health Network (Toronto, Canada); (4) Providence Health (Toronto, Canada); (5) Sunnybrook Health Sciences Centre (Canada); (6) St Michael's Hospital (Canada); (7) North York General Hospital (Canada)

**Introduction:** Clinicians and policy makers are increasingly aware of the need to improve the quality of health care delivery. Quality indicators for dementia care have been developed by the American College of Physicians Assessing Care in Older Vulnerable Adults (ACOVE). The objective of this Quality improvement project was to audit practice and improve the quality of dementia care delivered in geriatric outpatient clinics by the geriatricians affiliated with the RGP and the University of Toronto Methods: A data collection tool was developed and used to extract information regarding the performance of 19 quality indicators. A retrospective audit was performed on a convenience sampling of sequential ambulatory geriatric clinic charts which met eligibility criteria: a new consultation seen between July 2006 and June 2007 in which the main issue identified was dementia. Documentation of the performance of the identified quality indicators was documented through the audit. Indicators with less than 80% documentation were flagged as needing improvement. Each participating received a summary of their own performance and the group mean. Results Ten geriatricians volunteered to participate. One hundred and seven charts were included in the audit. Trends in the aggregate data were analyzed by a steering committee. Enabling tools (reminder sheets, data collection forms and information pamphlets) were developed to address potential barriers to provision of quality care in dementia. The majority of quality indicators (eleven out of nineteen) were documented in more than 80% of cases. There were eight issues with suboptimal documentation (<80%). These were educational level of patient, wandering, fire –water safety, home safety assessment, caregiver stress, driving and POA for finances. The use of the enabling tools was promoted through individualized physician “detailing”. A repeat audit will take place in 3 to 4 months to determine if there was any change in practice. Conclusion: Geriatricians in this audit are presently meeting benchmarks for quality dementia care in 11 out of 19 ACOVE indicators included in the audit. Areas with suboptimal documentation were targeted for a quality improvement intervention.

**PB8 101 THE VALIDITY OF THE KOREAN-MONTREAL COGNITIVE ASSESSMENT (K-MOCA) AS AN INSTRUMENT FOR SCREENING OF VCI**

Y. KANG\* (Hallym University, Chuncheon, Kangwondo, Republic of Korea)

Y. KIM(1), J. PARK(1) - (1) Department of Neurology, Hallym University Sacred Heart Hospital (Anyang, Gyeonggi, Republic of Korea)

**Introduction:** The Montreal Cognitive Assessment (MoCA) was originally developed as a brief cognitive screening tool for mild cognitive impairment. However, the NINDS-CSN Vascular Cognitive Impairment Harmonization Standardization work group (Hachinski et al., 2006) suggested that the MoCA would also be a useful instrument for vascular cognitive impairment (VCI). This study was conducted to examine the validity of the newly developed Korean version of Montreal Cognitive Assessment (K-MoCA) as an instrument for screening of VCI. Methods: Eighty-six stroke patients (mean age=70.44 years, mean education=7.91 years) with confluent white matter lesions were given the K-MoCA and the K-MMSE with a comprehensive neuropsychological test battery. Among the patients, 55 had a CDR score of 0.5 or less (vascular mild cognitive impairment group; VMCI), and 31 had a score of 1.0 or more (vascular dementia group; VD). Eighty-six matched healthy normal controls (mean age=70.07 years, mean education=7.71 years) who met the Christensen's health criteria (Christensen et al., 1991) were recruited from the community and were given the K-MoCA and the K-MMSE. The K-MoCA was re-administered to 29 normal subjects with a 4-week interval for assessing the test-retest reliability. Results: Strong correlations between the K-MoCA and the K-MMSE were found in patients ( $r=.92$ ,  $p<.001$ ) and normal controls ( $r=.86$ ,  $p<.001$ ). Receiver Operating Curve (ROC) analysis showed that the K-MoCA effectively differentiated stroke patients from normal controls ( $AUC=.72$ ,  $p<.001$ ). Moreover, it was found that the K-MoCA could differentiate the VMCI ( $AUC=.60$ ,  $p<.05$ ) as well as the VD ( $AUC=.92$ ,  $p<.001$ ) from normal controls. Test-retest reliability of the K-MoCA was significantly high ( $ICCR=.85$ ,  $p<.001$ ). Conclusions: These results suggest that the K-MOCA can be used reliably for screening of VCI. The K-MoCA might help identify individuals in the early stage of cognitive impairment due to cerebrovascular problems.

**PB8 102 NEUROPSYCHIATRIC SYNDROMES AND PROGRESSION OF COGNITIVE AND FUNCTIONAL DECLINE IN PATIENTS WITH ALZHEIMER DISEASE.**

L. CRAVELLO\* (IRCCS Fondazione S. Lucia, Rome, Italy)

K. PALMER(1), R. PERRI(1), L. FADDA(1), S. MOSTI(1), G. SALAMONE(1), F. LUPO(1), C. CALTAGIRONE(1), M. MUSICCO(1) - (1) IRCCS Fondazione S. Lucia (Rome, Italy)

**Introduction:** Recently, several studies have been conducted with the purpose of determining neuropsychiatric syndromes in patients with dementia. The aim of this work is to evaluate the impact of neuropsychiatric syndromes on the progression of cognitive and functional decline in subjects with Alzheimer Disease (AD). Methods and materials. We included 106 AD patients who were consecutively seen in a special unit for the diagnosis and treatment of dementias and were followed up for a mean time of 1 year. In all patients, cognitive functioning was assessed with the Mini-Mental State Examination (MMSE); the functional impairment was evaluated by means of basic and instrumental activities of the daily living (BADL and IADL) and Barthel Index (BI). Neuropsychiatric syndromes were identified by a factor analysis based on the symptoms assessed with the Neuropsychiatric inventory (NPI). Results. Five neuropsychiatric syndromes were identified in the factor analyses: 1) psychosis (delusion, hallucinations and aberrant motor behaviour), 2) sleeping and eating changes (night-time behaviour disturbances and appetite and eating abnormalities), 3) mood (depression, anxiety, and irritability), 4) mania (euphoria and disinhibition), 5) apathy (agitation and apathy). After 1 year, patients with the mood syndrome and apathy syndrome had greater cognitive and functional decline than other ones. Conclusions. Our results confirm previous findings that different neuropsychiatric syndromes are present in patients with AD. Syndromes featuring apathy and depression related symptoms are associated with increased cognitive and functional decline in AD patients.

**PB8 103 ASSESSING ALZHEIMER DEMENTIA IN POPULATION OF OLDER INDIVIDUALS IN TUNISIA**

F. JEMAA KHALDI\* (Charles Nicolle's Hospital, Tunis, Tunisia)

H. MRABET KHIARI(1), T. BELLAJ(2), S. BELLAJ(2), N. ATTIA ROMDHANE(1), I. BEN HAMMOUDA(1), A. MRABET(1) - (1) Department of Neurology - Charles Nicolle's Hospital (Tunis, Tunisia); (2) Department of Psychology - Human and Social Sciences University (Tunis, Tunisia)

**Introduction:** With the increase of dementia incidence in developing countries, there is a pressing need to apply simple but reliable tools for dementia screening. Aim: To offer to general practitioners a practice-based strategy, adapted to the Tunisian socio-cultural context for the diagnosis of Alzheimer disease. Methods: A cross-sectional study of 20 Tunisian patients with Alzheimer disease (10 men and 10 women) aged from 62 to 89 years has been conducted by the neurological department of Charles Nicolle Hospital. Alzheimer disease diagnosis was based on clinical and neuropsychological assessments, blood tests and MRI findings according to the latest consensus. A model of cognitive test performance using the Mini Mental State Examination Arabic Version (A-MMS), the 5 Word Test (5WT) and the Clinical Dementia Rating (CDR) were performed for all patients. Results: The median age of patients was 72 years. The median age of onset was 67 years. The most common comorbidities were hypertension (9 patients) and diabetes (3 cases). In all cases, episodic memory and praxis were the predominant revealing symptoms. Brain imaging was done in all cases and showed hippocampal atrophy in 85% of cases. Homocysteine blood level was measured in 19 patients and was high in 32% of cases. The median A-MMS score was 21.5 (5-24) with 60% of patients with mild dementia. The median CDR score was 0.66 (0.33-1.55). The median Total Score concerning the 5WT was 8(7-10). Conclusion: A model of general and specific cognitive tests can simplify the diagnosis and the assessment of normal aging and Alzheimer disease patients.

**PB8 104 SLEEP HYGIENE IN SLEEP DISORDERS OF DEMENTIA ELDERLY**

A. MARTINS\* (Universidade de Aveiro, Santo Tirso, Portugal)

A. FERREIRA, A. ROSA

Sleep hygiene is recommended, in combination with others, as a method to reduce sleep disorders in elderly. However, there is a lack in literature about the efficiency of sleep hygiene routine in dementia elderly. The objective of this work is to examine the effect of a sleep hygiene protocol in persons with dementia in residential units (nursing homes). The experimental group will receive a sleep hygiene protocol intervention while the control group received usual care. Data will be collected using the "Sleep Disorders Inventory" (SDI) and a sleep log. The SDI is an instrument developed in 2003 by Tractenberg et al., to describe the frequency and severity of sleep disorders for persons with dementia and also for describe the distress of the caregiver. Data analysis will be made through the T-student test, for average comparisons and Linear Regressions to determinate the factors that contribute to sleep pattern. This study is being conducted on behalf of the final thesis for

the Degree in Gerontology, and we expect to contribute for the discussion about non-pharmacological interventions in sleep disorders of elderly dementia.

**PB8 105 DO DIFFERENT COGNITIVE TASKS INTERFERE WITH POSTURAL CONTROL IN ELDERLY AND DEMENTED SS.?**

B. MANNI\* (University of Modena. Estense hospital, Modena, Italy)  
V. GUERZONI(1), E. FERRARI(1), M. VESCHI(1), F. NEVIANI(1), M. NERI(1) -  
(1) University of Modena e Reggio Emilia (Modena, Italy)

**Background:** A bulk of evidence indicates that frontal lobes functions are involved in both cognitive performance and postural control. Few studies showed that in clinical and experimental conditions an interpolated cognitive task remodel postural balance. This issue seems relevant considering the high rate of falls in the elderly and in demented Ss. in particular. Aim: investigate a) the influence of different cognitive tasks on postural control and b) the relationship between frontal functions and postural control. Methods: the sample consists of 39 demented Ss. and 13 controls, aged 60+. Exclusion criteria: disabling visual, hearing and proprioceptive deficits, clinically relevant depression, severe cognitive impairment and high comorbidity. All the subjects underwent the following assessment: IADL/ADL to check disability levels, CAMCOG and MMSE to detect cognitive performance levels. Frontal lobe functions were assayed with both Frontal Assessment Battery and "Frontal Lobes score" derived from Camcog. Postural control was monitored by a force platform, two measures of postural sways were considered: length trace and area. All the Ss. were requested to maintain a standing position on the platform (30 sec trial) in two different conditions: a) at rest with open and closed eyes; b) with closed eyes while performing 3 different interfering cognitive tasks, namely counting back one by one, serial 7 and verbal fluency task Results: Repeated Analyses of Variance showed expected differences between groups respect to number of drugs, cognitive and functional performance. No significant difference was found respect to postural measures at rest conditions, whereas, significant differences were found in two out of the three trials with cognitive task. Namely, controls Ss. performed better than demented Ss. in serial 7 and verbal fluency tasks. Finally, in both groups, none of the Pearson's coefficient of correlation, computed between postural measures and Frontal Lobes score, reached the level of significance

**PB8 106 PREVALENCE AND THERAPEUTIC HANDLING OF DEMENTIA IN NURSING HOMES OF THE PRINCIPADO DE ASTURIAS**

J. GUTIERREZ\* (OVIDA, Luanco, Spain)  
G. JOSE(1), S. LUCÍA(1), J. FRANCISCO(2), A. ARSENIO(2) - (1) OVIDA (Luanco, Spain); (2) IGA (Gijón, Spain)

**Objectives:** Study the prevalence of cognitive decline and dementia in the residential environment, pharmacological and non-pharmacological treatments used and the possible existence of undiagnosed dementia. Material and methods: Cross-sectional epidemic study on a population of 215 elderly persons institutionalized in October 2008 in 3 nursing homes in Asturias. Socio-demographic, clinical, functional and mental variables were collected through a Memorandum of predefined study. Results: 215 elderly were included in the study (81.2 +/- 10.2 years, 70.2% women), scores on the Barthel 50.63 +/- 37.43, on the MMSE 14.71 +/- 9.73 and on the GDS 3.63 +/- 3.74. 34.4% had been diagnosed of dementia, Alzheimer's disease being the most prevalent cause (20.9%). Of those patients diagnosed with dementia 45.9% received specific pharmacological treatment for Alzheimer. Amongst those individuals that had attended school 77.8% had MMSE scores below 24 and 32.9% were diagnosed with dementia; amongst those individuals that did not attend school 75% had MMSE scores below 18 and 39.6% were diagnosed with dementia. Conclusions: For our population study, some 76% of subjects show some degree of cognitive decline, 1 in 3 residents has been diagnosed with dementia and about half are receiving specific pharmacological treatment. The results show about half of elderly people with cognitive problems have no clear diagnosis of the syndrome or the cause of the same.

**PB8 107 RELEVANCE OF THE PRESCRIPTION OF THE ACETHYLCHOLINESTERASE INHIBITORS AND THE MEMANTINE FOR THE AGED PATIENTS**

R. DELSOL\* (Hôpital Charles Richet, Villiers le Bel, France)  
C. GARD(1), T. MAI(1), S. MEDJAHED(1), V. DAREES(1), A. GRANCHER(2), M. GUIMFACK(1), C. CANTE(1), B. MEZHOU(1) - (1) Hôpital Charles Richet (Villiers le Bel, France) (2) Hôpital Rothschild (France)

**Introduction** The alzheimer's disease and the similar diseases are very frequent in aged population. The efficiency of the anti-alzheimer treatments was proved even if modest on the cognitive, no cognitive symptoms and the autonomy. **Objectives** The goal of this study is to establish the just prescription. **Method** It is about a retrospective study, about a clinical audit targeted . all the patients having had a treatment anti-alzheimer on the estableissement were edited by the pharmacy a given day . The data collection has been established from every patient's file . a multi parameters evaluation has been used . this later has been established according to scientific publications. An evaluation with data analysis was made in 2006. Actions of improvement were been organized with a revaluation in 2007 and 2008. Results 221 patient's file were exploitable on 238 listed. We notice a degradation of

the respect for the label . The effective maximal posology was only used for donepezil (aricept\*). The adaptation of the posology of memantine (ebixa\*) was significantly improved . The electrocardiogram was realized more frequently . the targeted co-morbidity (bronchopneumopathy obstructive (BPCO) , asthma, atrioventricular block and 186 bradycardia , arrhythmia , ulcer gastroduodenal and epilepsy ) were noted. Serious side effects have been appeared more in half of the cases to them at the patients having a targeted comorbidity. The neuroleptics were more often prescribed than atypical antipsychotics . Several prescribed anxiolytics presented anticholinergic properties . **Conclusions** The anti-alzheimer treatments have been showed a clinical benefit . although relatively safe . The cholinesterase inhibitors are prescribed for a frail population and may have clinically significant adverse drug effect on the cardiovascular system or worsening BPCO. Early and accurate recognition of past and present arrhythmia or syncope appears to be essential. Monitoring for pharmacokinetic and pharmacodynamic interactions and a more systematic clinical follow-up are mandatory.

**PB8 108 PREVALENCE OF SLEEP DISORDERS IN A MCI POPULATION AND ASSOCIATION WITH COGNITIVE SUBTYPES**

S. BOMBOIS\* (Memory Center, university hospital Lille, Lille, France)  
X. DELBEUCK(1), L. LAURIER(1), J. JACQUESSON(2), P. DERAMBURE(2), C. MONACA(2), P. FLORENCE(1) - (1) Memory Center (Lille, France); (2) 2Clinical Neurophysiology Department (Lille, France)

**Background:** Patients with mild cognitive impairment (MCI) are at high risk to progress to dementia. Some sleep disorders are associated with cognitive deficit, and have been reported as predictive factors for dementia. **Objective:** To determine the prevalence of sleep disorders in MCI patients attending a memory clinic, and to test the association between sleep features and cognitive profile. **Patients and method:** Consecutive patients with MCI (cognitive complain, normal general cognitive functioning, objective impairment in at least one cognitive domain as evident by scores < 1.5 SD below the age appropriate mean, preserved activities of the daily living, and no dementia) were included. A standardized clinical, neuropsychological and sleep evaluation with a polysomnography during 2 consecutive nights were performed. MCI cognitive profiles were classified as amnestic single or multiple domains and non amnestic single or multiple domains. **Results:** We included 65 MCI patients (mean age  $67.7 \pm 6.7$  years; 50.8% women). Arterial hypertension was present in 47.7% of the patients, dyslipidemia in 55.4%, diabetes in 20%, and cardiopathy in 20%. The mean body mass index was  $25.6 \pm 3.7$ . The mean MMSE was  $28.1 \pm 2.0$  points. The total sleep time was  $404.7 \pm 75.3$  min, mean apopnea/hypopnea index was  $15.8 \pm 12.2$ . The mean Epworth Sleepiness Scale was  $7.2 \pm 4.4$ . An obstructive sleep apnea was diagnosed in 84.6% of the MCI patients, a restless legs syndrome in 30.8%, and periodic limb movements in 36.9%. One patient had rapid eye movement sleep disorders. In a statistical multivariate model, sleep disorders and polysomnographic data were not associated with any MCI cognitive subtypes. **Conclusion:** Sleep disorders are highly prevalent in our cohort of MCI patients, whatever the cognitive subtype. The follow-up of these patients will document the influence of the treatment of sleep disorders on cognition.

**PB8 109 ORAL STATUS OF MEMBERS OF FRANCE-ALZHEIMER-HAUTS-DE-SEINE (FA92) AND THEIR MAIN CAREGIVER.**

P. CHARRU\* (Hôpital Louis Mourier APHP, Colombes, France)  
A. BODINEAU(1), L. SALOMON(1), M. FOLLIGUET(1) - (1) Hôpital Louis Mourier APHP (Colombes, France)

**Introduction** Oral health of patients with AD and their main caregivers are poorly documented. The difficulties of care in last stages of the disease need to prevent oral diseases, particularly by a rigorous hygiene. The caregiver's role is essential. **Methods and materials** 470 double self-questionnaires (patient and caregiver) were sent in May 2008 with three aims: describing the oral status of patient and his caregiver; determining the existence of a link between the two populations and understanding the difficulties to access to dentist consultation. **Results** 82 patients and 76 main caregivers completed the questionnaires. 62.2% of patients were women, with  $82.4 \pm 7.08$  years. They had an Alzheimer's Disease (75.25%), a mixed dementia (7.5%), a dementia with Lewy's bodies (6.45%), an Parkinson's dementia (3.2%). The diagnosis was known for over 5 years (65%). 78% took specific treatment. The caregiver was a woman (58%), with  $74.3 \pm 11.7$  years. She was a spouse (68.8%), a child (25%), a friend (3.75%) 68.1% of patients and 83.3% of caregivers had more than 10 missing teeth. They wore denture (66.1% vs. 62%). Oral hygiene were realized once a day for 51.4% of patients and more than once a day for 58.1% of caregivers. The access to dental care was reduced because of difficulties of transport and care. The frequency of caregiver's consultation to the dentist influences significantly (and positively) the frequency of patients's consultation ( $p < 0.001$ ). The caregiver's perception of his own oral health influences significantly (and positively) the perception of patient's oral health ( $p = 0.03$ ). **Conclusion** This study take part of a better knowledge of the epidemiology of Oral health in Community population with dementia and underline the importance of caregiver's role in a programme of prevention.

**PB8 110** POINTING INTERACTION TECHNIQUES FOR OLDER PEOPLE WITH COGNITIVE IMPAIRMENT AS A DIAGNOSIS TOOL ?

N. VIGOUROUX\* (Laboratoire Gérontopôle de La Grave, Toulouse, France)  
F. VELLA(1), P. RUMEAU(2), A. RIGAUD(3), B. VELLAS(2) - (1) IRIT (Toulouse, France); (2) Laboratoire Gérontopôle de La Grave (Toulouse, France); (3) Hôpital de Broca, AP-HP (Paris, France)

Introducing Information Communication Technology for aging population raise promises and challenges. One of the key challenges in developing assistive and rehabilitation systems for older people is finding some easy and effective means of interaction. This ongoing study (<http://www.tandem.memosyn.org>) aims to provide an understanding of how the performance of elderly with and without cognitive impairment is affected by three Point-Select-Drag interaction (clicking (CL), dragging (DR), clicking and automatic magnetization (CLM)) techniques to move an item to another item. Study participants (4 Mild Cognitive Impairment and 8 Alzheimer disease subjects; 4 older control persons), recruited at Toulouse geriatric hospital, were asked to select the sugar piece and to put it into the cup of coffee. After pre-tests, we chosen a black background and hand cursor to facilitate respectively the readability and the appropriation. Sessions consisted in training the patient to move the cursor and to select an object, then doing the computer trial and finally answering a semi-structured questionnaire. The duration factor is significantly different for the three interaction techniques. Firstly, the duration increase is correlated to the decrease of the Mini Mental Score (MMS) for (DR). We observe a big variability for MMS between 15 and 20. (CL) duration is also dependant of the MMS (more MMS is low more duration is long). CLM duration, around 20 seconds per action is stable for all patients and twice as shorter than for DR. From the empirical observations, we identify several difficulties with mouse, such as losing the cursor and bad control in moving with DR. We will continue to explore the added click factor to confirm the identification of the most efficient technique. These first experiments postulate that pointing technique could be used as a differential factor of cognitive impairment.

**PB8 111** PROFIT FOR THE USE OF THE GERIATRIC DAY HOSPITAL FOR PATIENTS WITH MILD-MODERATE DEMENTIA.

P. SORANDO FERNANDEZ\* (Hospital de la Cruz Roja., Madrid, Spain)  
J. GÓMEZ PAVÓN(1), N. OTAZU ARÉVALO(1), I. RUIZPÉREZ CANTERA(1) - (1) Hospital Cruz Roja (Madrid, Spain)

AIMS: Analyze the benefits of the use of the Geriatric Day Hospital for patients with mild-moderate dementia. METHODS: Prospective observational study of patients admitted in the last 3 years (1-1-2006 to 1-1-2009) in a day hospital for Geriatric Services from Madrid area V . Excluding those with incomplete data (1), attending <4 (73 (12%). N: 542; 344 women, mean age 83,7 +/- 6,34 years. Two groups in study. A= Patients with mild-moderate dementia (GDS 4-5) and B= rest of patients. Discusses functional gain according Barthel scale ( admission-discharge ) and improvement in gait and balance according Tinetti scale (admission-discharge), attending and 2 , Mean $\bar{x}$ institutionalization at discharge. Statistical analysis with difference by paired T of student (admission-discharge ), T of Student (analysis group ) . Confidence interval and significance level of 95%. RESULTS: A) Dementia: N= 125 (69 women, mean age ( 84,5+ 6,37 years). Mean attending: 15 + 6 days. Show a gain functional mean in Barthel of 15,95 (13,8-18,09, p<0,001 and in Tinetti of 4,58 (3,92-5,23), p<0,001); institutionalization at discharge rate of 0%. B) No dementia: N=417 (275 women, mean age 83,81 + 6,33 years). Mean attending: 15 + 6 days. Show a gain functional mean in Barthel of 13,81 (12,86-14,76), p<0,001 and in Tinetti of 4,58 (4,28-4,88), p<0,001 both p<0,001; institutionalization at discharge rate of 2%. Comparing both groups, no significant differences between the different variables. CONCLUSIONS: Patients with mild-moderate dementia benefit to the same extent as the rest of the patients in the Geriatric Day Hospital showing a significant gain in Barthel and Tinetti scales, with no increase in hospital stay.

**PB8 112** FUNCTIONAL ASSESSMENT, CO-MORBIDITIES AND PROGNOSIS FOR ELDERLY ADMITTED AT A GERIATRIC SERVICE.

A. BARRETO VIEIRA\* (Hospital Mater Dei, Instituto AURUS-IEPE, Belo Horizonte, Brazil)  
F. LIMA NOGUEIRA(1), M. TONIDANDEL BARBOSA(1), J. BARBOSA MACHADO(1) - (1) Hospital Mater Dei (Belo Horizonte, Brazil)

INTRODUCTION Assessment of patients according to their performance at basic activities of daily living (BADL), and comparison between dependent and independent groups in relation to some variables. METHODS AND MATERIALS Some elderly patients were evaluated and ranked, according to Katz's BADL. Average age and gender, main diagnosis, average time of hospital permanence, number of co-morbidities, history of complications, and death were analysed and further compared among the three groups of patients. RESULTS Among the 151 patients, average age of  $79.0 \pm 9.6$  years (60 men and 91 women). Patients were classified as independent for the DLBA (group A, n = 74), partially independent (group B, n = 31) and totally dependent (group C, n = 46). Average ages of groups A, B and C were, respectively, 74.7; 80.5; and 85.0 years ( $p = 0.00$ ). Groups B e C showed more Pneumonia or Urinary Tract Infection when compared to group A (48.4%, 41.3% vs. 13.5%, respectively). The average time of permanence was of 8.4 days for group A; group B: 11.6; and group C: 15.0 days ( $p = 0.02$ ). Group A showed an

average of 2.9; group B: 3.5; and group C showed 4.2 associated diseases ( $p = 0.00$ ). Complications occurred in 10.8% of patients in group A; in 22.6% in group B; and 37.0% in group C ( $p < 0.01$ ). No death was registered in group A during hospital permanence hospital, while in groups B and C, respectively, 2 (6.5%) and 7 (15.2%) were registered. CONCLUSIONS There was a clear correlation between the worst BADLs and the variables evaluated. Those data reinforce the necessity of a deeper geriatric evaluation aiming to a better approach of the elderly, emphasizing care and attention to the greater chances of complications for the more dependent.

**PB8 113** COGNITIVE PERFORMANCE OF PATIENTS WITH PRE-DIABETES AND DIABETES MELLITUS.

S. SILVA-FILHO\* (Hospital das Clínicas de Ribeirão Preto USP, Ribeirão Preto, Brazil)  
R. JS(1), L. RR(1), R. STS(1), F. MP(1), F. PF(1), F. MC(1), F. E(1), L. NKC(1), S. AC(1), M. JC(1) - (1) Hospital das Clínicas de Ribeirão Preto USP (Ribeirão Preto, Brazil)

Introduction: Pre-Diabetes(PD) and Diabetes mellitus(DM) are implicated es risk factors not only vascular dementia but also to Alzheimer's disease (AD). We evaluated the cognitive performance of patients with PD and DM compared with health control (HC) using neuropsychological evaluation. Methods and materials: 40 Volunteers, both sexes, 60-75 years old, were divided in three groups: DM(n=19), PD(n=12), HC(n=9). The patients were submitted of a battery of neuropsychological tests evaluating attention and executive functions by Color Trail Test (CTT), Stroop Test (ST) and Wisconsin Card Sorting Test; memory by Logical Memory (LM) and Visual Reproduction (VR) tasks of the Wechsler Memory Scale, Rey Auditory Verbal Learning Test (RAVLT) and Rey Complex Figure; visuospatial skills by Waisz-III (Cube) and RAVLT; language by verbal fluency (VF) and Waisz-III (Vocabulary); and intellectual efficiency by Mattis Dementia Rating Scale (MDRS). The results were compared using Kruskal- Wallis test. Results: we found significant difference ( $p<0,05$ ) in ST.

**PB8 114** CLINICAL PROGRESSION IN MILD COGNITIVE IMPAIRMENT MAY NOT BE REFLECTED IN NEUROPSYCHOLOGICAL DOMAIN DECLINE

G. ARSENault-LAPIERRE\* (Lady Davis Institute for Medical Research - Sir M. B. D Jewish General Hospital, Montréal, Canada)  
H. CHERTKOW(1) - (1) Bloomfield Center for Research on Aging, Lady Davis Institute in Medical Research, Sir Mortimer B. Davis - Jewish General Hospital (Montréal, Canada)

Mild Cognitive Impairment (MCI) is often a stage which precedes dementia such as Alzheimer's Disease (AD), and the decline from MCI to AD generally involves increasing cognitive impairment as well as the onset of functional impairment. In a medical setting, assessment of these impairments is generally accomplished with short global screening tools, but the assumption is that the decline will also be reflected in progressing impairment across multiple cognitive domains, and this progression should separate MCI progressors (MCIP) from MCI non-progressors (MCInp). This assumption was tested in a set of 48 MCI subjects drawn from a clinical patient population followed at the memory clinic of the Jewish General Hospital (JGH), Canada. Twenty-five Normal Controls (NC) were also recruited for comparison from the community in Montreal. All were subjected to an annual neuropsychological battery of tests grouped in four domains: memory, language, executive functions and visual perception. Scores on the four domains and a global score were computed for each subject. Based on clinical follow-up after two years, the MCI individuals were ultimately classified as 35 MCInp and 13 MCIP subjects. The changes in neuropsychological tests over the two years, in MCI subjects compared to normal, was assessed. A group by time interaction ( $p=0.002$ ) showed a decline in the global scores for the MCIP subjects only. In the other cognitive domains, a decline in the performance of MCIP was only noted for visual perception ( $p=0.013$ ). Despite the performance of MCIP subjects being inferior to NC in every domain (all  $p<0.05$ ), they did not show decline in memory, language or executive functions scales. We conclude that a clinically observable decline in MCI individuals after two year follow-up may not be reflected in most individual neuropsychological domain scores. This may reflect possible floor effects of tests, test sensitivity, and patient variability.

**PB8 115** EFFICACY OF SSRI ON COGNITION OF ALZHEIMER'S DISEASE PATIENTS TREATED WITH CHOLINESTERASE INHIBITORS.

R. LUCA\* (University of Brescia, Brescia, Italy)  
L. ROZZINI(1), B. VICINI CHILOVI(1), M. ZANETTI(1), E. BERTOLETTI(1), M. TRABUCCCHI(2), A. PADOVANI(1) - (1) University of Brescia (Brescia, Italy); (2) Geriatric Research Group (Brescia, Italy)

Background: To examine the joint effect on cognition of selective serotonin re-uptake inhibitors (SSRI) and cholinesterase inhibitors (AChEIs) in depressed patients affected by Alzheimer Disease (AD) living at home. Methods. The study was conducted in two different outpatient neurological clinics. 338 patients with probable AD were treated with ChEIs (donepezil, rivastigmine and galantamine) as per the clinician's judgment and were observed for nine months. At study entry, participants underwent a multidimensional assessment evaluating cognitive, functional and psychobehavioral domains. All patients were evaluated at baseline, after one (T1), three (T2) and nine months (T3). Patients were grouped in three different categories (patients not depressed and not treated with SSRI,

patients depressed and treated with SSRI, and patients depressed but not treated with SSRI). Results: At baseline 182 of these were diagnosed as not depressed and not treated with SSRI, 66 as depressed and treated with SSRI, and 90 as depressed but not treated with SSRI. The mean change in MMSE score from baseline to nine months showed that depressed patients not treated worsened in comparison with not depressed and not treated with SSRI (mean change  $-0.8 \pm 2.3$  vs  $0.04 \pm 2.9$ ;  $p=0.02$ ) and patients depressed and treated with SSRI (mean change  $-0.8 \pm 2.3$  vs  $0.1 \pm 2.5$ ;  $p=0.03$ ). Conclusions: SSRI in AD patients treated with AChEIs may exert a protection on the negative effects of depression on cognition.

**PB8 116 UNAWARENESS OF MEMORY IMPAIRMENT AND BEHAVIOURAL ABNORMALITIES IN PATIENTS WITH ALZHEIMER'S DISEASE: RELATION TO PROFESSIONAL HEALTH CARE BURDEN**

M. AL ALOUCY\* (Pitie Salpetriere hospital, Paris, France)  
M. ROUDIER, G. DALIA BARBA

Introduction: unawareness of deficit (anosognosia) is a common phenomena in patients with Alzheimer's disease (AD). The main objective of this study was to examine the impact of anosognosia in patients with AD upon the professional health care burden. Methods and Materials: participants were 65 patients with probable AD, aged from 75 to 94 years old, consecutively admitted at Alzheimer Day Hospital in order to complete a program of cognitive stimulation and psychosocial rehabilitation. Each patient was submitted to a standardized evaluation including clinical investigation, cerebral imagery and neuropsychological assessment. Anosognosia of memory deficit and anosognosia of behavioural disturbances were measured as the "discrepancy scores" between patients' self-reports and family members ratings of patient memory performance and behavioural disturbances. Professional health care burden was assessed with the Professional Health Care Dementia Burden Index (PCDBI; maximal score: 12), designed for this study. Multiple linear regressions were used to examine the correlations between the PCDBI and the severity of anosognosia. Results: our findings showed a significant positive correlation between the PCDBI and both anosognosia of memory impairment and behavioural abnormalities (both  $p$  at least less than 0.05). However, there was no significant correlation between the severity of the burden and the severity of cognitive decline or functional impairment (both  $p$  at least >0.05).

**PB8 117 ANTICHOLINERGIC DRUGS USE AND MEMORY DECLINE IN ELDERLY COMMUNITY RESIDENTS**

P. KROLAK-SALMON\* (Hopital des Charpennes CM2R, Villeurbanne, France)  
I. ROUCH(1), M. FORTIN(2), V. DAUPHINOT(3), F. ROCHE(4), J. BARTHÉLÉMY(4) - (1) neurology unit (Saint Etienne, France); (2) geriatry unit CM2R de Lyon (Saint Etienne, France); (3) neurology unit CM2R de Lyon (Saint Etienne, France); (4) physiology unit CHU de Saint-Etienne (Saint Etienne, France)

Introduction Dysfunction of the anticholinergic (AC) system has been widely shown to impair cognitive performance, in particular memory. Elderly people take many medications. Drugs with AC activity are frequently prescribed in this population. Recent studies have shown a measurable AC effect of frequently used drugs not usually recognized to have such properties. The present study aimed at assessing the relationship between the use of AC drugs and episodic memory and attention in a large sample of elderly non-demented community residents. Methods and materials The study population was selected from the PROOF study, a population-based cohort study of 1011 community-dwellers aged 65 years. A general interview was conducted to obtain information on demographics, current and past illness, cardiovascular risk factors, mood disorders and medications. A list of 279 drugs with AC effect was obtained by combining various literature studies. Even drugs with minimal effects or in vitro demonstrated effects were included. Subjects also performed an extensive neuropsychological evaluation exploring memory and executive functioning. Means of neuropsychological performances were compared between two groups of subjects, using or not AC drugs, with a multivariate MANOVA analysis. Results Of the 752 people included in the analysis, 102 (13.56 %) were taking at least one drug with anticholinergic properties. A selective effect of AC drug taking was disclosed on Free and Cued Selective Reminding test performances, exploring episodic memory. This effect remained significant after adjustment for age, gender, education, total medications taking, comorbidities and various cardiovascular risk factors ( $F=3.09$ ;  $p<0.01$ ). Conclusion The present study shows, in a large sample of elderly non-demented community dwellers, that taking drugs with "hidden" AC activities induces a selective episodic memory decline compared to non-users. When possible, drugs with AC effects should be avoided in elderly patients.

**PB8 118 IMMUNE SIGNATURE IN ALZHEIMER**

A. LARBI\* (Center for Medical Research, Tübingen, Germany)  
G. PAWELEC(1), E. DERHOVANESSIAN(1), D. GOLDECK(1), T. FULOP(2) - (1) Center for Medical Research (Tübingen, Germany); (2) Centre de Recherche sur le Vieillissement (Sherbrooke, Canada)

Introduction: Alzheimer's disease, although phenotypically manifested as cognitive deficits exhibits pathological traits that are suggestive of a systemic disorder. The amyloid  $\beta$  ( $A\beta$ )

is at center stage of the immune reactions leading to the development of a chronic inflammatory process eventually manifesting as AD. However, the peripheral immune alterations accompanying the development of cognitive decline and knowledge on the involvement of the immune system as a mechanism for instigating or exacerbating AD have not been well investigated. Thus, the aim of the present study was to investigate more thoroughly phenotypic changes in T cell subsets in AD patients compared to healthy elderly. Methods and Materials: Most published studies have so far been limited to a rather unsophisticated assessment of different lymphocyte subsets. We have applied the most recent models for T cell subset discrimination using multi-parametric flow-cytometry to describe the immune signature of AD patients compared to healthy controls. Results and Conclusions: Our data provide stronger evidence than hitherto presented for more highly differentiated CD4 T cells in AD patients than age-matched healthy controls, consistent with an adaptive immune system undergoing persistent antigenic challenge and possibly manifesting premature immunosenescence as a result. Several putative sources of persistent chronic stimulating antigen exist, which might result in mild to severe immune exhaustion. The possibility remains that  $A\beta$  itself is the chronic stimulus, although as yet no data are available to support this hypothesis. Clinical trials aimed at reducing the  $A\beta$  load by vaccination should be pursued at very early stages of AD and also considering the underlying specific immune status from the long-term follow-up of the earlier phase I  $A\beta42$  immunisation trial. Further efforts are needed to elucidate whether the observed alterations are differentially occurring in various stages of the disease and whether they are already detectable in MCI.

**PB8 119 IMPORTANCE OF A BLACK BACKGROUND IN IMAGE DISPLAY FOR COGNITIVE REHABILITATION SOFTWARE**

F. VELLA\* (CHU Toulouse, Toulouse, France)  
S. HERMABESSIÈRE(1), P. RUMEAU(1), N. VIGOUROUX(1), A. RIGAUD(2), B. VELLAS(3) - (1) CHU Toulouse, Gerontechnology Lab, Gerontopole (Toulouse, France); (2) Hôpital Broca, Assistance Publique Hôpitaux de Paris (Paris, France); (3) CHU Toulouse, Pole gériatrie, Gerontopole (Toulouse, France)

Introduction A growing number of educative, rehabilitation or playing softwares are proposed for cognitively impaired elderly people. Very few maker are considering specific visual needs and understandability of their visual interfaces. Population and method We proposed the same image of a milk bottle, with milk written on it, (5.5 cm high x 1.8 cm wide) first on a white background then on a black background, displayed on a 29 cm x 22 cm laptop computer screen to 30 cognitively impaired patients. Patients with major sighting problems were excluded. Errors occurred in one third of the patients with a white background and patients felt more comfortable with the black background. Discussion A white background is sending photons to the eye when a black background is absorbing most of the photons. The ratio between information and noise is decreased in case of a white background. If we then consider that vision is based on a prototypic encoding based on the information coming through four channels (shape, color, movement and intensity) and that this prototype is then formally recognized through a process of multi-sensorial integration ; the better the signal on noise ration, the smallest cognitive work is needed. Conclusion We should not have been surprised to find that the requirements made for low vision should then be the same for cognitively impaired patients. If we want to develop efficient multimedia rehabilitation programs for cognitively impaired patients, we have to make sure to limit the cognitive impact of visual information that patients have to use to achieve other specific training tasks.

**PB8 120 NUTRITIONAL SUPPORT AND BED SORES IN PATIENTS WITH ADVANCED ALZHEIMER'S DISEASE**

A. MORENO-GUERRÍN BAÑOS\* (Diputación, Sevilla, Spain)  
E. PÉREZ-GODOY DÍAZ(1), F. FERNANDEZ VARGAS(1), I. DEL BARCO DE LA HAZA(1), J. RUIZ GONZÁLEZ(1), A. ALVARADO TATO(1), A. AMAYA CORTIJO(1) - (1) Diputación., Unidad Geriatría Miraflores (Sevilla, Spain)

INTRODUCTION: In patients with advanced Alzheimer's disease, mental fitness starts to decrease and they eventually develop a vegetative state. Motor activity and gait gradually deteriorates until the patient becomes unable to walk and on the neurological side, swallowing problems start to take place. Nutritional status, as factor related to appearance of pressure sores is taken into account in every risk assessment scale. Patients which present pressure sores are considered at risk to be suffering of malnutrition. AIM: To recognize that nutrition helps with healing of pressure sores in patients with advanced Alzheimer's disease. METHODS AND MATERIALS: We studied 7 cases of patients with advanced Alzheimer's disease (II and III), with limited movements (armchair/bed) and with associated pathologies (Crohn's disease, hypertension, urinary incontinence...). These patients presented with long standing pressure sores in sacrum, heels and ischiatric tuberosities which progressed poorly, and they were treated with enteral nutrition due to deterioration of their clinical situation (progressive cognitive/perceptive deterioration) and swallowing problems; this was delivered via nasogastric tubes and gastrostomy. RESULTS: In spite of the degenerative features of the progressive disease in all the cases we achieved, at least, control of the pressure sores in sacrum (2 of them healing well). One of the patients died after having the heel pressure sores completely healed and the sacral pressure sores following a good course (photographic records of the lesions).

**CONCLUSION:** In patients with advanced Alzheimer's disease, apart from having a protocol for pressure sores that includes general measures, it is important a nutritional support that restores a possible nutritional imbalance (nutritional and laboratory parameters) as to prevent pressure sores. Although healing of pressure sores does not affect directly the progression of the dementia, it does affect the patient's quality of life, as well as the emotional impact on the family.

**PB8 121 IMMUNE STATUS OF CMV AND INFLAMMATORY MARKERS IN PATIENTS WITH ALZHEIMER DISEASE**  
T. FULOP\* (Research Center on Aging, Sherbrooke, Canada)  
A. LARBI(1), C. BRODEUR(2), G. LACOMBE(2), E. FROST(2), G. PAWELEC(1) - (1) Universiety of Tuebingen (Tuebingen, Germany); (2) Research Center on aging (Sherbrooke, Canada)

**Introduction:** Alzheimer disease (AD) is the most common type of dementia. The incidence and prevalence of AD is increasing with age. Aging is also accompanied with an alteration of the immune response called immunosenescence. One hypothesis for this decrease in immunity is the chronic antigenic stimulation by chronic viral stimulation. One of the most well known chronic viral stimulation is cytomegalovirus (CMV). Aging is also accompanied as well as age-related diseases by a low grade inflammation. **Methods:** We studied all subjects referred to our memory clinic and diagnosed AD. As controls we studied all other subjects referred for all other cognitive problems (vascular dementia, MCI, Lewy body disease or healthy). We determined by standard methods the Immune status of CMV (negative or positive), CRP levels and complete blood count. **Results:** We studied altogether 100 subjects. From these 110 subjects 50 presented AD, 25 mixed type of dementia, 10 vascular dementia, 8 MCI and 17 healthy elderly. All were over 65 years. No significant alterations in the CRP levels or in the white blood cell count were found among these groups. The CMV immune status was significantly ( $p<0.05$ ) more frequent in patients presenting AD or mixed dementia. In vascular dementia and in healthy elderly the prevalence was much less. The positivity of the CMV immune status seemed to correlate with the degree of dementia. **Conclusion:** these results seem to suggest that CMV positivity could have a role to play in the immunological alterations found in AD. Future studies are needed to confirm this in a larger population.

**PB8 122 QUANTITATIVE AND QUALITATIVE ANALYSIS OF THE VERBAL LEARNING PROFILE IN PATIENTS WITH MILD COGNITIVE IMPAIRMENT**  
M. SÖDERLUND\* (Hospital Italiano de Buenos Aires, Buenos Aires, Argentina)  
E. LABLOS(1), S. TROJANOWSKI(1), V. SATINOSKY(2), A. MAURIÑO(2), D. SEINHART(1), L. CAMERA(1) - (1) Hospital Italiano de Buenos Aires (Buenos Aires, Argentina); (2) Hospital Central de San Isidro (San Isidro, Argentina)

**Introduction:** Verbal Episodic Memory (VEM) deficit is considered as an Alzheimer disease preclinical marker and a relevant symptom of the amnesic mild cognitive impairment (MCI). Formal test mostly used in a standard exploration are the learning and recall of a lists of words or phrases. **Objectives:** Evaluate the clinical utility of Adas Cog Scale as a tool for studying VEM in a cohort of patients suffering from MCI and describe the Verbal Learning Profile (VLP) in the same group of subjects. **Materials and methods:** A clinical and neuropsychological evaluation was performed in a group of 116 patients (Age:  $73.81\pm0.7$  years old; Level of instruction:  $9.58\pm0.3$  years, MMSE  $28.4\pm1.18$ ) with previously diagnosed amnesic MCI. The Adas Cog was done. Word Recall subitem (memory subitem, MS) was selected as marker of VEM deficit. Cognitive subitem (CS) was also recorded. Percentage of recalled words in each trial was used to study VLP. The results were compared with values from an age and gender matched control group using a t-test. Age subgroup analysis was done (group 1 (n=20): 50-64 years, group 2 (n=68): 65-79 years and group 3 (n=28): 80 or more years). **Results:** Individuals Adas cog MS and CS were higher than reference values in patients with MCI ( $6.51\pm1.51$  ( $p<0.001$ ) and  $2.36\pm1.49$  ( $p<0.001$ )). MS was not abnormal in group 1 while it was higher in group 2 and 3 ( $5.10\pm1.05$  ( $p=0.667$ )),  $6.50\pm1.41$  ( $p<0.001$ ) and  $7.51\pm1.20$  ( $p<0.001$ )). VLP study revealed relevant differences with the controls in each recall trial (trial 1:  $36.72\pm14.31\%$ ,  $p<0.001$ ; trial 2:  $56.12\pm13.50\%$ ,  $p<0.001$  and trial 3:  $60.34\pm14.01\%$ ,  $p<0.001$ ). **Conclusion:** VEM deficit and VLP alteration were found in amnesic patients with MCI. VLP modifications may serve as a potential diagnostic marker in the context of global scales of rapid application.

**PB8 123 FOCUSED ATTENTION DIFFERENCES BETWEEN COGNITIVELY NORMAL OLDER AND YOUNGER ADULTS IN A VERBAL STROOP TASK: A FMRI STUDY**  
J. BOWES\* (University of British Columbia , Vancouver, Canada)  
S. KLAR(1), P. STROMAN (1), I. JOHNSRUDE(1), A. GARCIA(1) - (1) Centre for Neuroscience, Queen's University (Kingston, Canada)

**Introduction** Focused attention (FA), or the ability to focus on relevant stimuli while ignoring distracting ones while performing a task, declines in older adults. The Stroop task is the gold standard for FA investigations. Stroop studies using functional magnetic resonance imaging (fMRI) have focused on younger populations and manual rather than verbal forms of the task. **Methods** In an fMRI study we investigated differences between

16 older (age =  $73.94\pm5.04$ ) and 20 younger (age =  $21.05\pm1.28$ ) cognitively normal participants brain activation during a verbal Stroop task. The participants were shown one stimulus at a time for 1.75 seconds and their verbal responses were recorded. **Results** There were no differences in overt scores between older and younger participants but random effects analysis showed that older participants had much greater activation than younger participants in occipital, parietal and frontal regions including bilateral inferior frontal, left medial frontal and middle frontal gyri but not in the anterior cingulate cortex (ACC), in contrast to previous research. The areas of activation were greater, less localized with more bilateral distribution in older adults. **Conclusion** We found evidence that in verbal Stroop task older and younger adults have similar areas of activation as in the manual Stroop task. Greater and less localized activation in older adults may provide support for the compensatory-recruitment hypothesis, with most compensatory recruitment happening in parietal and frontal areas. This study also provides the baseline for future FA studies of older adults with cognitive deficits.

**PB8 124 OLD NON-WESTERN IMMIGRANTS ARE NOT BEING REFERRED TO HOSPITAL SERVICES. A STUDY FROM CITY DISTRICTS OF OSLO, NORWAY.**  
A. VALEN-SENDSTAD\* (Lovisenberg Diakonale Hospital, Oslo, Norway)  
T. VON TREPKA(1) - (1) Lovisenberg Diaconal Hospital (Norway)

**Objective:** Compare frequency of referral to Hospital / clinic for internal medicine and memory clinic for non-western immigrants in the groups 50-75 and 76+ years of age, with the larger population within the same age groups in different city districts of Oslo. **Method:** Retrospective collection of data from Lovisenberg Diaconal Hospital for the year of 2006. Independent variables were age, sex and ethnicity. Diagnoses were collected from the epicrises of the patients. **Results:** For the age group 50-75 years there was no difference of referral to the hospital between the total population and the non-western immigrants. But in the age group 76+ the difference was evident. 18, 4% (257 of 1395) of the total population was referred to hospital and only 7, 9% (5 of 63) of the non-western immigrants. Patients referred to the Memory clinic for cognitive impairments: 4.1% (26 of 4594) of a total population in the age group 76+, but none (0 of 148) of the non-western immigrants. **Conclusion:** The results indicate that old non-western immigrants above 76 years more seldom are being referred to hospital for internal medicine or to a specialized center for cognitive examination than other citizens of the same age. This may have several causes. Cultural and religious traditions play an important role. They may be more difficult to examine due to language difficulties, cultural differences and levels of literacy. The elderly immigrants may be more invisible than others citizens. They may accept reduced physical and psychological disability, have limited social network or are shielded by the family. They may be afraid and not want to get an examination in a specialized medical center. The lack of standardization of screening tools for neuropsychometric assessments is a problem in cognitive testing. Another explanation for reduced use of hospital services maybe those elderly immigrants have left Norway and returned to their native country for a shorter or longer time. Further studies are needed.

**PB8 125 BMI, ALBUMIN, HEMOGLOBIN AND ALZHEIMER'S DISEASE**  
B. GONZALEZ\* (Centro Regional para el Estudio del Adulto Mayor, Monterrey, Mexico)  
D. GAMEZ(1), R. SALINAS(1), X. ORTIZ(1) - (1) Centro Regional para el Estudio del Adulto Mayor (Monterrey, Mexico)

**Introduction:** Studies had shown a decline in serum albumin levels in patients with Alzheimer's disease. The objective of this study is to show the changes of the albumin and hemoglobin levels in 30 patients diagnosed with Alzheimer's disease, during a one year period. **Methods and materials:** This is an observational, descriptive, prospective study. The sample consisted of 30 outpatients that fulfilled the DSM IV and NINDS-ADRDA diagnosis criteria for Alzheimer's disease. Three visits were performed at 0, 6, and 12 months. Body mass index (BMI), albumin and hemoglobin (Hb) were evaluated using standard methods. Data analysis was performed using SPSS version 13 by means of a Pearson correlation with 0.95 confidence interval, mean study (t student) and Anova variable correlation. **Results:** The descriptive analysis showed: Sample population 30 patients, with means of age 77.90, of educational level 6.30, of Mini Mental State Examination (MMSE) score 12.83 (5-25). Statistical analysis demonstrated that there is no significant change in the levels of serum albumin and it's independent of the cognitive decline, showing the following means: V1: 40.9, V2 41.2 and V3 41.3 (t: 64.5, 78.6, 70.8, .000 significance). The hemoglobin and BMI showed a decline during the disease process with the following means: Hb in V1 134.5, V2 132.1 and V3 127.0 (t: 52.9, 45.7, 33.3, .000 significance) and BMI mean: V1 25.1, V2 25.17 and V3 24.62 (t: 25.2, 23.8, 18.6, .000 significance). During the correlation study (Pearson), statistical differences were found in Alzheimer's disease, BMI and Hb and no correlation could be determined with respect to the albumin level. **Conclusion:** The study showed that the albumin level did not decline during the Alzheimer's disease process. Although a correlation between Alzheimer's disease, BMI and Hemoglobin levels was found. We suggest new studies to develop clinical elements that can predict or participate as biological markers of Alzheimer's disease.

**PB8 126 RISK OF COGNITIVE DECLINE AND MORTALITY IN DIABETIC MEXICAN ELTERS**  
S. MEJIA\* (Colegio de la Frontera Norte, Tijuana, Mexico)  
C. ZUNIGA(1) - (1) Hospital General de Tijuana (Tijuana, Mexico)

Introduction Diabetes is one the leading causes of death in Mexican elders. Some studies have demonstrated an association between diabetes and a higher risk of cognitive impairment. We evaluated this in the Mexican Health and Aging Study (MHAS) a prospective community-based study. Methods and materials 6,681 subjects aged 60 or more were classified as having or not having diabetes mellitus based on self reported variables. Using cognitive and functional data, subjects were also classified in three groups: Normal, Cognitive Impairment No Dementia (CIND) and Dementia. After two years, the association of diabetes with cognitive decline and mortality was established. Results Diabetes in the Normal Cognitive group was 14.3%, 15% in the CIND and 23.6% in the Dementia group. After 2 years 12% of diabetic subjects in the Normal group remain normal, 13% decline to CIND, 18.6% decline to dementia and 25% died. After adjusting for age, years of education, sex and other coomorbidities there was an increased risk of getting demented for normal diabetics independently and in addition with hypertension (OR, 1.58; 95%CI, 1.04 – 2.40). Exactly the same pattern was observed in the normal cognitive subjects that died after two years (OR, 2.27; 95%CI, 1.55 – 3.32). In the progression to CIND, diabetes didn't have a significant risk (OR, 1.07; 95%CI, 0.88–1.30). When CIND basal diabetic group was followed, 19.6% decline to Dementia and 26.3% died. Diabetes showed an increased risk in both groups: Dementia (OR, 1.93; 95%CI, 1.11 – 3.34), Mortality: (OR, 2.87; 95%CI, 1.77- 4.64) together with hypertension and age. Finally 30% of the diabetic demented subjects died 2 years later. Diabetes was not a significant risk factor. Conclusions Diabetes is a significant risk factor for cognitive decline in subjects which progress to dementia either from a normal or from a cognitive impairment stage.

**PB8 127 GALANTAMINE IN ALZHEIMER**  
T. METS\* (Universitair Ziekenhuis Brussel, Brussels, Belgium)  
K. VAN PUYVELDE(1), R. STUDY GROUP - (1) Universitair Ziekenhuis Brussel (Brussels, Belgium)

Introduction: to record in a real life setting the safety and clinical outcome of a once daily prolonged release of galantamine in the treatment of mild to moderate Alzheimers disease as well as caregivers, patients and physicians evaluation of treatment. Patients and methods: prospective, multi-centre, non-interventional, observational study in 13 centres (geriatrics and neurology) in Belgium. Two groups of patients were compared: galantamine treated patients and a group treated with other standard Alzheimer medication. At baseline functional, cognitive and behaviour assessment was performed and comorbidity, concomitant medication, blood pressure, heart rate and weight were noted. After 2 and 6 months dosage of galantamine, adverse effects, concomitant medication, caregivers global evaluation and patients satisfaction with therapy were noted, and at 6 months also a global evaluation of treatment by the physician. Results: 128 patients (mean age 77.9y; SD 6.6y; 42M/86F) were included of whom 110 completed the study. After 6 months of galantamine treatment non-significant improvements were noted for MMSE (21.2 to 21.6) and NPIq (14.7 to 13.5); physicians rated global impression as 50% better, 33% unchanged, 20% worse; caregivers rated global evaluation as 40% better, 40% unchanged, 20% worse; patients reported satisfaction with the therapy as 48% better, 47% unchanged, 4% worse. The incidence of side effects with galantamine was 11.7%, which was not different from the other treatments. Conclusions: galantamine once daily is evaluated as beneficial (improvement or stabilisation) by an important part of physicians, caregivers, and patients; side effects are limited.

**PB8 128 CHOLINESTERASE INHIBITORS AND CARDIOVASCULAR DISTURBANCES IN ALZHEIMER'S DISEASE**  
F. BERTIN HUGAULT\* (Hopital des Charpennes, Villeurbanne, France)  
F. BERTIN-HUGAULT(1), Y. GUILHERMET(1), J. GAYET(2), P. HAOND(1),  
P. KROLAK-SALMON(1) - (1) Hôpital des Charpennes (Villeurbanne, France);  
(2) Consultant (Colombes, France)

Introduction : Cholinesterase inhibitors (CI) have shown to improve attention and memory in patients with Alzheimer's disease. However, some cardiovascular disturbances are susceptible to provide symptoms like syncope or equivalents. It may be sometimes difficult to disentangle benefits and risks in elderly with cardiovascular comorbidities. Material and method : Case report : A 76 year old woman with Alzheimer's disease has been treated with 10 mg a day of donepezil for one year. Then, as she was presenting a stability of memory troubles, she presented a serie of syncopes. A sinus bradycardia and a first grade auriculoventricular block were disclosed by a holter monitoring. These abnormalities were absent one year before. Donepezil was then discontinued. Results : Because of probable benefits from CI, rivastigmine was introduced during an hospitalization allowing holter monitoring. After one year, the patient is stable for memory performance and she does not present syncope any longer. Two other monitoring controls have disclosed correction of ECG abnormalities. Discussion : Four cases of syncopes and four cases of syncope equivalents with identified ECG abnormalities (four AV blocks, three bradycardias, one not described) were reported after CI introduction in literature. A pace-maker (PM)

implantation or cessation of CI were proposed. In these patients, the balance between benefits and risks should be systematically re-evaluated. When CI is effective, a molecule switch should be proposed before PM implantation. This switch should be performed in the context of cardiovascular supervision and ECG monitoring during a hospitalization.

**PB8 129 CAREGIVER BOURNOUT IN ALZHEIMER DISEASE PRESENT IN MEXICAN FOUNDATION**  
V. VICTOR\* (Guadalajara Alzheimer Foundation, Guadalajara, Mexico)  
S. PANIAGUA(1) - (1) universidad del valle de atemajac (guadalajara, Mexico)

BACKGROUND: Primary caregiver fatigue in alzheimer disease is present and cause irreversible damage at the health system. Sometimes caregiver needs more attention even the dementia patient. Institutions are interested to known which the bournout level is and how can help to the families in order to avoided objective: identify the presence of burnout in caregivers of patients with Alzheimer and the level at which it presented method: assessed 135 caregivers of people with dementia in a cross-sectional study of whom 91 were taken as sample. It applies the scale of caregiver stress Zarit RESULTS: 71% of the total sample showed intense level of overload, of which 67% was found with psychological wear. profile for Alzheimer caregivers in Mexico is mostly women married women over 40 years CONCLUSIONS: attention to caregivers of patients with dementia is known by all but the degree of affection and the characteristics of stress that occurs in this population indicates that most suffer from being overloaded with intense psychological consequences in the area to focus on urgent because they are women who still support his family and children.

**PB8 130 ASSOCIATION BETWEEN MILD COGNITIVE IMPAIRMENT (MCI), NUTRITIONAL STATUS AND BODY COMPOSITION AMONG ELDERLY PEOPLE IN MALAYSIA**  
S. SHAHAR\* (Universiti Kebangsaan Malaysia, Kuala Lumpur, Malaysia)  
L. LEE(1), N. SHAARI(1), N. MOHD YUSOFF(1), N. MOHD SAKIAN(1),  
N. RAJAB(1), S. A.AZIZ(1), R. RAJIKAN(1), A. CHIN(2) - (1) Universiti Kebangsaan Malaysia (Kuala Lumpur, Malaysia); (2) Universiti Malaya (Kuala Lumpur, Malaysia)

This cross-sectional study was conducted to determine the association between mild cognitive impairment, nutritional status and body composition among elderly people in Malaysia. The study aimed to screen 500 individuals aged 60 years and above from a few flat residential area in Klang Valley. Mild Cognitive Impairment were assessed using Mini Mental State Examination (MMSE), Dementia Rating Scale (DRS), Geriatric Depression Scale (GDS), Activities of Daily Living (ADL), Instrumental Activities of Daily Living (IADL) and memory complaints by participants. Anthropometric measurements taken were height, weight, mid-upper arm circumference, calf circumference, waist and hip circumference. Body composition was measured using Body Impedance Method to obtain data on fat free mass (FFM), fat mass (FM), Resting Skeletal Muscle Index (RSMI). A total of 30 ml fasting venous blood was taken for determination of antioxidant status, plasma homocysteine, folate and iron status, fasting serum lipid, HbA1c and APOE polymorphism. Preliminary analysis of the results among 68 subjects showed that 27 (39.7%) men and 41 (60.3%) women had MCI. Men had a significantly greater value for waist hip ratio, skeletal muscle mass and fat free mass than women ( $p<0.05$  for all parameters). There as also a trend that MCI is more prevalent among subjects with low education and high waist hip ratio. The association between mild cognitive impairment with biomarkers and antioxidant status is also being investigated. In conclusion, MCI was detected in approximately a quarter of samples and related to educational status and poor nutritional status.

**PB8 131 SMALL UNITS AND A DAY CARE CENTER FOR PEOPLE WITH DEMENTIA IN AN INTERGENERATIONAL HOUSING AND SERVICES STRUCTURE IN SAINT APOLLINAIRE "HELLO NEIGHBOUR"**  
P. DAURE\* (FEDOSAD , Dijon, France)

introduction In 2002, FEDOSAD : a non-profit-making association for support at home and in institution had the opportunity of working with both the Town Council of Saint Apollinaire and a public service of social housing. An intergenerational place was founded : besides early childhood services and a small unit of 6 people with dementia, there is also a day care center for 13 persons with dementia. Close by to the institution live people in flats provided by public housing : half young couples having small children and half old people. Method The idea of course is to make all these different-aged people meet regularly and improve cordial relations between them. Intermixing of generations is rules by a Charter "Hello neighbour" which is based on a moral agreement to live together harmoniously and learn how to provide help and ways of communication in order to keep in touch as often as possible. With the help of a coordinating committee including professionals of care and social services, some regular meetings are organized between all people living there (in institution or at home). Numerous activities are offered : lectures, shows, exhibitions, parties, which give to everyone a chance to meet the other and strengthen social relations. Results These meetings let people know each other better and better. We noticed that the relations became actually friendly and pleasant, in an easy way : people recognize each other, talk together, know who the other are ("critical distances")

being abolished). Old people particularly find again appropriate gestures towards small children. People with dementia and their families consider this place as really different from the other health care places, as they feel at home : this appears through the answers to the questionnaires addressed to the families, which are very positive proving that these sorts of structures are in great demand Conclusion: People with dementia are no more stigmatized. During the meetings with their neighbours and particularly with the small children, they are able to find convenient social behaviours. People are highly motivated in planning the meetings as they feel involved and responsible for the projects.

**PB8 132 ARE OLDER PERSONS APPRECIATED IN THE FINNISH SOCIETY?**

S. VAAPIO\* (Institute of Clinical Medicine, Turku, Finland)  
M. SALMINEN(1), M. HINTSALA(2), S. KIVELÄ(1) - (1) Institute of Clinical medicine (Turku, Finland); (2) Oy Leiras Finland AB (Nycomed) (Helsinki, Finland)

Introduction This study is a part of the Senior Study Project. The aim was to describe the opinions of older Finns about the appreciation of older persons and the quality of care of the aged in Finland. Methods and materials The material consisted of a random sample of Finns aged 65 years or older (N=503). Data were collected by structured telephone interviews in June 2008. Results According to the preliminary results about two-thirds (67%) of participants answered that older persons are appreciated less than middle-aged persons. Only 13% thought that older persons are highly appreciated. Every third (30%) thought that care of the aged is organized poorly and 62% thought that the quality of the care of the aged is not adequately good for older people and it has become worse during the past years. Conclusion According to the opinions of older Finnish citizens, the appreciation of older persons is poor. The quality of the care of the aged is quite poor and its quality has even become worse during the previous few years. Older citizens think that their autonomy and individuality are not respected by younger generations in modern Finland.

**PB8 133 BIOMARKERS OF OXIDATIVE STRESS IN OLDER HEALTHY SPANISH SUBJECTS**

M. JUANA\* (University Catholic San Antonio, Guadalupe (Murcia), Spain)  
R. JOSE MIGUEL(1), A. MARIA DOLORES(2), P. SOLEDAD(2), Z. PILAR(1) - (1) University Catholic San Antonio (Guadalupe(Murcia), Spain); (2) Hospital Virgen de la Arrixaca (Murcia, Spain)

Introduction Oxidative stress has been reported to increase with ageing. However, the data in healthy humans remains controversial and studies in healthy elderly people are scarce. The objective of the present study was to compare age-related oxidative stress in male and female older healthy subjects. Materials and Methods The effect of ageing on oxidative stress and antioxidant parameters was investigated in seventy-two older subjects (32 male and 40 female), from Murcia (Spain). We performed an ADL test to select older subjects who were independent in all activities of daily living. Blood and urine samples were collected and analyzed to select the male and female older healthy subjects. The urinary concentration of isoprostanes and the concentration of oxidized LDL and autoantibodies against oxidized LDL in plasma by ELISA methods were measured as markers of the degree of lipid oxidation. The oxidation of proteins was analyzed by measuring the protein carbonyls in serum. For quantitative measurement of the oxidative DNA the adducts 8-hydroxy-2'-deoxyguanosine (8-OHdG) in urine using anti-8-OHdG monoclonal antibody were analyzed. Furthermore, it has measured the total antioxidant activity in plasma and the activity of endogenous antioxidant enzymes: glutathione peroxidase (GPx), glutathione reductase (GR) and superoxide dismutase (SOD). The total antioxidant status (TAS) was measured in plasma. 1 years) of this study are healthy for Results The older subjects (69 the values of the parameters biochemical and haematological parameters analyzed. These values are within those considered normal for both men and women, except the values of uric acid and urinary creatinine in the female subjects which are lower ( $p<0.05$ ). The results of biomarkers of oxidative stress showed that the female have lower values of TAS than the males, and higher values for GR ( $p<0.05$ ). No significant differences were found between men and women for the values of GPx, SOD and biomarkers of protein, lipidic and DNA oxidation. Conclusions The results of this study showed that the degree of oxidative stress is similar in male and female older healthy Spanish subjects, but women are a better antioxidant status than men.

**PB8 134 DEBRECEN LONGEVITY STUDY II. HEALTH AND FREE RADICALS IN OLDEST OLD RESIDENTS**

S. IMRE\* (Medical and Health Science Center, University of Debrecen, Debrecen, Hungary)  
A. KOVACS(1), K. NAGY(1), Z. VARGA(1), M. UDVARDY(3), Z. SZIKSZAI(2), G. PARAGH(1) - (1) I st. Department of Internal Medicine, Medical and Health Science Center, University of Debrecen (Debrecen, Hungary); (2) Institute of Nuclear Research of the Hungarian Academy of Sciences (Hungary); (3) Department of Clinical Biochemistry and Molecular Pathology, Medical and Health Science Center, University of Debrecen (Hungary)

Introduction: Among the elderly population in Hungary the number and proportion of the oldest old ( defined as age 90 years or older ) residents would increase most significantly in

the near future. We decided to make a systemic analysis of this target group under this title : Debrecen Longevity Study. It is well known that the toxic effects of oxygen free radicals contribute not only to the incidence of age-associated diseases, but also to the aging as a biological phenomenon. To study the damaging effect of oxygen free radicals and the efficiency of antioxidant defence in this special group three parameters were examined: plasma vitamin E and lipidperoxid contents as well as the carbonil contents of plasma proteins. Methods: The laboratory results of 185 persons above 90 years old have been presented. For healthy controls in the evaluation of vitamin E contents 100 persons with an average age of 37,5 +/- 9.9 years have been used. For healthy controls in the evaluation of lipidperoxid and carbonil contents three age groups, 20 – 39 years of age (60 persons), 40 – 59 years of age (40 persons) and 60 – 80 years of age (40 persons) have been used. Results: Significantly higher levels of alfa - tocopherol ( $p < 0.001$ ) and gamma - tocopherol ( $p < 0.05$ ) were observed in the oldest old residents as compared with the values found in healthy controls. The trend of significant ( $p < 0.001$ ) increase was observed in the contents of lipidperoxid and carbonil as a function of age in healthy controls, but the increase was not significant over 80 years of age. Conclusions: It could be concluded that the oldest old residents had a native resistance to the damaging effect of oxygen free radicals.

**PB8 135 PROSTATE CANCER TREATMENT TOLERANCE AND EFFICACY IN THE ELDERLY**

A. DAUFFY-ALLAIN\* (HEGP-APHP, Paris, France)  
C. LAZAROVICI(1), S. OUDARD(2), H. LAHJIBI-PAULET(1), A. MINARD(1), C. BAUER(1), O. SAINT-JEAN(1), M. GISSELBRECHT(1) - (1) HEGP-APHP-Gériatrie (Paris, France); (2) HEGP-APHP-Oncologie (France)

Introduction: Prostate cancer is the more common cancer in man with half of diagnosis made after 74 years of age. Adjusted death risk seems to be independently increased with age. However, these patients are too often excluded of controlled trials of new treatment strategies. Moreover, most elderly men presented at the first consultation metastasis stage. It seems important to determine if age by itself is sufficient to assess the benefit and risk of chemotherapy, which is the gold standard treatment of metastatic prostate cancer. Methods: We made a retrospective study of medical files of more than 75 years old patients consulting for metastatic prostate cancer between 2000 and 2006 in a reference University Center for prostate cancer treatment. We extracted data related to the disease (Gleason classification, stage, date of diagnosis, symptoms), data related to co-morbidity (Charlson index) and clinical status (performance status and pain), and biological parameters (haemoglobin, albumin, renal and hepatic function). We also extracted treatment details (chemotherapy products used, treatment modality) and outcome related to tolerance of the treatment and clinical status after treatment in order to assess efficacy. Results: We aimed to clarify relationship between 1) clinical data and efficacy and tolerance of treatment 2) biological parameters and efficacy and tolerance of treatment and 3) cancer stage and efficacy and tolerance of treatment. Conclusion: Results will be discussed during the session in order to improve the metastatic prostate cancer management of old and very old patients.

**PB8 136 THE VALUE OF A COMPREHENSIVE GERIATRIC ASSESSMENT (CGA) FOR ELDERLY PATIENTS WITH NON METASTATIC BREAST CANCER.**

C. DIONNE\* (Centre Léon-Bérard, Lyon, France)  
G. ALBRAND(1), C. TERRET(2), J. DROZ(2) - (1) Hôpital gériatrique Antoine Charial (Francheville, France); (2) Centre Léon-Bérard (Lyon, France)

Introduction : The value of a CGA has been well demonstrated in many geriatric settings. Few studies has evaluated the usefulness of such an evaluation in taking care of the global medical condition of elderly patients with cancer and more over, the evolution of the included items over time. Methods and materials : Women aged > 70 years with operable breast cancer pre and post-operatively underwent a CGA procedure conducted by a multidisciplinary team. The CGA incorporated numerous validated instruments (GDS, MMSE, MNA, ADL...) and a comprehensive physical examination and standard paraclinic exams. Comorbidity was measured with the CIRS-G. According to this detailed evaluation, recommendations were formulated by the geriatrician when necessary. Results : 79 women aged 70 or older received a multidisciplinary CGA at baseline and if possible, at 1 year and 2 years. At baseline, most patients (66%) were fully independent for ADL and 46 % for IADL. 19 % were at risk for cognitive impairment, 30% for depression and 33 % for malnutrition. Mean CIRS-G total score was  $10 \pm 4$ . Patients presented on average three new problems identified initially. An average of  $3 \pm 1$  recommendations were implemented based on the CGA. After 2 years of follow-up, 37 patients were dead or lost. Among the remaining, 58% were still independent for ADL and 44 % for IADL. 23 % were then at cognitive risk, 23 % at depression risk and 20 % at nutrition risk. Conclusion : A CGA appears to be a useful way to detect new geriatric problems in those cancer patients and to build recommendations to manage their global condition. In addition, it makes possible to follow the evolution on the physical, psychological and social status of the patient.

**PB8 137 A NOVEL WAY OF ASSESSING HEALTH AND VULNERABILITY IN OLDER NEWLY-DIAGNOSED CANCER PATIENTS: RESULTS OF A PILOT STUDY**

V. GIRRE\* (Institut Curie, Paris, France)

M. PUTS(1), J. MONETTE(2), C. PEPE(4), M. MONETTE(1), L. PANASCI(5), M. BASIK(5), G. BATIST(5), C. WOLFSON(6), H. BERGMAN(2) - (1) Centre for Clinical Epidemiology and Community Studies, Jewish General Hospital McGill University (Montreal, Canada); (2) Division of Geriatric Medicine, Jewish General Hospital McGill University (Montreal, Canada); (4) Pulmonary medicine, Jewish General Hospital, McGill University (Montreal, Canada); (5) Department of Oncology, Jewish General Hospital, McGill University (Montreal, Canada); (6) Division of Clinical Epidemiology, McGill University Health Center, McGill University (Montreal, Canada)

**Introduction:** Oncologists may have difficulty in determining appropriate treatment and predicting complications in older patients. In this regard, the concept of frailty may be a useful way to characterize their health, functional status and vulnerability. **Methods:** Objectives: 1) To evaluate the recruitment and retention strategy and the feasibility of the selected measurement tools. 2) To describe the health and vulnerability of older cancer patients and the adverse outcomes of treatment. **Study Population:** Cancer patients aged 65 and older referred to the Segal Cancer Center with a new diagnosis of breast, colorectal or lung cancer, lymphoma or myeloma, able to give informed consent, life expectancy >3 months, who have not received cancer treatment in the previous five years. **Results:** 112 patients are included: mean age 74.32, 34 men and 78 women (response 72%). At 6 months follow-up 91 patients completed the interviews (81.3%), 14 died (12.5%) and 7 refused follow-up (6.2%). Most patients had a new diagnosis of breast or lung cancer. The mean number of frailty markers at baseline (range 0-7) was 2.3, at 3 months, 2.4 and at 6 months 2.0. The most common frailty markers were slow gait speed, nutrition deficit and low physical activity. 38 patients had one or more functional limitations, 39 patients had disability in instrumental activities of daily living (IADL) and 13 had disability in activities of daily living (ADL) at baseline. The most common functional limitation was unable to walk a mile, the most common IADL disability was unable to do housekeeping activities and the most common ADL disability was incontinence. **Conclusion:** It was feasible to recruit and retain newly-diagnosed cancer patients but it required considerable time and effort. The majority has vulnerability markers present at baseline. The functional status over time fluctuates but returns to baseline status for most patients.

**PB8 138 PRACTICAL FUNCTIONING OF AN ONCO-GERIATRIC READAPTATION UNIT (OGRU)**

C. LAZAROVICI\* (AP-HP Hôpital Paul Brousse, VILLEJUIF, France)

H. VINCENT(1), A. LAPLANTE(1), E. KAROUBI(1) - (1) Hopital Paul Brousse (Villejuif, France)

**Introduction** Elderly cancer is a public health problem. More than half cancers occur after the age of 70. The french cancer plan (Plan Cancer) recognizes the need to develop an active policy of special care for elderly people with cancer. An onco-geriatric mission was given to the french national institute for cancer (INCA). Pilot units of coordination in onco-geriatrics (UPCOG) and OGRU were created in this context. Their major task was to optimize the care of elderly people with cancer, taking into account their common comorbidities and their sensitivity to adverse effects of treatment. We review retrospectively the first year of functioning of one OGRU. Results The OGRU contains actually 10 beds (gradually open) within a geriatric MCU of 35 beds. There was 31 patients (and 49 stays), including 52% of women and 48% of men, with an average age of 79.4 years. The most frequent cancer were digestive cancers (39%) and hematologic cancers (26%). The most common hospitalization reasons were chemotherapy intercourse (41%) and care support (39%). Most of patients had an advanced stage disease as they entered the unit, 52% had metastatic cancer. Autonomy and cognitive functions were often less damaged than in geriatric RU. Comorbidities (assessed by the CIRS-G) were higher. The acute episodes and evolution to palliative care were more frequent. 35% of patients went back home, 16% of patients died in the unit, 8% were transferred in palliative care unit. **Conclusion** Because of burden of care, frequency of acute failures and complications, the activity of OGRU is more similar to short-stay units, though without benefiting the same resources. The frailty of patients often leads to an exclusive palliative care, needing a necessary close collaboration with palliative care units. OGRU is adapted to the needs of a growing number of patients.

**PB8 139 OVERALL SURVIVAL IN ELDERLY WOMEN WITH EARLY BREAST CANCER**

M. MOLINA-GARRIDO\* (University Virgen de la Luz Hospital in Cuenca, Cuenca, Spain)

G. CARMEN(2), M. ANTONIA(3), S. JOSE ANTONIO(1), M. MARIA M(1), C. MONICA(4), O. AMAYA(1), C. ALFREDO(2) - (1) Virgen de la Luz Hospital in Cuenca (Cuenca, Spain); (2) Ramon y Cajal Hospital in Madrid (Madrid, Spain); (3) University General Hospital in Elche (Elche (Alicante), Spain); (4) Geriatric Convalescence Unit in Gerona (Gerona , Spain)

**Background and purpose:** Life expectancy and mortality rates for breast cancer are improving in most countries. Age is the major risk factor for the development of breast

cancer. The current work assessed the independent contributions of age, comorbidities and tumor features, to the outcome of elderly women with early breast cancer in University General Hospital in Elche. **Material and methods:** Records of consecutive women aged > or = 65 years with a histologic diagnosis of invasive and no metastatic breast cancer between 1st January 2003 and 31st December 2006 and available medical information were reviewed. Overall survival (OS) of patients was compared between tumoral and patient characteristics. **Results:** There were 164 patients with a median diagnosis age of 73,66 years (range: 65,0-93,56 y). Of 8 patients who died during the study period, and all of them died from their tumors. The 5-year OS rate was 88,3%. Mean of time to death was 27,34 months (range: 8,57-35,35 months). On univariate analysis, ECOG 2-4 vs ECOG 0-1 was associated with poor 5-year OS (57,9% vs 92,4%; p=0,002), so HER2 amplification vs non amplification (77,4% vs 96,2%; p=0,011). No group of age (>70 vs <70 years), Charlson index (3-7 vs 1-2), medication intake (5-10 vs 0-4), tumoral stage (III vs I-II), St Gallen guidelines (high-intermediate risk vs low risk) or hormonal receptors (negative vs positive) were associated to differences in OS. On multivariate analysis, none of all factors were associated with a worse outcome. **Conclusion:** This study confirms that age was not a predictive factor of poor overall survival in women older than 65 years with early breast cancer. Just ECOG and HER2 overexpression were related to poor overall survival (just in univariate analysis). Decision on treatment should not be taken just because of age.

**PB8 140 CYTOREDUCTIVE SURGERY COMBINED WITH PERITONEAL INTRAOPERATIVE HEATED CHEMOTHERAPY FOR MANAGEMENT OF PERITONEAL CARCINOMATOSIS IN 59 OLDER ADULTS OVER 65 YEARS.**

I. BEREDER\* (CHU NICE, Nice, France)

O. GUERIN(1), R. BOULAHSSASS(1), A. COUDERC(1), V. MAILLAND(1), P. PRAS(1), P. BROCKER(1), J. BEREDER(2) - (1) CHU Nice hopital de cimiez (NICE, France); (2) CHU Nice hopital de l'archet (NICE, France)

**Background:** peritoneal carcinomatosis (PC) has long been regarded as a terminal disease with short median survival. Recent success of new approach, combining surgery and intraperitoneal heated chemotherapy (HIPEC) are reported. But in the most studies patients over 65 years are excluded. We report our experience in this selected group of patients. **Methods:** a retrospective study was performed to evaluate toxicity and to identify the principal prognostic indicators with this combined treatment. All patients had cytoreductive surgery and HIPEC. This population of patients was compared with younger over the same period. We have excluded patient with frailty by comprehensive onco-geriatric assessment based upon cognitive, nutritional assessment and comorbidities. **Results:** the study included 291 procedures in 249 patients between 2000 and 2008. 64 procedures were performed in 59 older patients (group1) and 227 procedures in 190 younger patients (group2). The principal etiologies of PC in group1 were recurrent ovarian cancer (N=33), colorectal cancer (N=9), peritoneal mesothelioma (N=6), pseudomyxoma (N=9) and sarcomatosis (N=2). No death occurred in post operative course and the procedure related morbidity rate was 10%. 5 years overall and free survival rate were respectively 33% and 15%. Median overall survival was 44 months and median disease free survival was 13 months. There were no difference between group1 and 2 for survival. Independent prognostic factors for survival by multivariate analysis were extent of carcinomatosis, completeness of cytoreductive surgery and performance status. **Conclusions:** therapeutic approach combining cytoreductive surgery with HIPEC may achieve long-term survival in a selected group of patients with PC with acceptable mortality and morbidity. For elderly patients, this treatment could be performed in selected cases without frailty.

**PB8 141 IMPACT OF A GERIATRIC ASSESSMENT IN ONCOLOGY.A RETROSPECTIVE STUDY ABOUT 59 OLDER PATIENTS WITH CANCERS.**

R. BOULAHSSASS\* (Hopital de Cimez CHU de Nice, Nice, France)

O. GUERIN(1), I. BEREDER(1), E. CHAMOREY(2), V. MAILLAND(1), E. FRANCOIS(2), P. PRAS(1), A. COUDERC(1), P. BROCKER(1), A. THYSS(2) - (1) CHU de NICE Hopital de Cimiez (Nice, France); (2) Centre Antoine Lacassagne (Nice, France)

**Introduction:** The comprehensive geriatric assessment (CGA) is a useful tool to determinate different groups of patients with different frailty levels (classification of Balducci). The goal of this study is to determinate if a CGA help in making therapeutic decision in oncology. **Material and methods:** Data of 59 patients with cancer are analysed retrospectively including a CGA by a unique operator between June 2005 and November 2008. The patients selected didn't have a therapeutic's decision when the CGA was done. **Results:** the populaion have a mean age of 81 years ,66% of them have a digestive cancer and 20% a breast cancer.The decision of treatment is according with the conclusion of the CGA for 92% of the patients. After 6 months of follow up in the one, second and third group according to the Balducci classification ,the global survey was respectively 86,84% and 54%.For 80% of the patients the staff use the CGA or the grade of Balducci classification to justified the decision for the treatment.This classification is correlated significantly with the treatment of chemotherapy. (p=1,59 10-09\*\*).**Conclusion:** Our data

suggest that the CGA is a useful tool in clinical practice for helping the decision of cancer treatment in elderly patients

**PB8 142 THE CONSTRUCTION OF ILLNESS RELATED KNOWLEDGE VARIED AMONG PROSTATE CANCER PATIENTS AT THE BEGINNING OF RADIOTHERAPY**

S. RANKINEN\* (University of Turku, Turku, Finland)

S. SALANTERÄ(1), A. RYHÄNEN(2), K. TULUS(3), H. LEINO-KILPI(4) - (1) University of Turku, The Hospital District of Southwest Finland (Turku, Finland); (2) University of Turku, The Hospital District of Southwest Finland (Turku, Finland); (3) University of Turku (Turku, Finland); (4) University of Turku, The Hospital District of Southwest Finland (Turku, Finland)

Introduction Prostate cancer is one of the most frequent cancers in men and its prevalence increases among older population. The cancer diagnosis can be a traumatic experience to the patients because it has been traditionally considered as an illness which leads to the death. We should know better patients' thoughts about their illness, the learning strategies they use during their illness, their knowledge expectations and motivation to care themselves. The aim of the study was to find out how prostate cancer patients construct their illness related knowledge. Methods and material The data were collected by an interview and with two structured questionnaires, i.e. "Prostate Cancer Knowledge Test" developed by the researchers in our study group, and previously developed and validated "Learning Style Diagnostic" instrument (Romero-Simpson 1996). The patients (n=50, 26 of whom received hormonal therapy) were interviewed at the beginning of radiotherapy between August and December 2007. The structured questionnaires were analysed statistically. The interviews are analysed with the phenomenological psychological method. The analysis of the interviews is going on and results are available in April, 2009. Results The mean knowledge score was 13.10, standard deviation 3.36, range 3-21. Most of the patients knew that the doctor makes a decision on the patient's care together with a patient (92 %) and that prostate gland is men's sexual gland (88 %). Most of the patients did not know that hormonal therapy causes permanent impotence (72 %). Patients used different strategies in order to construct their knowledge. Some patients wanted to see the results of their actions, some patients wanted to watch what is going on, and some patients just wanted to understand things. Conclusion The nursing staff should have a possibility to evaluate prostate cancer patients' knowledge construction. This could help them to support patients more individually.

**PB8 143 TREATMENT DECISION-MAKING BY OLDER INDIVIDUALS WITH CANCER: ANALYSIS OF THE CONCEPT OF 'PATIENT DECISION-MAKING'**

F. STROHSCHEN\* (McGill University, Montreal, Canada)

C. G. LOISELLE(1), F. A. CARNEVALE(2), H. BERGMAN(3) - (1) McGill University School of Nursing, Jewish General Hospital (Canada); (2) McGill University School of Nursing (Canada); (3) McGill University Departments of Geriatric Medicine, Medicine, Family Medicine and Oncology, Jewish General Hospital (Canada)

Introduction: Treatment-related decision-making is often a concern for older individuals with cancer. Variations in health and functional status among the elderly and physiologic aspects of aging affecting cancer treatment present unique challenges. Treatment decisions represent a difficult balance between quality and quantity of life. A better understanding of older individuals' decision-making processes and of factors influencing decision-making is necessary to optimally support this group of patients and their families. This is an emergent area of research and it is often lacking theoretical foundations to guide inquiry and intervention. Purpose: This paper offers an in-depth analysis of 'patient decision-making' in the context of treatment-related decision-making among elderly individuals with cancer, according to the criteria established by Morse and her colleagues. Methods: A computer-generated search of scholarly works published in peer-reviewed journals was done to find conceptual or theoretical papers whose specific focus was 'patient decision-making'. A second search was performed for treatment-related decision-making from the perspective of elderly cancer patients and their families. Results: Elements of the concept of 'patient decision-making' found to be central to the experience of older individuals with cancer include: role of the family, interaction between patient, family and health care provider, changes in decision-making over time, and post decisional appraisal. Certain assumptions inherent in the concept may not be consistent with the experience of elderly individuals with cancer. An individual's decision may not be 'rational' in the way assumed by health care professionals and patients may not perceive a choice where health care professionals assume a choice has been presented. Factors influencing decision-making related to patient, family, health care practitioners, health care interaction, system, environment, and decision problem itself are identified. Conclusion: With attention to inherent assumptions, the concept of 'patient decision-making' can provide a useful foundation for understanding and investigating decision-making by elderly cancer patients.

**PB8 144 AN UNEXPLAINED FEVER**

M. EMILIE\* (CHU Limoges, Limoges, France)

E. MATONNAT (1), M. PICAT(1), M. ARRESTIER(1), T. DANTOINE(1) - (1)CHU Limoges, (Limoges, France)

Fever is observed at approximately 60% of the patients having a cancer. The difficulty is to differentiate the secondary fever with the syndrome paraneoplastic, other causes of fever, the infection and the side effects with the treatments. Test with non sterooidal anti-inflammatory drugs described by authors would allow making this difference. 86 year old man hospitalized for falls in a context of deterioration of the state general, associated a recent hyperthermia 38, 5°C. Its antecedents include sideroblastic anemia, a narrow lumbar channel not operated, cholecystectomy. Its treatment includes Oxazepam, Pantoprazole, Citalopram, Aceprometazine, Diclofenac. For a few months have appeared an asthenia, a dyspnea of effort and a weakness of the lower limbs explaining the recent falls. The examination: paler, hyperthermia 39°C, without point of infectious call private clinic. Results: Biology finds an inflammatory syndrome with CRP 113mg/l, hyperleucocytosis 12300 Giga/L polymuclear neutrophils thus that one weakens normochrome macrocytic for which a myelogramme eliminates a transformation from the myelodysplasia. Bacteriological taking away: blood culture, ECBU, search for BAAR, lumbar puncture are negative. Radiological examinations: do not find a pulmonary infectious hearth, abdominal ultrasonography is without characteristics and cardiac echography eliminates an endocarditis.TDM thoraco-abdomino-pelvic which will reveal a suspect heterogeneous lesion on the level of segments VII and VIII of the liver. The hepatic biopsy will conclude with one hepatic metastasis little differentiated from an adenocarcinoma, digestive origin to the exclusion of the colonist and rectum. The primitive neoplasia will remain unknown. This clinical case evokes the difficulty among old patients polypharmacologic with symptomatology varied to make the diagnosis of neoplasia. It is important to seek among these patients with a persistent inflammatory syndrome associated a degradation of the state general and the appearance of a dependence for the basal and instrumental activities of the everyday life to seek one neoplasia.

**PB8 145 IMPACT OF AN ONCOGERIATRIC PROGRAM IN A MEDICAL ONCOLOGY UNIT**

D. GOMEZ ABREO\* (Centre Hospitalier Lyon Sud, Pierre Benite, France)

M. BONNEFOY(1), G. FREYER(2), V. TRILLET-LENOIR(2), C. FALANDRY(2) - (1) Centre Hospitalier Lyon Sud (PIERRE BENITE, France); (2) Centre Hospitalier Lyon Sud (Pierre Benite, France)

Introduction: Oncogeriatric practice tends to get more structured. In 2005, International Society of Geriatric Oncology (SIOG) "strongly recommended" a "Comprehensive Geriatric Assessment-based approach"..."in elderly patients...". In the same time, the french national cancer institute (INCA) financed 15 pilot units to coordinate and implement oncogeriatrics (UPCOG) on the french territory. We investigated, on a registry basis, the local impact of this implementation on everyday practice in our medical oncology unit. Patients and methods: three distinct and successive cohorts of elderly patients (>70), identified respectively as "2005", "2006" and "2007" were defined on a registry basis using the date of the first medical visit in the unit. Patient characteristics, extent of geriatric evaluation were analyzed and compared to international guidelines. Results : Respectively 25, 44 and 62 patients were evaluated during 2005, 2006 and 2007. Mean and median ages were respectively 77 and 76 in the whole group (extremes 70-95), with a trend towards an increase from 2005 (mean:75, median:75, p=0,007) to 2007 (respectively 79, 78,5, p=0,11). In 2007, a comprehensive geriatric assessment was recommended at an institutional level and effectively done in respectively 16%, 27% and 67% for 2005, 2006 and 2007 cohorts. Multidimensional geriatric assessment was realized in respectively 28%, 19% and 21% of the patients. Vulnerable (Balducci 2) and frail (Balducci 3) patients represented respectively 41% and 8% of the patients treated between 2005 and 2007. During this time, patients with a poor performance status (PS=3, total 13%) tended to increase, from respectively 0% in 2005 to 23% in 2007 (p=0,0018). Conclusions : Short term consequences of oncogeriatrics structuration in clinical practice in our institution are the followings : (1) increase in total number of new visits (2) compliance for international recommandations in more than two thirds of the patients (3) Trends towards recruitment of older people, whose geriatric covariates are more frequently deteriorated.

**PB8 146 EFFECTS OF DIETARY CONJUGATED LINOLEIC ACID ISOMER ON HEPATIC ANTIOXIDANT ENZYME SYSTEM IN 1,2-DIMETHYLHYDRAZINE-TREATED RATS**

Y. KIM\* (HALLYM COLLEGE, CHUNCHEON, Republic of Korea)

The study was designed to observe the effect of conjugated linoleic acid(CLA) on hepatic level of malondialdehyde(MDA) and tocopherol, and antioxidant enzyme(superoxide dismutase, glutathione peroxidase, glutathione-S- transferase, catalase) in rats. Male Sprague Dawley rats aged 7 week were divided into 4 groups. Control group was beef tallow(BT) and experimental groups were subdivided into 3 groups depending on CLA isomer supplement, i.e. BT, CLA(M), CLA(C), CLA(T). All rats were fed experimental diet containing total dietary fat at 14.5%(w/w) including CLA at 0.8% level for 14weeks. Tocopherol level was significantly lower in rats fed CLA than BT. CLA had shown significant decrease in hepatic level of glutathione-S-transferase activities in rats fed BT. In microsomal lipid in rat fed CLA(C), the level of c9,t11 fatty acid was significantly increased than rat fed BT. In microsomal lipid in rat fed CLA, the level of other CLA isomers fatty acid was significantly increased than rat fed BT. MDA were negatively correlated with tocopherol, other cla fatty acid and n3 fatty acid. Activities of GST in

hepatic cytosolic fraction were positively correlated with tocopherol and c9,t11 cla fatty acid. In conclusion, CLA isomer supplementation could be reduced the level of total tocopherol for the reason of increased MDA. In CLA isomer supplementation, tocopherol was used for eliminated MDA and GST was suppressed. These results might suggested that CLA isomer supplementation could act as pro-oxidant rather than antioxidant. And in hepatic microsomal membrane, c9,t11 CLA isomer fatty acid was incorporated with high level. However, t10,c12 CLA isomer fatty acid was incorporated with a trace of level.

**PB8 147 THE NURSING ROLES IN ENHANCING THE CERVICAL CANCER SCREENING PARTICIPATION AMONG THE ELDERLY WOMEN IN HONG KONG.**  
A. WONG\* (The Open University of Hong Kong, Kowloon, Hong Kong)

Introduction: Cervical cancer was the fifth most common cancer in females in Hong Kong in 2006. According to the Hong Kong Cancer Registry, there were 459 new cases of cervical cancer, accounting for 4.2% of all new cancer cases in females. Both incidence rate and mortality rate generally increase with age with a peak at the age group of 65-69 and the group of 85 and above, respectively. Although screening for cervical cancer reduces the risk of developing the disease, the coverage of screening in women aged 65 years or above is less than 10% in Hong Kong. Most of them did not adhere to regular screening and many of them had never had the opportunity to have it done before. Methods and materials: Literature review shows that local public elderly health centres where health assessment is conducted for elderly women aged 65 and above, about 30% eligible for Pap smear screening declined. Acceptance of Pap smear examination is affected by the level of knowledge about cervical cancer and Pap smear screening, perceived pain or fear of pain during the test and the gender of health care professionals. Results: Female nurses who are trained as the accredited smear takers in Hong Kong play an important role in enhancing the screening uptake rates of the elderly. Researches reveal that the related counseling component in the training and screening program was found deficient. A study is now being carried out to investigate whether positive attitudes towards cervical cancer screening could be nurtured among elderly women with increased counseling by nurses. Conclusion: Nurses play the roles of educator, facilitator, advocate, carer and smear takers in the cervical cancer screening program. It is reasonable to hope that with a better educated elderly population and increased health awareness, the screening uptake rate will be improved and the prevalence of cervical cancer among them will be minimized.

**PB8 148 THE 6-MIN WALK TEST AND BODY COMPOSITION IN ELDERLY COPD PATIENTS WITH DEPRESSIVE SYMPTOMS**

A. DORNELAS DE ANDRADE\* (Universidade federal de Pernambuco, Jaboatão dos Guararapes, Brazil)  
P. MARINHO(1), J. CRUZ(1), A. GAMA(1), I. BEZERRA(1), D. LOS(1), R. SOUZA(1), M. SANTANA(1), R. GUERRA(2) - (1) Departamento de Fisioterapia - Universidade Federal de Pernambuco (Recife, Brazil); (2) Departamento de Fisioterapia - Universidade Federal do Rio Grande do Norte (Natal, Brazil)

Depressive symptoms compromise the functional capacity of patients with chronic obstructive pulmonary disease possibly due to alterations in body composition. It is not known if encouragement during walk tests influences this performance. We assessed the level of obstruction, body mass index, fat-free mass, fat mass and fat-free and fat mass indices, 6-minute walk test, number of comorbidities and the presence of depressive symptoms in 40 patients with stable chronic obstructive pulmonary disease. Depressive symptoms occurred in 22.5% of the men. Muscle depletion began to occur at the mild obstruction level in the asymptomatic individuals, and at the moderate level in those with depression. The distance walked was lower than expected and walk time with encouragement was longer in the asymptomatic group. Body mass index was correlated with walk time in the asymptomatic group, which walked with verbal encouragement. Encouragement did not seem to be decisive for performance on the test. Depletion occurred at the onset of the disease and none of the patients were medicated for depressive symptoms.

**PB8 149 SERUM LEVELS OF LOW DENSITY LIPOPROTEIN CHOLESTEROL IN PATIENTS ADMITTED TO MID STAY GERIATRIC HOSPITAL**

J. JAFARBAY\* (Les Abondances, Boulogne Billancourt, France)  
H. ANGLARET(2), E. LAMAS(1), Y. DOUDIBA(1), J. ARVIEU(1) - (1) Centre de Gérontologie (Boulogne Billancourt, France); (2) Hopital Saint Cloud (Boulogne Billancourt, France)

Introduction: The AFSSAPS recommended as target a low-density lipoprotein cholesterol (LDL-C) level of <1 gr/l (2.6 m mol/l) for patients with high risk for cardiovascular events. Reducing LDL-C levels lowers the risk of consequences of cardiovascular disease. Objective: The goal of this study was to evaluate the profile of LDL-C in patients with high risk for cardiovascular events. Methods: During 18 months serum levels of LDL-C were measured in fasting samples of patients admitted to mid stay geriatric hospital and with risk for cardiovascular events. Patients with thyroid, renal deficiency and digestive cancer were excluded. In our study we did not differentiate patients receiving lipid lowering therapy. Results: 220 patients were measured for serum LDL-C (140 women, 80 men) aged 70 years and older. 90 patients had very high risk factors, or were admitted after

acute events (myocardial infarction, acute heart failure, cerebral stroke). 44% (44/90) of these patients had higher levels of LDL-C than recommended. 50% of them (22/44) or 24% of patients with very high risk factors and high levels of LDL-C were hospitalized for acute events (myocardial infarction, stroke) compared to 0.06% patients with lower levels. 27% of patients with two risk factors had high LDL-C (>1.6 gr/l). Conclusion: Results from this study showed high incidence of acute cardio -cerebral events in elderly with high risk factors and LDL-C levels. It is important for health care professionals to address the lipid lowering therapy in the elderly at hospital discharge and attempt to achieve the recommended LDL-C targets during follow-up. AFSSAPS : agence Française de sécurité sanitaire des produits de santé.

**PB8 150 ANTIANGINAL EFFICACY OF THE SELECTIVE IF CURRENT INHIBITOR IVABRADINE IN ELDERLY PATIENTS WITH STABLE ANGINA**

O. HANON\* (Hopital BROCA- LA ROCHEFOUCAULT, Paris, France)  
J. EMERIAU(1), G. BERRUT(2), M. PACCALIN(3) - (1) Hopital Xavier Arnozan (Pessac, France); (2) Centre Hospitalier Bellier (Nantes, France); (3) Chru la Miletie (Poitiers, France)

Background: Ivabradine, a selective inhibitor of the pacemaker If current, is a novel heart rate-reducing agent with proven anti-ischemic and antianginal efficacy in stable angina. Since the prevalence of stable angina increases sharply with age, it was of interest to confirm the efficacy and tolerability of ivabradine in elderly patients. Method: Data on frequency of angina attacks, short-acting nitrate (SAN) consumption, and heart rate (HR) were pooled from five randomized trials in patients with stable angina receiving ivabradine 5, 7.5, or 10 mg bid for 3 or 4 months. The whole population of 2425 patients was subdivided for analysis into elderly (aged 65 and over; n=838) and very elderly (aged 75 and over; n=91) subpopulations. Results: Ivabradine reduced HR similarly in elderly (-11.6±11.3 bpm) and very elderly (-12.0±11.1 bpm) patients. Angina attack frequency and SAN consumption decreased substantially by almost 60% (change in number of angina attacks from baseline was -1.7±3.6 in elderly, and -1.5±4.1 in very elderly population). These values are similar to those for the whole population. Only 1.4% of patients withdrew due to sinus bradycardia in the whole ivabradine group. This percentage was even smaller in the elderly (1.2%) and 0% in very elderly. There were no withdrawal of treatment due to AV blockade in both elderly subpopulations. Conclusion: Antianginal efficacy and tolerability of ivabradine in stable angina are maintained in elderly, even in those aged 75 and over. Since coronary artery disease increases in prevalence with age and is becoming a major public health concern in the elderly, these results may have important clinical implications.

**PB8 151 HEAD ROTATION INDUCED HYPOTENSION IS COMMON IN OLDER PERSONS WHO FALL.**

Y. SCHOON\* (University Medical Centre St. Radboud, Nijmegen, The Netherlands)  
S. RONGEN(1), A. BOS(1), J. CLAASSEN(1) - (1) University Medical Centre St Radboud (Nijmegen, The Netherlands)

INTRODUCTION: Carotid sinus hypersensitivity (CSH) is frequently found in older fallers. It is generally accepted that triggers such as head rotation cause hypotensive episodes in patients with CSH, and patients are advised to avoid such triggers. However, the actual influence of these triggers on blood pressure (BP) and heart rate in patients with CSH has never been published. We examined whether head rotation induces hypotension (HRIH) and if it is related to the presence of CSH. METHODS AND MATERIALS: Cross-sectional study in older persons visiting the fall and syncope clinic of the university hospital Nijmegen. All patients underwent carotid sinus massage (CSM) and head rotation test (HRT). Beat-to-beat BP was measured with the photoplethysmographic method (Finometer). CSH was defined as an asystole of at least 3 seconds and/or a drop in systolic BP (SBP) of at least 50 mmHg, in response to CSM. A positive HRT was defined as a drop in SBP of at least 20 mmHg in response to head rotation to the right or left side or hyperextension. RESULTS: In n=105 patients (mean age 79 years) HRIH was found in 41 patients (39%). Patient with HRIH were 3 times more likely to have CSH ( $p = 0.004$ ). In 58% of all patients with CSH (n=61) head rotation induced hypotensive episodes. The mean decrease in SBP during HRIH was 32.9 mmHg ( $SD \pm 12.7$ ); this was similar for the different types of rotation and was similar for patients who did and did not fulfill criteria for CSH. Both CSH and HRIH did not cause subjective symptoms in 83%. CONCLUSION: Head rotation is an important cause of hypotension in older persons who fall. In 50 % of patients with CSH, head rotation induced hypotension, supporting the instruction to avoid such triggers.

**PB8 152 OLDER PATIENTS WITH ST-ELEVATION MYOCARDIAL INFARCTION BENEFIT FROM PRIMARY PCI WITHIN A MYOCARDIAL INFARCTION NETWORK**

A. BRAUN\* (Bethanien Hospital- Geriatrics Centre at the University of Heidelberg, Heidelberg, Germany)  
A. RILLIG(2), U. MEYERFELDT(2), W. JUNG(2), P. OSTER(1), R. BIRKEMEYER(2) - (1) Bethanien Hospital (Heidelberg, Germany); (2) Schwarzwald- Baar- Hospital (Villingen-Schwenningen, Germany)

**Introduction:** Primary PCI (PPCI) is first-line therapy for patients with acute ST-elevation myocardial infarction (STEMI). Aim of this prospective study is to investigate incidence of acute complications in older patients with STEMI after PPCI. Patients and methods: All patients with acute ST-elevation myocardial infarction transferred to our institution for PPCI (n=400) between 1/2005 and 10/2007. Patients aged ≥ 70 years (group 1), n=125, 6; mean age 77.5±4.9 years are compared to younger patients aged<70y (group 2). Results: Older patients less frequently showed hyperlipoproteinemia (group 1 vs. group 2: 43.2% vs. 55.6, p=0.021) and smoking habits (15.2% vs. 48.4%, p<0.001). However, arterial hypertension (72.8% vs 52.7, p<0.001), diabetes mellitus (26.4% vs 16.1%, p=0.015), coronary artery disease (20% vs 10.2%, p=0.007), previous myocardial infarction (15.2% vs 7.6%, p=0.019), and left main stem involvement or 3-vessel-disease (40.8% vs 21.8%, p<0.001) was more frequent in older patients. In 96% (n=120) of older patients PPCI was successful. Between groups the success-rate of PPCI and TIMI-flows did not differ significantly as well as major- (4% vs 1.8%, p=0.195) or minor- bleedings (8% vs 5.1%, p=0.256). However, older patients received stent implantation (91.2% vs 96.7%, p=0.019), drug eluting stents (38.4% vs 71.3%, p<0.001), and abciximab (69.6% vs 92%, p<0.001) less frequently. In-hospital mortality of older patients was low (10.4%). Door-to-balloon-time did not differ (32.5±1.3 min vs. 29.9±0.9 min, p=0.1). However, in the older group pain-to-balloon (257.8±13.6 min vs 211.6±7.45 min), pain-to-first-medical-contact (147.5±13.7 min vs 117.4±7.5 min, p=0.038) and first-medical-contact-to-balloon (104.9±3.7 min vs 95.4±2.2 min, p=0.021) times were longer. Summary: In this infarction network primary PCI is an effective and save treatment strategy for eligible older patients with acute ST-elevation myocardial infarction.

**PB8 153 STROKES AND PRESSURE SORE IN A GERIATRIC SUB ACUTE CARE UNIT**  
 S. HAULON\* (GHU Broca - La Collégiale - La Rochefoucauld (APHP), Paris, France)  
 V. GAUTIER(1), A. SAUTEREAU(1), F. BLOCH(1), L. JOFFREDO(1),  
 T. JOUCDAR(1), M. MANKOUR(1), G. ABITBOL(1), N. CHARASZ(1) - (1) GHU Broca - La Collégiale - La Rochefoucauld (APHP) (Paris, France)

**Introduction :** In France, strokes represent the 3rd cause of mortality, after cardiovascular pathology and cancers, with an annual incidence of 125.000 new cases. Loss of mobility constitutes a risk factor of pressure sore and stroke represents the first cause of dependence. Our objective was to analyze the presence of pressure sore of patients hospitalized in a geriatric sub acute care unit after a stroke. Materials and methods: From January 2006 to June 2008 we retrospectively collected the presence of pressure sore for all the patients with stroke in our geriatric sub acute care unit . Results: 169 patients were included (47 women and 122 men) with a mean age of 84.5±6.9 years, a mean hospitalization duration of 52 ± 26days and a early death rate of 15.4%. After rehabilitation, 31.4% of the subjects were autonomous for walking, 20.7% needs help for walking and 47.9% had lost totally their autonomy. 38 patients had a wound with a mean number of wound of 2 ± 2.1 per patient. 17.7% of the population had one or more pressure sore. 9 elderly subjects developed their pressure sore in the unit. 9 pressures sores were on the heel and 16 on the sacrum. 13.3% of stage I, 43.3% of stage II, 26.7% of stage III and 16.7% of stage IV. The patients with total hemiplegia (41.4%) had significantly more often a pressure sore (p=0.03), at those who lost totally their autonomy (p<0.0001). The elderly subjects with pressure sore had an albuminemia significantly lower than those without pressure sore (p=0.0001). Conclusion: We find more pressure sore among patients presenting a major loss of autonomy or severe hemiplegia. This study confirm that the loss of autonomy after a stroke constitutes one of the well-known supporting factors of pressure sore.

**PB8 154 ACEBUTOLOL, A DELAYED-ACTION BOMBER**  
 S. MARILIER\* (University hospital of Dijon, Dijon , France)  
 M. EMMANUEL(1), D. SOFIA(1), M. ISABELLE(1), M. PATRICK(1), P. PIERRE(1) - (1) Internal medicine and geriatrics Centre de Champmaillot (Dijon, France)

Iatrogenic diseases should be more often suspected despite the difficulty to diagnose : this case report is an example. A 75-year-old woman was hospitalized for a persistent pneumopathy of the left upper lobe despite amoxicilline-clavulanic acid treatment. Her medical history consisted of breast cancer, cardiac arrhythmia treated by acebutolol for ten years, primary tuberculosis of the lungs, iodine allergy. clinical exam showed an asthenia, a dry cough, a left basithoracic pain and a well- endured dyspnea and crepitations of the left upper pulmonary lobar., 3Initial biological screening showed hyperleucocytosis (13000/mm<sup>3</sup> ), and inflammatory syndrome [C-reactive3thrombocytosis (742000/mm protein (CRP) 129 mg/l, erythrocyte sedimentation rate 91 mm/h]. The NT-proBNP rate was 134 pg/ml (normal < 300). The spit bacteriological analysis was normal and did not found pneumococcus or BK. Blood culture did not found any bacteria. Mycoplasma and chlamydiae serologies, BK skin test were negative. The x-ray showed an alveolar condensation in the left upper lobe. Despite different antibiotics, there was no clinical or biological improvement. Moreover, a new site of right pulmonary crepitations appeared. A CT scan showed a left alveolar condensation. Pulmonary embolism was dismissed. The bronchoscopy and broncho-alveolar washing did not found any abnormality. In front of no etiological diagnosis and because of the patient's treatment, an iatrogenic pneumopathy due to acebutolol was suspected. Acebutolol was substituted by verapamil and a corticotherapy (60mg per day) was started. A rapid clinical and biological improvement was noted with decrease of dyspnea and C reactive protein rate (19 mg/l) in three day. The

iatrogenic pneumopathy is often an exclusion diagnosis after large investigations. Regarding acebutolol, interstitial pneumopathy and Bronchiolitis Obliterans Organizing Pneumonia (BOOP) are reported. This case and his good evolution with corticotherapy speak in favour of a delayed acebutolol iatrogenic pulmonary effect .

**PB8 155 VITAMIN K ANTAGONISTS OVERDOSE PREDICTIVE FACTORS IN ELDERLY PATIENTS**

C. DJIAN\* (Hôpital Pierre Garraud, Lyon, France)  
 G. GIROUIN(1), A. GUILLERMET(1), M. DUCHER(2), L. BOURGUIGNON(1) - (1) Hôpices Civils de Lyon, Hôpital Pierre Garraud (Lyon, France); (2) Hôpices Civils de Lyon, Hôpital Antoine Charial (Francheville, France)

**Introduction:** Vitamin K Antagonists (VKA) are widely used anticoagulant drugs, but show low therapeutic index and significant interindividual variability. As many interactions are observed with these drugs and with the high prevalence of polypharmacy in geriatric patients, elderly are particularly at risk. Our objective was to identify, in hospitalized elderly patients, the predictive factors of VKA overdoses. Methods and materials: A retrospective analysis was undertaken in Pierre Garraud Hospital (Hôpices Civils de Lyon), including all patients treated with a VKA during one year. Anthropometric, biological, clinical information and drug-drug interactions were collected. Moderate overdose (INR>5) or high severity overdose (INR>7) occurrence was recorded. Therefore, a multivariate analysis was conducted using SPSS software in order to identify links between supra-therapeutic INR (variable to explain) occurrence and information recorded for each patient. A logistic model was chosen, and explanatory variables were integrated using a step-wise methodology. Results: 221 patients were included in the study. The total number of supra-therapeutic INR was 52 (with 20 patients with INR > 7) representing 23.5% of considered patients. The final model retains 26 variables and has 75% of sensitivity and 91% of specificity. Model R-Squared is calculated at 0.43 and Area Under ROC Curve is 0.9. Liver and renal function markers, and amiodarone or valproic acid concomitant administration also seems to be significantly linked with VKA overdose occurrence. Conclusion: The model shows good predictive capabilities. The key variables selection has led to a precise identification of patients subgroups subject to considerable overdose risk. A complementary analysis by a Bayesian neural network enables us to assess the consequences of changes in the characteristics of our population about the overdose risk.

**PB8 156 STROKE AND NUTRITIONAL STATUS IN A GERIATRIC SUB ACUTE CARE UNIT**

A. SAUTEREAU\* (GHU Broca - La Collégiale - La Rochefoucauld (APHP), Paris, France)  
 V. GAUTIER(1), F. BLOCH(1), S. HAULON(1), L. JOFFREDO(1), T. JOUCDAR(1), M. MANKOUR(1), G. ABITBOL(1), N. CHARASZ(1) - (1) GHU Broca - La Collégiale - La Rochefoucauld (APHP) (Paris, France)

**Introduction:** In France, strokes represent the 3rd cause of mortality, after cardiovascular pathology and cancers, with an annual incidence of 125.000 new cases. Because dysphasia and swallowing disorders are frequent after a stroke, it constitute a risk factor of malnutrition. Our objective was to analyze the nutritional status of patients hospitalized in a geriatric sub acute care unit after a stroke. Materials and methods: From January 2006 to June 2008 we collected the serum albumin dosage for all the patients with stroke in our geriatric sub acute care unit . Results: 169 patients were included (47 women and 122 men) with a mean age of 84.5±6.9 years, a mean hospitalization duration of 52 ± 26days and a early death rate of 15.4%. 43.8% of the elderly subjects had swallowing disorders at the commencement of the hospitalization, and 24.8% at the end. 3% of the patients had gastrostomy and 13.6% had naso-gastric probe at the commencement of the hospitalization, and respectively 4.7% and 3.5% at the end of the hospitalization. Gastrostomy (p=0.03) and naso-gastric probe (p=0.01) were significantly more often found for patients with swallowing disorders. The average albuminemia at the commencement of the hospitalization was 32.8±4.0 g/l and 33.2±4.3 g/l at the end of the hospitalization. Albuminemia was significantly lower for patients with swallowing disorders (p<0.001), with gastrostomy (p=0.02), or with naso-gastric probe (p=0.02). The patients with a total loss autonomy (p<0.0001) and those with complete hemiplegia (p=0.03) presented more often a malnutrition. It was also found that subjects with pressure sore had a significantly lower albuminemia level than those without (p=0.0001). Conclusion: The stroke patients presented a risk of malnutrition and this more especially as the loss of autonomy was marked.

**PB8 157 CENTRAL ANGIOTENSIN II-MEDIATED HYPERTENSIVE RESPONSES TO RESTRAINT STRESS ARE DIMINISHED WITH AGE**

B. ERDOS\* (University of Florida, Gainesville, United States)  
 M. WOODS(1), B. BASGUT(1), I. CUDYKIER(1), M. WHIDDEN(1), R. TAWIL(1), A. CARDOUNEL(2), P. SCARPACE(1), N. TUMER(1) - (1) University of Florida, Dept of Pharmacology and Therapeutics (Gainesville, United States of America); (2) University

of Florida, Dept of Physiology and Functional Genomics (Gainesville, United States of America)

Introduction Central angiotensin II (Ang II) and NADPH-oxidase-dependent superoxide production play a key role in the regulation of stress-induced BP elevations. However, the effect of age on cardiovascular stress responses and central AngII signaling are not fully understood. Therefore, we tested the effects of centrally infused losartan, an Ang II type-1 receptor (AT1) inhibitor on resting BP, heart rate (HR) and spontaneous baroreflex sensitivity (sBRS), as well as on restraint stress-induced BP and HR responses in young and old rats. Methods and Materials BP and HR were measured using radiotelemetry in 5 month-old (n=7) and 27 month-old (n=6) male F344BN rats. Losartan (15 µg/µL/hour) or vehicle was infused intracerebroventricularly for 3 days with osmotic minipumps. Restraint stress was induced using acrylic cylinder restrainers for 20 min. Results Old rats had significantly higher resting BP (104.1±1.0 mmHg), lower HR (311±4 min<sup>-1</sup>) and lower sBRS (-0.062±0.048 ms/mmHg) compared with young (95.9±1.2 mmHg; 335±4 min<sup>-1</sup>; 0.141±0.028 ms/mmHg, p<0.05). Losartan had no effect on resting BP and HR in either the young or old rats; however, it significantly reduced sBRS in young animals, while it had no effect on sBRS in old rats. Restraint stress induced rapid BP and HR increases in both young and old; however, changes were significantly reduced in the old rats. Losartan significantly inhibited stress-induced BP increases in young rats, while it had no effect on HR responses. In contrast, in the old rats, both BP and HR responses remained unaffected by losartan. In addition, hypothalamic protein expressions of AT1 receptor, NADPH-oxidase p47phox subunit, CuZn-superoxide dismutase and catalase decreased significantly with age, while oxidative stress, as indicated by ascorbate radical levels, increased. Conclusion Resting BP increases with age, but hypertensive responses to stress diminish with age due to a decline in AngII-mediated central mechanisms.

**PB8 158 PERCUTANEOUS ENDOSCOPIC GASTROSTOMY (PEG) MORTALITY IN STROKE PATIENTS.**

R. WILLIAMS\* (St Peters Hospital, Chertsey, Chertsey, Surrey, United Kingdom)  
M. STOREY(1), S. ISACC(1), B. MANDAL(1) - (1) St Peters Hospital, Care of Elderly Department (KT16OPZ, United Kingdom)

INTRODUCTION: Percutaneous endoscopic gastrostomy is (PEG) is a well recognised mode of feeding in patients with swallowing difficulties. Limited evidence is known on long term mortality in stroke patients feeding via PEG. In this study we looked into the long term survival of stroke patients following PEG insertion and indicators which may predict outcome. METHODS AND MATERIALS: Patient data was collected on all PEG insertions from 2004, 2007 and 2008 in a District General Hospital. 3 and 6 month mortality data were obtained from General practitioners record, care homes and family. Risk stratification tool and awareness of poor prognostic factors were made aware amongst physicians in 2004, while SPH set-up a stroke unit in 2007. RESULTS: A total of 90 patients (26, 42, and 22 in 2004, 2007 and 2008 respectively) in three years were included. Three and six month's mortality for patients who had PEG following stroke were 44% and 47.5% respectively. Of the stroke patients cumulative 3 and 6 month mortalities were calculated in 2004, 2007 and 2008. Long term mortality decreased from 44% to 35.7%. The factors which contributed towards decrease in mortality were lower age and a multidisciplinary team decision for PEG in a stroke unit. CONCLUSION: In our study we found – 1. 52.5% of patients who had a PEG following a stroke were alive after six months. 2. Lower age and PEG decision by a multidisciplinary team in a stroke unit were main contributory factors for better outcome. 3. Further studies are needed to assess other contributing factors influencing long term survival in stroke patients with PEG feeding.

**PB8 159 CARDIAC REMOTE TELEMETRY IN A GERIATRIC ACUTE CARE UNIT: A DIAGNOSTIC TOOL.**

M. MEURICE\* (Saint Augustin Hospital Group, MALESTROIT, France)  
P. LE DEUN(1), P. DA COL(1), L. GARNIER(2), F. PINOCHE(1) - (1) Saint Augustin hospital group (Malestroit, France); (2) Alphonse Guerin hospital (Ploermel, France)

INTRODUCTION : Cardiac Remote Telemetry (CRT) is a continuous cardiac rhythm recording system transmitted by radio waves to a PC. Such a system was installed in a geriatric acute care unit. METHODS AND MATERIALS : 277 patients were admitted under CRT from January 2007 to December 2008. Indications and cardiac rhythm and conduction troubles diagnosed by the CRT were analysed. RESULTS : The mean age +/- standard deviation was 84.2 +/- 5.9 years. Most frequent indications were falls with presumption of faintness (58.5%), arrhythmias (19.1%), cerebral infarction (14.1%), dizziness (4%). Rhythm or conduction troubles were found in 151 patients (54.5%). In 134 cases (48.4%), it led to cardiologist consultation, and in 120 cases (43.3%) to changes in therapeutics. 5 patients (1.8%) were transferred to an intensive care unit, and in 11 other cases (4%) pace-makers were implanted. CONCLUSION: In accordance with the good practice in French geriatric acute care units, CRT has to be restricted to being a diagnostic or treatment management tool. Patients considered to be at high risk of life threatening dysrhythmia mustn't undergo CRT in such a unit. Patients were admitted to CRT on four conditions: 1 indication to cardiac rhythm recording, 2 necessity to be hospitalized, 3 no early indication to intensive care unit, and 4 intention to take abnormalities into account. In our experience CRT is non invasive and is easily tolerated. It appears to be a useful tool in

elderly, which often associates polyopathy, atypical clinical presentation, social loneliness and dependence, and therefore requires a single place for care and second line complementary examinations. This survey shows that CRT is efficient in the management of number of patients in geriatric acute care units.

**PB8 160 LATE ONSET MYASTHENIA GRAVIS. A DISEASE TO TAKE INTO ACCOUNT. A CASE REPORT.**

J. BLAZQUEZ\* (TOLEDO HOSPITAL, TOLEDO, Spain)  
J. GIL MORENO(1), G. MARTINON TORRES(1), N. PARRAS GARCIA DE LEON(1), N. FERNANDEZ MARTINEZ(1) - (1) Ciudad real hospital (Ciudad real , Spain)

INTRODUCTION Myasthenia gravis (MG) is an autoimmune disorder of the neuromuscular junction that causes muscle weakness and fatigue. MG mainly affects young adults and is uncommon after the age of 50 years. The disease occurs, for the most part, in the third decade, and is rare before the age of 15, or after 70. In approximately 60 per cent of the patients the disease develops between the ages of 20 and 40. The prevalence of myasthenia gravis (MG) among middle-aged and older patients has increased. It is often misdiagnosed. METHODS AND MATERIALS We report a case of an 87-year-old white female at the Acute Geriatric Unit in Ciudad Real General Hospital. Past history reveals hypertension, multinodular goiter, hip fracture and ischemic stroke three months earlier. As consequence of the stroke the patient experienced dysphagia. RESULTS The patient referred weakness and fatigue, palpebral ptosis present since two months ago and she continued with dysphagia. MRI showed small periventricular lacunar infarcts. Thoracic CT revealed no thymoma. Acetylcholine receptor antibody test was positive: 94.44nmol/L. Electromyogram detected abnormal and severe postsynaptic neuromuscular transmission. This case portrays the misdiagnosis of an ischemic stroke that was made at the initial presentation three months earlier. Treatment with corticosteroids and anticholinesterase drugs (piridostigmine) was initiated with a significant and maintained improvement. CONCLUSION Bulbar signs as dysphagia might be misdiagnosis as ischemic stroke. Myasthenia gravis mimicking stroke in elderly patients. The prevalence of MG among older patients is increasing and we have to take into account in the diagnosis.

**PB8 161 MECHANISMS OF AGE-RELATED CHANGES OF OXYGEN-TRANSPORTATION FUNCTION OF BLOOD**

O. KORKUSHKO\* (Institute of Gerontology of the AMS of Ukraine , Kiev, Ukraine)  
L. IVANOV(1), A. PISARUK (2), N. CHEBOTAREV(3) - (1) Institute of Gerontology of the AMS of Ukraine (Kiev, Ukraine); (2) Institute of Gerontology of the AMS of Ukraine (Kiev, Ukraine); (3) Institute of Gerontology (Kiev, Ukraine)

Introduction. The morphological and functional changes, developing with ageing, lead to the development of hypoxia, which nowadays is considered now not only characteristic feature of ageing, but also as a factor, that accelerates its development. Therefore, the question of the mechanisms of developing hypoxia, its role and its correspondence to the factors defining it, is of a considerable theoretical and practical interest. And it hasn't been studied sufficiently. In particular, we are not sure of the role of blood system in the development of hypoxic shifts with elderly and old people. The purpose of the present research is to study the mechanisms of age-related changes of oxygen-transportation blood function. Methods and materials. Blood gases and oxyhemoglobin dissociation curve of 62 elderly and aged practically healthy people of 60-92 and of 18 healthy young people of 19-30 have been analyzed, with the device DCA-1 (produced by "Radiometer", Denmark). The concentration of ATP in erythrocytes was defined by the method of a thin-layer chromatography, and the 2,3-DPG – was defined enzymatically with the reagent produced by "Sigma" (USA), and the concentration of K<sup>+</sup> and Na<sup>+</sup> in erythrocytes was defined by the method of flame photometry. Results. Elderly and old people showed the decrease of pO<sub>2</sub> in the arterial blood as a result of poor coordination of ventilation and blood flow in the lungs. In response to arterial hypoxemia, elderly persons show a shift of oxyhemoglobin dissociation curve to the right that facilitates the rebound of oxygen to tissues. At the same time, they do not show an increase of concentration of 2,3-DPG in erythrocytes which is a basic modulator of affinity of haemoglobin to oxygen. The research has shown, that with ageing there is a slow down of glycolysis in erythrocytes, the decrease of concentration of ATP, and of the activity of Na<sup>+</sup>, K<sup>+</sup> -ATPase, the decrease of [K<sup>+</sup>], growth of [Na<sup>+</sup>] and the decrease of intraerythrocytes pH. Conclusion. The shift of the oxyhemoglobin dissociation curve to the right with ageing improves rebound of oxygen to tissues that has adaptive value with arterial hypoxemia. The reason of this shift is the decrease of intraerythrocytes pH (Borb effect) as a result of the distortion of the energy metabolism of erythrocytes. The facilitated rebound of oxygen by oxyhemoglobin with elderly and old people does not compensate the influence of the factors, causing deterioration of the oxygen supply of tissues with ageing.

**PB8 162 CARDIOVASCULAR DISEASE AND NUTRITION RISK AMONG THOSE LIVING TO ADVANCED AGE**

R. TEH\* (University of Auckland, Auckland, New Zealand)  
C. WHAM(2), N. KERSE(1), R. DOUGHTY(3) - (1) University of Auckland (Auckland, New Zealand); (2) Massey University (Auckland , New Zealand); (3) University of Auckland (Auckland, New Zealand)

**Introduction** In New Zealand an increase of 507% is expected in the oldest old population between 2006 and 2051. More than 45% of older New Zealanders are affected by cardiovascular disease (CVD). Physical measures of height, weight and body composition possibly influenced by dietary factors and can modify cardiovascular risk. The aim of this study was to examine associations between CVD, physical parameters and nutrition risk in those of advanced age. **Methods and materials** A cross-sectional study of 112 participants aged 85 years (75-79 for Maori) from three locations (urban and rural) in New Zealand measured comprehensive health and physical assessments including height, weight and body composition. Face-to-face interviews were conducted using the 14-item validated questionnaire SCREEN II (Seniors in the Community: Risk evaluation for eating and nutrition, Version II). Fasting blood samples were collected. Results A total of 107 (96%) of the participants completed the study (43% men). Sixty six participants (62%) reported to have clinically manifest CVD (52% men). The mean SCREEN II score was 48.3+/-6.0 (range 29-58 out of a maximum score of 64). Those with CVD had no greater nutrition risk versus those with no CVD as evidence by SCREEN II score (47.9+/-6.1 vs 49.2+/-5.9; p>0.05). Physical measures were higher in those with CVD compared to those with no CVD: BMI (28.8+/-7.8 vs. 25.4+/-3.9; p=0.018), waist circumference (98.9+/-16.1cm vs. 88.8+/-11.6cm; p=0.001) and waist-hip ratio (0.91+/-0.08 vs. 0.87+/-0.08; p=0.031). Using a regression model controlling for gender, lipids and blood pressure only WC remain significantly associated with CVD. Conclusion In this sample of older people, nutrition risk and BMI were not associated with CVD but WC rather than WHR was related to CVD. This is unexpected compared to associations established in the younger population. Further investigations related to CVD risk will be undertaken in a longitudinal cohort study.

**PB8 163 IMPACT OF ALDOSTERONE RECEPTOR BLOCKADE VERSUS THIAZIDE THERAPY ON SYMPATHETIC NERVOUS SYSTEM FUNCTION IN GERIATRIC HYPERTENSION**  
M. SUPIANO\* (University of Utah, Salt Lake City, United States)  
W. WRAY(1) - (1) University of Utah (Salt Lake City, United States of America)

**INTRODUCTION:** Both aldosterone receptor blockade and thiazide therapy have demonstrated beneficial effects in geriatric hypertension. The impact of these therapeutic agents on sympathetic nervous system (SNS) function has not been evaluated. **METHODS AND MATERIALS:** In a double-blind, randomized study, 36 patients ( $69 \pm 1$  yrs) with Stage 1 hypertension underwent six months of therapy with either aldosterone receptor blockade (spironolactone [SPIRO], 25-100mg q.d., n = 19) or thiazide therapy (hydrochlorothiazide [HCTZ], 12.5-50mg q.d., n = 17). Arterial blood pressure (BP), [3H] norepinephrine (NE) kinetics (extravascular NE release rate), and alpha-adrenergic sensitivity (forearm blood flow vasoconstriction to graded intra-arterial NE infusions) were evaluated at baseline, following a 4-week antihypertensive medication withdrawal, and after SPIRO or HCTZ treatment. **RESULTS:** Arterial BP decreased significantly with both SPIRO ( $160 \pm 3$  to  $134 \pm 2$  mmHg;  $77 \pm 2$  to  $68 \pm 2$  mmHg) and HCTZ ( $161 \pm 4$  to  $145 \pm 4$  mmHg;  $78 \pm 2$  to  $73 \pm 2$  mmHg) treatment. SNS activity was significantly reduced following SPIRO (plasma NE =  $378 \pm 40$  to  $335 \pm 20$  pg/ml, P=0.04; 3H NE =  $2.74 \pm 0.3$  to  $1.97 \pm 0.2$   $\mu$ g/min/m<sup>2</sup>, P=0.04) but not HCTZ (plasma NE =  $368 \pm 25$  to  $349 \pm 23$  pg/ml, P=0.47; 3H NE =  $2.63 \pm 0.4$  to  $2.11 \pm 0.2$   $\mu$ g/min/m<sup>2</sup>, P=0.21). Despite the fall in SNS activity, alpha adrenergic sensitivity was unchanged with either drug treatment. **CONCLUSIONS:** These findings demonstrate a beneficial effect of aldosterone receptor blockade on reducing SNS activity in hypertensive older patients. While both drugs effectively lowered BP, a greater inhibition in SNS activity was observed with SPIRO versus HCTZ treatment, identifying a potential advantage for this drug class compared with traditional diuretic therapy.

**PB8 164 CORRELATION AMONG CARDIOVASCULAR TESTS IN PATIENTS WITH CHAGAS DISEASE OVER 50 YEARS OF AGE**  
S. SILVA\* (SBGG, Belo Horizonte, Brazil)  
C. AMARAL(1), E. GONTIJO(1) - (1) UFMG (Belo Horizonte, Brazil)

**Introduction:** Chagas still remains as an endemic disease in the American continent, with prevalence estimated at 16 -18 million cases. About 30% of people infected with the Trypanosoma cruzi will develop chronic Chagas heart disease (CCHD), the most important consequence of the pathology concerning morbidity and mortality (World Health Organization). Among the characteristics of CCHD are the frequent and complex episodes of cardiac arrhythmia in combination with conduction disorders, and the remarkably high incidence of sudden death and systemic thromboembolism due to severe heart failure. A few studies have looked at patients over 50 years of age with Chagas disease in spite of the strong aging process population all around the world is going through. **Methods and materials:** In order to assess and correlate the findings of non-invasive cardiovascular tests, 97 chagasic patients over 50 years of age were closely examined and underwent such tests (Electrocardiogram - ECG, Holter monitoring, Doppler echocardiogram, and ergometric testing). A descriptive methodology was adopted in this study of patients evaluated at UFMG University Hospital between 1997 and 2005. **Results:** There were included 97 patients with average age of 57.6 years, mostly females (56,7%). No patient with normal ECG had altered Doppler echocardiogram. Electrical conduction disorder was the most prevalent ECG finding. Lown's classification for arrhythmia complexity made the correlation between Holter monitoring and ergometric testing evident (Spearman: 0,704; p

= 0,000). The agreement between Holter monitoring and Doppler echocardiogram results was significant, however weak (Fisher: p=0,019; Kappa: 0,193; p=0,011). Poor agreement (Kappa: 0,236) was found between ergometric testing and ECG. Conclusion: There was correlation – although weak – between ECG and ergometric testing, Holter monitoring and Doppler echocardiogram, and Holter monitoring and ergometric testing. No patient with normal ECG had altered Doppler echocardiogram, confirming the value of a normal ECG to exclude Chagas heart disease.

**PB8 165 HYPERTENSION IN A SPANISH POPULATION AGED 85 OR OLDER. NON-DIPPING PATTERN AND PHARMACOLOGICAL CONTROL.**

J. BLAZQUEZ CARRASCO\* (VIRGEN DE LA SALUD HOSPITAL, TOLEDO, Spain)  
F. MADRUGA GALAN(1), A. BLANCO ORENES(1), M. MAREQUE ORTEGA(1), J. GIL MORENO(2), F. TARAZONA SANTABALBINA(3) - (1) VIRGEN DEL VALLE HOSPITAL (TOLEDO, Spain); (2) CIUDAD REAL HOSPITAL (CIUDAD REAL, Spain); (3) ALZIRA HOSPITAL (VALENCIA, Spain)

**INTRODUCTION** Hypertension is highly prevalent in older persons. Risks for morbid events resulting from hypertension increase with age. The optimal pharmacological control of hypertension substantially reduce cardiac and cerebrovascular events. **MATERIAL AND METHODS** To assess the control of blood pressure levels in a Spanish population aged 85 or older through 24-hour blood pressure measurement, in inpatients Acute Geriatric Care Unit and outpatient geriatric clinic at the Toledo Geriatric Hospital in the term of 18 months. We studied 153 hospital charts that fulfilled the inclusion criteria, between March 2004 and September 2005. **RESULTS** Mean age was 87 (73.6% women). 26.5% were diabetics, 18.9% had obesity (body mass index (BMI)> 30, 01). Average number of drugs used was of  $1, 8 \pm 0, 8$ . 41.5% had high cholesterol levels. 18.87% had previous ischemic cardiopathy, 22.7% presented heart failure and 30.2% had presented cerebrovascular disease. Ambulatory Blood Pressure Monitoring (ABPM) showed 84.9% of nonreducing (No Dipper) blood pressure pattern. 73.6% presented suboptimal control of blood pressure levels. **CONCLUSION** Non-dipping pattern in hypertensive patients has been shown to be associated with an excess of target organ damage and with an adverse outcome. In our area patients aged 85 or older present a high prevalence of nonreducing blood pressure pattern and inadequate blood pressure control. The accomplishment of ABPM directed to the strict adjustment of blood pressure levels is basic to these patients in order to diminish the incidence of cardiac, renal or cerebrovascular disease.

**PB8 166 ADVERSE DRUG EVENTS AND ASSOCIATED FACTORS IN CONGESTIVE HEART FAILURE THERAPY AMONG THE VERY ELDERLY.**

R. SZTRAMKO\* (University of British Columbia, Vancouver, Canada)  
M. BROWN(1), V. CHAU(1), R. WONG(1) - (1) Department of Medicine, University of British Columbia (Vancouver, Canada)

**Introduction:** Congestive heart failure (CHF) is common in older adults and standard therapy involves the use of multiple medications (beta blocker, ACE inhibitor, spironolactone, digoxin). We assessed the nature, frequency and factors associated with adverse drug events (ADE) associated with standard CHF therapy among older adults greater than 75 years of age. **Methods:** Systematic review using standardized databases including Medline, AgeLine, CINAHL from 1 January 1988 to 31 December 2008, and references from published literature. Randomized trials and studies with observational, cohort, and cross sectional design were included. Two investigators independently selected the studies and extracted the data (kappa =0.86). **Results:** 23 studies were identified, which included 2 randomized trials, 1 non-randomized trial, 6 observational studies, 10 cohort studies and 4 cross sectional studies. ADE were reported in 13/23 (57%) studies, and most commonly related to beta blocker use: dyspnea (66/343 subjects, 20%), fatigue (75/384 subjects, 19%), dizziness (52/343 subjects, 19%) hypotension (128/1181 subjects, 11%) and bradycardia (55/1273 subjects, 4%). ADE related to ACE inhibitor, spironolactone, or digoxin use was not reported in sufficient numbers to be included. Factors associated with ADE included advanced age, poor left ventricular function, and increasing New York Heart Association Class. Very few studies reported associations between ADE and patients' comorbidities (4/13 studies, 31%) or cognitive/functional status (3/13 studies, 23%). **Conclusion:** ADE in CHF therapy among the very elderly were poorly characterized in the literature despite their relatively common occurrence, with insufficient data to establish a risk prediction rule. Further studies are warranted.

**PB8 167 AMBULATORY BLOOD PRESSURE MONITORING (ABPM) PATTERN IN HYPERTENSIVE ELDERLY WITH POSTPRANDIAL HYPOTENSION (PPH).**

A. ZANASI\* (Geriatrics, Baggiovara di Modena, Italy)  
A. MINNUCCI(1), C. VEDELE(1) - (1) Università degli Studi di Modena e Reggio Emilia (Baggivara di Modena, Italy)

**INTRODUCTION:** PPH is a decrease in systolic blood pressure (SBP) of 20 mmHg or more within 2 hours of the meal and may be a clinical problem in treated hypertensive elderly. **DESIGN AND METHOD:** In 334 elderly hypertensive patients (EHP) with normal activities of daily living we performed 24-hour ABPM recording daytime (09:00-21:00) and nighttime (01:00-06:00) ambulatory blood pressure (BP) with SpaceLabs 90207

recorder. Daytime-nighttime ambulatory arterial stiffness index (AASI) was evaluated as 1– regression slope of diastolic on SBP; dipper status indicates night:day ratio of systolic BP <0.9. The variables with a significant P at the univariate analysis were included as covariates in a binary logistic regression model to identify drugs and ABPM variables associated with PPH. RESULTS: The EHP (49.1% men and age  $73.17 \pm 11.35$  yr) received  $1.69 \pm 1.31$  antihypertensive drugs (AHD); the mean SBP night:day ratio was  $0.95 \pm 0.10$  with dipper's prevalence of 28.7%. PPH prevalence (57%) increases with age, lower mean SBP and diastolic BP (DBP), higher SBP and DBP variability, non dipping status and lower AASI (low arterial stiffness); the prevalence increases when ACE-inhibitors or a b-blockers-calcium channel blockers association are given. The multivariate analysis shows that the major determinants of PPH are non-dipping status ( $\beta=0.834$ ,  $P=0.001$ ), daytime AASI <0.37 ( $\beta=0.808$ ,  $P=0.003$ ), mean DBP <75 mmHg ( $\beta=0.928$ ,  $P=0.002$ ), daytime standard deviation of SBP >11 mmHg ( $\beta=0.863$ ,  $P=0.003$ ), and of DBP >9 mmHg ( $\beta=0.756$ ,  $P=0.009$ ). CONCLUSIONS: PPH occurs in 56.8% of EHP. Its prevalence is higher in those taking 2 or more AHD; non dipping status, highest daytime SBP and DBP variability favors PPH; daytime highest values of DBP and a stiffened arterial tree (daytime AASI >0.37) are protective factors. The identification of PPH by ABPM may be helpful to optimize the choice of AHD and their dosing time in EHP.

#### **PB8 168 STANDARDIZED GERIATRIC ASSESSMENT IN THE MANAGEMENT OF ELDERLY PATIENTS WITH AORTIC STENOSIS.**

C. PATRY\* (Hôpital Bichat, Paris, France)

T. OLLIVIER(2), D. HIMBERT(1), N. FAUCHER(1), B. IUNG(1), A. RAYNAUD-SIMON(1) - (1) Hôpital Bichat (Paris, France); (2) Hôpital Charles Richet (Villiers-le-Bel, France)

Introduction. The development of percutaneous aortic valve implantation techniques is likely to increase the referral of elderly patients with aortic stenosis, often presenting with a high surgical risk profile. A specialised geriatric evaluation could help in the decision making process for these patients. Material and Methods. In 2008, thirty-nine patients aged  $84.8 \pm 5$  [70 to 94] hospitalised in the cardiology department for treatment of symptomatic aortic stenosis were submitted to a geriatric evaluation and management protocol. First, initial opinion for treatment (surgical or transcatheter) of the multidisciplinary team (cardiologists, thoracic surgeons, anesthesiologist) was collected. Then the geriatrician assessed patient's history, treatments, comorbidities, functional, cognitive, mood and nutritional status. There was a physical examination. An opinion regarding the initial treatment hypothesis was given and specific problems addressed. Statistical analysis was achieved using Mann-Whitney U test and Fischer's exact score. Results. Amongst the 39 patients, 15 were malnourished and 22 had inadequate non cardiologic treatments, Mini Geriatric Depression Scale was positive for 20 patients, and 5 had important cognitive disorders: these factors were diagnosed and addressed by the geriatrician. Initial therapeutic orientation was changed in 11 patients after geriatric evaluation, 9 of which received medical treatment. These patients compared to the rest of the population had significantly lower functional scores : ADL ( $p<0.01$ ) and IADL ( $p<0.01$ ), more caregivers. Cognitive status was lower regarding to the MMS ( $p<0.05$ ) and more frequently unachievable, as was the clock-drawing test ( $p=NS$ ). Conclusions. Comprehensive geriatric assessment brings specific information that may influence the decision making process in the treatment of symptomatic aortic stenosis in the elderly patient. The use of geriatric standardized tools could be evaluated in prediction of operative risk and further outcome in this population.

#### **PB8 169 EVALUATION OF PULSE WAVE VELOCITY [PWV] AND ARTERIAL STIFFNESS INDEX [ASI] IN ELDERLY PATIENTS WITH CORONARY ARTERY DISEASE**

A. MATHUR\* (Dr S N Medical College, Jodhpur, Jodhpur, India)

H. AGARWAL(1), M. CHATURVEDY(1), M. KUMAR(1), S. MATHUR(1) - (1) Dr S N Medical College, Jodhpur (Jodhpur, India)

Objectives: - Ageing is associated with vascular changes like arterial wall thickening (dilatation of large elastic arteries), endothelial dysfunction, arterial stiffening, arterial pulse pressure widening, and increased IM thickness leading to increased cardiovascular morbidity and mortality. Measuring pulse wave velocity and arterial stiffness index with non-invasive techniques provide a convenient opportunity to evaluate these changes. The present study was conducted to evaluate significance of changes in pulse wave velocity (PWV) and arterial stiffness index (ASI) in elderly patients of coronary artery disease (CAD) proven with angiography. Material and Methods: The study included 100 elderly individuals among them fifty had angiography proven coronary artery disease and fifty were age matched healthy controls. Pulse wave velocity (PWV) and arterial stiffness index (ASI) were determined by an 8-channel real-time PC-based simultaneous acquisition and analysis system. The data obtained was statistically analyzed Results: In CAD patients average heart rate was  $78 \pm 30.4$  per minute, average blood pressure SBP= $139 \pm 19.6$ , DBP= $74 \pm 7.8$  and average pulse pressure was  $64 \pm 16.7$  mm of Hg. Whereas in control group average heart rate was  $70 \pm 15.5$  per minute, average blood pressure SBP= $133 \pm 13.9$ , DBP= $77 \pm 8.7$  and pulse pressure was  $52 \pm 12.7$  mm of Hg. Central arteries pulse wave velocity and arterial stiffness index were higher in the patient group. There was a good correlation between pulse wave velocity [PWV], arterial stiffness index [ASI] and pulse

pressure in patient group and healthy controls. Conclusion: Our study findings emphasize the importance of the PWV and ASI in identifying the vascular damage in elderly patients with high cardiovascular risk. Increased pulse wave velocity and arterial stiffness index were found to be good independent predictors of cardiovascular morbidity.

#### **PB8 170 NEW TECHNIQUE OF SURGICAL MYOCARDIAL REVASCULARIZATION – BETTER SURVIVAL OF OCTOGERIANS**

R. SPUNDA\* (2nd Department - Clinical Department of Cardiovascular Surgery of the First Faculty of Medicine and , Prague 2, Czech Republic)

T. URBAN(1), M. SEMRAD(1), M. SALMAY(1), M. SPACEK(1), T. PRSKAVEC(1), E. TOPINKOVA(2) - (1) 2nd Department - Clinical Department of Cardiovascular Surgery of the First Faculty of Medicine and General Teaching Hospital (Prague, Czech Republic); (2) Department of Geriatrics of the First Faculty of Medicine and General Teaching Hospital (Prague, Czech Republic)

INTRODUCTION: Standard methods of myocardial revascularization using cardiopulmonary bypass showed higher risk of mortality and morbidity for elderly patients. The „Aortic No-touch Technique“ is an up-to-date method avoiding cardiac arrest, cardiopulmonary bypass and aortic manipulation. The aim of this study was to prove the usefulness of this technique during coronary artery bypass surgery in elderly population.

METHODS: The total of 271 patients (mean age 81 years [78-93]) undergoing CABG between 2003 and 2008 were enrolled in a prospective non randomized study. The „Aortic No-touch Technique“ group (A, 96 patients) was compared with other two groups of elderly done on-pump (B, 129 patients) using cardiopulmonary bypass and cardiac arrest and off-pump (C, 46 patients) with aortic manipulation (saphenous vein graft central anastomoses). Postoperative data included in-hospital mortality and frequency of major postoperative complications in all groups. RESULTS: The results demonstrate higher early (30-day) mortality in patients whose ascending aorta was touched during surgery (2 [2%] in group A versus 18 [9.7%] in groups B+C). Significant difference was observed in frequency of neuropsychological events (15 [15.6%] in group A versus 62 [35.4%] in groups B+C,  $p < 0.01$ ), perioperative myocardial infarction (0 [0%] in group A versus 12 [6.9%] in groups B+C,  $p < 0.05$ ) and poor wound healing (11 [11.5%] in group A versus 38 [21.7%] in groups B+C,  $p < 0.05$ ). CONCLUSION: Lower mortality and less postoperative complications were documented in the „Aortic No-touch Technique“ group. This technique seems to be effective and useful particularly in octogenarians. The favorable effect of off-pump surgery, when a saphenous vein was harvested and used as a graft and ascending aorta was manipulated during central anastomoses accomplishment, was not proven in patients of an age > 78.

#### **PB8 171 IMPACT OF GAMMA-GLUTAMYLTRANSFERASE ON FUNCTIONAL OUTCOME IN ELDERLY PATIENTS AFTER ISCHEMIC STROKE**

D. D'AMBROSIO\* (University Federico II, Naples, Italy, Naples, Italy)

D. DELLA MORTE(2), G. GARGIULO(1), F. GALLUCCI(3), M. ROSSETTI(1), G. DE ROSA(1), G. UOMO(3), T. RUNDEK(2), F. RENGO(1), P. ABETE(1) - (1) Department of Internal Medicine, Cardiovascular Sciences, and Immunology. University Federico II (Napoli, Italy); (2) Department of Neurology and Neuroscience, University of Miami, Miller School of Medicine (Miami, United States of America); (3) General Medicine Department Internal Medicine Unit III Cardarelli Hospital (Napoli, Italy)

Introduction: The catalytic activity of gamma-glutamyltransferase (GGT), which is present on the surface of cell membranes and in serum, is responsible for the extracellular catabolism of the antioxidant glutathione. GGT may have a role in the pathogenesis of atherosclerosis: his activity has been detected in atheromatous plaques of carotid and coronary arteries. Several studies showed that GGT is associated with morbidity and mortality from cardiovascular disease as well as stroke. However, this latter association was significant in men aged >60 years. Our aim was to evaluate the impact of GGT on functional outcome in elderly patients after ischemic stroke. Methods and materials: We retrospectively reviewed the medical charts of elderly patients (> or equal to 65 years; n=223) with diagnosis of ischemic stroke. Serum GGT levels were classified as normal (0-17U/L for women and 0-27U/L for men; n=89), moderate (18 to 35, 28 to 55U/L; n=94), and high (>35, >55U/L; n=40). Stroke severity was assessed by the National Institutes of Health Stroke Scale (NIHSS) and disability by modified Rankin scale (mRs) at baseline. Results: Chi-square tests for crosstab data showed that NIHSS decreased from 85.7 to 35.7% in normal GGT while it increased from 14.3 to 21.4% in moderate and from 0.0 to 42.9% in high GGT, respectively ( $p<0.02$ ); similarly, mRs decreased from 69.2 to 30.4% in normal GGT while it increased from 23.1 to 34.8% in moderate and from 7.7 to 34.8% in high GGT, respectively ( $p<0.002$ ). Logistic regression analysis adjusted for age and sex showed that GGT was significantly associated with NIHSS (Odds ratio: 7.70; 95%-CI: 1.04-58.46) and mRs (Odds ratio: 2.60; 95%-CI: 1.01-6.90). Conclusion: These results suggest that higher levels of serum GGT are associated with a poor functional outcome after ischemic stroke in the aging population and may account in part for the higher mortality in elderly stroke patients.

**PB8 172 QUALITY OF LIFE IN LOW INCOME PATIENTS WITH COPD**

L. DANOJEVIC\* (Health Care Grocka, Belgrade, Serbia)

V. LUBIC BEGANOVIC(1), P. REBIC(2), B. GVOZDENOVIC(3) - (1) Health Care Grocka (Belgrade, Serbia); (2) Clinical Centre of Serbia (Belgrade, Serbia); (3) AbC.R.O. Inc. Serbia (Belgrade, Serbia)

Chronic obstructive pulmonary disease(COPD) can have profound effects on a patients quality of life and functioning. A cross-sectional, observational study of 34 patients(27 male, 7 female, mean age was 65.79+/-8.81, mean income 150+/- 77.94 Euros) with diagnosis of COPD according to the GOLD criteria by a pulmonary specialist was performed. All patients completed 6-Minute Walk Test(6MWT), the 10-Item Respiratory Illness Questionnaire-Monitoring 10 (RIQ-MON 10).The RIQ-MON 10 consists of 10 items, producing a "complaints" and "limitations" scores. Twenty two patients (64.7%) walked <400m or 400m during a period of 6 minute. Relationships between parameters on the 6MWT, the RIQ-MON 10 and patients characteristics were assessed with Spearman rank correlation coefficients &rho;. The correlation coefficient between the 6MWT (mean 357.26, SD 92.66) and age (&rho;= -0.340 correlation is significant at the 0.05 level), the 6MWT and the subscale "complaints"(&rho;=-0.351 correlation is significant at the 0.05 level), the 6MWT and the RIQ-MON 10 (&rho;=-0.346 correlation is significant at the 0.05 level), the subscale "complaints"( mean 9.21, SD 2.98) and the subscale "limitations" (&rho;=0.525 correlation is significant at the 0.01 level), the RIQ-MON 10 (mean 17.82, SD 5.15)and the subscale "complaints"(&rho;=0.830 correlation is significant at the 0.01 level), the subscale "limitations" (mean 8.62, SD 3.01) and income (&rho;=0.396 correlation is significant at the 0.05 level) were determined. The two most frequent types of activity limitations in the subscale "limitations" were "going out for a day" and "going upstairs". Effective strategies to prevent or limit disabling impact of COPD are important to improving the quality of life of the elderly patients.

**PB8 173 PERIPHERAL BLOOD MONONUCLEAR CELL TRANSPLANTATION FOR PATIENTS WITH PERIPHERAL ARTERIAL DISEASE**

E. KANEKO\* (Tokyo Medical and Dental University, Tokyo, Japan)

Y. ABE(1), A. KAWAKAMI(1), K. SHIMOKADO(1) - (1) Tokyo Medical and Dental University (Tokyo, Japan)

Introduction: Critical limb ischemia (CLI) due to peripheral arterial disease (PAD) not only impairs QOL but also causes life threatening ischemic gangrene. Although bone marrow transplantation has been used for CLI patients, bone marrow harvest is so invasive that peripheral blood mononuclear cell transplantation (PBMCT) may be more suitable for elderly patients. Methods and Materials: Nineteen patients suffering from rest pain, ischemic ulcer or gangrene without indication for endovascular or surgical treatment underwent PBMCT in combination with (n=10) or without (n=9) G-CSF pretreatment. Informed consent was obtained before the procedure. Results: One month after the procedure, pain score improved in 15 patients. Transtaneous oxygen pressure was measured in 16 patients and improved in 10 patients. Serial angiography was performed in 17 patients and improvements were observed in 10 patients. One year after the procedure, remission of the lesion was observed in 10 patients (53%). Among 11 elderly patients, 6 showed remission of the lesion (55%). Below knee amputation was performed in 3 patients and 3 elderly patients died from heart failure (16%). Transplanted cell counts for WBC and CD34(+) cells increased after G-CSF treatment and the clinical outcome was better in G-CSF treated group. Conclusions: Compared to TASC II results where both remission rate and death rate were 25%, our data showed a better 1 year outcome for CLI after PBMCT. Although 3 patients who died were over the age of 65, remission rate was slightly better for elderly patients. Therefore it seemed to be safe and effective treatment for elderly patients. Since we did not have a control group for this study, efficacy of PBMCT was not established. Japan Study Group of Peripheral Vascular Regeneration Cell Therapy is now planning a randomized study (IMPACT-Study) to test the efficacy and safety of G-CSF mobilized PBMCT.

**PB8 174 CLINICAL RELEVANCE OF AN INCREASED PLASMA NT-PROBNP LEVEL IN NONAGENARIANS FROM THE GENERAL POPULATION**

B. VAES\* (Université Catholique de Louvain, Woluwe-Saint-Lambert, Belgium)

W. DE RUIJTER(2), J. DEGRYSE(1), R. WESTENDORP(2), J. GUSSEKLOO(2) - (1) Université Catholique de Louvain (Woluwe-Saint-Lambert, Belgium); (2) Leiden University Medical Center (The Netherlands)

Introduction We investigated whether plasma NT-proBNP remains a specific marker of cardiac illness in very old age and is able to identify very elderly at high risk for death independent from the presence of known cardiac diagnoses. Methods Prospective, observational, population-based follow-up study within the Leiden 85-Plus Study of a 2-year birth cohort (1912-1914). A total of 274 participants were followed up from age 90 onwards (median follow-up 42.3 months, interquartile range 20.2 to 50.2 months). Plasma NT-proBNP level, indicators of general health and functioning, and specific cardiac diagnoses at age 90 and mortality from age 90 onwards were measured. Results Plasma levels of NT-proBNP were not correlated to indicators of poor health or poor functioning. However, the level of NT-proBNP increased significantly with increasing numbers of cardiac diagnoses ( $p < 0.001$ ). High NT-proBNP was associated with overall mortality, both in participants with specific cardiac diagnoses (HR 2.8, 95% CI 1.5-5.2) and without

(HR 3.5, 95% CI 1.6-7.5). This was also found for cardiovascular mortality risks (with specific cardiac diagnoses HR 4.1 (95% CI 1.5-11) versus without HR 5.6 (95% CI 1.0-30)) and noncardiovascular mortality risks (with specific cardiac diagnoses HR 1.9 (95% CI 0.84-4.5) versus without HR 3.4 (95% CI 1.3-8.6)). Conclusions Plasma NT-proBNP is still a disease specific marker of cardiac illness in nonagenarians and can possibly be used as a predictor of mortality, both in elderly with and without specific cardiac diagnoses.

**PB8 175 BEFORE A STROKE AND AFTER – WHAT HAPPENS?**

L. OLAI\* (Uppsala University, Department of Public Health and Caring Sciences, Uppsala, Sweden)

M. OMNE-PONTÉN(1), L. BORGQUIST(2), K. SVÄRDSUDD(1) - (1) Department of Public Health and Caring Sciences, Family Medicine and Clinical Epidemiology Section (Uppsala, Sweden); (2) Department of Health and Society (Linköping, Sweden)

Introduction The knowledge, of the course of events for elderly stroke victims, is limited, by the time before and after the stroke onset. Methods and materials A prospective study was performed in central Sweden. In total, 390 stroke subjects >65 years, living in their own homes and having no dementia diagnosis prior to hospital admission, constituted the study population. Interviews with the survivors were performed with validated instruments for example the MMSE, HAD, NHP. Health care records and local and national registers were scrutinized. Results The mortality risk and risk for recurrent stroke was highest in the very early post-morbid phase and then fell considerably. The utilization of hospital inpatient care was higher during the years following index than preceding years. The use of outpatient care increased slowly during the year preceding index and fell slowly during the following year, but to a somewhat higher level. The utilization of community support was substantially higher than the health care utilization, increased slowly during the year preceding index, and with a marked increase during the year following index. In total women received more municipality support than men, but relief services were more common in men. Conclusion The risk for stroke recurrence or mortality is high during the first period after a stroke incident but the risk decreases the first six months. The utilization of care, both in hospital and primary health care, and community support was considerably higher the year following the index admission, but with an increasing trend the year preceding index. With an increasing number of elderly stroke survivors, and increasing needs, this will be a challenge for the municipality and for the relatives.

**PB8 176 CHANGES IN AUTONOMIC REGULATION IS CORRELATED WITH THE SEVERITY OF BRAIN LESIONS IN PATIENTS WITH STROKE**

N. FERRARA\* (University of Molise, Campobasso, Italy)

G. D'ADDIO(2), G. CORBI(1), R. GIOVANNA(2), B. LANZILLO(2), G. FURGI(2), F. RENGO(3) - (1) University of Molise (Campobasso, Italy); (2) Fondazione S. Maugeri (Campobasso, Italy); (3) University of Naples (Campobasso, Italy)

It is known the cardiovascular autonomic regulation is impaired in patients with stroke. The non-linear analysis of heart rate variability (HRV) is an useful tool to assess the autonomic imbalance in patients with cardiovascular disease. Aim of this study is to evaluate the relation between the brain lesions severity and the changes in Poincaré plots (PPlots)of HRV. We studied 20 subjects with a previous first-ever stroke divided in two groups of 10 patients in according to a CT finding of medium cerebral artery single (SL, meanage 69+/-9 y) or multiple (ML,meanage 69+/-8 y) lesion. The control group (N) consisted of 10 healthy subjects (meanage 42+/-6 y). All subjects underwent to a 24-hour Holter ECG recording. PPlots maps were automatically quantified by nine novel computer-generated quantitative descriptors: length (L), wideness (W) and area (A) of the 2D plot and the number of peaks (Np) and the length of the three radii of the semi-ellipse of inertia Px, Py, Pz of the 3D plot. The main time-domain parameters (SDNN, PNN50, MSSD) were also evaluated. Statistical analyses were performed for all parameters by Kruskal-Wallis test and the Dunns post test. We observed a direct relationship between the increasing brain lesion's severity and the related impairment in the autonomic cardiac control of these patients showed by the progressive collapsing both in 2D and 3D PPlots. L, A and Np, showed the mainly significant differences between the three study groups, while lower significant differences were found in spectral parameters and none in time-domain indexes. These results clearly indicate that the changes in Poincaré plots (PPlots) of HRV are correlated with the severity of brain lesions in patients with stroke.

**PB8 177 ADIPONECTIN AND HOMOCYSTEINE IN CARDIOVASCULAR DISEASE ASSOCIATED WITH AGING; CORRELATION STUDY**

E. LUPEANU\* (National Institute of Gerontology and Geriatrics , Bucharest, Romania)

V. ANDREI(1), R. PIRCALABU(1), G. PRADA(1), I. RADUCANU(1), S. OPRIS(1), R. HNIDEI(1), B. MOROSAN(1) - (1) National Institute of Gerontology and Geriatrics (Bucharest, Romania)

INTRODUCTION Antiatherogen, anti-inflammatory, antioxidant and antidiabetic actions of adiponectin are opposite to the homocysteine proatherogenic and prooxidant actions. This study has aimed to investigate in old subjects with cardiovascular disease: a) circulating levels of adiponectin, total homocysteine; b)the relationships of adiponectin and total homocysteine with others clinical metabolic indicators, anthropometric and

**physiologic parameters.** METHODS Women and men, ages 40 to over 85 years were enrolled in two major groups: healthy (control group) and subjects with cardiovascular disease. Adiponectin and homocysteine were assayed by ELLISA. Pearson's correlation coefficient was calculated in order to find out any relation of serum adiponectin and plasma homocysteine with the clinical chemistry panel tests, BMI, systolic and diastolic BP. RESULTS Serum adiponectin and plasma homocysteine were significantly higher in healthy subjects of 65-86 year compared with those of 40-65 year. In the control group there were positive correlations of adiponectin with age ( $r=0.355$ ;  $p<0.05$ ) and HDLc ( $r=0.408$ ;  $p<0.05$ ), a negative correlation with triglycerides ( $-r =0.4448$ ;  $p<0.05$ ), and no correlation with total homocysteine. Also, there was a significant positive correlation of plasma homocysteine with age( $r=0.0384$ ;  $p <0.05$ ). In the cardiovascular disease group we found out significantly high BMI, SBP DBP, glucose ( $p=0.012$ ), uric acid( $p=0.0028$ ), creatinine( $p=0.0481$ ), triglyceride( $p=0.039$ ), homocysteine ( $p=0.035$ ) concentrations, and a significantly low adiponectin( $p=0.0011$ ) level. We showed significant negative correlations of adiponectin with uric acid(-  $r =0.288$ ;  $p=0.05$ ) and triglycerides(-  $r =0.342$ ;  $p<0.05$ ) in subjects with cardiovascular disease. On the contrary, plasma homocysteine pointed out significant positive correlations with uric acid( $r=0.315$ ;  $p<0.02$ ), total cholesterol( $r=0.311$ ;  $p<0.02$ ) and creatinine( $r=0.408$ ;  $p<0.01$ ). CONCLUSIONS: This study has pointed to an alteration of the glucidic and energy metabolism associated with the hipoadiponectinemia and hiperhomocysteinemia in the old patients with cardiovascular disease. Modulation of the adiponectin and homocysteine levels by pharmacologic and nonpharmacologic factors could improve the metabolic modifications in cardiovascular pathology.

**PB8 178 THE BOLOGNA OUTCOME ALGORITHM FOR ISCHAEMIC STROKE (BOAS)**

M. ZOLI\* (University of Bologna, Bologna, Italy)

A. MUSCARI(1), P. GIOVANNI MARIA(1), S. NADIA(1), M. BEATRICE(2) - (1) University of Bologna (Bologna, Italy); (2) S.Orsola-Malpighi Hospital (Bologna, Italy)

**Introduction –** Although age and neurological impairment are the main determinants of stroke prognosis, other variables may help to predict more precisely the medium term dependence (D) and mortality (M) of patients (pts) with ischaemic stroke (IS). Methods and materials – By an electronic duplicate of our medical record, 415 variables were collected concerning the 333 pts admitted to our Stroke Unit in 2007. After a median interval of 9 months a telephone interview was performed to establish the degree of disability attained (modified Rankin Scale, mRS) and M. Among the 221 IS pts, 40 with D and 40 without D were matched by age and National Institutes of Health Stroke Scale (NIHSS). The 2 groups were then compared, and 27 of the 415 variables were found to be univariately associated with D. Finally, these variables were studied by multivariate analysis in all pts with IS in whom they were available (N=211). Results – Seven variables were independently associated with D. The model was then simplified and reduced to only 4 clinical variables: age>80 years (OLD), persistent paralysis of upper limb (ARM), NIHSS>10, and use of oxygen or urinary catheter or preadmission mRS>0 (OCR) (overall  $R^2=0.38$ ,  $P<0.0001$ , accuracy=83.4%). The algorithm derived from these results identifies 8 categories of pts, 5 of which with unfavorable outcome (>60% with D, 53% of population: NIHSS>=19 [D100%, M83%], NIHSS 11-18 [D87%, M32%], OLD+ARM [D100%, M29%], YOUNG+ARM+OCR [D88%, M13%], OLD+OCR [D64%, M9%]), and 3 with favorable outcome (<35% with D, 47% of population: OLD [D33%, M0%], YOUNG+ARM [D32%, M3%], YOUNG [D18%, M4%]). Conclusions – A persistent paralysis in the upper limb and other simple clinical findings, in addition to stroke severity and age, may help to accurately predict the medium term outcome of pts with IS. Further studies are in progress for validation of the proposed algorithm.

**PB8 179 CHARACTERISTICS OF OLDER PATIENTS ADMITTED TO A GERIATRIC DAY HOSPITAL: A NEW EXPERIENCE IN BRAZIL.**

M. ALTONA\* (Clinics Hospital, Sao Paulo, Brazil)

T. JUNQUEIRA AVELINO DA SILVA(1), C. RIBEIRO MAUÉS(1), J. YUMI TIZON KASAI(1), M. ALIBERTI(1), B. BARBIERO SAAD(1), F. RAINHA LOPES(1), W. JACOB FILHO(1) - (1) Hospital das clínicas of University of Sao Paulo Medical School (Sao Paulo, Brazil)

**Introduction:** Geriatric Day Hospital is an environment where a multidisciplinary therapeutic approach to an older outpatient is possible while still being served by resources usually available only to inpatients. Possible interventions include rehabilitation, compensation of chronic diseases and incompliance assessment. In Brazil, there are virtually no reports on this kind of approach to the older patient. The objective of this study was to identify the epidemiologic characteristics of the individuals admitted to a Brazilian Geriatric Day Hospital. Methods and Materials: All patients admitted to the Geriatric Day Hospital from February 2008 to January 2009 were evaluated for possible inclusion. Participant's data were collected by the medical team using pre-defined questionnaires which included: identification, reason for admission, geriatric syndromes, functionality appraisal, occurrence of delirium, comorbidities, number of prescribed medications, recent hospitalizations. Results and conclusion: A group of 103 older patients was analyzed. Age average was of 77 years and 66% were women. Most were initially treated either in the Geriatrics Department (48%) or in the Emergency Room (17%). Infections (38%) and decompensation of chronic diseases (48%) were the main reasons for admission. An average of 1.17 geriatric syndromes per patient was observed, urinary incontinence being

the most prevalent (47%). Patients were inflicted by an average of 5 comorbidities. Polypharmacy was verified in 79% of the cases. Most of the patients were independent for their basic daily live activities (57%); 51% of them had been to an emergency room at some point during the 6 previous months. Patient incompliance was suspected in 22% of the cases and in 48% a poor outcome was at risk. Among older patients admitted to a Geriatric Day Hospital there was a predominance of functionally independent elderly women diagnosed with multiple comorbidities and polypharmacy, with clinical decompensation and infections, and at risk for unfavorable prognosis.

**PB8 180 CARDIAC SURGERY AT THE UNIVERSITY HOSPITAL OF DIJON: MORTALITY, MORBIDITIES AND MEAN LENGTH OF STAY IN OLD AND OLD-OLD POPULATIONS**

E. MAZEN\* (Geriatric Department of Champmaillot, University Hospital of Dijon, France, DIJON, France)

A. MUSAT(2), L. POPITEAN(1), A. CAMUS(1), M. DAVID(3), P. PFITZENMEYER(1) - (1) Geriatric Department of University Hospital of Dijon (Dijon, France); (2) Informatic Medical Department of University Hospital of Dijon (Dijon, France); (3) Cardio-Vascular Surgery of University Hospital of Dijon (Dijon, France)

**Introduction:** Cardiac surgery is required more frequently in an increasingly elderly population today due to the increase in life expectancy, aging and the high prevalence of coronaropathies and valvulopathies, which require valve replacements, coronary artery bypass grafts or both surgeries. Methods and materials: This retrospective study was done using figures from the medical computer database of the Dijon University Hospital. The 482 elderly subjects included in the study were divided into 2 groups : the old group, composed of subjects aged 65 to 79 (mean age: 72.6) and the old-old group, with subjects aged 80 and over (mean age: 81.9). All subjects had had cardiac surgery between 1st July 2005 and 31st December 2006. The 2 groups were compared according to the type of surgery, selected comorbidities (32), complications (15), therapeutics (3), mean lengths of stay in hospital and in the acute care unit, as well as mortality. Results: The old-old suffered less often from diabetes (22.8% vs 35.7%) and obesity (7.6% vs 34%). They more often required valve replacement (40.5% vs 24.8%) whereas the old had coronary artery bypass grafts (64% vs 41.8%). There were no significant differences between the two groups for the complications and the lengths of stay. The old-old had more transfusions (34.2% vs 20.1%) and dialyses (8.9% vs 3%). The rate of mortality was 8.9% for the old-old and 1.73% for the old ( $p=0.002$ ). Conclusions: This study tends to favour cardiac surgery even for the old-old. Although, in comparison to the mortality rate of the old, the old-old group's rate is higher, it does not appear to be much higher than the general mortality rate for this group (6.7%). Prospective studies with geriatric parameters are required to improve preoperative selection and the management of the old-old.

**PB8 181 SPONTANEOUS CONVERSION OF CHRONIC ATRIAL FIBRILLATION TO SINUS RHYTHM**

H. TAKKUNEN\* (Freelance, Helsinki, Finland)

M. KARESOJA (1), P. HIRVONEN(2) - (1) Kivelä Hospital (Helsinki, Finland); (2) Dextra Medical Centre (Helsinki, Finland)

Permanent atrial fibrillation (AF), a frequent arrhythmia in old people, has a great impact on morbidity and mortality. If AF has persisted some years, spontaneous conversion to sinus rhythm is very rare. We present two patients, whose long-lasting chronic AF converted spontaneously to sinus rhythm. The patients. Case 1. A man, with a long history of coronary heart disease had AF from the age of 60 years. A three-vessel by-pass surgery was performed two years later. At the age of 75 years angioplasty with stenting was performed due to the occluded grafts. Eighteen months after angioplasty he had ventricular fibrillation. Resuscitation was successful. Amiodarone 100 mg was added to earlier medication; beta-blocker, ACE-inhibitor, diuretic, statin and warfarin. Fifteen months later, at the age of 78 years, he found his pulse regular and bradycardic, 40-48 bpm. ECG confirmed sinus rhythm with a first-degree A-V block, a low amplitude P wave, the component of the left atrium in V1 was absent. Atrial contractions were not seen in echocardiography in spite of a small A wave. The diameter of the left atrium was 4.8 cm, the diameter of the left ventricle was 5.6 cm and the ejection fracture 48 %. The patient felt, that his quality of life was essentially better during sinus rhythm. After three weeks of sinus rhythm, paroxysmal AF periods appeared again. Eight months later sinus rhythm and AF vary sinus rhythm being dominant. Case 2. A man with a history of rheumatic mitral valve disease had several attacks of atrial fibrillation. At the age of 49 years the mitral valve was replaced with a Björk-Shiley prosthesis. Three years after heart operation AF became permanent. Fifteen years after heart operation bradycardic regular pulse was found at blood pressure measurement. ECG confirmed sinus rhythm with a first-degree AV block. The left atrium was dilated due to valve disease. There were no changes in the patients medication. Sinus rhythm maintained over six months, then permanent AF returned. The subjective quality of life was equal during AF and sinus rhythm. Conclusion Permanent atrial fibrillation of many years duration, even in patients with large left atria, can occasionally revert to sinus rhythm. Despite electrical sinus rhythm the atria may not be mechanically active. Even sinus rhythm of several months' duration is not a guarantee of

stability. Accordingly, the continuation of anticoagulant therapy is essential, if there are no contraindications.

**PB8 182 USE OF FLUINDIONE IN GERIATRIC POPULATION: CLINICAL AUDIT SIX MONTHS AFTER IMPLEMENTATION OF LOCAL PROTOCOL.**

M. LEFEBVRE\* (Hôpital des Charpennes, Villeurbanne, France)

E. ARMOIRY(1), Y. GUILHERMET(1), C. BUREAU(1) - (1) Hôpital des Charpennes (HCL) (Villeurbanne, France)

Introduction Managing vitamin K antagonists (VKA), an oral anticoagulant therapy, is complex, especially among elderly inpatients for whom there are not any accurate guidelines. A local fluindione induction regimen adapted to geriatric population and management protocol for cases of VKA's overmedication was implemented in November 2006 in Charpennes' Hospital, a geriatric institution in a large teaching hospital (Hospices Civils de Lyon). Methods and materials Six months after local protocol's implementation, we surveyed a clinical audit to evaluate compliance of prescribing practices, of biological monitoring, and of over-anticoagulation management with the recommended protocol. We conducted a prospective observational study, during five months, blinded from the prescriber's knowledge. We defined fourteen conformity criteria like initial fluindione dose or frequency of biological monitoring and we calculated conformity rate between prescriptions and recommendations. Results We analysed thirty cases of fluindione's instauration and forty one cases of VKA's overmedication. We noticed differences between delivered care and local guidelines, especially in regards to biological monitoring: the average conformity rate for prescribing and monitoring fluindione treatment was 53% and 64% for over-anticoagulation management. We noticed that 17% of VKA's overmedication appeared between one and five days after starting a concomitant drug known for having interactions with VKA. That's why we suggested improving the protocols by including additional information, like recommendations for biological monitoring after concomitant drugs' introduction. Moreover we proposed to distribute local protocol more widely. Conclusion In conclusion, this protocol is a useful tool for doctors, but it was necessary to find a better way to diffuse it because it was underused in our study. Finally we started to consider the choice of fluindione and we proposed to adapt the protocol for warfarine: more studies have been conducted with this anticoagulant which appears to present a certain number of advantages like a better galenic form.

**PB8 183 FACTORS LEADING TO UNPLANNED HOSPITAL ADMISSIONS AND UNPLANNED OUTPATIENT CLINIC VISITS IN ELDERLY PATIENTS WITH HEART FAILURE.**

M. STOMPOR\* (Collegium Medicum of the Jagiellonian University of Cracow, Cracow, Poland)

B. WIZNER(1), M. FEDYK-LUKASIK(1), M. DUBIEL(1), T. GRODZICKI(1) - (1) Collegium Medicum of the Jagiellonian University of Cracow (Cracow, Poland)

INTRODUCTION Although the progress in diagnosis and treatment of heart failure (HF) is being observed, episodes of the disease's exacerbation leading to unplanned outpatient clinic visits (UOCV) and unplanned hospitalizations (UH) remain an important challenge for health care. Aim of the study was to determine factors connected with UH and UOCV in elderly patients with HF. METHODS AND MATERIALS The survey was performed in Poland between March and December 2005 in 3980 HF patients from the randomly chosen 400 primary care and 396 cardiologic outpatient clinics in whom questionnaire-based assessment of diagnostic procedures and pharmacotherapy during the last 365 days was performed by trained nurses. RESULTS The patients' mean age was 67,1±11,8 years, 58,4% were male. 42,5% patients experienced at least one UH with mean rate of 3,3±1,99. Significantly more often general practitioners' than cardiologists' patients were hospitalized (46,5% vs 38,4%). The most often causes of hospitalizations were respiratory tract diseases, coronary artery disease, atrial fibrillation, non compliance with recommended therapy. Higher rate of UH was observed among men, younger subjects, those living in rural area, with lower EF, more advanced NYHA class, treated with diuretics, spironolactone or digitalis and patients with more co-morbidities. 34,7% patients had UOCV with mean number of visits 3,1±3,0. Significantly more often general practitioners' than cardiologists' patients had UOCV (49,0% vs 21,6%). Older subjects, living in rural area, with lower EF, more advanced NYHA class, treated with diuretics, spironolactone, or digitalis, not receiving beta-blockers, with co-morbidities experienced UOCV significantly more frequently. CONCLUSIONS Presented study shows that the number of UOCV and UH in elderly patients with HF is related to advanced HF, co-morbidities and managed in general practice. Improvement in availability of cardiologic care in those patients especially living in rural areas should be considered to reduce the number of UH and UOCV.

**PB8 184 THE ATTITUDES AND APPROACHES TO DECISION MAKING ABOUT ANTIHYPERTENSIVE TREATMENT IN ELDERLY PATIENTS.**

C. PERRET-GUILLAUME\* (Service de gériatrie, Hôpital de Brabois, Vandoeuvre-lès-Nancy, France)

C. GENET(2), D. ALLALI(2), F. HERRMANN(2), S. HURST(3), U. VISCHER(2) - (2)

Department of Rehabilitation and Geriatrics, Geneva University Hospitals (Switzerland);

(3) Institute for Biomedical Ethics, Geneva University Medical School (Switzerland)

Introduction/aim: Despite proven efficacy, treatment for hypertension meets with high non-compliance rates in elderly people. Patients' perception of disease and benefits of treatment are important determinants of compliance. We tested the acceptance of anti-hypertensive treatment and its determinants in a population of elderly patients. Methods: After illustrated explanations of the consequences of hypertension in older people and hypothetic benefits/risks of treatment, 120 patients > 65 years old were asked for their willingness to take treatment in 15 scenarios proposing different absolute risks of cardio-vascular events, risk reductions by treatment and incidences of side effects. Patients also answered the Autonomy Preference Index (API), assessing their preferences for medical information and participation in decision-making. Results: 96 women and 24 men (mean age 83,8, range 65-97) completed the interview. 82% presented with hypertension, 65% were aware of it, but only 22-34% were aware of their antihypertensive treatment. Only 6% of patients refused treatment under any circumstances, 20-30% couldn't make up their mind after detailed explanations, 10% were willing to accept treatment only with zero side-effects. A majority (50-60%) accepted treatment irrespective of absolute risk, risk reduction or incidence of side effects. Treatment acceptance rates were significantly higher in patients aware of their hypertension. The API indicates that most patients want to receive extensive information but that they usually prefer to leave important or complex medical decisions to their physician. Conclusions: A majority of elderly patients accept antihypertensive treatment whatever the risks, risk reductions and adverse drug effects. However, they are uncomfortable with this decision and would rather leave it to their physician, even though a majority wants to receive extensive information. Promoting better awareness and understanding of anti-hypertensive treatments by repeated explanations at follow-up visits could improve both safety and patient compliance in elderly hypertensive patients.

**PB8 185 ACUTE FULMINANT MILIARY TUBERCULOSIS WITH ADULT RESPIRATORY DISTRESS SYNDROME IN AN OCTOGENARIAN**

I. IRAIZOZ\* (Hospital de navarra, Pamplona, Spain)

J. ALONSO(1), A. CASAS(1), N. MARTINEZ(1), H. GOMEZ(1), J. REDIN(1), J. LARRION(1), B. GONZALEZ(1) - (1) Hospital de Navarra (Pamplona, Spain)

INTRODUCTION: Miliary tuberculosis is a life-threatening disease resulting from the haematogenous spread of *Mycobacterium tuberculosis*. It also features as an unusual cause of acute respiratory distress syndrome (ARDS). When ARDS develops after miliary TB the prognosis is worse. According to the limited number of articles reporting the outcome of ARDS caused by miliary tuberculosis, the fatality rate ranges from 33% to as high as 100%, which is far higher than for ARDS from other causes. METHODS: We report the case of an 82 years old woman with a previous history of primary middle lobe pulmonary tuberculosis, hypertension, depression and disability after hip fracture, who was admitted to the acute geriatric ward with a short history of progressive anorexia, nausea, constitutional symptoms and severe functional decline. On examination she was confused and dysphonic. Temperature was 38,1 °C, pulse 101 beats/min, blood pressure 140/80 mmHg and respiratory rate 26/min with basal oxygen saturation of 74% and 82% while on 3 L/m oxygen by face mask. She appeared dyspneic with labored breathing. Lung examination revealed crackles in both lung fields. She had tachycardia with regular rhythm. Laboratory investigations revealed a L (92% neutrophils, 6% lymphocytes, white blood cell count of 7800/ 2% monocytes) with platelet count of 152000/  $\mu$ L; aspartate transaminase of 58 U/L with normal rest liver function test and elevated reactants acute phase. Chest radiograph showed diffuse bilateral interstitial infiltrates and right lung consolidation areas. The patient was started on empirical antibiotics, supplemental oxygen and systemics corticosteroid. Because of aspiration episode, she had a rapid progression of her clinical state, dying 5 days after admission. RESULTS: Autopsy reported middle lobe cavitary lesion and disseminated tuberculosis involving the lungs, liver, bone-marrow and spleen. CONCLUSION: This case confirms the difficulties in identifying patients with miliary tuberculosis and its ominous prognosis when ARDS is developed.

**PB8 186 DYSFUNCTION OF MICROCIRCULATION AND LEFT VENTRICLE FUNCTION IN THE ELDERLY WITH HEART FAILURE.**

M. DUBIEL\* (Collegium Medicum of the Jagiellonian University of Cracow, Cracow, Poland)

J. KROL CZYK(1), M. STOMPOR(1), T. GRODZICKI(1) - (1) Collegium Medicum of the Jagiellonian University of Cracow (Cracow, Poland)

Introduction Periphery circulation dysfunction is an element of hemodynamic irregularities in patients with heart failure (HF). The aim of this study was to assess skin microcirculatory and to establish relation between microcirculatory parameters and indices describing left ventricular function. Methods: 100 patients were involved in study. Each patient was interviewed to obtain anthropometric data, information concerning medication, NYHA classification. Blood pressure, echocardiographic examination and assessment of skin microcirculatory were performed with respect to all patients. Forearm skin microcirculatory blood flow was measured using Laser Doppler Flowmetry. First, three minute flow in basal conditions was measured, then three minute ischemic reaction was performed, followed by three minute reactive hyperemia and eight minute vasodilatatory reaction with temperature of 44 degrees Centigrade. Measurements were taken of mean flow in basal conditions (MFb), peak flow in hyperemic reaction (PF), mean flow in 44 degrees Centigrade (MF44). Patients were divided into a group with normal left ventricle end-diastolic diameter (LVEDd) and with left ventricle enlargement ( $\geq$ 5,6 cm),

and group with normal and impaired ejection fraction (EF<45%). Relations between parameters of microcirculation and echocardiography were measured using correlation, followed by multi-variable analysis. Results: Average age of patients was 68,2±11,5; 57% were male. Patients with systolic dysfunction had significantly lower values of flow in basal conditions and in higher temperature. Comparison of patients with and without left ventricle enlargement also showed differences in microcirculatory indices. Patients with left ventricular enlargement had significantly lower values of PF and MF44. Moreover, significant negative correlation between LVEDD and microcirculation was found for MF44 ( $p=0.02$ ). Both relations remained significant after adjustment for sex, age and medication. Conclusions: In HF, both left ventricle dilatation and reduced EF are accompanied by impaired skin microcirculatory function. Key words: heart failure, microcirculatory, ejection fraction, left ventricle diastolic diameter, Laser Doppler Flowmetry.

**PB8 187 EFFICACY OF CYCLOPHOSPHAMIDE FOR CORTICODEPENDENT GIANT CELL ARTERITIS**  
**J. BOUTEMY\*** (CHU Côte de Nacre, Caen, France)  
**Y. OLLIVIER(1), C. CREVEUIL(1), A. ZOULIM(1), B. BIENVENU(1), P. LETELLIER(1)** - (1) CHU de Caen (Caen, France)

Glucocorticoids (GC) are considered as the best therapies for Giant Cell Arteritis (GCA). However relapses affect near 50% of the patients and may lead in some cases to GC-dependency. In addition, because of their advanced age (mean age : 75 years), GCA patients are particularly sensitive to consequences of a long-term GC treatment. The use of Cyclophosphamide (CYC) have already been studied in an elderly population in oncology, haematology and currently for necrotizing vasculitis (CORTAGE Study). CYC is well tolerated, as long as dosage is adapted to the renal function, and as monitoring is carefully conducted. In this study, we assessed the effects of monthly intravenous CYC pulses in the GCA treatment. In a same hospital unit, CYC was administrated to GC-dependent patients (defined as a daily uptake of prednisone  $\geq 20$  mg at 6 months or  $\geq 10$  mg at 1 year) or those suffering from side-effects of GC. Our objective was to determine if CYC could reduce or not cumulative GC requirement (daily dose of prednisone  $\leq 10$  mg at 6 months after CYC initiation) and GCA relapses. Ten patients with GCA diagnosis (according to ACR 1990 criteria) were included in this study. Our objective was reached for 8 patients (daily dose of prednisone  $\leq 10$  mg at 6 months, without relapse). CYC was associated with a significant decrease in daily average intake of prednisone ( $p=0.0051$  - Wilcoxon signed-rank test). Tolerance of the treatment was good in 8 patients (side effects grade  $\leq 2$  on the WHO scale). In the remaining two patients, neutropenia - including fever in one case - were observed. Both were resolved favourably. CYC treatment for patients suffering from GC-dependent GCA (or from severe side-effects) seems efficient and should allow thus the use of GC in a lesser extent. Toxicity levels are acceptable, as long as CYC intakes are tailored to each patient.

**PB8 188 AORTIC STIFFNESS PREDICTS HYPOTENSION DURING ANAESTHETIC INDUCTION IN ELDERLY**  
**A. BENETOS\*** (Nancy University Hospital , Vandoeuvre, France)  
**C. ALECU, E. CUIGNET-ROYER(2), H. BOUAZIZ(2), P. SALVI(1), H. VESPIGNANI(3), P. MERTES(2)** - (1) Department of Geriatrics (Vandoeuvre, France); (2) Department of Anesthesia and Reanimation (Vandoeuvre, France); (3) Department of Neurology (Vandoeuvre, France)

**BACKGROUND:** In aging general population, clinically significant hypotension during induction of anesthesia and cardiovascular postoperative complications are of 0.5% and 2% respectively. The aim of this study was to establish, in a population aged 60-80 years having a non-cardiovascular surgery, if an elevated arterial stiffness, assessed before surgery is correlated with a more pronounced hypotension during anesthesia induction. **PATIENTS AND METHOD:** Carotid-femoral pulse wave velocity (c-f PWV) an indicator of aortic stiffness was measured with the PulsePen® during the pre-surgical anesthetic evaluation. During anesthesia induction (30 minutes) with propofol and remifentanil, monitoring included electrocardiography, pulse oxymetry, non invasive blood pressure, bispectral index (BIS) and oxygen concentration. Anesthesia was induced so as to maintain BIS values between 40 and 50. Heart rate and blood pressure were recorded every 150 seconds. **RESULTS:** 45 patients aged 71.1±5.8 years were included in the study, (62% women). The mean value of c-f PWV was 12.1±3.9 m/s. During anesthesia, BP diminished with a maximum decrease of 64.9±23.5 mmHg for SBP. There was no correlation between hypotension during anesthesia induction and the quantity and rhythm of propofol or remifentanil. In bivariate analysis, hypotension was correlated with age and c-f PWV. In stepwise regression including PWV, history of cardiovascular events, age and ASA score, only c-f PWV influenced significantly SBP variation during anesthetic induction ( $R^2=12.7\%$ ). **CONCLUSION:** Increased aortic stiffness assessed with PWV measured at the pre-operative anesthetic evaluation is associated with a more pronounced hypotension during induction of anesthesia. This, measurements of aortic stiffness could be a good indicator of the risk of hypotension during anesthesia induction.

**PB8 189 THE IMPORTANCE OF RISK FACTORS IN EVALUATION OF CARDIOVASCULAR DISEASES IN THE LONGEVIVES**

**A. TEIXEIRA\*** ("Fluminense" Federal University, Rio de Janeiro, Brazil)  
**G. POPESCU(1), J. NOBREGA(2), E. AZEVEDO(3), J. TEIXEIRA FILHO(4), J. TEIXEIRA(5)** - (1) 'Ana Aslan' National Institute of Geriatrics and Gerontology (Romania); (2) State University of Paraíba (Brazil); (3) Clínica Proaslan (Brazil); (4) 'Gama Filho' University (Brazil); (5) Federal University of Paraíba (Brazil)

It is welknown the risk factors are these individual peculiarities which could produce an ailment. The incrimination of risk factors in determining of cardiovascular diseases need no comments, this just was provide. On the other hand, it is well known that aging produces age-related changes, which interfere with pathological processes. It is normal to ask about the wheight of risk factors in the very old patients with cardiovascular diseases. The goal: The study aim was the assessment of the risk factors' value in the longevives patients with different cardiovascular diseases. Method: We evaluated 136 patients( 42 males and 94 females) aged over 85, with different cardiovascular diseases, in whom were followed : living area ( town/ country ), smoking, dislipidemia, obesity, diabetes mellitus, hypertension. Results: We observed a directly relationship between the number of risk factors and the cumulation of cardiovascular diseases , between the number of risk factors and the degree of cardiovascular diseases; it was discovered an cotrarily relationship between number of diseases, their vdegree and the very old age. No significant relationship was discovered between number of risk factors and gender or living area of patients. Conclusion: In the longevives the role of the risk factors incriminated in cardiovascular diseases determining is decreased comparative with degenerative age-related changes.

**PB8 190 PROGNOSTIC VALUE OF THE N-TERMINAL PRO-BRAIN Natriuretic Peptide IN GERIATRIC PATIENTS WITH ACUTE MYOCARDIAL INFARCTION**

**R. TOUFIQ\*** (CHU Limoges, Limoges, France)  
**M. PICAT(1), J. MEYNIER(1), T. DANTOINE(1)** – (1) CHU Limoges (Limoges, France)

Aim : to evaluate prognosis of patients over 75 years old with Acute Myocardial Infarction, based on NT-proBNP levels measured in the acute phase of myocardial infarction. Methods : the study included all patients hospitalized between january 2008 and 2009 with acute myocardial infarction, either with or without ST segment elevation. The NT proBNP in serum was measured in all patients upon admission to hospital. Results : The NT proBNP was measured in 18 patients with acute myocardial infarction, median age of 89.5 (range 82-97 years) and sex ratio (F/M) of 3.5. 12 patients (66.7%) were malnourished. The average troponin level measured in all patients was 0.915. The average NT proBNP level in the studied patients was 11797 and increased with the age of patients. Two patients died during the hospitalization, their NT pro BNP levels were higher than in patients who were alive (41166.5 compared with 10322.5). However, their troponin levels were not higher than the other patients in the group. There was not a significant correlation between these two parameters. The NT pro BNP level is a predictor factor of death. Conclusions : the NT proBNP measured in the acute phase of myocardial infarction, is a likely short-term prognostic factor in patients aged over 75. This study needs to be completed to be able to confirm the results .

**PB8 191 "J-CURVE" PHENOMENON BETWEEN COGNITIVE FUNCTIONS AND BLOOD PRESSURE IN OLD PATIENTS DURING TREATMENT OF HYPERTENSION**

**A. ZHIRKOV\*** (Saint-Petersburg State University, Saint-Petersburg , Russian Federation)  
**V. KOSTENKO(1)** - (1) Research Institute for Emergency medical care (Saint-Petersburg, Russian Federation)

In order to explore the cognitive function of aged people and blood pressure, we examined 125 patient over 80 years of age. There were 72 women among them. All of the patients examined completed higher education and worked as engineers before retiring. People who had myocardium infarction,insult or suffered from Alzheimer disease were not included. For scaling cognitive function parameters MMSE and "10 words" were used. For normal blood pressure determining JNC7 and ZhGS criteria were used. When patients were examined for the first time, they were not given therapy of Hypertension. The next time they were examined after 6 months. The results have shown that all the patients evaluated their cognitive function satisfactory both first and second times they were examined. The psychological test proved these result. There was heterogeneity in results of cognitive tests in some patients. When cognitive function characteristics were compared there was a correlation ( $r=0.43, p<0.05$ ) between cognitive functions and blood pressure disturbance in cases when BP was above 170 and 100. In cases with lower BP correlation turned out to be nonlinear. The best results of cognitive function were in patients with BP 145 and 95 mm.Hg. According to the results, 73 of patients were prescribed to take hypertension therapy, according also to ESC recommendation. They took therapy that lasted 6 months. The next examination showed that 12% of patients felt disorders during the therapy. The average cognitive function rate increased after therapy. Maximum results of cognitive function were in cases when BP was 146 and 94 mm.Hg. Judging from this, we could make a conclusion that hypertension therapy in aged patients may improve their cognitive function. Besides, in that case the phenomenon of "J-curve" connection between BP and

cognitive function is evident. These results are matching HYVET trial results and ZhGS formulas.

**PB8 192 OPERATIONALIZING MULTIMORBIDITY AND AUTONOMY FOR HEALTH SERVICES RESEARCH IN AGING POPULATIONS (OMAHA) - STUDY DESIGN AND PRELIMINARY RESULTS FROM WAVE ONE DATA-COLLECTION**

M. HOLZHAUSEN\* (Charité \_ Universitätsmedizin Berlin, Berlin, Germany)  
M. HOLZHAUSEN (1), C. SCHEIDT-NAVE (2), J. FUCHS(2), M. BUSCH (2),  
A. ERNERT (1), U. HAPKE(2), H. KNOPF (2), J. SIX-MERKER(2), J. WELKE(2),  
P. MARTUS (1) - (1) Charité - Universitätsmedizin Berlin (Berlin, Germany); (2) Robert Koch Institut (Berlin, Germany)

The primary objective of the OMAHA project is to develop a conceptual framework and standardised measurement instruments for the multidimensional assessment of multimorbidity, autonomy and quality of life in old age. Ways of reaching target groups that are difficult to access, such as older immigrants, are also being tested. The overarching aims of the OMAHA project are to provide a defined set of survey instruments that can be used in health and social reporting, and to identify empirically sound means of accessing samples representative of the elderly population. The study consists of two longitudinal arms: one for three-wave telephone interview (CATI; N = 1200), and a second for a two-wave face-to-face assessment including functional tests and basic physical examination (CAPI; N = 300). Assessments consisted of various objective and subjective measures of functionality, physical health, emotional well-being, cognitive ability, depression, eating behaviour, social contacts, and economics. Concerning range of measures, CAPI is considered an extension of CATI. Samples were drawn representatively from the population of Berlin aged 65 years and older. Waves one for CAPI and CATI ran from January and February, respectively. A brief overview over study design and assessment procedures is given. Preliminary results from waves one concerning patterns of physical morbidity and level of functioning are presented.

**PB8 193 ROUTINE IN-HOSPITAL CARE AND PROGNOSIS OF ELDERLY PATIENTS WITH HEART FAILURE**

departement de Geriatrie (France)

Introduction: Most of the studies performed in heart failure (HF) patients have been conducted in middle-aged adults. However, patients with HF are mainly elderly patients in whom management is complicated by comorbid conditions. Little is known about the quality of care among this population. Methods: The aim of this prospective and multicenter study was to describe the in-hospital management in routine clinical settings of elderly patients over 75 years presenting to the emergency department with pulmonary oedema. Results: During the 12-month study period, 398 patients were enrolled in 5 French emergency departments. 96% of them had at least one major comorbid condition and the prevalence of cognitive impairment was high (63% of patients with a Mini Mental State Examination <20). Admission in cardiology departments (33.7%) was associated with previous cardiologic assessment (OR: 2.32 [1.33-4.07]), prior coronary artery disease (OR: 2.39 [1.47-3.87]) and elevated troponin (OR: 1.67 [1.03-2.70]). By contrast, cognitive impairment (OR: 0.39 [0.24-0.62]) was associated with non-cardiology department admission (66.3%). 64.1% of patients admitted to cardiology department underwent echocardiographic assessment versus 23.7% of the others ( $p<0.01$ ). A preserved left ventricular ejection fraction ( $\geq 45\%$ ) was found in 70.5% of patients. Recommended treatments were under-prescribed at admission (48.1%) and were more likely to be delivered at discharge to patients admitted to cardiology departments (OR: 1.51 [1.01-2.23]). In-hospital mortality (11.0 %) was not associated with department speciality. However, the two years survival of patients treated with recommended medications at discharge was significantly improved compared with patients treated by symptomatic drugs. Conclusion: Routine care of HF was dependant on non-cardiologic factors in this elderly population. Our findings suggest that the institution of protocols to standardize care could improve compliance with guidelines and long-term outcomes.

**PB8 194 MORTALITY OF ELDERLY PATIENTS WITH HEART FAILURE ADMITTED TO AN ACUTE GERIATRIC UNIT: THE IMPORTANCE OF FUNCTIONALITY AND COMORBIDITY**

C. RODRIGUEZ PASCUAL\* (HOSPITAL MEIXOEIRO, VIGO, Spain)  
A. VILCHES MORAGA(1), E. PAREDES GALAN(1), A. FERRERO MARTINEZ(1),  
M. TORRENTE CARBALLIDO(1), M. LÓPEZ SÁNCHEZ(1), O. LAZARINI(1),  
M. OLCOZ CHIVA(1), J. VEGA ANDIÓN(1), M. LOPEZ SIERRA(1) - (1) Hospital  
Meixoeiro (Vigo, Spain)

INTRODUCTION.- HF is the most frequent cause of hospital admission in elderly patients and has a general 2-year mortality of 50%. There is no studies on particular aspects of

older-old patients with HF. There is no information about the influence of physical function, comorbidity and cognitive function on the mortality of these geriatric HF subpopulation. METHODS.- Prospective study of patients admitted to our AGU since 1 October 2006 until 30 April 2008 with diagnosis of HF. The patients should fulfil de European Society of Cardiology and the Framingham diagnostic criteria for HF. At discharge the patients was followed during 1 year. Chi square and Student t test was used to investigate variable relations with .05 significance cutpoint. For adjusting with variables known related with mortality in univariate analysis and literature, a logistic regression analysis was used with progressive elimination of variables from the model. RESULTS.- 310 patients, age 86 years and 69% women. Mortality during index hospitalization was 18% and one-year mortality 40%. Mean Charlson comorbidity index was 4.2, 25% were independent in al ADLs, cognoscitive exam showed that 45% of patients scored with cognitive decline and the Yessavage questionnaire indicated that 50% of patients fulfilled criteria for depressive symptoms. On univariate analysis factors related with in-hospital mortality was dependence in ADL, mobility problems, literacy, chronic renal failure, Charlson index, NYHA class, mean arterial pressure, creatinin, white blood cells al glucose on admission. One year mortality was related on univariate analysis with dependence on ADL, mobility problems, cognitive decline, Charlson comorbidity index. On multivariate analysis dependence o ADL, Charlson index, NYHA, diabetes mellitus, age and left ventricular ejection fraction was factors that entered on the model predicting one-year mortality. CONCLUSIONS: functionality is one of the main factors determining in-hospital and one-year mortality in geriatric patients admitted due to heart failure.

**PB8 195 AGE RELATED MODIFICATION OF THE TOTAL ANTIOXIDANT CAPACITY AFFECTS AN ATHEROSCLEROTIC RISK FACTOR IN ELDERLY PEOPLE**

E. FABIAN\* (University of Vienna, Vienna, Austria)  
M. BOGNER(1), I. ELMADFA(1) - (1) University of Vienna, Department of Nutritional Sciences (Vienna, Austria)

Introduction: The oxidative conversion of low density lipoproteins (LDL) to oxidized LDL (oxLDL) is considered to be a key event in the process that initiates and accelerates the development of atherosclerotic lesions. oxLDL is more atherogenic than native LDL and elevated levels are associated with a remarkably increased risk of atherosclerosis. However, the formation of oxLDL might be impaired by a high antioxidant capacity in the body. The objective of this study was to characterize the lipid profile and the impact of the total antioxidant capacity (TAC) on oxLDL as an atherosclerotic risk factor in elderly people. Methods and Materials: A total of 102 subjects (45 men, 57 women, normo- and mild hypercholesterolemic) were recruited for this investigation. The participants were divided into three groups: A ( $70>75y$ ; n=48), B ( $75>80y$ ; n=35), and C ( $>80y$ ; n=19). Plasma concentrations of total cholesterol (TC), HDL-cholesterol and triglycerides were determined by enzymatic methods, LDL-cholesterol (according to the Friedewald equation), the TC/HDL, LDL/HDL, and oxLDL/LDL ratios were calculated. TAC was analyzed by a photometrical method, oxLDL using an ELISA kit. Results: In this study no significant differences in plasma TC, HDL-, LDL-cholesterol, and triglycerides could be found between the investigated groups. The indices of atherogenicity, TC/HDL, and LDL/HDL were comparable in all age groups and indicated a rather positive lipid profile (up to 95% within the reference values). Further analyses exhibited an age related significant decrease of TAC values ( $A>C>B$ ) accompanied by a significant increase of oxLDL levels ( $A<0.001$ ;  $B<0.05$ ), resulting in a significantly enhanced age associated oxLDL/LDL ratio ( $A<0.001$ ;  $B<0.05$ ). Conclusion: The findings of this investigation indicate no age associated modulation of plasma lipid profile components and the indices of atherogenicity, but a significant age related decrease of TAC accompanied by an increased level of the atherosclerotic risk factor oxLDL in elderly people.

**PB8 196 INTEREST OF ANTIDEPRESSANT ON ELDERLY WHO SUFFER FROM CORONARY FAILURE AFTER 75 YEARS OLD**

K. TALEB\* (Hospital Bretonneau, Paris, France)  
V. FOSSEY DIAZ(1), A. MISME(1), M. BENBEKINA(1), O. DRUNAT(1),  
Y. WOLMARK(1) - (1) Hospital Bretonneau (Paris, France)

Introduction :According to litterature depression is related to coronary failure.We observed more coronary heart disease among patients who suffer from depression and coronary failure in a rehabilitation geriatric unit. Method:The aim of the study is to evaluate the impact of antidepressant (ISRS) on hospitalized elderly who suffer from heart disease and depression during 6 months.15 patients have been included: all were more than 75 years old, have a coronary heart disease treated and a depression untreated. All have been included evaluated by the GDS ( Geriatric Depression Score), the MNA ( Mini nutritional Assesment ). Coronary accidents have been noticed at the entrance, 3 months and 6 months. Results:The GDS diminishes ( 48 % less at 6 months, p=0.005), less coronary heart disease and none at 6 months, no impact on the MNA No undesirable side effects with the antidepressant have been related. Conclusion:Has antidepressant an effect on the

incidence of coronary heart disease? A prospective study could help us to answer to this question.

**PB8 197 ETHNIC DIFFERENCE IN PREDICTED VALUES OF PULMONARY FUNCTION BY AGE GROUPS**

K. KWON\* (Seoul National University School of Public Health, Seoul, Republic of Korea)  
K. YOON(1), H. CHUN(2), J. SUNG(1), S. PARK(3), B. CHO(3), J. CHANG(4), S. CHO(1) - (1) Seoul National University School of Public Health (Republic of Korea); (2) Seoul National University Institute of Health and Environment (Republic of Korea); (3) Seoul National University College of Medicine (Republic of Korea); (4) KLoSA Team, Korea Labor Institute (Republic of Korea)

Introduction: Predicted values of pulmonary function are used to define the range of expected values for a normal population. Knudson's equation derived from Caucasians is the current standard to estimate pulmonary normal predicted values, used not only in Caucasians but also in Asians. This study is conducted to assess the discrepancy in different age groups resulting from potential ethnic difference involved in pulmonary function equation. Methods and materials: Pulmonary function tests were performed in 509 Korean subjects (217 men; 292 women) aged 47 or older, within the KLoSA Biomarker Pilot study. Chronic lung disease patients were excluded. FVC and FEV1 tests using Micro Plus Spirometer(Micro Medical Ltd., Kent, UK) were conducted 3 times per person, and the maximum value was used. A new pulmonary function equation (KLoSA equation) was derived from our study population by regression analysis. Predicted values were compared between those based on KLoSA and Knudson equations. T-test was used to evaluate the difference for each group. Results: Predicted FEV1 was significantly lower by KLoSA equation than by Knudson's equation in all age and gender groups(overall mean: 2.15 vs. 2.89; p<0.01). In contrast, predicted FVC was significantly higher by KLoSA equation than by Knudson's equation in men aged 65-74 (mean: 3.16 vs. 2.96; p<0.01) and 75+ (mean: 2.87 vs. 2.60; p<0.01), and women aged 75+ (mean: 2.03 vs. 1.98; p<0.01). No significant difference were observed in other groups. Conclusion: This study suggests that the ethnic difference involved in the equations for predicted normal values of FVC may increase with aging. Utility of common and ethnicity-specific pulmonary predicted normal values should be balanced for the particular purpose of study.

**PB8 198 COGNITIVE FUNCTION AND FUNCTIONAL CAPACITY OF OLD PATIENTS WITH HIGH RISK FOR ATHEROSCLEROTIC DISEASE**

Y. GARCIA\* (Medical School of São Paulo University, São Paulo, Brazil)  
E. KLEIN(1), R. MOREIRA(1), R. MIRELA(1), R. DEMARCHI(1) - (1) Clinics Hospital of Medical School of São Paulo University (São Paulo, Brazil)

Introduction: recent studies demonstrate the association of cognitive decline and the presence of risk factors for atherosclerotic cardiovascular disease. The objective of this study is to evaluate the evolution of cognition and functional capacity of old patients with high risk for cardiovascular atherosclerotic disease who attend to a public ambulatory. Methods and materials: in 99 elderly patients who attend to the Cardiovascular Risk Group of the Ambulatory of the Geriatric Discipline of Internal Medicine Department of Clinics Hospital of Medical School of São Paulo University the presence of risk factors (primary prevention) or clinical signs of atherosclerotic complications (secondary prevention) were evaluated. Cognitive function was assessed by Mini Mental State Test (MMST), and Hachinsky isquemic score, depressive mood by Geriatric Depression Scale (GDS) or DSM-IV criteria and functional capacity by Lawton and Katz scales (basic activities of daily living, ADL and instrumental activities of daily living, IADL). This evaluation was repeated every year. Results were compared by frequency tabulation or comparison of means by analysis of variance. Results: mean age was 74 years. Most patients were females (75,7%) and were in the secondary prevention group (53,53%). About educational level, only 12,12% were illiterate. Concerning risk factors, means body mass index (BMI) was 29,2 Kg/m<sup>2</sup>, 92,2% were hypertensives, 55,55% diabetic and 40,4% had inadequate lipid levels. Most elderly were submitted to two evaluations. Mean Hachinsky score was 2,9 for primary prevention group and 2,8 for secondary prevention group. Mean values of MMST did not vary on time (p=0,766) as did mean ADL (p=0,236). Mean IADL decreased with time (p=0,020, mean decrease was 0,20 by year). Conclusion: cognition and basic functions of daily living did not vary with time in this group, maybe because it's clinical control is focused on their particular needs. Patients lost functionality for more complex activities.

**PB8 199 DIFFERENCES IN SURVIVAL AND CLINICAL FEATURES OF PATIENTS DIAGNOSED WITH SYSTEMIC SCLEROSIS BEFORE AND AFTER THE AGE OF 65.**

M. PEREZ-BOCANEGRA\* (Vall d'Hebron Hospital, Barcelona, Spain)  
R. SOLANS(1), C. SIMEON(1), V. FONOLLOSA(1), J. PRIETO(1), M. CAMPILLO(1), M. VILARDELL(1) - (1) Departement Bioestadistica Universitat Autònoma Barcelona (Cerdanyola del Vallès, Spain)

Objective: To analyze the differences in SSc clinical features and survival in patients aged 65 years or more compared with young SSc patients. Patients and methods: Of a total of

319 SSc patients, we identified 67 (21%) patients older than 65. Demographic data such as were SSc subsets, the cutaneous complaint, internal organ involvement and the causes of morbidity and mortality were collected. Results of the elderly and young patients were compared. Results: There were 61 (91%) women and 6 (9%) men aged 65 years or more. The limited SSc subset was more frequent in elderly than in young patients (74.6% vs. 54%, p=0.002). Pulmonary disease (86.6% in elderly vs. 73.8% in young, p=0.034), and cardiac involvement (70.1% in elderly vs. 49.6% in young, p= 0.004) were significantly more frequent in elderly patients. In contrast, esophageal affection (43.3% in elderly vs. 57.5% in young, p=0.040) was less frequent in aged patients. In addition, pulmonary and heart disease appeared significantly earlier after the diagnosis in patients aged 65 years or more. Mortality was significantly higher in elderly than in young patients (35.8% vs. 19%, p=0.005). The most frequent cause of death related to the disease in elderly patients was heart failure. Conclusion: In elderly patients the limited SSc subset is more frequent than the diffuse. Pulmonary and cardiac involvement are more frequent in aged patients and appears sooner after the disease diagnosis. SSc in advanced age is clearly related to a worse prognosis.

**PB8 200 PLASMA BNP HELPS RECOGNIZE CARDIAC FROM NON-CARDIAC ORIGIN OF LOWER LIMB EDEMA IN OLD PATIENTS**

C. BUSSY\* (Charles Foix hospital, Ivry sur Seine, France)  
E. DUBOIS(1), S. CHAUVELIER(1), B. MBWAKONGO(1), C. OASI(1), S. PARIEL(1), J. BELMIN(1) - (1) Hopital Charles Foix (Ivry sur seine, France)

Background : Lower limb edema is a common condition in old patients. Diagnosing the causes of edema is sometimes difficult. Plasma BNP was found to recognize heart failure in old patients with acute dyspnoea. Objective : To improve the detection of heart failure in old patients with lower limb oedema. Methods : Sixty consecutive hospitalized patients with bilateral lower limb edema were included. Standard demographics, clinical and biological data were collected. The etiological diagnosis of lower limb oedema has been determined one of us using medical record analysis, patient examination and additional investigations (echocardiography, lower limb veins ultrasonography, plasma albumin determination) if not available in the medical record. At the same time, plasma BNP value has been measured. Final diagnosis were classified in three categories: edema from cardiac etiology (CE), venous etiology (VE), and other (OE). Patients with edema both venous and cardiac origin were considered as CE. Results : The patients comprised 9 men and 51 women aged 85.3 +/- 7.1 years. Systolic blood pressure was 126+20 mmHg/ and diastolic 71.7+/- 11.3 mmHg. Origin of edema was CE in 20 cases (33.3%), VE in 30 (50%) and OE in 10 (16.7%). BNP values expressed in pg/ml were: CE : 797 +/- 883; VE: 152 +/- 84; OE: 172 +/- 196, p=0.0002. Receiver operating curve showed that the BNP cutoff value of 306 pg/ml had a sensitivity of 0.71 and a specificity of 0.97 to determine cardiac origin of edema. Conclusion: BNP helps recognize the cardiac origin of lower limb edema in old patients, with a BNP cutoff value similar to that used to for the diagnosis of acute dyspnea in old patients.

**PB8 201 ORTHOSTATIC HYPOTENSION AND ELASTIC COMPRESSION STOCKINGS: CLINICAL DESCRIPTIVE AND COMPARATIVE STUDY.**

A. MINARD\* (Henri Mondor's Hospital, Creteil, France)  
S. KRYPCIAK(1), E. ALONSO(1), O. MONTAGNE(2), E. TAILLANDIER(1), E. PAILLAUD(1) - (1) Henri Mondor's hospital, Dpt of internal and geriatric medicine (Cretiel, France); (2) Henri Mondor's Hospital, Centre d'Investigation Clinique (Cretiel, France)

Introduction. Orthostatic hypotension, its functional symptoms and its consequences are a frequent cause of consultation in general hospitals. Methods and materials. Prospective study to determine the prevalence of orthostatic hypotension (OH) in a cohort of 64 elderly patients hospitalized in an acute geriatric ward, to describe and compare a group with OH and a second one without OH, and to assess the interest of preventive or therapeutic of elastic compression stockings. Results. Prevalence of OH in our cohort was 48%. Our study revealed the involvement of antidepressants (p=.013), alpha-blockers (p=6.10-5), IEC (p=.016) in OH and to a lesser extent of diuretics (p=.095) and calcium channel blockers (p=.055). History of arrhythmia (p=.012), ischemic cardiopathy (p=.037), lung oedema (p=.044), diabetes (p=.031) and depressive syndrome (p=.025) predisposed to this pathology. Logistic regression analysis showed that the presence of anti-depressive therapy and history of heart failure appeared to be potential factors for the occurrence of OH (p=.063 and p=.082 respectively). Compression stocking allowed an improvement in functional symptoms of OH (p=.045) and a significant improvement in postprandial pressure loss (p=.001). But patients wearing compression stocking still matched OH criteria. It seems interesting to conduct a prospective study in the longer term to assess the interest of compression stocking on the prognosis for survival of patients with OH. Conclusion. A multidisciplinary approach should prevail in the elderly, often carrying multiple pathologies and risk factors, as well as awareness of the team testing of OH and his subjective symptoms.

**PB8 202 ELEVATED PLASMA FIBRIN D-DIMER AS A RISK FACTOR FOR VASCULAR DEMENTIA: THE THREE-CITY COHORT STUDY**

L. CARCAILLON\* (Inserm, Villejuif, France)

P. GAUSSEM(2), P. DUCIMETIERE(1), M. GIROUD(3), C. TZOURIO(3), K. RITCHIE(4), J. DARTIGUES(5), P. SCARABIN(1) - (1) Inserm U780 (France); (2) Inserm U765 (France); (3) Inserm U708 (France); (4) Inserm U888 (France); (5) Inserm U897, Bordeaux (France)

Introduction: High plasma levels of haemostatic variables have been associated with the incidence of coronary heart disease and stroke. However, few studies have investigated these associations in elderly. Moreover, vascular factors might be involved in the pathogenesis of dementia. Data on the relationship between biomarkers of thrombotic process and the incidence of dementia remain scarce. Methods and materials: Using a case-cohort design within the Three-City Study, a French population-based prospective cohort of subjects aged 65 and more, we investigated the association of baseline levels of fibrinogen, D-dimers and von Willebrand Factor with the 4-year incidence of clinical manifestations of arterial disease (coronary heart disease (CHD, n=199), stroke (n=111) and of dementia (n=167 and 51, for Alzheimer's disease and vascular dementia, respectively). Measurements were performed for all subjects with incident events and for a stratified random sample of the entire cohort (n=1254). Tests for linear trend across quintiles of the parameters distribution were performed. Hazards ratios (HR) compared the last quintile with the first and were adjusted for traditional risk factors. Results: High levels of fibrinogen were significantly associated with increased risks of CHD and myocardial infarction (HR=2.16 and 2.44, respectively). We also found a positive association between high levels of D-dimer and prevalent strokes (n=53, age-adjusted p=0.01). Moreover, increased levels of D-dimer were significantly associated with CHD among younger subjects (aged under 75, HR=3.64) but not among older (p for interaction 0.01). Finally, the risk of vascular dementia increased significantly with D-dimer levels (HR=3.05). No significant association was found between von Willebrand Factor and any of the outcomes. Conclusion: In the elderly, elevated levels of fibrinogen and D-dimer were associated with incident arterial disease. In addition, this study suggests that high D-dimer levels, as a witness of coagulation activation, could represent a new risk factor for vascular dementia.

**PB8 203 PREDICTORS OF SURVIVAL AFTER CORONARY ARTERY BYPASS GRAFT IN YOUNG AND ELDERLY PATIENTS AFTER CARDIAC REHABILITATION**

F. CACCIATORE\* (Maugeri Foundation, Institute of Care and Research, Telese , Italy)

F. CACCIATORE(1), F. MAZZELLA(1), A. PAPA(1), D. ACANFORA(1), G. IANNUZZI(1), G. LONGOBARDI(1), A. NICOLINO(1), L. ODIERNA(1), G. FURGI(1), F. RENGO(2) - (1) Maugeri Foundation, Institute of Care and Research (Telese , Italy); (2) University of Naples-Federico II (Italy)

Introduction: We investigated the prognostic value on survival of distance walked in 6 min (6MWT), ejection fraction (EF) and change in distance walked between admission and discharge in 6 min ( $\Delta$  6MWT) in coronary artery bypass graft (CABG) patients admitted to cardiovascular rehabilitation (CR) and evaluate differences between young and elderly patients (< 65 and  $\geq$  65 years). Methods: We studied 882 patients consecutively enrolled from October 2000 to April 2004, who referred to our institution soon after CABG. A standardized echocardiography and 6MWT was performed at baseline and at discharge. All patients were followed up since April 2006. Results: Mean age of the 882 patients was  $63.8 \pm 8.9$  years, 48.9% with age  $\geq$  65 years. Mean EF was  $52.1 \pm 8.9$ , mean distance at 6MWT was  $303.7 \pm 103.4$  meters and mean  $\Delta$  6MWT was  $90.7 \pm 68.5$  meters. 83 patients (9.4%) died after a mean follow-up of 42.7 months. Cox regression analysis demonstrate that EF (HR= 0.952; 95% CI = 0.920-0.985; p=0.005) and 6MWT (HR = 0.997; 95% CI = 0.993-0.999; p=0.046) were predictive of mortality independently by the effect of age and  $\Delta$  6MWT. When patients were divided into two subgroups according to age (< 65 and  $\geq$  65 years), EF is predictive in the group of patients with age < 65 years (HR = 0.911; 95% CI = 0.864-0.960; p=0.001), while distance walked at baseline was predictive of mortality in patients with age  $\geq$  65 years (HR = 0.994; 95% CI = 0.988-0.999; p=0.040). Conclusion: EF and 6MWT provides independent prognostic information in CABG patients. Different results are observed between young and elderly patients. Different results are observed between young and elderly patients where 6MWT and no EF predicts survival.

**PB8 204 COLLABORATION BETWEEN A NURSING HOME AND A PSYCHO-GÉRIATRICS UNIT.**

A. SIMON\* (Hopital Gerontologique et Medico-Social de Plaisir-Grignon , Plaisir, France)

S. MAMAN(1) - (1) Hôpital Gériatrique et médico-social de Plaisir-Grignon (Plaisir, France)

Background : Behavioral and Psychological Symptoms of Dementia are a reality in Nursing Home. Aim : Determine situations involving a transfer from Nursing Home to Psycho-Gériatrics Unit. Material and methodology : A retrospective study was conducted on patients transferred from Nursing Home to Psycho-Gériatrics during the year 2007. Gathered data were : age, sex, behavioral and psychological symptoms involving a transfer and its plausible etiology, underlying pathology, therapy changes and stay period. Results :

Nine patients were hospitalized during the year 2007, four women and five men. Their average year was 78 years old ( from 68 to 83). The average stay period is 16.4 days. The behavioral and psychological symptom responsible for hospitalization is physical and / or oral aggressiveness in all cases, the etiology most likely involved being an anxiety-depressive syndrome. Seven patients on the nine were presenting a severe dementia, the other two being psychotic. The psychoactive drugs administered are changed in all cases : six patients benefited a change in their anti-depressive treatment, five patients form a change in their neuroleptic drug treatment and three patients had a modification in their benzodiazepine drugs. Conclusion : In most cases, the nursing home are adapted for taking care of the behavioral and psychological symptoms. The aggressiveness, physical one particularly, remains hard to handle and often involves a transfer to specialized unit.

**PB8 205 UNDERTREATMENT OF DEPRESSION SYMPTOMS AMONG THE OLDEST OLD PATIENTS IN ONTARIO, CANADA**

K. SZCZERBINSKA\* (Jagiellonian University Medical College, Krakow, Poland)

J. HIRDES(2), J. ZYCZKOWSKA(3) - (2) University of Waterloo, Department of Health Studies and Gerontology (Waterloo, Ont., Canada); (3) Jagiellonian University Medical College, Department of Internal Diseases and Gerontology (Krakow, Poland)

Introduction: Prevalence of depression decreases with age among elderly people. However, early recognition and appropriate treatment of depression remain a problem among the oldest of the elderly. Our study questions concerned: prevalence of symptoms of depression among older persons admitted to home care (HC) and Complex Continuing Care (CCC) hospitals, risk factors for depression related to those two types of services, rate of antidepressants use by elderly patients with depression. Methods and materials: 191,987 patients aged 65 and older were assessed: 114,497 enrolled to HC and 77,490 to CCC in Ontario province of Canada. Data was collected using RAI 2.0 (1996-2004) in CCC and RAI-HC (2003-2004) in HC. Model of risk factors for depression among elders was tested in logistic regression analysis to assess influence of those factors on depression occurrence. Afterwards, frequency of antidepressants use depending on patient's age and type of care was assessed. Results: Prevalence of depression symptoms among older HC-enrollees was lower (12.0%) than in CCC (23.6%). It decreased significantly with age in HC (to 6% in centenarians) and did not in CCC. Common risk factors for depression in both types of care were: moderate to severe dementia, instability of health, daily pain, ADL disability, high numbers of medicines and diseases, but advanced age lost its protective meaning in front of illness and disability of patients in CCC. Less than half of elderly enrollees in HC and CCC reporting symptoms of depression were treated with antidepressants. Moreover, use of antidepressants by those patients decreased with age in both types of care (from about 40% in persons aged 65-70 to 18% in centenarians). Conclusions: Undertreatment of depression in elderly persons remains a serious problem. Learning more about risk factors for depression among the oldest elderly might improve detection of its symptoms and accuracy of recognition.

**PB8 206 IS AGING JUST A DISEASE? COGNITION, FUNCTIONALITY AND SOCIO CULTURAL CONSIDERATIONS IN THE VERY OLD ELDERLY AND CENTENARIANS**

D. MATALLANA\* (Universidad Javeriana, Bogotá, Colombia)

P. MONTAÑES(1), C. CANO(2), S. CECILIA(3) - (1) Universidad Nacional (Bogota, Colombia); (2) Universidad de los Andes Fundacion Santafe (Bogota, Colombia); (3) Universidad Javeriana (00100, Colombia)

Introduction: An increase in the elderly population does not necessarily widen our knowledge in the very old (older than 85 years old) and centenarians, when regional, social and cultural ageing matters, define their normal and pathological boundaries. This study aims to identify an integral functional and cognitive assessment of the very old and centenarians with and w/o Alzheimer's disease in a Colombian sample. Methods: A total of 95 subjects were included: 23 Young-Old (YO) and 14 Old-Old (OO) patients with Alzheimer's disease; 8 centenarians(C) and 50 normal subjects. Subjects were evaluated at the Memory Clinic of Hospital San Ignacio in Bogotá, Colombia, between 2000-2008. National Institute of Neurological Disorders and DSM-IV criteria were used to diagnose AD in case of cognitive impairment. Socio cultural dimension of patients and families were evaluated by examining daily and basic activities where normal and pathological functioning will be discussed through a qualitative analysis. A range of neuropsychological measures was compared among groups of patients diagnosed with Alzheimer's Disease (AD). Patients were classified as Young-Old (YO,  $\leq$  70 years), Old-Old (OO,  $\geq$  80 years) according to the NINCDS-ADRDA criteria for Probable Alzheimer's Disease, and were not depressed. Patients were matched for age with a group of normal controls, also without evidence of depression (Yesavage Geriatric Depression Scale  $\leq$  5) and MMSE  $\geq$  24. All groups were matched for gender and education. Results: A statistically significant ( $p<0.01$ ) difference was observed in all measures, where different profiles emerged: through a description of Mild Cognitive Impairment as well as mild Alzheimer's disease in young old, very old and centenarians subjects, deep analysis will support adaptations based on

critical analysis of the traditional instruments, the paradigms that endorse them, as well as a proposal of other alternatives when interpreting ageing in the very old.

**PB8 207 IMPROVING PSYCHIATRIC CARE OF OLDER MEDICAL INPATIENTS: TWO-YEAR EXPERIENCE WITH A SPECIAL INTEGRATED MEDICAL-PSYCHIATRIC UNIT**

G. GOLD\* (University Hospitals of Geneva, Thônex, Switzerland)  
P. HUBER(1), L. LAURENT(2), T. VÉRONIQUE(1), G. UMBERTO(2),  
C. CHRISTIAN(1), G. PANDELIS(2), G. GABRIEL(1) - (1) Department of rehabilitation  
and geriatrics, University Hospitals of Geneva (Thônex, Switzerland); (2) Department of  
psychiatry, University Hospitals of Geneva (Thônex, Switzerland)

**Objectives:** Psychiatric co-morbidity is common in geriatric patients hospitalized for somatic conditions, and is associated with an increase in adverse outcomes and a longer length of stay. In order to address this issue, we developed a special 8-bed medical-psychiatric unit in our Geriatrics Hospital. **Methods:** Admission criteria include the presence of a somatic disorder associated with an acute psychiatric disorder. Individuals with significant cognitive impairment or who require involuntary admission to a psychiatric institution are excluded. The geriatric multidisciplinary team is reinforced by two full-time nurses specialized in psychiatric care and a part-time senior psychiatrist. Geriatric and psychiatric multidisciplinary care is provided. This descriptive study evaluates the first two-year experience with this unit. **Results:** 180 patients were admitted in 2007 and 2008. Mean (32) and median (27) length of stay in days were similar to that of other units. Sixty-four percent of patients returned home and 4.5% were admitted in a nursing home, 14.5% were transferred to a psychiatric unit and 14% to a long-term care unit. Five patients (3%) died. Most frequent psychiatric diagnoses included depressive disorders, substance-related disorders, anxiety disorders, bipolar disorders, and personality disorders. **Conclusions:** This first two-year evaluation indicates that this new unit is well integrated in our geriatric hospital setting. Early positive outcomes including the fact that the length of stay is comparable to other units are encouraging. However, further evaluation of this model of care is warranted before this approach can be generalised to multiple acute care settings.

**PB8 208 THE HOSPITALIZED OLDER PERSON EDUCATION CURRICULUM H.O.P.E SUPPORTED BY THE EDUCATION DEVELOPMENT FUND**

M. NORRIS\* (Sunnybrook Health Sciences Centre, Toronto, Canada)  
L. ANDERSON(1), R. MEHTA(1), M. CHAIL(1), K. SIVJEE(1) – (1) Sunnybrook Health Sciences Centre (Toronto, Canada)

**Background** The Hospitalized Older Person Education curriculum (H.O.P.E.) engaged five trainees in the Hospitalist Training Program to develop improved knowledge, skills and attitudes in caring for hospitalized older adults. These trainees include four International Medical Graduate students and one University of Toronto Family Medicine resident. The core competencies of the Society of Hospital Medicine are included in this curriculum, as they are incorporated in the H.O.P.E. curriculum within the different teaching sessions and curriculum content objectives. This evidence-based geriatric curriculum for hospitalists was designed, developed, implemented and evaluated with the goal of enhancing practice and patient safety within the current hospitalist curriculum. **Methodology** An assessment of educational needs was obtained from multiple choice pre-test questions as well as attitude surveys. Each trainee was assigned a presentation and covered the following topics: Dementia/Depression, Falls and Least Restraints, Incontinence, Polypharmacy and Pharmacokinetic Changes with Aging and End of Life Care. Two Sunnybrook Health Sciences' Centre staff geriatricians taught the following topics: Comprehensive Geriatric assessment, Delirium and Hazards of Hospitalization and Patient Safety and End of Life Care. Wound care was taught by a staff family physician. Peer and instructor evaluations from each teaching sessions were collected. Two quality improvement projects have been initiated to assist in improving care of hospitalized older adults. A post test knowledge, attitude, and skills survey along with a focus group survey will be implemented. **Results** The trainee's specialization included; Family Medicine, Geriatric medicine, Cardiology and General Internal Medicine. The result of the pre-test illustrates significant knowledge deficits in the area of care of the hospitalized older adults. The average score on the pre-test was a score of 17/29 (57%) with the highest score being 22/29 (76%) and the lowest score being 11/29 (38%). Conclusion International Medical Graduates and recent Family Medicine residents can successfully engage in an evidence-based hospitalist geriatric curriculum that is highly relevant to their work and effectively teach each other.

**PB8 209 GALANTAMINE IN THE TREATMENT OF MINOR DEPRESSION WITH MILD TO MODERATE ALZHEIMER**

K. ALAGIAKRISHNAN\* (University of Alberta, Edmonton, Canada)

**Introduction:** This is a case report where minor depression features in an Alzheimer's dementia patient, responded very well to Galantamine therapy alone. **Case Report:** A 80 year old female presented with a two year history of cognitive decline and eight months history of minor depression. Depression features include decreased interest in social activities, less energetic, psychomotor slowing and was more withdrawn and lonely. Sleep and appetite was good. Met only three out of the nine features of the DSMIV criteria for

major depression. GDS score was 11/30. Cornell Scale score for depression in dementia was 13. MMSE score was 22/30 and met the DSM IV criteria for Alzheimer's Dementia. CT scan of the brain revealed generalized atrophy. Patient was started on Galantamine 8 mg orally twice a day and subsequently increased to 16 mg orally twice a day after four weeks. Patient's minor depression features responded very well to Galantamine therapy alone in two months. **Discussion:** Depression is seen in 15- 20% of Alzheimer's dementia patients. In Alzheimer's Dementia , mild to moderate depression may manifest as new onset of agitation, apathy, insomnia or change in functional status. Depressive symptoms in dementia should be viewed as a cause of significant and excess disability. Depression is associated with multiple neurotransmitter defects like serotonin, dopamine and acetylcholine. Galantamine is an acetylcholinesterase inhibitor, and an allosteric modulator of nicotinic acetylcholine receptor and is mainly used in the treatment of dementia. Studies suggest Galantamine in addition to mediating cholinergic neurotransmission also by nicotinic acetylcholine receptors may influence several other neurotransmitter systems, possibly modulating the activity of serotonin, dopamine, glutamate and gammaaminobutyric acid in certain nerve tracts. So it is possible that Galantamine, a cholinesterase inhibitor used in the treatment of dementia may also have some anti-depressant effect.

**PB8 210 COGNITIVE IMPROVEMENT IN PATIENT WITH INCIPENT DEMENTIA AND NEW SERTRALIN TREATMENT**

Z. DANZIGOVA\* (Nursing Home of St.Charles Borromeo, Prague, Czech Republic)  
J. TENAIOVA(1) - (1) IVnd Dept. of Internal Medicine, General Teaching Hospital, Charles University in Prague (Prague, Czech Republic)

In this case study we describe 82 years old patient with dementia of combined origine (vascular and Alzhaimer type). She was admitted in nursing home for behavioral changes and disability which resulted in impossibility to stay home alone. In admission, MMSE was 25, ADL test was 65%. GDS was normal, but the patient felt anxiety for live in nursing home. That was the reason for sertraline treatment, the daily dose added to 100mg daily in one month. After two months the patient felt better, started rehabilitation and ergotherapy, but there was no difference in ADL-related vitality. MMSE after 3 months was 27, after 6 months 30. In this time, there was no behavioral changes seemd. Patient was dismissed home. After two years, she still lives home. Her daughter refers occasionally night fuzziness. MMSE is now 25. CT prooved Alzhaimer type changes in combination with postischemical changes. We started donepezil treatment in dose 50mg per day, sertraline therapy continues. Conclusion: Depresiv syndrom can significantly lower life quality in geriatric patients. Relation between depresion and ADL and MMSE tests results is not yet clear. In case of coincidency of depresion, behavioral changes, cognitive and self-sufficiency impairment, the successfull treatment of depresion can lead to overall improvement. In consequence, MMSE normalization should be seemd.

**PB8 211 DEPRESSION, SELF-RATED HEALTH STATUS AND DISABILITY: THE EUROPEAN STUDY ON ADULT WELL-BEING (ESAW)**

L. DOMINGUEZ\* (University of Palermo, Palermo, Italy)  
M. DELEO(1), G. LAMURA(2), C. BALDUCCI(2), S. QUATTRINI(2),  
M. MELCHIORRE(2), A. FERLISI(1), G. COSTANZA(1), E. PUTIGNANO(1) - (1)  
University of Palermo (Italy); (2) INRCA, Department of Gerontological Research, Ancona (Italy)

**Introduction:** Depression was the leading cause of disability, as measured by years lived with a disability in 2000, and will be ranked second worldwide for all ages and both sexes by 2020, according to WHO projections. This complex condition is particularly frequent in older persons, although it is not a necessarily part of usual aging with many seniors being satisfied with their lives despite the challenge of growing old. The self-rated health status (SRHS) is a key determinant of quality of life and it may be a consequence and/or a source of depression. We aimed to examine the relationship of SRHS and depression symptoms according to age, sex and area of residency (urban vs. rural) among participants of the ESAW. **Subjects and Methods:** The ESAW was designed to evidence the main determinants of successful ageing analyzing social support, health status, emotional well being, and financial resources in a population sample (n=12432; age range: 50 to 89 years, 5687 men and 6745 women) from five European countries (Austria, Italy, Luxembourg, Nederland, UK) by means of a detailed questionnaire performed by trained personal. Preliminary results suggested a large variability of SRHS among the countries studied. The questions included in the analysis evaluated the presence of diseases, number of drugs used, ADL, IADL, quality of life, emotional status, and SRHS. **Results:** We observed significant differences in SRHS and depression symptoms from participants living in urban areas vs. those living in rural areas in the total sample, specially among women. After adjustment for age and sex, there was a significant relationship between functional status, depression symptoms, and SRHS. **Conclusion:** In this European sample, negative SRHS may be an indicator of clinical or subclinical depression, which is more prevalent in urban vs. rural areas.

**PB8 212 PREVALENCE OF DEPRESSION IN BEDRID ELDERLY IN MACEIÓ, ALAGOAS, BRAZIL**

R. COSTA\* (Elderly Domiciliary Care Service , Maceió, Alagoas, Brazil)  
F. MELO(1) - (1) Secretaria de Saúde do Município de Maceió (Maceió, AL, Brazil)

The objective of this study was to determine the prevalence of depression in bedrid elderly. A cross-sectional descriptive study was conducted January through December 2008, with

elders at the age of 60 and older who have been registered in Elderly Domiciliary Care Service , Maceió, Alagoas, Brazil. The sample includes 75 patients, who were distributed into age ranges, with intervals of 5 years. The Yesavage's Geriatric Depression Scale was utilized. Variance analysis were made among the groups, along with square qui test, in terms of confidence interval (95%). Female predominance was observed (73,7%), the majority of them was between 85 and 90 years (26,31%). Depression was found in 19 elders (25,3%). Thus, the prevalence of depression is important (25,3%), loss of autonomy and dependence are strongly associated with Organic Brain Syndrome.

**PB8 213 IS DEPRESSIVE SYMPTOMS AS A BARRIER TO PARTICIPATION IN PHYSICAL ACTIVITY AMONG OLDER PEOPLE?**

R. SAHAF\* (University of Social Welfare and Rehabilitation Sciences, Tehran, Islamic Republic of Iran)  
A. MARSHALL(1), H. BARTLETT(2), M. RASSAFIANI(3) - (1) Queensland University of Technology (Australia); (2) Monash University (Australia); (3) University of social Welfare and Rehabilitation (Tehran, Islamic Republic of Iran)

Introduction: Despite the recognition that physical activity has a beneficial role in health and longevity, sedentary behavior is increasing particularly with age. Physical inactivity is also prevalent among depressed people. Therefore, older people, especially those with depression are at increased risk of a sedentary lifestyle. Identifying the barriers to and facilitators of physical activity among older members of the population is important to inform the development of strategies for physical activity promotion. Some qualitative studies have investigated the barriers and facilitators to physical activity among older people. However, no study investigated the barriers and facilitators to participation in physical activity among older people with depressive symptoms. Methods and Materials: This study was a qualitative study that aimed to further explore the barriers and facilitators to participation in physical activity among community-dwelling sedentary older people with depressive symptoms. This study was a qualitative study. The participants were 12 older people with depressive symptoms who participated in a Randomized Controlled Trial. Data collection was conducted through face-to-face in-depth interviews. Data was analyzed using NVIVO 7 Software. Results: The findings suggest health problems and pain are the main barriers to participation in physical activity among older people with depressive symptoms. Generally, different personal, social and environmental factors may stop or motivate older people from engaging in regular physical activity. Conclusion: Although depression did not emerge as a major barrier to participation in physical activity for the participants in this study, it may still be a possible barrier to physical activity for some individuals.

**PB8 214 DEPRESSION AND ONSET OF CARDIOVASCULAR EVENTS: MODIFICATION BY DISABILITY OR INACTIVITY**

M. GLYMOUR\* (Harvard School of Public Health, Boston, United States)  
M. AVENDANO(1) - (1) Harvard School of Public Health (Cambridge, MA, United States of America)

Introduction: Recent research suggests physical activity is a primary pathway linking depression and cardiovascular events. We investigated whether physical inactivity or limitations in activities of daily living (ADLs) modified the relationship between depressive symptoms and first stroke or myocardial infarction (MI) incidence. Methods and materials: Health and Retirement Study participants age 50+ who reported no prior stroke or MI were followed on average 8.2 years (n=19,547). We used Cox proportional hazards models to assess the hazard ratio (HR) associated with elevated depressive symptoms (3+ items on an 8-item Centers for Epidemiologic Study of the Elderly scale) for onset of MI (1,843 events) or stroke (1,707 events). Baseline disability (1+ ADL limitation) and physical inactivity (participation in vigorous physical activity <3 times/week) were examined as potential modifiers using both stratification and interaction terms. Covariates included age, sex, race, own and parental socioeconomic status, marital status, alcohol use, and smoking; supplementary models were adjusted for self-reported hypertension, diabetes or heart disease diagnoses. Results: Baseline depressive symptom elevation was associated with a 36% increase in the hazard of onset of first stroke or MI (95% CI: 1.23-1.51). The HR was similar among the inactive (1.34; 1.20-1.51) and active (1.37; 1.09-1.71). The interaction between inactivity and baseline depression was non-significant ( $p=0.91$ ). Among those with no baseline ADL limitations the HR was 1.37 (1.21-1.54), but depressive symptoms did not predict onset of cardiovascular events among those with 1+ ADL limitation (HR=1.13; 0.93-1.37). The interaction between disability and depression was marginally significant ( $p=0.07$ ). Additional adjustment for comorbidities did not change the pattern of results. Conclusion: Depressive symptoms predict cardiovascular events in both the active and inactive, but the association was attenuated among individuals with ADL limitations. Research should explore whether ADL disability and depression trigger common pathways that increase risk of stroke or MI.

**PB8 215 HOW GOOD ARE WE AT PREDICTING DEATH ON ELDERLY CARE WARDS?**

M. GOSNEY\* (University of Reading, Reading, Berkshire, United Kingdom)  
A. MATTHEW(2), J. WILSON(3) - (2) Royal Berkshire NHS Foundation Trust (Reading, Berkshire, United Kingdom); (3) Royal Berkshire NHS Foundation Trust (Reading, Berkshire, United Kingdom)

Introduction Various algorithms have been developed to ensure that patients that are dying receive optimum therapy. Within the UK the Liverpool Care of the Dying Pathway (LCDP) is frequently used. In order to ensure the optimum care of all elderly patients within the last days of life, this or similar pathways should be introduced at time when clinicians agree that further active therapy is futile and that the patient should be treated with palliative intent. Methods and Materials During a two month period on a 135 bedded elderly care unit a retrospective study was undertaken of all patients who had died. All notes were scrutinised by a Consultant and a Registrar in Geriatric Medicine and a Palliative Care Specialist Nurse. Results 33 patients were identified (mean age 85 years). Eleven died within 72 hours of admission and the remainder had been inpatients for 3-45 days. In 73% of patients, three days prior to death the patient was considered to be declining and death could be predicted for >90% within the last 24 hours of life. A combination of chronic health status (69%) and severity of conditions on admission (53%) as well as failure to progress despite intensive intervention (56) were the reasons for a patients predicted death. In 97% of patients there was no cancer present. Although clinicians could retrospectively identify those patients who were dying they had not been started on the LCDP. Conclusions Although the LCDP is well documented to support patients, their families and healthcare professionals during the last days of life there is a reluctance of staff to introduce the pathway even when death is predictable. Further work needs to be undertaken to identify barriers which result in patients being actively treated despite deterioration and not having a diagnosis of cancer.

**PB8 216 DIFFICULTIES IN THE DESIGNATION OF THE RELIABLE PERSON IN GERIATRICS AND PALLIATIVE CARE**

F. SCHWEITZER\* (Paul Spillmann Center , NANCY, France)  
A. POP(1), I. GANTOIS(1), C. LAMOUILLE(1), M. FRANCOIS(1), T. JONVEAUX(1) - (1) Centre Paul Spillmann (NANCY, France)

Introduction Six years after defining the reliable person and his aim by the law of March, 4th 2002, twice a week a regular evaluation of medical records of patients hospitalized in our unit for 14 months pinpoints difficulties for in getting the information needed. The reliable person is legally appointed for every hospitalized patient to assist him, especially when that person is "fragile". The reliable person helps the patient in his relationships with the doctors to express his will when there is a communication disability. The law of April, 22nd, 2007 about the end of life reinforces this reliable person's role. In France, his opinion is one of advice and prevails against the families'. European or North American legislations include similar directives. Materials and methods 408 medical records of patients hospitalized in 2008 have been analysed. Several groups according their ages were compared: patients older than 65 in follow-care (227) and palliative care units (124) and the group of younger patients in palliative care unit (57). Results The questioning to appoint the reliable person is provided in 80% of cases, for this interviewed population. Finally, the information is available only in 40% cases. The obstacles in naming this person are analysed in the different groups. Conclusion The designation of the reliable person by older patients appears to be limited by the pathologies affecting the comprehension and the expression. This research has to be repeated during the hospitalisation, the pathologies being fluctuant or reversible. A better information concerning the law must be given to the elderly. The training for the nurses which provide this questioning and a regular information towards the whole health care personal appears to be a necessity.

**PB8 217 DEBRECEN LONGEVITY STUDY I. THE HEMORHEOLOGICAL STATUS IN OLDEST OLD RESIDENTS**

A. KOVACS\* (Medical and Health Science Center, University of Debrecen, Hungary, Debrecen, Hungary)  
Z. SZIKSZAI(2), G. PARAGH(1), E. VARADY(3), S. IMRE(1) - (1) 1 st. Department of Internal Medicine, Medical and Health Science Center, University of Debrecen (Debrecen, Hungary); (2) Institute of Nuclear Research of the Hungarian Academy of Sciences (Hungary); (3) Laboratory of Debrecen Health Public Benefit Company (Hungary)

Introduction: Among the elderly population the number and proportion of the oldest-old (defined as age 90 years or older) will increase most significantly in the near future. Since there was no similar study on this target group in Hungary, we decided to make a systemic analysis of the social, clinical and biological conditions of them under this title: Debrecen Longevity Study. Debrecen is the second largest city in the country, and the oldest old residents represent 0.4 % of the total population (834 residents). Methods: The probands were examined in their homes with an interview, based on a questionnaire which contained questions about their nutrition, health status, physical activity, etc. After the interview medical and laboratory investigation were performed in order to evaluate the general health status of the subjects. We examined 52 routine laboratory parameters. Since age-specific reference values are not available for the oldest-old persons neither in clinical practice, nor

in the scientific literature, our results could be compared only to the general, adult reference values. Results: Blood samples were obtained from 304 persons (228 women, 76 men) randomly selected from the total oldest-old population. Most of the investigated parameters were in the normal range. The alterations were not extreme, but they were statistically significant. We compared these results with our earlier laboratory screening test (completed in 2001) of Debrecen residents between 60-74 and 75-89 years respectively. Thus we had the opportunity to compare three age groups. We have experienced significant decreasing trends at cholesterol and triglyceride levels, while there is an increasing trend at HDL-cholesterol level. Conclusions: During aging the population becomes increasingly selected, namely over 90 years only the "survivors" are alive. As the proportion of „survivors" increases, some parameters stop worsening or even show some improvement.

**PB8 218 USE OF PALLIATIVE CARE AT THE END OF LIFE AMONG VERY OLD PATIENTS IN BELGIUM**

L. VAN DEN BLOCK\* (Vrije Universiteit Brussel, Brussels, Belgium)  
R. DESCHEPPER(1), N. BOSSUYT(2), V. VAN CASTEREN(2), L. DELIENS(1) - (1) Vrije Universiteit Brussel, End-of-Life Care Research Group (Brussels, Belgium); (2) Scientific Institute of Public Health (Brussels, Belgium)

Introduction: About half of the persons who die in developed countries are very old (aged 85 years or older). In general, there is little information available concerning the circumstances surrounding death of this group and the care received at the end of life. This study aims to describe how often very old patients of whom death is expected by their general practitioner use a specialist multidisciplinary palliative care team in Belgium, and to compare this with younger patients. Methods: We performed a mortality follow-back study in 2005 (Sentinel Network Monitoring End-of-Life Care [SENTI-MELC] study). Data were collected via the nationwide Sentinel Network of General Practitioners, an epidemiological surveillance system representative of all Belgian GPs. Each week, all 205 participating practices reported all deaths of patients in their practice. Sudden, unexpected deaths were excluded. Results: We studied 892 deaths, representative for Belgium. Specialist multidisciplinary palliative care services were provided in 41% of all cases. Patients older than 85 years of age at death used these services in 27% of cases, compared with 46% of patients younger than 85 ( $p<.001$ ). In a multivariate logistics regression analysis controlling for possible differences in sex, cause of death, educational level, estimated financial status, place of death, urbanization degree of place of residence, and region of Belgium, older patients had a 1.02 times (95% CI 1.01 to 1.03) lower chance of dying while using these multidisciplinary teams than younger patients. Conclusions: Although other studies have shown that palliative care needs are often very high among very old patients, this group uses multidisciplinary palliative care less often than younger patients in Belgium. This might be the result of a lower accessibility of these services for older patients, but might also be related to a lack of recognition of very old patients' needs at the end of life.

**PB8 219 CHANGING CULTURES IN CARE CHOMES TO ENABLE GOOD END OF LIFE CARE**

M. JOHNSON\* (University of Bath, Bath, United Kingdom)

Death and dying is a constant presence in the life and work of care homes. Almost everyone who enters a Home will after an average stay of around 16 months (nursing) or 28 months (social care), die there. The care home is therefore the setting of the last major event of each resident's life. In the UK 80% of all deaths are of people over 65 and 1 in 5 of them take place in or from a care home. Common practice, until very recently has been to send dying residents with any kind of complications (respiratory difficulties or physical pain) to hospital - to die. Almost everyone close to death needs to talk about and be helped with "last things"; whether these are the practicalities of funerals and memorials or more spiritual issues. Staff need to learn the skills to listen and appropriately respond Pain in late life is as likely to be 'biographical pain' as physical or spiritual. Such pain(s) needs to be skilfully and sensitively addressed. At the far end of life, palliative care skills are essential, but they need to be integrated into a broader end of life care for the whole person. Training needs to be appropriate to care homes, not models made and adapted from other settingsCare homes need to recognize that "death is our business". Biographical reflection is the endemic preoccupation of old age. For some, all memories are golden. But my own research, strongly indicates that life review is usually painful and often deeply anguished -a circumstance I call 'biographical pain'. Being willing to and being capable of listening nonjudgmentally to troubled life stories should be a central task for care staff. But they can only do this with proper training that includes non judgmental listening and appropriate, safe, responses.

**PB8 220 THE**

B. ALMEIDA\* (University of Sao Paulo, Santo Andre, Brazil)

The process of dying can be experienced in different ways by each individual, depending on the socio-historical and cultural environment in which they are in. Currently, death is no longer considered a natural phenomenon but it is characterized as failure, impotence or incompetence and being hospitals responsibility.The palliative care is a new approach in

dealing with the process of dying and death itself. Due to proximity and coexistence, the family is better able to monitor the process of health-disease-death of its members. Matherial and Methods: This study is a qualitative research, using interview that took place at diverse family caregivers homes. The objective was to identify and analyze the meanings of the process of dying of nine family caregivers. Results:According to the data obtained the feelings toward the care were: warmth, affection, bonus, sadness, discomfort and worry/anxiety. The feelings toward the process of dying and death were: denial and acceptance of death. Among the difficulties found during the caring process we could mention: lack of technical knowledge, emotional disorders, physical and financial difficulties. Most of the caregivers showed changes in his personal life after having assumed that role. Some interviewees had hope of cure for the patient, while others seem conformed with the situation. In the face of all this, we found that the sources of support that caregivers seek to address the situation include: formal and informal social support, and spiritual support. Discussion: The data revealed that the presence of chronic diseases that lead the elderly in need of palliative care imposes on family caregivers a series of complex and ambivalent feelings. The proximity and inevitability of death of family members collaborate to intensify these feelings, but also allow caregivers to deal with it in a better way.

**PB8 221 MANAGEMENT OF PRESSURE SORES AMONG JUNIOR DOCTORS**

J. DALE-SKINNER \* (Lincoln County Hospital, Lincoln, United Kingdom)  
O. D'SOUZA(1), J. DALE-SKINNER(1), G. HAYES(1), S. PATANWALA(1) - (1) Lincoln County Hospital (Lincoln, United Kingdom)

Pressure sores form an important part in the assessment of the frail elderly patient and contribute to morbidity and mortality. However, doctors often do not take into account pressure sores in the comprehensive management of these patients, leading to their detriment Aim: To evaluate the utilisation of pressure sore documentation among the junior doctors Methods: Doctors who qualified in the past two years, were invited to complete a questionnaire. Results: Twenty five doctors responded, out of a total of about 30 in a district hospital in UK. Majority were medical or surgical. Only one (4 %) regularly examined for pressure sores. When asked, whose responsibility was assessment of pressure sores was, 19 (76 %) said that it was all professionals. Sixty eight percent knew that it was the nurses who documented, while most of the others were not sure. Thirty two percent knew where in the documentation, to look for pressure sore information. Only fifty two percent said the pressure sores influenced the management of patients Conclusion: While most doctors, felt that pressure sore assessments were the duty of all involved professional, very few actually looked for it. Most knew that it was the nurses who documented pressure sores, but a majority did not know where to find it Recommendations Doctor, especially in the most formative years, should be educated about the importance of pressure sores and that this assessment should form a part of the comprehensive geriatric assessments.

**PB8 222 FALL RECORDS IN PERSONS WITH DEMENTIA: A COMPARISON OF DIFFERENT RECALL PERIODS**

T. ZIESCHANG\* (Bethanien Hospital, Heidelberg, Germany)  
M. SCHWENK(1), P. OSTER(1), C. BECKER(2), K. HAUER(1) - (1) Bethanien Hospital (Heidelberg, Germany); (2) Robert-Bosch Hospital (Stuttgart, Germany)

Introduction: The Prevention of Falls Network Europe working group recommends fall recording by combination of a daily prospective method (e.g. fall calendars) with monthly telephone calls (Lamb, 2005). However, is this applicable for persons with dementia? Methods: In a RCT (n=122) on physical training in people with dementia ( $83 \pm 7$  years, MMSE  $22 \pm 3$ ) falls were recorded using five methods: face-to-face interview during practice, phone interview with participants (weekly during 12 week training, monthly during 9 months follow-up), prospective recording by monthly calendar, telephone interview with proxy and GP. Results: The analysis covers six months of fall recording and includes 110 participants (4 deceased, 8 refused). Comparing the three months of weekly phone calls to the three months of monthly phone calls shows a significant decrease in the number of recorded falls even after having excluded falls only registered by face-to-face-interview during practice (85 vs. 56,  $p=0.005$ , Wilcoxon signed-rank test). However, there is no significant difference in recorded falls by calendars (37 vs. 35,  $p=0.55$ ), proxy-interview (36 vs. 38,  $p=0.95$ ) or GP-interview (13 vs. 10,  $p=0.71$ ). The decreased number of reported falls in participant-interviews (56 vs. 23,  $p=0.002$ ) accounts for the difference. Such a considerable decrease in falls after the training intervention seems improbable since we could not register a difference comparing the intervention group with the control group. Furthermore, the number of recorded falls has not changed in any of the other methods. Thus, we presume this difference does not reflect a real decrease in suffered falls but rather the methodological issue of length of recall period. Conclusions: The number of recorded falls in this cohort of persons with dementia is significantly decreased by extending the recall period from one week to one month. Therefore, the Profane-Recommendation has to be re-evaluated for persons with dementia.

**PB8 223 DEVELOPMENT OF AN ALLIED HEALTH PROFESSIONAL (AHP) NEEDS ASSESSMENT TOOL**

L. PEACOCK\* (Hairmyres Hospital, East Kilbride, United Kingdom)  
J. STOBIE(1), S. CREE(1), P. KERR(1), B. MARTIN(1) - (1) Hairmyres Hospital (East Kilbride, United Kingdom)

**Introduction:** Allied health professionals play a key role in comprehensive geriatric assessment. Currently, physiotherapy (PT) and occupational therapy (OT) interventions for older people are not always provided on a needs-related basis. **Aim:** To pilot a tool to assess the AHP resource needs in different types of Geriatric Medicine wards and to inform therapy service provision. **Methods:** Over one day, independent therapists used a specifically designed needs assessment tool to interview members of the multi-disciplinary team on six geriatric wards across three acute hospitals. This included geriatric assessment and specialist rehabilitation wards. This entire process was repeated one week later. **Results:** 277 patients in total with mean age of 82 years. Two thirds were female (no difference between ward types). Median lengths of stay were 11 days (assessment) and 37 days (rehabilitation). The resource needs assessment tool revealed the following: For assessment ward patients, >57% (median 62%) required PT and >42% (median 50%) required OT. Needs were higher for rehabilitation ward patients; >72% (median 83%) required PT and >71% (median 81%) required OT. The specialist geriatric orthopaedic rehabilitation unit had the highest requirements of all. There were marked variations in therapy requirement from one week to the next even within the same ward. Total hours of therapy required ranged from 30-128 hours per week for PT and from 13-127 hours per week for OT. The majority of patients requiring PT need one or more sessions of PT per day. Most OT can be delivered with less frequent input. All ward types had a deficit between patients' weekday therapy requirements and current provision. **Conclusion:** Building flexibility into in-patient therapy provision for older people is challenging. A needs assessment tool has identified resource deficits and highlighted inter and intra ward variability. **Comment:** This tool is now being used to inform service re-design.

**PB8 224 EVALUATION OF THE OUTCOME OF PERSONS AFTER A SEVERE TRAUMATIC BRAIN INJURY AT 60 YEARS AND MORE.**

H. BOUVIER\* (Concept Santé-Délégation de la SFGG, Saint Cloud, France)

**Introduction** The morbi-mortality and the load in care to elderly having had a serious traumatic brain injury (TBI), which is frequent consequence of falls over 60 years and more, is little studied (morbidity, taken care by care, care givers' burden, etc.) **Methods and materials** Objectives : To study the care before and after hospitalization and one year after the accident in order to evaluate the outcome of TBI aged 60 years and more. **Materials :** The functional outcomes of survivors was assessed with the GOS-E test ; the behavior troubles were assessed with the DEX. The burden of the care givers was assessed with the Zarit test and their quality of life with the MOS SF-36. Results Studied population : 121 persons aged 60 and more. The TBI is often isolated. It is mainly masculine and, in most cases, is consecutive to falls. Most of the TBI (79%) get in a « grande garde de neurochirurgie » hospital and 34% are admitted in a service of one of these hospitals ; 40% of the elderly only pass on one hospital service. Among them, 21% had an intracranial pressure (IP) monitoring. At last, 55% of the living people got into a re-education service. The functional outcome of the survivors is rather unfavourable (average : GOS-E=4/8) and they present behavioral troubles (DEX=21,3/80). The burden of care givers is less important than foreseen (21/88) and the quality of life is slightly altered (40,9/100). **Conclusion** As a health problem, the TBI the elderly deserves more prevention, information and care.

**PB8 225 CORRELATES OF HEALTH-RELATED QUALITY OF LIFE OF OLDER ADULTS SEEKING SERVICES FOR VISUAL IMPAIRMENT**

J. RENAUD\* (Université de Sherbrooke, Longueuil, Canada)

M. LEVASSEUR(1), J. GRESSET(2), O. OVERBURY(2), J. DESROSIERS(1), M. WANET-DEFALQUE(3), M. DUBOIS(1), K. TEMISJIAN(3), C. VINCENT(4), M. CARIGNAN(1) - (1) Université de Sherbrooke (Canada); (2) Université de Montréal (Canada); (3) Institut Nazareth et Louis-Braille (Canada); (4) Université Laval (Canada)

**INTRODUCTION:** Health-related quality of life (HRQOL) is a key outcome measure in health research and interventions. Visual impairment, a frequent reported disability among older adults, has a major impact on someone life and potentially on HRQOL. However, few studies explored the correlates of HRQOL of visually impaired older adults. The purpose of this study was (1) to document HRQOL of visually impaired older adults seeking rehabilitation services and (2) to explore the determinants of their HRQOL. **METHODS:** A convenience sample of 64 participants with visual impairment (mean=79.3 years, sd=5.9 years) were recruited at a specialized low vision center in Québec, Canada. Health-related quality of life was measured with the Visual Function Questionnaire-25 (VFQ-25). The potential correlates were: sociodemographic and clinical characteristics including depressive symptoms (Geriatric Depression Scale/GDS-15), level of and satisfaction with participation (Assessment of Life Habits/LIFE-H), perceived activity level and use of technical aids. Correlations of these potential determinants with HRQOL were examined, followed by multiple linear regression analysis. **RESULTS:** The participants had lower HRQOL than normative data from older adults. The vision-specific subscales (near and distance vision) and two psychosocial subscales (mental health and role difficulties) presented the lowest scores. The VFQ-25 was mostly correlated with the GDS-15 and the LIFE-H. Greater level of participation in social roles, higher perceived activity level, use of writing aids and greater satisfaction with participation in social roles, together, were the best correlates to explain better HRQOL ( $R^2 = 0.66$ ;  $p < 0.001$ ). **CONCLUSIONS:** Health-related quality of life of older adults with visual impairment is lower than the general population and is mainly explained by participation in social roles,

perceived activity level and use of technical aids. Vision rehabilitation specialists should be aware that participation correlates are important for HRQOL of this population and should address this aspect in their interventions.

**PB8 226 STANDARD GERIATRIC ASSESSMENT IN A GERIATRIC WARD**

G. BAKÓ\* (Division of Geriatric Medicine, Debrecen, Hungary)

A. SZABÓ(1), F. TIZEDES(1), I. TÁRKÁNYI(1), E. NAGY(1), M. HORVÁTH(1) - (1) Division of Geriatric Medicine (Debrecen, Hungary)

**Introduction** The population of Hungary is getting older similarly to the world. The majority of them suffers from multimorbidity and need hospitalization. Patients and methods Since there is no proper data of health state of elderly patients in our region we made a geriatric assessment among our randomly selected patients over 65 years. We processed the data of 368 patients (249 female and 119 male) accepted from their home to our ward as acute cases hospitalized between 2005 – 2008. We used the standard geriatric assessment questionair. Results Over the age of 65 almost all of the patients are still able for independent daily living. The decrease of independence continuously grows with age. Elderly patients tend to use less instruments, they could learn fewer new things. By the scale of the instrumental activities of daily living a large part of the elderly can hardly live without help. Tinetti's balance and gait examination shows that advancing in age the risk of falling increases gradually, the chance of falling reached 100 % at the age of 95+. Fractures happened over the age of 65 was increaseda gradually and reached 100 % at the age of 95+. The nutritional status was estimated with the help of the MNA. It showed, that 60-70% of them has a high risk of malnutrition. Nearly 40-50% of the patients suffer from moderate depression. The prevalence of a serious depression shows a slight increase with advance in life-years. With the help of MMSE we assessed the degree of dementia. In the age between 75 and 80 ages in 2% we noticed serious, in 5% medium, and in 23% moderate dementia. Conclusion We conclude that, our elder patients are in need of more help, care, solicitude. Furthermore all of these examinations helped us in proper diagnosis, careful treatment.

**PB8 227 TREATMENT OF OSTEOPOROTIC VERTEBRAL FRACTURES BY KYPHOPLASTY**

M. LÁZARO\* (Hospital Clínico San Carlos , Madrid, Spain)

J. CEBRIÁN(1), A. PUENTE(1), F. MARCO(1), J. LÓPEZ -DURÁN(1), J. RIBERA(1) - (1) Hospital Clínico San Carlos (Madrid, Spain)

**OBJECTIVE:** A retrospective clinical and radiological study of patients with vertebral osteoporotic fracture treated by kyphoplasty procedure at a San Carlos Hospital center of Madrid. **MATERIALS AND METHODS.** 104 patients were reviewed (136 vertebrae) between December 2002 to September 2007. Mean age: 71 years. The etiological cause was osteoporotic fracture in all cases. Mean follow-up was 22 months. Pain reduction was assessed by means of the Visual Analog Sacale (VAS), the Karnofsky score and the amount of analgesia used before the procedure and during the follow-up. Pre and postoperative endplate angles were measured to assess the restoration of the sagital alignment. **RESULTS.** A 91 % of the patients improved (97 cases). Mean VAS increased by 5 points (8,45 preop to 3,65 postop). Karnofsky score went from 70 to 87 points. Patients using major opioid went from 54% before surgery to 6% postoperatively. Radiological improvement obtained was 9,8° Coob´s angle (range 0° to 35°). There were 6 anterolateral extravasation, all of them asymptomatic. Two adjacent fractures were detected (both in the first three month postop). **CONCLUSION:** Most cases show a significant improvement whit no associated complications. Kyphoplasty cement augmentation has been a safe and effective method in the treatment of symptomatic vertebral osteoporotic compression fractures (VCFs).

**PB8 228 EVERYDAY PHYSICAL ACTIVITIES AND SPORTS ACTIVITIES IN OLD AND VERY OLD AGE – RESULTS FROM A COMMUNITY STUDY**

V. CIHLAR\* (Heidelberg University, Heidelberg, Germany)

C. ROTT(1) - (1) Heidelberg University, Institute of Gerontology (Heidelberg, Germany)

**Introduction:** Although regular physical activity is essential for healthy aging, only a minority of elderly meet established recommendations. One reason might be that many studies only consider sports activities and ignore everyday physical activities with health enhancing effects. In addition, individuals above age 80 are rarely investigated. **Methods and materials:** Physical activity was assessed through a translated and modified version of the CHAMPS questionnaire to fit the needs of a German sample. With this instrument it was possible to distinguish between physical activity as everyday activities (e.g. gardening) and physical activity as sports activities (e.g. swimming). This questionnaire was mailed to 1002 senior citizens of the city of Heidelberg aged 65 to 94 years in June 2008. The response rate was 35 % for men and 25 % for women. **Results:** Considering only activities with MET values of 3 or above revealed that (1) 15 % of the elderly were sedentary, (2) more than 80 % performed at least one activity (MET  $\geq 3$ ) till the end of the ninth decade, (3) education and income had no effect while morbidity influenced the activity level. More important, (4) about 20 % of the women aged 65-79 reached the recommendations of the American College of Sports Medicine and the American Heart Association by everyday physical activities while only 10 % reached them by sports activities. This effect was less

pronounced in men. Beyond age 80 both kinds of activities strongly declined in women while the activity level of men remained rather stable. Conclusion: Evaluation of only sports activities in the elderly might lead to an underestimation of their actual physical activity level, especially for young old women. Interventions to increase physical activity in the elderly should include everyday activities.

**PB8 229 USEFULNESS OF COMPREHENSIVE GERIATRIC ASSESSMENT (CGA) TO IDENTIFY CARE NECESSITIES OF PATIENTS ADMITTED TO A HOME PROGRAM**

M. MAS\* (Badalona Serveis Assistencials, Badalona (Barcelona, Catalonia), Spain)  
G. SARA(1), D. VERONICA(1), G. JOSEP ANTONI(1), S. SEBASTIA(1) - (1) Badalona Serveis Assistencials (Badalona, Spain)

Introduction: CGA is useful for home care teams in the task of prevention of functional decline and admissions to long term care facilities. The objective of our study is to use CGA to define care necessities of a group of patients with chronic illness admitted for home intervention and follow up. Methods and materials: CGA tools at admission -Lawton Index (LI), Barthel Index (BI), MMSE Folstein Index, Charlson Index (CI) and number of main geriatric syndromes and other related health conditions (NGSOC)- were used for a multidimensional assessment of all patients referred to a new home care service. Results: We analized 99 patients admitted consecutively during six months (age 83.0±7.4, female 60.6%). We defined 3 groups: co morbidity (previously independent to instrumental and basic activities of daily living (ADL) patients, main diagnosis COPD, 19%); frail (previously independent to basic ADL patients, main diagnosis heart failure and femur fracture, 41%); and geriatric (previously dependent to basic ADL patients, main diagnosis dementia, 39%). CGA at admission of each group found: age (75.9±8.0; 82.3±5.8; 87.3±5.6, p<0.001), LI (3.6± 1.9; 1.0±1.0; 0.0±0.0, p<0.001), BI (88.0±12.0; 64.22±28.6; 19.1±19.7, p<0.001), MMSE (25.3 ±2.8; 22.9±5.3; 10.9±8.5, p<0.001), CI (2.3±1.4; 2.1±1.4; 2.6±1.2, p 0.379); NGSOC 1.5±0.8; 3.8±1.6; 5.7±1.7, p<0.001). Significant differences in prevalence of geriatric syndromes and related health conditions (%) were found in walking instability in the frail group (10; 54; 28, p <0.001), and in immobility (0; 15; 69, p<0.001), pressure ulcers (0; 19; 36, p<0.05), dementia (0; 14; 69, p<0.001), delirium (0; 2; 30, p<0.001), incontinence (5; 49; 87, p<0.001), constipation (0; 44; 67, p<0.001) and terminal illness (0; 2; 15, p<0.05) in the geriatric group. Conclusion: CGA at admission detected different health status for each group. Due to this situation it seems necessary to define specific intervention programs for each of these groups.

**PB8 230 THE 6-MIN WALK TEST IN ELDERLY WOMAN: CORRELATION WITH CARDIOPULMONARY AND ANTHROPOMETRICS VARIABLES AND PHYSICAL ACTIVITY LEVEL**

A. DORNELAS DE ANDRADE\* (Universidade federal de Pernambuco, Recife, Brazil)  
A. GAMA(1), P. MARINHO(1), M. PESSOA(1), D. BRANDÃO(1), L. ALCOFORADO(1) - (1) Departamento de Fisioterapia - Universidade Federal de Pernambuco (Recife, Brazil)

The six-minute walk test (6MWT) is commonly used to measure the functional exercise capacity and the execution of the daily activities. The 6MWT can be performed by elderly, in which aging is generally accompanied by decline in physical activity and functional capacity. Aim: To analyze the 6MWT applicability in elderly woman and to correlate it with cardiopulmonary and anthropometrics variables and also with physical activity level. Method: 45 elderly women were studied. Weight, height, blood pressure, heart rate, oxygen saturation (SaO<sub>2</sub>), ventilometry, and spirometry were measured and they answered the International Physical Activity Questionnaire. The Enright and Sherrill equation was used to calculate the predicted distance (PD). Results: Lower walking distance (WD) for higher body mass index (BMI) was observed. The WD mean was 453.20 ± 66.29m, greater than the PD of 437.76 ± 40.26m. Significant correlation between age(r=-0.37, p=0.01), Peak Expiratory Flow (r=+0.36, p=0.017), heart rate gain (HR) (r=+0.50 p = 0.001) and oxygen saturation fall (r=-0.35,p=0.022), were found. For higher BMI a lower WD was measured. Correlation with physical activity level showed greater DW for higher physical activity levels. Conclusion: Age, Peak Expiratory Flow, heart rate, oxygen saturation and the physical activity level had significantly influenced on WD. Larger WD than PD was also found in this research. These results suggest that more studies should be done to analyze the correlations and equation adjustment for each population.

**PB8 231 FALLS BY AWKWARDNESS? NEVER!**

F. DECLIPPELEIR\* (Centre Hospitalier de Chambéry, Chambéry, France)  
J. ZIRNHELT(1), I. CLERC-GIRARD(2) - (1) CH Chambéry (Chambéry, France); (2) CH Chambéry (Chambéry, France)

Introduction: Falls by elderly are often a reason for admission in emergency services. The care is inconstant and sometimes incomplete, without diagnosis, handling only consequences. This study is about falling patients, which were taken into account by the Geriatric Mobile Team (GMT). It analyses differences between reasons for admission, diagnosis made by emergency service and then by the GMT and finally during hospitalisation. The aim of this work is to know whether it is necessary to suggest to

emergency services a protocol to implement for falling patients. Methods and materials: It is a prospective study from June to November 2008 about patients admitted for falls and examined by GMT in UHCD (Unité d'Hospitalisation de Courte Durée). The first step was data-gathering about age, sexe, dependence, frequency of falls, existence of dementia, and way of life. Secondly, informations about plans at short, mid and long term, length of hospitalisation and readmission were collected. Finally, reasons for admission, initial and subsequent diagnosis were compared. Results: 76 patients were included. 60% were between 80 and 90 years old. More than 50% were living alone. Three-fourths had already felt. In 55% of situations, the reason for admission was a fall by awkwardness. This diagnosis was confirmed by emergency service in 33% of cases but only in 5% of situations by GMT. Finally, after investigations, awkwardness was never taken as the etiology for falls, whereas infectious diseases, orthostatic hypotension, dementia and biological disorders were the most frequent diagnosis. Conclusion: Awkwardness is not a valuable diagnosis for falls and falling patients need systematically clinic and paraclinic investigations. As a result, it seems useful to suggest more interventions of GMT in emergency services, more training in those services about this subject and could lead to the determination of standard investigations for falling patients.

**PB8 232 PRACTICE OF PHYSICAL RESTRAINTS IN A GERIATRIC HOSPITAL.**

V. GAUTIER\* (GHU Broca - La Collégiale - La Rochefoucauld (APHP), Paris, France)  
S. HAULON(1), F. BLOCH(1), L. JOFFREDO(1), T. JOUCDAR(1), A. SAUTEREAU(1), M. MANKOUR(1), G. ABITBOL(1), N. CHARASZ(1) - (1) GHU Broca - La Collégiale - La Rochefoucauld (APHP) (Paris, France)

Introduction: During the evaluation of the professional practices, we decided to analyze, a recognized risk practice, the physical restraints. Materials and methods: After the constitution of a multidisciplinary group, it was decided to carry out a clinical audit. We analyzed the population in which was used physical restraints in long term care and sub acute care units over two 6 weeks periods. Four fields of evaluation were selected: medical prescription, installation, supervision and information to patient and his entourage. After analysis of the 1st turn, improvements were made before the 2nd turn. Then a 3rd was carried out 18 months later. Results: 25 situations of physical restraints were isolated during the 1st turn, among which 84% were prescribed, and 76% after appreciation of the benefit risks 18 situations were observed on the 2nd turn among which 100% were prescribed after consideration on the benefit risks but without improvement of the traceability in the patient files: 11% vs 8%. Because some new materials were purchased, there were less missing or degraded materials on the 2nd turn. The supervision progressed between the two turns passing from 16% to 66.7%. Progress was also made for the information given to the patients (78% vs 20%) and to their families (100% vs 88%), but we deplored a weak remaining retranscription. At 18 months of the 2nd turn, 16 situations were still observed among which 94% were prescribed. A specific supervision was programmed in 68.8% of the cases and 37.5% of the given information was retranscribed in the files. Conclusion: Prescribers became aware of the considerable risks of physical restraints. However, it's prejudicial that the reflexion surrounding such an installation was so infrequently retranscribed in the patient file. The third turn confirmed the perpetuation of this risky practice.

**PB8 233 COMPREHENSIVE GERIATRIC ASSESSMENT FOR OLDER ADULTS ADMITTED TO HOSPITAL: INITIAL RESULTS FROM THE COCHRANE REVIEW**

G. ELLIS\* (Monklands Hospital, Airdrie, United Kingdom)  
M. WHITEHEAD(1), D. ROBINSON(2), D. O'NEILL(3), P. LANGHORNE(4) - (1) Wishaw Hospital (Wishaw, United Kingdom); (2) Department of Medical Gerontology (Dublin, Ireland); (3) Department of Medical Gerontology (Dublin, Ireland); (4) Glasgow Royal Infirmary (Glasgow, United Kingdom)

Introduction: We sought to determine the effectiveness of in-patient comprehensive geriatric assessment (CGA) for frail older adults admitted to hospital as an emergency in comparison to routine or general medical acute care. Methods: We searched for randomised controlled trials in the following. The EPOC Register, Controlled Trials Register (CCTR), Database of Abstracts of Reviews of Effects (DARE), The Cochrane Central Register of Controlled Trials (CENTRAL), MEDLINE (from 1966); EMBASE (from 1980); CINAHL (from 1982) and AARP Ageline (from 1978). Results: We identified 21 RCTs comparing CGA with usual care. For the outcome of Death or Institutionalisation at up to 6 months, there was a significant reduction in patients who received CGA compared to usual care (OR 0.81, 95% CI 0.71 – 0.91, p=0.0005). This effect was most marked for patients admitted to CGA wards (OR 0.77, 95% CI 0.68 – 0.88, p<0.0001) as opposed to those reviewed by CGA teams (OR 1.19, 95% CI 0.80 – 1.75, p=0.39). We also looked at those studies which targeted CGA according to a patient's "needs" in contrast to an "age-only" admission criteria. Greatest benefit was observed for wards that targeted a "needs" based admission criteria (OR 0.49, 95% CI 0.32 – 0.73, p=0.0005), followed by wards that targeted an "age-only" admission criteria (OR 0.83, 95% CI 0.72 – 0.96, p=0.009). No benefit was seen from CGA teams for either "need" (OR 1.41, 95% CI 0.75 – 2.63, p=0.29) or "age-only" admission criteria (OR 1.07, 95% CI 0.65 – 1.76, p=0.8). Heterogeneity tests indicate a significant subgroup effect ( $\chi^2$  p=0.04). Conclusion: CGA is effective in reducing death and institutionalisation at up to 6 months.

This effect is most pronounced for CGA wards with a “needs” based admission criteria with no evidence of benefit for CGA teams.

**PB8 234 KNEE AND ANKLE ISOMETRIC MUSCLE STRENGTH IN WOMEN WITH AND WITHOUT OSTEOPOROSIS**

M. CHAVES AVEIRO\* (Federal University of São Carlos, São Carlos, Brazil)  
G. MARINHO NONATO(1), J. GIANJOPPE DOS SANTOS(1), V. DASSI KIYOTO(1),  
A. CECCATTO(1), P. DRIUSSO(1), J. OISHI(1) - (1) Federal University of São Carlos  
(São Carlos, Brazil)

**Introduction:** The trend towards increased life expectancy will certainly lead to increases in morbidity and mortality related to osteoporosis. Many elderly people experience difficulty in performing activities of daily living, because the strength-generating capacity of their skeletal muscles is reduced. The weak muscles of an elderly person may be a problem for brittle bones by increasing the risk of falls and therefore the possibility of sustaining a fracture. Then, the purpose of this study was to compare knee and ankle isometric muscle strength of osteoporotic and non-osteoporotic women. **Methods:** Twenty osteoporotic ( $69.15 \pm 3.88$  years old) and thirty non-osteoporotic ( $67.4 \pm 5.21$  years old) women participated in this study. Isometric peak torque for the knee flexors and extensors and the ankle plantar flexors and dorsiflexors was assessed using a BIODEX 2 isokinetic dynamometer located at Federal University of São Carlos (UFSCar). Volunteers performed three valid maximal voluntary contractions for each movement, as forcefully as possible during five seconds. Knee and ankle were aligned with the dynamometer axis, as recommended in the Biodex manual. The statistical analysis was performed using nonparametric test Mann-Whitney. The level of significance used for all comparisons was 5% ( $p \leq 0.05$ ). **Results:** It was found that osteoporotic women exhibit a significant lower knee extensors isometric peak torque than non-osteoporotic women for both dominant ( $p=0.005235$ ) and non-dominant sides ( $p=0.002699$ ). They didn't present significant differences for ankle plantar flexors and dorsiflexors and knee flexors isometric peak torque. **Conclusion:** Women with osteoporosis have deficit in the muscle strength function of knee extensors in comparison with non-osteoporotic women. It could represent difficulties in performing activities of daily living like climbing stairs, sitting and standing. Then, knee strengthen exercises are important to osteoporotic women.

**PB8 235 THE ASSESSMENTS OF FALLS AMONG COMMUNITY-DWELLING OLDEST OLD VETERANS IN TAIWAN**

M. CHOU\* (Kaohsiung Veterans General Hospital, Kaohsiung, Taiwan)  
S. CHOU(1), C. LIANG(2), L. CHEN(3), K. HSUEH(4), Y. LIN(2), M. TU(4) -  
(1) Department of Emergency Medicine, Foo-yin University Hospital (Pingtung County, Taiwan); (2) Geriatric Medicine Center, Kaohsiung Veterans General Hospital (Kaohsiung, Taiwan); (3) Center for Geriatrics and Gerontology, Taipei Veterans General Hospital (92847, Taiwan); (4) Department of Family Medicine, Kaohsiung Veterans General Hospital (Kaohsiung, Taiwan)

**Introduction:** Falls are one of geriatric syndromes threatening the independence of older persons, and it's reported that 30-40% of community-dwelling adults older than 65 years fall each year. It's the secondary leading cause of accidental death for elderly in Taiwan, and moreover, it's the common cause for elderly to be hospitalized or institutionalized. This study aimed to explore the falls among community-dwelling oldest old veterans in Taiwan. **Methods and materials:** Elderly residents of a community area were invited for study. A comprehensive geriatric assessment was implemented by a trained nurse and a physical therapist at the same time. **Results:** One hundred and eighty-eight residents (mean age =  $82.6 \pm 4.0$  years, 99.7% men) were enrolled, and 51 (27.1%) residents reported that they fell once at least within one year. Among the residents with falls, 39.2% fell more than twice, and 45.1% reduced their daily activities due to fears of falls. Univariate analysis showed that the using anti-psychotic drugs (23.2% vs. 50.0%,  $p = 0.003$ ), urinary incontinence (19.1% vs. 37.3%,  $p = 0.010$ ), constipation (33.8% vs. 52.9%,  $p = 0.017$ ), and self-reported ambulace problem (45.3% vs. 70.6%,  $p = 0.002$ ) were significantly associated with falls. Using multivariate logistic regression, we showed that using anti-psychotic drugs (odds ratio [OR]: 2.58, 95% confidence interval [CI]: 1.07-6.26,  $p = 0.035$ ) and self-reported ambulace problem (adjusted OR: 2.31, 95% CI: 1.08-4.92,  $p = 0.031$ ) were independent risk factors associated to falls. **Conclusion:** Among the community-dwelling oldest old veterans, 27.1% ever fell within on year. For the residents with high risks of falls, we should educate them to prevent the falls in the community and refer them to the falls clinics to identify and reduce the risks of falls.

**PB8 236 THE CIRCUMSTANCES AND CONSEQUENCES OF FALLS DURING A STUDY TO THE EFFECTIVENESS OF A TAI CHI FALL PREVENTION PROGRAMME.**

I. LOGGHE\* (Avans University of Applied sciences , Breda, The Netherlands)  
C. BEILO(1), A. VERHAGEN(2), A. RADEMAKER(1), S. BIERMA-ZEINSTRA(2),  
E. VAN ROSSUM(3), M. FABER(4), R. WIJNEN-SPONSELEE(1), P. ZEEUWE(2),  
B. KOES(2) - (1) Avans University of Applied Sciences (Breda, The Netherlands);  
(2) ErasmusMC (Breda, The Netherlands); (3) Department of Health Care Studies, Faculty of Health, Medicine and Life Sciences, Maastricht University (Breda, The Netherlands);

(4) Center for Quality of Care Research, Radboud University Nijmegen Medical Centre (Breda, The Netherlands)

A RCT conducted in the Netherlands to the effectiveness of Tai Chi Chuan (TC) in preventing falls in elderly people living at home showed no beneficial effects on primary outcome fall risk (Adj. HR 1.16; 95% C.I. 0.84 – 1.60) or secondary outcomes: balance, fear of falling, physical activity, blood pressure, heart rate at rest, physical activity and functional status. This study provides more information about the circumstances and consequences of falls during the study period. We used data of 269 community-dwelling elderly people with a high fall risk who participated in the randomized controlled trial (TC: n=138 and Control group (CG): n=131). Participants filled out a fall calendar on a daily basis for one year. When a fall occurred the elderly registered the circumstances and consequences of the fall with a standardised form. We categorised qualitative data based on the content of the answers given. Preliminary results showed 205 registered falls (TC: n= 115, CG: n= 90) of which 108 were injurious. There were 7 (TC n=3, CG n=4) standardised forms missing. The number of falls inside the house equals the numbers of falls outside. Most injuries were minor (bruises: n=52, contusions: n=30, wounds: n= 45), whereas six fractures occurred. Medical attention was required for 14 falls. Both fall localisation and gender were independently associated with an injurious fall: the odds of having an injurious fall were increased by 170 % when the fall localisation was outside and increased by 130 % if the participant was woman. The tai chi training was not independently associated with injurious falls.

**PB8 237 FALL SEVERITY AS A PREDICTOR OF FUTURE FALL RISK**  
N. LELAND-WIATROWSKI\* (University of Massachusetts, Boston, United States)

Accidental falls are a significant health issue for older adults. Fall events have been associated with an increased risk of disability and institutionalization among community-living older adults. This study examined the longitudinal relationship between fall severity and future fall risk among a nationally representative community-based older adult sample. Data from the Health and Retirement Survey (HRS), wave 4 through wave 7 (1998-2004) were used resulting in 24,715 person-wave observations. Baseline fall severity was classified based on the number of falls and the occurrence of an injury due to the fall. The sample of baseline fallers, which included community-living older adults identifying one fall event but no injury, multiple falls but no injury, and at least one fall with an injury were older (mean age 76.6 vs. 74.2), had lower education (11.9 vs. 12.1 years of education), and reported poorer health (59.9% vs. 73.8) than the non-fallers. The dependent fall status variable was defined to include: no fall, one fall no injury, two or more falls without an injury, and at least one fall with an injury. Multinomial logit analysis showed a positive association between severity of the fall at baseline and the future fall severity even when adjustments were made to incorporate socioeconomic status, health conditions, health behaviors, and environmental characteristics. Individuals reporting multiple falls without an injury at baseline had lower expected odds of experiencing only one fall in the future (OR=0.80) and higher expected odds of experiencing multiple falls in the future (OR=1.33) and an injurious fall (OR=2.04) compared to individuals experiencing only one fall without an injury at baseline. The findings of this study support fall prevention policy for the community living older adult population.

**PB8 238 TRANSCULTURAL ADAPTATION AND PSYCHOMETRIC VALIDATION OF A FRENCH-LANGUAGE VERSION OF THE DEMENTIA QUALITY OF LIFE INSTRUMENT (DQOL)**

G. SCHWEBEL\* (University of reims Champagne-Ardenne, Reims, France)  
D. JOLLY(1), L. DI POLLINA(2), E. RAVENEL(3), P. PFITZENMEYER(4),  
O. ROUAUD(4), M. GEORGE(5), M. PONCELET-GOCHARD(6), E. QUIGNARD(7),  
F. BLANCHARD(1), J. NOVELLA(1) - (1) University of reims Champagne-Ardenne,  
Faculty of Medicine, EA 3797 (Reims, France); (2) Geneva Medical School and University  
Hospitals (Geneva, Switzerland); (3) Joeuf Hospital Centre (Joeuf, France); (4) Dijon  
Teaching Hospitals (Dijon, France); (5) Saint-Charles Hospital (France); (6) Sedan  
Hospital Centre (France); (7) Reims Teaching Hospitals (France)

**Objectives:** This study aimed to validate a French-language version of the Dementia-Quality of Life (DQoL) instrument. **Methods:** Transversal, test-retest study in elderly patients with mild to moderate dementia. Feasibility and acceptability were assessed by the time required to complete the questionnaire, the rate of refusal to participate, and the rates of abandon or non-response. Reliability and reproducibility were assessed respectively by Cronbach's alpha coefficient and Pearson's correlation coefficient. The discriminant validity was tested by evaluating the influence of severity of cognitive decline, dependence, existence of depression or behavioural troubles, as well as caregiver burden. **Results:** Of the 155 eligible patients, 46 did not meet the inclusion criteria defined in the original instrument. The remaining 109 patients had an average age of  $81 \pm 6$  years, 62.4% were women and average Mini Mental State Examination (MMSE) score was  $20.8 \pm 4.4$ . The average time required to complete the questionnaire was  $13.3 \pm 6.9$  minutes. No patient refused to participate or abandoned. The rate of non-response per dimension ranged from 0% to 2.8%. The French-language version of the instrument showed good psychometric properties, with acceptable internal consistency (Cronbach's alpha ranging from 0.70 to 0.87) and good reproducibility (Pearson's r 0.96-1.00). Cognitive status, humour and behavioural troubles had an impact on QoL, whereas dependence and caregiver burden did

not. Conclusion: The French-language version of DQoL, validated by recommended standards, showed comparable psychometric properties to the original version, and is therefore suitable for use in a population of French patients with mild to moderate dementia.

**PB8 239 ASSESSMENT OF FRAILTY PREVALENCE AND SURVIVAL OUTCOME: THE FRAILTY INDEX APPROACH AND THE 5-ITEM PHENOTYPE APPROACH**

K. ROCKWOOD\* (National Research Council Canada, Halifax, Canada)  
X. SONG(1), A. MITNITSKI(1) - (1) Dalhousie University (Halifax, Canada)

How to quantify frailty remains debated. Two operational definitions have gained popularity. One emphasizes the "core" features that often present in frail older people, whereas the other integrates multidimensional health information. No study has compared the performance of the two approaches in estimating the prevalence of frailty. Here, we constructed a frailty index and approximated the 5-item phenotypic measure. The data come from the Canadian National Population and Health Survey, initiated in year 1994-5 ( $n=2740$ , aged 65-102 years old, 43.3% died by 2004-5). Self-reported information concerning various aspects of health was collected every two years, with complete follow-up of vital status. The frailty index (FI) consisted of 36 variables assessing medical conditions, symptoms, average daily living, and life style, and was calculated as the sum of all health deficits present. Frailty was defined as an index score  $>0.22$ . The 5-item phenotypic measurement (5IPM) was constructed using self report information about strength, mobility, weight loss, fatigue, and limited physical activities. Frailty was defined as the presence of at least 3 of these 5 items. The FI and 5IPM both showed right-skewed distribution, with more people opposing a relatively low level of frailty. Both the FI and 5IPM increased exponentially with age ( $R^2=0.93$ ,  $p<0.001$  for FI,  $R^2=0.89$ ,  $p<0.001$  for 5IPM). The FI estimated that 613 (22%) of the population was frail, compared with 239 people (9%) by the 5IPM. The 10-year mortality was significantly related to both the FI ( $p<0.001$ ) and to the 5IM ( $p<0.05$ ). A dose-response relationship between the 10-year survival probability and the FI was observed. Both the FI and 5IM identify people who are vulnerable in relation to 10-year survival. The FI approach appears to offer greater precision. Whether constructing a 5IPM based on physical performance measures would improve its precision is unclear, but merits further inquiry.

**PB8 240 HANDGRIP STRENGTH AS A LONG-TERM MORTALITY PREDICTOR. TOLEDO STUDY OF AGING.**

A. ALFARO\* (Hospital Virgen del Valle, Toledo, Spain)  
R. PAZ(1), M. DE LA TORRE(1), J. FLORES(1), L. MORENO(1), T. ESTRADA(1), G. GUTIERREZ(2) - (1) Hospital Virgen del Valle (Toledo, Spain); (2) Consejería de Sanidad de Castilla La Mancha (Toledo, Spain)

INTODUCCCTION: In recent years, Handgrip strength evaluation has won interest as a marker of health status, showing itself as an accurate predictor of long-term mortality. The aim of this study is to evaluate whether handgrip strength is a predictor of mortality in a Spanish elderly adults cohort. MATERIAL AND METHODS: Data used are from de Toledo Study, a longitudinal population cohort study of elderly people aged 65 years and older living in Toledo County. The subjects were selected by a Multistage Randomized Sampling in 1994 for the study of prevalence and incidence of dementia. 3,214 subjects were evaluated in 1994. In 1996, 2,651 were evaluated (incidence survey). Those subjects that couldn't perform the handgrip strength due to great health deterioration were excluded. Mortality was ascertained from 1996 to 2007. Measurements included socio-demographic factors, Katz and Lawton's Index, Yesavage's GDS, Folstein's MMSE, alcohol and tobacco habits, social support (OARS), comorbidity and handgrip strength (Jamar's Dynamometer). A descriptive analysis of the population was done. The handgrip strength was encoded in quintiles adjusted by gender. Cox proportional hazard model was used to adjust the risk of mortality by the handgrip strength adjusted by confounders. Coxs analysis was performed on 2,462 persons (711 deceased) for accumulative losses. RESULTS: 2,651 subjects were evaluated (56.4% female); the mean age was 75.9 (SD 6.9) years. The mortality percentage was 30.2, 23.8, 24.7, 10.1 and 11.2 for the 20, 40, 60, 80 and >80 ( $p<0.001$ ) handgrip strength quintiles respectively. In the Cox's analysis adjusted by cofactors, an increase of risk was observed over the best quintile of HR: 1.44 (95% CI: 1.07-1.9), 1.55 (1.18-2.03), 1.36 (1.02-1.77) and 1.02 (0.75-1.40) for the quintiles 1, 2, 3 and 4 respectively. CONCLUSION: The handgrip strength is a mortality predictor in the Spanish population of 65 years old and over.

**PB8 241 EXAMINING OLDER WOMEN'S CONCEPTIONS OF PHYSICAL HEALTH USING PHOTOVOICE**

J. NASLUND\* (University of British Columbia, Vancouver, Canada)  
J. SIMS-GOULD(1), T. LIU-AMBROSE(1), M. ASHE(1), L. HURD-CLARKE(1) - (1) University of British Columbia (Vancouver, Canada)

Introduction The World Health Organization states that falls are the third cause of chronic disability worldwide (Murray & Lopez, 1996). We also know that approximately 30% of adults over the age of 65 fall each year (Nikolauš & Back, 2003). This study examines how thirty-eight women between the ages of 65 and 75 from Vancouver, British Columbia,

Canada, perceive their physical health and the benefits of engaging in an exercise program designed to prevent falls through the use of a novel methodology called photovoice. Methods and Materials Photovoice is a unique research strategy in which participants "use the power of the visual image to communicate their life experiences, expertise and knowledge" (Wang et al. 1998). The participants ( $N=38$ ) were given disposable cameras and were asked to photo document how they experience their health, the aging process and the benefits of engaging in physical activity. In addition to their photographs, participants kept a photo log journal and also participated in in-depth face-to-face interviews. Results Collectively, the participants took 713 photographs. Renewal, Strength, and Commitment to Self and Others emerged as three important themes through analysis of the photographs and verbatim interview transcripts. Renewal signified a regeneration of the physical self and recognition of being able and willing to participate. Strength represented balance and the ability to lift or feel strong as well as inner strength. Commitment to self and others was conceptualized as having the obligation to attend exercise class and to follow through with responsibilities. Conclusion The participants in this study provided diverse visual representations of their health and emphasized common desires to stay involved, to feel strong, and to uphold commitments. These factors are important because they influence the reasons why older women engage in an exercise program, and contribute to the understanding of the aging process.

**PB8 242 UPDRS SCORE IS RELATED TO FUNCTIONAL CAPACITY IN PARKINSON DISEASE PATIENTS**

N. RINALDI\* (UNESP - State University of Sao Paulo, Rio Claro, Brazil)  
F. BARBIERI(1), F. STELLA(1), S. GOBBI(1), L. GOBBI(1) - (1) UNESP - State University of Sao Paulo (Rio Claro, Brazil)

Introduction: Functional capacity can be impaired with the aging process. As a result, to perform the daily activities could be considered a difficult task for the older people. In Parkinson's disease (PD) patients, the functional capacity must be investigate as a function of the impaired system. The aim of this study was to verify if the UPDRS points could influence the functional capacity. Methods and materials: 14 idiopathic PD patients participated in this study (66.7 $\pm$ 7.8 years of age; Stages 1 to 3 Hoehn and Yahr). The tests were performed in two consecutive days: 1) clinical assessment done by a neurologist (UPDRS scale); 2) AAHPERD tests (flexibility, agility, strength, coordination and aerobic resistance). In the UPDRS scale, only the functional and motor subscales were considered. The relationship between the UPDRS points and AAHPERD tests was analyzed by Pearson correlation ( $p<0.05$ ). Results: The functional subscale showed high relationship with flexibility ( $r=-0.54$ ,  $p=0.043$ ) and strength ( $r=-0.65$ ,  $p=0.010$ ). Besides, the motor subscale showed not only high relationship with coordination ( $r=0.68$ ,  $p=0.006$ ) but also with agility ( $r=0.56$ ,  $p=0.034$ ). Conclusion: Based on these results, the functional capacity in PD could be influenced by the UPDRS score. So, to perform the daily activities involving flexibility and strength could be even more impaired in function of the some symptoms like hypokinesia (reduction in movement amplitude) and akinesia (difficulty in motion initiation and changing position). Therefore, the motor subscale that investigates the movement components like bradikinesia (slow movements), tremor and rigidity can influence activities involving coordination and agility. PD patients present slow movements that can affect the efficiency of the movements' performance. Finally, the AAHPERD tests could also be considered an important tool to assess some movement disorders related to the disease. Acknowledgements: PROPARKI, FAPESP, CNPq, FNS, CAPES.

**PB8 243 RELIABILITY OF FALLS RECALL - A FACTOR TO KEEP IN MIND FOR IMPLEMENTATION OF FALLS INTERVENTION PROGRAMS**

E. FREIBERGER\* (University of Erlangen, Erlangen, Germany)

Introduction: Falls in older people are a major public health problem, with one in three people aged 65 and over falling each year. Falls are the leading cause of injury-related hospital admissions in older people, accounting for 4% of all hospital admissions in this age-group. Apart from the injurious outcomes falls can also have serious social and psychological consequences . Prevention of falls and subsequent disability is therefore a key priority area in geriatric rehabilitation. The implementation of research knowledge into daily practice is often not very effective. One reason for this failure is the missing theoretical approach in the implementation process. At the Institute of Sport Science of the University of Erlangen a study was conducted to investigate into the implementation process of an EB intervention fall prevention program for community-dwelling active older persons. Related to the RE-AIM model by Glasgow et al. (1999) the first step to Reach for the right participants was investigated. Given the fact that a fall history is one of the most important risk factors, very often an intervention program reaches out for participants with a fall history. One of the key question of this approach is how reliable is the self- reported fall history. Method: 96 community-dwelling active older persons with 55.2% being male took part in a controlled study for falls prevention. The age range was 70 years to 90 years. In a Pre- and Post test design data on fall history, physical performance, fear of falling, cognitive performance and quality of life were collected. The presentation will discuss only the falls data. Falls were monitored with a daily falls calendar handed in every first week of the following months. A fall was defined as an unexpected event in which the participant comes to rest on the ground, floor, or lower level. Participants were being contacted by telephone if the monthly calendar was not returned in due time or to obtain data regarding the circumstances of a fall. After 12 months participants were reassessed and questioned

for fall history of the past 12 month. The numbers of self-reported falls recall were then compared to the falls calendar. Results: In the 12 month according to the falls calendar in total 93 falls occurred whereas 45,2 % of the participants did not report a fall. 22,8 % of the participants reported one fall. The percentage of male non fallers was similar to the female non fallers rate (47,1% vs. 43,9 %). One fall reported 20,8 % of the male participants and 23,3 % of the female participants. In contrast to the falls calendar only 63 falls were recalled after 12 month with only in one case recalling one fall more than actually was obtained via fall calendar. In all other cases the number of recalled falls was less than in the monthly calendar marked. In total about 25% of falls during the past 12 month were not recalled by the participants. Conclusion: The first step in implementing an EB falls intervention program will be the reach of the appropriate target population. In many cases falls intervention programs recruit participants on the recall of their falls history. Given the fact of our results this inclusion criteria might not fully target the right population. Therefore additional risk factors should be included to target the appropriate population, and successfully implement falls prevention programs.

**PB8 244 COULD PHYSICAL ACTIVITY LEVEL INDICATE DEPRESSION AND ANXIETY IN PARKINSON'S DISEASE PATIENTS?**

F. BARBIERI\* (UNESP - State University of Sao Paulo, Rio Claro, Brazil)  
L. GOBBI(1), C. TEIXEIRA-ARROYO(1), N. RINALDI(1), R. VITORIO(1), P. SANTOS(1), C. TAKAKI(1), F. STELLA(1), S. GOBBI(1) - (1) UNESP - State University of Sao Paulo (Rio Claro, Brazil)

Introduction: Depression and anxiety are common problems in Parkinson's disease (PD) patients. However, the causes of depression and anxiety in PD are uncertain. Physical activity level can be related to depression and anxiety in this population. The purpose of this study was to verify the association among depression and anxiety with physical activity level. Methods and materials: 27 idiopathic PD patients participated in the study (63.52±8.55 years of age; Stages 1 to 3 on Hoehn and Yahr-HY; 32.64±13.45 points in Unified Parkinson's Disease Rating Scale-UPDRS; 26.44±2.9 points in Mini-Mental State Examination-MMSE). The tests were performed on two different days and in a random order: a) clinical assessment was done by a neurologist: Hospital Anxiety and Depression scale (HAD), HY, UPDRS and MMSE; b) functional capacity – AAHPERD tests: flexibility, coordination, agility, strength and aerobic resistance. The Pearson correlation was used to verify the relationship among anxiety and depression level with functional capacity components ( $p<0.05$ ). Results: High relationship was observed among depression and anxiety and coordination ( $r=0.38$ ,  $p=0.02$ ;  $r=0.53$ ,  $p=0.002$ , respectively), agility ( $r=0.50$ ,  $p=0.004$ ;  $r=0.54$ ,  $p=0.002$ , respectively) and aerobic resistance ( $r=0.52$ ,  $p=0.003$ ;  $r=0.68$ ,  $p=0.0001$ , respectively). A significant relationship was also observed between strength and depression ( $r=-0.44$ ,  $p=0.01$ ). Conclusion: Low performance in coordination, agility, strength and aerobic resistance tests are associated with anxiety and depression in PD, especially with agility and resistance. The increased functional capacity helps PD patients in the treatment of depression and anxiety. So, it is recommended the enrollment of PD patients in physical activity programs in a regular basis to improve their functional capacity and decrease their depression and anxiety symptoms. **PB8 245 XEROSTOMY IN ELDERLY WITH DIFFERENT FRAILTY LEVELS**

M. SOUSA\* (PIRACICABA DENTAL SCHOOL, PIRACICABA, Brazil)  
L. RIHS(1), M. DIOGO(2), M. GUARIENTO(2), F. CINTRA(2), A. NÉRI(2) - (1) Piracicaba Dental School (Brazil); (2) Faculty of Medicine Science (Brazil)

Introduction.Xerostomy is a lack of saliva stated by individuals that causes discomfort sensation, and can be associated with chronic diseases and/or use of drugs. The aims of this study were: to verify the xerostomy prevalence and its association with chronic diseases and drugs, besides verifying those relations with frailty levels. Methods and materials.This study was conduct in a Geriatric Ambulatory of UNICAMP Clinics Hospital in Campinas, Brazil. It was used a Chi Square Test comparing aged frails and prefrails. Afterwards it was used a logistic regression. The elderly was 60 years old and more. Results. 151 elderly were interviewed with a mean age of 76.3 years ( $sd=8.0$ ). All subject presented 1 disease at least and all subjects were using drugs. 78.8% ( $n=119$ ) used 1 drug at least that could cause xerostomy according to the adverse effects of drug instructions. The prevalence of xerostomy stated by the elderly was less than 68.2%. The average number of diseases among those who related xerostomy was 5.1 ( $sd=2.2$ ). Among those diseases: diabetes (32.4%), heart disease (49.5%), depression (17.2%), and psychiatric disorders (9.7%), Chagas' disease (18.3%) and others – there were many with comorbidities. Elderly with dry mouth felt more chronic pain. It was verified among all examined subjects that 4.6 ( $n=7$ ) were classified as non frail, 40.4 %( $n=61$ ) as prefrail and 55% ( $n=83$ ) as frail. The frailty condition did not have association with xerostomy ( $p>0.05$ ). Conclusion.Xerostomy is a high prevalent condition among elderly who is using drugs as a routine, but this condition does not differ according to frailty levels. Xerostomy was highly prevalent (68.2%) in this aged group, justifying additional studies about this condition and its association. Fapesp 05/58980-4

**PB8 246 INTEREST OF POSTUROGRAPHY DURING THE FALLS CONSULTATION**

C. DELECLUSE\* (Chr Lille, Lille, France)  
C. GAXATTE(1), I. DELABRIERE(1), F. PUISIEUX(1), V. PARDESSUS(1) – (1) Chr Lille (Lille, France)

Introduction: Fall is a major public health problem in the elderly. Posturography allows to measure static and dynamic balance. The primary objective of this study was to determine to which clinical parameters are static posturography data correlated. The secondary objective was to determine the predictive value of posturography parameters for recurrent falls. Methods and materials: The study concerns 111 consecutive persons referred to the Falls Consultation between June, 2003 and December, 2005 and having undergone a static posturography. All outpatients were assessed by a geriatrician, a neurologist and a physiatrist. For statistical analysis, a Mann-Whitney test for quantitative variables and a Pearson's correlation test for qualitative variables were used. Results: There was no statistically significant correlation between clinical parameters and static posturography data except for the parameter mediolateral mean sway with closed eyes which was correlated to the timed up and go test ( $p < 0.05$ ), the one-leg balance ( $p = 0.05$ ), and the ADL score ( $p < 0.05$ ). Furthermore, there was no correlation between posturography parameters and the number of falls within the 6 months following the initial evaluation. Conclusions: Posturography does not predict recurrent falls and, in practice does not influence our therapeutic propositions. Nevertheless this method could be helpful to define the strategies of rehabilitation of the fallers.

**PB8 247 SPONTANEOUS ACTIVITY OF OLDER PEOPLE: ASSOCIATION WITH BODY COMPOSITION AND LEG STRENGTH AND POWER OUTPUT**

E. FERRIOLLI\* (University of Edinburgh, Edinburgh, United Kingdom)  
C. GREIG(1), N. STEPHENS(1), R. SKIPWORTH(1), T. PRESTON(2), K. FEARON(1) - (1) University of Edinburgh (Edinburgh, United Kingdom); (2) Scottish Universities Environmental Research Centre (United Kingdom)

Introduction: Spontaneous physical activity and its correlation with body composition and muscle function has been studied through the use of accelerometers and pedometers. New generation activity monitors allow the registration of more detailed aspects of activity; the ActivPAL™ system registers the time sitting/lying, time standing, time stepping, step number and number of sit to stand transitions. The aim of this study was to measure the spontaneous physical activity of men and women aged 75 years and to investigate associations with body composition and lower limb strength and power. Methods and materials: Eighteen healthy participants, (mean age 79.8±3.8 years, n=10 female), were studied. All participants wore the monitor on the anterior thigh for seven days. Body composition was determined using dual energy X-ray absorptiometry, isometric knee extensor strength (IKES) was measured using a specialised chair equipped with a strain gauge and data acquisition system. Lower limb power output was measured using the Nottingham Power Rig. Results: Body mass index was 24.2±3.6 kg.m<sup>-2</sup>. Percentage body fat was 31.2±8.3 (women) and 22.3±1.3 (men). Mean sitting/lying time was 17.3±1.6 h/day, time standing was 4.9±1.3 h/day, time stepping was 1.7±0.6 h/day, number of steps taken was 8589±3283 steps/day and the number of sit to stand transitions 52±9.8. In women, time sitting/lying and number of sit to stand transitions were associated with percent body fat ( $r=0.683$ ,  $p=0.029$  and  $r=0.819$ ,  $p=0.004$ , respectively); time sitting/lying and time standing were correlated with BMI ( $r=0.820$ ,  $p=0.004$  and  $r=-0.752$ ,  $p=0.012$ ); there were no correlations with leg strength or power. In men, there were no correlations with body composition and IKES was correlated with time stepping and number of steps ( $r=0.738$ ,  $p=0.037$  and  $r=0.810$ ,  $p=0.015$ ). Conclusion: In this study, spontaneous physical activity of women only, was associated with body composition, while leg strength was associated with spontaneous physical activity in men only.

**PB8 248 INCIDENCE OF SECOND HIP FRACTURE IN MEN AND WOMEN: A SYSTEMATIC REVIEW**

M. ASHE\* (University of British Columbia, Vancouver, BC, Canada)  
J. DAVIS(1), E. GORMAN(1), M. DONALDSON(2), P. BRASHER(3), P. GUY(1) - (1) University of British Columbia (Canada); (2) San Francisco Coordinating Centre (United States of America); (3) Centre for Clinical Epidemiology and Evaluation (Canada)

Introduction: Most published literature on health outcomes following a hip fracture have been focused on women and less is known about the recovery process for older men. Early literature on second hip fracture reported frequencies ranging between 2% to 11% of people with a first hip fracture; there may be differences in the incidence of second hip fracture between men and women however this has been less studied. Therefore our aim was to review the available evidence that compared the incidence of low-trauma second hip fracture between men and women aged 60 years and older. Methods and Materials: We searched the published literature from 1990 to present using OVID MEDLINE, CINAHL, Embase, Cochrane Database of Systematic Reviews and key journals/authors who published in this area. Keywords included hip fracture, second hip fracture, re fracture, reinjury and recurrent hip fracture. We limited our search to English language and people aged 60 years and older. We determined the methodological quality of included studies and provided a qualitative description of fracture risk for older men and women. Results: Ten

articles met inclusion criteria. Overall, we noted some methodological issues used to report fracture incidence. Despite the fact that women have a significantly higher risk for the initial hip fracture, five observational studies reported no significant differences in incidence of second hip fracture between older men and women. Conclusion: Based on the available evidence, men and women have similar risks for a second low-trauma hip fracture. Secondary prevention strategies are important for both men and women to reduce the risk of future fractures.

**PB8 249 A META ANALYSIS OF THE IMPACT OF MEDICATIONS ON FALLING IN THE ELDERLY**

J. WOOLCOTT\* (University of British Columbia, Vancouver, Canada)  
K. RICHARDSON(1), M. WIENS(1), B. PATEL(2), J. MARIN(3), K. KHAN(4),  
C. MARRA(1) - (1) Faculty of Pharmaceutical Sciences, University of British Columbia  
(Canada); (2) School of Pharmacy, University of London (London United Kingdom); (3)  
Fraser Health Authority (Canada); (4) Faculty of Medicine, University of British Columbia  
( Canada)

Background There is increasing recognition that prescribed medications can contribute to falls in seniors. However, determining which medications contribute to falls and which do not remains a clinical challenge. The most recent meta-analysis of medications associated with falls only included studies to 1996 and did not consider all currently relevant drug classes. Therefore, this meta-analysis includes studies on a wide range of relevant drugs published through to 2007. Materials and Methods: Studies were identified through a systematic search of English-Language articles collected from EBM, CINAHL, EMBASE and MEDLINE using the keywords: falls, accidents and accidental falls, aged or age factor, elderly, drug or drug therapy and therapeutic. Studies were limited to those with subjects >60 years exposed to one or more drug therapies and having an identified outcome of falling. Meta-analyses were completed on those drug classes with 4 or more published studies completed in the period 1996-2007. Bayesian methods allowed for the use of the results from Leipzig et al's (2000) meta-analysis which incorporated 40 articles published from 1966-1996. Leipzig's findings combined with newly available information were used to provide pooled odds ratio (OR) estimates and 95% credible intervals (95% CI) Results: Of 11081 identified articles, 20 met our inclusion criteria and were used in our meta-analysis. Meta-analyses were completed on 9 unique drug classes including 75,792 subjects. For each of the classes the following Bayesian OR point estimates (95% CI) were found: Anti-hypertensives: OR=1.16(0.92-1.14); Sedatives/hypnotics: OR=1.49, (1.35-1.63); Diuretics: OR=1.08, (1.02-1.16); Neuroleptics: OR=1.06, (1.34-1.89); Anti-depressants OR=1.69, (1.49-1.91); Beta-blockers OR=1.01, (0.85-1.19); Benzodiazepines: OR=1.53, (1.35-1.73); Narcotics: OR=0.95, (0.77-1.18); and NSAIDS OR=1.17, (0.99-1.40). Conclusion: Diuretics, antidepressants, neuroleptics, sedatives/hypnotics, and benzodiazepines demonstrated a significant association with falls in seniors.

**PB8 250 FRACTURES PREDICT SHORT- AND LONG-TERM FUNCTIONAL DECLINE IN THE AGED - A POPULATION-BASED STUDY WITH 8- YEAR FOLLOW-UP.**

M. PIIRTOLA\* (University of Turku, Turku, Finland)  
M. LÖPPÖNEN(1), T. VAHLBERG(2), R. ISOAHO(3), S. KIVELÄ(4), I. RÄIHÄ(4) -  
(1) Häkäti Health Centre (Finland); (2) Turku University, Department of Biostatistics  
(Finland); (3) Malax-Korsnäs Health Center (Finland); (4) Turku University, Department  
of Family Medicine (Finland)

Introduction: The independent relationships of fractures on functional decline are poorly known. The objective of this study was to describe short- and longer-term relationships between fractures and functional abilities in older population. Methods and materials: A population-based, prospective, cohort study in the municipality of Lieto, Finland. Data on health, health behavior, fractures, and functional ability was collected in 616 participants (291 men, 472 women) aged 65 or older both in 1991 and 1999. Change in the level of mobility, managing activities of daily living (ADL) and instrumental activities of daily living (IADL) were analysed both in short-term (0-2 years) and long-term (2.1 -8 years) follow-ups. The cumulative logistic regression model with cumulative odds ratios (COR) and their 95% confidence intervals (95% CI) were used in analyses. RESULTS: During the 8-year follow-up, 112 (18%) persons sustained at least one fracture. In the multivariate analyses, lower body fractures (hip, pelvis, lumbar vertebrae and lower limbs) predicted decline in performing mobility tasks and activities of daily living (ADL) both in short-term (COR 4.7, 95%CI: 1.9-11.7), (COR 3.1, 1.3-7.6) and long-term (COR 2.6, 1.1-6.2), (COR 4.7, 2.0-11.4) follow-ups, respectively. Upper body fractures (shoulder, thoracic vertebrae, ribs and upper limbs) decreased only ADL functions in long-term follow-up (COR 2.5, 1.3-4.8). In addition, inactivity in leisure-time physical exercise at baseline predicted decline in all three areas of function independently of other predictors CONCLUSION: Lower body fractures are powerful independent predictors of short-term and even long-term functional decline in older people. Improved actions to prevent fractures and to make rehabilitation more effective as well as extended re-assessment after sustained fractures are

needed in order to reduce functional decline and dependence in aged persons. Promoting physical activity and exercise are important factors in these actions.

**PB8 251 HIP PROTECTORS - ADHERENCE IS INSUFFICIENT FOR EFFECTIVENESS: DATA FROM THREE RANDOMISED TRIALS**

S. KURRLE\* (University of Sydney, Ryde NSW, Australia)  
S. QUINE(1), P. SAMBROOK(1), L. MARCH(1), D. CHAN(2), K. LOCKWOOD(1) -  
(1) University of Sydney (Sydney, Australia); (2) University of New South Wales  
(Bankstown, Australia)

Introduction: Adherence with hip protector use is a major factor in their doubtful clinical effectiveness. We hypothesised that adherence with hip protectors can be increased by reducing their cost and providing education about their use. Methods: Three randomised trials with a preplanned meta-analysis are reported. These are two cluster randomised trials with participants recruited in sub-acute hospital wards or residential aged care facilities, and an individually randomised trial in frail older people living in the community. Participants are allocated to a control group (who receive a brochure about hip protectors), or intervention group 1 (supply of three pairs of hip protectors at no cost ('no cost')), or intervention group 2 (free hip protectors and an educational program that aims to encourage their use ('combined')). The primary outcome measure is adherence with the use of hip protectors at six months which was defined as wearing the hip protectors 50% or more of the recommended time in the month before follow-up. Results: 714 older people (81% female, mean age 84.8) years participated. The percentage of participants who were adherent at 6 months was 4.6% in the control group; 43% in the 'no cost' hip protector group and 43% in the 'combined' hip protector and education group ( $\chi^2=99.1$ , df 2,  $p < 0.001$ ). Adherence was higher in people recruited from a community setting (41% versus 25%,  $p < 0.01$ ). There were 10 hip fractures (including three sustained while wearing the hip protectors). Conclusions: The study has shown a level of adherence with hip protector use that is inadequate for clinical effectiveness. However, supply of hip protectors at no cost to the user is a better strategy than merely providing information. Further developments in hip protector design are needed, as are incentives for hip protector use.

**PB8 252 UPTAKE AND TWO-YEAR ADHERENCE TO ANTI-OSTEOPOROTIC TREATMENT IN PATIENTS WITH RECENT HIP FRACTURE**

J. RYG\* (Odense University Hospital, Odense, Denmark)  
J. GRAM(1), S. OVERGAARD(2), J. SØRENSEN(3), K. BRIXEN(2) - (1) Hospital of Southwest Jutland (Denmark); (2) Odense University Hospital (Denmark); (3) University of Southern Denmark (Denmark)

Introduction: Hip fractures (HFx) are associated with increased mortality and risk of further fractures, however, fracture discharge programs are rarely routine. The aim of our study was to evaluate uptake and adherence to anti-osteoporotic treatment in a population-based cohort of patients with recent HFx. Methods and materials: During 2005, all HFx patients  $\geq 45$  years were offered participation in a fracture discharge program excluding patients with dementia, severe comorbidity, and pathological fractures. Osteoporosis was defined as low bone mineral density  $\leq -2.5$  SD and/or presence of a vertebral fragility fracture. Follow-up was minimum 2 years. Data are shown as median[range] or mean(95% CI). Results: During inclusion period, 496 HFx patients (337 women (82.6[46.9;97.4] years); 159 men (77.7[45.8;97.4] years)) were admitted to our hospital. Age-adjusted cumulative 2-year survival was higher in patients offered participation in the program (n=310) compared with those excluded (n=186) (0.83(0.78-0.88) vs. 0.51(0.41-0.60),  $p < 0.01$  and 0.65(0.56-0.74) vs. 0.38(0.27-0.50),  $p < 0.01$  in women and men, respectively). A total of 204 patients showed up and 169 were diagnosed with osteoporosis (114 women (81.1[46.9;96.2] years); 55 men (76.2[45.8;94.5] years)). Age-adjusted cumulative 2-year survival was higher in patients with osteoporosis receiving treatment (n=139) compared with those left untreated due to comorbidity or decline by patient (n=30) (0.89(0.84-0.95) vs. 0.51(0.34-0.69),  $p < 0.01$ ). In HFx patients still alive after 2 years, 71% were adherent to specific anti-osteoporotic treatment. Adherence to treatment was predicted by "any fracture prior to present HFx" (odds-ratio, OR 3.22(1.12-9.28),  $p < 0.05$ ) and "any fall in the year prior to present HFx" (OR 3.41(1.08-10.79),  $p < 0.05$ ). Conclusion: The fracture discharge program successfully identified HFx patients with low mortality and thus likely to benefit from anti-osteoporotic treatment. Furthermore, the majority of patients initiating medical treatment were adherent to this at 2-years follow-up. Nevertheless, only 25.8% of patients alive after two years were on treatment.

**PB8 253 ANALYZING COMPLICATIONS IN A CONVALESCENCE CARE GERIATRIC UNIT (CCGU).**

M. GONZALO LÁZARO\* (Hospital San Juan de Dios, Pamplona (Navarra), Spain)  
J. OTEIZA OLASO(2), F. URIZ OTANO(1), C. MARTÍNEZ VELASCO(2),  
M. MUNIESA(2), J. JIMÉNEZ ARRIBAS(2), P. JULIAN(3) - (1) Unidad de Geriatría  
Hospital S. Juan de Dios (Pamplona, Spain); (2) Unidad de Medicina Interna Hospital San  
Juan de Dios (Pamplona, Spain); (3) Unidad de Cuidados Paliativos Hospital San Juan de  
Dios. (Pamplona, Spain)

Introduction and aims: know the profile of patients remitted to a CCGU coming from Acute Hospital Geriatric Units (AHGU). Estimate risk factors for development of acute

complications and/or mortality. Methods: We analyzed 99 consecutive discharges in our Hospital, collecting personal history, reason for admission, clinical stability, functional status prior admission, analytical parameters, instrumentation, as well as complications requiring medical intervention. Data base in ACCESS, analyzing SPSS(15.0). Results: Age:81'73(SD:9'05); 62% > 80y. Mean length stay: 35'06 d(SD: 28'8). Chronic-diseases: mean:4'72; 69% had≥4 chronic diseases. Hypertension:60'6%; diabetes:34'3%; dementia:34%; Atrial F.: 26 %; dyslipidemia:24'2%; COPD:23%; stroke:23%; IschemicC.:15%. Reason admission:respiratory:29'3%; neurological: 27'3%; infectious:14'1%; traumatology:10'1%; cardiopathy:9'1%; others:9'1%. Prior functional status:Barthel:62'4. Total dependency:25%; severe:18'7%; moderate:14'6 %; mild:39'6. Mobility: total immobility:17'7%; moderate:36'5%; mild:5'2%; without-help:40'6%. Prior drugs:5'94 (> 4 drugs:61'4%). Origin: emergency-room(21'9%); surgical(17'7%); AGHU(55'2%); primary-health(5'2 %). Complications:73%. There were 152: respiratory infection(23%); confusional syndrome(15%); urinary-tract infection(14%); exacerbation reason for admision(12%); renal failure(11%), gastroenteritis (10 %), cardiac failure (7%); urinary retention (7%). Medical complications : in 46% of hypertension; 28% of dementia; 27% of diabetes; 22% of dyslipidemia; 19% of stroke; 17% of COPD; 16% of AtrialF.; 12% of isquemicC. % Institutionalization: if complications:39%; if not:8%(p=0'04). Exitus: if complications:30%;if not: 4%(p=0'04). Probability of death greater if complication was renal failure(p=0'02)or exacerbation of reason for admission (p=0'001). Risk factor more associated with exitus was stroke (p=0'04) and dementia (p=0'04). Complications appeared more frequently in diabetes (p=0'02) and dyslipidemia(p=0'016). Conclusions: Patients who come to our Convalescence Unit are elderly patients, with pluripathology and polypharmacy, dementia, great dependency level. Main reasons for admission are convalescence of respiratory and neurological pathologies. There is high probability of being complicated, especially when there're vascular risk factors or dementia. The fact of suffering complications (fundamentally renal failure or exacerbation of reason for admission) increases the probability of institutionalization and exitus.

**PB8 254 THE EFFECT OF LOW HAEMOGLOBIN LEVELS ON THE POST-OPERATIVE OUTCOMES OF FRACTURED NECK OF FEMUR REPAIRS IN THE ELDERLY**

E. AITKEN\* (University Hospital Lewisham, London, United Kingdom)  
S. JACOBSBERG(1), E. READ(1) - (1) University Hospital Lewisham (London, United Kingdom)

The one-year mortality rate following fractured neck of femur repairs is typically reported as 20-35%, significantly higher than in the general population of comparable age. There is also a significant post-surgical morbidity. Studies have linked post-operative outcomes, such as post-operative time to mobilisation and time to discharge with worsened morbidity and mortality. Identification of risk factors for poor post-surgical prognosis is therefore important. Recent studies have suggested that pre- and post-operative haemoglobin levels may be one such risk factor. A retrospective study of 87 patients, over 65 years, undergoing fractured neck of femur repairs at University Hospital Lewisham, was carried out between September 2007 and April 2008. Data was gathered from the patients' case notes and the hospital's computerised results system. Post-operative outcomes (including mortality, time to mobilisation, time to discharge and pre- and post-operative infection rates) were analysed against pre- and post-operative haemoglobin levels. Significant ( $p<0.05$ ) relationships were found between pre-operative haemoglobin levels greater than eleven and both faster times to mobilisation and discharge. Similarly, there was a significant ( $p<0.05$ ) relationship between post-operative haemoglobin levels greater than nine and faster time to mobilisation. No significant relationships were found linking either pre- or post-operative haemoglobin levels with improved post-operative morbidity or mortality. These results suggest a need to consider pre- and post-operative interventions to maximise haemoglobin levels. However, given the risks to the patient associated with blood transfusions, coupled with the expense and scarcity of blood as a resource, it would be necessary to conduct further (preferable prospective) studies with larger sample sizes to discover whether transfusion in this cohort of patients is prudent.

**PB8 255 EFFECTS OF PHYSICAL EXERCISE TRAINING ON COGNITION, QUALITY OF LIFE AND FUNCTIONAL CAPACITIES IN FRAIL OLDER ADULTS**

F. LANGLOIS\* (UQAM and IUGM, Montreal, Canada)  
M. HÉBERT(1), T. MINH VU(3), K. CHASSÉ(4), L. BHERER(2) - (1) Université du Québec à Montréal (Montreal, Canada); (2) Centre de recherche de l'Institut universitaire de gériatrie de Montréal (Montreal, Canada); (3) Centre Hospitalier de l'Université de Montréal (Montreal, Canada); (4) Institut universitaire de gériatrie de Montréal (Montreal, Canada)

Introduction: Recent studies suggest that physical fitness training can significantly enhance cognition and quality of life in sedentary but otherwise normal older adults. However, it is not well known if this kind of intervention might improve cognition and quality of life in frail older adults. This is a major issue since frail elders are at greater risk of experiencing mobility limitations, reduction in psychological well-being and an increase in cognitive problems. Objectives: The principal objective of this study was to assess the impacts of a twelve-week physical training program on cognition, quality of life and functional capacities in frail elderly persons. This program included aerobic, muscular and flexibility exercises. The study also aimed at comparing the effects of this intervention between frail

and non-frail sedentary participants. Methods and materials: Out of 80 older adults that participated in this research, 71 (33 frails and 38 non-frails) completed all of the assessments (pre/post-test). They were distributed between two experimental conditions: an intervention group (physical activity program) and a control group (no intervention). This study was conducted in a gymnasium equipped for a geriatric population and involved a multidisciplinary team of health care professionals: a geriatrician, a physiotherapist, a kinesiologist and a neuropsychologist. Results: Results indicate that compared to the control group, participants who completed the physical training program showed performance improvements in cognitive tests that assessed attention and attentional control functions. They also reported changes in quality of life and showed a significant increase in functional capacities. Moreover, changes in cognition, psychological well-being and functional capacity were equivalent overall among frail and non-frail individuals despite group differences in baseline performances. Conclusion: Physical activity programs combining aerobic, muscular and flexibility exercises seem to be a very promising non-pharmacological approach in order to enhance physical, psychological and cognitive functioning in frail older adults.

**PB8 256 MAINTENANCE OF ELDERLY MUSCULAR STRENGTH IN A RESISTANCE EXERCISE PROGRAM**

M. DE JESUS MIRANDA\* (Faculdades Integradas Metropolitanas de Campinas - METROCOMP, Campinas, Brazil)  
F. MARQUES CAMARA (2), M. JESUS MIRANDA(1), M. VELARDI(1) - (1) Universidade São Judas Tadeu (São Paulo - SP, Brazil); (2) Faculdades Integradas Metropolitanas de Campinas - METROCOMP (Brazil)

The muscular strength has a key role for the maintenance of functional capacity of the elderly. The elderly resistance exercise (RE) guidelines propose 2 day per week sessions. However, it has been suggested that, after an initial 2 days week phase, the reduction of the week frequency, may maintain the strength gain. Thus, the purpose of this study was to verify if the week frequency reduction can maintain de strength level of the elderly. This way, 10 elderly subjects ( $68,1 \pm 6,5$  years) participated in a two phases 16-week RE program: the first phase was a strength gain phase (SGP) consisted in 8 weeks, 2 days a week, followed by 8 weeks maintenance phase (MP), performed 1 day a week. In these two phases, the elderly performed 2 sets, 10 repetition maximum (RM) of leg press, lat pull down, military press and chest press. The muscular strength was measured at the initial (ISGP) and at the end (ESGP) of the SGP and MP (EMP), with 10 RM tests. The Repeated-measures Analysis of Variance was used to data analysis, followed by Scheffé post-hoc test ( $p<0,05$ ). From the ISGP to the ESGP the muscular strength of the group increased for all exercises, except for the Leg press. In the MP the strength levels were unchanged. Between ISGP and EMP the strength level of Leg press increased, but was not significant ( $p=0,06$ ). The results indicated that the reduction of week frequency was efficient to maintain strength gains, after an initial period of 2 times a week. Furthermore, the entire program was not sufficient to elicit significant strength gain in the leg press exercise. Thus, additional studies are necessary to verify possible differences of strength gain and maintenance, between different exercises and muscle groups.

**PB8 257 FACTORS ASSOCIATED WITH FALLS IN INSTITUTIONALIZED ELTERS, IN SÃO PAULO, BRAZIL**

M. MARINI\* (Albert Einstein Long Term Care Unit - Albert Einstein Hospital, São Paulo, Brazil)  
J. BEZ(1), V. CORREIA(1), S. TEIXEIRA(1), F. FRANCO(1), N. PIRES(1), M. ODIERNA(1), M. RIBEIRO(1) - (1) Albert Einstein Long Term Care Unit - Albert Einstein Hospital (São Paulo, Brazil)

Introduction: Institutionalized elders usually have elevated risk for falls. Fall risk assessment in long term care (LTC) settings can be challenging, considering that functional and clinical status of residents may vary. Few studies have evaluated fall risk instruments for institutionalized elders. This study goal is to determine factors linked to fall risk in LTC. Methods and materials: Two groups of elders were compared: those who had one or more falls between January and June 2008 and those who did not fall during that year. Variables taken for statistical comparison were functional status, Downton Index, FIM (Functional Independence Measure), TUGT (Timed Up and Go Test), POMA (Performance Oriented Mobility Assessment), grip strength, MMSE (Mini Mental Status Examination), GDS (Geriatric Depression Scale), and number and classes of medications prescribed. Statistical analysis was conducted using SPSS for Windows. Quantitative variables were compared through t-Student or Mann-Whitney tests, and chi-square or Fisher tests were used for categoric variables. Multivariable logistic regression was applied in order to search for fall predictors. Results: 59 subjects had at least one fall in the study period, and 51 did not fall. Mean age of fallers was  $85,75 \pm 5,97$ , compared to  $83,18 \pm 6,16$  of non-fallers ( $p=0,029$ ). Subjects scored  $4,66 \pm 1,39$  and  $3,75 \pm 1,71$  in Downton Index, respectively ( $p=0,003$ ). FIM-cognitive domain scores were lower for fallers (26,00; 18,00-31,00) than for non-fallers (30,50; 23,50-34,25); ( $p=0,036$ ). GDS scores also differed between the two groups:  $5,67 \pm 3,80$  and  $3,17 \pm 2,22$  ( $p=0,001$ ). No statistically significant difference was found concerning gender, dependency status, grip strength, POMA and TUGT scores, MMSE and number of medications. Logistic regression identified Downton Index as a predictor of falls (OR=1,76 (1,02-3,04)). Conclusion: In this population, the Downton Index predicted fall events. Factors linked to cognitive decline

and positive screening for depression were associated to falls. These findings may contribute to planning fall prevention interventions in LTC settings.

**PB8 258 THE EFFECT OF PHYSIOTHERAPY PROGRAMME IN THE QUALITY OF LIFE IN SUBJECTS WITH OSTEOARTHRITIS GRADE I AND II.**

K. GRAMANI-SAY\* (Federal University of São Carlos, São Carlos, Brazil)  
L. MARTINS GARCIA(1), P. MENDES DA SILVA SERRÃO(1), S. MATTIELLO GONÇALVES ROSA(1) - (1) Federal University of São Carlos (São Carlos, Brazil)

Introduction: Osteoarthritis (OA) is a degenerative joint disease that causes deterioration of the articular cartilage, changes in subchondral bone, pain and stiffness motion. Of all joints the knee is the most frequently affected by OA, which leads to the greatest loss in functional performance and incurs the highest social costs. The WOMAC (Western Ontario and Mc Master Universities) is a quality of life specific questionnaire for OA of the knee and hip and was validated for the Portuguese language. It is divided into three subscales (pain, stiffness and physical function) with separate scores, which identify each area. Methods and materials: The purpose of this study was to evaluate pain, joint stiffness and physical functions through the WOMAC before and after physical therapy in patients with knee OA in grade I or II. We evaluated 12 male volunteers in knee OA patients ( $51.42 \pm 6.24$  years) and 15 healthy subjects ( $55.6 \pm 6.75$  years). Every subjects will be selected by physical and radiograph assessment and submitted to a standardized program of physical therapy treatment (flexibility, strength training and sensory-motor), 11 weeks, whereas before and after treatment was applied WOMAC. Results: Significant difference was found between OA and control groups before and after treatment for all sessions of the WOMAC pain ( $p = 0.0004$ ), stiffness ( $p = 0.01$ ) and physical function ( $p = 0.000018$ ). For the analysis between the OA group before and after treatment a significant difference was found for scores on the WOMAC pain section ( $p = 0.003$ ) and physical function ( $p = 0.015$ ). Conclusion: Thus, it appears that the protocol of treatment for 11 weeks was effective in reducing pain and improving functionality of the individual with knee OA, contributing to improved quality of life and emphasizing the importance of exercises in individuals with chronic degenerative diseases.

**PB8 259 FALL IN SENIORS PRESENTING TO THE EMERGENCY DEPARTMENT: DOES MANAGEMENT BY AN INTERDISCIPLINARY GERIATRIC TEAM HAVE AN IMPACT ON PATIENT'S CARE AND OUTCOME?**

M. SULLIVAN\* (McGill University Health Centre - Royal Victoria Hospital, Montreal, Canada)  
P. BARASSI(1), K. BAIG(1), K. BROWN(1), N. PLAISIR(1), G. RAMSAY(1), A. TURNER(1), A. HUANG(1), J. VERDON(1) - (1) MUHC/Royal Victoria Hospital (Montreal, Canada)

Introduction: Falls is a common presenting complaint for seniors in the Emergency Department (ED). Numerous intervention programs for 'fallers' in the ED have been described in the literature. Most have been based on specialized geriatric nursing in the ED. The management of seniors presenting with falls by an interdisciplinary geriatric team in the ED has not been described. Objective: To describe the interdisciplinary management and outcome of seniors presenting with a fall to the Emergency Department of a large university affiliated hospital in North America. Methods: Prospective observational study. Consecutive seniors presenting in ED with a diagnosis of fall over a 6-month period are included. Information on basic demographic and living arrangements is collected. Description of patient's management and intervention is done using a pre-established protocol. Outcome measures include satisfaction with care, disposition at the time of discharge from ED and rate of return ED visits. Results: Preliminary data on interdisciplinary management of consecutive seniors presenting to the ED with falls is available. Geriatric Liaison Nurse systematically screens seniors with falls and/or fall related injury. Consultations to the most appropriate member of the interdisciplinary team are then done. Aetiologies and interventions are classically multi-factorial, involving most commonly 2 to 3 professionals. Most seniors are discharged home with home care services and geriatric assessment clinics (including Geriatric Day Hospital). A growing percentage is referred to rehabilitation/ convalescence centres. A minority need hospitalisation. Return ED visits is low and often unrelated. More detailed findings from data analysis will be presented. Conclusion: Management of seniors presenting with falls by an interdisciplinary geriatric team in the ED of a large university affiliated hospital has a positive impact on care and outcome. Comparison with other models of care and cost-effectiveness study would be very useful.

**PB8 260 BODY COMPOSITION, MUSCLE STRENGTH AND FUNCTIONAL PERFORMANCE OF AN INDEPENDENT URBAN BRAZILIAN OLDER POPULATION**

P. FORMIGHIERI\* (HOSPITAL DAS CLÍNICAS RIBEIRÃO PRETO, RIBEIRÃO PRETO, Brazil)  
E. FERRIOLLI(1), J. MORIGUTI(1), N. LIMA(1), S. SILVA FILHO, E. OLIVEIRA(1), J. RORIZ FILHO(1), M. WALTER IBRAIM(1), K. VILAÇA(1), K. PFRIMER(1),

F. PAULA(1) - (1) GERIATRIC MEDICINE DIVISION - HOSPITAL DAS CLÍNICAS DE RIBEIRÃO PRETO - USP (RIBEIRÃO PRETO, Brazil)

Introduction: the development of sarcopenia is clearly linked to dependency and functional restrictions. Studies on the correlations between body composition and muscle function are scarce in developing countries, where different anthropometric and nutritional characteristics have been described in the rapidly aging population. This study was aimed to characterize and correlate the body composition of the independent older population of an urban area in Brazil with markers of muscle strength and performance in a walking test. Methods and materials: one hundred and one volunteers with no physical or psychic limiting illnesses, of both genders, aged from 60 to 75 years were studied. After clinical evaluation and blood tests, volunteers were submitted to the assessment of body composition by DXA, lower limb performance through the 6-minute walking test (6WT) and handgrip strength by dynamometry. Descriptive analysis of data was performed, as well as bivariate correlation analysis followed by linear regression to correct the influence of height and body mass index (BMI), with the significance level of 0.05. Results: there was high prevalence of overweight and obesity, and 64% of the women and 41% of men had their BMI above 27. Although there was a positive correlation between lean mass (LBM) and BMI, the ratio LBM/fat mass (FBM) was inversely correlated with BMI, specially in women. No linear correlations were identified between handgrip strength and 6WT. While the percentage of FBM was negatively correlated with 6WT in both genders ( $r=0.370$  and  $p=0.022$  in men and  $r=-0.272$  and  $p=0.034$  in women), LBM and appendicular lean mass (ALM) were significantly correlated with 6WT (and handgrip) in men only ( $r=0.439$  and  $p=0.006$  for 6WT and  $r=0.448$  and  $p=0.004$  for handgrip). Conclusion: in this population, correlations of body composition and physical function are essentially different between genders and a better understanding of fat mass influence is fundamental.

**PB8 261 THE EFFECT OF WEIGHT LOSS PROGRAM ON BONE METABOLISM IN JAPANESE OBESE PEOPLE**

A. MORITA\* (National Institute of Health and Nutrition, Tokyo, Japan)  
N. AIBA(1), M. MIYACHI(1), S. SASAKI(2), N. KAWASHIMA(1), M. TSUBOTA(1), S. WATANABE(1) - (1) National Institute of Health and Nutrition (Tokyo, Japan); (2) The University of Tokyo (Tokyo, Japan)

Introduction Recently the metabolic syndrome has been a subject of public interest in Japan. It is necessary for obese people to lose weight in order to prevent the metabolic syndrome. However, the long-term effect of lifestyle intervention for weight loss on bone metabolism is unknown. To evaluate the effects of an intervention program for weight loss on bone metabolism in obese adults, we examined the change of bone mass caused by the one year interventions undertaken in our program (Saku Control Obesity Program (SCOP)). Subjects and Methods Japanese obese subjects aged 40 to 64 with a high body mass index ( $BMI > 28.3 \text{ kg/m}^2$ ) were selected for our weight loss program from those who had undergone a medical checkup at the Saku Central Hospital. They received one year interventions by healthcare professionals to change their dietary habits and physical activity in order to achieve weight loss. Result Of 235 participants, 98 subjects (47 men and 51 women) received an examination of bone mineral density (BMD) at the lumbar spine and hip before and after the intervention. Body weight significantly decreased 6.9 kg and 4.2 kg in men and women respectively. The mean waist circumference and visceral fat area in men and women were also significantly decreased. BMD at the total hip were significantly decreased, however, BMD at the femoral neck and the lumbar spine did not show the significant changes. When divided into tertiles based on weight loss, men in the lowest tertile (weight loss  $< 3.1\text{kg}$ ) did not show a loss of BMD at the total hip. Meanwhile, a significantly larger loss of BMD at the total hip in men was found in the middle and highest tertiles than in the lowest tertile. Conclusion Weight loss induced by the long-term modest intervention may decrease hip BMD in obese adults.

**PB8 262 TOOLS TO ASSESS FALL RISK: COMPARISON OF GAIT SPEED, TIMED UP & GO WITH LORD**

W. COOK\* (University of British Columbia, Vancouver, Canada)  
M. DONALDSON(1), L. DIAN(2), K. KHAN(3) - (1) San Francisco Coordinating Center, California Pacific Medical Center (San Francisco, United States of America); (2) Centre for Hip Health, University of British Columbia (Vancouver, Canada); (3) Division of Geriatric Medicine, University of British Columbia (Vancouver, Canada)

Introduction: Lord's PPA is a validated fall risk assessment tool. PPA z-scores of  $<\text{less than or equal to } 2.0$  identify individuals at risk for  $>\text{greater than or equal to } 2$  falls. However, the PPA requires  $>\text{greater than or equal to } 15$  minutes to administer and is not easily incorporated into physician visits without additional personnel support. We determined whether performance on 2 shorter tests: gait speed and the Timed Up & Go test (TUG) could discriminate high from low risk fallers (PPA  $>\text{greater than or equal to } 2.0$ ) and potentially help triage patients to a resource intensive falls clinic for comprehensive testing. Methods: We tested 363 consecutive new patients aged 65-100 years at 2 falls prevention clinics in Vancouver, Canada from July 2004-February 2008. We used logistic regression and ROC curve analysis to measure the association of TUG time and 4m gait speed with PPA z-scores, adjusted for age and Mini Mental Status Exam (MMSE) scores, and to identify cut-off values for characterizing high-risk fallers (defined as PPA scores of  $>\text{greater than or equal to } 2.0$ ). Results: Fall clinic attendees were 75% female and  $81 \pm 7$  years

old. Gait speed was  $0.77 \pm 0.28$  m/s. Median TUG time was 16s. Mean PPA z-score was  $2.01 \pm 1.50$ , with 52% classified as high risk fallers. 19% had MMSE scores < 25/30 (median 28). ROC curve analysis indicated that TUG and gait speed could be used to identify high risk fallers with cut points of 14s for the TUG (sensitivity 0.83, specificity 0.65, AUC=0.81) and 0.81 m/s for gait speed (sensitivity 0.80, specificity 0.63, AUC=0.80). Conclusions: We confirmed previous work using a larger sample with a cut point of 14s on the TUG and found that a gait speed of &lessthanorequalto 0.81 m/s identified high risk fallers. These brief measures may facilitate triage of high risk older fallers for detailed fall risk assessments.

#### PB8 263 IN-PATIENT FALLS – CAUSES AND CONSEQUENCES

C. JACQUELINE\* (Prince of Wales Hospital & Prince of Wales Medical Research Institute, Sydney, Australia)  
K. HO(1), S. LORD(2) - (1) University of New South Wales (Australia); (2) Prince of Wales Medical Research Institute (Sydney, Australia)

**Introduction** This case control study was designed to look at the causes and consequences associated with hospital wide in-patient falls. Methods Consecutive in-patient fallers were identified over a 3 month period using the Incident Information Management System (IIMS). Patient records were reviewed within 48 hours of a fall event being registered on IIMS. Data was collected from the patient records and medication charts. Fallers were matched in a ratio of 1:2 for age, gender, ward and duration of hospital stay. Logistic regression modelling was used to identify predictors of in-patient falls. Results 244 fallers were matched with 122 controls. 28% of hospital falls occurred in Aged Care wards. 89 falls resulted in an injury including 4 fractures and 1 death. 50% of falls occurred within the first 12 days of admission to hospital and 80% within 41 days. In patients with a length of stay of up to 12 days, outlier status (OR 2.481, 95%CI 1.030 - 5.976), cognitive impairment (OR 3.710, 95%CI 1.524 - 9.032) and consuming three or more centrally acting medications in the 24 hours prior to a fall (OR 2.979, 95%CI 1.390 - 6.383) were independent predictors of fall risk. Both cognitive impairment and consuming 3 or more CNS medications remained independent predictors in falls occurring up to 41 days after admission. Conclusion Important independent predictors of risk were identified across a hospital which can potentially inform intervention strategies. The predictors are not always possible to extract from the existing reporting system.

#### PB8 264 NURSE-LED WARD-BASED CONTINENCE REHABILITATION PROGRAM-A BIG FOOTSTEP FORWARD

L. LAU\* (TWGHs Fung Yiu King Hospital, Pokfulam, Hong Kong)  
K. WONG(1), M. LAM(1), A. YUEN(1) - (1) Fung Yiu King Hospital (Pokfulam, Hong Kong)

**Introduction** Urinary incontinence is a common problem encountered among hospitalized elderly (Bradway, 1998). Fung Yiu King Hospital conducted a point prevalence survey in 1997. The result showed that 68% of in-patient had urinary incontinence on admission. To prevent hospital-acquired urinary incontinence and improve the quality of life of patients and carers, a Nurse-led ward-based continence rehabilitation program has been implemented in the Geriatric Rehabilitation Ward since June 1999. The program was extended to patients over 65 in Medical and Geriatric Ward and Orthopedic Ward from July 2003. Methods A focus assessment was carried out on patients with urinary incontinence on admission. Ward nurses were responsible to identify different types of urinary incontinence by means of the continence assessment form including a problem related checklist. The patients who were identified with overflow, urge and stress incontinence would be referred to Continence Clinic for further management. Meanwhile, the patients who were diagnosed with functional incontinence would be recruited into the program. A specific and constructed management plan was then established according to the identifying problems. The range of cause-specific treatment options included the problems related to environmental barrier, impaired mobility, impaired dexterity, sensory deficits, language barrier and psychological unwillingness. Nursing interventions included diaper weaning regimen, bladder training, environment and clothing modification for toileting, mobility training, communication enhancement, psychological support and compensatory training of adapted device (i.e. bedpan, urinal and commode). The continent status of the patients before and after intervention was compared to check for any improvement in functional incontinence. Results The results are based on data obtained in the program conducted from July 2003 to Nov 2008. There were 587 patients recruited into the program during the period. 51.1% (300) were male and 48.9% (287) were female with a mean age of 81.8. Their average AMT was 7.7. After a mean period of rehabilitation (approximately 18.3 days), 49.5% (268) had no more functional incontinence. 28.8% (156) patients had reduction of incontinence at both day and night time while 7.6% (41) patients had reduction of incontinence at day time and 3.9% (21) at night time. 53 out of 587 (9.8%) had no improvement after the management process. Most of them were due to deterioration in general condition, mobility and cognitive status. Lastly, 46.9% & 91.9% patients were successfully weaned off diaper and Paul's tube respectively. Conclusions / Recommendations Functional incontinence in hospital is preventable and manageable through the program. Although urinary incontinence is multi-factorial, the problem-based managing approach assists nurses to identify patient's incontinence problems as well as to develop a constructed and specific management plan. Ward nurses play the coordinating role successfully in initiating continence rehabilitation program. As a result, promoting

continence should be considered as one of the major nursing practice domains in geriatrics. Urinary incontinence is also a common problem of elderly in the community particularly in institutions. Continence rehabilitation program is highly recommended as an essential element to improve their quality of life.

#### PB8 265 HEART RATE IN ELDERLY WOMEN IN WATER AEROBICS EXERCISE

C. SCHWANKE\* (Pontifícia Universidade Católica do Rio Grande do Sul - PUCRS, Porto Alegre, Brazil)  
A. SCARTON(1), C. STOBÄUS(1) - (1) PUCRS (Porto Alegre, Brazil)

**Introduction:** Physical activity leads to several temporary and future gains, looking for successful aging, it also corresponds to a reduction and the postponing of developmental changes. One physical activity in particular, aqua aerobics, is an excellent choice for exercising without harmful effects, because in liquid environment various healthy and beneficial changes can happen, even more for elderly. The justification for this study is the necessity to identify the specific physiological variables, with self-protocol, that could assist with the instructor's future lesson plans, offering healthier benefits. Therefore, the purpose of this research is to analyze heart rate (HR) levels in water aerobics exercise protocol, inside and outside water, in elderly women. Methods and materials: This was a direct research method and fieldwork adopting the quantitative-descriptive method. Sample was composed of 27 elderly women. The data collection took place inside and outside water. HR levels were verified before and after the aqua aerobics basic exercises protocol. Results: All results showed that HR is lower in water when compared to outside. The resting ( $69.07 \pm 10.36$ ) and exercising ( $114.22 \pm 16.32$ ) HR in water was lower when compared to outside ( $77.48 \pm 11.47$  and  $118.74 \pm 18.29$ ; respectively). When comparing the rise from resting to exercising HR, the differences in water and outside were significant. When this group was separated in two groups, with or without medication for high blood pressure, the difference in outside resting HR was significant ( $p=0.027$ ) but the same wasn't true for inside the water. And significant difference was found in exercising HR inside and outside of the water. Conclusion: These results can help exercise prescription for elderly people keeping in mind that this group needs special attention, particularly when high blood pressure medication are taken.

#### PB8 266 IS FUNCTIONAL FITNESS RELATED TO INDICATORS OF SARCOPENIA?

M. POWERS\* (University of Central Oklahoma, Edmond, United States)  
T. LAKE(1) - (1) University of Central Oklahoma (Edmond, United States of America)

Recent information indicates that reduced lean tissue mass is associated with functional impairment in late life. Despite several suggestions, a definitive measure of sarcopenia has not been widely accepted. If a feasible field test of functionality could be used to predict measures of sarcopenia, then practitioners could more easily identify those at risk for sarcopenia. The purpose of this study was to examine the relationship between measures of functional fitness and indicators of sarcopenia. Twenty-five women (age  $80.67 \pm 6.72$  years) completed four tests of the Senior Fitness test (chair stand, arm curl, 8-foot up-and-go, and 6-minute walk) as well as hand-grip strength assessment. A total body DEXA scan was used to assess appendicular skeletal muscle (ASM) and fat mass (AFM). Three potential measures of sarcopenia were calculated: ASM divided by height squared, ASM divided by body mass, and the ratio of ASM to AFM. Pearson product moment correlation coefficients were used to assess the relationships between all variables. No significant correlations were observed between functional measures and body composition measures ( $p > .05$ ). These preliminary results do not support the use of hand-grip strength or functional tests from the Senior Fitness Test as field measures of sarcopenia. Despite non-significance, this study does contribute important information regarding which tests might be indicators of sarcopenia. Due to the exploratory nature of this study and the small sample size, this question should be studied further in a larger and more diverse group of elders. Additional measures (i.e. functional tests of muscular power) should also be examined as the field moves toward a more definitive assessment of sarcopenia.

#### PB8 267 OPTIMAL SHOE FEATURES FOR BALANCE, GAIT AND STOPPING: FINDINGS OF THREE SYSTEMATIC STUDIES

J. MENANT\* (Prince of Wales Medical Research Institute, Randwick, Australia)  
H. MENZ(1), B. MUNRO(2), J. STEELE(2), S. LORD(3) - (1) La Trobe University (Bundoora, Australia); (2) University of Wollongong (Wollongong, Australia); (3) Prince of Wales Medical Research Institute (Randwick, Australia)

**Introduction:** Despite footwear being an easily modifiable falls risk factor, what constitutes safe footwear for everyday use by older people is still largely unknown. Methods: The effects of common shoe features (elevated heel, soft sole, hard sole, flared sole, bevelled heel, high-collar and tread sole) were systematically compared to standard shoes in three studies examining: (i) standing balance, leaning balance and stepping in 29 older people, (ii) centre of mass (COM)-base of support (BOS) margins and, vertical and braking loading rates in 11 young and 15 older people walking on even and uneven surfaces, and (iii) temporal-spatial gait variables and gait termination in 10 young and 26 older people, on level, irregular and wet surfaces. Results: Elevated heel shoes impaired overall

performance in functional tests of balance and stepping. They were also perceived as lacking comfort and stability and led to a conservative walking pattern characterised by increased step width and double-support time and reduced braking and vertical loading rates on various surfaces. Soft sole shoes increased lateral COM-BOS margin and step width, indicating reduced medio-lateral walking stability. When wearing these shoes, subjects displayed longer total stopping times and on the wet surface, reduced step lengths and shoe/floor angles at heel strike, suggesting an increased risk of slipping. The high-collars shoes improved balance, reflected by increases in the lateral COM-BOS margin, double-support time and step width. Shoes with hard, flared or tread soles or a bevelled heel did not affect balance, gait or stopping ability. Discussion: These three studies revealed that shoes with a low square heel, a sole of medium hardness (shore A-40) and a high-collars provide the greatest stability for older people and are the safest in terms of reducing falls risk when walking and stopping on dry, wet and irregular surfaces.

#### **PB8 268 EFFECTS OF A FLOOR-RISE TRAINING PROGRAM FOR ELDERLY PEOPLE AT RISK OF FALLING**

A. SAIMPONT\* (INSERM U887 Motricité-Plastique, Dijon, France)  
F. MOUREY(1), P. MANCKOUNDA(1), T. POZZO(1), P. PFITZENMEYER(1) -  
(1) Laboratoire INSERM U887 Motricité-Plastique (Dijon, France)

**BACKGROUND AND AIMS** Elderly adults often have difficulty to get up from the floor after a fall even when they are not seriously injured. This inability to rise is associated with substantial morbidity and may lead to dependency. Despite these risks, few therapists teach elderly people how to get up from the floor. The main aim of the study was to evaluate the benefits of a floor-rise training program in older adults at risk of falling. **METHODS** Participants: 41 elderly subjects (mean = 84.1 & more or less 5.4 years), at risk of falling (TUG & higher than 14s), non-demented (MMSE & higher than 23) and without any neurologic, muscular or articular disease. Testing: subjects' ability to rise from the floor with the help of a chair was assessed before ( $t_{pre}$ ), just after ( $t_{post}$ ) and 3 months after the end of the training-program ( $t_{3m}$ ). In case of success, rise times were also measured. Training: subjects were trained for 15 min, 2 times a week for 3 weeks. They practiced the intermediate movements necessary to get up and were trained to perform complete floor-rise sequences as soon as possible. **RESULTS** Proportions of subjects able to rise:  $t_{pre}$  = 0.41,  $t_{post}$  = 0.68,  $t_{3m}$  = 0.67. The increase between  $t_{pre}$  and  $t_{post}$  was significant ( $\chi^2$  test,  $p < 0.01$ ). Rise times:  $t_{pre}$  = 34 s,  $t_{post}$  = 24 s,  $t_{3m}$  = 24 s. The decrease between  $t_{pre}$  and  $t_{post}$  was significant ( $t$  test,  $p < 0.01$ ). Proportions and rise times remain stable at  $t_{3m}$  compared to  $t_{post}$  ( $p > 0.05$ ). **CONCLUSIONS** This study shows that a short rise-training program is sufficient to significantly improve the ability of elderly people at risk of falling to get up. Considering the complications associated with the inability to rise after a fall, therapists in charge of such patients should systematically teach them how to get up.

#### **PB8 269 THE EFFECT OF THE FUMANET® EXERCISE ON THE ELDERLY WALKING ABILITY.**

K. KITAZAWA\* (Hokkaido University of Education, Kushiro, Japan)  
S. OSHIMA(1) - (1) Hokusei Gakuen University (Atsubetsu, Sapporo, Japan)

**Introduction:** It is widely recognized that exercise is very important to improve ADL and prevent falls for the elderly. In order to make these exercises easier for them, a new exercise method, named the Fumanet® exercise, is invented. Fumanet® is a 4-meter-by-1.5-meter net. The Fumanet® exercise uses 50 square centimeter meshes and features low impact physical movement. Participants are asked to walk across the net without stepping on the ropes or getting caught in the net. **Method and Materials:** Non-randomized controlled trial was conducted to examine the effect of the Fumanet® exercise. 21 people of an exercise group (9 males, 12 females, average age 79.0) voluntarily participated in 60 minutes Fumanet® exercise every once in a week. 17 people of a control group (8 males, 9 females, average age 80.6) carried out ordinary daily rehabilitation program in every once in a week. TUG (timed up and go test) was measured for both groups before and after the 6 weeks trial. Result: TUG was significantly shortened ( $p=0.009$ , Wilcoxon matched pairs signed ranks test) and 9 % improvement was observed only in the Fumanet® exercise group in the period of 6 weeks. Conclusion: The result indicated that Fumanet® exercise improved the walking ability of the elderly. Cooperation between the motion of exercise and the sense of sight seems to be effective to improve of the body balance for the walking ability. Participants of an exercise group were strongly required visual attention to make their foot away from net and step over the ropes, while they were walking across the net.

#### **PB8 270 NEUROPROTECTIVE AND CONSEQUENT NEUROREHABILITATIVE OUTCOMES IN ELDERLY WITH SEVERE BRAIN CONDITIONS, TREATED WITH NEUROTROPHIC DRUGS ACTOVEGIN® OR/AND CEREBROLYSIN® - PRELIMINARY RESULTS**

G. ONOSE\* (Clinic Division, of the "Bagdasar-Arseni" University Emergency Hospital , BUCHAREST, Romania)  
C. POPESCU(1), C. CHEDREANU(2), A. ANHELESCU(2), S. MIHAESCU(2),  
D. MARDARE(2), C. POPESCU(2), L. ONOSE(3), L. PADURE(4), A. MIREA(2),  
M. HARAS(2) - (1) The National Institute of Gerontology & Geriatrics "Ana Aslan"

(BUCHAREST, Romania); (2) The Physical & Rehabilitation Medicine (PRM) Clinic Division, of the "Bagdasar-Arseni" University Emergency Hospital (BUCHAREST, Romania); (3) The Medical Service of Metrex (BUCHAREST, Romania); (4) The National Center for Pediatric neuro-psychomotor Rehabilitation, N.Robanescu" (BUCHAREST, Romania)

**Objective:** assessment of the outcomes obtained in our PRM Clinic with Actovegin®, Cerebrolysin® and combined - neuroprotective/ neurotrophic therapy. **Materials and Methods:** Three homogeneous lots of elderly, admitted between 2007 - 2008: 62 with Actovegin®, 39 with Cerebrolysin® ; 67 with Actovegin® + Cerebrolysin®. The mathematical method(s) used, consisted within analyses of variance (ANOVA). There have been assessed 13 parameters, among which the most contributive ones were: admission/ discharge Functional Independence Measure (a/d FIM), (global) status at discharge (ES), number of physical therapy days (PT), hospitalization length (H), days until the recovery of: functional (orthostatism enabling) knee extension (EXR), (assisted) walk between parallel bars (WPB), cane assisted walk (CWR), first time independent stairs ascent/ descend (SR). **Results:** For the Actovegin® lot, the most significant statistical correlations were PT- H ( $r = .99$ ;  $p=.001$ ) and EXR - WPB ( $r = .87$ ;  $p=.001$ ); the most statistical significant predictors of the dependent variables d FIM, were independent variables: a FIM ( $T=9.553$ ;  $sig.T=.000$ ), and ES ( $T=7.620$ ;  $sig.T=.000$ ); and respectively, for a FIM: d FIM ( $T=9.553$ ;  $sig.T=.000$ ) and ES ( $T=-4.509$ ;  $sig.T=.000$ ). For the Cerebrolysin® lot, similarly: PT - H ( $r = .99$ ,  $p=.001$ ) and CWR-SR ( $r = .97$ ,  $p=.001$ ); d FIM was explicited by ES ( $T=10.494$ ;  $sig.T=.000$ ), a FIM ( $T=7.466$ ;  $sig.T=.000$ ) and respectively: a FIM, by d FIM ( $T=7.466$ ;  $sig.T=.000$ ) and ES ( $T=-5.179$ ;  $sig.T=.000$ ). For the Actovegin® + Cerebrolysin® lot, similarly: PT - H ( $r = .99$ ;  $p=.001$ ); EXR - WPB ( $r = .87$ ;  $p=.001$ ); d FIM were explicited by a FIM ( $T=9.553$ ;  $sig.T=.000$ ), ES ( $T=7.620$ ;  $sig.T=.000$ ) and respectively: a FIM, by d FIM ( $T=9.553$ ;  $sig.T=.000$ ) and ES ( $T=-4.509$ ;  $sig.T=.000$ ). **Conclusion:** Our initial - in elderly - study, emphasized a significant variance, favourable to an important therapeutic benefit for the combined use (simultaneously/ sequential) of Actovegin® and Cerebrolysin®. **Key words:** Actovegin, Cerebrolysin, neuroprotective agents.

#### **PB8 271 CLINICAL EVALUATION OF NPWT FOR CHRONIC WOUNDS TREATMENT IN HOSPITALIZED ELDERLY**

T. LANDRE\* (René Muret University Hospital (APHP), Sevran, France)  
S. FEUILLOLAY(1), M. CABROL(2), G. SEBBANE(2), R. RATINEY(1) - (1) Pharmacy Department René Muret University Hospital (APHP) (Sevran, France); (2) Geriatric Medicine Department René Muret University Hospital (APHP) (Sevran, France)

**INTRODUCTION:** Negative pressure wound therapy (NPWT, VAC® therapy) is a topical treatment used to promote healing in acute and chronic wounds. It is seldom used in the elderly with bedsores. The aim of this study is to evaluate the benefit of NPWT for pressure ulcers in hospitalized geriatric patients. **METHODS AND MATERIALS:** The study was carried out at René Muret Geriatric University Hospital (550 beds). A retrospective review of medical records was performed for patients treated with NPWT between June 2006 and January 2009. Demographics, diagnosis, nutrition status, Norton scale value, associated treatments, localization and stage of pressure ulcers, length of NPWT and withdrawal reasons were also recorded. **RESULTS:** 14 patients (9 females), mean age 81 years, were evaluated. Most patients had a critical health status and presented with severe denutrition before treatment. NPWT was used on sacral bedsores for 11 patients (stage III = 3, stage IV = 8); on heel pressure ulcers for 3 patients (stage III = 2, stage IV = 1). Mean score of Norton scale was 10. Mean length of NPWT was 21 days [10; 35]. 13 favourable evolutions (92, 8%) were observed (recovery for 3 patients, granulation for 10). **DISCUSSION:** In our study, the important proportion of positive response showed a real clinical benefit of NPWT. This profit is observed in spite of the wound stage often advanced, due to the general health status of these patients; independently of Norton's score and evolution of the wound or duration of the treatment. The nutritional aspect seems important and need to be further analyzed. **CONCLUSIONS:** This study shows that the NPWT is effective in treatment of chronic wounds in that population. It is necessary to pursue the search for predictive factors. The economic interest of this practice versus classic treatment remains to be confirmed.

#### **PB8 272 FUNCTIONAL STATUS ONE YEAR AFTER HIP FRACTURE: RESULTS FROM THE SARCOPEANIA AND HIP FRACTURE (SHIP) STUDY**

K. SIMPSON\* (University of Sydney, Sydney, Australia)  
L. BRADLEY(1), D. WILLIAMSON(1), N. SINGH(2), R. HANSEN(3), T. DIAMOND(4), T. FINNEGAR(7), B. ALLEN(5), T. STAVERINOS(2), A. DIWAN(6), M. FIATARONE SINGH(1) - (1) Exercise, Health and Performance, Faculty of Health Sciences, University of Sydney (Sydney, Australia); (2) Balmain Hospital (Sydney, Australia); (3) Gastrointestinal Investigation Unit & Centre for In Vivo Body Composition, Royal North Shore Hospital (Sydney, ); (4) St George Hospital (Sydney, ); (5) Cancer Care Centre, St George Hospital (); (6) Faculty of Medicine, University of New South Wales (Australia); (7) Department of Aged Care & Rehabilitation Medicine, Royal North Shore Hospital (Australia)

**Introduction** This report investigates the pattern of change in 8 areas of function during the first 12 months following hip fracture in participants of the SHIP study. **Methods and**

**Materials** Community-dwelling persons (n=193, 81 ± 8 years, 72% women) admitted for hip fracture to 3 acute care hospitals in Sydney, Australia were followed prospectively. Function was assessed at baseline (in reference to pre-fracture period), and 4 and 12 months following hip fracture using Part C (Activities of Daily Living) of the National Health and Nutrition Examination Survey I. A summary functional score, and eight separate functional scores (Dressing, Eating, Hygiene, Walking, Transferring, Errands/Chores, Reaching, and Grip) were obtained for each time-point. Results Mean functional scores were 9 to 51% poorer in all eight areas at 4 and 12 months when compared to pre-fracture. In the period between 4 and 12 months, mean scores improved for Dressing and Eating, were poorer for Reach and Grip, and were unchanged in other areas. Only 22% of participants were at their pre-fracture level of function (>= summary score) at 4 and 12 months following hip fracture. At 12 months when compared with function at 4 months, 37% of the cohort had improved, 50% had deteriorated, and 13% were at the same level of function. Walking was most impaired (44% at pre-fracture level at 4 months, 45% at pre-fracture level at 12 months), and grip was least impaired (84% at pre-fracture level at 4 months, 74% at pre-fracture level at 12 months). Large inter-individual variation was observed for direction of change in scores for all areas of function between all time-points. Conclusion One year following hip fracture only about one-fifth of persons are at their pre-fracture level of function. Large heterogeneity exists in functional recovery during the first year following hip fracture.

#### PB8 273 COMPARISON OF PHYSIOLOGICAL AND FUNCTIONAL PERFORMANCE BETWEEN CAUCASIAN AND CHINESE OLDER PEOPLE

M. KWAN\* (Prince of Wales Medical Research Institute, Sydney, Australia)  
J. CLOSE(1), W. YANG(3), C. LIAO(4), S. LIN(3), S. LORD(1) - (1) Prince of Wales Medical Research Institute (Sydney, Australia); (3) Department of Physical Therapy, National Cheng Kung University (2031, Taiwan); (4) Institute of Allied Health Science, National Cheng Kung University (Tainan City, Taiwan)

Older community-living Chinese and Japanese have significantly lower falls rate (approximately 20-25%) than Caucasian (typically 30-35%). Previous attempt in identifying factors mediating such rate differences between Japanese and Caucasian older women reported that Japanese women had better functional and balance performance while Caucasian women were stronger and had quicker reaction times<sup>1</sup>. To date, no studies have compared the prevalence of fall risk factors between Chinese and Caucasian groups and reasons for the lower falls rate remain unknown. A cross-sectional study of 2 elderly cohorts consisted of 278 Chinese in Tainan, Taiwan and 298 Caucasian in Sydney, Australia. A range of standardised physiological and functional performance measures were assessed. Responses to subjective health, falls history and falls-related questions were also recorded. Significantly fewer Chinese older people (29.0%) reported having fallen in the past year compared to the Caucasian group (36.9%) ( $p=0.04$ ). After adjusting for age and gender, the Caucasian cohort performed better in both physiological (simple reaction time, lower limb proprioception and tactile sensitivity, postural sway, contrast sensitivity and depth perception) and functional (sit-to-stand time, alternate stepping time and near tandem stand with eyes closed) measures. The Chinese cohort were significantly less likely to rate their balance as good, and significantly more likely to report a fear of falling. The difference in falls rates between the two populations could not be explained by physiological or functional measures. However, it appears that the Chinese cohort demonstrated a greater appreciation of their balance limitations and risk of falling. Further longitudinal studies are required to investigate the role of behavioural, psychological and social factors as falls risk factors in Chinese older people. <sup>1</sup>Davis JW, Nevitt MC, Wasnich RD, et al. A Cross-Cultural Comparison of Neuromuscular Performance, Functional Status, and Falls Between Japanese and White Women. *J Gerontol A Biol Sci Med Sci* 1999; 54A:M288-292.

#### PB8 274 INTERACTION BETWEEN THE LEVEL OF WALKING SPEED AND THE ABILITY TO MULTI-TASK CONDITIONS IN OLDER PEOPLE

H. IHIRA\* (Sapporo medical university, Sapporo, Japan)  
H. MAKIZAKO(1), H. SHIMADA(2), M. KIMURA(3), T. FURUNA(1) - (1) School of Health Sciences, Sapporo Medical University (Sapporo, Japan); (2) okyo Metropolitan Institute of Gerontology (Japan); (3) International Life Sciences Institute JAPAN (Japan)

**Introduction:** The walking speed is a common measurement of physical performance in older people. They require more attention to walking in the multi-task conditions than simple-task one. The purpose of this study was to determine the relationship between the maximum walking speed and the reaction time under different conditions in community-dwelling older people. **Methods and materials:** We evaluated data on 135 older people (92 women and 43 men; age: 68 to 91 years; mean age: 77.6 years). Participants performed the 5m walk tests at a maximum pace. The reaction time was measured under the three different conditions; quiet standing (simple-task), stepping in place (dual-task) and counting backward while stepping in place (triple-task). Participants were required to push a handheld button as quickly as possible in response to a visual stimulus. **Results:** Participants were classified by the two levels of walking speed. Both of the two levels, the reaction time increased with task difficulty. For reaction time, the results showed that there are statistically significant main effects of task ( $F=6.6$ ,  $p<0.05$ ) and level of walking speed ( $F=13.7$ ,  $p<0.01$ ). In addition, statistically significant interaction between task and level of

walking speed was revealed in reaction time ( $F=4.9$ ,  $p<0.01$ ). **Conclusion:** The results suggest that the ability to multi-task may have influenced by physical performance such as the walking speed in community-dwelling Japanese older people.

#### PB8 275 ASSESSMENT OF THE IMPACT OF PHYSICAL CONDITION ON THE HEALTH AND FUNCTIONAL STATUS OF COMMUNITY DWELLING OLD PEOPLE

L. ARAÚJO\* (Instituto de Ciências Biomédicas Abel Salazar, Porto, Portugal)  
Ó. RIBEIRO(1), C. PAÚL(2) - (1) Universidade de Aveiro (Aveiro, Portugal); (2) Instituto de Ciências Biomédicas Abel Salazar (Porto, Portugal)

**Introduction –** The aging process is characterized by biological changes, specially the deterioration of global physical condition. In considering new paradigms for the prevention and treatment of disease and disability, assessing the influence physical condition has on other variables that follow the aging process, is of extreme importance. The purpose of this study was to investigate relationships between physical condition and the health status of the old people, so as in their functional status. Methods and materials – the sample was derived from a larger study designed to examine the predictors of the active ageing (WHO, 2002), conducted in a sample (N=1266) of old people (mean age 70.3 years, SD 8.66), living in the community, in mainland of Portugal and in the islands of Madeira and Azores. Different measures on physical condition (grip strength and self-report physical condition), functional status (composite index of ADLs e IADLs) and health status (number of medical diagnosis, self-reported health, medication use and visual impairment) were used. Results – the cross sectional analyses confirm that physical condition decreases with age. Physical capacity is associated with all the variables tested. Self-reported health was highly correlated ( $p<.001$ ) with several physical capacity measures. 46.7% of the participants have a good physical condition and rate their health as "good" likewise, 90% of those presenting health problems that intervene with their professional and house activities reveal a frail physical condition. Conclusions – the results are analyzed in order to comprehend one of the top challenges in active aging, the formulation of a preventive health care to the older population. Taking in consideration the influence of physical condition on these variables, and the imperative implementation of interventions designed to maintain or improve the physical condition, some recommendations on this issue are presented within the active ageing framework.

#### PB8 276 MIDLIFE VASCULAR RISK AND OVERWEIGHT PREDICT FRAILTY IN OLD MEN

J. SIROLA\* (University of Helsinki, Helsinki, Finland)  
K. PITKÄLÄ(2), R. TILVIS(3), T. STRANDBERG(1) - (1) University of Oulu (Oulu, Finland); (2) University of Helsinki (Helsinki, Finland); (3) University of Helsinki (Helsinki, Finland)

**Introduction:** An interconnection between cardiovascular disease and frailty has been proposed but it is not known whether these conditions also share similar risk factors. We explored this in a socioeconomically homogenous sample of Finnish men followed from midlife to old age. **Methods:** In 1974, cardiovascular risk was assessed in 1815 healthy middle-aged men (the Helsinki Businessmen Study). They were followed up for 26 years. Frailty status and disease prevalence were appraised using postal questionnaire including RAND-36 in 2000 (response rate 87.8%, mean age 73 years). Four criteria were used to define frailty: 1) >5% weight loss from midlife, or BMI <21 kg/m<sup>2</sup> in 2000; 2) physical inactivity in 2000; 3) low vitality (RAND-36); 4) physical weakness (RAND-36). The respondents with 3 to 4 criteria were classified as frail, with 1 to 2 criteria as prefrail, and with zero criteria as robust. Total mortality from 2000 to 2007 was assessed from central registers. **Results:** According to our criteria, 34.2%, 54.1% and 11.8% were classified as robust, prefrail and frail, respectively. Both prefrailty and frailty were powerful predictors ( $P<0.001$ ) of mortality between 2000 and 2007, even after adjustment for prevalent diseases in 2000. As compared to robust old men, frail men had significantly ( $P=0.02$ ) higher body mass index in midlife but lower in old age. Also systolic blood pressure was higher and smoking more frequent in midlife among those who became frail in old age ( $P$  for trend  $<0.001$ ). Consequently, age-adjusted composite risk score of coronary artery disease in midlife was 1.7, 1.8, and 2.1 among robust, prefrail and frail men, respectively ( $P=0.04$ ). **Conclusion:** Cardiovascular risk and overweight in midlife were associated with characteristics related to frailty in old age. Hence, attempts to prevent vascular disease may also have significance in preventing frailty in later life.

#### PB8 277 RESPIRATORY REHABILITATION PROGRAM IMPLEMENTED TO THE HOSPITALIZED ELDERS WITH COPD

M. FELEA\* (MEDICINE and PHARMACY UNIVERSITY of IASSY, IASI, Romania)  
F. MITU(1), G. PANDELE(1) - (1) Medicine and Pharmacy University of Iasi (Romania)

**Introduction:** Older people declare that illness, pain or injury force them to restrict their activities on a regular basis. Restricted activity may prove to be a useful indicator of permanent functional decline. Patients reported five different problems as causes for restricted activity. Respiratory rehabilitation is an integral part of the clinical management and health maintenance of patients with chronic respiratory disease who remain symptomatic or continue to have decreased function despite standard medical treatment.

**Methods and materials:** The respiratory rehabilitation program performed by the medical team, psychotherapist and kinetotherapists includes all symptomatic patients with restrictive, obstructive or mixed ventilatory dysfunction. At the admission, the patients are assessed by case history, physical exam, dyspnea on the Medical Research Council scale, quality of life questionnaire (MRF28, Saint George, Dijon), pulse oxymetry, ECG at rest, spirometry and bronchodilatatory test, meeting patients in GOLD stages for COPD and calculation of the BODE score, thoracic radiography, other explorations related to the pathologies, and the exploration of the exercise capacity. Varying with the exercise capacity assessed by the 6 minutes walk test, by cycloergometer 25 W test and by cardiovascular exercise test, the patients were divided in 4 groups, and so they can benefit by specific respiratory rehabilitation programs. **Results:** 1. Reducing symptoms, decreasing disability, increasing participation in physical and social activities, and improving the overall quality of life for patients with chronic respiratory disease. 2. Achieving goals through patient and family education, exercise training, psychosocial and behavioral intervention, and outcome assessment. 3. The rehabilitation intervention is geared toward the unique problems and needs of each patient. **Conclusion:** Respiratory rehabilitation is a multidimensional continuum of services directed to persons with pulmonary disease and their families, performed by an interdisciplinary team of healthcare professionals, to achieve and maintain the individual's maximum level of independence and functioning in the community.

**PB8 278 ASSOCIATION OF HALLUX VALGUS AND FOOT FUNCTION IN OLDER MEN**

R. DEMIRTAS\* (Eskisehir Osmangazi University, Medical School, Eskisehir, Turkey)  
Y. KAVLAK(2) - (Eskisehir Osmangazi University Medical Services Vocational School (Eskisehir, Turkey)

**Introduction:** Hallux valgus is common deformity of the metatarsophalangeal joint that also affects elderly people. The aim of this study was to investigate the association between hallux valgus and foot function in older men. **Methods and Materials:** One hundred and six feet of fifty three older men (mean age: 73.79±7.08 years) were assessed. Hallux valgus was evaluated using The Hallux Valgus Index (HVI) which is a goniometric measurement of the angle between the first metatars and phalanx from medial side of the foot and the Hallux Valgus Grading Score (HVGGS) (Grade 0-3). The foot function was assessed with the timed up and go test (TUG), walking speed and the Foot Function Index (FFI) which is a questionnaire (a higher score indicating worse foot function) covering foot pain, disability and functional limitation. To determine the foot pain was used Visual Analog Scale (VAS). **Results:** HVI was  $17.32 \pm 11.29$  degrees for right foot and  $16.45 \pm 10.65$  degrees for left foot. There were poor correlations between HVI with TUG ( $r=0.12$ ,  $p>0.05$ ), walking speed ( $r=-0.19$ ,  $p=0.05$ ), FFI ( $r=0.31$ ,  $p>0.05$ ), VAS ( $r=0.27$ ,  $p>0.05$ ), and HVGGS with TUG ( $r=0.08$ ,  $p>0.05$ ), walking speed ( $r=-0.11$ ,  $p>0.05$ ), FFI ( $r=0.14$ ,  $p>0.05$ ), VAS ( $r=0.10$ ,  $p>0.05$ ). **Conclusion:** The results showed that the degree of hallux valgus by itself isn't reflected in the values of FFI although it partially affected the walking speed in older men.

**PB8 279 FACTORS ASSOCIATED WITH SELF-RATED HEALTH IN COMMUNITY-DWELLING INDEPENDENT JAPANESE OLDER PEOPLE**

T. FURUNA\* (Sapporo Medical University, Sapporo, Japan)  
H. MAKIZAKO(1), H. IHIRA(1), H. SHIMADA(2), M. KIMURA(3), E. UCHIYAMA(1) - (1) School of Health Sciences, Sapporo Medical University (Japan); (2) Tokyo Metropolitan Institute of Gerontology (Japan); (3) International Life Sciences Institute JAPAN (Japan)

**Introduction:** Self-rated health (SRH), a subjective measure of health, has been shown to be a reliable predictor of functional decline. Relationships between physical performance (muscle strength, balance, flexibility and mobility), higher-level functional capacity, habituation of exercise and self-rated health in community-dwelling independent Japanese older people were examined. **Methods:** Ninety seven older individuals participated in the study including 65 women and 32 men; aged 75 to 91 years (mean age 80.1 years). Participants were asked about their health through the question: "In general terms, how would you describe your health: very good, good, poor, or very poor?" and their higher-level functional capacity according to the Tokyo Metropolitan Institute of Gerontology (TMIG) index of competence. We assessed their habituation of exercise using stages of behavior change within a questionnaire. Participants were measured lower muscle strength, one-leg standing test, flexibility and 5-m walking time. SRH was dichotomized into good (very good or good) and poor (poor or very poor). **Results:** Overall 79.4% respondents rated their health as good. Good responders showed a significantly higher physical performance as compared to respondents rated their health as poor (lower muscle strength;  $p < 0.05$ , one-leg standing test;  $p < 0.01$ , 5-m walking time;  $p < 0.01$ ). We found significant differences in habituation of exercise between good SRH (42.1% habitual exercisers vs. 57.9% non-habitual exercisers) and poor SRH (15.8% habitual exercisers vs. 84.2% non-habitual exercisers). However, there were no statistically significant differences in higher-level functional capacity between good SRH and poor SRH ( $p = 0.23$ ). **Conclusion:** These results suggest that in spite of there are no differences in higher-level functional capacity, higher physical performance and habituation of exercise associate with good self-rated health in community-dwelling independent Japanese older people. Physical

performance and habituation of exercise might be important factors to maintain good SRH in older people.

**PB8 280 CLINICAL ASSESSMENTS OF BALANCE ASSOCIATED WITH INCREASED FALL RISK: A PROSPECTIVE STUDY**

M. SPEECHLEY\* (University of Western Ontario, London, Canada)  
S. MUIR(3), K. BERG(1), B. CHESWORTH(2), N. KLAR(3) - (1) University of Toronto (Toronto, Ontario, Canada); (2) University of Western Ontario (Toronto, Ontario, Canada); (3) University of Western Ontario (London, Ontario, Canada)

**Introduction:** Impairment in balance is a major predictor of falls in older adults but there is a lack of information on how to effectively measure it in the clinical setting. Balance assessment features prominently in clinical practice guidelines for fall prevention screening, which should have easy and valid measurement tools to identify increased future fall risk. The objective of the study was to evaluate the independent contribution of the clinical assessment of balance on future fall risk using five methods to quantify balance impairment on the outcome any fall. **Methods and materials:** Sub-sample from Project to Prevent Falls in Veterans (n=182, mean age=79.7 years, 70% male). A questionnaire and comprehensive geriatric assessment were performed at baseline. Prospective falls were collected monthly for 1 year. Balance impairment measured by single leg stance, tandem stand, limits of stability, observational gait assessment, and the self-report of balance problems was evaluated. Multivariable modified Poisson regression modeling was used to obtain relative risks (RR). **Results:** Seventy-eight people (43%) fell. Prevalence of balance impairment varied with the method used; single leg stance (63%), tandem (43%), self-report (30%), limits of stability (24%) and unsteady gait (17%). Adjusted RR estimates were statistically for single leg stand [RR=1.58 (1.03, 2.41)], limits of stability [RR=158 (1.02, 2.09)] and self-report of balance problems [RR=1.46 (1.02, 2.09)]. **Conclusions:** The number of people identified as having a balance impairment varied with the measurement tool used to clinically assess balance, therefore measurement tools are not interchangeable or equivalent in defining an at risk population. The self-report of balance problems, single leg stand test, and the limits of stability test were associated with increased risk for any fall in this population of community-dwelling older adults. A finding of impairment using these measurement tools indicates an individual who would benefit further comprehensive geriatric assessment.

**PB8 281 BODY COMPOSITION INDICES AND FUNCTIONAL DISABILITY IN OLDER WOMEN: THE EPIDOS STUDY**

M. BONNEFOY\* (Hospices Civils de Lyon, Lyon, France)  
M. AMINE(1), F. CANOUI-POITRINE(1), B. GELAS-DORE(1), N. BERTHOUX(1), A. SCHOTT(1) - (1) Hospices Civils de Lyon (Lyon, France)

**Introduction:** The link between low muscle mass and functional disability is not established in elderly. The aim of the study was to assess the association between body composition indices, including body mass index (BMI), waist circumference (WC) and muscle mass (MM), and functional disability among older women. **Material and methods:** Between 1992 and 1994, 7598 women aged 70 years and older were included in the EPIDOS cohort study in 5 French centres. Functional disability was assessed by the Instrumental activity of Daily Living (IADL) scale and Short Performance Physical Battery (SPPB). Muscle mass was assessed by dual-energy x-ray absorptiometry (DEXA). Association between body composition indices and functional disability at baseline was estimated using multivariable logistic regression models adjusted for age, marital status, educational level, smoking, alcohol consumption and chronic conditions. **Results:** At baseline, 2500 women (33%) had a self-reported functional disability (IADL) and 3672 (51.8%) a physical limitations assessed by the SPPB. Adjusted odds ratios of fourth quartile of BMI ( $\&\geq;$ ;  $27.9 \text{ kg/m}^2$ ) compared to second quartile ( $22.5 \text{ } \&\leq;$ ;  $BMI \&\leq;$ ;  $25.1 \text{ kg/m}^2$ ) were 2 (95% confidence intervals (95%CI): 1.8-2.3) and 1.9 (95% CI: 1.6-2.2) respectively for self-reported functional disability and physical limitations. Similarly, adjusted odds ratios of fourth quartile of WC compared to first quartile were 2.34 (95% CI: 2.0-2.7) and 2.72 (95% CI: 2.3-3.2). Adjusted odds ratios of first quartile of muscle mass (sarcopenia) compared to fourth quartile were 1.4 (95% CI: 0.96-2.2) and 1.52 (95% CI: 1.03-2.24) after additional adjusted for BMI. **Conclusion:** Increase of body mass index and waist circumference and decrease of muscle mass were significantly associated with functional disability in older women.

**PB8 282 ASSESSING OLDER PATIENTS AT THE POINT OF HOSPITAL ADMISSION - SIMPLE CLINICAL CRITERIA IDENTIFY FRAILTY**

H. MILLER\* (Hairmyres Hospital, Glasgow, United Kingdom)  
B. MARTIN(1), G. ELLIS(2), B. MCGURN(1) - (1) Hairmyres Hospital (Glasgow, United Kingdom); (2) Monklands Hospital (United Kingdom)

**Introduction:** Frailty is recognised as a crucial concept in Geriatric Medicine yet there is debate about how best to identify it. Validated tools such as the Rockwood Frailty Index (FI) are cumbersome to use in clinical practice. In our hospital we developed simple clinical criteria to identify patients suitable for admission to Care Of The Elderly (COTE). We sought to determine if these criteria identify frailty. **Methods:** We assessed consecutive patients aged 65 or older with unscheduled admission to acute medicine in a Scottish

district general hospital in March 2008. Our criteria determined suitability for COTE or general medicine care. Baseline characteristics, length of stay and mortality during the index admission and at 3, 6 and 9 months were recorded. A FI was constructed using routinely recorded data and calculated by retrospective case note review in 200 patients. Results 312 patients were admitted. 58% were suitable for COTE by criteria. Compared with general medical patients, COTE patients had higher mortality during index admission (17.7% vs 3.8%, P=0.0002), at 3 months (24.7% vs 7.7%, P<0.0001), 6 months (31.9% vs 8.5%, P<0.0002) and 9 months (33.5% vs 10.8%, P<0.0001). Hospital length of stay was longer for COTE patients (mean 18.9 vs 6.9 days, P<0.0001). The FI predicted mortality during the index admission and at 3.6 and 9 months. Less frail patients (FI=0-0.2) had a mortality rate of 1.6 % at 9 months whilst frailer patients (FI=0.4-0.6) had a mortality rate of 45.3% (P<0.0001). The proportion of patients suitable for COTE by criteria increased in a linear fashion with FI. Inter-rater reliability was calculated for the criteria ( $\kappa$ =0.78) and for the FI ( $\kappa$ =0.94). Conclusion Our simple clinical criteria correlate with the frailty index and predict mortality.

**PB8 283 IS REHABILITATION FOLLOWING A STROKE SUFFICIENTLY ATTENTIVE TO SOCIAL ROLES?**

M. PLANTE\* (University Institute of Geriatrics of Montreal, Montreal, Quebec, Canada) L. DEMERS(1), B. SWAINE(2), J. DESROSIERS(3) - (1) Research center, University Institute of Geriatrics of Montreal (Montreal , Canada); (2) Centre de recherche interdisciplinaire en réadaptation (CRIR) (Montreal , Canada); (3) Research Centre on Aging (Montreal , Canada)

Introduction: Intensive rehabilitation following stroke focuses principally on the remediation of capabilities and on the restoration of independence in daily activities. Then the person returns home to resume their social roles (including responsibilities, community life, interpersonal relationships, and leisure). We hypothesized that the ability of older adults to carry out their daily activities at rehabilitation discharge would be weakly associated with the expression of their social roles 6 months later. Method: The study followed 111 post stroke older adults (mean age 77 years). The Functional Autonomy Measurement System (SMAF) was used to obtain a daily activities measure at discharge. Data collected at 6 months included socio-demographic information, capability measures as well as a measure of social roles (Assessment of Life Habits) which comprises four life domains: responsibilities, community life, interpersonal relationships, and leisure. Hierarchical regression analyses were conducted to isolate the association between daily activities and social roles by controlling for capability variables (e.g. physical foot, physical arm, language, cognitive, depression). Results: Independence in daily activities increased the variances by 7 &% to 8 &% for social roles (total score), responsibilities and community life models. The total explained variances ranged from 47 &% to 52 &% with corresponding beta values for daily activities ranging from -0.37 to -0.41. The lack of association between independence in daily activities and both interpersonal relationships and leisure were striking results. The lowest social roles' scores were in the leisure domain. Conclusion: The association between daily activities at discharge and social roles 6 months following rehabilitation varies depending on the social role domain. Leisure may not be sufficiently addressed during rehabilitation warranting a "second wave" of rehabilitation upon return to the community.

**PB8 284 THE PREVALENCE ANALYSIS OF ISCHEMIC AND HEMORRHAGIC STROKE IN THE ELDERLY POPULATION AND CORRELATION STUDY WITH LOCAL AVERAGE TEMPERATURE: A HOSPITAL-BASED CROSS-SECTIONAL STUDY IN SOUTHERN TAIWAN**

H. HSU\* (Chiayi Chang Gung Memorial Hospital, Putz City, Taiwan) C. CHEN(1), K. CHEN(2) - (1) Chang Gung Memorial Hospital (Kuei-Shan, Taiwan); (2) Chiayi Chang Gung Memorial HospitalChang Gung Memorial Hospital (Putz, Taiwan)

Introduction: Stroke is a commonly encountered neurologic disorder in the elderly population in Taiwan, but the prevalence and extent of severity is not clear. Previous studies suggest there might be an association between weather pattern and risk for ischemic stroke. Methods and materials: We conducted a cross-sectional study by reviewing the stroke patients who admitted to Chang Gung Memorial Hospital for six years period (Jan 2003-Dec 2008), and patients over 60 were recruited for study. Comparative studies including type of stroke, gender, length of admission, peak prevalence age were analyzed. Local average temperatures were also calculated for correlation. Results: 6733 patients reviewed, 3583 (53.2%) were over sixty years. Among them, 1089(30.4%) were hemorrhagic and 2494 (69.6%) were ischemic. The female to male ratio is 0.77(477/612) in ischemic stroke and 0.81 (1123/1371) in hemorrhagic stroke. The average length of admission is 11.51-12.22 days (95% confidence interval) in ischemic and 11.25-13.85 days in hemorrhagic stroke patients. The peak prevalence age is 76 in ischemic and 71 in hemorrhagic stroke patients. The regression analyses of prevalence in stroke patients over 60 and local temperature are: R square 0.095 in 2003, 0.099 in 2004, 0.259 in 2005, 0.068 in 2006, 0.015 in 2007, 0.003 in 2008 respectively. Conclusion: The patients between 70-80 are 1.4 times more likely to have stroke than those between 60-70, 2.14 times than those between 80-90. Above 60, the overall prevalence of ischemic stroke is about 2.3 times more than hemorrhagic stroke. Men are about 1.5 times more likely to have stroke than women. The peak prevalence age is older in ischemic than hemorrhagic stroke. The severity hemorrhagic stroke is statistic significant more than ischemic stroke, according to

length of admission (p<0.05). In stroke patients over 60, there is no significant correlation between the prevalence and local average temperature.

**PB8 285 THE RELATIONSHIP BETWEEN THE MUSCLE STRENGTH OF LOWER EXTREMITY MEASURED BY LEG PRESS MACHINE AND BASIC ACTIVITIES OF DAILY LIVING IN FRAIL OLDER PEOPLE**

H. HASHIDATE\* (Yamanashi Care Academy, Yamanashi, Japan) H. SHIMADA(2), N. SASAMOTO(1) - (1) Yamanashi Care Academy (Yamanashi, Japan); (2) Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology (Tokyo, Japan)

Introduction: The purpose of this study was to explore the relationship between muscle strength of lower extremity measured by leg press machine and basic activities of daily living (BADL) status in frail older people. Methods: The participants were 123 older adults (86 women, mean age  $78.6 \pm 6.3$  years) who utilized day-care services. The BADL status was assessed by the Barthel Index (BI). The physical performances measurements included the grip strength, 1 repetition maximum (1RM) of leg press, one-leg standing (OLS), functional reach test (FRT), and 10m-walking time as maximum speed (MWS). Mann-Whitney test was used to compare the physical performances between the participants with 100 point in the BI (independent) and those with less than 100 point in the BI (dependent). Multiple logistic regression model was used to examine the relationship between the BADL dependency and the physical performances. Results: The independent participants in the BADL showed significantly higher functioning in the 1RM, OLS, FRT, and MWS than the dependent participants in the BADL. Multiple logistic regression analysis revealed that only 1RM was associated significantly with the BADL disability (OR 0.27, 95% CI 0.11-0.69, P = 0.027). Conclusion: The results suggested that muscle strength of lower antigravity muscles was more important performance to maintain the BADL than the grip strength, balance, and gait performances in the frail older adults.

**PB8 286 PERFORMANCE-ORIENTED MOBILITY ASSESSMENT OF ELDERLY ATTENDED AT DAY CENTER, A CARE ASSISTANCE OF RESIDENCIAL ISRAELITE ALBERT EINSTEIN, SAO PAULO-SP, BRAZIL**

J. BEZ\* (Hospital Israelita Albert Einstein, Sao Paulo, Brazil) S. DÉBORA CRISTINA OLIVEIRA MELO (1), C. DANIELA AFONSO BRITO(1), K. RAFAEL MARQUES(1), O. MARIA TERESA APARECIDA DA SILVA(1), I. MYRIAN RIBEIRO(1) - (1) Residencial israelita Albert Einstein (Sao Paulo, Brazil)

The objective of this study is to analyze and describe the mobility performance of these elderly attending activities twice a week, being supported by a multi-professional team at the institution. POMA (Performance-oriented mobility assessment), TUG (Time get up and go test) and hand grip were the tools used in the methodology to evaluate the 16 elderly with ages between 68 and 89. Descriptive analysis were held for the continuous variables (age, hand grip, gait and balance) and for the categorical variables between two groups, the Fisher and Mann Whitney exact test, the Spearman correlation coefficient and, at last, the level of significance adopted for the statistic tests was of 5%, i.e., p<0.05. This way, it was observed that the application of the tools used are complementary in functional capacity assessment and the consequent motor performance, and when analyzed with the hand grip, predictors of frailty, prevention of fall risks and promotion of active ageing can be visualized, which reinforces the initiative of maintaining tools for assessment in this Day Center model. For gait and balance, 25% showed high risk of fall; for hand grip, the significant difference occurred in the male gender. There was a significant correlation between the age range and the balance, where the higher the age the lower the score of balance. A significant difference was noted among groups, with larger values of gait time for the ones with high risk of fall. This fact is confirmed in other studies in the international literature, as for the POMA total score, being known that it brings damages to the physic and subjective functional performance of elderly and we can infer measures directed to the Day Center, according to the management of this institution.

**PB8 287 THE RELATIONSHIP BETWEEN THE FREQUENCY OF UTILIZING A DAY-CARE PROGRAM AND THE EFFECTS ON PHYSICAL FUNCTIONS IN FRAIL OLDER PEOPLE**

H. HIROYUKI\* (Yamanashi Care Academy, Yamanashi, Japan) H. SHIMADA(2), N. SASAMOTO(1) - (1) Yamanashi Care Academy (Yamanashi, Japan); (2) Research Team for Promoting Independence of the Elderly, Tokyo Metropolitan Institute of Gerontology (Tokyo, Japan)

Introduction: The purpose of this study was to identify the relationship between the frequency of utilizing a day-care program and the effects on physical performance or activities of daily living (ADL) status in frail older people. Methods: The participants were 51 older adults (46 women, mean age  $80.7 \pm 7.5$  years) who utilized day-care programs with once a week (n = 8) and with twice a week (n = 43). The programs included stretching, muscle strength of lower extremities (60% of 1 repetition maximum), balance retraining using form, and gait exercise. ADL functions and physical performances were assessed by the Tokyo Metropolitan Institute of Gerontology (TMIG) index and the grip strength, muscle strength in leg-press, one-leg standing (OLS), functional reach test (FRT), timed up and go test (TUG), and maximum 10m-walking speed (MWS), respectively. The

participants performed the tests before and after 3 month study period. Results: The participants with exercise twice a week improved significantly the grip strength, OLS, FRT, TUG, and MWS ( $P < 0.05$ ) after the 3 month period, although there was no significant improvements in the participants with exercise once a week. Conclusion: The day-care exercise twice a week could improve muscle strength, balance, and gait performances in the older adults. Our study results suggested that exercise programs should be performed at least twice a week to improve physical performances in the older adults.

**PB8 288 RISK FACTORS OF FALLS IN COMMUNITY-DWELLING ELDERLY IN TAIWAN: A PROSPECTIVE COHORT STUDY**

J. WANG\* (Chang Jung Christian University, Kway Jen, Tainan , Taiwan)  
L. CHANG(1) - (1) Chung Shan Medical University (Taiwan)

Introduction: There are very few population-based studies that examine the risk factors for falling in Asian countries. This longitudinal cohort study contributes to this literature by examining the risk factors for falls in community-dwelling elderly in Taiwan. Methods and materials: Analytical Data came from 2003 and 2007 Survey of Health and Living Status of the Elderly in Taiwan, nationally representative sample from community-dwelling elderly in Taiwan. Logistic regression models were used to examine the relationships between risk factors in 2003 and falls in 2007. Risk factors considered included pain, incontinence, cognitive status, depression, exercise habit, and activities of daily living. Control variables included demographics, vision, comorbidity, and social support. Results: Among the risk factors examined, depression and activities of daily living most significantly predicted falls in 2003. Conclusions: Future study should examine the effectiveness of depression treatment and activities of daily lives intervention in preventing falls.

**PB8 289 SARCOPENIA: REVERSIBILITY OF THE PROCESS QUANTIFIED IN A SEGMENT OF THE THIGH BY WAY OF CT SCAN IN ELDERLY WOMEN BY AN EXERCISE PROGRAM OF PROGRESSIVE RESISTANCE**

A. HERRERA PÉREZ\* (Clínica Las Condes - U. de Chile, Santiago, Chile)  
K. VENEGAS(1), I. LEYLA(1), A. GUZMÁN(2) - (1) Clinica LasCondes (Santiago, Chile); (2) Clínica Las Condes (Chile)

Introduction: Sarcopenia is a characteristic of aging which involves alterations in the quality and, most importantly, the amount of movement, resulting in a high rate of disability and dependence in the Elderly. A proper Program of Training in Progressive Resistance (PTPR) produces a physiological response that increases functional independence and has a positive influence on the risk factors of the elderly improving their quality of life and self sufficiency. Purpose: To determine whether the PTPR delays or reverts the process of Sarcopenia in the lower limbs of institutionalized elderly women. Material and Method: 40 institutionalized elderly women, between 65 and 101 years old divided in a control group (CG) and an experimental group (EG). The EG was subject to a PTPR during three months, 3 times a week. Results were obtained from CT images taken before and after the training period. To muscle volume (cm<sup>3</sup>) were analyzed with Stata 0.01.<statistical program and Student's T Test p Results: The muscular volume in the CG showed no significant media (0.2957) cuts. The EG=0.1171) and 20 cm (p=differences for the 6 mm (p 0.0006)=volume showed statistically significant changes for the 6 mm (p 0.0002) cuts. The statistical evidence allows to=and the 20 cm (p sustain the hypothesis that muscular volumes were increased after PTPR. That means that after applying PTPR a muscular volume increase was obtained in the EG over a 99% limit. Conclusion: PTPR increases the muscle volume in the studied group thus reducing Sarcopenia showing that there is a possibility to slow or revert the process. This work gives scientific evidence on the efficacy of PTPR as a tool to avoid the problems derived of Sarcopenia which can be developed in the community as part of the activities used to promote health and render a more active and independent aging.

**PB8 290 GAIT CHARACTERISTICS AND PREDICTORS FOR GAIT OUTCOME 3 MONTHS AFTER HIP FRACTURE**

J. HELBOSTAD\* (Norwegian University of Science and Technology, Trondheim, Norway)  
P. THINGSTAD(1), B. VEREJKEN(2), O. SLETVOLD(3) - (1) Department of Neuroscience, NTNU (N-7006, Norway); (2) Programme for Human Movement Science, NTNU (Trondheim, Norway); (3) Department of Neuroscience, NTNU (Trondheim, Norway)

INTRODUCTION: Hip fractures in elderly are associated with high mortality and reduced function. Little is known about gait characteristics after hip surgery. This study investigates gait characteristics and factors predicting gait outcome 3 months after hip surgery. METHODS: 88 hip-fracture patients (mean age 81.6±5.8 yrs) participated. Gait was measured 3 months after surgery using an electronic gait mat. Participants walked back and forth the gait mat at different speeds, without walking aid if possible. Gait parameters were walking speed, cadence, step length, step width, and single support. Within-subject means, asymmetry ratios (affected/unaffected), and variability (CV) were calculated. Gait characteristics of 165 healthy elderly (mean age 79±5 yrs) were used as reference data. RESULTS: Hip-fracture patients had significant reductions in Activities of daily living

(ADL), and a strong increase in use of walking-aids three months post-surgery compared to before the fracture. Compared to the reference group, hip-fracture patients walked slower with shorter steps, had shorter single-support phases, increased step-length variability, and increased asymmetry in step length and single-support. Apart from step-length variability, these differences persisted after controlling for walking speed. Multiple linear regression within the hip-fracture group, with gait characteristics as dependent variables, demonstrated that speed was the single most significant predictor. Other predictive variables were age (all measures), Body Mass Index and pain (mean and CV of step length and single support), ADL and fracture type (variability measures), and use of walking aid (step length and single support). CONCLUSIONS: Gait three months after hip surgery is characterized by high asymmetry and variability. In combination with slow walking speed, small steps, and long double support phases, this reflects high risk for new falls, with associated further functional loss. The predictive value of multiple background variables for gait characteristics reflects the complexity of functional loss in elderly hip-fracture patients.

**PB8 291 RISK OF FALL AND EXECUTIVE FUNCTION IN DIABETIC AND NON DIABETIC ELDERLY**

D. ANJOS\* (Centro Universitário de Belo Horizonte, Belo Horizonte, Brazil)  
P. ALVARENGA(1), D. PEREIRA(2) - (1) Centro Universitário de Belo Horizonte - UNIBH (Belo Horizonte, Brazil); (2) Universidade Federal de Minas Gerais - UFMG (Belo Horizonte, Brazil)

Introduction: Type 2 diabetes elderly (DM2) tend to show cognitive deficits related to more complex processes such as the executive function, which can lead to greater risk of falls. The aim of the study was to compare DM2 and not DM2 elderly regarding the risk of falls and executive function, and check the correlation between these variables. Methods and Materials: 40 community elderly participated in the study and were divided into two groups: G1: DM2 elderly and G2: non DM2 elderly. Socio-demographic and clinic data were obtained by means of a structured questionnaire. The risk of falls was assessed by the Timed Up and Go test (TUG, cognitive TUG) and the executive function was assessed by the Verbal Fluency Test (animal category) (VFT). For the characterization of the sample a descriptive analysis was carried out; to compare the groups the Mann-Whitney test was used and the correlation between the risk of fall and executive function was verified through the Spearman test ( $a<0.05$ ). Results: The variables age (G1:71.0±7.6; G2:68.4±7.4 years), BMI and gender ( $p=0.67$ ) were similar between the groups. The diabetic elderly showed worse performance in the verbal fluency test (G1:14.9±4.9; G2:17.7±5.6;  $p=0.03$ ). A statistic difference was observed between the groups regarding the risk of falls; G1 presented worse performance in TUG (G1:10.5±1.8sec; G2:8.9±1.9sec;  $p=0.01$ ) and cognitive TUG (G1:13.9±3.2sec; G2:10.9±2.3sec;  $p=0.004$ ) tests. A significant correlation was observed between the cognitive TUG and VFT only in G1 (G1:s=-0.53;  $p=0.01$ ; G2:s=-0.25;  $p=0.28$ ). There was no correlation between the TUG and VFT in the groups. Conclusion: DM2 elderly showed more risk of falls and worse performance in the VFT, which suggests higher cognitive alteration. The correlation between cognitive TUG and VFT in G1 showed that the greater the alteration in the executive function, worse the performance in mobility and greater the risk of falls.

**PB8 292 EXPERT SURVEY REGARDING ASSESSMENT INSTRUMENTS ON PHYSICAL ACTIVITY AND PHYSICAL FUNCTIONING IN OLDER PEOPLE**

K. FRÄNDIN\* (Karolinska Institutet, Huddinge, Sweden)  
E. RYDWIK(1), A. BERGLAND(2), N. WAALER LOLAND(3), L. FORSÉN(4) - (1) FoU Äldre Norr (Järfälla, Sweden); (2) Oslo University College (Oslo, Norway); (3) Oslo University College (Norway); (4) Institute of Public Health (Norway)

Introduction Assessment is critical in identifying individuals at risk and in measuring outcome in intervention studies aimed at reducing physical frailty and increasing mobility. One of the overall objectives of the European Network for Action on Ageing and Physical Activity (EUNAAPA) was to offer advice concerning the assessment of physical activity and physical functioning in older people. The first step in this process was to give an overview of instruments currently used in Europe. Methods A questionnaire including a great number of instruments was sent to 14 countries and distributed to experts according to a matrix covering both community-dwelling and institutionalised older persons at regional as well as national levels. The categories addressed were Physical Activity and Physical Functioning, here including Endurance, Mobility, Balance, Range of Motion, Dexterity, Muscle Strength, Overall Indexes and Activities of Daily Living (ADL). Results A lack of knowledge in Europe concerning a great number of assessment instruments was revealed, and it became obvious that in many countries only a few instruments are being used. Physical activity: The most common questionnaires were IPAQ and PASE, and for performance-based evaluation Pedometer. Physical functioning: The dominating Endurance test was the Six-Minutes Walking test and for Mobility the Timed Up and Go. Balance was most often assessed through Romberg, One-Leg Stance and Berg's Balance Scale. Hand in Neck and Hand in Back were the most used Range of Motion tests and for Muscle Strength, Grip Strength was the most common test. The most used overall index was Tinetti's Performance Oriented Mobility Assessment and regarding ADL, Barthel Index and Katz ADL Index dominated. Conclusion The results of the survey lead to an

increased knowledge in Europe of good instruments that need to be translated to other languages, and a heightened awareness of other measures that need to be taken.

**PB8 293 IS THE ASSESSMENT OF GRIP STRENGTH FEASIBLE AND ACCEPTABLE IN A COMMUNITY HOSPITAL?**

H. ROBERTS\* (University of Southampton, Southampton, United Kingdom)

J. RITCHIE(3), J. BUTCHART(3), J. SPARKES(3), D. PADIARCHY(3), H. SYDDELL(2), K. JAMESON(2), A. AIHIE SAYER(1) - (1) Academic Geriatric Medicine, University of Southampton (Southampton, United Kingdom); (2) MRC Epidemiology Resource Centre, University of Southampton (Southampton, United Kingdom); (3) Medicine for Older People, Southampton University Hospitals NHS Trust (Southampton, United Kingdom)

Introduction Grip strength is used to characterise frailty in older people participating in research but is not used in routine clinical practice in the United Kingdom. We were interested to assess the feasibility and acceptability of grip strength assessment amongst older people undergoing in-patient rehabilitation. Methods and materials Patients aged 70 years and over were prospectively recruited within one week of admission to a community hospital for a period of rehabilitation. Maximal grip strength was assessed three times in each hand one minute apart using a Jamar dynamometer. A Mini Mental State Examination (MMSE) and a questionnaire on pain/tiredness associated with measurement of grip strength were administered. Patients were admitted from acute hospitals or their own homes, but those for terminal care were excluded. Results 100 / 160 eligible patients participated (m 37: f 63, median age 83.6 years, range 70-99). 60 patients were not included (12 too unwell; 12 severely confused; 4 refused; 11 discharged or transferred before review; 21 assessor could not be seen within one week of admission). Only one patient (with advanced peripheral neuropathy) could not hold the dynamometer. Patients with arm fractures, arthritis or hemiparesis could all grip with at least one hand, and those with lower MMSE scores (overall median 23.0, range 7-30) could participate with clear instruction and demonstration. Assessment of grip strength took around five minutes and only three patients did not want repeat measurement. It did not cause pain or tiredness in 90% of participants. Median grip strength was 16.6 kg (range 2-39kg). Conclusion Assessment of grip strength is feasible and acceptable among most community hospital inpatients. Further research is required to establish normal ranges and quintiles for this group, and whether low grip is associated with poor outcomes as has been found with community dwelling older people.

**PB8 294 HOLY GRAIL QUEST FOR A FALLS DETECTOR: PRELIMINARY RESULTS FROM A PILOT STUDY**

C. HOSKOVEC\* (CHUV - CTR Sylvana, Epalinges , Switzerland)

S. ROCHAT(1), A. ROULET(1), C. BÜLA(1) - (1) CHUV - CTR Sylvana (epalinges, Switzerland)

Introduction: Falls are common in older people and can have serious consequences such as injuries, fractures, and disability. About a fifth of elderly people are unable to get up from the floor by themselves after a fall. This can result in further disability due to prolonged immobilization and consecutive increased fear of falling. Despite multiple attempts there are no reliable systems currently available that could permit early fall detection and limit these additional adverse consequences. The objective of this pilot study was to evaluate the falls detection rate of an experimental falls detector. Methods and materials : Two young volunteers performed a standardized fall protocol, under supervision in a laboratory setting. Falls were performed from standing position, in different directions (forward, backward, to the sides), with and without upper-limb protective reaction. Sports protections and a mat were used for safety reasons. A watch-like falls detector was worn on the wrist by the volunteers. This device, based on a mechanical impact detector, is activated by direct and indirect shock. To provide a preliminary estimate of false detection, the detector was also worn during daily activities over a 18 hours period. Results: Overall, 82% (23/28) of falls were detected. Further analyses showed that detection rate for falls without upper-limb protective reaction were 100% (10/10) for backwards falls, 80% (8/10) for falls to the sides, 75% (3/4) for forward falls. In contrast, detection rate for forward falls with upper-limb protective reaction was only 50% (2/4). During daily activities only 2 false positive detections were recorded. Conclusion: Falls detection rates seem promising in this pilot study with young volunteers. Further testing in a larger number of volunteers is now planned to confirm these preliminary results before undertaking clinical testing in older persons.

**PB8 295 TIMED UP AND GO (TUG) IN ELDERLY PHYSICALLY ACTIVES**

G. GOMES\* (Universidade Federal de Minas Gerais, Belo Horizonte, Brazil)

G. GOMES(1), M. MOURA BORGES(1), T. MAX FERREIRA LEITE(1), R. ASSIS PEDROSA(1), R. LANE DE FREITAS PASSOS (1), L. GUIMARÃES PEREIRA(1), A. OLIVEIRA DIAS(1) - (1) Universidade Federal de Minas Gerais (Belo Horizonte, Brazil)

INTRODUCTION: The Timed Up and Go (TUG) is widely known on scientific literature and very much used as a randomized measure to use for institutionalized and community-dwelling elderly as the assessment of the risk of falls and gait functional decline. Bohannon

(2006), had determined normative reference values for TUG based on a meta-analyses study with 21 studies that used this instrument in community-dwelling older people, however none of them where done with physically active elderly. OBJECTIVE: The purpose of this study was to assess the TUG in physically active elderly. METHODOLOGY: The sample had 65 older with at least three years non-stopping physical exercises activity began after completing 60 years old (minimal age of the sample were 63 years). The subjects used to do physical exercises to improve their functional capacity at least three times a week. There were excluded subjects that present some affection that compromise the gait and its performance. There were taken three trials, one of them in the usual path and the other two as quickly as they can. It was considered to statistic analyses the average velocity of the two trials. The statistical program used was Sigma Stat 3.5. RESULTS: the data obtained was: for the age of 63 to 69 years (n: 27) in usual velocity:  $8,42 \pm 1,65$  seg and in quickly as possible was  $6,08 \pm 1,21$  seg. For the ones of 70 to 79 years (n:34) it was:  $8,60 \pm 1,68$  seg. and  $6,64 \pm 1,28$  seg. respectively; and at the 80 and older (n: 4) it was:  $9,91 \pm 0,88$  seg. and  $7,41 \pm 0,48$  seg. respectively. CONCLUSION: the data obtained can be useful to comparative studies that will try to determine reference normative values for the TUG in community-dwelling older people that are physically actives.

**PB8 296 FUNCTIONAL CAPACITY, HEALTH CONDITIONS, DEPRESSION SYMPTOMS AND WELL-BEING IN ELDERLY OF CH-UNICAMP, CAMPINAS-SP, BRAZIL**

D. SIGNORETTI\* (UNICAMP, Sao Paulo, Brazil)

G. MARIA ELENA(1), N. ANITA LIBERALESSO(1) - (1) UNICAMP (Campinas, Brazil)

With the progressive increase of elderly people in the Brazilian population, it's verified the increase of comorbidities associated to chronic and degenerative diseases that consequently represents a higher demand of drugs used by this population. The fact submits us to the observation of the functional capacity preservation, sometimes leading to a worse functional limitation in reason of this comorbidities and well-being deficit. Is important to recognize and carefully evaluate this association in order to know the effects in the process of aging. The aim of this study is to identify and evaluate the profile of 122 elderly that were attended from August 2005 to August 2007, by a multidisciplinary support team of the Geriatric Ambulatory on the University of Campinas Clinical Hospital, Sao Paulo, Brazil, related to the presence of depressive symptoms, number of comorbidities and drugs prescriptions, in association to the locomotion and mobility, items that are essential for the preservation of the individual functional capacity. This evaluation allowed estimating the level of interference of these variables in the life and well-being of the individuals, through a Protocol applied by a group of health professionals. Instruments were inserted to appreciate the objective and subjective aspects of physical and mental health of elderly, highlighting the use of these instruments and scale: FIM, SPPB, CES-D, Cantril, besides the number of disease and medication prescribed, according to medical register. A higher level of functional incapacity, presence of depressive symptoms, comobidities and polipharmacos could be noted, mainly with more prevalence in female gender. The results obtained from the associations to the variables in this study are fundamental to manage actions related to the functional capacity, aiming to allow a better independence, autonomy and quality of life for these elderly.

**PB8 297 VIDEO RECORDING OF REAL-LIFE FALLS TO INVESTIGATE THE CAUSES AND CIRCUMSTANCES OF FALLS IN LONG TERM CARE FACILITIES**

F. FELDMAN\* (Simon Fraser University and Fraser Health Authority, Burnaby, Canada)

D. WAN(1), O. AZIZ(1), T. SARRAF(1), S. ROBINOVITCH(1) - (1) Simon Fraser University (Burnaby, Canada)

INTRODUCTION Falls and fall related injuries are a major health problem in the elderly population. However, a major impediment to the design and evaluation of fall prevention strategies is our inability to obtain objective data on the incidence, cause, and circumstances of falls in real life. Instead, our current understanding of "how falls occur" is based on studies that report the post-hoc recollection of the faller [1,2], which is known to be of limited accuracy. These studies suggest that slips and trips are the most common causes, and that forward falls are twice as common as backward and sideways. In the current study, we tested whether this describes the scenario for most falls in long term care, by analyzing video recordings of 81 falls from two long-term care facilities in the Vancouver area. METHODS All 81 falls occurred in common areas and were captured with networks of digital video cameras. A team of three experts reviewed each fall recording to determine the primary cause and activity of the individual at the time of the fall. The experiment was approved by the Office of Research Ethics at SFU. RESULTS Only 15% of falls were caused by tripping and 5% by slipping; the most common cause (32% of cases) was incorrect weight transfer. 28% of falls occurred during standing, 15% during forward walking, 14% while initiating walking, and 12% while moving from standing to sitting. Backward falls were more than twice as common as forward or sideways. Furthermore, head impact occurred in 28% of falls, hip/buttock 88% of falls, and hand/forearm in 44% of falls. CONCLUSIONS These results challenge traditional assumptions regarding the nature of falls in older adults, and have important implications

for the design and evaluation of fall and injury prevention strategies targeting intrinsic and/or environmental factors.

**PB8 298 PHYSICAL ENVIRONMENTS AND THEIR IMPACT ON OUT-OF-HOME SOCIAL PARTICIPATION AMONG ELDERLY CANADIANS WITH PHYSICAL DISABILITIES**

F. LIU\* (Memorial University of Newfoundland, St John's, Canada)  
P. WANG(1), A. LOUCKS-ATKINSON(2) - (1) Memorial University of Newfoundland (St John's, Canada); (2) Memorial University of Newfoundland (St John's, Canada)

**Objectives:** Although physical barriers are generally believed to impede out-of-home social participation for people with physical disabilities, scientific evaluations on this issue are scant. Based on the WHO ICF (International Classification of Functioning, Disability and Health) conceptual framework, the objectives of this study are: 1) to describe the patterns of out-of-home social participations among the elderly Canadians with physical disabilities and 2) to examine how various physical barriers in home-design and in public areas affect out-of-home social participation in this population. **Methods:** A sub-sample of 5,820 individuals aged 65 years or older selected from the 2001 cross-sectional Canadian Participation and Activity Limitation Survey (PALS) was included in this study. Out-of-home participation was derived from eight self-reported activities within the past 12 months and was dichotomized no-restriction (at least once a week) and restriction. Measures of assistive aids and devices included automatic/easy open doors, lever handles, widened doorways/hallways, elevator/lift device, and ramps/street level entrances. Other predictor variables included level of disability, income, age, gender, and living arrangement. Exploratory data analyses and multivariate logistic regressions were conducted to examine the associations of interest. **Results:** As anticipated, people with severe disability, older age and living alone were more likely to report out-of-home participation restriction with corresponding odds ratios of OR=3.293 (2.762-3.926), 2.017 (1.753-2.402, every 10-years) and 2.003 (1.225-3.276). Similarly, self-reported barriers in home-design significantly contributed to participation restriction with OR=1.844 (1.387-2.501). In contrast, individuals having access to public assistive aids and devices were more likely to engage in out-of-home social participation with OR=0.806 (0.673-0.966). However, income level did not present significant impact on social participation. **Conclusion:** Our study suggests barriers both in home-design and in public areas are significant factors affecting out-of-home social difficulty among elderly Canadians with disability. Thus, reducing these barriers is expected to enhance social participation in this population.

**PB8 299 POSITIONAL RELEASE THERAPY TECNIQUE OF PAIN AND EMG ACTIVITY OF TRAPEZIUM IN ELDERLY PATIENTS**

P. RONALDO\* (UNICID, Sao Paulo, Brazil)  
R. PIOVEZAN(1), C. TORRIANI(1), S. PINTO(1), F. GONDO(1) - (1) UNICID (Sao Paulo, Brazil)

**INTRODUCTION:** Positional Release Therapy is an indirect technique. It is a method of evaluation and treatment using sensitive points in a position with minimum tension of the muscle. The sensitive points are located and palpated, soon after a comfort position is sought, which this comfort produces the ideal relaxation of the involved fibers. The objective of this study was to verify the reduction of pain, through an analogical visual scale, of descending fibers of the trapezius after the use of the PRT (Positional Release Therapy) technique in elderly patients. **METHOD AND MATERIAL:** The collection data was accomplished with 14 elderly patients, ages between 65 to 77 years, with pain above 5 in a visual analogical scale after the palpation of the tender point of the descending fibers of the trapezius. The EMG activity was collected with EMG MIOTEC model miotool 400 of 4 channels and surface electrodes of Ag/AgCl, round, pre gelled and auto adhesive from Meditrace, during gait for 5 minutes. All of the samples were divided into two groups, a treatment group and a control group, therefore, containing 7 individuals in each. For the individuals of the treatment group (PRT) the correct form of the technique was applied, while for the samples of the control group, a relax technique was applied. A level of significance of 0.05 was defined for this study. **RESULTS:** After having made the entire collection of data and statistical analysis, it was established that averages for both of the groups after the evaluation were smaller than the average before, but only in the group of PRT, can it be said that a statistically significant difference, 8 EVA pain scale and 123,33μV (RMS mean) before and 2 for the EVA and 65,60 μV after the PRT ( $p=0,001$ ). **CONCLUSION:** This study suggests a decrease pain and EMG activity of Trapezius muscle during gait in elderly patients after PRT technique.

**PB8 300 INSPIRATION EXERCISE, FLOW AND VOLUME RESPIRATORY STIMULATOR IN ELDERLY PATIENTS**

R. PIOVEZAN\* (UNICID, Sao Paulo, Brazil)  
C. TORRIANI(1), S. PINTO(1), F. GONDO(1) - (1) UNICID (Sao Paulo, Brazil)

**INTRODUCTION:** Evidences suggest that deep inspirations exercises could be so effective as respiratory stimulators (RS), which are contradictory in clinical practice when referring to the use of flow respiratory stimulator and volume respiratory stimulator. The objective of this study was to investigate the activity of some ventilatory muscles as

scalene (ESC), external intercostals (EI) and rectus abdominal (RA) during the utilization of a flow respiratory stimulator, volume respiratory stimulator and maximal sustained inspiration exercise throughout EMG. **METHODS AND MATERIAL** 19 subjects, 10 women; 9 men were evaluated with a EMG MIOTEC model Miotool 400 of 4 and surface electrodes of Ag/AgCl, round, pre gelled and auto adhesive from MEDITRACE. Electromyography data were randomly collected during quiet breathing and pulmonary re expansion exercises. **RESULTS:** It was observed statistically significant differences in the electromyographic values for media and peak when comparing maximal sustained inspiration exercises to respiratory stimulators ( $p<0,001$ ), however there wasn't significance between flow and volume respiratory stimulator for external intercostals ( $p=0,542$ ) and scalene muscle ( $p=0,730$ ) **CONCLUSION:** Maximal sustained inspiration exercises as well as respiratory stimulators provoked muscle recruiting in the analyzed respiratory musculature, once electromyographic activity was higher when the devices were utilized.

**PB8 301 STEP LENGTH PREDICTORS CHANGE AFTER ENROLMENT IN A PHYSICAL ACTIVITY PROGRAM FOR PARKINSON'S DISEASE PATIENTS**

L. GOBBI\* (Unesp - Sao Paulo State University, Rio Claro, Brazil)  
F. BARBIERI(1), R. VITORIO(1), C. TEIXEIRA-ARROYO(1), M. CAETANO(1), F. STELLA(1), S. GOBBI(1) - (1) Unesp - Sao Paulo State University (Rio Claro, Brazil)

**Introduction:** Short step length is one of the major gait consequences of Parkinson's disease (PD). Interventions have been conducted to increase patients step length. A multi-mode physical activity program focusing on the functional capacity components (aerobic capacity, flexibility, strength, coordination and balance) was not able to change step length in PD patients. The aim of this study was to analyze the step length predictors before and after the enrolment in program. **Methods and materials:** Eleven PD patients (65.9±7.8 years of age), in low to moderate stages of PD (1 to 2 sages of Hoehn-Yahr scale) completed at least 70% of the program (6 months, 72 sessions, 3 times a week, 60 minutes per session). Patients walked on an 8m pathway in their preferred velocity, in 5 trials, and kinematic gait data collection was done before and after the program. Functional capacity was assessed by the AAHPERD tests and by Berg balance scale, while physical activity level was measured by the Baecke's instrument for older people. A digital camcorder recorded the trajectories of markers attached on the right fifth metatarsal and on the left first metatarsal joints on the right sagittal plane. The images were analysed in the Dvideow6.3 and a specific algorithm was written in Matlab7.0 to calculate the dependent variable: step length, stride velocity and length, cadence, and stride phases durations. **Results:** Multiple regression analysis (stepwise) before the program revealed an association of physical activity level, stride velocity, cadence, swing phase duration and scores in balance and strength predicted step length ( $R^2=0.95$ ;  $p<0.001$ ). After the program, stride velocity and duration and swing phase duration were revealed as predictors of step length ( $R^2=0.80$ ;  $p<0.001$ ). **Conclusion:** A multi-mode physical activity program was able to change the step length predictors. We recommend interventions for PD patients focusing on temporal gait parameters. **Acknowledgements:** CNPq, CAPES.

**PB8 302 COMORBIDITY AND FUNCTIONAL RECOVERY IN A GERIATRIC REHABILITATION UNIT (GRU).**

J. RIBERA CASADO\* (HOSPITAL CLINICO SAN CARLOS, MADRID, Spain)  
E. ROMERO PISONERO(1), F. CUESTA TRIANA(1), J. MORA FERNANDEZ(1), P. MATIA MARTIN(1) - (1) HOSPITAL CLINICO SAN CARLOS (MADRID, Spain)

**Introduction:** Functional outcome is the most important objective for the GRU inpatients, so it is interesting to select those patients who can benefit from this specialized level. The principal aim of this study was to know the factors related to an incomplete recovery (IRE) at hospital discharge, taking into account the basal functional situation. **Methods and materials:** GRU inpatients consecutively admitted for 6 years were selected. The principal admission pathologies were: hip fracture, stroke, and immobility secondary to medical illnesses. A formula to calculate the incomplete recovery (IRE) included the modified Barthel index: basal (BMBI) and at hospital discharge (DMBI):  $DMBI - BMBI \times 100/BMBI$ . Different variables were studied: age, gender, dementia diagnosis (mild and moderate), nutritional items (albumin, prealbumin and cholesterol) and comorbidity measures: CIRS (Cumulative Illness Rating Scale) and Charlson index. **Results:** 461 patients were included (women 69.8 %), mean age 84.9 years (65-100). Diagnosis on admission: hip fracture (23.2%), stroke (25.2%) and immobility (51.6%). Mild to moderate dementia (29.0%). Median BMBI 85 (interquartile range - IQR 70-95), DMBI 50 (IQR 30-70). Median IRE was 29.41 %. Only 52 patients (11.2%) fully recovered the basal situation. After age adjustment several variables were IRE predictors: prealbumin ( $p=0.039$ ; OR 1.03 -CI 95%: 1.002-1.072), dementia diagnosis ( $p=0.000$ ; OR 0.42 -CI 95% 0.290-0.621-) and Charlson index ( $p=0.016$ ; OR 0.886 -CI 95%: 0.803-0.978). CIRS showed a significant tendency ( $p=0.059$ ; OR 0.962 -CI 95%: 0.924-1.001). Length of stay was higher for the patients with worst IRE ( $p<0.001$ ; OR 0.98 (0.977 - 0.991)). **Conclusions:** A complete functional recovery was not possible in a third of the sample. Comorbidity, prealbumin and mild-moderate dementia were functional recovery predictors, taking into

account a basal functional status. In this study, Charlson index was better than CIRS to predict the functional evolution.

**PB8 303 FLAIL CHEST AFTER MINOR TRAUMA IN GERIATRIC POPULATION: THREE CASES.**

I. CLEMENT CORRAL\* (Chu St Pierre, Bruxelles, Belgium)

A. ROMAN(1), E. STEVENS(1) - (1) chu St Pierre (Bruxelles, Belgium)

**Introduction:** Dyspnea is a frequent complaint in geriatric patients. Flail chest is a common diagnosis in trauma victims and can be more difficult to be identified in old patients than in young people. **Materiel and methods:** We report three cases. **Results:** The first patient was a 75-year-old lady living in an old people's home. She was admitted for respiratory distress. Her physician diagnosed acute lung oedema. She rapidly required intubation and mechanical ventilation. Twelve hours later pulmonary gas exchanges had improved. A weaning trial failed and a respiratory paradox was seen. A novel questioning of her nurses revealed that the patient had fallen on the ground the day before admission. The second patient was a 84-year-old lady living in a nursing home. She felt the day before admission and was found in a comatose state on the next morning, needing intubation, and ventilation. Initial head and cervical CT-scan did not reveal traumatic injury. The patient improved the next day. A weaning trial failed. During the next day weaning trial respiratory paradox was seen. X-ray of the chest did not show rib fracture. Bone scintigraphy identified the anterior flail chest. The third patient was a 81-year-old man living at home. He suffered of morbid obesity and syringomyelia and most of the day he stayed in bed. The night before admission he felt. He was admitted to hospital for dyspnea. An airways infection was suspected and treated by antibiotic. Six days later he presented a respiratory distress and required intubation and ventilation. Then after a weaning trial failed and another analyse of the first chest x-ray showed a right flail chest. **Conclusion:** In these three cases the diagnosis of flail chest was delayed. The trauma was minor. The chest pain was not a symptom. The chest x-ray is not always demonstrative. The co-morbidities can hide the real diagnosis.

**PB8 304 CAN WE PREDICT ADVERSE GERIATRIC EVENTS (AGES) IN ELDERLY PATIENTS ADMITTED FOR TRAUMATIC FEMORAL FRACTURE?**

I. DE BRAUWER\* (St-Luc university Hospital, Brussels, Belgium)

B. BOLAND(1) - (1) St-Luc university hospital, UCLouvain (Brussels, Belgium)

**Introduction.** Home-resident elderly patients admitted for femoral fracture (FF) are heterogeneous. This study wanted to describe in such patients 1] the geriatric profile, 2] the incidence of common hospital adverse geriatric events (AGEs) and 3] the value of admission scores (ISAR, VIP and pre-KATZ) to predict AGEs. **Methods.** Cohort of consecutive community elderly patients (age>75 years) admitted for traumatic FF in orthopaedic divisions over 18 months. The geriatric liaison team performed early screening (ISAR' JAGS-1999;47:1118-24; VIP'Eur.J.Geriatrics-2008;10:120-6) and evaluation of pre-hospital features (ADL=pre-KATZ, pre-existing geriatric syndromes). Medical and nursing hospital notes were thoroughly reviewed to collect the incidence of three common and preventable AGEs, namely major behavioural problems (aggressiveness/agitation/delirium), pressure sores and fall. The predictive value of a score for AGE incidence was assessed by four measures: its sensitivity (Se) and specificity (Sp) at all cut-off values, the area under the curve (AUC) of its ROC curve, and its likelihood Ratios (LR, negative and positive) and accuracy (Acc=TruePos+TrueNeg/All) at the most sensitive cut-off. **Results.** 1] Of 145 FF patients (mean age 84±8 years; 77% women; 57% living alone), 65 (45%) showed pre-existing G syndromes (recent falls 32%; dementia 15%; cachexia 15%). 2] Within hospital, 81 (56%) patients developed some AGE: behavioural troubles (46%), pressure sores (16%) and/or falls (5%). 3] Scores showed poor sensitivity-specificity trade-off (ROC curve, AUC: ISAR 58%, VIP 53%, pre-KATZ 57%) and weak LR and accuracy at the most sensitive cut-off: ISAR'2+6 (Se0.86,Sp0.22,-LR 0.63,+LR 1.10; Acc58%), VIP'1+3 (Se0.70,Sp0.28,-LR 1.07,+LR 0.97; Acc=51%), and pre-KATZ'7+24 (Se0.53,Sp0.59,-LR 0.80,+LR 1.29; Acc56%). No score provided valuable predictive information (-LR<0.5 or +LR>2) at any cut-off. **Conclusions.** These scores, developed for frailty screening, were unable to predict AGE occurrence in elderly patients with femoral fracture. If these results were confirmed in other elderly populations, better screening instruments should be searched to select inpatients for geriatric management.

**PB8 305 POST-FRACTURE USE OF CALCIUM PLUS VITAMIN D AND ANTI-OSTEOPOROTIC DRUGS AND SURVIVAL AMONG HIP FRACTURE PATIENTS**

I. NURMI-LÜTHJE\* (Health Centre of Kouvola, Kouvola, Finland)

P. LÜTHJE(1), J. KAUKONEN(2), M. KATAJA(3), S. KUURNE(1), H. NABOULSI(2), K. KARJALAINEN(1) - (1) Kuusankoski Regional Hospital (Kuusankoski, Finland); (2) Päijät-Häme Central Hospital (Lahti, Finland); (3) National Public Health Institute (Finland)

**Introduction:** The Finnish guidelines for medical treatment of hip fracture patients are: osteoporosis medication and the daily concomitant use of prescribed calcium and vitamin D supplements. However, it has not been studied previously whether the post-fracture use of these drugs has any association with the survival. Our aim was to study the survival of

hip fracture patients in association with the patients' other characteristics and the post-fracture use of prescribed calcium plus vitamin D and anti-osteoporotic medication. **Methods and materials:** The survival of hip fracture patients (n=221) treated in 2003-2004 was analysed. After a median of 27.5 months follow-up the patients who were still alive at the time (n=137) were inquired for the use of prescribed calcium plus vitamin D supplementation and of anti-osteoporotic drugs. Furthermore, the use of these drugs in all patients (n=221) was checked in the data of the Finnish Social Insurance Institution. These data contain information on the reimbursement of drug prescriptions. The survival was analysed by using both the Bayesian multivariate analysis and the life table method. **Results:** The combination of variables which best explained the post-fracture survival were age under 80 years, ASA class 2, post-fracture use of prescribed calcium plus vitamin D supplements concomitantly with anti-osteoporotic drugs, post-fracture use of prescribed calcium plus vitamin D supplements, post-fracture use of anti-osteoporotic drugs only, and type of fracture. At 36 months we observed a reduction of 36 % in the deaths of the females who used prescribed vitamin D plus calcium supplementation and, correspondingly, 43 % in males. The survival of females who used anti-osteoporotic drugs concomitantly was even better during the whole follow-up. **Conclusion:** Our results indicate a potential relationship between the post-fracture use of prescribed calcium plus vitamin D supplementation and, in females, the concomitant use of anti-osteoporotic drugs, and reduced mortality.

**PB8 306 ARE THE CONTEXTUAL FACTORS URBAN VERSUS RURAL LIVING, GENDER AND AGE ASSOCIATED WITH ACTIVITIES AND PARTICIPATION AMONG OLDER PEOPLE?**

S. ARNADOTTIR\* (University of Akureyri, Akureyri, Iceland)

E. GUNNARSDOTTIR(2), L. LUNDIN-OLSSON(3) - (2) University of Akureyri, Faculty of Law and Social Sciences (Akureyri, Iceland); (3) Umeå University, Department of Community Medicine and Rehabilitation, Physiotherap (Sweden)

**Background:** Urban versus rural living, gender and age can all be categorized as contextual factors within the framework of the International Classification of Functioning, disability and health (ICF). These contextual factors may play an important role in older peoples function or disability through their association with activity and participation in this group. **Material and methods:** Cross-sectional data, collected in Iceland in June through September 2004. Participants were randomly selected, community-dwelling, 65-88 y/o, 68 rural (40% females) and 118 urban (53% females) adults. The Late-Life Function and Disability Instrument (LLFDI) was used to obtain measures of self-reported activity limitations, participation limitation and participation frequency. Three-way analysis of variance (ANOVA) with residency, gender and age group as main factors, was used to test the association with the three outcome variables. Statistical significance was accepted at  $p \leq 0.05$ . **Results:** Participation limitation was more pronounced among those living in rural areas ( $p < 0.001$ ), females ( $p = 0.01$ ) and the older age group ( $p = 0.02$ ). The interaction between residency and gender, however, was associated with participation frequency ( $p = 0.03$ ). More specifically, rural females reported higher participation frequency than the rural males while females and males in urban areas had similar scores on this outcome measure. The measure for participation frequency was lower for the older than the younger group ( $p < 0.001$ ). Finally, the measure for activity was not associated with urban and rural residency while females reported more limitations in activities than males ( $p < 0.001$ ) and the 75-88 y/o more limitations than the 65-74 y/o ( $p = 0.001$ ). **Conclusion:** The contextual factors: residency, gender and aging are strongly associated with older peoples' activities and participation and should therefore be in focus when studying and developing strategies to optimize activity and participation with increasing age.

**PB8 307 CLINICAL PROFILE, TREATMENT PATTERNS AND OUTCOMES OF ELDERLY BRAZILIANS WITH HIP FRACTURES**

E. VIDAL\* (Albert Einstein Hospital, São Paulo, Brazil)

C. COELI(1), R. PINHEIRO(1), R. SOUZA(4), L. ALMEIDA(3), K. CAMARGO JR.(2) - (1) Public Health Studies Institute - Federal University of Rio de Janeiro (Brazil); (2) Social Medicine Institute - State University of Rio de Janeiro (Brazil); (3) National Cancer Institute (Brazil); (4) Serra dos Órgãos Educational Foundation (Brazil)

**Introduction:** Around the Globe there is great variability concerning the epidemiology of Hip Fractures (HF). The greatest increase regarding the incidence of HF is expected to occur in the developing countries of the World, nevertheless those are also the regions from where less information is available regarding the epidemiology of those fractures. The present research aims to describe the clinical profile, patterns of care and mortality rates of elderly with HF in one University Hospital responsible for a substantial share of all HF surgeries in Rio de Janeiro, Brazil. **Methods and materials:** All medical records of patients aged 60 and older with a main admission diagnosis of HF between 1995 and 2000 were reviewed. Mortality rates were determined by means of Probabilistic Record Linkage Methodology linking the Hospital database with the Brazilian Mortality Information System. **Results:** Among 354 subjects, 74.3% were women and the mean age was 77.3 years. 53% of patients had one or two comorbidities, while 52.5% and 35.3% had American Society of Anesthesiology (ASA) scores of 2 and 3, respectively. The mean gaps from fracture to hospital admission and from admission to surgery were 3.6 and 14.6 days, respectively. Most HF (54.5%) were of the intertrochanteric type, while 37.6% and 7.3% were femoral neck and subtrochanteric fractures, respectively. A fall was the cause of the

fracture in 88.7% of the cases. Internal fixation and hip arthroplasties were performed in 64.12% and 35% of patients, respectively. Most patients (74%) underwent general anesthesia, 14.7% spinal anesthesia and 9.6% a combination of both types of anesthesia. Mortality rates 30 days, 90 days and one year after the fracture were 3.4%, 8.2% and 13.6%, respectively. Conclusion: Understanding the epidemiology of HF, its patterns of care and outcomes in developing countries is vital for the design of elder friendly public policies.

**PB8 308 STUDY REGARDING THE EFFICIENCY OF POSTURAL REHABILITATION FEEDBACK IN ELDERLY PATIENTS AFTER STROKE**  
E. ICONARU\* (University of Pitesti, Pitesti, Romania)

Introduction Posture represents a neuro-mechanical response in the process of interaction with gravity, with huge impact on the overall health status of the individual. One of the aims of physical therapy for elderly after stroke is to improve posture in daily living. Sometimes this goal is very difficult due to weakness and spasticity in affected limbs, which it rises secondary the risk of developing sarcopenia, joint stiffness and ankylosis. Methods and materials We evaluated the postural changes of a group of 30 elderly (sex ratio 1/1, average age 68.7 years) after stroke (1-3 months after the acute event) by using a 3 cell computerized stabilometric platform with a software which allows dynamic exercises for balance improvement. This method utilizes the visual control of the barycenter (postural feedback) during stabilometric dynamic exercises. Results The assessment showed initially a low postural control level for all elderly (unequal distribution of the load on both feet and on support points), reflected in relative altered scores for medium frontal (left/right) and sagittal (anterior/posterior) deviation, curve length of barycenter displacement, statokinesigram surface area (for 90% confidence interval) and fundamental harmonic frequencies (Fourier type, left/right and anterior/posterior). After three weeks of daily dynamic postural exercises (30 minutes by day, 5 day by week) we concluded that our patients developed a better orthostatic posture behavior, scoring significantly higher for all mentioned parameters ( $p < 0.001$ ). In addition, the specific test for postural feedback recorded a medium improvement of 35% ( $p=0.001$ ). Conclusion The evaluation of plantar stabilometry is very useful for understanding the postural physio-pathology in elderly after stroke; the posturo-stabilometric feedback has a large applicability in postural rehabilitation, as a real alternative for the classic posture corrective therapies. Thus, the long-term balance recovery after stroke could prevent some severe complications, which interfere with normal life functions.

**PB8 309 ANEMIA AS A MARKER OF DISABILITY AT HOSPITALIZATION OF ELDERLY PATIENTS**  
R. RIBEIRO\* (UFRRJ, Rio de Janeiro, Brazil)  
C. MONTES PAIXÃO JÚNIOR(1), S. OLIVEIRA E SILVA(1) - (1) Federal University of Rio de Janeiro- University Hospital Clementino Fraga Filho (Rio de Janeiro, Brazil)

Introduction: The maintenance of independence in activities of daily life is the major goal of geriatrics care and the disability is not a static condition, so it is important to know which people need more attention at hospitalization. The objective of this article is analyzed if the value of hemoglobin in elderly patient is a marker of functional loss for their first hospitalization. Methods and material: Observational longitudinal retrospective study. We selected patients aged over 65, at geriatric sector of University Hospital Clementino Fraga Filho. 448 outpatients that had the first hospital stay occurred between 1999 and 2008. Of these, 60 were chosen because they have complete data on the review of medical records. The instruments used to measure the activity of daily living (ADL) and instrumental activities of daily living (IADL) respectively were KATZ and LAWTON and anemia was defined according to the criteria of the World Health Organization. Other second variables have been seeing like cognition with the mini mental state exam (MMSE), length of hospitalization, socio demographics factors and co-morbidities. Results: The mean age was 82.8 years, 56.6% women; the prevalence of anemia was 55%. Of all patients 35% died in first hospitalization, 71.4% with anemia. Statistical analysis has shown that patients with anemia have increased length of hospitalization stay ( $P$  value = 0.0147) and patients with anemia have increased dependence for ADL ( $P$  value = 0.0003), IADL ( $P$  value = 0.0005) and low score at MMSE ( $P$  value = 0.015) at admission. Conclusion: Anemia is a marker of disability and longer time of hospitalization in the elderly people.

**PB8 310 MYASTHENIA AND OLD AGE**  
P. MARIE-AGNES\* (CHU Limoges, Limoges, France)  
M. PICAT(1), J. FARGEAS(1), A. LABROUSSE(1), T. DANTOINE(1) – (1) CHU Limoges (Limoges, France)

Myasthenia is an unusual affection with two peaks of frequency: between 20 and 40 years in feminine ascendancy and between 55 and 75 years in male ascendancy. Frequency of myasthenia at the late beginning is with difficulty estimable. Diagnosis of myasthenia must not be underestimated for all that in the old age. Two old patients with polyopathy are hospitalized for fluctuating neurological deficit. It is about 84-year-old man presenting a ptosis of right eye fluctuating during the day, deteriorated by the tests of fatigability. His histories include: a multi defect dementia, a depressive syndrome, a hypercholesterolemia

level. 87-year-old woman is hospitalized for dysphagia, ptosis of right eye and dysphonic. In his histories: of the degenerative osteoarthritis, a cerebro vascular accident ischemic passing. It had been recently coverage for spontaneously regressive left facial deficit of the right upper limb and the paralysis with a diagnosis of accident passing composed ischemic (cerebral scanner without sign of ischemia or bleeding). In front of this fluctuating symptom, increased in the effort an electromyography is in favour of an infringement of the neuromuscular junction with a significant decrement of 15 % for him and 18 % for her after the effort. Antibodies anti receptor of the acetylcholine are positive, thoracic scanner does not find a thymoma. The answer to the anti cholinesterase treatment is favourable to the patient with disappearance of the symptom. The myasthenia at the late beginning it must be evoked in particular when there are signs bulbar and oculo-bulbar, frequently revealing. However the diagnosis in the old age is all the more difficult as the old person's polyopathy, poly-medicated with multiple differential diagnoses. It is nevertheless interesting to put the diagnosis because treatments allow an improvement of the considerable symptoms and thus a better quality of life for these very old patients.

**PB8 311 DYSPHAGIA SEVERITY AND THE RISK OF THE ELDERLY POPULATION DEVELOPING ASPIRATION PNEUMONIA**  
M. SANTOS\* (Universidade Federal de Minas Gerais, Belo Horizonte, Brazil)  
C. TANURE(1), . PIETRA PEDROSO(1), L. CASEIRO VICENTE(1) - (1) Universidade Federal de Minas Gerais (Belo Horizonte, Brazil)

Introduction Brazil's geriatric population growth occurs at large rates. Around 32 million people over 60 years old are expected within the next 15 years, which means an increase of chronological disabling diseases that can generate complications associated to oropharyngeal dysphagia. The tendency is that morbidity increased by oropharyngeal dysphagia will amplify the prevalence of aspiration pneumonia which leads to worsening the elderly population's health situation and also interfering in their quality of life and health costs. The purpose of this study was to investigate the correlation between dysphagia severity and the risk of the elderly population developing aspiration pneumonia with associated diseases under videofluoroscopic vision of deglutition. Methods and materials Videofluoroscopic views of 217 elderly were analyzed, divided in five groups according to: normal deglutition, slight oral phase alteration without aspiration, laryngeal penetration, tracheal aspiration and silent aspiration. To determine pneumonia occurrence, clinical and radiological data was investigated in the time span of six months prior and after deglutition videofluoroscopic execution. The variables included in breathing and clinical data analysis were age, sex, original disease, feeding way, coughing, fever, prostration, oxygenotherapy use and radiological image compatible with pneumonia. Results The analysis of the results revealed that 106 individuals with average age of 82 evolved with aspiration pneumonia, with statistical difference ( $p$  value = 0.000) when compared with the group without pneumonia. The main risk factor was central neuropathy with prevalence of 72.5%. Videofluoroscopy revealed that pneumonia was observed in two patients (0.9%) with normal deglutition, 15 (6.9%) with slight deglutition alteration, 16 (7.4%) with laryngeal penetration, 22 (10.1%) with tracheal aspiration and 51 (23.5%) with silent aspiration. Conclusion Elderly with tracheal aspiration and silent aspiration had 170 and 280 times, respectively, more chances to develop aspiration pneumonia. The existence of correlation between aspiration pneumonia development and dysphagia severity observed by videofluoroscopy was verified.

**PB8 312 PREVALENCE OF FRAILTY ACCORDING TO FRIED'S CRITERION IN A COMMUNITY GERIATRIC POPULATION ASSESSED IN A GERIATRIC DAY UNIT IN ANNECY, FRANCE**  
M. DEBRAY\* (Centre Hospitalier de la Région d'Annecy, Annecy, France)  
G. BOUCHET(1), B. MOHEB(1), V. PEUCHET(1), L. TAVERNIER(1), F. PICOT(1) - (1) Centre Hospitalier de la Région d'Annecy (Annecy, France)

Introduction: Frailty has been proposed as a state of decreased physiologic reserve conferring increased vulnerability to stressors. Fried's and all, proposed in 2001, a new phenotype of frailty defined as a clinical syndrome in which at least three criterion out of five were present: unintentional weight loss, self-reported exhaustion, weakness (grip strength), slow walking speed, and low physical activity. The overall prevalence of frailty in the validation cohort (Cardiovascular Health Study) was 6.9%. Since, a few authors applied those criterion to various population, with a prevalence varying from 4% to 25.7%. The purpose of this study was to measure the prevalence of frailty according to Fried's criterion, in a community dwelling geriatric population. Methods and materials : From March 2008 to July 2008, all consecutive patients attending the Geriatric Day Assessment Unit of Annecy' Hospital were included. Addressed by their generalist practitioner, all patients benefit from a Comprehensive Geriatric Assessment focused on balance, nutrition, cognitive function, comorbidities, disability, social environment. We applied for all patients the Fried's criterion: Weight loss: (10 pounds unintentionally in, the last year); Exhaustion: Using the CES-D Depression Scale; Physical Activity: Based on the short version of the Minnesota Leisure Time Activity questionnaire; Walk Time, stratified by gender and height (gender-specific cutoff a medium height). Grip Strength, stratified by gender and body mass index (BMI) quartiles. Results : among 261 patients, 28.3 % were frail, 46.3 % were intermediate and 25.4% not frail. Sex ratio (W/M) was 64.4%, mean age 80.9 years; 82.8% living in the community. Comorbidities were highly prevalent (77.4% with CIRS $c>2$ ) as disability : 72.4%. Frailty was associated with being older,

higher disability and comorbidities. Conclusion : Using Fried's criterion, the prevalence of frailty in a community dwelling population attending a Geriatric Day Assessment Unit was very high.

**PB8 313 NO ASSOCIATION BETWEEN OUTCOME EXPECTANCIES AND FUNCTION 6 MONTHS AFTER HIP FRACTURE SURGERY**

B. BOGEN\* (Haraldsplass Deaconal Hospital, Bergen, Norway)

K. SPERSTAD(1), A. HYLEN RANHOFF(2) - (1) Haraldsplass Deaconal Hospital (Bergen, Norway); (2) The Kavli Center for Research on Aging and Dementia (Bergen, Norway)

Introduction: It has been suggested that expectations of a favourable outcome are related to high self-efficacy, and that perceived self-efficacy is an important contributor to performance. For health-purposes it is presumable that those with expectations of a favourable outcome would have a better outcome, which has also been suggested for hip fracture patients. In this study we investigate the relationship between outcome expectancies and postoperative function for hip fracture patients. Methods and material: Data are from an evaluation study of an orthogeriatric unit. 31 women and 11 men (mean age 77.8, SD 6.7) admitted for hip fracture surgery were asked: (1) "To what extent do you believe that your injury will affect you negatively in the coming 6 months?" and (2) "To what extent do you think you will be able to function as you did before your injury?". Responses were graded from 0 to 10. Function was measured with the Timed "Up & Go" (TUG)-test at 6-months follow up. Results and conclusion: Analysis (Pearsons r) showed no association between responses to question (1) and TUG after 6 months ( $r=0.0$ ) and between responses to question (2) and TUG after 6 months ( $r=0.0$ ). The lack of association could be caused by the fact that a hip fracture is a complex injury with unforeseeable consequences. Also, high self-efficacy does not in itself produce new skills, that may have been important in the rehabilitation process. In addition, the questions were not directed at what the respondents believed they were capable of and the TUG may not have been the right outcome.

**PB8 314 CHALLENGES AND PARADOXES OF FALL PREVENTION RESEARCH**

M. SPEECHLEY\* (University of Western Ontario, London, Canada)

Introduction: By any statistical definition, falling in community-dwelling older adults is a major population health problem. Responsible for >90% of hip fractures, falls are a significant factor in loss of independence and reduced quality of life, and a major driver of direct and indirect health care costs. Reviews suggest that many falls can be prevented cost-effectively through multifactorial risk factor identification and modification, although accumulating evidence suggests a minimal intensity level for interventions to yield a detectable effect. Specifically, conducting a risk assessment and providing recommendations for care seem insufficient; the intervention should include the actual ongoing provision of care. Algorithms such as the AGS Guidelines have entry points from either primary-care case finding or emergency room admissions. But not all developed nations have national fall prevention strategies. In Canada, fall risk assessment and risk modification are not routinely incorporated in primary care. Given that much more is known than unknown about preventing falls, my question is: What are the barriers keeping fall risk abatement from achieving equivalent status to, for example, hypertension and lipid screening and treatment? Methods: Reviews, editorials and fall researchers were used to identify key factors that prevent fall prevention from occupying a higher societal profile in the care of older adults. Results: Nine challenges and paradoxes of fall prevention were identified: i) falling in humans is normal, expected and common; ii) falling is funny; iii) environmental factors are seen as primary; iv) protective factors become risk factors; v) some falls are 'good' falls; vi) some steps to reduce risk actually increase it; vii) a major genetic role has not been identified; viii) interventions are 'low-tech' and unprofitable, ix) there are no 'celebrity fallers'. Conclusions: Considering these factors strategically might assist the social marketing of the message that many falls can and should be prevented.

**PB8 315 THE EFFECT OF STRETCHING AND PROGRESSIVE LOADING EXERCISES IN THE BODY WEIGHT OF OSTEOPENIC FEMALE RATS**

A. SILVEIRA GOMES\* (Pontifícia Universidade Católica do Paraná, Curitiba, Brazil)

L. ANA PAULA CUNHA(1), A. RENNO (3), J. LEIKO IWAZAKI(1), T. GIANELLO GNOATO(1), C. BRESSAN(1), P. NENEV (1), R. RIBAS LOCKS(2) - (1) Pontifícia Universidade Católica do Paraná (Brazil); (2) Universidade Federal do Paraná-Litoral (Brazil); (3) UNIFESP (Brazil)

Introduction: The aim of the present study was to evaluate the effect of stretching and resistive exercise in the body and muscle weights of osteopenic female rats. Materials and Methods: Sixty four female Wistar rats (8 weeks old, 280 ± 42g) were divided into 8 groups (n=8): CONT- intact control; OH- ovariectomy and hysterectomy; STRET- left soleus muscle was submitted to stretching; RE- resistive exercise; RE+STRETCH- resistive exercise and stretching. OHS- ovariectomy, hysterectomy and stretching. OHRE- ovariectomy, hysterectomy and RE. OHSRE- ovariectomy, hysterectomy, STRET and RE. The soleus muscle stretching protocol consisted by 10 bouts of 1 min, manually, through maximal dorsal flexion of the left ankle, twice a week. Resistive exercise was performed by four bouts of 10 jumps with progressive

loading carried out by fixing an additional load on the animal's body, 3 times a week. After 6 weeks the soleus muscles of both hindlimbs were dissected and it was evaluated body and muscle weights. It was used paired Student t test to compare the initial and final body weight and also to the comparison between right and left soleus muscle. The groups were compared by ANOVA. Results: The final body weights of RE (256±28g) and OHRE (255±19g) were slight in comparison to CONT (330±24g), p≤0.001. However, OH & plus RE (338±24g) was higher (p=0.006) when compared to STRET (298±13g). The body weight of OH was higher (307±8g) than RE (256±28g), p=0.007. It was not found difference in the soleus muscle weights. Conclusion: It can be supposed that progressive loading and its combination with stretching was sufficient to prevent the gain of body weight. The ovariectomy and hysterectomy induced an increase in the body weight even when the rats were submitted to exercises.

**PB8 316 PREVALENCE OF FRAILTY SYNDROME IN NURSING HOME ACCORDING TO DIFFERENT DEFINITIONS**

A. PARNICKA\* (Jagiellonian University Medical College, Krakow, Poland)

K. CHMIELOWSKA(1), K. TOMASZEWSKI(1), J. NOWAK(1), P. MATUSIK(1), T. GRODZICKI(1) - (1) Jagiellonian University Medical College (Krakow, Poland)

Introduction: The frailty syndrome is associated with higher mortality, disability and hospitalization. There are many definitions of frailty, but a standardized definition has not yet been established. In Cardiovascular Health Study about 7% of the population older than 65 year of age and 20% of the population older than 80 years were frail. Our aim was to establish how many patients in nursing homes are frail and to compare two methods of describing the frailty patients. Study Groups and methods: We examined 96 of all 118 patients over 65 years old living in two nursing homes in Cracow. We excluded subjects who refused to take part in study. Frailty was measured using the Cardiovascular Health Survey definition (frail-CHS) and the CHSA-Clinical Frailty Scale (CHSA- $\sim$ CFS). Results: Mean age of participants was 83,6 ± 8,2 yrs ( range: 66-101 yrs) and 79,7 % of them were women. According to the CHSA-CFS the prevalence of frailty syndrome was 77,1% of all 96 patients (mildly frail-22,9%; moderately frail-21,9%; severely frail-33,3%). The assessment based on CHSA definition was possible in only 14 subjects as 74 patients suffered from dementia (MMSE < 24 points), and another 6 from paraparesis and 2 from aphasia. In 9 of them frailty was diagnosed, and 3 of them fulfill also the criteria of CHSA-CFS. Conclusion: The frailty syndrome is a very frequent observed amongst the elderly living in nursing homes. Choice of the different scales influences on the frequency of the recognition of frailty syndrome. Scale based on CHS study seems to be less useful due to the high prevalence of dementia and disability amongst elderly patients of nursing homes.

**PB8 317 IMPACT OF RESISTIVE TRAINING ON ELDERLY CARDIOVASCULAR PHYSIOLOGY: BENEFITS AND ADVERSE EFFECTS**

L. RIANI COSTA\* (University of São Paulo, São Paulo, Brazil)

A. QUEIROZ(1), H. KANEGRUSUKO(1), M. CHEHUEN(1), L. FRANÇA WALLERSTEIN(1), C. UGRINOWITSCH(1), M. DE MELLO(2), C. DE MORAES FORJAZ(1) - (1) University of São Paulo (Brazil); (2) Federal University of São Paulo (Brazil)

Introduction. Resistive training prevents loss of strength and improves quality of life in sedentary subjects, particularly in elderly. Some works suggest that weight training benefits are better than those from aerobic exercise in this specific population. However, possible adverse effects related to cardiovascular overload during resistive training are not completely understood. Objectives. To evaluate the impact of a 4 months resistive training program on cardiovascular variables related to cardiac performance and clinical risk secondary to overload damage in sedentary subjects older than 60 years, analyzing two different resistive training protocols (strength S and power P) comparing to control group (C). Methods and Materials. Thirty nine subjects were randomly allocated into 3 groups: 10 C, 14 S and 15 P and performed a cardiopulmonary testing until exhaustion on treadmill, before and after the intervention. We analyzed heart rate (HR bpm), systolic blood pressure (SBP mmHg), double product (DP mmHg.bpm) and oxygen pulse (mL/bpm), in resting, anaerobic threshold (AT) and peak of exercise. Data were compared by two-way ANOVA and post-hoc test of Newman-Keuls ( $p<0.05$ ). Results. All the groups showed reduction on SBP in resting and AT, without differences in peak exercise. HR remains unchanged in 3 groups in resting and AT, but only in C the peak HR decline. DP, a major index of myocardial stress was not increased after 4 months in all groups. Oxygen pulse, a variable related to ventricular performance, raised in all exercise moments in 3 groups. Conclusion. All the groups showed improvement on cardiovascular performance after 4 months. Moreover, both training modalities exhibited excellent profile of safety cardiovascular variables, either in maximal and submaximal exercise. These findings suggest that resistive training with S or P protocols don't have negative impact or increased damage overload in cardiovascular physiology, without additional risk in these subjects with increased susceptibility to cardiovascular diseases.

**PB8 318 COGNITIVE IMPAIRMENT AND FUNCTIONAL OUTCOME IN A GERIATRIC INPATIENT REHABILITATION UNIT.**

M. FARRE\* (Fundacio Hospital Asil de Granollers, Granollers, Spain)  
S. ARIÑO-BLASCO(1), I. SAEZ(1), O. DUEMS(1) - (1) Fundacio Hospital Asil Granollers (Granollers, Spain)

**INTRODUCTION:** Cognitive impairment is often considered a predictor of adverse rehabilitation outcomes in the geriatric patient. However, the relative contribution of cognitive impairment and other risk factors remains unclear. **OBJECTIVE:** To assess, the relative value of cognitive impairment on admission using the Cognitive Performance Scale (interRAI MDS) for predicting functional outcomes in a Geriatric Inpatient Rehabilitation Unit. **METHOD:** Observational prospective, comparative, study performed in a Geriatrics Inpatient Rehabilitation Unit. Functional outcome (positive gain in ADL hierarchical scale) were predicted using logistic regression models with age, sex, weekly minutes of physiotherapy, length of stay, incontinence and depression as independent variables. **RESULTS:** A total of 1558 patients, 57.8% female, with mean age of 80 years, range 25-75 74-84 were included; Cognitive Performance Scale showed 229 cases (14.7%) with mild impairment and 316 cases(20%) moderate-severe impairment. Cognitive impairment, incontinence, depression and minutes of physiotherapy were associated with functional outcome in univariate analyses. In multivariate analysis, only dementia and minutes of physiotherapy proved to be independent predictors of functional recovery. **CONCLUSIONS:** Cognitive impairment assessed by the Cognitive Performance Scale on admission in a Geriatrics Inpatient Rehabilitation Unit predicts independently functional gain.

**PB8 319 THE IMPACT OF EXTRA NUTRITIONAL SUPPLEMENTS AND RESISTANCE EXERCISES ON UNDERNOURISHED OLDER ADULTS WITH A RECENT HIP FRACTURE: 12 MONTHS RESULTS OF A RANDOMISED CONTROLLED TRIAL EXAMINING A MORE INTENSIVE REHABILITATION PROGRAM**

M. CROTTY\* (Flinders University, Adelaide , Australia)  
M. MILLER(1), L. DANIELS(2), E. BANNERMAN(3), C. WHITEHEAD(4) - (1) Flinders University (Adelaide, Australia); (2) Queensland University of Technology (Brisbane, Australia); (3) Queen Margaret University (United Kingdom); (4) Repatriation General Hospital (Adelaide, Australia)

Introduction Rehabilitation outcomes in older people following hip fracture are generally modest and there is interest in new approaches. While nutritional supplementation and extra resistance training seem sensible there is uncertainty around the independent and combined effects of these approaches in frail patient groups which include nursing home patients Methods and materials 100 nutritionally at risk older adults (70+) hospitalised following a fall related lower limb fracture. We stratified on pre-fracture accommodation (community dwelling or residential care) and randomised patients to receive individually prescribed oral supplement (6.3kj/ml) for 6 weeks (n=25), supervised tri weekly resistance exercises for 12 weeks (n=25), combined treatment (n=24) attention control (n=26). All participants also received usual hospital and post hospital rehabilitation. Cognitively impaired older adults able to follow instructions and those from nursing homes were included. Results At 12 months there were 3 withdrawals leaving 97 older adults with hip fracture available for masked assessment. Of these 19% had died, 29% had been admitted to hospital at least once, 21% moved to a higher level of care. There were no differences between groups in the outcomes achieved. When those receiving any additional intervention were compared with the attention control group mean gait speed was 21 secs (SE 2.2) compared with 26.4 secs (SE 5.7). Improvements in gait speed were seen in those from nursing homes as well as those from the community. Conclusion This small trial suggests that augmenting conventional rehabilitation may improve gait speed over 12 months but there was little evidence to support an impact on key health outcomes. Larger trials are now needed to explore whether the shifts in walking achieved can be translated into meaningful health outcome changes which would justify investment by health services in additional therapies.

**PB8 320 PROFIT FOR THE GERIATRIC DAY HOSPITAL IN VERY ELDERLY PATIENTS**

N. OTAZU AREVALO\* (Hospital Cruz Roja, Madrid, Spain)  
J. GÓMEZ PAVÓN(1), P. SORANDO FERNANDEZ(1), I. RUIPÉREZ CANTERA(1) - (1) Hospital Cruz Roja (Madrid, Spain)

**AIMS:** Analyze the benefits of the use of the Geriatric Day Hospital in very old patients. **METHODS:** Prospective observational study of patients admitted in the last 3 years (1-2006 to 1-1-2009) in a day hospital for Geriatric Services from Madrid area V. Excluding those with incomplete data (1), attending <4 (73 (12%). N: 542; 344, women, mean age 83,7 +/- 6,34 years. Three groups in study : A: patients > 90 years; B: patients 89-90 years; C: < 80 years. Discusses : Discusses functional gain according Barthel scale (admission-discharge) and improvement in gait and balance according Tinetti scale (admission-discharge), attending and institutionalization at discharge. Statistical análisis with  $\chi^2$ , Mean difference by paired T of student (admission-discharge), and Anova factor (Bonferroni test and Games-Howells test) for differences between groups. IC and signification level 95%. **RESULTS:** A) > 90 years: N= 99 (71 women, mean age 92,72 +/- 2,5 years). Mean attending: 15 +/- 5,6 days. Show a gain functional mean in Barthel of

15,18 (13,05-17,32) p<0,001, and in Tinetti of 4,33 (3,66-5,00) p<0,001; institutionalization discharge rate of 0%. B: 89-75 years; N : 180 ( 122 women , mean age 82,5+- 3,7 years) . Mean attending: 15,33 +/- 5,49 days. Show a gain functional mean in Barthel of 14,08 (12,95-15,16) p<0,001, and in Tinetti 4,44 (4,08-4,77) p<0,001); institutionalization discharge rate of 2%. C) <80: N= 328 (203 women , mean age 84,54 +/- 2,71 years). Mean attending: 16,13 +/- 6,28 days. Show a gain functional mean in Barthel of 14,26 (12,21-16,31) p<0,001 and in Tinetti of 5,21 (4,54-5,87) p<0,001); institutionalization discharge rate 0%. Comparing the three groups, no statistically significant differences between among the different variables. **CONCLUSIONS:** Very elderly patients aged more than 90 years to benefit from the Geriatric Day Hospital at the same extent as younger showing a similar gain in Barthel as in Tinetti, without more assistance.

**PB8 321 EFFECT OF VITAMIN D3 ON FALL AND FALL RISK ASSESSMENT IN GERIATRIC INPATIENTS**

Y. GÖKÇE-KUTSAL\* (Hacettepe University, Ankara, Turkey)  
Ö. ERKAN (1), A. ÇETİN(1), H. ŞAHİN(1) - (1) Hacettepe University (Ankara, Turkey)

**Introduction:** The aim of this study was to determine the risk factors of fall and the relationship between vitamin D3 level and fall risk assessment tests in geriatric inpatients. **Methods and materials:** Fifty patients (43 female and 7 male) ages 61 to 86 (mean age 71) were included in our study. Patients included in our study if they were able to walk with or without aid and were able to complete the fall risk assessment tests. For fall risk assessment, timed get up and go, tandem walk, gait speed and stand-up from chair tests were performed. Patients' last one year femur neck and lumber 1-4 (L1-4) dual energy X-ray absorptiometry (DXA) T- scores and blood vitamin D3 level were also noted. Results: 40% of patients have had at least one falling history after age 60 and 25% of these were living alone, 15% had anemia, 25% had low glomerular filtration rate, and 75% had polypharmacy. Out of 20 fallers 9 have had fragility fracture history. More than half of the patients that were failed in timed get up and go test and gait speed below 1 m/s had low vitamin D3 level (<20IU/l). Among patients who have had fragility fracture 37.5% have osteoporosis. Conclusion: The results of this study show that patients hospitalized in physical therapy and rehabilitation center over 60 years of age were under high risk of fall. Fall risk factor assessment and appropriate interventions should be done to prevent fragility fractures.

**PB8 322 OSTEOPOROSIS IN MEN ADMITTED TO THE OSTEOPOROSIS AND METABOLIC BONE DISEASE CLINIC OF A GERIATRIC INSTITUTE**

I. SANTI\* (Geriatric Institute Pio Albergo Trivulzio Milan, Milan, Italy)  
M. GANDELLI(1), M. GIANOTTO(1), M. MONTI(1) – (1) Geriatric Institute Pio Albergo Trivulzio Milan (Milan, Italy)

In literature one in three osteoporotic fractures (FRC) occur in men but only too few men at high risk of FRC are detected and treated. Fragility FRC are the primary clinical expression of osteoporosis (OP) in men, the most frequent sites being the hip, the vertebrae, the humeral and the distal forearm. In our Clinic we follow around 800 patients (pts) with OP and metabolic bone disease of whom only 66 men. Our aim was to define clinical characteristics, instrumental and laboratory findings of the male population we have in charge. In all of the 66 pts were collected a clinical and anamnestic evaluation including risk factors for FRC, previous clinical FRC, BMD (DXA/QUS), X-ray and laboratory evaluations and past or previous treatment for OP. Results: of the 66 pts studied (n $\pm$ SD): age: 69 $\pm$ 11 yrs, BMI: 25 $\pm$ 3 kg/cm $^2$ ), 12 had positive familial history for hip FRC (18%), 3 a history of alcohol abuse (4%), 6 were smokers (9%) while 26 smoke in the past (26%), 10 drank 3 or more cups of coffee per day (15%), 27 did regular physical exercise to keep fit (41%), but only 5 out of 15 pts with vertebral FRC did physical exercise, 4 were taking corticosteroids (CS)(6%) and 10 took CS in the past (15%), 23 showed previous fragility FRC (35%)(15 vertebral, 2 femoral, 2 of the wrist e 4 humeral). The daily calcium intake was 720 mg/die, but 44 pts (76%) had a calcium intake less than 1000 mg/die, only 12 pts (18%) were taking calcium supplements. The calcemia was in the normal range in all of the subjects (9.46 $\pm$ 0.6 mg/dl), while the concentration of 25OH-D3 was below the normal range (<30ng/ml) in 33 of the 42 pts (78%) and very low (<15 ng/ml) in 16 pts (36%). All the pts with low levels of calcium and/or vitamin D were supplemented with oral calcium and colecalciferol; 18 pts on 42 (19%) had a iperPTH (2 primary and 6 secondary, to reduced level of vitamin D). Eight pts of 42 (19%) had ipercacalciuria (>300mg/24h) and 11 pts (26%) had low calcium excretion (<100mg/24h). Of the 46 pts studied with X-ray and morphometric exam, 26 showed silent vertebral FRC (65%). Of the 61 pts who underwent a spinal or femoral DXA or calcaneal QUS, 27 showed T-score < -2,5SD (44%). Only 23 pts were taking therapies for OP. Considering overall the clinical, DXA, morphometric and laboratory data, we detected 49 pts with OP presenting with fragility FRC, clinically evident (23) or silent (26), of whom 43 with idiopathic male OP, 4 with OP secondary to CS therapy, 1 with OP secondary to hepatic failure, 1 with OP due to renal transplantation (treated with alendronate, risedronate, teriparatide), 2 pts with primary iperparathyroidism (sent to the surgery), 2 pts with Paget disease (treated with neridronate). In conclusion, according to literature, our preliminary data show that OP is a

significant problem in old men (still largely underdiagnosed and undertreated) that request a greater awareness among both the physicians and the general population.

**PB8 323 THE INTRODUCTION OF AN IN-PATIENT HOSPITAL EXERCISE VIDEO**

D. FORSYTH\* (Cambridge University NHS Trust, Cambridge, United Kingdom)  
C. STONEHAM(1) - (1) Cambridge University NHS Trust (Cambridge, United Kingdom)

**Introduction:** A program of simple exercises shown via a bedside entertainment system was developed at Cambridge University Hospital NHS Trust to increase activity and decrease the incidence of thromboembolism in the in-patient population. Reduced activity due to immobility is a weak risk factor for venous thromboembolism. Additionally, periods of bed rest and immobility associated with hospital stay have been linked with adverse effects at musculoskeletal and cardiovascular levels, compromising functional recovery and increasing length of stay. **Method:** A randomised qualitative review of a heterogeneous selection of one hundred patients found 88% were in favour of a short program of bed and chair based exercises. Following these results, a video was compiled of four five minute programs of simple upper limb, lower limb and breathing control exercises. This is available to be viewed by all in-patients at intervals throughout the day through a free hospital channel. **Results:** This exercise video was launched at Addenbrooke's Hospital in November 2008 and is the first program of its kind in the UK. **Conclusion:** It remains to be seen whether this program can have an effect on prevention of thromboembolism and influence activity amongst the adult in-patient population. The concept is a useful adjunct to therapeutic practice and requires audit to extrapolate direct correlation to clinical outcomes.

**PB8 324 CAN PRACTITIONERS GIVE AN AVERAGE AGE FOR FRAILTY IN THEIR PATIENTS?**

P. RUMEAU \* (CCAS Toulouse, Toulouse, France)  
A. STILLMUNKES(2), P. RUMEAU(1), R. ABADIE(1), T. VOISIN(1), B. FONTAN(1),  
B. VELLAS(1) - (1) CHU Toulouse, pole gériatrie (toulouse, France); (2) CCAS Toulouse  
(Toulouse, France)

**Introduction** Until the late nineties and the publishing of the results of the Canadian Study of Health and Aging and the Cardiovascular Health Study in the USA, frailty was mostly clinically defined. Frailty, as a syndrome, could be proved to be independent of age. Although better known now from an experimental point of view, it's still hard to find a cut off to target specific actions. Even rough clues are needed we developing insurance schemes or market model for support technologies. Age could still be an acceptable marker for regional populations with some homogeneity. Population and method We went back to the clinical appreciation of practitioner and asked them what was the average age of the typical frail elderly woman or man in their practice. We contacted the 91 members of a geriatric medical association in Toulouse, France. Results 30 answered, 20 were visiting patients in their home and 10 worked in a nursing home or hospital. Both in men and women we found two peaks of answers : a main peak at 85 and a secondary peak at 80 for women, at 80 and 75 for men. The proportion of practitioners visiting the patients at home was the same in both peaks both in women and men. Discussion We have older ages than in USA or Canada, but are close to Tuscany, this is correlating with morbidity and mortality data of which frailty is a risk factor. The two peaks could relate to the intermediate then frail states that were described in Frail-CHS; an incipient then an installed form of frailty. Conclusion Age as defined by local experts could be used as a clue to reach frail population when regional action is considered.

**PB8 325 ASYMPTOMATIC VERTEBRAL FRACTURES IN ELDERLY HOSPITALIZED PATIENTS**

M. MAGDALENA\* (Joan March Hospital, Mallorca, Spain)  
S. ROSARIO(1), C. ROBERTO(1), B. MIGUEL(1), D. OROFILA(1) - (1) Joan March  
Hospital (Spain)

Orthogeriatrics is the term used to refer to the care of older people with fractures, of which the most significant is hip fracture. The orthogeriatric teams in Spain Hospitals see all people over 65 who are admitted with fractures. They are involved in their medical care and they manage their rehabilitation depending of the patients needs. Hip fractures are a serious health problem common among elderly men and women who fall and osteoporosis are the most frequent cause. The objective of this study has been to analyze the prevalence of asymptomatic vertebral fractures in patients entered by hip fractures in a Orthogeriatric unit and its relationship with age and gender factors. Methods. A sample was composed by 43 patients (68.9% were women and 30.2% were men) with hip fracture who entered in the Orthogeriatric unit of Joan March Hospital in Spain with an average of 79.4 years old. No of them indicated compatible clinical symptoms with vertebral fracture or have antecedents of knowing fracture. A radiological study of dorsal and lateral column was realised to them and analyzed by MORPHOPRESS by a specialist. Fracture from 20% of deformity of a vertebra was considered. Results. The 93, 4% (n=40) of the entered patients shows an asymptomatic vertebral fracture among which the 65,11% were in wedge formation, the 44,18% biconcave and the 34,88% presented crushing. The correlation study (Rho Spearman) showed a positive relationship between gender and fractures ( $p<0.05$ ) but a

relationship between age and fracture prevalence was not observed. In conclusion this study show the importance of a radiological study of column to all elderly patients who entered in the hospital orthogeriatrics units by fracture of hip.

**PB8 326 BODY COMPOSITION, LOWER EXTREMITY PHYSICAL PERFORMANCE AND LIMITATIONS IN AMBULATORY OLDER WOMEN**

E. EVANS\* (University of Illinois, Urbana, United States)  
E. McAULEY(1) - (1) University of Illinois (Urbana, United States of America)

**Introduction:** The interactions among key body composition outcomes, fat mass (FM) and appendicular (legs) lean mass (aLM-Legs), and reported functional limitations (LIMITS) and lower extremity physical function (LEPF) is of public health importance due to the obesity epidemic and risk of physical disability in an aging society. The aim of this study was to determine the relative impact of FM, aLM-Legs and a novel characterization of functional body composition, aLM-Legs expressed relative to total body mass (TBM; aLM-Legs/TBM), on LIMITS and LEPF in older ambulatory women [N = 238,  $M \pm SD$ ;  $68 \pm 6$  y, (60-84 y)]. **Methods and materials:** Body composition was assessed by dual-energy X-ray absorptiometry. A FM index (FM-I) and aLM-Legs index (aLM-Legs-I) were calculated by normalizing values by height (meters squared). LIMITS were assessed using the basic lower extremity function score of the Late Life Function and Disability Instrument. LEPF was assessed via a timed up-and-go (UPGO) performance. Tertile analyses using ANCOVA (controlling for age) and Tukey post-hoc tests determined the impact of body composition status on LIMITS and UPGO. **Results:** FM-I, aLM-Legs-I and aLM-Legs/TBM were all related to LIMITS and UPGO ( $p < 0.05$ ). The middle and highest FM-I tertiles (greater adiposity) reported more LIMITS than lowest tertile ( $p < 0.05$ ) whereas highest FM-I had worst UPGO performance comparatively ( $p < 0.05$ ). Interestingly, the lowest aLM-Leg-I reported fewer LIMITS comparatively and highest aLM-Leg-I tertile had worse UPGO performance comparatively (all  $p < 0.05$ ), perhaps due to an interaction with weight status. However, no differences existed in LIMITS or UPGO across aLM-Legs/TBM tertiles ( $p > 0.05$ ). **Conclusion:** The impact of body composition on lower extremity functional limitations and physical performance is complicated due to interactions among adiposity and leg lean mass in ambulatory older women. Adiposity appears to be the key body composition variable related to risk for physical disability and should be a target for interventions. Support: NIH RO1-AG020118 (PI: McAuley); UIUC Campus Research Board (PI: Evans).

**PB8 327 VITAMIN D DEFICIENCY IN ELDERLY SERBIAN PEOPLE, SUFFERING FROM OSTEOPOROSIS**

S. DJURICA\* (Medical faculty, University of Belgrade, Clinical Hospital , Belgrade, Serbia)  
M. VUKSANOVIC, N. MARKOVIC, B. ŽERAJIĆ

Vitamin D deficiency is commonly found in the elderly and is associated with osteoporosis and osteoporotic fractures. Vitamin D status of 112 female and 34 male subjects living in their own homes, were assessed. The study was conducted in Belgrade. All measurements were performed between september and december in the same year. Serum levels of 25(OH)D were measured in serum samples taken after an overnight fast. The values from 75 to 250 nM/l were optimal for the method, which was applied. Intra and interassay coefficient of variations were 5% and 8%, respectively. The values lower than 75 nM/l were accepted as vitamin D deficiency. Osteoporosis was confirmed in all subjects, included in this study, by densitometry (Hologic, Explorer). Serum osteocalcin, betacrossLaps and parathormone levels were analysed in all geriatric patients, also. We have found vitamin D deficiency in 52.4% analysed elderly (58 nM/l $\pm$ 4.8,  $X \pm SE$ , with negative linear correlation ( $r=-0.16$ ) to elevated PTH (110 pg/ml $\pm$ 6.8,  $X \pm SE$ ). The increase in serum PTH, secondary to vitamin D insufficiency, may affect bone remodeling and contribute to age related reduction in bone density. The osteocalcin serum level was diminished, but the betacrossLaps was not elevated. We found the very close relationship between low vitamin D serum concentration and bone mineral density (BMD), with rang of linear correlation of 0.78. Vitamin D deficiency is common due to the habits in nutrition,in sunlight exposure as well as in every day supplementation. Vit D is the real risk factor of very importance in geriatric patients. Management of osteoporosis in elderly people includes a modification of lifestyle risk factor, exercises, adequate nutrition and intake of calcium and vitamin D. Only optimal vitamin D serum level could to minimize the occurrence of fractures in elderly people, suffering from osteoporosis during antiresorptive therapy.

**PB8 328 EFFECTS OF AEROBIC AND RESISTANCE TRAINING AND DETRAINING ON CARDIORESPIRATORY STATUS IN ELDERLY**

A. SILVEIRA GOMES\* (Faculdades Integradas do Brasil - UNIBRASIL, Curitiba, Brazil)  
D. ROMANOVITCH RIBAS(1), R. RIBAS LOCKS(1), I. PANEK PEREIRA(1),  
M. CAMARGO(1) - (1) Universidade Federal do Paraná (Curitiba, Brazil)

**Introduction:** The aim of this study was to examine the effects of 12 weeks of aerobic and resistance training on cardiorespiratory capacity and blood pressure in healthy elderly people. **Materials and Methods:** Eleven volunteers (70 &plusminus sign 5 years old; 8 women) performed 20 minutes of walking followed by progressive resistance training

(PRT) for lower body muscle groups, twice a week. The PRT was performed with level set at 65% of 10 repetition maximum (10-RM) for the first four weeks, 70% for the next four weeks and 75% for the last four weeks. The cardiorespiratory capacity was measured by the six minute walk test (SMWT). The blood pressure was measured through the auscultatory method before and immediately after the SMWT. The subjects were evaluated before and after 4, 8 and 12 weeks of training and after 4 weeks of detraining. The homogeneity results were compared by Wilcoxon ( $p < 0.05$ ). Results: Aerobic and resistance training increased the walking distance on SMWT when compared before training (555 ± 65m vs 514 ± 100m,  $p = 0.04$ ). The cardiorespiratory gain occurred between 8 and 12 weeks of training. Only 4 weeks of aerobic and resistance training decreased the systolic (120 ± 16mmHg vs 138 ± 20mmHg,  $p = 0.01$ ) and diastolic blood pressure (70 ± 9mmHg vs 84 ± 10mmHg,  $p = 0.007$ ) at rest and decreased the diastolic blood pressure after the SMWT (78 ± 12 mmHg vs 86 ± 9mmHg,  $p = 0.01$ ) when compared before training. Conclusion: The aerobic exercise associated to resistance training for 12 weeks improved cardiorespiratory capacity of the elderly and decreased their systolic and diastolic blood pressure at rest and their diastolic blood pressure after submaximal effort at 4 weeks. The benefits were maintained even after detraining.

#### **PB8 329 DIFFERENCE BY AGE IN THE ASSOCIATION BETWEEN BODY COMPOSITION AND BONE MINERAL DENSITY**

J. JUNG\* (Seoul National University School of Public Health, Seoul, Republic of Korea)  
D. PAEK(1), S. CHO(1) - (1) Seoul National University School of Public Health (Republic of Korea)

Introduction Bone mineral density (BMD) is known to be affected by body composition, such as body mass index (BMI), fat mass (FM), lean body mass (LBM). However, the strength of association may vary by age group because of changes of body composition with increasing age. The aim of this study is to assess the association between body composition and BMD by age groups. Methods Data were collected from 317 volunteers aged over 40 from a Korean community, who were not taking any medication affecting bone metabolism. All subjects completed a questionnaire by interview, and body composition analysis and BMD measurements were taken. Body composition was measured using bioelectric impedance, Inbody 3.0, biospace Co., instrument. BMD value at the calcaneus was measured by dual-energy X-ray absorptiometry (DEXA) using a Lunar instrument. Spearman correlation and multiple regression were used for data analysis. Results BMD(g/cm<sup>2</sup>) were 0.56±0.11(mean±SD), 0.48±0.10, 0.43±0.12 by age group, 40-49, 50-59, and 60+, respectively. BMD was positively correlated with LBM in all groups, BMI in age 40-59 group, FM in age 40-49 group, and 60+ year groups. By multiple regression analysis, only LBM and BMI were significantly associated with BMD. Thus, for 1kg increase in LBM was associated with 0.0051g/cm<sup>2</sup> increase in BMD among 40s age group, 0.0053g/cm<sup>2</sup> among 50s age group, and 0.0117g/cm<sup>2</sup> among a group with 60. This result implies that the effect of LBM on BMD increases by age. Conclusion This study suggest that the LBM, among body composition, is most strongly associated with BMD with increasing age. With the risk for age-related loss of lean muscle mass, measures of maintenance of LBM may be important for preventing osteoporosis.

#### **PB8 330 EXPERIENCES OF OLDER ADULTS ACCEPTING OR REFUSING IMPLANT DENTURE REHABILITATION**

R. BRYANT\* (University of British Columbia, Vancouver, BC, Canada)  
M. MACENTEE(1) - (1) University of British Columbia (Vancouver, Canada)

Objective: This study aimed to use the International Classification of Functioning Disability and Health to help explore psychosocial perceptions of edentate elders who had either accepted or refused dental implants to assist rehabilitation with dentures. The objective was to develop hypotheses to explain quality of life perceptions relevant to the oral health of older adults with complete tooth loss. Methods and Materials: Fifty edentate adults, from 50 to 89 years of age, were interviewed individually using open-ended questions on quality of life related to their general and oral health including tooth loss and denture use. Half of the participants had accepted implant denture rehabilitation, and half had refused treatment. Themes related to psychosocial and quality of life perceptions were identified in verbatim transcripts of the interviews. Results: Various responses were revealed including satisfaction and dissatisfaction with body structure and function, activities and participation. The influence of personal beliefs was noted, such as adaptation in the face of adversity, and of environmental factors, such as financial freedom. Those accepting implants revealed expectations of improved prosthesis stability and a desire to be 'normal' despite a small risk of surgical complications including altered sensation. Those refusing implants typically viewed conventional dentures to be acceptable substitutes for natural teeth and considered implants unnecessary to improve quality of life. Some found the perceived benefits of implants did not outweigh surgical or maintenance concerns. Conclusion: Elders with or without implants can use very positive language to describe their quality of life outcomes, suggesting factors other than physical impairment may be influencing positive adaptation in the face of tooth loss. Although aging edentate adults can maintain quality of life consistent with their expectations, it remains unclear what

psychosocial factors predispose to a desire for a more extensive intervention. (Canadian Institutes of Health Research Grant #14R90998).

#### **PB8 331 THE RELATIONSHIP BETWEEN MUSCLE MASS AND PHYSICAL FUNCTION: NHANES 1999-2004**

S. SEN\* (Lehigh University, Bath, United States)  
J. MCFETRIDGE(1), P. MAVROS(2) - (1) Lehigh University (Bethlehem, United States of America); (2) Merck & Co., Inc. (Whitehouse Station, United States of America)

Introduction: Previous studies have shown a link between physical function and muscle power; however, there is a paucity of information on the relationship between muscle mass and physical function. The purpose of this study was to investigate the relationship between skeletal muscle index (SMI) and muscle power, and between SMI and various measures of self-reported physical function in a community-dwelling elderly population. Materials and Methods: Participants (>= 60 yrs of age, n = 3,799) were from the National Health and Nutrition Examination Survey (NHANES) 1999–2004. SMI [appendicular muscle mass (kg) / height (m)<sup>2</sup>] was measured by dual energy X-ray absorptiometry. Muscle power was the product of isokinetic peak leg torque and peak force velocity. Information on self-reported physical functioning was collected using 19 questions from the questionnaire portion of NHANES. These questions included activities like "walking up 10 steps" and "using a knife and fork." For each question, 3 groups were formed: no difficulty in doing the activity, difficulty in doing the activity, and unable to do. Linear regression was used to link muscle power and SMI. Multinomial logistic models with covariates (demographics, health behaviors, medical conditions) were used to explore the relationship between SMI and each area of physical function. Results: SMI showed a positive association ( $p < 0.05$ ) with muscle power. The odds ratios (95% confidence interval) for no difficulty vs. difficulty were significant ( $p < 0.05$ ) for a one unit (kg/m<sup>2</sup>) increase in SMI for some activities: walking ? mile [0.776 (0.668-0.907)], walking up 10 steps [0.801 (0.683-0.938)], stooping/crouching [0.869 (0.763-0.989)], house chores [0.793 (0.671-0.986)], and standing from an armless chair [0.791 (0.672-0.930)]. Increasing SMI was associated, although insignificantly, with decreased likelihood of difficulty in the majority of remaining activities including: getting in/out of bed, standing/sitting for long periods of time, using knife/fork, and lifting/carrying 10 lbs. Conclusions: Higher muscle mass was observed to be associated with greater muscle power. Lower muscle mass was associated with greater likelihood of difficulty in most areas of physical function in the community-dwelling elderly that had not reached the point of being unable to do those activities. However, more research needs to be done to further investigate this relationship.

#### **PB8 332 TRANSLATING AN EVIDENCE-BASED FALL RISK REDUCTION INTERVENTION INTO AN EFFECTIVE COMMUNITY-BASED PROGRAM: AN EVALUATION OF TWO TECHNIQUES FOR MAINTAINING FIDELITY.**

D. ROSE\* (California State University, Fullerton, Fullerton, United States)  
P. TRUEBLOOD(2) - (2) California State University, Fresno (Fresno CA, United States of America)

INTRODUCTION: According to the National Institutes of Health Behavior Change Consortium (BCC), developing techniques aimed at retaining the fidelity of evidence-based practices are critical to the effective translation of these practices into effective community-based programs that are widely accessible to older adults. The primary purpose of this study was to evaluate the effectiveness of (a) provider training and (b) standardized treatment delivery and program evaluation strategies on the successful replication of an evidence-based fall risk reduction program in nine community-based centers. METHODS AND MATERIALS: Nine providers (e.g., exercise specialists, physical therapists) were trained to implement an evidence-based fall-risk reduction program in one or more community sites. Instructors were specifically trained in the delivery of standardized program content suitable for group-based settings. A total of 188 older adults ( $M = 77.63$ ,  $SD = 7.91$ ) identified at moderate-to-high risk for falls were recruited to participate in the eight-week fall risk reduction program. Consistent with the original studies conducted, multiple performance outcomes (previously shown to be moderately-to-strongly associated with falls) were collected at baseline and post-intervention and used to evaluate the program's efficacy across sites. Measures included balance, gait, upper and lower body strength, and balance-related self-confidence. RESULTS: A Doubly Multivariate Multiple Analysis of Variance (DM MANOVA) yielded Main Effects for Site ( $F = 2.01$ ,  $p < .001$ ) and Time ( $F = 32.03$ ,  $p < .001$ ) only. The Site X Time Interaction was not significant ( $F = 1.22$ ,  $p = .14$ ). While certain functional performance outcomes differed across sites and also improved from baseline to post-intervention, the mean level of improvement did not differ across sites. CONCLUSIONS: Developing a standardized treatment delivery protocol, in conjunction with a provider training program, constituted effective methods for maintaining the fidelity of an evidence-based program when implemented by multiple providers.

#### **PB8 333 HEALTH SERVICES UTILIZATION AND HEALTH PRACTICES AMONG THE ELDERLY IN INDIA: RESULTS FROM THE KERALA AGING SURVEY**

S. JOHNSON\* (University of Regina, Regina, Canada)

Purpose The purpose of the study was to examine the patterns of health services utilization and health promotion practices of older adult population and suggest appropriate solutions

including programs and policies to address the health needs of the ageing population. Methods: The Kerala Aging Survey, conducted among more than 5,000 elderly (2271 men and 2722 women) in 14 districts using population-based epidemiological design, was the keystone of the study. The survey had detailed modules on various determinants of health developed around the World Health Organization's Determinants of Healthy Aging framework. Results: The results of the Kerala ageing survey have shown that the age of participants ranged from 60 to over 100 years of age with 54% being women. The study showed that common health problems include: diabetes, heart disease, high blood pressure, and arthritis. For medical needs, close to 40% accessed public hospitals and 56% used private hospitals. The reasons for access to private versus public varied. Most accessed public hospital for the free service provided whereas those who accessed private hospitals did so for the availability of better services, good care, and attention. In the study, only about 30% had routine medical check-up and over 80% were under regular medication. Health practices of the older adult population were also examined. The gender difference was clear in behavioural factors with men smoking cigarettes and drinking alcohol and women chewing betel leaf. Self reported participation in physical activity decreased with age. Approximately 60% of the young old (less the 70) participated in physical activities mostly in the form of household activities. Dietary patterns showed that most elderly consume three meals a day with a greater tendency for the older age groups to skip or miss meals. Also, the type of food changed from non-vegetarian to vegetarian as people aged. Approximately 30% were on special diet such as diabetic diet or low salt diet. Implications of the Results Given the aging of the population, evidence-based programs and policies are needed to address the growing health needs and issues faced by the elderly in India. In Kerala, which has the highest proportion of elderly in India, the extent of policies and programs for the elderly is limited. Given the limited resources available for the elderly, it is not surprising that there are no current programmes related to health promotion among elderly, targeting the determinants of healthy ageing.

#### **PB8 334 FALLS PREVENTION AND CORRECT USE OF CANE IN COMMUNITY-DWELLING ELDERLY PEOPLE**

J. DIONISIO AVILÉS\* (Universidad católica San Antonio de Murcia, Guadalupe (Murcia), Spain)  
V. ZAMORA(1), P. MONTOYA(1), M. MONTOYA(1), R. CAYUELA(1), V. ZAMORA(1), J. CARBAYO(2), M. RUIZ(1), J. MONTAÑO(1) - (1) Universidad católica San Antonio de Murcia (Guadalupe (Murcia), Spain); (2) Residencia de personas mayores de Espinardo (Guadalupe (Murcia), Spain)

**INTRODUCTION:** The aging carries a deficit on physical capacities, between them a decrease in balance and modifications in gait, appearing as consequence the accidental falls that suppose one of the most important geriatric syndromes because of his high effect and high morbi-mortality. The use of walking sticks is indicated in an important part of this population in order to prevent some consequences like accidental falls, immobility and dependence. **OBJECTIVES:** To identify the characteristics of individuals who use a walking stick. To analyze in this group of population the gait, balance and risk of falls by different validated tests. To verify if it is possible to improve gait and balance through a program executed by a physical therapist. **MATERIAL AND METHOD:** Randomized control trial on 60 individuals with an average of age of 69,65 (SD 2,83), with record of demographic variables and evaluation of gait, balance and previous risk of falls and later to the intervention through a program of adjustment and performance of gait with walking stick executed by a physical therapist. For statistical analysis, verifying the normality and independence of the distribution by means of Kolmogorov-Smirnov Test, T-Student Test for independent samples to compare the averages of both groups previous random assignment, and T-Student Test for samples related to compare the averages pre and post of the same group with a confidence interval of 95 %. **CONCLUSIONS:** This program for adjustment and performance of gait with cane improves the balance, gait and therefore, it might be useful for the prevention of falls in not institutionalized aged people who use this kind of self-help device.

#### **PB8 335 IDENTIFICATION OF THE RISK OF FALLS AMONG THE ELDERLY BY ANALYZING THE PARAMETERS OF THE HALF TURN ON THE PLATFORM IPF 502**

A. MADJLESSI\* (Centre Hospitalier Puteaux, Puteaux, France)  
D. BOUCCARA(1), S. ALAIN(2), B. CHRISTIAN(3), D. JEAN PAUL(4), H. JACQUES(5), H. ERICK(6), P. MARIE CHRISTINE(7) - (1) Beaujon (France); (2) Paris (France); (3) Rothschild (France); (4) Béthune (France); (5) Paris (France); (6) Amplifon (France); (7) Montpellier (France)

**Objectives:** The purpose of this study is to propose a method for detecting risk of falls in the elderly through the analysis of physiological parameters recorded at the completion of a half turn on the platform iPF02 ®. The results were compared with those obtained from clinical tests commonly used to detect the risk of falling. Materials and methods: - The platform includes iPF02 ® 4 sensors gauge constraint on a plateau instability damped, allowing a sampling frequency of 100 Hz, it is an extension of plates that serve as market area before reaching the platform where the tower is half done. The digital processing allows to analyze the following parameters at the half turn: number of steps carried out during the half turn, half turn length of time support monopodal, creates energy and received and correlation of phases and modes. - The population studied by 5 investigators

included 120 people aged over 75 years. A control group of 125 people under the age of 75 years was studied under the same conditions. For each of these epidemiological data: age, gender, lifestyle, diseases and treatments in progress, and fall history were collected. Four clinical trials testing the risk of falling have been made: unipodal support, get up and go test, walking and talking and pushed sternal test. The half round on the platform was done three times on each side. - The whole performance has benefited from a statistical study of the reproducibility of the parameters measured at the half turn, their agreement and their evolution with age. To determine the parameters that are most predictive of falls logistic regression was performed on the basis of the usual risk of falling. Results The results show: - A good reproducibility of criteria posturographiques (number of steps, length traveled, creates energy and received) recorded at the half turn. - A high level of correlation between different parameters measured at the half turn, in particular number of steps, time and support unipodal total. - The parameters: number of steps, support unipodal time, total time and length of the half turn are significantly associated with history of falling. - A good correlation between the clinical testing of the risk of falls and parameters of the half turn, especially the number of steps and total time. Conclusions: The results of this preliminary study show that an analysis method is reproducible turned around and found the parameters correlated with each other which helps to validate the technical review, on the other hand it allows for identify older people at risk of falling.

#### **PB8 336 FOUR QUESTIONS TO DETECT FRAIL ELDERLY PATIENTS IN EMERGENCY ROOM (ER)**

O. LACROIX\* (Hôpital sainte marguerite, Marseille, France)  
S. BONIN-GUILLAUME(1), P. JEAN(2), S. PARRON(3), S. GENTILE(3) - (1) hôpital sainte marguerite, APHM, internal medicine and geriatrics department (Marseille, France); (2) hôpital Nord, APHM, emergency department (Marseille, France); (3) faculty of medicine Timone, public health laboratory (Marseille, France)

**Introduction:** The ER visit of elderly patient is often the telltale sign of frail underlying condition. **Objectives:** to determine questions that detect frail elderly patients admitted in ER. **Methods and materials:** 118 patients aged  $\geq 75$  years old admitted in a French University Hospital ER were consistently included. The ER physicians filled out a 10-item questionnaire including the ISAR, 3 pertinent items of SEGA, and one more item: "living alone". Within the week of admission in ER, each patient was assessed (visit to patient hospitalized in acute care or telephonic interview for the others) by an experienced geriatrician in order to detect frailty (clinical evaluation). Only completed data (both ER physicians and geriatrician assessments) were submitted to analysis. **Results:** Complete data were obtained for 67 patients (mean age: 83 years old, minimum: 75 – maximum: 98; 58 % female). Number of comorbidities was (mean  $\pm$  SD)  $2.5 \pm 1.0$ , number of medications was  $5.2 \pm 3.5$ . 49 patients (74.2%) were hospitalized. According to the geriatrician assessment, 53 % of patients were frail, 35 % were fit and 12 % had polypathologies. Four items assessed by ER physicians were significantly associated to frailty determined by the geriatrician: - Do you need help on a regular basis? ( $p=0.001$ ). - Since the illness that brought you to the ER, have you needed more help than usual? ( $p=0.037$ ). - Have you problems with your memory? ( $p=0.005$ ). - Do you take more than 3 different medications daily? ( $p=0.017$ ). Conclusion: By asking 4 questions, French ER physicians can easily and quickly detect frail elderly patients that need a comprehensive geriatric assessment. These 4 questions are part of the ISAR scale regularly used in USA and Canadian ER. These results have to be confirmed by a validation study in different ED.

#### **PB8 337 SACRAL INSUFFICIENCY FRACTURE : AN OVERLOOKED CAUSE OF LOW BACK PAIN**

M. LAURAIN\* (Service de Gériatrie, Hôpital de Brabois, VANDOEUVRE LES NANCY, France)  
C. PERRET-GUILLAUME(1), J. DEIBENER(1), A. BENETOS(1) - (1) Service de Gériatrie (Vandoeuvre les Nancy, France)

**Introduction:** Sacral insufficiencies fractures (SIF) are not uncommon in geriatric population and usually occur in osteoporotic bone with minimal traumatism ; clinical diagnosis remains difficult because of atypical presentation. **Methods:** we retrospectively analysed 5 cases of SIF diagnosed in a geriatric unit between 2005-2008. **Results:** Four women and one man, mean age 88, living at home were admitted for lumbar pain or atypical sciatalgy, involving for two weeks in two of them. Pain was responsible of loss of autonomy and one patient developed a voluminous sacral pressure sore. Previous falls were absent in two cases. None of them was on corticotherapy, nor was receiving a treatment for osteoporosis ; three patients have severe renal insufficiency. Diagnosis was made by bone scintigraphy for 3, demonstrating a typical H-sign, and for 2 by computed tomography. Associated fractures were present in 2 patients. Four patients recovered after bed rest and analgesics, one died of septicemia. **Conclusion:** prevalence of ISF in the elderly is unknown, because of atypical presentation (pelvic and low back pain, mobility restriction) with non significant radiological signs. Osteoporosis is the major underlying pathology. The H sign of isotope bone scan confirms sacral fracture but is documented only in 40 %

of the cases. Computed tomography or magnetic resonance imaging may be useful to confirm diagnosis.

**PB8 338 COMPARISON OF BODY COMPOSITION, MUSCULAR STRENGTH, BALANCE, REACTION TIME AND ACTIVITY LEVEL IN COMMUNITY-DWELLING AND INSTITUTIONALIZED OLDER ADULTS**

F. CAN\* (International Association of Physiotherapist working with Older People&Hacettepe University , Ankara, Turkey)  
A. SAR(1) - (1) Hacettepe University School of Physical Therapy and Rehabilitation (Ankara, Turkey)

**Introduction:** Muscular strength, balance and reaction time are major contributing factors to enhance posture and postural stability and to promote functional activities. Some studies in the literature have shown community-dwelling older adults are more active with higher balance control than the older adults living in residential houses, although some authors have found opposite results. There is still controversy on geriatric care either could be in home based or in institution. **Aim:** The aim of this study was to determine whether there are differences in body composition, balance, reaction time, muscular strength and activity level between the older adults living in residential houses and community dwelling older adults. **Methods and Materials:** 26 older adults have been living in a residential house in Turkey (Group 1) and 26 community-dwelling older adults (Group 2) were included in the study. Their mean age was 66.773.71, aged between 60 to 73 years. All of them in both groups were assessed with the same measurement tools, then the groups were compared with each other. Older adults had serious neurological, cognitive, musculoskeletal, cardiac or psychological disorders were excluded. Body composition was calculated after taking their height, weight and skinfold measurements. Reaction time was measured by a visual reaction timer. Rhomberg test was used for assessing their balance. Activity level was measured using Activity Index scored with maximum 100 points. Strength of knee extensors and elbow flexors, handgrip strength and maximal respiratory pressure were measured as indicators of their strength. After recording all the measurements Results: There were no significant differences in body mass index, handgrip strength and strength of elbow flexors between the groups. However, percentage of body fat, strength of knee extensors and maximal respiratory pressure measurements (PI max and PE max) were higher in community-dwelling (0.05). Older adults in community showed comparable shorter-adults (p reaction time than the older adults in residential house (Group 1= 0.10 sec.). Community-dwelling older adults ± 0.22 sec., Group 2 = 0.40 ± 0.59 were capable to control their balance with eyes-open and eyes-closed < almost two times more than the adults living in residential houses (p 0.05). Activity Index score was 14.23 points for Group 1, while it was 0.05). Conclusion: This study showed that < 40.08 points for Group 2 (p community-dwelling older adults had some advantages in terms of muscular strength, activity level, balance and reaction time although their body fat was higher which could be attributed to the life-style of Turkey. These results revealed that home based geriatric care and rehabilitation is very important and could be preferable than to be institutionalized.

**PB8 339 REARRANGEMENT OF METABOLISM AND CEREBRAL HEMODYNAMICS IN ISCHEMIC STROKE PATIENTS DURING REHABILITATION: AGE PECULIARITIES**

S. KUZNETSOVA\* (Institute of Gerontology of the Academy of Medical Sciences Ukraine, Kiev, Ukraine)

**Purpose:** To study correlations between metabolism and cerebral hemodynamics as a function of age in ischemic stroke patients. **Subjects and Methods:** The study included 263 patients with an ischemic stroke in the internal carotid artery (ICA) area who were divided into two age groups: middle-aged (n=198) and elderly (n=65). Cerebral hemodynamics was inferred from duplex scanning using Sonoline Elegra (Siemens) and metabolism of the brain from the *in vivo* H1 MR spectroscopic data (1.5 T Magnetom Vision Plus, Siemens). **Results:** The middle-aged post-stroke patients versus age-matched control subjects displayed more pronounced decrease of LBFV and volumetric blood flow rate in the damaged (55.3% and 19.2%, respectively) and intact ICA (32.4% and 10%, respectively) and MBA (respectively 47.7% and 39%; and 36.4% and 29.3%) and the higher frequency of hypoechoic atherosclerotic plaques (49.5% in middle-aged and 24.1% in elderly). At the same time the gray and white matter NAA content in elderly patients was statistically lower than in elderly control subjects (18.2±0.9 and 24.1±0.8 nominal units, respectively). Dissociation between degree of changes in cerebral hemodynamics and NAA metabolism level is conditioned by that in elderly patients the influence of hemodynamics on NAA content on damaged basin vessels is more pronounced. Thus NAA content of the occipital gray matter in middle-aged patients correlated with volumetric blood flow rate in intact ICA ( $K=0.74$ ) and VA ( $K=0.81$ ), while in the elderly it correlated with hemodynamics in homolateral MBA ( $K=0.69$ ). In elderly patients, changes of cerebral hemodynamics and metabolism were more marked with right hemispheric stroke localization (white matter NAA content was  $21.74\pm0.52$  from the right and  $21.50\pm0.54$  from the left; gray matter NAA contents were respectively  $21.13\pm0.62$  and  $23.58\pm0.93$ ) than with left hemispheric stroke localization (white matter NAA content was  $23.43\pm0.5$  from the right and  $23.37\pm0.57$  from the left; gray matter NAA contents were respectively  $22.78\pm0.99$  and  $24.91\pm0.87$ ). In conclusion, cerebral hemodynamics changes were more pronounced in middle-aged patients and metabolic changes were more marked in elderly post-stroke

patients. Therefore such age peculiarities should be considered while choosing proper tactics for their pharmacological rehabilitation.

**PB8 340 FULMINANT MENINGITIS IN ELDERLY**

J. FLORES VALDERAS\* (Hospital Virgen del Valle, Toledo, Spain)  
M. ARAUJO ORDOÑEZ(1), A. ESCOLANTE MELICH(1), C. GARCIA REDECILLAS(1), T. ESTRADA ALVAREZ(1), M. MUÑOZ(1), M. CHECA(1), C. ROSADO ARTALEJO(1), J. FERNANDEZ SORIA(1), P. SERRANO CUADRADO(1), R. PAZ MAYA(1) - (1) Hospital Virgen del Valle (Toledo, Spain)

An 88 years old woman with a pacemaker for atrioventricular block, was admitted to the hospital because of the recent onset incoherent speaking and altered consciousness. Five days before admission diarrhea developed without fever. She did not have nausea, vomiting. On physical examination the patient was unconscious. The blood pressure was 100/50 mmHg, the pulse was 60 beats per minute, and the axillary temperature was 35°. The respiratory rate was 34 breaths per minute. The Chest was clear to auscultation. There was a 3/6 systolic ejection murmur at the left upper sternal border. The abdomen was nontender, nondistended, and soft. The tip of the liver was palpable. The remainder of the examination revealed no abnormalities. On Neurologic examination, the Score on the Glasgow coma Scale was 6 (Eye:1, Verbal: 2, Motor:3). The pupils were round; the right was 5 mm in diameter and reactive to the light, and the left was 3 mm in diameter and reactive to light. The neck was rigid, and Kerning's sign was present. The reflexes were present; the plantar responses were indifferent. An electrocardiogram revealed pacemaker rhythm. A radiograph of the chest revealed a big heart and the lungs were normal. Blood levels of electrolytes and serum levels glucose, albumin were normal. The urea and creatinine levels were high (198mg/dl and 1.41mg/dl respectively). Hematologic laboratory values were 25100 leucocytes (52% Neutrophils) hemoglobin 16.7, Platelets 300000, Quick ratio 60%. Urinalysis revealed 14-16 white cells. Computed Tomography (CT) of the head performed 1 hour after the patient's arrival in the Emergency Department, without the administration of contrast material, revealed age related parenchymal changes, no densitometric changes. Then CT, Lumbar puncture was performed, the results of cerebrospinal fluids were: proteins 74 mg/dl (normal 23 to 38 mg/dL), glucose 80 mg/dl (cerebrospinal glucose- serum ratio more less than 0.6), white cells count 47 (100% Neutrophils) and 64 red cells count. Vancomicine, Ceftriaxone and Acyclovir were begun. Two hours after, the patient remained comatose and unresponsive, and the patient died. 48 hours after culture of the cerebrospinal fluid, blood and urine that had been obtained on the Emergency department grew E. coli. **Discussion:** The Meningitis for Gram negative are often in newborn and children, it is unusual in elderly. In this case is associate to neurosurgical, traumatic brain injury, and other diseases about diabetes mellitus, cancer and steroids treatment. The presence of fever, the physical findings of meningeal irritation and perturbations of level of consciousness are often seen in patients with meningitis. The Septic Shock is an unusual complication with high mortality. The mortality for Meningitis in adults and children is around 40-80 percent. The Spontaneous Meningitis with bacteremia is often associated with high mortality equal to this clinical case.

**PB8 341 CORRELATION BETWEEN CASUAL SYSTOLIC BLOOD PRESSURE AND ARTERIAL STIFFNESS ACCORDING TO GENDER AND AGE IN NURSING HOME RESIDENTS AGED >80.THE PARTAGE STUDY**

D. MILJKOVIC\* (CHU, Geriatry Dpt, Nancy, France)  
P. SALVI(1), S. BUATOIS(1), F. VALBUS(2), O. HANON(3), F. MARINO(2), P. MANCKOUNDIA(4), O. TOULZA(5), F. ALLA(6), C. PERRET-GUILLAUME(1), A. BENETOS(1) - (1) CHU, Geriatric Dpt, Nancy (Nancy, France); (2) University of Verona, Geriatric Dpt, Verona (Nancy, Italy); (3) Hopital Broca, Paris (Nancy, France); (4) CHU, Division of Geriatric Medecine, Dijon (Nancy, France); (5) CHU, Geriatric Dpt, Toulouse (France); (6) CHU, Epidemiology INSERM, Nancy (France)

**Introduction:** Studies showed that there was strong positive relationship between casual Systolic Blood Pressure (SBP) and Pulse Wave Velocity (PWV). This relation could be modified in the elderly, particularly because of co-morbidities and/or multi medications that could differently influence SBP and PWV. One of the PARTAGE (blood Pressure and ARTerial stiffness in nursing home residents AGED over 80 y.o) objectives is to assess the correlation between the various measurement of SBP and PWV in this population. **Patients and methods:** 1130 nursing home residents older than 80 years, were recruited in France (Nancy, Dijon, Paris, Toulouse) and in Italy (Verona). SBP was first measured by instructed persons in a standardized manner with an automatic device with patients sitting (casual SBP) and standing (orthostatic SBP); second SBP was auto measured by patients themselves three consecutive times at the morning and at the evening for three consecutive days. Carotido-femoral PWV (c-f PWV) was measured by Pulse Pen device. These results refer to casual SBP and PWV measured at the inclusion (baseline values). **Results:** The mean age was  $87.7\pm4.8$  years and 22% of subjects were men. Mean casual SBP for men and women were 134 mmHg and 138 mmHg respectively with c-f PWV values of 14.9 m/s and 14.1 m/s respectively. For the 3 age class defined (80-84, 85-89, more than 90 years old), SBP values were 135 mmHg, 138 mmHg, 138 mmHg respectively and for c-f PWV 13.8 m/s, 14.3 m/s and 14.9 m/s respectively. Correlation between SBP and c-f PWV were stronger in women than in men ( $R=0.31$  vs 0.22) and in the lowest age group compared to highest ( $R=0.31$ , 0.31 and 0.24 respectively). **Conclusion:** In the highest age group and in men we observed an important increase in aortic stiffness and a weaker SBP/c-f PWV

relationship with a very slight increase in SBP for highest age group and a very slight decrease in SBP for men. These results may reflect different influence of co-morbidities on BP and arterial stiffness.

**PB8 342 DEMOGRAPHIC TRANSITION IN TUNISIA : SOCIO-MEDICAL AND**

ECONOMIC ASPECTS OF AGEING

S. HAMMAMI\* (CHU, Monastir, Tunisia)

A. BARHOUMI(1), R. ZNAIDI(2), S. HAJEM(2) - (1) Department of Internal Medicine  
CHU Monastir (Monastir, Tunisia); (2) Unit of research INSP Tunis (Tunis, Tunisia)

In developing countries, population ageing is occurring over an even shorter period than that observed in the developed countries. Thus this fast structural change leaves little time to adapt to the new situation. Purpose: this study aimed to evaluate and analyse geriatric epidemiology aspects in Tunisia Results: The observed population ageing in Tunisia is explained by a considerable phenomenon called the "demographic transition, it corresponds to the passage from a young population characterized by a strong fertility and a high mortality rate to an older population with low mortality and fertility rates. The population pyramid in thus transformed into a "haystack". Thus, in Tunisia, the proportion of elderly (60 years old people and more) passed from 4.1% in 1956 to 9.6% into 2004. That of the 65 years old people and more passed from 3.5% in 1966 to 6.5% into 2004. This weight will do nothing but double during the 25 next years. Indeed, the 60 years old people and more will represent, into 2030, close to the double is 17.7% of the whole of the population. In this horizon and for the first time of the history of the Tunisian population, the population of more than 60 years will be higher than that of the children from 0 to 14 years which will account for only 17.3%. The life expectancy at 65 years is today 14.2 years for the men and 15.6 years among women. The life expectancy to the birth could still increase and reach in 2030: 75 years for the men and 80 years for the women. The demographic transition is accompanied by another phenomenon called the "epidemiological transition" which is defined by a shift in the causes of death due to the reduction of infectious diseases and the progressive increase in deaths due to generative diseases such as cardiovascular and neoplastic pathologies, which are characterized by latency of several years between their onset and death. The epidemiological transition has resulted not only in a rise in the prevalence of chronic disease, but also in an increase in the number of centenarians Discussion and conclusion: The demographic transition of our country and the ever growing (medical and social) needs of the elderly is a problem of gigantic proportions. The consequences are enormous for the systems of care of health and assistance. It will be required deep reflection and a long term strategy to increase the capacity of our socio-medical system to answer the needs and waiting of the old people.

**PB8 343 GENDER DIFFERENCES IN COGNITIVE, FUNCTIONAL AND HEALTH STATUS AMONG THE VERY-OLD URBAN BRAZILIANS**

I. ROSET\* (São Paulo University, Porto Alegre, Brazil)

M. RORIZ-CRUZ(1), E. PEDRAZZI(2), A. GRATÃO(2), C. FREITAS(2),  
A. BASTOS(2), V. HAAS(2), R. RODRIGUES(2) - (1) Federal University of Rio Grande do Sul (Porto Alegre, Brazil); (2) São Paulo University (Ribeirão Preto, Brazil)

Introduction: Brazil is one of the countries where the very-old population group is growing fastest. This age group has been understudied, especially in the developing world. We evaluated how gender is related to socioeconomic and demographic characteristics, cognitive, functional, and health status among very-old Brazilians. Methods and materials: The aleatory sample was composed by 273 south and southeast urban very-old Brazilians (80 years) living in the community. The cross-sectional, population assessment was performed at home. Evaluation included socioeconomic characteristics, presence of comorbidities, Mini-Mental State Examination (MMSE), Functional Independence Measure (FIM) and the 15-item Geriatric Depression Scale (GDS). Results: Female comprised 67% of the sample, 73.4% of them were widowed, and 22% lived alone. Among men, the majority (70.5%) were married and 16% lived alone. Mean age and years of schooling were 84.3 ( $\pm 3.5$ ) and 3.9 ( $\pm 4.3$ ) for men, and 84.9 ( $\pm 4.4$ ) and 3.5 ( $\pm 3.6$ ) for women, respectively. Time from retirement was 26.8 years for male and 13.6 years for female ( $P = 0.001$ ). Men's income was almost twice higher than among women ( $P = 0.001$ ). Mean MMSE score was 22.3 ( $\pm 5.4$ ) for men and 19.2 ( $\pm 7.3$ ) for women ( $P = 0.001$ ). Mean number of comorbidities was 5.4 ( $\pm 2.5$ ) for males and 7.3 ( $\pm 3.0$ ) for females ( $P = 0.001$ ). Females (29%) presented a 2.7 higher chance of being depressive than men (13%,  $P = 0.004$ ). Mean FIM score was 111 ( $\pm 17.8$ ) for men and 104 ( $\pm 24.3$ ) for women ( $P = 0.01$ ), indicating higher independence levels for men. Conclusion Lower time from retirement probably indicates earlier withdrawal among men due to working years contributed to the Social Welfare System, while most women became retired due to age. Unfavorable health conditions which are usually biologically associated with gender, like functional dependency and depression, might be, at least partially, attributed to gender socioeconomic inequality.

**PB8 344 LICHENSTEIN TENSION-FREE INGUINAL HERNIA REPAIR IN ELDERLY MALE PATIENTS**

V. CIJAN\* (Clinical Hospital Center Zvezdara, Belgrade, Serbia)

P. BOJOVIC(1), M. SCEPANOVIC(1), Z. PUDAR - (1) Clinical Hospital Center Zvezdara (Belgrade, Serbia)

Introduction Inguinal hernia repair is currently the most commonly performed general surgical operation; it occurs with a greater frequency in men than women (12:1) especially

in elderly patients because of the abdominal wall weakness and conditions which increase intraabdominal pressure. The open tension-free Lichtenstein hernioplasty constitutes the current gold standard for the elective repair of inguinal hernia in men. The aim of this study was to evaluate the results of the Lichtenstein hernioplasty in elderly patients compared with younger patients in our department. Methods and materials A database of male patients, categorized in older (over 70 years) and younger (under 65 years) group who underwent elective Lichtenstein inguinal hernioplasty in 2008., has been established. Demography, co-morbidity, type of hernia and anaesthesia, postoperative pain and use of analgetics, complications, hospitalisation, return to normal daily activities were recorded. Results A total of 393 consecutive patients were studied, including 126 patients in the elderly and 267 patients in the younger group. Respectively for elderly versus younger group: Median age 76,14 (70-92) versus 51,4 (19-65) years; concomitant diseases 80% versus 40%; spinal anesthesia 52,3% versus 68%, local anesthesia 46% versus 23%, general anesthesia 1,7% versus 9%. Nyhus's classification, type 2 and 3 hernias were the most common in both groups. 6 patients (4,75%) developed postoperative haematomas versus 9(3,37%) and 8(6,34%) urinary retention versus 12(4,5%). There were no wound infections in both groups. Also observed were nonsignificant differences in hospitalization days (3,1 versus 2,75) ; pain scores and days of analgetics usage (3,9 versus 4,3); and return to normal daily activities 7,5 versus 8,4. Conclusion Lichtenstein inguinal hernioplasty is a simple, effective method, with prompt recovery and low complications and can be done in the elderly as safely as in younger patients. Local anesthesia is recommended whenever possible.

**PB8 345 OLDER PEOPLE'S EXPERIENCES OF HOME-BASED TECHNOLOGY IN UK- SPECIFIC EXTRA CARE HOUSING**

H. MATLABI\* (The University of Sheffield, Sheffield, United Kingdom)

K. MCKEE(1), S. PARKER(1) - (1) The University of Sheffield/ Sheffield Institute for Studies on Ageing (Sheffield, United Kingdom)

Introduction Extra Care Housing (ECH) is expected to provide a supportive environment for older people as they age and become frailer, but little post-occupancy evaluation has been performed. The EVOLVE study explores the relationship between building design and quality of life in ECH. This paper reports data from one aspect of the first stage of the EVOLVE study, examining how Home-Based Technology (HBT) influences quality of life for residents of ECH. Methods and Materials Five ECH schemes were recruited through purposive sampling. Scheme managers selected residents who represented a range of demographic and health characteristics in their scheme to participate in a focus group on the design of ECH. In total thirty-five residents took part across 6 groups. As part of the focus group schedule, issues relating to HBT in the schemes were raised. Transcripts were content analysed to examine the participants' views on HBT. Results There was little discussion of HBT, and few participants could name examples of technology in their scheme without prompting. However, problems with insufficient or poorly placed lifts were commonly cited. Kitchen devices were mentioned as being inadequately designed for residents' needs, and use of laundry facilities could be problematic. Some participants had concerns about their inability to operate new technology, were reluctant to expend the amount of effort required to learn to use technology, and supposed they had no use for it. Conclusions Residents in ECH schemes rarely consider technologies as impacting on their quality of life, yet connections have emerged between the design and location of the reviewed technologies and elements of life quality. The focus group data will be used in the development of a tool to evaluate the design of ECH schemes; a survey will follow to consider residents' attitudes towards and use of technology in terms of quality of life.

**PB8 346 INTERACTIVE AND INTUITIVE MEMORY AID FOR THE ELDERLY AND PEOPLE IN THE EARLY STAGES OF ALZHEIMER**

C. DESCHENEAUX\* (DOMUS Laboratory, Sherbrooke, Canada)

H. PIGOT(1) - (1) Université de Sherbrooke (Sherbrooke, Canada)

A lot of elderly people use some kind of low-tech memory aid(s) like post-its, paper calendars, note books, and alarm clocks, to compensate for memory loss. Many electronic memory aids are on the market today, but most of them are not adapted to the needs of the elderly population. The screen, labels and keyboards are often too small and the devices' numerous options make them complex to use. Given the potential benefits of using technology to provide elderly people with powerful memory aids, and the lack of tools specifically designed for this segment of the population, we propose the use of an interactive calendar. Because the calendar has the look-and-feel of its paper counterpart, it requires no or little adaptation and/or training on the part of the user and integrates itself seamlessly in the elderly's home. It can help recall appointments and social activities as well as help reminisce about past events such as a visit from a family member. It is also customizable in accordance to the user's needs, abilities and preferences. Testing and user input are important parts of the development process. Focus groups composed of social workers and elderly people with little or no experience with computers will help us evaluate the look and feel of various prototypes and gather information as to which functionalities are more desirable/useful. Individual testing sessions, with elderly people (mostly novice and intermediate computer users), based on scenarios followed by interviews and questionnaires will help us evaluate the usability of the calendar. Finally, evaluations in the homes of elderly participants for a period of one month each will enable us to test the reminder functions, see which functionalities of the calendar are used the

most, and validate with the participants the integration and use of the calendar in their own homes.

**PB8 347 PERCEIVED USEFULLNESS OF GEOLOCATION SYSTEM IN DEMENTIA BY GERIATRICIANS**

M. RIGUET\* (Hopital Broca, Paris, France)

G. DENIS(2), Y. WU(3), V. FAUCOUNAU(4), G. ORVOËN(5), A. LACOMBE(6), F. LABOUREE(7), A. RIGAUD(8) - (2) Hôpital Broca (Paris, France); (3) Hôpital Broca (Paris, France); (4) Hôpital Broca (Paris, France); (5) Hôpital Broca (France); (6) ESIEE Management (France); (7) Hôpital Broca (France); (8) Hôpital Broca (France)

**Introduction:** In elderly persons with Alzheimer's disease (AD), spatial disorientation in AD is a major problem and a source of stress for caregivers, as wandering and runaway situations can be life-threatening if the patient is not found within 24 hours. Gerontechnology is of interest for geriatricians because it may support the caring of AD patients.. Geolocation systems have been designed in order to improve patients' autonomy, limit problems related to their temporo-spatial disorientation, and avoid confinement at home. For the caregiver, the use of geolocation systems would facilitate the prevention and management of patient's runaways and wandering as well as reduce their anxiety and psychological burden. The present study addressed the issue of the geolocation system relevance for geriatricians. Methods and materials: 34 geriatricians responded to a questionnaire on the relevance of this geolocation technology for wandering patients. The questionnaire consisted in thirteen questions divided into five themes (adaptiveness, usefulness, intention to use, perceived as easy to use, ethics). This questionnaire was based on the Technology Acceptance Model (TAM) which is a key tool in the assessment of information technology. Results: Preliminary results showed that 90% of geriatricians believed that perceived adaptiveness and usefulness were satisfying, 68% of them thought that patients were ready to use the system, 60% of them thought that the system would be easy to use, and 67% believed that the system was not an obstacle to patients' freedom. Conclusion: The results reported here provide support for using geolocation technology for demented patients. The perception of geolocation system by geriatricians is very positive. The geriatricians think relevant to use such a system. This study is of wide practical importance since such geolocation system might reinforce autonomy in AD patients..Currently, the Broca team compares different geolocation systems with willing patients to find the most appropriate device.

**PB8 348 INTERGENERATIONAL TELE-MENTORING PROGRAM, LOCAL AND TRANS-ATLANTIC RESULTS**

M. BERNARD\* (PACE 2000 , Ottawa, Canada)

M. FRUHWIRTH, P.ENG.(1), X. WANG, PHD.(1), K. OUACEL(2), K. NACEL(2), J. VIVET(3) - (1) PACE 2000 (Ottawa, Canada); (2) Mission locale La Mire (Bobigny, France); (3) Mairie de Bobigny (Bobigny, France)

**Introduction:** Few conventional mentoring organizations recruit 65+ mentors (US 2005 survey "Mentoring in America"). Using accessible "gerontechnologies", PACE-2-Face®, FIAPA award 2007 (Fédération Internationale des Associations de Personnes Agées), an International Virtual Village is expanding where seniors may instantly contribute to youth and learners around the world, beyond geographic limitations and various institutional boundaries. Through the ergonomic design of information technologies for homebound seniors, senior tele-mentors connect with their paired learner, while remaining in their respective environment, be it at their office desk, in an institution or at home. Methods: The seniors friendly tele-mentoring application provides four simultaneous communication modes (verbal, non verbal, reading and writing) As part of the PACE 2000 intergenerational program, PACE-2-Face® was provided to 18 computer illiterate older adults (aged 70+- 7 years where 67% exhibiting a chronic disease) in Canada, paired with 9 unemployed youth (aged 20 to 28) in Bobigny, France, and also 9 university students in Ottawa, Canada, for the purpose of practicing a second language. Results: Compliance was highest in seniors. Seniors caused 20% while youth were the cause of 70% of cancelled sessions. A significant impact is observed in both generations. Seniors reported high degree of satisfaction in all intergenerational aspects (interacting with and aiding youth) as well as an opportunity for personal development. Youth also appreciated the intergenerational exchanges and universally appreciated the use of the technologies involved. Lastly, in as few as 2 to 4 tele-sessions behavioural changes (initial reluctance to speaking a foreign language changed into enthusiasm; increased self confidence etc.) had been observed (by the mentors and coordinators) in one third of the young persons.. Conclusions: More research is needed to understand both the quantitative results as well as the underlying factors which promote interaction and behavioural changes in vulnerable populations.

**PB8 349 THE NATURE OF PARTNERSHIP PROCESS IN NURSING CARES TO AGED PATIENT**

I. GOMES\* (Lisbon Nursing College, Lisbon, Portugal)

**Introduction** Various authors have highlighted that care practices focused on aged patient are needed, demystifying myths and stereotypes that can lead nurses underestimating their own abilities. The objective of this study is to understand the nature of partnership process

in nursing cares to aged patient at home environments in order to assure that those practices will be more focused on patients. Methods and materials This qualitative study uses grounded theory and was performed at home environments. Ten nurses and fifteen aged patients have taken part in the study. Data collection was made through participant observation, interviews and content review of various documents types. Results Partnership process requires understanding people not only as a being with project but also as a being under project, as well as establishing a relationship of trust. Strategies for implementing a partnership process include building conjoint actions and/or take care of the other person's care when he/she does not have enough information, knowledge, physical and mental strength or motivation to do so. Thus, the so-called Care of Oneself (himself and/or other people) is promoted. Conclusion Building conjoint actions which promote the Care of Oneself, respecting people's differences, will contribute to care practices more focused on aged patient. Moreover, it will allow patients to have control on their life and health projects, as well as proceed with the course of their lives. Idalina Delfina Gomes is a lecturer at Lisbon's College of Nursing, a member of UIDE (Nursing Research and Development Unit), and a Doctoral Student in Nursing Sciences at the Portuguese Catholic University – Lisbon.

**PB8 350 PERCEIVED NEEDS AND PREFERENCES OF ELDERLY PEOPLE WITH COGNITIVE COMPLAINT TOWARDS AN ASSISTIVE ROBOTIC AGENT**

V. FAUCOUNAU\* (Broca hospital, Paris, France)

Y. WU(1), A. RIGAUD(1) - (1) Broca hospital (Paris, France)

**Introduction:** Growing old at home is desired by most of elderly people despite their decline in health and cognitive capacities, because for them home is linked to independence. Daily activities are mainly performed in the home and certain measures to help them to remain healthy and active are necessary. One solution might come in the form of Information and Communication Technology (ICT) in which robots become increasingly important as a means of supporting older people at home. The aim of this study is to explore patients' needs to stay autonomous at home on one hand and their requirements towards the idea of having a robot to assist them in home on the other hand. Methods and materials: 30 patients aged 60 and older with memory complaints were recruited at the Broca Memory Hospital. We conducted an interview-administered questionnaire that included questions about their needs to stay autonomous and requirements concerning robots' functions and modes of action. Results: In order to stay autonomous at home, the subjects reported their needs to retain their capacity to manage their daily activities (60%), maintain good health (56.7%) and stimulate their memory (53.3%). Regarding the robot functions, the cognitive stimulation programme earned the highest proportion of positive responses (83.3%), followed by the safeguarding functions, fall detection (66.7%) and the automatic help call (63.3%). Conclusion: In sum, the elderly need more practical support with everyday tasks. They would like that the robot provides daily activity support and serves as a telesurveillance system that increases the sense of safety and security in case of emergency.

**PB8 351 PATHOLOGIES, GERIATRICS SYNDROMES, FUNCTIONALITY AND COGNITION IN GERIATRICS HOSPITAL.**

S. CASTRO\* (National Institute of Geriatrics, Santiago, Chile)

V. VIDAL(1), M. MERONI(1) - (1) National Institute of Geriatrics (Santiago, Chile)

**Pathologies geriatrics syndromes functionality and cognition at Geriatric Hospital Type of study:** observational retrospective study. **Purpose:** There are few studies that make mention to the type of patients that enter the geriatric hospital for medical service. In this study, the geriatric biomedical pathologies have been analyzed, as well as the most common syndromes, the functionality and the cognition of a simple entered in a limited period of time. **Material and method** observational retrospective study this includes 107 patient, older than 60 years old, between the month October and December 2008, registering the geriatric pathologies and evaluations in agreement with the preestablished guidelines. It analyzed the type, functionality, nutrition, and cognitive state of each one of the patient. **Result:** the average age of the hospitalized patient was 79 years old of which 67.2% were women. The most frequent pathologies were the cardiovascular with a 76%, arterial hypertension, 27 % diabetics, 27% cerebral vascular accidents, and those with the least frequency were obesity with 7 %, 5 % epilepsy, and 4% Parkinson disease. Of those most frequent geriatric syndromes were polypharmacy with 45 %, 43 % of dementia, 29% of dismobilism. The least frequent syndromes were acute confusion with 7 % and 2% social cases. **Conclusion:** the evaluation of those that enter this hospital is useful to set the steps of Action that capture the fragility present in these patients and better the quality of attention.

**PB8 352 TOKYO METROPOLITAN GERIATRIC HOSPITAL AUTOPSY RESOURCE (TMGH-AR)**

M. SAWABE\* (Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology, Tokyo, Japan)

T. ARAI(1), Y. SAITO(1), T. SHIMIZU(1), T. TODA(1), S. MURAYAMA(1), M. TANAKA(1), K. TAKUBO(1), M. MIENO NAKA(2), N. TANAKA(3) - (1) Tokyo Metropolitan Geriatric Hospital and Institute of Gerontology (Tokyo, Japan); (2) Jichi

Medical University (Tochigi, Japan); (3) Harvard School of Public Health (Boston, United States of America)

[Introduction] To collect human samples, we usually explain the purpose and expected results of planning research to the donors giving blood or other kinds of samples before taking informed consents from them. However, we seldom inform them of the consequences or results of the research. During recent decades, we have been conducting numbers of medical researches using TMGH Autopsy Resource. We have now opened its web site since this April for three reasons: disclosure of research results, proposal for new research collaboration, and communication with the bereaved families who gave us the consent of autopsy. [Methods and materials] TMGH Autopsy Resource comprises of clinicopathological database, photos, and paraffin blocks (7,500 cases, each); frozen tissues and DNA (2,000 cases); and frozen sera taken within two weeks before death (1,800 cases). The brain and spinal cord are registered to "Brain Bank for Aging Research". The average age at the time of death was 80 years, and a man to women ratio was 1.2. The Act of Autopsy Examination in Japan generally allows the use of autopsy samples for medical education and research. We follow the national guidance for use of human materials for genetic researches. [Results] The home pages comprise of several pages; introduction of research results, ethical and juristic consideration, communication with the bereaved families, characteristics of TMGH Autopsy Resource, proposal of new collaboration, rule of collaboration program, contributor and contact address, and web links. We have been showing more than 30 research results conducted in recent five years. At the page of communication with the bereaved families, we express great appreciation to them and provide a contact address if they wish to reject the continued usage of autopsy samples for medical research. [Conclusion] The new web site provides detailed information of TMGH Autopsy Resource, promotes research collaboration, and improve the ethical framework.

**PB8 353 PRELIMINARY STUDY ON MUSCLE LOAD IN THE UPPER BODY REGIONS WHILE USING A FOUR-WHEELED WALKER**  
N. SATO\* (Kinki University, Osaka, Japan)

Introduction A four-wheeled walker is a common assistive device for older people whose muscle strength and balance deteriorate with age. According to statistics on assist devices sales, about 380,000 four-wheeled walkers were distributed to Japanese market in 2006. However, relatively a small number of studies have investigated to evaluate muscle load while using a four-wheeled walker. The purpose of study was to evaluate the effect handlebar angle of a four-wheeled walker on muscle load while walking with the walker. Methods and materials Ten women (aged 65-84) participated in this study. Four different types of handlebars (L-shaped, U-shaped with 45 degree downward angle, U-shaped with no downward angle, and straight types) were used, replacing those bars to the body of the four-wheeled walker. Participants walked on the inclined plate (inclination level was 1:20) and on the flat floor for 4m with the walker. To evaluate muscle load, surface electromyography (EMG) was derived from the right-sided extensor digitorum communis, pectoralis major, deltoideus and latissimus dorsi while walking with the walker. EMG signals were digitized at a sample frequency of 1kHz. Results A 4 (angle) ? 2 (inclination) repeated measures of ANOVAs did not reveal significant main effects for angle or inclination in muscle load. However, significant angle-by-incline interaction was found for muscle load of digitorum communis and pectoralis major. On the inclined plate, the muscle activity level of digitorum communis was greater during using the L-shaped handlebar than using the other handlebars while it did not change remarkably with the angle on the flat floor. Similar trend was found for the muscle activity level of pectoralis major with using the handlebars on the inclined plate. Conclusion Results of this study suggested the need to consider the effects of handlebar angle of the four-wheeled walker on muscle load during walking on ramps.

**PB8 354 ATTITUDES, ADAPTIVITY AND ADOPTION: THE USE OF TECHNICAL INNOVATIONS IN LATER ADULTHOOD**  
B. WILLIGER\* (University Erlangen-Nuremberg, Erlangen, Germany)  
K. STEFAN(1), L. FRIEDER(1) - (1) University Erlangen-Nuremberg, Institute of Psychogerontology (Erlangen, Germany)

Technical innovations provide new potentials for independent living, health, communication and mobility in aging societies. However, recent studies suggest that potential older users often do not adopt new technological solutions of everyday challenges. As a result of such observations, research has focussed recently on issues related to accessibility, usability, and utility of new assistive technology in later adulthood. We argue that products and services for seniors need to adequately account for age-related change, heterogeneity and multiplicity in later life. We propose an ecological framework of the interplay between technical innovations and potential older users. The model states that the requirements of technical solutions (e.g. complexity, user interface, functional range) need to be in line with sensory, physical, cognitive and conative capacities of older users and maximize subjective benefits of use. Regarding conative capacities, first wave results of a one year longitudinal study with older adults ( $n = 136$ ;  $M = 67.33 \pm 5.53$ ) suggest that positive attitudes ( $r = .462$ ,  $p < .000$ ) as well as distrust ( $r = -.215$ ,  $p < .05$ ) towards technical innovations relate to the use of modern technologies. Moreover, technical openness correlates with the self-reported use of adaptive strategies in terms of selection, optimization and compensation ( $r = .242$ ,  $p < .01$ ). Further examination of the subscales

underlines the impact of compensatory mechanisms ( $r = .220$ ,  $p < .01$ ). Results confirm theoretical considerations that technical openness is an important resource for the use of adaptive strategies (e.g. compensation of functional losses through the adoption of assistive devices). Further research will help to improve our understanding of the sensory, physical, cognitive and conative factors that predict the use of technical innovations.

**PB8 355 USEFULNESS OF AN ASSISTIVE ROBOT IN AGING MANAGEMENT**  
V. FAUCOUNAU\* (Hopital Broca, PARIS, France)  
Y. WU(1), M. MAESTRUTTI(2), F. GZIL(3) - (1) Hopital Broca (France); (2) GET-INT (France); (3) IHYST (CNRS/ENS/Paris-1) (France)

Introduction: Aging in home becomes difficult because of physical and cognitive deficiencies. In such conditions, many old people need aides to perform daily activities. With advances in technology, robotics becomes increasingly important as a means of supporting older people at home. The goal of this study was to collect the old people's cognitive deficiencies and their opinions towards the presence of a robot which delivers specific services (appointment and drug reminder, web conference, televigilance, cognitive stimulation) in home. Methods and materials: We conducted a focus group with five persons aged from 63 to 88 years, living alone and suffering from mild cognitive impairment. Firstly, they were questioned orally about their cognitive impairment in the daily life and their strategies. Secondly, we showed them pictures with electronic devices (agenda, pills deliver, and computerized cognitive exercises). Thirdly, the robot entered in the room and they had a demonstration of the different functionalities of the robot. We collected their verbal reactions. Results: The difficulties and strategies they reported are those usually met in people with mild cognitive impairment. The more exciting observation was their reactions towards the robot. Initially, the persons rejected the robot, considered it as a source of intrusion, a loss of privacy and of human contact. Subsequently, they found it interesting with the function of cognitive stimulation and attractive on economical level (less expensive than employing part-time or full-time personnel). They recognized some usefulness later on when their health conditions will worsen. Conclusion: The way they perceive their future ageing emerged to influence their opinion about the robot. People who worry about cognitive weakening said it would be desirable to appropriate them with this kind of device before the aggravation of their cognitive impairment.

**PB8 356 ADDRESSING COGNITION NEEDS IN THREE EUROPEAN COUNTRIES WITH THE HELP OF TECHNOLOGY**  
E. URDANETA\* (FUNDACIÓN INGEMA, San Sebastian, Spain)  
C. BUIZA(1), M. GONZALEZ(1), D. FACAL(1), A. GEVEN(2), N. HÖLLER(2), M. TSCHELIGI(2), L. POLIMENAKIS(3), J. SOLDATOS(3), T. PETSATODIS(3), J. YANGUAS(1) - (1) Matia Gerontological Institute Foundation- INGEMA (San Sebastian, Spain); (2) CURE – Center for Usability Research and Engineering (A-1110, Austria); (3) Athens Information Technology - AIT (Greece)

INTRODUCTION: HERMES is a European project aimed at providing cognitive care to healthy elderly people through an assistive technology based on intelligent audio and visual processing and reasoning. In order to study older people's needs and opinions about technology, user requirements studies were conducted. Results from questionnaires collected in Spain, Austria and Greece are presented. METHODS - MATERIALS: An ad-hoc questionnaire was developed including three areas: sociodemographics, needs about information to be reminded and experience with technology. Questionnaire combined quantitative and qualitative data and was easy to understand by elderly people. 99 older adults (23 males and 76 females) completed it: 57 from Spain; 32 from Austria and 10 from Greece. Mean age was 70.7 years old in Spain, 69.5 in Austria and 71.4 in Greece. RESULTS: The most visited socio-sanitary service was the primary care doctor in the three countries. Most of the participants reported to have moderate memory problems (72.5% in Spain, 83% in Vienna, 50% in Greece). The 75.6% of them are interested in a device to play cognitive games. The interest is minor in a device able to remind interesting places. On the characteristics of technological devices to be developed, utility is perceived as the most important feature in the three countries, followed by simplicity, and finally aesthetics. CONCLUSIONS: Healthy older adults present subjective memory complaints in daily life, represented here by a high percentage of participants reporting moderate memory problems. The majority of them would like to include memory games into a technological supportive device, to combat these issues. Main elements for acceptance are that devices are to be easy to use and based on previous experience; otherwise they would not be appreciated. Research on this topic may help to turn the challenges of technologies in an ageing population into changes in cognitive lifespan development.

**PB8 357 CHARACTERISTICS OF SOCIO DEMOGRAPHIC AND HEALTH AMONG ELDERLY WITH HYPERTENSION**  
D. TAVARES\* (University Federal of Triângulo Mineiro, Uberaba - Minas Gerais, Brazil)  
M. DINIZ (1), F. DIAS(2), L. RODRIGUES(3) - (1) University Federal of Triângulo Mineiro (Uberaba - Minas Gerais, Brazil); (2) University Federal of Triângulo Mineiro

(Uberaba - Minas Gerais, Brazil); (3) University Federal of Triângulo Mineiro (Uberaba - Minas Gerais, Brazil)

**Introduction:** Among the degenerative chronic diseases Hypertension is one of the most that affect the population, being its prevalence between 22% to 44% among Brazilian cities. In the elderly population this rate increase to 60%. In this perspective, knowledge of socio-demographic and health characteristics of this population contributes to the planning of actions in health. **Objective:** To compare the number of morbidities, practice of physical activity and use of medication between genders and age groups. **Methodology:** This is a cross sectional household survey, conducted with 1,603 elderly residents in the urban area of Uberaba, Minas Gerais, Brazil. Data collection was conducted through interviews in homes, selected through systematical proportional stratified sampling technique. The data were typed in double entry, in the electronic program EpiInfo3.2., and subjected to descriptive analysis and chi-square test ( $p < 0.05$ ). The Project was approved by the Research Ethics Committee. **Results:** Among the interviewees, 69.8% were female, 52.1% are aged between 60 and 69 years, 74.5% live at home with companion, 53.8% have income of 1 minimum wage and the mean of years studied was 5.23 years ( $\pm 13.6$ ). The majority (94.9%) made regular use of drugs, 36.4% have by 4 to 6 morbidities, 54.9% do not practice physical activity and 47.5% consider their health regular. The comparison between the genders showed that the use of medication, the number of morbidities and the absence of physical activity is higher among women. When comparing the age groups it was found that the elderly of 80 years and over have more morbidities and do less physical activity and that those between 70 to 79 years join better to drug treatment. **Conclusion:** From these results occurs the need to discuss health care and implementation of prevention and promotion's actions aiming at the improving treatment adherence, self-care and quality of life.

**PB8 358 TECHNOLOGY, HUMAN RELATIONSHIPS, AND PRIVACY**

L. LORENZEN-HUBER\* (Indiana University, Bloomington, IN, United States of America)  
M. BOUTAIN(1), W. ROGERS - (1) Indiana University (Bloomington, United States of America)

Background Emotional and physical well-being for elders and their caregivers can be supported by new technologies. Research in the U.S. suggests that older adults welcome technology perceived as useful, prefer human contact and care, and are somewhat unconcerned about privacy. A life course perspective, including psychological and sociological theories of very late life, can give insight on older adults' perceptions of technology, human relationships, and privacy. Method In a series of focus group sessions, over 75 community-residing elders with an average age of 80 were shown prototypes which support health, safety, daily activities, and social communications. They were then asked questions based on a literature-based privacy framework. Data analysis identified themes including "technology replacing personal care or self-sufficiency," "intrusions on privacy of caregivers," "trade-offs between personal privacy and independence," and "complacency and compliancy." Results Results suggest that the oldest old and women are more concerned about burdening family caregivers and doctors with unnecessary information than with invasions of their own privacy. They were complacent about most challenges to personal privacy, accepting an (unnecessary) tradeoff between personal privacy and independence. They did not want technology to replace their own self-sufficiency or human contact: "Humans give the best care." Conclusion Psychological and sociological theories of very late life suggest that the oldest old select and prioritize the most important relationships and activities. Adults in the Fourth Age of life may be more concerned about the privacy of their caregivers than their own because of the perceived value of relationships with caregivers. The oldest old and women expressed complacency and compliancy, willing to unnecessarily give up personal privacy to uninformed design. We need more contextualized, sensitive privacy designs that are informed by a life course perspective of the needs and values of individual older adults and their caregivers.

**PB8 359 DEVELOPMENT OF A HOME-BASED GRIP-FORCE MEASUREMENT SYSTEM TO MEASURE THE CAPACITY OF ELDERLY TO LIVE AUTONOMOUSLY**

D. HEWSON\* (Université de Technologie de Troyes, Troyes, France)  
K. LI(1), J. HOGREL(2), P. DEJARDIN(3), J. DUCH NE(1) - (1) Université de Technologie de Troyes (Troyes, France); (2) Institut de Myologie (Paris, France); (3) Les Arcades (Troyes, France)

**Introduction** Recent developments in information and communication technology have enabled functional assessment of the elderly to be performed in their own homes. The use of such devices enables elderly to remain longer in their own homes, thus improving their psychological well-being, as well as delaying functional decline. One of the most useful indicators of the capacity to live autonomously is grip force, which can provide information on muscular capacity, as well as dexterity. Grip-force is a highly reproducible measure, and as such could be suitable for home-based assessment. The aim of the study was to develop a home-based grip-force tester as a means of detecting a loss of the capacity to live autonomously in the elderly. **Methods and materials** A home-based system must be autonomous, with low-energy consumption. In addition, the device must be accepted by the elderly user, and must not require the presence of anyone to operate the

device. The device must also be communicant, and, if possible, resemble an everyday object. **Results** The Grip-Ball, a home-based grip-force system was developed. The Grip-ball contains a sensor that measures the force applied by the user during the measurement protocol. The force signal is then automatically sent via wireless communication to a mobile phone, which in turn relays the signal to a distant server for subsequent analysis. The parameters obtained from the device include maximal grip-force, as well as innovative parameters related to the control strategy of the force production of the elderly user. **Conclusion** The Grip-Ball is an autonomous system that enables the capacity of elderly to live autonomously to be measured regularly, without requiring a tester to be present. The addition of other home-based measurement systems for gait and balance quality, as well as activity levels offer the perspective of a precocious detection of frail elderly.

**PB8 360 THE ROLE OF ECHOSCLEROSIS IN GERIATRIC PRACTICE.**

M. CHAHIM\* (APHP -Hôpital Corentin Celton, Issy les Moulineaux, France)  
M. SALOM(1), A. LEZY MATHIEU(1), S. SOUCHON(1), D. MIRIC(1), E. ATTAN(1) - (1) Corentin Celton (France)

Echosclerosis is one of the techniques available for the treatment of incompetence of the saphenous veins and their tributaries but it is not widely used in a geriatric environment. However, venous insufficiency and its complications are common pathologies of the elderly subjects and can become a cause of invalidism and eventually compromise patient autonomy. This technique is an effective, non invasive and low cost alternative to classical surgical methods, often contraindicated in the elderly, and is also avoids hospitalisation and immobilisation. Complications are rare (local and allergic inflammatory reactions).

**PB8 361 CROSS-CULTURAL ADAPTATION, RELIABILITY AND VALIDITY OF THE PERSIAN VERSION OF THE MODIFIED FALLS EFFICACY SCALE**

Z. MOSALLANEZHAD\* (Karolinka Institutet, Tehran, Islamic Republic of Iran)  
M. SALAVATI(3), K. HELLSTRÖM (4), L. NILSSON WIKMAR (1), K. FRÄNDIN (1) - (1) Karolinska Institutet (Stockholm, Sweden); (3) 3. Department of Physiotherapy, The University of Social Welfare and Rehabilitation sciences (Teheran, Islamic Republic of Iran); (4) 4. Division of Physiotherapy, Department of Neuroscience, Uppsala University (Uppsala, Sweden)

**Introduction** Among the main psychological consequences of falls in elderly people, that can be as disabling as the fall itself, is loss of confidence and fear of new falls. To assess the self confidence, the most valid and reliable instruments are the Falls Efficacy Scale (FES) and its modified versions. The aim of this study was to translate the Swedish version of the FES, FES(S), into Persian, and to determine cross-cultural validity and reliability of the scale to be used for Persian speaking elderly persons. **Methods and Material** The 'forward-backward' procedure was applied for the translation. Then a methodological study was carried out to determine the psychometric properties of the Persian version of the FES. A quasi-experimental method was used to evaluate the validity and reliability of the scale, and the final draft of the scale was administered to a study sample, consisting of 81 community-dwelling elderly persons,  $\geq 65$  years old. **Results** Reliability and validity of the Persian FES(S) were found to be acceptable (Cronbach's Alpha= 0.75, ICC=.99 &  $p < .001$  and SEM=1.82). The results showed also significant negative correlations of the total score of the scale with the age of the participants, number of walking days per week and number of falls in the past year. There were also positive correlations between the Persian FES score and MMSE score, duration of walks and self-rated physical fitness. The groups who had a daily walk, felt healthy and had no fall in the past year rated their self-efficacy higher than their peer groups. **Conclusions** The present study verified that the Persian FES (S) is a culturally relevant, valid, and reliable tool for measuring self-perceived confidence in Iranian older adults. This was reflected in a good internal consistency of the items, high test-retest reliability and good construct validity.

**PB8 362 SHOUTS IN THE DEMENTED ARE NOT ALWAYS ANXIETY**

P. RUMEAU\* (CHU Toulouse, Toulouse, France)  
M. PINAR(1), F. STEENKESTE(2), H. VILLARS(3), B. VELLAS(3) - (1) CCAS Toulouse, Pierre Ducis (Toulouse, France); (2) Gerontechnology Lab, Gerontopole, CHU Toulouse (Toulouse, France); (3) Pole gériatrie, Gérontopole, CHU Toulouse (Toulouse, France)

**Introduction** Seizure are a common condition in late stage dementia patients but may remain unnoticed. Population and method Mrs. B., 82 years old, living in a nursing home, has a Lewy bodies disease diagnosed 7 years ago and is bedridden. She was shouting in an unpredictable way and the staff thought of some anxiety. Her bed was fitted with a quiritchromometer, it gives an automated quantification of shouting activity and physical agitation in minutes for each hour in the day. Observation Shouts would come at random, between once and three times a day, last for 2 to 3 minutes then stop. We decided to take her for a day at the out patient clinic for close monitoring; we could observe and film that, during the time she shouted, she fully lost contact, was taking her right arm from right to left swiftly before bringing it back slowly to the right in a most stereotypic way. We started a treatment for supplementary motor area of frontal lobe epilepsy and soon could register, with the quiritchromometer, the decrease and disappearance of shouts and the cognitive

status of the patient improved with better communication with the staff. Discussion The quiritachronometer helped in showing a random shouting activity but with a rather constant duration. There was none of the physical agitation that is usually associated with shouting in case of anxiety and duration was too short. On the other hand, shouts sprouts related to delirium are more varied in duration. A closer look confirmed that a different diagnosis should be considered; i.e.: epilepsy. Conclusion The quiritachronometer helped in the diagnosis of supplementary motor area of frontal lobe epilepsy and verified the efficiency of the treatment.

**PB8 363 MIRAS A ROBOTIC WALKING AID TAILORED FOR THE HANDICAPPED ELDERLY PERSON**

V. PASQUI\* (ISIR, Paris, France)

P. RUMEAU(2), S. MOULIAS(1), F. PIETTE(3), P. DECQ(4), B. VELLAS(2), P. BIDAUD(5) - (1) APHP, Hôpital Ambroise Paré (Boulogne Billancourt, France); (2) CHU Toulouse (Toulouse, France); (3) Hôpital Charles Foix, APHP (Ivry sur Seine, France); (4) Hôpital Henri Mondor, APHP (Créteil, France); (5) ISIR, Paris6 Jussieu (France)

Assistive robotics are developing worldwide targeting elderly handicapped people. Intelligent walkers provide both obstacle avoidance and a walking aid. Lacey's Guido was tested by the Veterans Administration in the USA; both there and in Ireland it proved very useful for elderly people with sighting and walking problems but production costs proved to high for it to be affordable. KAIST developed a robot with more carrying power that could fit people with less strength in their legs, it was clinically tested and improved but was still quite cumbersome. We developed Monimad as a walking aid with robotized handles with an haptic command that could help elderly people who could walk but needed help to stand. We could prove that it worked with patients we recruited in Charles Foix Geriatric University Hospital, Paris. But the robot was not satisfying in terms of size and stability. Miras project, funded by French Agence Nationale de la Recherche, is developing a reduced cost walking aid with a standing aid included. The modular approach will allow further developments to include at low additional cost relevant monitoring and communication devices. Man-machine interfacing aspects will be integrated from the start in the developments as well as usability. Miras will be developed using Lacey's iterative methodology in collaboration with two major geriatric university hospitals and one major walk analysis lab. We hope to prove that integrating geriatric knowledge from the conception in assistive robotics projects may provide useful and affordable aids for the handicapped elderly person.

**PB8 364 STRESS AND COPING EXPERIENCED BY OLDER ADULTS CHALLENGED BY DENTAL IMPLANT SELF-CARE**

J. DUBE\* (University of British Columbia, Vancouver, Canada)  
S. BRYANT

Objective: The provision of dental implants to replace missing teeth for older adults is increasing and we know dental implant prostheses involve substantial challenges with long-term maintenance. This study aimed to explore older adult perceptions of such challenges in the light of literature on stress and coping and the common disabilities associated with aging. Methods: Semi-structured interviews were conducted with six elderly adults over the age of 70 to explore the long-term challenges they experienced with dental implant maintenance. Each participant presented with an oral prosthesis supported by a minimum of five dental implants placed more than 5 years prior. Emerging themes were identified in verbatim transcripts of the audio-taped interviews, and theoretical constructs were used to develop a conceptual framework. Results: Overall functional and psychosocial experiences with the prosthetic rehabilitation were positive. Initially participants also perceived challenges on a physical level such as difficulty in accessing compromised areas to clean their dental implant prostheses or accessing professional care to manage urgent problems with the prostheses while traveling abroad. However, further scrutiny of these challenges identified psychological and social challenges that sometimes included feelings of embarrassment, frustration, disappointment and disillusionment. Various management or coping strategies utilized by the participants were identified, such as avoidance, disengagement, intellectualization and rationalization. Conclusion: This investigation suggests that further exploration on management or coping strategies can reveal new insights for patients, practitioners and researchers to better understand the subjective challenges experienced by the aging elderly dental implant patient.

**PB8 365 DEMENTIA IN THE ASIA PACIFIC AN INDONESIAN VIEW**

T. SETIABUDHI\* (Trisakti School of Management, Jakarta Barat, Indonesia)

In 2005, there were 13.7 million dementia cases and, by 2050, the number is expected to reach an enormous 64.6 million. When ADI's Director, Marc Wortman, visited Indonesia in 2008, he stated that Indonesia should be prepared for an increase of dementia cases. With a population of more than 200 million, Indonesia would face a challenging situation when the majority of its population reaches old age. Given the forecast of a global upsurge in dementia cases of nearly 500 percent as well as the challenging condition that Indonesia will face, the Indonesian Association of Alzheimer (and related Diseases) (AAZI) is trying

to anticipate the situation. This paper will present some data which was presented in Singapore at ADI's annual meeting and the latest discussion and findings in 2009.

**PB8 366 PROFILE OF ELDERLY PATIENTS HOSPITALIZED IN AN ACUTE GERIATRIC UNIT COMING FROM REANIMATION**

C. THOMAS\* (Hôpital Saint Antoine, Paris, France)  
J. BAY(1), G. COSQUERIC(1), V. BELLAMY(1) - (1) Unité de Geriatrie Aigue - hôpital Saint Antoine (Paris, France)

In 2004, following the ministerial recommendation inciting all hospitals with emergency department to have an acute geriatric unit, the hospital Saint Antoine in Paris opened a unit of 16 beds for people over 75 years old hospitalized from emergency unit. Four hundred and twenty people have been hospitalized in 2007 in this unit among whom 34 were coming from reanimation. We wondered who these elderly patients admitted in reanimation were. Would they be the same patients that the ones that we admitted in the unit via emergency or would they be much heavier? Results: The mean age of this population was 83 y.o. [70-96] versus 87 y.o. in the unit. The mean stay in reanimation was 5.65 days [2-15]. Motive of hospitalization in reanimation: 40% a hypercapnia or a severe hypoxia, 20% had a neurologic pathology (Poisoning medicinal voluntary, crisis subintubant), 20% an acute renal failure and 20% a bacteraemic or cardiogenic shock. 30% of them needed an intubation and 15% a non-invasive ventilation. Before hospitalization, 95% were living at home, alone. They were all without disability but six of them had mild cognitive impairment. In the acute geriatric unit this population stayed an average of 15.5 days [1-40] whereas the average stay in the unit is 13.8 days. The outcome of this population was similar to the other admitted patients: 55% went to a physical rehabilitation department, 35% went back home, 9% died in the unit. Conclusion: old and very old patients are admitted in reanimation department since their functional and cognitive status is good. Once hospitalized in acute geriatric care, their outcome is no different to the other patients.

**PB8 367 MORTALITY AND PROGNOSTIC FACTORS IN ELDERLY PATIENTS ADMITTED IN A MEDICAL INTERMEDIATE CARE UNIT**

A. DUQUE\* (São Francisco Xavier Hospital, Western Lisbon Hospital Centre, Lisboa, Portugal)  
J. SILVESTRE(1), P. FREITAS(1), G. CARDOSO(1), D. FERNANDES(1), A. SOUSA(1), J. GUIA(1), J. PEREIRA(2), V. BATALHA(1), L. CAMPOS(1) - (1) Medicine Department IV, São Francisco Xavier Hospital, Western Lisbon Hospital Centre (Lisboa, Portugal); (2) Medical Intensive Care Unit, São Francisco Xavier Hospital, Western Lisbon Hospital Centre (Lisboa, Portugal)

Introduction: As a result of population ageing, there is an increasing prevalence of elderly admitted in hospital, not only in medicine wards but also in more differentiated units such as the Medical Intermediate Care Units (IntCU). Age should not be exclusively considered a prognostic factor; instead physiologic scores reflecting multiorganic failure and illness severity should be used. The aims of this study were to evaluate elderly patients mortality in a IntCU of a central hospital and identify prognostic factors, comparing with non-elderly patients. Methods and materials: During 8 months all patients admitted in a IntCU were prospectively included and categorized into 2 groups: A-elderly ( $\geq 65$  years) and B-non-elderly. The illness severity scores Acute Physiology and Chronic Health Evaluation II (APACHE), Simplified Acute Physiology Score II (SAPS) and Sequential Organ Failure Assessment (SOFA) were determined in the first 24 hours of admission. Charlson comorbidity index (CI) was also determined. Results: 92 patients were included, 53 (57.6%) in group A and 39 (42.4%) in B. The average values of APACHE II, SAPS II and SOFA were: Group A: 16.5, 39.0 and 5.5; Group B: 9.9, 21.5, 4.6, respectively. The average score of CI was 4 in group A and 2 in B. In group A, the areas under the receiver operating characteristic curves for hospital and IntCU mortality assessed through APACHE II, SAPS II, SOFA and CI were lower than 0.7. There was no statistically significant difference in IntCU and hospital mortality between 2 groups (A-7.5% vs B-5.1% and A-15.1% vs B-7.7%, respectively). Conclusion: Age  $\geq 65$  years was not a predictive factor of mortality. The validated physiologic scoring systems commonly applied in critical patients are not reliable predictors of hospital mortality in elderly patients. New severity illness and mortality scoring systems are needed to elderly patients.

**PB8 368 ELDERLY PATIENTS IN AN INTENSIVE CARE UNIT: OUTCOME BASED ON REASON FOR ADMISSION**

F. KYRIAKOU\* (EVANGELISMOS HOSPITAL, VRILISSIA, Greece)  
M. KYRIAKOPOULOU(1), C. KOLLAS(1), C. ROUSSOS(1), A. KOUTSOUKOU(1) - (1) 1st Critical Care Department and Pulmonary Services, Evangelismos Hospital, University of Athens Medical School (Athens, Greece)

Introduction Advanced age seems to be related with increased mortality in ICUs. Nevertheless, the reason for admission may influence prognosis. Methods and materials We retrospectively assessed the outcome based on the reason for admission (medical or surgical) in elderly patients (65 years or older), in a multidisciplinary ICU. As surgical, we considered post-operative conditions and multiple trauma and as medical, we considered all the other reasons for admission. We compared the outcome between 2 groups of elderly

patients, the first group was hospitalized in 1997-1998 (12 ICU beds) and the second in 2007-2008 (10 ICU beds). Results During the two years of the past decade, 252 elderly patients were admitted in the ICU, mean age ( $\pm$ SD) 73  $\pm$ 6 years, whereas during the similar time period of the recent decade, 181 elderly patients were admitted, mean age 74  $\pm$ 6 years. The reasons for admission were medical in 42.8% and surgical in 57.2% of the patients in the past decade, whereas they were medical in 32% and surgical in 68% of the patients in the recent decade. In the past decade ICU mortality amounted to 41.7% and 27.1% in the medical and surgical group correspondingly ( $p=0.015$ ). In the recent decade, ICU mortality was 46.6% and 30.1% in the medical and surgical group ( $p=0.31$ ). Conclusion ICU survival was significantly better for elderly patients with surgical reasons for admission compared to medical reasons in the past decade, but not in the recent.

**PB8 369 IMPACT OF AN ACUTE GERIATRIC CARE UNIT IN A POOR COMMUNITY HOSPITAL IN TIJUANA BAJA CALIFORNIA MEXICO.**

C. ZUNIGA\* (Hospital General de Tijuana, Tijuana, Mexico)

E. VAZQUEZ(1), H. GALLEGOS(1), S. MEJIA(2) - (1) Hospital General de Tijuana (Tijuana, Mexico); (2) Colegio de la Frontera Norte (Tijuana, Mexico)

Introduction Mexican elderly population has increased from 3% in 1930 to 8% in 2005, but less than 10% of hospitals have a geriatric service. There is little information on the impact of such units in developing countries community hospitals. In Tijuana's general hospital in 2007 we opened the geriatric acute care unit (GACU) in an attempt to better the quality of care of our frail elderly patients. In this study we evaluate the impact of this unit. Methods and Materials We conducted a prospective, comparative, observational study in patients over 70 years of age that were hospitalized in the internal medicine unit from March to December 2006 (group A) with patients hospitalized in the GACU from March to December 2007 (Group B). We evaluated their admission diagnosis, functional status (Katz and Lawton scales), cognitive status (MMSE Spanish version) the presence of delirium (CAM), depression (GDS), discharge diagnosis and placement, and their final outcome. We conducted descriptive and comparative statistical analysis. Results One hundred and forty two patients (52 % women) were included in group A and 236 (58% women) in group B. The mean age of the subjects was 74 years in both groups. Mortality decreased from 17.6% to 7.62% ( $p=0.003$ ), hospital length from a mean of 6.6 days to 4.3 days ( $p=0.001$ ), readmissions decreased from 5.6% to 1.27 ( $p=0.03$ ). Number of diagnosis increased from 1.8 per patient to 5.88 ( $p=0.0001$ ). There was no difference in placement after discharge between the two groups. Conclusion The GACU has had a positive effect on mortality, length of stay, diagnosis and readmissions. We have still to demonstrate its impact on functional decline and costs. We conclude that a GACU is beneficial in "poor" community hospitals in developing countries.

**PB8 370 MANAGEMENT OF VERY OLD CRITICALLY ILL PATIENTS IN A SPECIFICALLY DEDICATED INTENSIVE CARE UNIT**

J. DEIBENER-KAMINSKY\* (Centre Hospitalier Universitaire de Nancy, Vandoeuvre les Nancy, France)

J. DELOBELLE(1), C. LECLAIRE(1), S. BLUMSTEIN(1), A. BENETOS(1) - (1) Centre Hospitalier Universitaire de Nancy (Vandoeuvre les Nancy, France)

Introduction. Very old patients in critically illness are often not considered for intensive care, on the back of statement such as "he won't tolerate it" or "do not intubate" (DNI). However, old patients may support appropriate intensive treatment. We report the results observed in patients admitted in a specific geriatric intensive care unit (GICU). Methods and material We have collected the clinical history, premorbid conditions, and clinical outcome in all patients admitted in GICU during 1 year. The unit disposes of all materials necessary to treat critically ill patients, excepted for mechanical ventilation and invasive pressure monitoring. Admission criteria are one or more acute visceral failure. Results The mean age was 83.2  $\pm$  9.1 years, sex ratio 3F/2M. Symptoms presented at admission were acute respiratory failure in 44.4% of cases (COPD exacerbation 26%, severe pneumonia 18%, pulmonary embolism 4%), acute cardiopathy in 16% (congestive heart failure 8.6%, ischemic heart disease 6%), cerebrovascular disorders in 14.8% (stroke 11.6%, epilepsy 3%), acute renal failure in 9.9%, septic shock in 8.6%, digestive haemorrhagia in 6.1%. Simultaneous complications were 4.2/patients, including cardiac disorders in 80.6% of patients (rhythm abnormalities 45.1%, congestive heart failure 35.8%), respiratory failure in 53.1%, renal insufficiency in 27%, infectious complications in 19.8%, diabetes mellitus in 29%. One third of the patients had « DNI » orders and were treated with noninvasive positive pressure ventilation. Mortality rate was 15% and the length of GICU stay was 11.5 days. Conclusions Patients admitted in GICU are characterized by advanced age, by severe illness, especially acute respiratory and cardiac disorders, and by number of associated complications. Nevertheless, mortality rate remains reasonably low. These results are explained by age-related management with particular attention to nursing, drug dosage and posology, and quality of nutrition, requiring experience of clinical geriatricians.

**PB8 371 A PROGRESSIVE HYPERCAPNIC HYPOXEMIC DYSPNEA AFTER SURGERY**

J. DEIBENER.\* (Centre Hospitalier Universitaire de Nancy, Vandoeuvre les Nancy, France)

L. CLÉMENT(1), J. DEIBENER-KAMINSKY(1), J. DELEMAZURE(2), M. LAURAIN(1), A. BENETOS(1) - (1) Centre Hospitalier Universitaire de Nancy, Department of Geriatry (Vandoeuvre les Nancy, France); (2) Centre Hospitalier Universitaire de Nancy, Department of Cardiology (Vandoeuvre les Nancy, France)

Introduction Differential diagnosis of postoperative dyspnea includes numerous disorders and rigorous diagnosis procedure is necessary to identify a lifethreatening cause. We report the case of a 88-year-old patient presenting with progressive dyspnea after a hemorrhagic surgery. Methods and material To report the case of a 88-year-old patient treated with antiplatelet for coronaropathy, who benefits from osteosynthesis for a femoral neck fracture. A postoperative extensive hematoma induces acute anemia necessitating transfusion of 17 units of red cells over 7 days. She is admitted in intensive care unit because of progressive worsening dyspnea. Results At admission, the patient presents with NYHA III dyspnea, vital parameters are normal (TA : 12/6, cardiac frequency 80/min) and clinical examination is negative. Pulmonary radiography, electrocardiogram, echocardiography and pulmonary scintigraphy are normal. Hemoglobin level is 11.4g/dl, arterial blood gas analysis (ambient air): pH 7.48, pCO<sub>2</sub> 49 mmHg, pO<sub>2</sub> 66 mmHg, bicarbonate 36 mmol/L, SaO<sub>2</sub> 95%. Biochemical analysis in blood shows: Na+ 138 mmol/L, K+ 3.6 mmol/L, Cl- 99 mmol/L, creatinin 6.6 mg/l, urea 0.58 g/L, calcium 79 mg/L. Urine analysis/24h shows: Na+ 56 mmol, K+ 27mmol, Cl- 80 mmol. This results are compatible with metabolic alkalosis. We suspected an overload in calcium citrate due to massive transfusion. Treatment with acetazolamide, 500mg/day during three days results in dramatical clinical improvement and correction of blood gas: 7.42, pCO<sub>2</sub> 44.7 mmHg, pO<sub>2</sub> 76 mmHg, bicarbonate 28, SaO<sub>2</sub> 96% Discussion Since the patient was not ventilated, respiratory acidosis compensated by bicarbonate retention can be excluded. The patient did not receive diuretics and she has no digestive trouble or hypovolemia excluding direct or indirect H+ loss. The diagnosis of metabolic alkalosis due to excessive alkaline infusion remains the only hypothesis and massive transfusion is the diagnosis key.

**PB8 372 FACTORS RELATED TO THE LEVELS OF CARE NEEDS IN LONG-TERM CARE INSURANCE PROGRAM AMONG MEMORY CLINIC PATIENTS IN JAPAN.**

H. TAKECHI\* (Kyoto University, Kyoto, Japan)

Y. HAMAKAWA(1), H. YAMADA(2) - (1) Kyoto University (Kyoto, Japan); (2) Doshisha University (Kyoto, Japan)

Introduction: To support the life of patients with cognitive impairment, it is important to use social services in addition to care provided by family caregivers. In Japan, long-term care insurance program (LTCIP) is implemented in April 2000 to promote socialization of care. Here we show the factors related to the levels of care needs in LTCIP among memory clinic patients. Methods: Subjects were 205 patients from outpatient memory clinic in a university hospital, including 148 AD, 22 MCI, 13 DLB. Interview was performed from their informants, consisting of living arrangement, support by family, level of care needs in LTCIP (level 1; lightest to level 7; severest), use of care services. Cognitive function was evaluated with MMSE. Physical performance was assessed with Up & Go test and grip strength. Results: Seventy patients were not applied to the certification of LTCIP (designated here as level 0). The number, age, MMSE and Up & Go of the patients in each level are as follows; level 0 (n=70, 75.3 $\pm$ 6.8, 22.0 $\pm$ 4.9, 12.2 $\pm$ 5.0), level 1 (n=7, 76.1 $\pm$ 4.4, 21.9 $\pm$ 3.2, 11.6 $\pm$ 3.8), level 2 (n=11, 82.1 $\pm$ 3.4, 23.9 $\pm$ 3.3, 14.3 $\pm$ 5.1), level 3 (n=48, 80.1 $\pm$ 6.1, 21.1 $\pm$ 4.1), level 4 (n=31, 79.6 $\pm$ 7.1, 17.4 $\pm$ 5.6, 16.4 $\pm$ 8.0), level 5 (n=22, 83.5 $\pm$ 5.8, 14.1 $\pm$ 6.6, 17.6 $\pm$ 6.8), level 6 (n=8, 81.4 $\pm$ 8.2, 9.0 $\pm$ 4.6, 19.8 $\pm$ 6.8), level 7 (n=4, 78.8 $\pm$ 8.1, 7.7 $\pm$ 3.8, 26.1 $\pm$ 8.9). The levels of LTCIP was correlated both with cognitive and physical function in patients with cognitive impairment, although the age and living arrangement are determinant of the levels from 0 to 4. Conclusions: Use of care services and relation with living arrangement will also be discussed.

**PB8 373 HEARING SENSITIVITY AND THE FUNCTIONAL CAPACITY IN LONG-TERM CARE**

M. BARUZZI\* (Residencial Israelita Albert Einstein, São Paulo, Brazil)

S. SILVA(1), L. AGNELLI(2), A. GONZAGA(3), J. CORDEIRO(4), N. PIRES(5), M. RIBEIRO(6) - (1) Residencial Israelita Albert Einstein (São Paulo, Brazil); (2) Residencial Israelita Albert Einstein (São Paulo, Brazil); (3) Residencial Israelita Albert Einstein (São Paulo, Brazil); (4) Residencial Israelita Albert Einstein (São Paulo, Brazil); (5) Residencial Israelita Albert Einstein (Brazil); (6) Residencial Israelita Albert Einstein (Brazil)

Introduction: In long-term care, where the functional decline is more advanced, the prevalence of hearing loss is even higher than in general population. Sensory impairment has been frequently associated with difficulties in daily activities, performing harmful influence in the self-perception of health condition and maintenance of social relationships. The purpose of this study was to investigate the relationship between hearing impairment and functionality among long-term care residents in São Paulo, Brazil. Materials and Methods: A total of 31 elderly subjects were submitted to Functional Independence Measure – FIM (cognitive and motor score) and audiometric examinations, during the year of 2008. The sample was composed of 24 (77,42%) female and 7 (22,58%) male, between 77-95 (86,65  $\pm$  5,33) years of age. Results: The score of cognitive FIM was significantly associated (Spearman's correlation coefficient) with: motor FIM ( $r=0,578$ ;  $p<0,001$ ) and age ( $r=0,471$ ;  $p<0,001$ ); lower cognitive scores were due to lower motor scores and higher

ages. Higher levels of hearing impairment showed great correlation (Dunn's post-hoc test;  $p<0,05$ ) with: higher ages ( $p=0,033$ ) and lower scores of cognitive FIM ( $P=0,008$ ). Conclusion: There was a strong correlation between hearing impairment and functionality in the studied group. As we know, the development of hearing loss in elderly is usually slow and sometimes it is only perceived when all frequency range is compromised. The precocious and interdisciplinary intervention in this population is extremely relevant for minimizing the impact in functional capacity.

**PB8 374 WHICH ORGANISATION AND SPACE FOR PERSONALIZED CARE? - STATISTICAL AND ERGONOMICAL ANALYSIS IN LONG-TERM CARE**

F. GARCIA\* (Assistance Publique des Hôpitaux de Paris, Paris, France)  
M. ESTRYN-BEHAR(1), E. CHAUMON(3), G. MILANINI-MAGNY(4), T. BITOT(5) - (1) Hôpital Hotel Dieu (Paris, France); (3) Hôpital Hotel Dieu (75004, France); (4) Hôpital Hotel Dieu (Paris, France); (5) Maison de retraite Montbrison (France)

Introduction: Prevention of depression and malnutrition among residents in nursing homes is generally based on personalized care. However, health care workers (HCWs) in long-term care are frequently dissatisfied with their opportunities to give patients the care they need. They also suffer more burnout than other HCWs do, according to the NEXT study (10 countries, 4,979 HCWs involved in long term care). Method: A participatory action research model was used, involving HCWs and ergonomists in 10 institutions, with the support of the French regional Council of Ile-de-France and Rhône-Alpes. Continuous observations of HCWs' whole work-posts were conducted by ergonomists and by trained HCWs. Time spent in the different rooms, activities undertaken, interruptions, verbal exchanges and work postures were studied. Results: Different factors influenced the possibilities for a nursing aid (NA) to adapt to resident's rhythms and requests: work organization (split shifts or continuous work schedules, floating or fixed assignment, responsibility for 8 residents by one NA or for 23 residents by 2 NA, existence or absence of shift handovers, possibility of sharing information with nurses and doctors); space constraints (lack of a sufficient number of lifts when only one dining room for 120 residents or dinning rooms for every 16 residents, space for wheel chairs, attention given to noise reduction and lighting...), and number of staff. The possibility of developing verbal exchanges with residents lasted from a mean duration of 32 sec. to 4 min., according to these interactions. Helping residents to eat differed according to whether the NA was sitting or standing and interrupted (ex.: 21 min. to help four persons eat in 12 periods). Discussion: Improvements in the quality of care, and to protect HCWs' health, can be made by improving working processes through multidisciplinary teamwork, and by developing better ward designs and equipment.

**PB8 375 ASSISTANCE TO BASIC NEEDS. WHICH CONTEXT FOR EMPATHIC CARE? - PARTICIPATORY ERGONOMICS TO IMPLEMENT CHANGES**

F. GARCIA\* (Assistance Publique des Hôpitaux de Paris, Paris, France)  
C. ELISE(1), M. ESTRYN-BEHAR(1), G. MILANINI-MAGNY(1), T. BITOT (3), B. MEZHOUD(2) - (1) AP-HP, SCMT (Paris, France); (2) AP-HP, Hôpital Richet (Villiers-Le-Bel, France); (3) EHPAD les Monts du Soir (Montbrison, France)

Introduction: Prevention of bedsores, falls and musculoskeletal disorders (MSDs) among residents in nursing homes is a priority. However, health care workers (HCWs) in long-term care accumulate an excessive number of manual lifting and awkward postures and suffer more MSDs than other HCWs do, according to the NEXT study (10 countries, 4,979 HCWs in long-term care). It is necessary to understand the influence of organization and space constraints on the way activities are accomplished. Method: A participatory action research model was used, involving HCWs and ergonomists in 10 institutions, with the support of the French regional Council of Ile-de-France and Rhône-Alpes. Continuous observations of HCWs' whole work-posts were conducted by ergonomists and by trained HCWs. Time spent in different rooms, activities undertaken, interruptions, verbal exchanges and work postures were studied. Results: HCWs in long-term care had to choose between patients. This often meant not having the time to spend with an elderly patient to respond to his need of social contact or even to change his protection, in order to take care of another one's basic needs. All of our observations led us to wonder about interruptions: to deal with missing or failing equipment, to search for co-workers, to be faced with conflicting tasks. The mean consecutive time spent with a resident, to help him in mobilization and hygiene, varied from 3 min to 10 min, depending on access to bathrooms, supplies and even to the bed or wheelchair. HCWs sat only from 5% to 24% of their working time, and cumulated from 25 to 150 awkward postures according to architecture, equipment, number of HCWs and organization. Discussion: Data collected during the participatory ergonomic process are now being applied so as to organize space, furniture and supplies in a way that reduces preparation time, increases time spent with patients and decreases HCWs' health risks.

**PB8 376 EVALUATION OF TEN MEASURES OF COMORBIDITY AND ONE YEAR RISK OF FUNCTIONAL DECLINE OR MORTALITY IN AN ACUTE GERIATRIC WARD**

N. MARTINEZ\* (Hospital de Navarra, Pamplona, Spain)  
A. CASAS(1), J. ALONSO(1), H. GÓMEZ(2), I. IRAIZOZ(1), B. GONZALEZ(1), J. LARRION(1), J. REDÍN(1) - (1) Hospital de Navarra (Pamplona, Spain); (2) Radiología Ambulatoria. Centro de Consultas Externas Príncipe de Viana (Pamplona, Spain)

**INTRODUCTION:** It's important to measure the complexity in the elderly patient. The objectives of this study were to compare several measures of comorbidity and to study the factors predicting functional loss and mortality. **METHODS:** Hospital-based prospective longitudinal cohort study of 131 patients over 75 years. Barthel Index was assessed on admission and 1 year later. Other variables were collected: sociodemographic, laboratory values, comorbidity measures, nutritional, cognitive and social status. Bivariate and multivariate analysis were performed. Ten different methods to measure comorbidity were used: disease count, Charlson Index and its modification according to age, Cumulative Illness Rating Scale, Index of Coexisting Disease, ASA index, Spanish Red Cross Scale, Index of Disease Severity, Geriatric Index of Comorbidity (GIC), Burden of Illness score for elderly persons and Prognostic index. **RESULTS:** Mean age of the cohort was 85.4 years (SD 5.29), 56.5% female and 55% with cognitive impairment. Mean Barthel index on admission 65.69 (SD 34.22) and 34.92 (SD 33.32) one year later. One-year mortality was 36.5%. Variables associated with functional decline in bivariate analysis were: age>85, Barthel, Karnofsky index, OARS, Red Cross and ASA scales, GIC, BISEP and Prognostic indexes, diagnosis of dementia and readmission. In multivariate analysis were: age>85, OARS scale, levels of hemoglobin and albumin, GIC, readmissions and previous Barthel index. Variables associated with mortality in bivariate analysis were: age>85, Barthel, Red Cross and ASA scales, GIC, BISEP and Prognostic indexes and diagnosis of dementia. In multivariate analysis were: age>85 and diagnosis of dementia. **CONCLUSIONS:** This study confirms several functional and mortality predictor like functional, nutritional and cognitive status, age and diagnosis of dementia and adds others like OARS scale, levels of hemoglobin, GIC and number of readmissions. The only index of comorbidity that predicts functional decline in this study is GIC after adjustment for complexity.

**PB8 377 SUPPORT TO THE HOSPITALIZED SENIOR CITIZEN GROUP DYNAMICS OF LONG-TERM HOSPITALIZED PATIENTS**

M. OKA\* (Hospital Santa Catarina, São Paulo, Brazil)  
R. NOVEMBRE(1), C. COAGLIO(1), C. FRANCISCO(1), P. SOUZA(1), L. HINSCHING(1), I. NIGOHOSIAN(1), C. SALOMÃO(1) - (1) Hospital Santa Catarina (Brazil)

The world's population is aging at a greater rate than ever before. In 2025, Brazil will have 31.8 million senior citizens. São Paulo State ranks first in the number of senior citizens: approximately 4 million people 60 or more years old. In this scenario there is an increase of chronic diseases, which in turn creates demand of long-term hospitalization. According to data from the Santa Catarina Hospital, in the last 4 years admissions of aged people have increased from 15% to 18%. Which 60% of the patients were admitted for clinical treatment, 20% are neoplasm, 16.40% are circulatory diseases and 8% had an average hospitalization time of more than 30 days. Due to this facts, in 2008 an interdisciplinary group was created for the identification of long-term hospitalization patients (defined as those with a hospital stay longer than 20 days), in order to take preventive action, allowing for a smooth and safe discharge. The present paper intends to show the results achieved by the group's actions in situations of long-term hospitalization. Patients and methods: This is a descriptive and prospective study carried out in a private philanthropic hospital. Starting in September 2008, 234 long-term hospitalization patients have been monitored, of which 67.52% are senior citizens. Results: The number of patient-days corresponding to long-term hospitalization showed a 23.73% decrease, during the period from July/08 to January/09, and 78.28% of the patients discharged during this period were old-age people with an average hospitalization time of 56 days. Conclusion: The group introduced a greater involvement of the medical team with the possibility of an earlier discharge. The greater integration of the multiprofessional team with the family, service providers and payment agents made this entire process feasible, contributing towards a shorter hospitalization time, greater safety in patient care as well as treatment resoluteness.

**PB8 378 PREVENTING ADMISSIONS TO HOSPITAL: A NEW APPROACH TO MANAGING CHANGE OF HEALTH STATUS IN LONG TERM CARE FACILITIES**

D. BROWN-FARRELL\* (Sunnybrook Health Sciences Centre, Toronto, Canada)

In 2006-2007 almost 200,000 Canadians lived in continuing care settings such as nursing homes and chronic care facilities. Recent reports have shown that while these residents are older and more medically complex than ever before, the facilities they reside in are not often equipped to deal with their complex health care needs. Consequently, many residents have unplanned transfers to hospital care that result in long delays in the emergency department and the acquisition of iatrogenic illnesses. In a large university based veteran care facility, a unique approach was developed to prevent unnecessary transfers to emergency care and provide the staff with the process, knowledge and tools for managing change in health status. Lead by an acute care trained Specialty Practitioner, an interprofessional clinical practice guideline was developed to assist staff with risk identification, assessment, communication, treatment and monitoring interventions for residents experiencing the common illnesses and conditions that often precipitate transfers to acute care. Implementation processes included initial mass education and weekly case reviews to enhance clinical reasoning and judgement. The introduction of the Specialty Practitioner role, focused on working with the residents and their families along with the interprofessional team to assist with the interpretation of symptomatology, initiation of prompt treatment and continued monitoring. Process data for the improvement of practice

was generally positive with suggestions for continued improvement. Outcome data for the number of residents sent to emergency care also indicated a decrease in total numbers. With an increased focus on accountability for patient safety, efficiency and appropriate allocation of resources, it is important for administrators to examine options for enhancing the potential of present staffing models, funding frameworks and the approach to assessment of residents with complex care needs, in order to prevent unnecessary transfers to hospitals.

**PB8 379 THE PEONIES PROJECT: A NEW WAY TO MEASURE AND IMPROVE PERSON-CENTERED, OUTCOMES-DRIVEN LONG-TERM CARE**  
D. ZIMMERMAN\* (University of Wisconsin - Madison, Madison, WI, United States)  
S. KARON(1), B. BOWERS(1), D. KOPP(1), B. RYTHER(1), K. NOLET(1),  
K. HUTCHISON(1) - (1) University of Wisconsin-Madison (Madison, Wi, United States of America)

**Introduction:** The PEONIES project of the State of Wisconsin (USA) was developed to support the provision of person-centered, outcomes-driven long-term care services. This approach begins by identifying individually important outcomes in 12 quality of life domains. Support for these outcomes is designed to include assistance from family, friends, neighbors, and community groups, as well as from the formal service providers. Cost-effectiveness is defined in relation to the specific outcomes of importance to the individual. **Methods and Materials:** The PEONIES approach was developed by researchers at the University of Wisconsin – Madison. It uses semi-structured interviews to identify the quality of life outcomes that individuals wish for themselves, the types of supports needed to help achieve and maintain those outcomes, and the quality of the supports currently being provided. Information is used to support the development of service plans, and also to create quality measures for the service organization. Inter-rater reliability was tested in 4 care organizations, for adults receiving services due to physical or developmental disability or chronic conditions associated with aging. **Results:** Inter-rater reliability was statistically significant but in a low to moderate range, for most quality of life domains. The PEONIES interview process was found to empower individuals receiving services. Care managers reported that the approach helped them to do a better job of supporting people in useful ways, but required unlearning old habits and forming new ones. **Conclusions:** The PEONIES approach to supporting individuals and measuring quality is unique in its emphasis on individually-determined outcomes. This approach, which considers personally-defined outcomes and all sources of potential support, can enhance quality of life and do so in a cost-effective manner. Inter-rater reliability can be improved with additional training.

**PB8 380 EPISODIC CRISES: CHALLENGES IN THE DELIVERY OF HOME SUPPORT SERVICES TO ELDERLY CLIENTS IN A CANADIAN CONTEXT**  
J. SIMS-GOULD\* (The University of British Columbia, Vancouver, Canada)  
K. BYRNE(1), A. MARTIN-MATTHEWS(1) - (1) The University of British Columbia (Vancouver, Canada)

**Introduction** Home Care is an expanding sector of health care delivery in many countries. The purpose of this paper is to explore the nature of crises from the perspective of home support workers and family members of elderly persons receiving home support in Vancouver, Canada. **Methods and Materials** Based on a previous Canadian study of episodic crises in family caregiving, Sims-Gould & Martin-Matthews (2008) developed a conceptual model for understanding episodic crises. The model classifies crises on two dimensions: predictability (predictable or not) and duration (acute or chronic). This paper examines and further refines that model through an analysis of data from in-depth interviews with home support workers (N=118) and family caregivers (N=56) who have an older relative in receipt of home support services. The research was funded by the Canadian Institutes of Health Research (CIHR). **Results** Crises were experienced by 91% of home support workers and 94% of family caregivers. Workers and family members differed in their understandings of crisis. The most common type of crisis was health related and typically involved a fall by the elderly client/relative. Non-health related crises ranged from client refusal of service, to family members brokering arguments between workers and their relative. Crises varied in predictability and duration. Home support workers and family members engaged in a variety of strategies to manage crisis incidents and required quick problem solving skills and extra time (often outside agency guidelines and practices). **Conclusion** The analysis of crisis episodes (a) from the different perspectives of care workers and family members, and (b) framed in terms of predictability and duration, enables us to better understand how agency and care policies may be more responsive to circumstances and events that challenge paid and unpaid care work in domiciliary settings.

**PB8 381 HOME CARE SERVICES TO ELDERLY CLIENTS: THE LABOUR OF CAREWORK IN CANADA**  
A. MARTIN-MATTHEWS\* (The University of British Columbia, Vancouver, Canada)  
J. SIMS-GOULD(1), K. BYRNE(1) - (1) The University of British Columbia (Vancouver, Canada)

**Introduction** The care of community-dwelling older people is influenced by the availability and nature of home care services, in terms of their funding and structure; the characteristics of home support workers and clients; and the ways in which paid and unpaid care intersect. **Methods and Materials** Mahmood and Martin-Matthews (2008) developed a conceptual model that locates the home support worker, elderly client, and family member (caregiver) at the intersection of the public and private spheres framed by their social, spatial, temporal and organizational features. Funded by the Canadian Institutes of Health Research (CIHR), the current study examines and further refines that model through an analysis of data from in-depth interviews with 180 home support workers (who provide 'non-professional' domiciliary care services to elderly clients) in three provinces of Canada: British Columbia, Ontario and Nova Scotia. **Results** The organizational, spatial, temporal and social aspects of the delivery and receipt of home support services vary considerably between the three jurisdictions. Training and immigrant status of workers vary considerably, with immigrant workers often more highly skilled. Workers identify key issues of scheduling, time demands and balancing client's needs and preferences against the set care plan, and their strategies for addressing these challenges. Strategies are examined with particular emphasis on behaviours outside of agency guidelines and expected scope of practice. **Conclusion** Organizational, spatial, temporal and social factors significantly impact the labour of care work by home support workers in three jurisdictions of Canada. Variations in worker training and immigrant status, and in client care plans and funding arrangements, enable us to identify policies and practices that enhance or hinder the provision of domiciliary care services to elderly people.

**PB8 382 PHYSICIANS' ETHNICITY: DOES IT AFFECT NURSING HOME PLACEMENT?**  
H. SHEDA\* (LONG ISLAND JEWISH MEDICAL CENTER, NEW HYDE PARK, United States)  
G. EL-KASS (5), M. ASHRAF(1), . DUBSON(2), M. ISSA(6), Y. ZAKHARIA(7), N. ABD AL-NOOR(9), W. TOUMA(8), S. WASIF HUSSAIN(10), R. HUSSAIN(4), G. WOLF-KLEIN(3) - (1) NSLIJ Health System (New Hyde Park, NY, United States of America); (2) Lutheran Medical Center (New Hyde Park, NY, United States of America); (3) The Lorber Center for Advancement of Medical Education (New Hyde Park, NY, United States of America); (4) Krasnoff Institute for Quality Mgt, Great Neck (New Hyde Park, NY, United States of America); (5) Long Island Jewish Medical Center (United States of America); (6) St. Vincent Charity Hospital (United States of America); (7) Unity Health System (United States of America); (8) St. Louis University Hospital (United States of America); (9) St. Joseph's Regional Medical Center (United States of America); (10) Mayo Clinic (United States of America)

**Introduction:** By 2020, 12 million elderly will need long-term care in the US. Studies have linked institutionalization with patients' ethnicity, but none have addressed the impact of physicians' ethnicity. **Methods and materials:** An anonymous survey was distributed to physicians in 5 hospitals in New York. Data were collected on the correlation between institutionalizing their patients, mothers and fathers, and 14 medical conditions. Statistical analysis used the Pearson correlation coefficient and Kruskal-Wallis test with &KAI<sup>2</sup> test for associations. **Results:** Surveys were obtained from 204 physicians (52.9% primary care/PCPs and 9.3% geriatricians, 60.9% males and 56.8% in training). Of these, 47.0% were Caucasian, 37.7% Asian, and 8.8% African-American. Overall, physicians were twice as likely to place their patients in assisted living (ALF) or skilled nursing facilities (SNF), as they would for their mother or father, for the conditions: stroke ( $p<.001$ ), end stage renal disease ( $p<.012$ ), malignancy ( $p<.001$ ), incontinence ( $p=.04$ ) and dementia ( $p=.013$ ). Furthermore, PCPs were more likely to place, when compared to geriatricians, for malignancy ( $p<.005$ ), dialysis ( $p<.007$ ), stroke ( $p<.008$ ), dementia ( $p<.01$ ) and aggressiveness ( $p<.008$ ). Male physicians were more likely to place fathers and mothers, respectively, in ALF for malignancy ( $p=.008$ ,  $p=.007$ ), dementia ( $p=.01$ ,  $p=.02$ ), stroke ( $p=.03$ ,  $p=.009$ ), and for amputation ( $p=.01$ ,  $p=.006$ ) and their mothers only for caregiver stress ( $p=0.008$ ), and in SNF for caregiver stress ( $p=.025$ ,  $p=.01$ ) and for incontinence ( $p=.035$  and  $p=.009$ ). There was also a direct correlation between increasing age of physicians and placement for incontinence ( $p=.009$ ) and stress ( $p=.002$ ). Physicians' ethnicity was never found to be a significant factor in the decision to place patients or parents. **Conclusion:** These data present a significant lack of association between physicians' ethnicity and placement of either patients or parents. It also underlines the potential impact of geriatricians in seeking alternative community resources for long term care.

**PB8 383 CHANGING PRACTICE: UNDERSTANDING THE BARRIERS TO APPROPRIATE PAIN MANAGEMENT IN RESIDENTIAL AGED CARE**  
S. HUNT\* (La Trobe University, Canberra, Australia)  
R. NAY(1) - (1) La Trobe University (Bundoora, Australia)

**Introduction:** Management of pain and the promotion of comfort in residential aged care settings, particularly for people with impaired cognition, is a challenge for clinicians and service providers. Concerns include the over use and under use of analgesia, the selection of appropriate analgesia, as well as the validity of clinical assessment. Selection of pain management strategies are influenced by local practices. The numbers of registered nurses working in Australian residential aged care is decreasing. Consequently, pain management is increasingly a role undertaken by caregivers with a mixed educational preparation. This

paper discusses a change process to understand and improve pain management practices in a 30 bed dementia specific unit. Methods: A researcher facilitated action research cyclical process of planning and implementation, data collection, analysis and reflection was conducted over ten months. Quantitative data from a chart audit of assessment and medication charts, plus qualitative data from focus groups, interviews and fieldnotes provide insight into the breadth of issues facing caregivers trying to change pain management practices. Conclusions: Through successive action cycles, the group successfully designed, implemented and evaluated a number of change strategies resulting in a decrease in the number of residents experiencing poorly managed pain. The findings of this study highlight the challenges faced by caregivers working in high-level residential aged care. The group's work revealed the need for pain management tools which reflect current understanding of pain in older people; the need for evidenced-based education for caregivers; the need to use comfort measures as an adjunct to analgesia; and the advocacy role caregivers have when medical or nursing personnel do not prescribe or administer sufficient analgesia. The process provided the participants of this study their first opportunity to participate in research and to examine their practices. The process resulted in individual as well as organisational learning.

**PB8 384 MANAGEMENT OF GERIATRIC GIANTS: PRESSURE SORES AND IMMOBILITY SYNDROME**

E. PEREZ-GODOY DIAZ\* (Diputacion, Sevilla, Spain)

A. MORENO-GUERRÍN BAÑOS(1), J. RUIZ GONZALEZ(1), A. ALVARADO TATO(1), F. FERNANDEZ VARGAS(1), A. AMAYA CORTIJO(1) - (1) Diputacion, Unidad Geriatría Miraflores (Sevilla, Spain)

**INTRODUCTION:** Elderly mobility depends on the interaction among different factors like the patient itself, motor ability, cognitive capacity, health status and external and environmental personal resources. The reduction of these capacities can lead to the already described Immobility Syndrome with important consequences, one of them being the pressure sores. Its control is established as a quality of care parameter. **AIM:** To assess and treat stage IV pressure sores in patients with especial risk factors, which eventually lead to Immobility Syndrome and pressure sore. **METHODS AND MATERIALS:** We present a 72 years old patient with a cognitive disturbance, depressive syndrome. He suffered from several strokes (2007) and since then he suffered from speech impairment, swallowing difficulties and incontinence of sphincters. Due to his long term immobility he developed an ischaemic necrosis on the heel which became a stage IV pressure sore. Due to the described situation, it was decided to carry out a surgical debridement in different sessions and daily wound care. **RESULTS:** We followed up and undertook photographic recording of the pressure sore and the care of the wound. After five months from the beginning of the treatment we could appreciate the favourable course of the ulcer. **CONCLUSION:** The assessment of an infected wound must be carried out following certain criteria, either clinical or microbiologically; that would allow us to choose and provide the adequate treatment for the lesion. The choice of dressing must be based on the assessment of the patient and the wound, as well as the potential of the dressing to achieve its purpose.

**PB8 385 IMPROVEMENT OF CARE NETWORK BETWEEN EHPADS (NURSING HOMES FOR ELDERLY DEPENDANT PATIENTS) AND HOSPITALS THROUGH THE CREATION OF A GERIATRIC CARE AND ASSISTANCE UNIT.**

M. STEPHAN MEYER\* (CHU, Limoges, France)

P. SOPHIE PEYRICHOU, B. KHEIRA BETTAYEB, S. ISABELLE SAULNIER, M. NATHALIE MAUBOURGUET-AKE, D. THIERRY DANTOINE

**Introduction** In most of EHPADs, no nursing paramedical care continuation exists in 24 hours a day. In the case of acute diseases, to provide appropriate treatment to their health status, old patients need hospitalisation which is often in emergency because of lack of continuous nursing surveillance. For the past 2 years, the Geriatric Care and Assistance unit has been created in the University hospital in Limoges, to priority admit patients from EHPADs in a readaptation non-acute geriatric unit at the very beginning of acute health problem and when no diagnosis was already made in the EHPAD. **Methods** The unit set up over the past two years, admitted 234 patients requiring paramedical care during the critical phase of a given pathology (dehydration, high fever, agitation, aggressiveness, treatment of worsened bed sores, pain, malnutrition, unstable diabetes, wandering...). Results Frequently encountered pathologies were: Bronchial surinfection, States of agitation, Unstable diabetes, Treatment of bed sores, States of acute malnutrition. The mean time lapse between admission to the unit and the EHPAD request is 36 hours. The mean length of stay is of 15.5 days. Once the pathology has been treated, the patients return to the EHPAD that they came from. Ninety percent of patients returned to their EHPAD; the remaining ten percent, because of the worsening health problems, needed a long-term care unit or died. This Geriatric Care and Assistance unit has avoided transfer through the emergency rooms for many elderly patients living in EHPADs. This unit also participates in optimising the geriatric care network and helps to avoid the burn-out of nursing staff in EHPADs. **Conclusion:** After a 2 years period of experimental functioning, the Geriatric Care and Assistance unit, at the beginning of 2009 has been opened officially, with a 15 beds unit.

**PB8 386 MUSIC THERAPY: MEALS IN MUSIC**

A. KARIM AIT AHcene\* (CHU Dupuytren, Limoges, France)

M. STEPHAN MEYER, J. NICOLE JACQUIN-MOURAIN, M. NATHALIE MAUBOURGUET-AKE, P. CÉLINE PASSERIEUX, D. THIERRY DANTOINE

**Introduction** How can music therapy help demented patients re-appropriate the gestures required to feed themselves? Effects of music on demented patients have been demonstrated. It brings back memories with pleasure, establishing a contact with patients and facilitating communication. It improves mood, reduces neuroleptics anxiolytics use, has analgesic effects and improves concentration. The aim of this study was to explore music effects on the return of gestures required for feeding oneself in a long-term care unit. **Methods** Since 2007, groups of 8 demented Alzheimer patients (MMS (mini mental score) < 15), at mealtimes, are installed by carers at the same table. Carers sat with them, talking quietly and capturing their attention. A song is played. Patients behaviour was assessed by a psychomotrician. Strengthened by result, in a second time, two comparative groups of patients were set up: one being fed as usual and one being fed with playing music. **Results** After the first 6-month session, people that had to be fed by carers were able to eat on their own or with lesser help; however the carer must remain nearby to prompt them. A woman who needed to be prompted verbally to drink or eat, no longer required help. Two people who no longer fed themselves enough and needed help before the study were able to feed themselves again and also during other daily meals. The second part of the study demonstrated: - improvement of implications of demented patients in their skills in eating by themselves - possibility of mobilising only one carer for six demented patients, at the same time with efficient and harmonious meal. **Conclusion** Music regularly proposed to demented patients permits them to re-appropriate gestures of eating, thus improving their autonomy and should decrease risks of malnutrition.

**PB8 387 ONE-YEAR SURVIVAL ANALYSIS OF INFIRMARY PATIENTS: WHAT CAN WE DO TO IMPROVE THE SERVICES?**

K. LAM\* (Cheshire Home, Shatin, Shatin , China)

W. YING(1) - (1) Center of HealthProtection (Hong Kong , Hong Kong)

**Introduction** Although infirmary patients are known to be associated with a short median survival, there is a wide variation in survival observed in reality. Currently there has been a limited knowledge in the prognostic information in long term care. **. Objective** To identify reversible prognostic factors associated with one-year survival in infirmary patients, with the aim to improve clinical services. **Method** This was a prospective cohort of 112 patients from a long term care hospital in Hong Kong. Patients were followed for one year and the main outcome measure was death. Information on subject demographics, social support, nutritional status, disability level, mental status, clinical data, laboratory results and medications was collected at baseline. Univariate and multiple Cox proportional hazard regression were used to identify predictors of mortality. **Result** There were 19 deaths (17.0%) during the follow-up period. 17 patients (15.2%) had been admitted to acute hospital within six months before baseline assessment, and the most common cause for admission was severe infections (47%). In univariate analysis, the following factors predicted death within one year: higher age ( $P=0.072$ ), higher Charlson morbidity index ( $P=0.076$ ), previous admission to acute hospital within 6 months ( $P=0.013$ ), tube feeding ( $P=0.058$ ), weight loss greater than 10% within six month ( $P=0.002$ ), lower Norton Score ( $P<0.001$ ) and impaired mobility ( $P=0.035$ ). Multivariate analysis revealed the following independent predictors of death: weight loss in six month greater than 10% (hazard ratio, 6.4;  $P = 0.005$ ), previous admissions to acute hospital (hazard ratio, 4.3;  $P = 0.007$ ), and impaired mobility (hazard ratio, 0.2;  $P = 0.062$ ). **Conclusion** From this study, it appears that potential interventions that may improve the one-year mortality of infirmary patients include the following: aggressive intervention to treat the reversible causes of significant weight loss, and measures to prevent severe infections in long term care.

**PB8 388 PROFILE OF INSTITUTIONALIZED ELDERLY ASSOCIATED WITH SCORES OF FUNCTIONAL INDEPENDENCE MEASURE(FIM)**

M. IKEDA\* (Residencial israelita albert einstein, São Paulo, Brazil)

A. DE ALMEIDA PERNAMBUCO(1), V. LOPES CRISCIANI(2), V. DE POLI CORREA(3), C. SIMON BENEVIDES(4), E. MOURA E SOUZA(5), N. PIRES(6), M. SILVA ODIERNA(7) - (1) Residencial Israelita Albert Einstein (São Paulo, Brazil); (2) Residencial Israelita Albert Einstein (São Paulo, Brazil); (3) Residencial Israelita Albert Einstein (São Paulo, Brazil); (4) individual (São Paulo, Brazil); (5) Residencial Israelita Albert Einstein (Brazil); (6) Residencial Israelita Albert Einstein (Brazil); (7) Residencial Israelita Albert Einstein (Brazil)

**Introduction:** With the growth of world elderly population, the concern with functional capacity appears in focus in this segment of health estimate age. The diagnosis based only on clinical evaluation becomes inadequate to the actual condition of health of this population because, for this, the levels of functionality and independence are more relevant data than only the presence of diseases. Diagnosis of the disease remains important for the clinical treatment, however, linked to this, there must be understanding on the functional issues. They not only involve physical and mental health, but the socioeconomic conditions and self-care, which show the degrees of functional independence. An assessment of functional capacity is essential to choosing the best type of intervention and monitoring of clinical and functional status of the elderly. Purpose Assessing the existence of an

association of the scores of functional independence measure(FIM)with the classification of degree of dependence in consensus between a team of doctors,nurses,occupational therapist and leaders of caregivers. Method Held discussions with the team focusing on the level of dependence in acitivities of daily living(ADL)of each senior,was evaluated alongside the score of each one's FIM.The mean and standart deviation of total FIM and its sub-scales(cognitive and motor)for each degree of dependence(total dependent, semi-dependent and independent to ADLs) Results: Trend to higher values in FIM between residents classified as independent as between semi-dependent and remained dependents.This trend both in regard to the total amount of FIM(Independent:116 average,  $5\pm$ standart deviation7,3; semi-dependent:95average, $6\pm$ standart deviation14; dependent:average48standart deviation $\pm$ 24,3)and in the cognitive sub-scales(Independent:average:33standart deviation $\pm$  2,7; semi-dependent average:  $27,7\pm$ standart deviation5,4; dependent: average $16,1\pm$ standart deviation9 diversion,2)and motor(Independent:average:83,5standart deviation, $\pm$ 5,4; semi-dependent:average:  $68\pm$ standart deviation11,9; dependent:average:31,9 $\pm$ standart deviation $\pm$ 18,4) Conclusion: Direct association was observed between scores of FIM(total and sub-scales)and ranking in the degree of functional dependence of the consensus made by the team.

**PB8 389** HEALTH PROFILE OF ELDERLY PATIENTS IN AN ACUTE GERIATRIC UNIT FROM A BRAZILIAN TERTIARY HOSPITAL

S. SILVA\* (FEDERAL UNIVERSITY OF RIO DE JANEIRO-HUCFF, RIO DE JANEIRO, Brazil)

R. SERAFIM(1), R. PIANÇO(1), I. FIGUEIREDO(1), B. LOURES(1), C. PAIXAO(1) - (1) FEDERAL UNIVERSITY OF RIO DE JANEIRO - HUCFF (rio de janeiro, Brazil)

Introduction: The elderly constitute 8,6% of the Brazilian population and this figure will double in the next 20 years. Rio de Janeiro, a southeastern estate, has the greater proportion of elders. However, there is a lack of geriatric health care and medical centers. Therefore, it is essential to understand the epidemiology and needs of this special population. Materials and Methods: Data were prospectively collected from one hundred and forty three female patients admitted in a geriatric ward of a tertiary care hospital between October 2007 and November 2008. Information about epidemiological data, delirium occurrence, pressure ulcer incidence, and laboratory results were collected at admission and hospital discharge or death. The results are expressed as means and standard deviation. Analysis of difference in proportions used chi square test with a significance level of 0.05. Results: The mean age and APACHE II score were  $77,76\pm11,70$  years and  $14,83\pm5,91$  respectively. Patients used  $5,05\pm2,98$  medications at admission. The time spent between emergency room admission and transfer to the ward was  $3,11\pm4,41$  days. Despite longer length of stay in comparison with general wards ( $18,20\pm21,45$  vs  $11,94\pm9,91$  days), mortality rate was lower (6,1% vs 8,87%). The mean levels of albumin, hemoglobin and TSH at admission were  $3,32\pm1,25$ ;  $11,37\pm2,29$  and  $2,45\pm1,92$  respectively. Delirium occurred in 32% of the subjects. The mean Braden score was  $16,13\pm4,30$  and pressure ulcer incidence was 21%. Non-survivors had a statistically significant lower Braden score and higher delirium incidence but no difference in age, albumin and hemoglobin level. Conclusion: Mortality was less than expected. Despite lower risk as indicated by the Braden score, pressure ulcer incidence was very high. Pressure ulcer and delirium incidence seemed to confer a poor prognosis in this population.

**PB8 390** LONG TERM CARE DOCUMENTATION AND ITS EFFECT ON THE QUALITY OF CARE AND THE CLIENTS' QUALITY OF LIFE

C. HEISLBETZ\* (Hans-Weinberger-Akademie, München, Germany)

C. HEISLBETZ (1) - (1) Hans-Weinberger-Akademie (Germany)

The effect of care documentation on the quality of care is the subject of various studies. They mostly examine the impact of new documentation procedures, care process models etc. Observed outcome measures include many aspects of documentation quality or refer to the quality of care from a professional perspective. Only very few studies consider the clients' perspective on the documentation-results. The presented findings are based on a data set, gathered in five European countries including data from home and institutional care. It allows producing indicators on documentation quality referring to care theories and care process models for 1400 clients. Additionally the data set covers information on care quality and it comprises data, collected from the clients, regarding clients' satisfaction with care and their care related quality of life. Examining the interdependency between documentation, care quality and clients' satisfaction with care and quality of life, we find three patterns of interrelation. In the first pattern, care documentation is used, to follow bureaucratic guidelines with a negative impact on care results, both from the professional and the clients' perspective. In the second pattern, the documentation is primarily used to provide and indicate the professional care quality. This focus tends to neglect the client-referring care outcomes – observable by a negative relation between documentation quality and the clients' satisfaction with care. The interrelations within the third pattern reverse those of the second. Here we find a negative implication of documentation quality on the quality of care, whereas the effect on the clients' care satisfaction and their quality of life is positive. Care is focussed here primarily on the clients' outcome and care documentation makes systematic administrative deficiencies visible. Summarising, we see the importance

of documentation together with its heterogeneous impact on the quality of care and the clients' care satisfaction and quality of life.

**PB8 391** INFORMAL CAREGIVING: EXPERIENCES OF PRIMARY CAREGIVERS TO NON DEMENTED ELDERLY.

M. LAGE\* (University of Minho, Portugal, Braga, Portugal)

Due to the growth of the number of elderly people with functional incapacities, families face having to take care of their elderly relative for long periods of time. The goal of this article is to describe the meaning of caregiving felt by primary caregivers to no demented elderly people. For this study we used van Kaam's phenomenological method. After the analysis of the non structured interviews to nineteen primary caregivers, three major themes emerged: consequences on personal life; belongingness, reciprocity and structure of caregiving relationship; organization of demands and interdependency of the relationships and the tasks. The attention given to caregivers experience, either positive or negative, help construct the meaning of the experience and assure that more and better care been given. Acknowledging the importance of families taking care of their elderly is gaining a better understanding of psychosocial determinants of the caregivers' subjective well-being and health. This knowledge can be crucial in controlling negative emotions and identifying gain predictors. More specifically, this awareness can help identify needs, encourage strategies and activate and create resources able to optimize the caregivers' well-being and daily life of those that, by choice or obligation are faced with the experience of taking care of an elderly person.

**PB8 392** THE MULTI-COMPONENT TAILORED INTERVENTION IN TREATMENT OF DEMENTED RESIDENTS WITH BPSD. RANDOMIZED CONTROLLED TRIAL IN 2008-2010.

U. ELONIEMI-SULKAVA\* (Central Union for the Welfare of the Aged, Helsinki, Finland)

N. SAVIKKO(1), M. SAARENHEIMO(1), T. KÖYKKÄ(1), H. SILLANPÄÄ-NISULJA(1), M. FORDER(1), A. NUMMINEN(2), M. SUOMINEN(3), P. TOPO(4), H. FINNE-SOVERI(5), R. SULKAVA(6) - (1) Central Union for the Welfare of the Aged (Helsinki, Finland); (2) Sibelius Academy (Helsinki, Finland); (3) University of Helsinki (Helsinki, Finland); (4) Academy of Finland (Helsinki, Finland); (5) National Institute of Health and Welfare (Finland); (6) University of Kuopio (Finland)

Introduction: Alzheimer's disease and related dementias are frequently accompanied by BPSD that are common in long term care settings of elderly people. BPSD decrease the quality of life of people with dementia and cause distress in nursing staff. Objectives: To determine whether the multi-component tailored intervention is effective in treatment of BPSD. Methods: Randomized, controlled intervention study of 19 long-term care wards with 399 residents. Wards are randomly allocated to the intervention (n=11) or control group (n=8) according to the wards' and residents' several characteristics (case mix index, age and gender). The baseline data comprises of 298 residents with informed consent. Main outcome measures are (1) alleviation of BPSD (2) use of medication and (3) prevalence of BPSD in wards. Data (1) of residents' cognitive functioning, BPSD, physical functioning, nutrition, psychological well being and quality of life and (2) staff's work stressors and satisfaction are gathered at baseline and in 6 months and 12 months follow-ups. Intervention: The control wards will continue their normal work and are provided a four-hour training session about treatment of the BPSD. The intervention wards enter to a one-year predominantly psychosocial intervention program based on the holistic perspective where BPSD are seen as a person's effort to cope and adapt in the present circumstances. Intervention methods are designed to enhance the psychological well-being and mental health of each resident with BPSD. The intervention staff is supported by a mentor nurse and a consulting geriatrician to find the underlying multiple interacting causes of each resident's behavior, and to provide individually tailored, comprehensive and multi-component intervention. Staff is supported to work in collaboration with family members. Voluntary staff members are trained and encouraged to use singing, exercise therapy and reminiscence during daily practice. Preliminary results show that there are multiple potentially treatable causes for BPSD.

**PB8 393** THE ASSESSMENT OF PREALBUMIN AS AN EFFECTIVE SCREENING TOOL IN MALNUTRITION.

I. ERISA\* (University of Reading, Reading, United Kingdom)

W. CHEUNG(2), J. OSPYW(2), L. METHVEN(1), O. KENNEDY(1), M. GOSNEY(1) - (1) University of Reading (Reading, United Kingdom); (2) Royal Berkshire NHS Trust (Reading, United Kingdom)

Introduction: Malnutrition among the elderly population is reported to be as high as 60% (NICE, 2006). Despite its widespread prevalence and devastating consequences, malnutrition can not be diagnosed by simple physical observations and weight measurements but requires thorough nutritional assessment on admission to hospital. Prealbumin or transthyretin is emerging as one of the indicators of nutritional status and a marker for malnutrition since it correlates with patient outcomes in a wide variety of clinical conditions (Beck and Rosenthal, 2002). This aim of the current study was to investigate the effectiveness of prealbumin as a screening tool of malnutrition, compared to the use of albumin and other nutritional assessment

techniques. Methods and materials: Fifty nine patients, 65 years or older were admitted to the Royal Berkshire NHS Foundation Trust. Thirty patients (mean age 83.7±6.1years) were admitted with a fractured neck of femur (acute), and twenty nine patients (74±6.1years) were admitted for a total hip replacement (elective). Serum was analysed for the measurement of albumin and prealbumin on the VITROS 5.1 FS chemistry system and the Nutritional Risk Score (NRS) calculated. Results: Prealbumin Elective (n=26) Acute (n=29) <10mg/dl 0 0 10-17mg/dl 2(8%) 6(21%) >17mg/dl 24(92%) 23(79%) Albumin Elective (n=20) Acute(n=20) Normal 20 15 <3 0 5 (25%) <3 0 2 (10%) NRS Elective (n=27) Acute (n=30) 0-3 (low risk) 25 (93%) 25 (83%) 4-9 (mod risk) 2 (7%) 5 (17%) 10-13 (high risk) 0 0 Conclusions: Prealbumin identified more individuals who were at risk of malnutrition in both patient groups with the risk of malnutrition highest in patients who were admitted with a fractured neck of femur. The use of prealbumin should be incorporated into a patient's nutritional screening program on hospital admission. Beck F.K. and Rosenthal T.C. (2002). Prealbumin: A Marker for Nutritional Evaluation. American Family Physician, 65, 1575-1578. NICE (2006) The National Institute for Clinical Excellence [Online]. [Issued 2006 Feb 21]. [cited 2008 July 30] Available from: URL:<http://www.nice.org.uk/guidance/index.jsp?action=download&o=29985>

#### **PB8 394 SERUM 25-HYDROXYVITAMIN D AND MORTALITY IN AN OLDER BI-ETHNIC COMMUNITY-DWELLING POPULATION**

S. KRITCHEVSKY\* (Wake Forest University School of Medicine, Winston Salem, United States)  
D. HOUSTON(1), J. TOOZE(1), M. JOHNSON(2), D. HAUSMAN(2), J. CAULEY(3), D. BAUER(4), G. SCHWARTZ(1), K. SHEA(1), T. HARRIS(5) - (1) Wake Forest University School of Medicine (Winston Salem, United States of America); (2) University of Georgia (Athens, United States of America); (3) University of Pittsburgh (Pittsburgh, United States of America); (4) University of California, San Francisco (San Francisco, United States of America); (5) National Institute on Aging (United States of America)

Introduction: Serum 25-hydroxyvitamin D (25(OH)D) levels have been associated with all-cause mortality primarily in studies including persons of European origin. We compare the 25(OH)D – mortality relationship in black (n=1055) and white (n=1633) participants of the Health, Aging and Body Composition Study, a prospective study in well-functioning community dwelling older adults (age range 71-80, 51.2% women, 39.7% black). Methods and Materials: Serum 25(OH)D was measured by radioimmunoassay (DiaSorin, Stillwater, MN) at the Year 2 exam. Physician adjudicated deaths were ascertained through semi-annual contacts over the subsequent 8.5 years. The 25(OH)D – mortality relationships were analyzed using proportional hazards models adjusting for multiple covariates with 75+ nmol/L as the referent group. Results: Blacks had lower 25(OH)D levels than whites (52.2 (25.6) vs. 72.7 (27.5) nmol/L, p<0.0001). 31.8% of black and 23.1% of white participants died. After adjusting for demographics, health habits, season, physical and cognitive function, and common comorbidities, blacks had elevated mortality in all categories below the referent [HR, 95%CI (<25 nmol/L): 2.33, 1.43-3.79; (25-<50 nmol/L): 1.65, 1.15-2.35; (50-<75 nmol/L) 1.51, 1.03-2.21]. Mortality was also elevated among whites with low 25(OH)D levels [HR, 95%CI (<25 nmol/L): 1.90, 0.96-3.78; (25-<50 nmol/L): 1.53, 1.14-2.04; (50-<75 nmol/L) 1.19, 0.94-1.52]. There was no significant race x 25(OH)D interaction. Conclusions: Serum 25-hydroxyvitamin D levels <75 nmol/L are associated with elevated mortality in both black and white community-dwelling older adults. Trials are needed to show whether vitamin D supplementation can reduce mortality.

#### **PB8 395 DO OLDER MEN WITH ANDROPAUSE CARRY HIGHER METABOLIC RISK?**

R. CHEN\* (Changi General Hospital, Singapore, Singapore)  
K. NG(1) - (1) Department of Urology, Changi General Hospital (Singapore, Singapore)

Introduction: Lower levels of total testosterone (TT) and sex hormone binding globulin (SHBG) have been linked with higher metabolic risk in men. As testosterone concentration is known to decline with increasing age (aka Andropause), we aim to study whether older men labeled as having andropause would also carry poorer metabolic characteristics compared with non-andropausal men. Methods: Cross-sectional study involving 187 consecutive non-diabetic Asian (predominantly Chinese) men aged 34-75 years who attended a Men's Health clinic. Fasting plasma glucose (FPG), TT, SHBG, total cholesterol (TC), HDL cholesterol (HDL), LDL cholesterol (LDL), triglycerides (TG) and serum albumin were assessed after an overnight fast. Waist circumference (WC), body mass index (BMI) and blood pressure (BP) were measured. Free testosterone (FT) was calculated using formula validated by Vermeulen. Sexual dysfunction and psychosomatic symptoms were scored using the 5-item International Index of Erectile Function (IIEF) and Aging Male Symptom (AMS) questionnaires, respectively. Subjects were arbitrarily labeled as andropausal (N=66; 35.3%) if they had (i) FT <300 pM and (ii) IIEF <17 or total AMS >50. Data is reported as mean +/- SEM. Results: Both groups had similar mean ages of 54.9 years. Andropausal subjects had lower levels of TT (12.4 +/- 0.4 vs 18.1 +/- 0.4 nM, P <0.001) and FT (239 +/- 5 vs 344 +/- 7 pM, P <0.001). SHBG was lower but just missed statistical significance (35.6 +/- 1.9 vs 40.5 +/- 1.6 nM, P=0.058). They also had larger WC (93.1 +/- 1.2 vs 87.1 +/- 0.9 cm, P <0.001) and BMI (26.0 +/- 0.6 vs 24.3 +/- 0.3 kg/m<sup>2</sup>, P=0.009), as well as higher total AMS (45.3 +/- 1.3 vs 39.3 +/- 1.1, P=0.001) and lower IIEF (11.5 +/- 0.6 vs 14.7 +/- 0.5, P <0.001) scores. AMS sub-scores for sexual (14.9 +/- 0.3 vs 13.4 +/- 0.3, P=0.003), psychological (12.2 +/- 0.6 vs 10.5 +/- 0.4, P=0.018) and

somatic (18.3 +/- 0.6 vs 15.5 +/- 0.5, P=0.001) symptoms were also higher in andropausal men. However, no significant differences in BP, lipid profile or FPG were noted between the 2 groups. Conclusion: Older men with relative androgen deficiency experience more sexual dysfunction and psychosomatic problems compared to those without, independently of age. Although their TT and SHBG were significantly lower, this method of classifying andropause does not identify men with higher metabolic risk, suggesting that andropause is only a quality of life issue.

#### **PB8 396 NUTRITIONAL STATUS IN A GERIATRIC LONG TERM CARE UNIT**

V. GAUTIER\* (GHU Broca -La Collégiale - La Rochefoucauld (APHP), Paris, France)  
F. BLOCH(1), S. HAULON(1), A. SAUTEREAU(1), L. JOFFREDO(1), T. JOUCARD(1), M. MANKOUR(1), G. ABITBOL(1), N. CHARASZ(1) - (1) GHU Broca -La Collégiale - La Rochefoucauld (APHP) (Paris, France)

Introduction: The malnutrition of elderly subjects represents a public health problem. The prevalence of malnutrition is high as well at the people living in the community as those in institution or hospital, and its effects on health are now well recognized. Our objective: was to analyze the nutritional status and the care strategy in case of a protein-energy malnutrition of patients hospitalized in a geriatric long term care unit. Methods and materials We collected, on a one day transversal study, for all the patients in the unit, the last nutritional assessment containing, the body mass index (BMI), biological data and the different type of diets. Results: 226 patients were including ( 174 women (77.0%) and 52 men (23.0%)) with a mean age of 86.5±7.5 years. The average albuminemia was of 34.1 ± 4.0 g/l but 23.9% of the patients did not had a serum albumin dosage. The nutritional status according to albuminemia, was in 41.3% a severe malnutrition, in 9.9% a moderate malnutrition, and no malnutrition in 48.8%. The last albuminemia had been carried out on an average period of 97 ± 77 days before the study, and with a significantly more longer delay in patients with a more severe malnutrition versus those without malnutrition (56.9 ± 57.0 vs 100.6 ± 79.2; p<0.03). The average BMI was of 24.5 ± 5.9 kg/m<sup>2</sup>. The nutritional status according to the BMI was, in 12.2%, a malnutrition, in 12.2% a severe malnutrition and, in 75.6% no malnutrition. The patients who profited from a hyper protein diet (68.0%) had an albuminemia significantly lower (p<0.0001) like their BMI (p=0.002). Conclusion: According to our work the assessment of malnutrition seems to be more precise using the albuminemia than using the BMI.

#### **PB8 397 CARBOXYMETHYLLYSINE AS A MARKER OF CHRONIC METABOLIC COMPLICATIONS AMONG OVERWEIGHT/OBESE PERSONS**

S. DZIEGIELEWSKA\* (University of Medical Sciences, Poznan, Poland)  
E. WYSOCKA(1), M. CYMERYS(2), L. TORLIŃSKI(1), . (1) - (1) University of Medical Sciences, Department of Chemistry and Clinical Biochemistry (Poznan, Poland); (2) University of Medical Sciences, Department of Metabolic and Internal Medicine (Poznan, Poland)

Background: Carboxymethyllysine (CML) is one of the advanced glycation end products. It is proved that concentration of CML increase in hyperglycemia. Obesity and aging are the independent risks for cardiovascular diseases. Protein glycation may join and explain metabolic complications in a context of aging, obesity and leads to better treatment. The aim of the study was to analyze CML in elderly overweight/obese non-diabetic persons. Methods: Elderly overweight (n= 21) (EOV) and obese (n= 17) (EO) were compared with middle-aged overweight (n= 14) (MAOV) and obese (n=22) (MAO) persons respectively. Persons with no acute disease or severe chronic disorder were assessed BMI, percentage of body fat, blood pressure. During OGTT fasting and 2h-glycemia (bioMérieux) were determined then type 2 diabetics were excluded. After overnight fasting subjects were estimated: plasma lipids: total cholesterol, HDL-cholesterol, LDL-cholesterol, triacylglycerols (bioMérieux) and carboxymethyllysine CML (bioLogo). Statistical analysis were done by Statistica for Windows 6.0. Results: 1. Increased CML concentration were found in EOV versus MAOV group (p=0.000001) 2. Increased CML concentration were found in EO versus MAO group (p=0.0000...) 2. No correlations were found in any groups Conclusions: Advances glycated end products such as CML may be good prognostic factor for the late metabolic complications among overweight/obese elderly persons.

#### **PB8 398 CLUSTER ANALYSIS OF THE INCIDENCE OF PEG INDUCED DIARRHOEA IN ELDERLY PATIENTS**

O. GUERIN\* (CHU de DIJON, DIJON, France)  
O. GUÉRIN(1), F. ALLAERT(2) - (1) CHU de Nice - Hôpital de Cimiez - Pôle de Gérontologie (NICE, France); (2) Ceren ESC & DIM (DIJON, France)

Introduction: PEG is an effective osmotic laxative treatment of constipation which can induce a non negligible amount of diarrhoea and therefore may impact on the nurses' burden of work. Methods and materials: Cluster observational study designed to assess the incidence of PEG induced diarrhoea when used for treating constipation in elderly patients and to compare it according the PEG dose. The clusters were defined by hospital were a PEG, with adjustable dose (unit dose <10 g) or not (unit dose>10g), was available for the treatment of constipation in elderly patient. During one week, all patients presenting a constipation requiring PEG were included in all clusters. Results 241 patients were

included respectively in 8 clusters were a PEG, with adjustable dose (PEGAD) was available and 322 in 12 clusters using a PEG with non adjustable dose (PEGNAD). These patients were comparable in age (82.9 vs 83.3 y old), sex (women 73.2% vs 70.0%), diabetes (16.7% vs 18.5%), digestive diseases (13.3v vs 8.9%), infectious syndromes (2.5% vs 5.0%). Diarrhoeas occur in 8.9% of constipation treated with PEG, and with same efficacy, they occur in 5.8% when treated with PEGAD and in 11.2% treated with PEGNAD. Logistic regression adjusted on age, sex ad heath status score, shows that the dose adjustable treatment or not is a significant independent factor of diarrhoea occurrence with an OR of diarrhoea occurrence of 0.4 [0.2;0.9] in case of use of PEGAD. Conclusion. The use of PEGAD for the treatment of constipation in elderly patient which allows an adjustment of the dose according the patient induced two times less of diarrhoea than the use of PEGNAD which has significant consequences both on patients' quality of life and nurses' burden of work.

**PB8 399 RELATION OF VALUES WITH GLYCEMIC INDEX BODYWEIGHT AND WAIST CIRCUMFERENCE**

R. RIETHMÜLLER FRANCO\* (Universidade Regional do Noroeste do Estado do Rio Grande do Sul - UNIJUÍ, Ijuí, Brazil)  
E. MORAES BERLEZI(1), E. BERTOLO(1), L. BENTO FRANZ(1) - (1) UNIJUÍ (Ijuí, Brazil)

Introduction: Obesity represents a serious public health problem due to its magnitude and to be related to many important infirmities of clinic matter. The simultaneous occurrence of abdominal obesity and other scalable factors as diabetes, is a considerable factor risk for cardiovascular disease. This study objective was to check the blood glucose levels with anthropometric measures in postmenopausal women . Materials and methods: this is a cross-sectional descriptive - analytical study. The sample was composed of 107 women, aged between 50 and 65 years. Data collection has occurred through multidimensional, anthropometrical and biochemical interview . Results: In the characterization of the sample, the average age was  $58 \pm 4$ , 39 years. As at blood glucose was found that 86% submitted values of glicemia until 110mg /dl, 4, 7% of 110 to 200 mg / dl and 9,3% above 200 mg / dl. As the abdominal obesity 77,6% of the participants in the evaluation of the Waist Circumference had measures consistent with cardiovascular risk classification from the National Cholesterol Education program 's adult treatment Panel III. In the assessment of body mass index, 33,6% of women were overweight 98.31, 8% with obesity degree I 6,5% with obesity degree II and 4,7% with obesity degree III. Women who have presented cardiovascular risk in the CC evaluation, 4,8% presented glucose intolerance and 10,8% values of glicemia suggestive to diabetes. From the women with glucose intolerance 80% were overweight and/or obese, the same happening to 90% of women with blood glucose values compatible with diabetes. Conclusion: this study reinforces that levels of blood glucose tend to increase with the increase in body weight and the accumulation of abdominal fat. It is necessary to act with this population group to reduce cardiovascular risk through individual and collective strategies overtrade mainly by public services.

**PB8 400 MINI NUTRITIONAL ASSESSMENT: A STUDY OF ASSOCIATION AMONG ANTHROPOMETRIC AND BODY COMPOSITION MEASUREMENTS, SELF HEALTH PERCEPTION AND DIFFICULTY IN DAILY LIFE ACTIVITIES OF A GROUP OF MEXICAN 60 YEARS-OLD AND OLDER PATIENTS**

C. VELAZQUEZ\* (Metropolitan Autonomous University, Mexico City, Mexico)  
E. IRIGOYEN(1), G. SANCHEZ(1), L. GUTIERREZ(1) - (1) Metropolitan Autonomous University (Mexico City, Mexico)

Mini Nutritional Assessment (MNA) evaluation is a standardized instrument useful in the evaluation of nutritional status in elderly people. Objective. Describe the nutritional status of a group of 60 years-old and older patients, obtain their anthropometric body composition measurements, and to study the association among these measurements, self health perception, difficulty in daily life activities and the results of the MNA evaluation. Methods. Is a cross sectional study, it was carried out in a group of females of the Geriatric Clinic at the National Institute of Nutrition. Anthropometric and body composition evaluations were performed with standardized techniques. For the evaluation of nutritional status the MNA assessment was applied. Statistical analysis. Applying the analysis of variance, with the three groups constructed with the MNA score (well nourished, risk of malnutrition and malnutrition) comparisons were performed for the anthropometric and human body composition variables. For the qualitative variables Pearson's  $\chi^2$  test was used. Results. A total of 109 women were included; their mean age was 77.7 years-old (SD 6.58). MNS showed that only 10.1% of the patients have good nutritional status, 58.5% were in the nutritional risk category and 31.3% were in the under nutrition category. Women in the under nutrition group showed values 7.0% lower of lean body mass, also 5.0% lower for fat mass % values than the subjects in the well nourished group ( $p < 0.05$ ). The under nourished women perceived more deterioration in their health status than the elderly women in the well nourished ( $p < 0.01$ ) and showed more difficulties in performing daily life activities. Conclusion: low percent of the elderly women examined were classified in the good nutritional status group according to MNA . Conclusion: The

categories used by the MNA showed differences in the anthropometric, body composition, health perception and capacity to performed daily life activities.

**PB8 401 NUTRITIONAL RISK: AN ISSUE OF EVERYDAY LIFE IN ELDERLY WOMEN IN THE MUNICIPALITY OF GUADALAJARA, MEXICO**

N. MENDOZA\* (Universidad de Guadalajara, Zapopan, Mexico)  
E. ARIAS-MERINO(1), I. DIAZ-GARCÍA(1), A. MORALES-SÁNCHEZ(1) - (1) Universidad de Guadalajara (Guadalajara, Mexico)

INTRODUCTION: There is a clear correlation between nutrition - health, quality of life and welfare. Also it is predictive of morbidity and mortality. Our purpose is to consider the nutritional risk of elderly women of Guadalajara and the related factors. MATERIAL/METHODS: A sample of 638 women was interviewed from October to November 2007. The Nutritional Risk was evaluated with the Nutritional Risk Screening(NRS), sociodemographic data and health. Odd Ratio(OR) and confidence interval (95%) were obtained. RESULTS: Average age  $70.9 \pm 2.7$  (60-95 years), 54,4% with low educational level (<=4 years) and 78,5% with low income <=\$4000 per month (250 E). 87,6% suffered at least one sensorial problem and chronic diseases  $2.63 \pm 2.53$ , the 94,5% are ill and 82,9% take medicines. Those who need dental prosthesis 46,9% does not use it. They present/display 13,6% cognitive deterioration and depression 27,6%. An overwhelming majority lives with NR (82,9%), the 64,2% with high risk, 17,1% without NR. About the RN, the following ORs resulted from these factors: to have depression obtained OR=5.87(IC2.8-12.39), not to use dental prosthesis and to need it OR=4.76(IC1.9-12), to have at least sensorial problem OR=1.93(IC1.1-3.3) in olfactory OR=3.85(IC1.2-12.6). To suffer at least one disease OR=3.12(IC1.5-6.4), cognitive deterioration OR=3.10(IC1.3-7.3), low income OR=1.79(IC1.1-2.8). To be  $\geq 75$  years OR=1.73(IC1.1-2.9), to take medicines OR=1.68(IC1.02-2.8) and low educational level OR=1.58(IC1.04-2.39). CONCLUSIONS: A significant nutritional risk was found in the elderly women and exists an imminent presence of modifiable factors of risk as a preventive measure to delay the disease appearance, to improve the health and life quality.

**PB8 402 DIETARY PATTERN IS ASSOCIATED WITH ALLOSTATIC LOAD AND PHYSICAL DISABILITY IN OLDER PUERTO RICAN ADULTS**

K. TUCKER\* (Tufts University, Boston, MA, United States)  
S. NOEL(1), J. MATTEI(1), N. QIAO(1), L. FALCON(2) - (1) Tufts University (Boston, MA, United States of America); (2) Northeastern University (Boston, MA, United States of America)

Introduction: Puerto Ricans in the United States have disproportionately high prevalence of physical disability. Allostatic load (AL), the cumulative wear and tear of physiological responses to stressors, has been proposed as a possible mechanism for the inequalities observed in minority groups. Dietary intake may contribute to disability through effects on AL. Methods: We examined associations between dietary patterns, AL and Activities of Daily Living (ADL)in 1360 participants in the Boston Puerto Rican Health Study. The AL score was the sum of indicators of high cholesterol,waist circumference, glycosylated hemoglobin, diastolic and systolic blood pressure, urinary epinephrine, norepinephrine and cortisol; and low HDL cholesterol and DHEA-S. Dietary patterns were determined with factor analysis of food group intakes, as % energy. AL and ADL (logged) were each regressed onto quintiles of dietary factor scores, adjusting for age, sex, acculturation, income, smoking and alcohol use. Results: Three dietary dimensions emerged: 1)Meat and fast food, with negative loadings for fruit and vegetables 2) Traditional rice and beans, 3) Sweets. As in other studies, AL was significantly associated with ADL disability ( $P < 0.0001$ ). The fast food/meat dietary factor was significantly associated with AL ( $P < 0.05$ ), ranging from 3.6 for the lowest dietary pattern quintile to 4.2 for the highest ( $P = 0.0008$ ). The same dietary factor was significantly associated with ADL score ( $P < 0.05$ ), and (untransformed) ranged from 2.9 to 3.8 across extreme quintiles ( $P = 0.005$ ). Inclusion of AL in the latter model attenuated these results. Conclusions: Diets that most closely follow the healthy vs. the high fast food/meat dietary pattern may protect against disability at least in part, through effect on AL. Longitudinal studies are needed to clarify the causal pathway.

**PB8 403 LONGEVITY STUDY IN DEBRECEN IV. THE INTERACTION BETWEEN THE PHYSICAL / NUTRITIONAL CULTURE AND THE GENERAL HEALTH STATUS IN THE LONG-LIVED ELDERLY.**

S. HYUN \* (Medical and Health Science Center, University of Debrecen, Debrecen, Hungary)  
A. KOVACS(1), H. SZILVASI(1), Z. SZIKSZAI(2), G. PARAGH(1), S. IMRE(1) - (1) 1 st. Department of Internal Medicine, Medical and Health Science Center, University of Debrecen (Debrecen, Hungary); (2) Institute of Nuclear Research of the Hungarian Academy of Sciences (Hungary)

Introduction: There is a new conception of healthy aging, that is the interaction between health condition and physical/nutritional culture. This interaction was studied in the long-lived elderly (over 90 years old) in Debrecen city, the east of Hungary. Methods: 228 subjects (169 women, 59 men) randomly selected from the total number of the long-lived elderly were examined and interviewed by means of a questionnaire which contained 159

questions regarding their status of health, nutrition, and physical activity. Results: Based on a self-evaluation, 67% of them had good, very good or excellent and 10% of them had bad health conditions. The hypertension (81%), arthrosis, spondylosis (76%), and the hypacusis (74%) are manifested as the major complaints among their sicknesses. The rates of the dementia and NIDDM were 31% and 16%, respectively. The incidence rate of the full urine incontinence was 34% in old people's homes, but it was only seen in 19% of the people living in their own houses. 36% of them do gymnastics regularly (69.5% daily). 50.5% of them have free play, 40.5% barely move in their flats while 9% are bedridden. Most of the elderly who were examined consume fruits (52.6%) and butter/margarine (46.2%) daily. Vegetable (50%) and fowl (65.4%) are consumed several times weekly. 68.4% of them eat 3 times a day. 96.2% of them consume soup daily. 40.2% drink a cup of coffee daily, 31.1% drink tea a couple of times a day, 8.3% consume a glass of wine. 13.2% of them are on a diet [because of bile (51.8%), diabetes (24.1%)]. We found only 2.6% smoking rate. Conclusion: Significant correlations were found between parameters of the health condition and the physical / nutritional culture. These results support a new conception of the healthy aging.

#### **PB8 404 THE ACUTE EFFECTS OF GLUCOSE ON DIVIDED ATTENTION IN OLDER ADULTS: A NEAR-INFRARED SPECTROSCOPY (NIRS) STUDY**

C. GAGNON\* (Université du Québec à Montréal, Centre de recherche de l'Institut universitaire de gériatrie, Montréal, Canada)  
L. DESJARDINS-CRÉPEAU(1), M. DESJARDINS(2), I. TOURNIER(3), F. LESAGE(2), L. BHERER(1) - (1) Université du Québec à Montréal (Montréal, Canada); (2) École Polytechnique de Montréal (Montréal, Canada); (3) Université Bordeaux-II (Bordeaux, France)

Introduction. A growing body of literature suggests that what we eat and how we metabolize food can momentarily influence cognition. This is not a trivial issue relatively to older adults, where the proportion of individuals with dysfunctional metabolism, such as type 2 diabetes, is constantly rising. For example, small rises in blood glucose levels can momentarily improve cognition in healthy seniors (Kaplan et al., 2000). However, very few studies have investigated the effects of glucose on brain activation. Moreover, in studies that have done so, the results are contradictory: one study observed increased brain activation (Stone et al., 2005), whereas another observed decreased brain activation following glucose ingestion, compared to a placebo condition (Riby et al., 2008). This study aims at determining the effects of glucose ingestion on divided attention in healthy older adults and determining its effect on cerebral activation. Method. We conducted a between-subject behavioural study (1) in which we validated that 50g glucose ingestion (compared to placebo) influenced divided attention performances in older adults, and a within-subject study (2) in which we recorded brain activation using near infrared spectroscopy (NIRS) during dual-task execution. In both studies, participants performed two visual discrimination tasks alone and concurrently. Results. Both studies showed better dual-task performances when participants were in the glucose condition, compared to the placebo condition ( $p < .05$ ). This effect was specific to the dual-task condition and was observed for speed (study 1) and accuracy (study 2). Preliminary analyses on brain activation data showed that activation patterns tended to differ between glucose and placebo conditions with a greater activation in frontal regions in the placebo condition. Conclusion. Behavioural and brain activation results from our studies suggest that glucose ingestion can momentarily improve dual-task performances in healthy older adults.

#### **PB8 405 FOOD INGESTION AND ANTHROPOMETRIC STATUS OF ELDERLY PEOPLE**

T. JO MARQUES\* (University of São Paulo, São Paulo, Brazil)  
S. LIMA RIBEIRO(1), A. MARQUES P FREITAS(1), P. CAREY RAMOS(1), P. FERREIRA DE SOUZA(1), L. MELCHIORI LOTTI(1) - (1) USP (São Paulo, Brazil)

Introduction: we had the aim to investigate some aspects of nutritional status in elderly individuals. Methods and materials: we studied 136 individuals above 60 years old- 117 women (87.5%) and 17 men (12.5%) from São Paulo- Brazil. Evaluated variables: a-) 24-food recall analyzed from: energy, macronutrients, calcium and iron; frequency and number of servings of each food group, number of meals per day; b-) energy expenditure from a physical activity diary, calculated from METs and after converted to kilocalories; c-) anthropometric analysis: - weight and height (to calculate body mass index- BMI), arm (AC), calf (CC) and waist (WC) circumferences. Also, individuals above 70 years old were compared with individuals under 70y by t-student test. Main results: BMI values (mean=28.3±4kg/m<sup>2</sup>) pointed, in most of the individuals, overweight and obesity; waist circumference (mean= 99±9cm) indicated that most individuals presented risk for chronic diseases; calf circumference (mean =36.2±3.9cm) did not point any signal of deficiency; energy balance from these individuals was negative (mean energy ingested =1193 ± 415Kcal; energy expenditure= 2051± 865Kcal; energy balance= -858 ± 726Kcal). Consumption of cereals (median= 3.0 servings), vegetables (median= 1.0 serving), fruits (median=1.0 serving) and dairy (median=1.2 servings) were under the suggested by Brazilian guide. There were not any difference in food ingestion and anthropometric values when comparing individual under and above 70y. The mean number of meals was 3.0, and the older persons (>70y) ingested lower number of meals than younger ones (<70y). All the anthropometric variables correlated significantly with energy balance, with  $p<0.05$ . Conclusions: observing energy balance and anthropometric values, we can conclude that

elderly tended to underestimate their food ingestion; it is necessary to look for the appropriate methods to investigate food ingestion by elderly people. Nutrition education programs could be a good strategy to enhance the food behavior of these individuals.

#### **PB8 406 COMPREHENSIVE GERIATRIC ASSESSMENT OF ELDERLY HIGHLANDERS IN QINGHAI, CHINA ; FOOD DIVERSITY AND HEALTH OF HAN AND TIBETAN ELDERLY**

Y. KIMURA\* (Kyoto University, Kyoto, Japan)  
K. MATSUBAYASHI(1), T. WADA(1), K. OKUMIYA(1), M. ISHINE(1), R. SAKAMOTO(1), Y. ISHIMOTO(1), Y. KASAHARA(1) - (1) Kyoto University (Kyoto, Japan)

Introduction: In highland, with harsh natural environment, it seems to have been insufficient to get various foods because of the limitation of food resources. However, in recent years, food availability has changed with transition to market economy and this change might have been effected food diversity. With this background, this study aim to examine the association between food diversity and health status of the Han and Tibetan elderly highlanders conducting the Comprehensive Geriatric Assessment in Qinghai plateau, China. Methods: The study population consisted of 240 community-dwelling elderly subjects aged 60 years or more (176 Han elderly subjects, 64 Tibetan ones). Food diversity was determined using an 11-item Food Diversity Score Kyoto (FDSK-11). Health status including activities of daily living (ADL), screening-based depression and quality of life (QOL) were interviewed. Blood chemical investigation was carried out in association with food diversity. Results: ADL was significantly lower both in the Han and Tibetan elderly with lower food diversity than those with higher diversity. In Han elderly with lower food diversity, QOL were significantly lower in the items of subjective sense of health, relationship with family and subjective happiness, but not significant in Tibetan elderly. A close association was found between lower food diversity and lower financial satisfaction in both Han and Tibetan ones. No association was found between food diversity and age as well as BMI. Higher food diversity was associated with lower blood glucose level in Han elderly subjects, but opposite association was found in Tibetan ones. Conclusion: Food diversity was associated with ADL and QOL even in highlanders in Qinghai, China. Food assessment is very important as a useful indicator to know the actual condition of diet and its relation to health status of the community-dwelling elderly as well as the change of economical background in Qinghai highland.

#### **PB8 407 ELEVATED ENDOGENOUS DEHYDROEPIANDROSTERONE SULFATE LEVEL CORRELATES WITH INCREASED RISK OF METABOLIC SYNDROME IN ELDER TAIWANESE MEN**

C. WEN\* (National Taiwan University Hospital, Taipei, Taiwan)  
K. HUANG(1), Y. CHEN(2), C. CHEN(3) - (1) National Taiwan University Hospital (Taipei, Taiwan); (2) Taipei City Hospital , ZhongXing Branch (Taipei, Taiwan); (3) National Health Research Institutes (Taiwan)

Introduction: In the past studies, the result of the relationship between endogenous Dehydroepiandrosterone Sulfate (DHEA-S) level and metabolic syndrome in the aging population has been inconsistent. This study is aimed to evaluate the relationship between DHEA-S level and metabolic syndrome in elder Taiwanese men. Methods and materials: Our cross-sectional study enrolled 585 men above 54 years of age. It was part of the Social Environment and Biomarkers of Aging Study (SEBAS) which was performed in 2000. Study participants were healthy community-dwelling elder men who lived in 10 different townships in Taiwan. For each participant, we collected serum concentrations of DHEA-S, fasting glucose, lipid profiles, liver function test and albumin. Body mass index (BMI), waist-hip circumference, blood pressure, physical activities were assessed. Metabolic syndrome was defined according to the America Heart Association/National Heart Lung Blood Institute definition (AHA/NHLBI). Results: After adjustment for age, smoking, alcohol, physical activities, and albumin, multivariate logistic regression showed positive relationship between DHEA-S value and metabolic syndrome ( $P<0.001$ ) in elder men. When dividing into four groups according to DHEA-S level, the highest DHEA-S quartile group had strongly increased risk of metabolic syndrome comparing to the lowest quartile group ( $OR=2.31$ , 95% confidence interval: 1.36-3.91,  $P <0.01$ ). However, we didn't find significant association between DHEA-S level and lipid profile, or waist circumference. Conclusion: Our data revealed that the prevalence of metabolic syndrome increased with elevated DHEA-S level in aging Taiwanese males. Further study is required to prove the mechanism.

#### **PB8 408 PREPARATION OF MEALS WITH HIGH NUTRITIONAL VALUES**

K. SOULIER\* (Département de gériatrie, Clermont-Ferrand, France)  
C. BOUCHICHE(1), F. DUSART(1), B. LESOURD(1) - (1) Département de gériatrie, Faculté de médecine (Clermont-Ferrand, France)

Introduction : Many aged persons, not only those living in nursing homes, but also some living in their private homes do not eat enough to cover their needs. We studied food intakes in several nursing homes in Auvergne: 30-40% of 287 residents, (87 y.o.), eat less than 1500 kcal/d and less than 30% reach the French RDAs. At homes, 11% do not eat 1300 kcal/d and only 50% reach RDAs, even though those 452 aged persons are younger

(79 y.o.) and less dependent. Methods: Therefore, we built a special training program for cooks. Such a program focus on: dish plan to reach day to day adapted food equilibrium for aged persons, the way to prepare enriched food of better nutrient content compared to what is on the market, and also on the quantity that needs to be served. Of course the training specially emphasize on preparation for tasty food, adapted for elderly taste, in order to increase food intakes. Before training the mixed preparation whatever routinely prepared by the home cooks, or served from commercial ready to use preparations bring 230-250 kcal and 9-16 g of protein for 200g meat-vegetable mixed dish. After training, similar size dishes bring 480-500 kcal and 17-37 g of proteins, depending of the cook investment. In addition those enriched food preparations also have higher calcium (until 360 mg) and higher fibre's contents (lower potatoes and higher vegetable contents). This was done by adding to classical recipes either condensed milk, milk, extra eggs, allowing us to prepare tasty dishes. Particular attention was also given to serve dishes in more attractive plate presentation. Results: No effect was observed 2 month after the training, neither the dish content nor for resident consumption, showing that a period is needed for the cook to follow training instructions. In contrast, 5 month later, food served at lunch had increased of 425 kcal, 19g of protein and 216 g of calcium. Food consumption was also increased in initially low eaters (< 20 kcal/d) : intakes raised of 4.4 kcal/kg/d, of 0.2 g of protein/kg/d and calcium of 242 mg/d. In big eaters (>30 kcal/kg/d), as well as in middle eaters, the progressive declining in food intakes generally observed is slowed down. In addition such effect on food intakes was correlated with lower declining in Activity of Daily Living. Conclusion: Cook training is an effective way to slow down decreased intakes in Home residents. In addition adapted regularly served enriched food, permits to increase food consumption in low eaters.

**PB8 409 ELDERLY IS ASSOCIATED WITH HIGHER PREVALENCE OF METABOLIC SYNDROME IN A TAIWANESE METROPOLITAN ADULT POPULATION**

C. LIN\* (China Medical University Hospital, Taichung, Taiwan)  
T. LI(1), C. LIU(2), W. LIN(1), C. LI(2), C. CHANG(2) - (1) China Medical University (Taichung, Taiwan); (2) China Medical University Hospital (Taichung, Taiwan)

Introduction: The objective of this study was to assess the association between metabolic syndrome with age in a Taiwanese metropolitan adult general population. Methods and materials: We had a random sample of 1,559 Taiwanese adults aged 50 years and over who lived in a metropolitan city, Taiwan in 2004-05. Metabolic syndrome was defined according to the criteria of American Heart Association and National Heart Lung and Blood Institute (AHA/NHLBI). Results: The prevalence of metabolic syndrome in individuals aged 50-65 and >=65 years old was 43.25% and 51.18%, respectively for males, and 42.11% and 58.64%, respectively for females. Number of metabolic syndrome components was significantly higher in elderly participants (0.18 and 0.68 components higher compared to individuals aged 50-65 in males and females, respectively; p=0.057 in males and p<0.001 in females). After adjusting for smoking, alcohol drinking, and family history of DM, elderly was associated with an OR of 1.54 (95% confidence interval [CI]: 1.14, 2.07) in males and with an OR of 2.06 (95% CI: 1.48, 2.86) in females for metabolic syndrome. When we categorized age into 5-year intervals, we observed significant trend effect for age on metabolic syndrome in men and women (both p<0.001). Conclusion: Our findings show that elderly is associated with increased prevalence of metabolic syndrome. This association is consistent in men and women.

**PB8 410 EFFECT OF AGE ON RENAL FUNCTION ESTIMATED BY GLOMERULAR FILTRATION RATE IN A TAIWANESE METROPOLITAN ADULT POPULATION**

T. LI\* (China Medical University, Taichung, Taiwan)  
C. LIN(1), C. LIU(1), W. LIN(1), C. LI(1), C. LIN(1) - (1) China Medical University Hospital (Taichung, Taiwan)

Introduction: The objective of this study was to assess the effect of age on renal function estimated by glomerular filtration rate in a Taiwanese metropolitan adult general population. Methods and materials: We conducted a population-based cross-sectional survey in a random sample of 1,559 Taiwanese adults aged 50 years and over who lived in a metropolitan city, Taiwan in 2004-05. Renal function was assessed with estimated glomerular filtration rate (GFR) using the modified Modification of Diet in Renal Disease (MDRD) Study equation. Results: Of the participants, 999 (64.1%) were 50-65 years old and 560 (35.9%) were over 65 years. The GFR level was significantly lower among elders (-11.0 and -14.3 mL/min/1.73 m<sup>2</sup> compared to individuals of 50-65 years for males and females, respectively; both p<0.001). After adjusting for smoking, alcohol drinking, central obesity, and abnormalities of components of metabolic syndrome, elders was associated with an OR of 4.05 (95% confidence interval [CI]: 2.51, 6.52) in males and with an OR of 5.53 (95% CI: 3.08, 9.93) in females for decreased kidney function (GFR<60 mL/min/1.73 m<sup>2</sup>). When we categorized age into 5-year intervals, we observed significant trend effect for age on decreased kidney function in men and women (both p<0.001). Conclusion: Our

findings show that elderly is associated with decreased renal function estimated by GFR. This association is stronger in females than in males.

**PB8 411 LIFETIME DIET AND COGNITIVE PERFORMANCE IN AN OLDER COMMUNITY-DWELLING POPULATION**

D. HOSKING\* (CSIRO Human Nutrition, Adelaide, Australia)  
V. DANTHIIR(1), T. NETTELBECK(2), C. WILSON(3) - (1) CSIRO Human Nutrition (Adelaide, Australia); (2) University of Adelaide (Adelaide, Australia); (3) Cancer Council of South Australia (Adelaide, Australia)

Introduction - Research has identified the possible role of diet in age-related cognitive decline and cognitive impairment. Epidemiological studies suggest that dietary factors are associated with the aetiology of cancer and cardiovascular disease, playing a role several years before diagnosis. However, possible long-term influences of diet on cognitive status in old age have not been investigated. Methods and Materials - A sample of 314 community-dwelling older adults (Females = 163) completed a non-quantitative food frequency questionnaire designed to assess lifetime diet. Ages ranged from 65 to 91 years (M = 72.95, SD = 5.44) with a mean of 13 years of education (SD = 4.0). Participants also undertook an extensive battery of computerised and pencil and paper cognitive tasks to assess reasoning, knowledge, perceptual speed, memory, choice-reaction time and inhibition. Principle components analysis was performed on each of the lifetime periods to determine possible dietary patterns within those periods. Relationships were then examined between dietary patterns and performance on the cognitive tasks. Factor scores derived from confirmatory factor analytic models of the cognitive domains were the dependent variables in these analyses. Co-variates included current diet, physical activity, smoking status, and relevant health and demographic variables. Results - Three common dietary patterns emerged within each life-period; they were labelled 'Traditional Australian' 'European/Mediterranean' and 'Sweets and Processed foods'. Associations between dietary patterns across different life-periods, cognitive outcomes, and demographic influences will be discussed. Conclusion - Dietary intake across the lifetime, as measured by this retrospective food frequency questionnaire, may be related to cognitive status in later life.

**PB8 412 THE NUTRITION STATUS AND EATING HABITS OF ELDERLY INHABITANTS OF KRAKOW CITY (POLAND)**

K. SZCZERBINSKA\* (Institute of Public Health, Faculty of Health Sciences, Jagiellonian University Medical College, Kraków, Poland)  
B. PIÓRECKA(1), M. CISEK(2), A. GNIADEK(2), K. SZCZERBIŃSKA(3), I. CHMIEL(2), M. SCHLEGEL-ZAWADZKA(1) - (1) Human Nutrition Department, Institute of Public Health, Faculty of Health Sciences, Jagiellonian University Medical College, (Kraków, Poland); (2) Internal and Community Nursing Department, Institute of Nursing and Midwifery, Faculty of Health Sciences, Jagiellonian University Medical College, (Kraków, Poland); (3) Health Promotion Unit, Institute of Public Health, Faculty of Health Sciences, Jagiellonian University Medical College, (Kraków, Poland)

Introduction: The excess of weight among elderly in Poland is more prevalent than its deficiency. It is highly associated with a risk of cardiovascular diseases. The aim of study was assessment of nutrition status and eating habits of persons aged 60 and more, living in the community in a large city. Methods and material: 422 patients aged 60 and more (146 men, 276 women) who visited primary care outpatient clinic were examined by family nurses. Basic anthropometric measures, BMI and circumference of the abdomen were taken according to IDF recommendations for the central obesity diagnosis (WC: M > 94 cm and F > 80 cm). MNA was applied for the risk of undernutrition. Food frequency questionnaire of select products and meals was used to test the eating habits. Statistical analysis was done with U Manna-Whitney's and Kruskal-Wallis tests. Results: Mean age of elderly was 71.91y (SD=7.07). They suffered most often from hypertension (53.4%), other cardiovascular diseases (11.8%) and diabetes (10.7%). Mean value of BMI was significantly higher among male than female (26.95kg/m<sup>2</sup> vs. 26.16kg/m<sup>2</sup>). Obesity (BMI > 30kg/m<sup>2</sup>) was diagnosed in 20.62% of all participants. The prevalence of central type of obesity (63.1%) was significantly higher among men (p< 0.03). However, about 48.8 % patients according to MNA pre-test were a risk of undernutrition. Assessment of frequency of select products and meals intake proved significantly better healthy eating behaviors among women, while men more often preferred red meat, alcohol beverages and snacks. Moreover, some demographic factors like higher education, income and younger age were related to better health status perception, lower BMI and healthy eating style. Conclusions: Coincidence of high prevalence of undernutrition with central obesity occurrence among elderly patients admitted to primary care clinic is the most striking result. Medical staff should put more attention to that.

**PB8 413 ASSOCIATION OF WAIST CIRCUMFERENCE WITH OTHER FACTORS RELATED WITH METABOLIC SYNDROME IN ELDERLY**

S. HOMMA\* (School of Medicine, Keio University, Tokyo, Japan)  
H. KINOSHITA(1), T. MIZOGUCHI(2), Y. MURAI(3) - (1) Tokyo Metropolitan Bokutoh Hospital (Tokyo, Japan); (2) Clinic of Higashi-Murayama Nursing Home (Tokyo, Japan); (3) Tama-Hokubu Medical Center (Tokyo, Japan)

**Introduction:** Little is known about what parameter is related to the pathogenesis of metabolic syndrome (MS) for elderly people. We examined correlations among aging, waist circumference and other MS-related factors including serum adiponectin concentration using the subjects of the baseline cohort of elderly people. Methods and materials: The cohort comprises of 278 elderly subjects (147 female) living in the home for aged conducted by Tokyo Metropolitan. The subjects, ranging from 65 to 99 years old, could stand by themselves on daily living. The present study used the clinical data checked on entry of the cohort study in 2006. Results: Average waist circumference was smaller in the subjects aged 80 and more (82.5cm) than that under 80 years old (84.2cm). Stepwise regression analysis of waist circumference with variable factors indicated that waist circumference associated with female sex, diastolic blood pressure, HbA1c, and negatively with systolic blood pressure, serum concentration of high-density lipoprotein cholesterol (HDL-C) and adiponectin. The stepwise regression analysis of body mass index (BMI) also exhibited the correlations with female sex, diastolic blood pressure, HbA1c, and negatively with systolic blood pressure, and HDL-C. However, serum concentration of adiponectin did not associate with BMI, but hemoglobin concentration, instead, correlated with BMI. Serum concentration of hemoglobin, albumin and total cholesterol, which were known to be indicators of nutrition status in elderly people, were smaller in the oldest age group than in the youngest group of the cohort. On the contrary, serum adiponectin showed the greatest in the oldest age group. Conclusion: Waist circumference correlated with MS-related factors including adiponectin also in elderly people. BMI suggested a better indicator for nutrition status compared to waist circumference. Greater concentration of serum adiponectin should be a factor for longevity.

**PB8 414 ACUTE EFFECT OF AEROBIC AND ANAEROBIC PHYSICAL ACTIVITY IN THE INSULIN SENSIBILITY IN SENIORS WITH TYPE 2 DIABETES**  
D. CHRISTINE MARINHO ARAUJO SILVA\* (Pernambuco University- Brazil, Recife, Brazil)

W. SERRANO SMETHRUST(1), D. CELESTINO SOBRAL FILHO (1), J. MUNIZ BARRETO DE OLIVEIRA(1), M. DO CARMO LENCASTRE LINS(3), M. DE FATIMA MONTEIRO(2), A. HENRIQUE RODRIGUES DE ANDRADE LIMA(1), S. LIRA QUEIROZ(1), G. FELIPE MUNIZ AYRES(1), A. HENRIQUE SILVA FERREIRA(1), R. RAIZA MONTERAZO CYSNEIRO(1) - (1) Pernambuco University (Recife, Brazil); (2) University Hospital Oswaldo Cruz (Recife, Brazil); (3) Real Portuguese Hospital of Charity of Recife (Recife, Brazil)

**Introduction:** The objective of this study was to compare the acute effect of aerobic and anaerobic physical activities in the insulin sensibility in diabetic seniors. Methods and Materials: A clinical essay in a crossover design was held from August to December of 2008 with 20 female and 5 male diabetic seniors (60-85 years old) assisted at the Geriatric Service of the Real Portuguese Hospital of Charity of Recife, PE - Brazil. They performed an aerobic exercise (20 minutes walk in an electric treadmill at 40% of the individual maximum capacity), and after an interval of one week, they performed an anaerobic exercise session (3 sets of 6 resisted exercises for the whole body at 70-80 % of the individual maximum capacity) during 20 minutes. It was collected samples of blood for dosage of the glycemic levels and fast insulin 24 hours before the exercise interventions and after each one of them. To determine the insulin sensibility degree it was used the model of homeostatic evaluation (HOMA-IR) that is calculated from the glucose dosage and the fast insulin. In this research, it was defined 3,0 as the value of HOMA-IR as cutoff level. The comparisons of HOMA-IR among the two types of exercise were accomplished through the Wilcoxon test for parity samples, since they presented a pronounced positive asymmetry distribution. Results and Conclusions: It was obtained as result the indication of a significant reduction of the values of HOMA-IR after the anaerobic exercise in relation to the aerobic exercise ( $p=0.001$ ). The median of the reduction in the values of HOMA-IR was estimated in 0,43 (IC 95%:0,25 to 1,06). Although the medical community, in general, priorly stimulate the aerobic physical activity for diabetic elders, this study revealed a better acute effect of the resisted exercises in the insulin sensibility.

**PB8 415 A STUDY ON RELATED FACTORS OF METABOLIC SYNDROME OF THE ELDERLY LIVING IN TAIWAN RURAL AREA**

Y. YANG\* (Institute of Medicine, Chung Shan Medical University, National Project for Excellence in Geriatric Ca, Taichung, Taiwan)  
H. CHUANG(2), Y. YI-SUN(1), H. CHIEN-NING(3) - (1) Institute of Medicine, Chung Shan Medical University, National Project for Excellence in Geriatric Care Education (Taiwan); (2) Division of Endocrinology & Metabolism, Department of Internal Medicine, Chung Shan Medical University Hospital, Taichung, Taiwan, Institute of Medicine, Chung Shan Medical University, National Projec (Taiwan); (3) Division of Endocrinology & Metabolism, Department of Internal Medicine, Chung Shan Medical University Hospital, (Taichung, Taiwan)

**Introduction:** To examine the prevalence of metabolic syndrome (MS) in a rural area of Taiwan and associated risk factors to document emerging problems as a basis for preventive and/or therapeutic interventions in the elderly. Methods and materials: Using the Adult Preventive Care under National Health Insurance System data (2007) to analyze the prevalence rates and its associated factors for MS. A sample of 638 noninstitutionalized Taiwanese aged  $>= 40$  were collected. Fruit/vegetable intake, daily physical activity, and smoking behaviors; biochemistry and demographic variables were recorded. Diagnosis

of MS was based on the National Cholesterol Education Program (ATP III), waist circumference modified by the Taiwan Health Bureau criteria (male  $> 90$  cm, female  $> 80$  cm). Prevalence, chi-square, and regression analyses were done. Results: From 638 subjects, 293 were aged more than 65, among these 139 (47.4%) were males. The MS prevalence was 16.7% and 20.4% for age  $< 65$  and  $> 65$ , respectively. For the group of age  $< 65$ , 24.2% in males and 14.6% in females; 19.4% in males and 20.6% in females for the age  $> 65$ . Of the five risk factors, central obesity, hypertension, and elevated triglyceride were the most prevalent in the elderly. Body mass index  $> 27$  kg/m<sup>2</sup> was the least prevalent component. Using multiple regression analyses, among the MS components, triglyceride  $> 150$  mg/dl, waist circumference  $> 90$  in female and 80 cm in female, and systolic blood pressure  $> 130$  mmHg were predictors ( $p < .001$ ). In addition, elevated GPT and decrease physical activity were also predictors of MS in elderly ( $p < .001$ ). Conclusion: prevalence of MS for the elderly living in Taiwan rural area was high, similar to that in urban area. These findings reveal that MS screening should be emphasized for waist circumference, blood pressure monitoring and laboratory exam. Population-wide management strategies are apparently needed.

**PB8 416 SELF-REPORT ADHERENCE IN DIABETIC ELDERLY PATIENTS AND ASSOCIATED FACTORS**

C. SILVEIRA NETTO TRENTIN\* (Pontifícia Universidade Católica do Rio Grande do Sul, Porto Alegre, Brazil)  
M. WERLANG(1), R. MILANI EL KIK(2), I. GOMES DA SILVA FILHO(3) - (1) Pontifícia Universidade Católica do Rio Grande do Sul (Porto Alegre, Brazil); (2) Hospital São Lucas PUCRS (Porto Alegre, Brazil); (3) Instituto de Geriatria e Gerontologia (Porto Alegre, Brazil)

**Introduction** The quality of life of older people depends directly on his health. The control of chronic diseases is crucial in the prevention of its complications, particularly diabetes mellitus (DM), which affects a quarter of the population above 60 years old from Porto Alegre. The objective of this work was to verify adherence to drug treatment in elderly diabetics, and its association with the feeding habits and demographics. Methods and materials We studied 109 elderly patients with diagnosis of DM in the municipality of Porto Alegre, derived from a population-based cross-sectional study. All the elderly were evaluated by a pharmacist and a nutritionist. The Morinsky's questionnaire was used to assess the adherence, and a questioning of the usual diet to verify the total and proportional consumption of carbohydrates. Results 28.6% were high adherent, 58.2% were medium adherent and 13.3% are low adherent. The consumption of carbohydrates was  $56 \pm 9\%$  and was significantly higher in medium adherents. The average of medicines used was  $4.3 \pm 3.0$ . There was a trend to greater age and greater number of drugs used in the more adherent elderly. Conclusion Only 28% of elderly patients reported closely follow the prescription. A pharmaceutical intervention based on education about the disease could perhaps improve the degree of adherence of these elderly. We believe that populational educative measures can provide an early diagnosis and a better awareness of the importance of its control to avoid complications and hence a better quality of life.

**PB8 417 OVERZEALOUS THERAPY OF TYPE 2 DIABETES IN GERIATRIC PATIENTS**

B. BOLAND\* (St-Luc Hospital, UCLouvain, Brussels, Belgium)  
P. CAVRENNE(1) - (1) St-Luc university hospital, UCLouvain (Brussels, Belgium)

**Introduction.** Type 2 diabetes is frequent in elderly patients ( $\geq 75$  years) and its control - reflected by glycated hemoglobin (HbA1C) - is based on glucose-lowering drugs. The lower the HbA1C, the higher the risk of hypoglycaemia and its complications (e.g. cognitive dysfunctions, falls). In frail elderly diabetic patients, HbA1C target value should range from 7.5% to 8.5% according to the EUGMS guidelines. Methods. Retrospective analytic study of consecutive frail elderly type 2 diabetes patients whose HbA1c was measured upon admission in our hospital geriatric division (2005-2008). Following the EUGMS guidelines, we defined (and excluded) patients without frailty criteria (ADL dependency, cognitive disorders, co-morbidity and nursing home residency) and defined low HbA1C ( $< 7.5\%$ ). Results. Of 189 elderly frail type 2 diabetic patients (mean age  $83 \pm 5$  yrs; 52% female), 144 (76 %) had low HbA1C. This feature was more frequent in patients aged  $\geq 85$  yrs (OR 1.97) and in men (OR 1.74), although not statistically significant. Low HbA1C was not associated with any of the four frailty criteria. Among home-residing patients (n=138), low HbA1C was much less frequent in those living alone (31vs.61%; OR 0.29, 95%CI 0.13-0.66; p<0.01). Low HbA1C prevalence was not significantly lower in the presence of insulin resistance features (e.g. hypertension OR 0.75; obesity OR 0.53), but was much less present in patients on insulin (19vs.69%; OR 0.11, 95%CI 0.04-0.29, p<0.001). Conclusions. HbA1C was too low in a large majority of elderly frail diabetic patients. Two protective factors against chronic low glycaemic levels were insulin treatment and living alone at home. This latter puzzling observation raises the question of low - and thereby safer - adherence with glucose-lowering drugs. HbA1C should be monitored in elderly frail diabetic patients on oral anti-diabetic drugs - especially in old old ones - and dosage reduced accordingly.

**PB8 418 WOUND HEALING & PERIPHERAL PARENTERAL NUTRITION: A CASE REPORT**

K. LIU\* (Prince of Wales Hospital, Hong Kong , Hong Kong)  
D. DAI(1), T. TING(1), W. HO(1), J. WOO(1), L. HUNG(1) - (1) Prince of Wales Hospital (Hong Kong)

Introduction: Pressure ulcers cause considerable suffering for patients and high financial burden for the health care system, particularly of the geriatric patient and persons who was immobilized. Nutritional status may dramatically influence the healing process. The use of peripheral parenteral nutrition (PPN) is worthwhile for severe pressure sores refractory to conventional treatment. This may reduce costs from lengthy hospital stay, dressing materials and manpower. In addition, PPN is more acceptable than total parenteral nutrition(TPN) by :1) obviating the need for central line, 2) infusion of less hypertonic solutions ,3) reducing chance of metabolic complications, and 4) increasing calorie source along with fat emulsion . Aim: To report the use of PPN improved wound healing of refractory pressure sores. Methods: A patients with grade IV severe pressure were managed with surgical debridement. Their nutrition status was assessed by dietian and geriatricians clinically and biochemically. PPN was commenced for 21 days. The wound was regular by wound charting and serial taking digital photography. Result: An 86-years-old lady has of Alzheimer disease. She was progressively worsen despite the use of medications of Rivastigmine. Her mobility and appetite were decreased in recent three months resulting in a severe grade IV bedsore 7x6 cm in size. Despite intense community nurse wound dressing cares, oral antibiotics,her wound was getting severe. She was admitted to Her first blood test result of white cell count, WCC is  $5.5 \times 10^9/L$  and lymphocyte count is  $0.6 \times 10^9/L$ , albumin (alb) is 31g/L, total cholesterol (TC) is 4.7 mmol/l, Triglycerides (TG) is 1.3mmol/l and C reactive protein (CRP) is 37.5mg/L.Surgical debridement was done. After geriatricians and dietian assessment, peripheral parenteral nutrition was commenced for 21 days. Her wound is markedly improved as 4x5.5 cm grade II. Her Body weight was increased 2Kg e.g 5 % increase of her usual body weight. Her blood test of lymphocyte count is increased to  $1 \times 10^9/L$ , alb is increased to 37g/L, TC was increased to 4.7mmol/l and TG is increased to 1.4 mmol/l. CRP is decreased to 4.8 mg/l Conclusion: PPN is not yet regarded as a form of nutritional management for pressure sore healing. Oral dietary intervention on pressure ulcer healing is not effective. PPN offers aggressive nutritional augmentation which enhances wound healing, saves cost and reduce physical suffering.

**PB8 419 METABOLIC SYNDROME IN THE PREDICTION OF ALL-CAUSE MORTALITY AMONG OLDEST OLD INSTITUTIONALIZED CHINESE MEN IN TAIWAN**

C. LIN\* (Taichung Veterans General Hospital, Taichung, Taiwan)  
Y. TANG (1) - (1) Taichung Veterans General Hospital (Taichung, Taiwan)

**ABSTRACT INTRODUCTION:** The metabolic syndrome (MS) is associated with increased cardiovascular morbidity and mortality. But the data between metabolic syndrome and all cause mortality in elderly people are lacking. **METHODS AND MATERIALS:** A longitudinal study was performed in Chung-Wha self pay assistant daily living, Taiwan. All data are collected in 2002, and follow up the conditions of residents in that assistant daily living till 2008. **RESULTS:** A total of 369 residents were enrolled (mean age:  $78.92 \pm 4.00$  years, 100% males). During following period, 97 residents died (mean age:  $79.02 \pm 3.79$  years) and 176 residents (mean age:  $78.3 \pm 3.72$  years) still live in that assistant daily living. There are no significant difference among Waist, HDL, Blood pressure and Fasting blood sugar in those 2 groups, but the TG is significant ( $P=0.038$ ). The prevalence of metabolic syndrome in 2 groups are the same. **CONCLUSIONS:** metabolic syndrome can not predict the all-cause mortality among oldest old institutionalized Chinese men in Taiwan

**PB8 420 CLINICAL DESCRIPTION OF SLEEP APNEA SYNDROME IN THE ELDERLY**

P. DEBLOIS\* (Centre hospitalier de Gonesse, Gonesse, France)  
N. ZREK(1), H. KHEMLICHE(2), F. CHELIOUT-HERAUT(3), M. OUAYOUN(4),  
J. GUILLAUME(4), F. BOUR(1) - (1) Centre Hospitalier (Gonesse, France); (2) Centre Hospitalier (Senlis, France); (3) Université Paris ouest (95500, France); (4) Université Paris nord (Bobigny, France)

Introduction The sleep apnea syndrome (SAS) is a frequent and severe pathology. The aim of this study was to describe the semiology of SAS in the elderly, which has not been done so far. Methods and materials Sixty-one community-dwelling patients aged 60 years or more, suspect of SAS, had polygraphy or polysomnography. Several data were collected: gender, age, body mass index (BMI), diurnal [among which sleepiness (Epworth scale)] and nocturnal symptoms, and vigilance [Oxford sleep resistance test (OSleR)]. The results were compared between gender and to the literature. Results The data of 59 patients were available (men: 78%, mean age = 70 years for the men and the women). SAS was confirmed [apnea-hypopnea index (AHI) = 10/h or more] for 83%. 78% were men. 63% were severe (AHI = 30 or more). In the severe SAS group, BMI was 35 or more for 21% of men and 50% of women. The sleepiness was not high (Epworth < 10) for 75% of severe SAS and for 63% of non-SAS patients. The vigilance was altered in 74% of SAS and 50% of non-SAS patients. Morning headaches existed in 23% of men with or without SAS.

Snoring and nocturia were reported by 50% of non-SAS- and 100% of SAS-women and 83 and 88% of all men. Memory complaint was expressed by 75% of non-SAS men, 41% of SAS men and 88% of severe SAS women. There was no memory complaint for 81% of men and 14% of women with both severe SAS and altered vigilance. Conclusion In the elderly, SAS is frequent even for women, or without obesity or sleepiness; headache have no diagnostic value in men; snoring, memory complaint and nocturia in women, altered vigilance in both sexes suggest SAS; and lack of memory complaint suggests associated cognitive impairment.

**PB8 421 GERIATRIC DIABETIC PATIENTS IN AN INTERNAL MEDICINA WARD**

H. LEITE GRUNER\* (Hospital Curry Cabral, Lisbon, Portugal)  
A. ALVES(1), A. CHIPEPO(1), A. FERREIRA(1), M. VENTURA(1), V. RISCADO(1) - (1) Hospital Curry Cabral (Portugal)

Diabetes is a prevalent disease with important morbidity and mortality in particular in the elderly. This study aims to document and contribute towards the better knowledge,of the specific characteristics,of this population. The authors made a retrospective study of all the diabetic patients admitted to an internal medicine ward during 2 years (1january2007 to 31december2008). The patients were divided in two groups: grpA<65years and grpB>65years, and characterised according to age, sex, admission, comorbidities, complications, mortality and medication at discharge. Of the 3296patients admitted, 849(25.8%)were diabetic, had an average age of 72,27years and 436(51.4%)were female. There were 188(22,1%)patients in grpA, of which 14(7,4%) were Diabetic type1, and 661(77,9%) in grpB. The average length of stay was grpA9,2, grpB8,9days and diabetes was the cause of admission in grpA14(7,4%),grpB39(5,9%)patients. The n° of comorbidities was grpA5,34,grpB5,5, of which: Hypertension grpA129(68,6%),grpB519(78,52%), Atrial fibrillation grpA4(2,1%),grpB127(19,2%), Dislipidemia grpA56(29,8%),grpB146(22,1%), Obesity grpA19(10,1%),grpB24(3,63%). Urinary and Respiratory infection were present in grpA71(51,6%),grpB332(50,2%). Concerning micro and macrovascular complications: ischaemic cardiopathy grpA73(38,3%),grpB219(33,1%), stroke grpA45(23,9%),grpB126(19,1%), myocardial infarction grpA12(6,38%),grpB21(3,18%). The mortality was grpA15(7,9%), grpB73(11,04%). Despite the limitations of the study, we clearly witness the enormous prevalence of diabetes, (25% of all the patients) and the inherent complications it brings and costs it implies. Diabetics were mainly elderly patients, with an average length of stay (9,02daysVS10,7days) and mortality(10,4%VS12,2%), below the ward average and diabetes was rarely the cause of admission. This study is the basis of a prospective study, which aims to complement the information obtained.and to evaluate whether our present actions could eventually be modified to diminish admissions and prevent complications.

**PB8 422 FREQUENCY OF POLYMORPHISM OF VNTR IN PER3 IN BRAZILIAN ELDERLY WITH METABOLIC DISEASES.**

M. CENDOROGLO\* (UNIFESP, São Paulo, Brazil)  
C. CS CARRASCO(1), A. A BARBOSA(1), L. MQ ARAÚJO(1), C. M ALMADA FILHO(1), M. PEDRAZZOLLI(1), S. TUFIK(1), M. S CENDOROGLO(1) - (1) UNIFESP (São Paulo, Brazil)

Introduction: The response to luminous entry in the retina, involves the expression of many genes, some of which, are the "watch genes" that regulate the circadian rhythm. A particularity of the circadian rhythm of the sleep-vigilance cycle is that the elderly are described as matinee people. Aging modifies the quantity and quality of sleep, due to the alterations of the intrinsic arquitecture of the sleep and the dislocation of the matinee/vespertine difference to the matinee side. Objective: To study the frequency of polymorphism of VNTR in per3 in Brazilian elderly with metabolic diseases - preliminary data. Population and methods: We evaluated elderly above the age of sixty, from the Federal University of São Paulo Metabolic Diseases ambulatory. The elderly answered to the Horne and Ostberg questionnaire, had biochemical exams and had a global geriatric evaluation. The elderly were divided in: matinee (naturally wake up early, apt to perform any activity) and vespertine (tend to wake up and go to sleep later, preferring to have activities in the evening or at night). Results: Of the 70 evaluated elderly, 72.9% are women, 27.1% are men, and they're about 77.02 years old. The frequency of elderly with the 4/4 genotype was of 21(30%-vespertine); of the 5/5 genotype was of 11(15.7%-matinee); and of the 4/5 genotype was of 38(54.3%). Discussion and Conclusion: The rhythmic interaction between organisms and the environment occurs by the "biological clock", a self-sustainable timer that continuously oscillates. The circadian clock may work autonomously, without a necessity of stimulation, but can be adjusted by external conditions, particularly, the light-dark cycle. Although there may be individual differences between the timing preference of activity and sleep, we do not know how much genetic interaction itself might influence in this behavior and in metabolic disease control.

**PB8 423 INFLUENCE OF HDL CHOLESTEROL IN POSTPRANDIAL TRIGLYCERIDEMIA IN ELDERLY.**

P. MOREIRA\* (Universidade Federal de São Paulo - UNIFESP, São Paulo, Brazil)  
P. FERREIRA DO PRADO MOREIRA(1), M. DALBONI(1), C. UEHARA(1),  
F. MARTINIANO FILHO(1), L. MIGUEL QUIRINO ARAUJO(1), M. SEABRA  
CENDOROGLO(1) - (1) UNIFESP (São Paulo, Brazil)

HDL-cholesterol (HDL)> 50 for women reduces the risk for cardiovascular disease. The aim of this study was to relate the HDL, triglycerides (TRL) and postprandial dietary habits in elderly women. We included 18 elderly (age 72+5.5 years) for assessment of fasting lipids and TRL in postprandial (PP) at 2 (PPt2), 4 (PPt4) and 6 (PPt6) hours. Each elderly received a shake with 19g fat/m2 body surface area and filled the food records in the same week of the test. The participants were divided into 2 groups, HDL>60 (n = 7) and HDL<60 (n = 11). Employed in the analysis: T-Test and Pearson's correlation- p<0.05. Between the groups there was no difference in average age, weight, BMI, waist circumference, blood glucose, LDL-cholesterol. In HDL>60 group, the average obtained in the TRL of fasting (87+32mg/dL) and the PP (PPt2 =129.8+50mg/dL; PPt4 =115.6+45mg/dL and PPt6 = 84+28mg/dL) were different from the average found in HDL<60 group (fasting = 132+37mg/dL; p<0.019, PPt2 =179+36mg/dL; p<0.029, PPt4 = 214.4+70mg/dL; p<0.005, PPt6 =160.8+51mg/dL; p<0.002). Although the average of the fasting TRL of both groups were less than 150mg/dL, within 6 hours the HDL<60 group did not achieve satisfactory levels of TRL. We found inverse correlation between fasting TRL and HDL ( $r = -0.51$ ;  $p < 0.030$ ), TGL PPt4 ( $r = -0.61$ ;  $p < 0.007$ ), TGL PPt6 ( $r = -0.79$ ;  $p < 0.000$ ). The HDL<60 group consumed more saturated fatty acids (SFA) in percentage (%) of the diet ( $p < 0.006$ ) and less fiber ( $p < 0.006$ ) than the HDL>60 group and there was an inverse relationship between HDL and consumption of SFA % ( $r = -0.64$ ;  $p < 0.017$ ). In this sample of elderly women have low HDL seems to relate to a profile of atherogenic risk in postprandial, slow clearance, and inadequacy of food habits (high intake of SFA and low consumption of fiber) even when the fasting TRL is <150mg/dL.

**PB8 424 DEVELOPMENT OF A HELP DECISION TOOL FOR ENTERAL NUTRITION IN ELDERLY HOSPITALIZED PATIENTS**

N. COHEN\* (Hôpital Paul Brousse, Villejuif, France)  
E. KAROUBI(1), F. CHAMI(1), C. GUERIN(1), M. HARBOUN(1) - (1) Hopital Paul Brousse (Villejuif, France)

Introduction: Up to 64% of elderly hospitalized patients suffer of malnutrition and are exposed to adverse complications. In case of severe denutrition, enteral nutrition may be justified. The percutaneous endoscopic gastrostomy (PEG) tube placement gives medical and ethical issues. The decision on whether to offer and recommend PEG tube placement to patients can cause significant confusion among healthcare team, patients and caregivers. Some contraindications have been published: severe dementia, opposition to treatment, palliative care. Methods: We have developed an algorithm to provide the group with appropriate indications for PEG placement in this patient population. This algorithm has been developed by a multidisciplinary healthcare team (physician, nurse, dietitian, physiotherapist, and psychologist). It is filled during a multidisciplinary meeting of the unit. According to the literature and after an audit among the geriatric staff, we have proposed relevant items for feeding tube placement. We validated the work with the local nutritional board and presented it to the national nutritional board. Results: The tool is composed of clinical and biological nutrition data, cognitive evaluation, and functional evaluation. We notified the etiology of the malnutrition and the aim of an eventual PEG. We collected patient or family agreement. The result of the algorithm leads to: either a clear indication of PEG tube placement, a contraindication, or a situation in between that needs to be argued (ethic, quality of life, demand of the patient). During one year, we have used this tool for twenty patients: 8 benefited from the enteral nutrition and 12 were denied. Conclusion: This tool helped the healthcare team in the decision to place a PEG tube. Validation by confronting the decision of the algorithm to the decision of two nutritional experts in geriatric is the second step of our study.

**PB8 425 EFFECT OF DIABETES ON THE ENDOTHELIAL DYSFUNCTION ASSOCIATED WITH AGING. PRELIMINARY RESULTS.**

C. MARTA\* (Hospital universitario de getafe, Getafe, Spain)  
A. CRISTINA(1), E. MARIAM(1), M. JAVIER(1), R. LEOCADIO(1) - (1) hospital universitario de Getafe (Getafe, Spain)

Among the factors involved in the development of vascular disease, the endothelium seems to play a central role in the onset of vascular damage associated with multiple pathological (like diabetes) or physiological entities(such as aging). In recent years there have published data suggesting that the endothelium plays a central role in the changes to both the aging process and diabetes in the vascular system. This is extremely important because endothelial dysfunction precedes in years the clinically evident vascular damage, which indeed predict, thus allowing for preventive interventions before the establishment of vascular structural damage and, in particular, before it is expressed clinically. MATERIAL AND METHODS The aim of this study was to evaluate endothelial function in elderly people with regard to persons (non-elderly adults and elderly) without diabetes. We have conducted an observational study, cross in elderly ( $\geq 65$  years) non-institutionalized Health Area 10 in Madrid, who came to the clinics of endocrinology and geriatrics. The problem

group consists of 27 problem subjects 65 years or older, diagnosed with diabetes. The control group had trained 40 non-diabetic subjects over 18 years, of which 16 are over 65 years. The variable result is endothelial function measured by Echo-Doppler, following the protocol recommended by the International Brachial Artery Reactivity Task Force (Guidelines for the ultrasound assessment of endothelial-dependent flow-mediated vasodilation of the brachial artery: a report of the International Brachial Artery Reactivity Task Force. *J Am Coll Cardiol.* 2002; 39:257-65). RESULTS In assessing the endothelium-dependent vasodilation (measured as the percentage change in the diameter of the brachial artery after inducing ischemia), we see that is greater in young subjects (3.7%) than in healthy elderly subjects (3.4%) such as diabetics (3.1%), but did not reach statistically significant differences between any of the three groups ( $p > 0.05$ ). However, when exploring the non-endothelial dependent vasodilation (measured as the percentage change in the diameter of the brachial artery after oral administration of nitrates), there are statistically significant differences between young and elderly healthy subjects ( $p < 0.009$ ) and among young people and the elderly diabetics ( $p < 0.002$ ). However, among healthy elderly and diabetic patients has no statistically significant difference. CONCLUSION In a control group of subjects age is accompanied by a impairment of the non-endothelium dependent vasodilation, which is unchanged by diabetes.

**PB8 426 CORRELATION OF TRUNK FAT BY DXA AND VISCERAL FAT BEFORE AND AFTER A WEIGHT LOSS PROGRAM: A MONET STUDY**

C. DOYON\* (Université de Sherbrooke - CDRV, Sherbrooke, Canada)  
C. DOYON (1), V. MESSIER (2), M. LAVOIE (2), E. DOUCET (3),

Introduction Visceral fat (VAT) is associated with several health risks. The direct measurement of VAT, such as CT scan or MRI, are expensive, limited in availability, and expose subjects to high radiation doses. On the other hand, abdominal fat mass, as measured by whole body dual energy X-ray absorptiometry (DXA), was shown to be significantly correlated with VAT obtained with the use of CT scans. This method requires to select regions of interest manually and was not validated to measure variations of VAT following a weight loss program. The objective of this study is to determine if abdominal fat by DXA is still significantly correlated with VAT obtained from a CT scan after weight loss among overweight and obese sedentary postmenopausal women. Methods and materials One-hundred and one non-diabetic, sedentary overweight and obese (4.73 yrs) were randomized in two weight $\pm$ post-menopausal women (58.1 loss program groups: caloric restriction ( $n=68$ ) and caloric restriction combined with resistance training ( $n=33$ ). Abdominal fat was measured using DXA, and visceral fat with a CT scanner LightSpeed 16 was used to measure VAT. The position of the scan was established at the L4-L5 vertebral disc using a scout image of the body. Results No difference was observed between abdominal fat and VAT in any groups pre and post intervention. All data were pooled to calculate the correlation between abdominal fat and VAT. Correlations were significant and found to be equivalent before and after the intervention (pre  $r = 0.606$ ; post  $r = 0.692$ ;  $p < 0.01$ ). Conclusion Our results show that correlations obtained between abdominal fat and VAT remained stable after a weight loss program (with or without exercise) in overweight and obese post-menopausal women. These thus suggest that the use of DXA-measured abdominal fat to estimate losses in VAT after a weight loss intervention would be reliable.

**PB8 427 IS VITAMIN B12 DEFICIENCY MASKED BY FOLIC ACID FORTIFICATION IN CHILEAN ELDERS?**

H. SANCHEZ \* (Institute of Nutrition and Food Technology (INTA), Santiago , Chile)  
C. ALBALA(1), L. LERA(1), E. HERTRAMPF(1), R. VERDUGO(2), M. LAVADOS(2),  
J. CASTILLO(2), R. UAUY(1) - (1) Institute Nutrition and Food Technology, University of Chile (Santiago, Chile); (2) Neurological Sciences Department, Faculty of Medicine, University of Chile (Santiago, Chile)

Introduction The great demographic epidemiologic and nutritional changes experienced by Latin America in recent decades has meant a continuous growth of the population 60 years and over with a speed of aging which has been estimated at least double that in North America and Western Europe. An aging population with its consequent increase in health-associated problems, highlight the need to identify modifiable risk factors for disease and disability in the elderly as VitaminB12 deficiency. Subjects and Methods: We studied 923 community living subjects (61-87 years), 283 men and 623 women from Santiago, Chile. The values of plasma vitamin B12 and folate were determined by radioassay techniques, using Abbot AXSYM assays. Cut points for plasma Folates deficit was <14 nmol/L, for vitaminB12 (B12)deficiency <148 pmol/L and for marginal vitamin B12 deficit 148-221 pmol/L. Results: The median concentrations and interquartile range (IQR) values of plasma vitamins were: B12 (357.9pmol/L, IQR352.3) and folate (38.6nmol/L; IQR11.1). The prevalence of Folate deficiency was only 0.34%, while prevalence of B12 deficiency was 9.26% (95% CI:7.4-11.3) and marginal B12 deficit reached 12.9% (95% IC:10.8-

15.2). B12 deficit was higher in men than in women (31.4% vs 17.9%, p<0.01). An increasing risk of having deficit with age 70-79y was observed (gender adjusted OR:3.96,95%CI 2.82-5.57). The prevalence of Anemia was 8.2% with no association with B12 deficiency(p=0.43). Conclusions: The results of this study evince a high prevalence of B12 deficiency or marginal deficit affecting 22.2% of older adults without the hematologic disorders –probably solved by folic acid fortification- that have been traditionally used as biomarkers of B12 deficiency. Whereas the deficiency of Vitamin B12 is associated with cognitive and neurologic disorders in this age group, there is a need of permanent surveillance and evaluation of nutrition interventions to correct these deficits. Supported by Fondecyt grants 1070592 and 1080589.

**PB8 428 OBESITY, GLUCOSE PROFILE AND COGNITION IN A INTERDISCIPLINARY PROGRAM TO TREAT AGED WOMEN OBESITY**

L. SCHAFIROVITS-MORILLO\* (Hospital of Clinics University of São Paulo, São Paulo, Brazil)  
N. HORIE(1), R. MAGALDI(1), A. SILVESTRE(1), A. QUADRANTE(1), R. AREZZA(1), C. SALDIVA(1), R. MOREIRA(1), C. BOTTINO(1), R. NITRINI(1), W. JACOB FILHO(1) - (1) Hospital of clinics university of Sao Paulo (Sao Paulo, Brazil)

Background: There is correlation between memory decline , insulin resistance and obesity owing to several distinct mechanisms. Objectives: To compare memory performance and the profile of insulin resistance in obese women over 60 years before and after intervention for obesity treatment. Methods: This clinical study was conducted with 22 women with mean age of 65,5 ± 4,0 years (mean ± standard deviation), with body mass index (BMI) 36,92 ± 5,1 kg/m<sup>2</sup> from june to september of 2006. The intervention consisted in a monthly individual medical assessment, weekly nutritional groups, supervised physical activity twice a week (aerobic and localized exercises without the use of equipments). We compared the group before and after the intervention with memory tests (Brief Cognitive Screening Battery DR-BCSB, MMSE, Semantic Verbal Fluency and Clock Drawing Test) and the glicemic profile, insulin resistance (fasting glucose, basal insulin and HOMA IR) and theirs weight loss in the period. For statistical analysis we used Student T test, Pearson linear correlation, considering a 95% confidence interval and statistical significance with p < 0,05. Results: The participants lost 6,6 ± 3,0 % of the weight post intervention. The fasting glucose, basal insulin and HOMA IR decreased (-23,1g/dl; -3,41μU/mL; -1,62 and p = 0,05; 0,043 and 0,009 respectively) which were correlated with significant improvement in Recognition score in DR-BCSB (difference final - inicial = 0,18 and p = 0,042) and there was positive correlation between the immediate memory improvement and the percentage of weight loss achieved (r = 0,539, p= 0,01). Conclusion: The multidisciplinary intervention for weight loss in women over 60 years was effective in the improvement of the glicemic profile and followed by a betterment in the performance of the humour and learning. The explanation over the effect of the weight loss in the cognitive performance must be better studied.

**PB8 429 ALCOHOL CONSUMPTION OF AN ELDERLY EUROPEAN POPULATION: DAILY AND WEEKLY CONSUMPTION**

C. DE MORAIS\* (Faculty of Nutrition and Food Sciences of University of Porto, Porto, Portugal)  
C. AFONSO(1), B. OLIVEIRA(1), M. RAATS(2), M. LUMBERS(3), M. DE ALMEIDA(1) - (1) Faculty of Nutrition and Food Sciences of University of Porto (Porto, Portugal); (2) Faculty of Arts and Human Sciences of University of Surrey (Surrey, United Kingdom); (3) School of Management of University of Surrey (Surrey, United Kingdom)

Introduction: The aim of this study was to identify differences between countries on patterns of alcohol consumption per day and to study the type of meals and days of the week when alcoholic beverages are consumed. Methods and materials: This project was carried out within the European Project “Food in Later Life”, under the leadership of the University of Surrey and with financial support of the 5th EU Framework Programme. 644 European citizens aged 65+ years from 8 EU countries were interviewed face-to-face; the sample was stratified by groups: sex (male/female), age (65 – 74; ? 75 years) and living circumstances (living alone/with others). Data was collected by 7 days food diaries. Analysis was performed using SPSS 14.0 by the Kruskal-Wallis test with post-hoc Mann-Whitney test with Bonferroni correction; and Friedman test with post-hoc Wilcoxon test with Bonferroni correction. Results: The mean average number ± Standard Deviation (SD) of alcohol events per day were higher for Italy (0,88 ± 0,87) and lower for Poland (0,12 ± 0,22); Poland was statistically different from all other countries except from Portugal (0,68 ± 1,00); United Kingdom (0,78 ± 0,71) was statistically different from Sweden (0,36 ± 0,35) and Spain (0,41 ± 0,53). Alcohol consumption was statistically different for all type of meals (elaborate, cold and hot main or light meals). The higher differences were found between the alcohol events in hot main meals and the cold main meals, with mean values ± SD of 1,72 ± 2,64 and 0,11 ± 0,35, respectively. Based on similarity of number of alcohol events on the days of the week, two groups were identified based on similarity: (1) Monday to Thursday (lower) and (2) Friday to Sunday (higher), with statistical differences between them. Conclusion: Differences were found on the average number of alcoholic beverages consumed per day between countries, daily and weekly routines for its

consumption. We can conclude that alcohol consumption is a phenomenon perceived by older people as a social act that is still culturally linked.

**PB8 430 NUTRITIONAL EVALUATION AND COMPARISON USING MINI NUTRITIONAL ASSESSMENT (MNA) AND BODY MASS INDEX(BMI). NOVOMET STUDY. PRELIMINARY RESULTS.**

R. LOPEZ MONGIL\* (Diputacion de Valladolid, Valladolid, Spain)  
J. LOPEZ TRIGO(2), D. DE LUIS ROMAN(3), M. GONZALEZ SAGRADO(3), C. NOVOMET(4), G. GUERRERO RAMOS(2) - (2) Ayuntamiento de Malaga (Malaga, Spain); (3) Universidad de Valladolid (Valladolid, Spain); (4) Multicenter (Spain)

Introduction Information about the epidemiology of undernutrition and risk of undernutrition for older Spanish citizens, particularly those living institutionalized, must be a priority for our Health System. In NOVOMET study, we evaluated as secondary objective the prevalence of malnutrition. Objective To compare MNA with other way to classify nutritional status determined by anthropometric measurements of BMI (corresponding question F-screening in MNA) (MNA-SF). Material and methods Multicenter, cross observational, descriptive, randomized, conducted in November-December 2007 in nursing home(NH) in all the autonomous regions of Spain. 45 NH participated. Criteria include: People over 65 years(N=410). Nutritional status was assessed from anthropometric variables: BMI and MNA. The distribution of variables were analyzed with the Kolmogorov-Smirnov test. Quantitative variables were analyzed with t-Student test and the qualitative test of chi-square Results Comparing the values of question F of MNA-SF (corresponding to BMI) with the total MNA scores we obtained : punctuation 0 MNA-SF matches 15.8 +/- 5,3 MNA(N=65), punctuation 1 MNA-SF matches 15.5 +/- 4.2 MNA(N=50), punctuation 2 MNA-SF matches 18.2 +/- 3,1 MNA(N=77), punctuation 3 MNA-SF matches 21.1 +/- 3.5 MNA(N=218). For all these values p<0,001. If we group the scores of 0 and 1 MNA-SF 115 patients are malnourished. A total of 295 patients at risk of malnutrition (scores 2 and 3 MNA-SF) Conclusions MNA grows significantly with the increase BMI , especially if we compare malnutrition, underweight compared to normal-risk of overweight. It is necessary to make a full nutritional assessment in elderly, not sufficient anthropometrical valuation, because although there is significant correlation between BMI and MNA, many patients with adequate value in BMI, may present a risk of malnutrition.

**PB8 431 OMEGA-3 POLYUNSATURATED FATTY ACIDS, APOE GENOTYPE, AND COGNITIVE FUNCTIONING IN COMMUNITY-DWELLING OLDER ADULTS**

V. DANTHIIR\* (CSIRO, Adelaide , Australia)  
T. NETTELBECK(1), C. WILSON(2), N. BURNS(1), G. WITTERT(3) - (1) School of Psychology, University of Adelaide (Adelaide, SA, Australia); (2) Cancer Council of South Australia (Adelaide, SA, Australia); (3) School of Medicine, University of Adelaide (Adelaide, SA, Australia)

Introduction - The omega-3 (n-3) long-chain polyunsaturated fatty acids (PUFA) eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) are crucial to normal brain functioning. Evidence in human studies suggests a link between n-3 PUFA and cognition in ageing; lower plasma and erythrocyte levels of n-3 have been associated with the presence of dementia, greater risk of developing dementia, cognitive decline, and lower cognitive function in older age. However, results from such observational studies are still inconclusive. The objective is to examine relationships between erythrocyte membrane levels of n-3 PUFAs and cognitive functioning, comprehensively assessed, in a sample of cognitively-healthy (MMSE > 23) older participants. Methods and materials – Results are from the baseline data of the EPOCH (older people, omega-3, and cognitive health) trial: An 18-month parallel, randomised, double-blind, placebo-controlled trial with repeated measures every 6 months, examining the effect of fish-oil (DHA-rich) on age-related cognitive decline. Participants were 391 (46.3% male) community-dwelling adults, aged 65-90 years (M = 73.1, SD = 5.5), with a mean of 12.9 years of education (SD = 3.8). An extensive battery of cognitive tasks were administered to assess the following cognitive constructs; working memory, reasoning, short-term memory, long-term memory and retrieval, inhibition, processing speed and perceptual speed. Erythrocyte levels of n-3 fatty acids were measured and APOE genotype was also assessed. Results - Factor scores from confirmatory factor analytic models of the cognitive domains constitute the dependant variables used in analyses. Multiple regression was used to examine relationships between erythrocyte membrane levels of n-3 PUFA and the cognitive constructs, controlling for possible confounding factors including physical activity, smoking status, age, and years of education. Analyses were conducted for the whole sample as well as sub-samples defined by APOE genotype. Conclusion - Associations between erythrocyte levels of n-3 PUFA, cognitive functioning, and APOE genotype will be discussed.

**PB8 432 ZINC STATUS AND DNA REPAIR IN ELDERLY: RELATIONSHIP WITH LIFE STYLE AND PSYCHOLOGICAL CONDITIONS**

J. JAJTE\* (Medical University of Lodz, Lodz, Poland)  
J. BLASIAK(2), I. LEWKOWICZ(2), E. MOCCHEGIANI(3), F. MARCELLINI(3), A. SAPOTA(1) - (1) Medical University of Lodz (Lodz, Poland); (2) University of Lodz (Lodz, Poland); (3) INRCA (Lodz, Italy)

**Introduction:** Impaired DNA repair is considered as one of signs of ageing. On the other hand, the level of zinc, one of the essential trace elements playing a central role in a wide range of biochemical reactions as well as physiological and psychological processes, drops also progressively with ageing. The aim of our study was to examine the relationship between zinc status and the efficacy of DNA repair in elderly Polish volunteers recruited for the ZINCAGE project (EC VI FP), in relationship with life style and psychological conditions. Methods and materials: Thirty healthy old subjects with zinc deficiency (16 women and 14 men), age range 60-85 years old (median  $70.4 \pm 7.8$  for women and  $74.5 \pm 7.3$  for men), were recruited to this study. The healthy status was assessed through a medical examination and by routinely clinical laboratory analysis. The efficacy of DNA repair was determined in each subject using the alkaline comet assay. This was performed at the beginning of the experiment and after six weeks of their diet supplementation with zinc. Moreover, the relationship between DNA damage/repair and respectively age, gender, zinc status and psychological dimensions (cognitive functions, mood, perceived stress) were assessed. Results: We observed an increase in the efficacy of DNA repair after six-weeks supplementation with zinc in 75% men and 65% women. Interestingly, among women who responded positively to the supplementation increasing efficiency of DNA repair the majority constitutes the eldest (over 85 years). In Poland old people showed impaired psychological conditions in relation to zinc deficiency. A low zinc level was associated also with unpaired psychological factors (low MMSE, high PSS and GDS). Conclusion: The results obtained suggest that zinc may play an important role in the reaction of cells to DNA damaging agents and this reaction may be age-and zinc status-dependent.

#### PB8 433 DIETARY PATTERNS AND SURVIVAL OF OLDER ADULTS

N. SAHYOUN\* (University of Maryland, College Park, United States of America)  
 A. ANDERSON(1), T. HARRIS(2), F. TYLAVSKY(3), S. PERRY(4), D. HOUSTON(5),  
 T. HUE(6), . SAHYOUN(6) - (1) Dept. of Nutrition and Food Science, Univ. of Maryland (College Park, United States of America); (2) National Institute on Aging (Bethesda, United States of America); (3) Dept. of Preventive Medicine, Univ. of Tennessee, (Memphis, United States of America); (4) Sticht Center on Aging, Wake Forest Univ (Winston-Salem, United States of America); (5) Dept. of Epidemiology and Biostatistics, Univ. of California (United States of America); (6) Health ABC Study. (United States of America)

**Introduction:** The objective of this study was to determine the dietary patterns of a cohort of older adults, and to explore associations of these dietary patterns with survival over a 10-year period. A secondary goal was to evaluate participants' quality of life and nutritional status according to their dietary patterns. Methods and materials: The Health, Aging and Body Composition (Health ABC) Study is a prospective cohort study of 3075 older adults. In Health ABC, all-cause mortality was assessed from baseline through year 10. Food intake was estimated with a modified Block food frequency questionnaire (FFQ), and dietary patterns of 2582 participants with complete data were derived by cluster analysis. Results: Six clusters were identified, including a 'Healthy foods' cluster, characterized by higher intake of lowfat dairy products, fruit, whole grains, poultry, fish and vegetables. The 'Healthy foods' cluster had a significantly lower risk of mortality than both the 'High-fat dairy products' and 'Sweets and desserts' clusters after adjusting for potential confounders. The 'Healthy foods' cluster also had significantly more years of healthy life and more favorable levels of selected nutritional biomarkers than the other clusters. Conclusion: A dietary pattern consistent with current guidelines to consume relatively high amounts of vegetables, fruit, whole grains, poultry, fish and lowfat dairy products may improve the nutritional status and quality of life and reduce the risk of mortality in older adults.

#### PB8 434 THE IMPACT OF HIGHER ALANINE AMINOTRANSFERASE LEVELS WITHIN THE NORMAL RANGE ON INCIDENT DIABETES

C. WANG \* (National Yang-Ming University, Taiwan , Tainan , Taiwan)  
 S. WANG(1), W. YAO(2), T. CHANG(3), P. CHOU(4) - (1) Institute of Public Health, College of Medicine, National Cheng Kung University (Tainan, Taiwan); (2) Department of Radiology, College of Medicine, National Cheng Kung University (Tainan, Taiwan); (3) Division of Gastroenterology, Department of Internal Medicine & Institute of Clinical Medicine, College of Medicine, National Cheng Kung University (Tainan, Taiwan); (4) Community Medicine Research Center and Institute of Public Health, National Yang-Ming University (Taipei, Taiwan)

**Background/Aims:** Elevated ALT levels might be associated with type 2 diabetes but whether higher ALT levels within the normal range predict the risk is unknown. Methods: We followed a community-based cohort of 3,446 individuals  $\geq 35$  years old without diabetes and hepatitis B or C in southern Taiwan for 8 years (1997-2004) to study the risk for type 2 diabetes with different normal ALT levels. Results: Three hundred thirty-seven participants developed type 2 diabetes. Among the incident diabetes cases, 16.0% were from those with ALT levels  $< 10$ , 44.5% with ALT levels 10-19, 30.0% with ALT levels 20-39, and only 9.5% with ALT levels  $\geq 40$ . A cumulative hazard function test showed that the higher the ALT levels, the greater the cumulative incidence rate of diabetes ( $P < 0.001$ , log-rank test). A multiple Cox proportional hazards analysis showed that increasing age, lower educational levels, higher BMI, and higher ALT levels, from hazard ratio (HR) = 1.8, [95% confidence interval (CI): 1.3, 2.5] for ALT = 10-19, (HR = 3.7, 95% CI: 2.6, 5.1)

for ALT = 20-39, to (HR = 4.5, 95% CI: 2.9, 7.0) for ALT  $\geq 40$ , were significant for developing diabetes ( $P < 0.001$ ). After adjusting for BMI levels, the HR of ALT levels was markedly higher for those with a BMI  $< 25$  than those with a BMI  $\geq 25$ . Conclusions: Higher ALT levels, even within the normal range, are strong predictors of type 2 diabetes independently of BMI levels with a dose-response relationship.

#### PB8 435 BIOMARKERS OF AGING STUDY:

H. CHUN\* (Seoul National University School of Public Health, Seoul, Republic of Korea) S. CHO(2), J. SUNG(2), S. PARK(3), B. CHO(3), Y. HWANG(4), J. CHANG(5), B. HAN(6) - (2) Seoul National University School of Public Health (Republic of Korea); (3) Seoul National University College of Medicine (Republic of Korea); (4) Neodin Medical Institute (Republic of Korea); (5) KLoSA Team, Korea Labor Institute (Republic of Korea); (6) KNIH, KCDC (Republic of Korea)

**Background & Objective:** An evidence-based policy is needed for fast growing elderly population in South Korea. Korean Longitudinal Study of Ageing(KLoSA) was initiated with representative samples of the middle aged and elderly population aged 45+ in 2006, modeled on previously launched aging cohorts such as The Health and Retirement Study (HRS) in the USA and The English Longitudinal Study of Aging (ELSA) in England. The current Biomarker Pilot study was conducted for developing comprehensive aging biomarkers for the Korean elderly and for testing the feasibility in a community setting, aiming for international comparability. Methods: The Biomarker Pilot was embedded in the 2nd wave of KLoSA field work targeting 10,254 participants. A representative sampling scheme plus extra samples included 527 subjects nationwide in Korea. The first step involved trained KLoSA interviewers collecting informed consents for recruiting Biomarker participants. Secondly, a confirmation of home visits in response to recruited participants was arranged by trained nurses. Collected biospecimens were transported by express mail service to a collaborating lab test company in Seoul within 2-3 days. Biomarkers we tested are as follows: Physical measures(blood pressure, pulse, height, sitting height, leg length, weight, waist, hip, eyesight, hearing, number of teeth, EKG, body composition-BIA and bone density for selective sample); Functional /performance test(lung function, balance-full/semi/stand, maximum step strength, uni-pedal stance, chair rises, timed walks); Lab test(total, HDL, LDL, TG cholesterol, creatinine, CBC, urine). In-depth health questionnaire was also implemented by KLoSA interviewers: quality of life (SF 36, EQ 5D), fatigue (BFI-K), physical activity (IPAQ-SF), family function (APGAR), genitourinary problems (IPSS, ICIQ-SF), mobility (LSM) and nicotine dependency (FTND-K). Most samples were basically collected by home visit nurses with about 50 cases from a fixed-center model. Sample enrollments began in September and concluded in December 2008.

#### PB8 436 COMPARISON OF OBESITY INDICES IN ASSOCIATION WITH DYSLIPIDEMIA AMONG MIDDLE AGED AND ELDERLY KOREANS

K. NA\* (Seoul National University School of Public Health, Seoul, Republic of Korea) H. KIM(1), H. CHUN(2), J. SUNG(1), K. SON(3), B. CHO(4), Y. HWANG(5), S. CHO(1) - (1) Seoul National University School of Public Health (Republic of Korea); (2) Seoul National University Institute of Health and Environment (Republic of Korea); (3) Seoul National University Hospital (Republic of Korea); (4) Seoul National University College of Medicine (Republic of Korea); (5) Neodin Medical Institute (Republic of Korea)

**Introduction** Body-mass index(BMI), waist circumference(WC), and body fat percentage are common indices for obesity. However, these are only surrogate measures, and the utility is often variable in older population. We compared these three obesity indices to predict adverse serum lipid profile among middle-aged and elderly Koreans. Methods and Materials In 2008, serum lipid levels(Total Cholesterol, Triglyceride, LDL Cholesterol, HDL Cholesterol) and Obesity indices(BMI, WC and Body fat percentage) were measured in 219 men and 291 women aged 47-95 (mean 63.7) years in Korea, as a part of KLoSA Biomarker Pilot study. Asian- or Korean-specific criteria were used to define obesity for BMI( $\geq 25$ ), WC (male  $\geq 90$ cm, female  $\geq 85$ cm), and body fat percentage (male  $\geq 20\%$ , female  $\geq 30\%$ :measured by HBF-359). NCEP-ATP III classification was used for serum lipid level (High Total Cholesterol: $\geq 240$ mg/dL, High Triglyceride: $\geq 200$ mg/dL, High LDL Cholesterol: $\geq 160$  mg/dL, Low HDL Cholesterol: $< 40$  mg/dL). Spearman rank correlation and logistic regression were used for statistical analyses. Results Spearman correlation adjusted for age, sex, smoking, drinking, and exercise showed that triglyceride level was positively correlated with BMI, WC and body fat percentage( $< 0.001$ ), and HDL cholesterol level was negatively correlated with WC( $< 0.001$ ). After adjusting for age, sex, smoking, drinking, and exercise, odds ratios of high triglyceride were 2.2(95% CI: 1.5,3.3) for BMI( $\geq 25$ ) and 1.8(95% CI: 1.2,2.7) for WC(male  $\geq 90$ , female  $\geq 85$ ). Odds ratios of low HDL cholesterol were 1.6(95% CI: 1.0,2.4) for BMI( $\geq 25$ ), 3.1(95% CI: 1.1,9.2) for body fat percentage(male  $\geq 20$ , female  $\geq 30$ ). Area under curve from ROC curve range was 0.62-0.70 for all significant associations. Conclusion In this study, high triglyceride was associated with BMI and WC, while low HDL cholesterol was associated with BMI and body fat percentage. Despite the limitations of BMI as obesity index in older population, it

remains a consistent predictor for dyslipidemia as a major risk factor of CVD among middle aged and elderly Koreans.

**PB8 437 THE PIEDMONT HOME RADIOLOGY PROJECT (RADHOME)**

N. AIMONINO RICCAUDA\* (San Giovanni Battista Hospital, Torino, Italy)

T. CAMMAROTA(1), A. BEUX(2), M. GROSSO(3), O. DAVINI(4), D. MINNITI(5), E. QUAGLIOTTI(6), V. TIBALDI(7), A. TIZZANI(8), O. BERTETTO(9) - (1) Department of Radiology V, San Giovanni Battista Hospital (Torino, Italy); (2) Health Technologies assessment, AReSS-Piedmont Region (Torino, Italy); (3) Customer Care Service, San Giovanni Battista Hospital (Torino, Italy); (4) Hospital Medical Direction, San Giovanni Battista Hospital (Torino, Italy); (5) Hospital Medical Direction, San Giovanni Battista Hospital (Italy); (6) Department of Medical and surgical Disciplines-Geriatic Section, University of Torino, San Giovanni Battista Hospital (Italy); (7) Department of Medical and surgical Disciplines-Geriatic Section, University of Torino, San Giovanni Battista Hospital (Italy); (8) Department of Medical and surgical Disciplines-Geriatic Section, University of Torino, San Giovanni Battista Hospital (Italy); (9) Regional Agency for Health Services (AReSS) - Piedmont Region (Italy)

**Introduction** The Piedmont Regional Agency for Health Services (AReSS) has funded a research on a public domiciliary radiography program for frail elderly and immobile patients in order to evaluate the benefits and the cost-effectiveness of this service. A randomized controlled study is ongoing at the Geriatric Hospital at Home Service (GHHS) of San Giovanni Battista Hospital of Torino, a big University teaching and tertiary-care hospital. The GHHS provides substitutive hospital-at-home care in a "physician-led clinical unit" model. It has been in operation since more than 20 years with a multidisciplinary team (geriatricians, nurses, physiotherapists, social workers, counselors) caring for patients mostly affected by cardiopulmonary, cerebrovascular, metabolic and neoplastic diseases. Methods and materials Eligible patients are acutely ill patients treated at home by the GHHS between June 2008 and December 2009. Patients in need of a radiological assessment are randomly assigned to perform diagnostic imaging at home or in hospital. At home, the radiological examinations are carried out using a portable high frequency X-ray tube and a mobile radiological station (Computed Radiography POC 260, Carestream) with visualization and real-time processing of acquired images. Currently, examinations suitable for domiciliary radiography are chest, pelvis/hips, joints, upper and lower limbs, hands and feet. All patients are examined using a standardized protocol which includes multidimensional assessment (e.g., socio-demographic data, clinical characteristics, functional and cognitive status, mood), reasons for needing the domiciliary radiography service, customer satisfaction, cost analysis and radiological quality of imaging. Conclusion This project is very innovative in the outline of international literature. Domiciliary radiography may be of great value to the patients, family, consultants and general practitioners.

**PB8 438 WORKPLACE-BASED MASTERS' LEVEL TRAINING IN GERIATRIC MEDICINE**

S. BHAT\* (North Western Deanery, Manchester, United Kingdom)

P. BAKER(1) - (1) North Western Deanery (Manchester, United Kingdom)

**Introduction** Successive changes with the Calman reforms, European Working Time Directive and Modernising Medical Careers have shortened training time and heightened tensions between training and service. The traditional apprenticeship has disappeared. Generic skills training (research, teaching, communication, management, law, ethics) remain vital, but is patchy, not assessed and of variable quality. Scholarship, research and publishing are commended by the medical Royal Colleges. Trainees need to understand, evaluate and implement evidence-based practice. During and upon completing training, most doctors are likely to focus on maintaining their clinical competence amidst rapidly evolving medical knowledge. We set out to train in the 'softer' yet vital. Methods Colleagues with good will, talent and commitment are vital. We established structured curricula combining real-life consultant-level generic practice, with technical medical skills. Academic writing and practical assignments are assessed. We linked with a farsighted academic institution for expertise in education administration and accreditation of learning. Results The course is more cost-effective than traditional study leave activities. Running part-time over 4 years fits with Higher Specialist Training. Structured programmes, over 9 month 'terms', fit with clinical rotations. Module leaders run yearly clinical modules alongside continuous generic modules. Clinical units are signed up to releasing trainees to attend. Evaluation is external to faculty, with highly favourable feedback. Conclusions The masters' programme was motivated by the need to train in a changing environment. It provides a cohesive, coherent structure ensuring integration of theory with practice, enabling formal qualifications alongside their professional development. Clinical training and course running in parallel allows academic training from existing resources. In essence, the Masters' programme provides a more cohesive and coherent structure for the trainees' normal teaching programme. Our teaching has become professional.

**PB8 439 APPROPRIATE DAYS IN FRENCH GERIATRIC DAY HOSPITALS: A PILOT STUDY**

B. DURAND-GASSELIN\* (Groupe Hospitalier Paris Saint-Joseph, Paris, France)

L. VOLPE-GILLOT(1), I. SORS-MIREUX(1), B. MAAKAROUN(1), A. DAUFFY-ALLAIN(2), O. SAINT-JEAN(2) - (1) Groupe hospitalier Paris Saint-Joseph (Paris, France); (2) Hôpital Européen Georges Pompidou (Paris, France)

Until 2006, geriatric day hospitals (GDH) were not well-defined in France, because of the lack of official text or definition notebook. Two recent ministerial texts in 2007 and 2008 have defined the content of the stay in GDH and its place in the geriatric care network. The aim of this study was to evaluate the relevant of stays in GDH regarding to these two new reference texts. We built a referential table from criterions included in the two texts, and made it validated by French professionals (day hospital geriatric practitioners, quality specialists, public health managers). Each of 496 following days of two GDH (short-stay price setting) was compared to this referential table. The geriatrician in charge of the stay, as an expert, was secondly allowed to criticize the result of this comparison. The table contains 10 criterions about the way of admission (medical or non medical), the indication (EGS, memory, falls, chemotherapy, transfusion, ...), the delivered care (nurse evaluation, complementary exams, information-action, specialized advices) and quality items (multidisciplinary conclusion report in the chart, same-day report given to the patient, therapeutic recommendations). The day was classified as appropriate if all of the 10 criterions were presents. Results: 322 (65%) of the days were classified as appropriate. Among the 174 (35%) classified as inappropriate, about half of them (84, 17%) were judged justified by the geriatrician in charge of the stay. Most frequent factors of inappropriateness were the lack of same-day report given to the patient, the lack of multidisciplinary conclusion, the too low number of exams passed or the lack of therapeutic information delivered. According to the new texts, 65% of days in both French GDH studied are appropriate, and this rate reaches 82% with the geriatricians' judgment. We expect this pilot study to be confirmed by an oncoming French ten-centre study evaluating about 5000 days in GDH.

**PB8 440 CHARACTERISTICS OF GERIATRIC PATIENTS AT THE TEACHING HOSPITAL OF LILLE FROM THE ADMINISTRATIVE DATA**

K. MOTI\* (Hôpital Saint Philibert, Lomme, France)

A. MARQUIS(1), R. BEUSCART(1), F. PUISIEUX(1), D. DREUIL(1) - (1) CHRU de Lille (Lille, France)

**Introduction.** - Few data are available on geriatric patient in French hospitals. In order to describe the population, we took into account general features, identify comorbidities and clinical pathways Method and materials. - Retrospective study from Administrative diagnosis-related groups database of Lille teaching hospital. All patients over 75 years polypathological (>4 comorbidities) during period 2004-2005 are compared to patient at same age non polypathological, with younger patients (60-75 years old) polypathological and with the same group during 1999-2000 Results. - Geriatric patients are 43% of elders are geriatric patients. They are more likely women and are older (81.12 years vs 81.11 years; p<0.00001). Often admitted through Emergency Care (44% vs 31% and 28%; p<0.00001) most of them are from Lille health zone. Their length of hospital stay is the highest (12 days vs 6 and 10; p<0.00001). The most frequent discharge destination is home (92.6%). Readmissions decrease between 1999 and 2005. As comorbidities: Cardiovascular disease (39%), neurological disease (17.51%), pulmonary disease (14.68%), iatrogenic disorders (13.5%), geriatric syndromes (8.90%) and cancers (4.03%). Two clinical pathways are identified: neurology department for cerebrovascular disease and geriatric syndrome for geriatric department. Conclusion. - Geriatric patient care is characterized by a combination of age and polyopathy.

**PB8 441 VITALITY: IMPROVING OUTCOMES FOR HOSPITALIZED OLDER ADULTS**

S. SINHA\* (University of British Columbia, Vancouver, Canada)

S. BERG(1), E. KIDD(1), D. THOMPSON(2), S. MUIRHEAD(1), J. MCELHANEY(3) - (1) Vancouver Coastal Health (Vancouver, Canada); (2) Providence Health Care (Vancouver, Canada); (3) University of British Columbia (Vancouver, Canada)

**Introduction:** The VITALiTY (Vancouver Initiative To Add Life To Years) initiative recognizes the high-risk environment of the acute care hospital setting to all persons age 65 and older. This population accounts for 36% of hospital admissions and 50% of expenditures. Most importantly, one in three of every hospitalized older person will experience significant disability. We propose that these events are often catastrophic in terms of the decline in functional ability, but at the same time, preventable. Methods: Five problems that were predicted to complicate a hospital admission and prolong the length of hospital stay in older adults including catheter use, medications, nutrition and hydration, delirium, and mobility, were identified. Using the Vancouver Coastal Health regional database, Case Mix Groups (CMGs) were identified based on outcomes that could be linked to these five problems and the actual length of hospital stay / expected length of stay (ALOS/ELOS) was calculated. Results and Conclusions: Based on a 50% reduction in the acute days that exceeded the ELOS that had been accomplished on our older adult care hospital units, and the prevention of 20% of cases from waiting nursing home placement from hospital, we calculated that 12,300 acute care days could be saved in the region. We

have developed evidence-informed Practice Statements targeting five key areas for care improvement strategies including catheter use, medications, nutrition and hydration, delirium, and mobility, to improve quality of care for older adults, reduce the risk for disability and decrease hospital length of stay across all medical and surgical units. Across a Canadian network, we propose to implement these Practice Statements in a five-step process to develop a common vision for an integrated service delivery model, analyze existing models of care, and select preferred models of delivery that includes Interprofessional Collaborative Practice to prevent disability in hospitalized older adults.

**PB8 442 AUTONOMY OR SECURITY? NURSES' ATTITUDES TOWARDS THE USE OF ELECTRONIC SURVEILLANCE IN NURSING HOMES**

A. GERLACH\* (University of Hamburg, Hamburg, Germany)  
K. SEIDENSTÜCKER(1), S. KÖPKE(1) - (1) University of Hamburg (Hamburg, Germany)

Introduction Electronic surveillance technologies are increasingly used in geriatric care to prevent falls or wandering especially in persons with dementia. These systems include tracking devices to locate a person's position, electronic tagging systems to detect a person passing a distinct line, and bed-alarm systems that intend to give a signal when a person is leaving the bed. Currently, there is no convincing evidence for the effectiveness of electronic surveillance. Ethical, legal and technical problems remain a major concern. Little is known about nurses' attitudes towards electronic surveillance in nursing homes residents although nurses' attitudes might be an important factor determining the use of the systems. Therefore, we investigated nursing staff of nursing homes in Hamburg, Germany. Methods and materials Qualitative interviews ( $n=3$ ) with geriatric nurses were performed to explore their subjective experiences and understandings towards electronic surveillance. Hypotheses were generated and a 6-item questionnaire on nurses' attitudes and nurses' emotional burden concerning the use of electronic surveillance was developed and pre-tested. The answers were rated on a 4-point Likert- scale and descriptive data analysis was performed. Results The sample consisted of 258 nurses from 18 nursing homes. In general, nursing staff rated the use of electronic surveillance rather neutral. Most nurses assessed the use as an appropriate measure to avoid accidents (74%). Two-thirds (66 %) believe that electronic surveillance potentially restricts residents' freedom, but most of the nurses do not consider them as a form of physical restraint. The majority (58 %) of nurses' do not feel emotionally burdened using electronic surveillance systems. Conclusion Nurses' opinions concerning the influence of electronic surveillance on residents' freedom and autonomy are heterogeneous. However, the majority considers the use of electronic surveillance as feasible for nursing home residents.

**PB8 443 REDUCTION OF CHALLENGING BEHAVIOURS IN PEOPLE WITH DEMENTIA: GERMAN VERSION OF THE SERIAL TRIAL INTERVENTION (STI-D)**

J. NORDHEIM\* (Charité Universitätsmedizin Berlin, Berlin, Germany)  
T. FISCHER(1) - (1) Charité Berlin, Institut für Medizinische Soziologie (Berlin, Germany)

Introduction: Challenging behaviours are frequent in patients with dementia and constitute a major burden for the patient as well as for carers. Based on the Need-Driven Dementia Compromised Behaviour (NDB) Model it is thought that challenging behaviours arise from unmet needs, which the patient can neither communicate adequately nor fulfil for himself. Developed in the USA, the Serial Trial Intervention constitutes a structured framework for the process of assessment and intervention regarding unmet needs when challenging behaviours occur. STI proved to be advantageous in the reduction of challenging behaviours compared to standard care. Furthermore pain was reduced, less psychotropic drugs were prescribed as well as more non-pharmacological interventions performed. Methods and materials: For this study an adapted German version of the STI was developed with experts in the field. In a cluster randomized controlled trial (ISRCTN 6139 7797) with three measurements it will be investigated whether the STI-D is more effective in reducing challenging behaviours in nursing home patients with dementia than standard care. Calculated sample size is  $n = 365$ . The primary outcome variable under investigation is the occurrence of challenging behaviours, measured with the NPI-NH, secondary outcome variables include quality of life, pain, prescriptions of analgesics and psychotropic medications, frequency of assessments and interventions performed. Results: Adaptations to the STI concept were necessary to match German nurses' scope of professional practice. Emphasis was put on the process of communication between nurses, physicians and other health professionals. It is expected that the application of the STI-D will reduce challenging behaviours to a significantly greater extent in nursing home patients with dementia compared to standard care. First study results will be presented.

**PB8 444 ORGANIZATIONAL CONTEXT AND THE UPTAKE OF BEST PRACTICES IN LONG-TERM CARE FACILITIES**

A. BOSTROM\* (University of Calgary, Calgary, AB, Canada)  
C. ESTABROOKS(1), S. SLAUGHTER(1), J. SQUIRES(1), G. CUMMINGS(1),  
D. MORGAN(2), L. DEGNER(3), J. RYCROFT-MALONE(4), G. TEARE(5),  
S. DOPSON(6), N. STEWART(7) - (1) University of Alberta, Faculty of Nursing (Edmonton, AB, Canada); (2) University of Saskatchewan (Edmonton, AB, Canada); (3) University of Manitoba, Department of Family Medicine (Edmonton, AB, Canada);

(4) University of Wales (Edmonton, AB, United Kingdom); (5) Health Quality Measure and Analysis (Canada); (6) University of Oxford, Templeton College (United Kingdom); (7) University of Saskatchewan, College of Nursing (Canada)

Introduction: In Canadian long-term care (LTC) facilities (e.g., nursing homes) the majority of care is provided by unregulated direct care providers or health care aides (HCAs). Quality of care and quality of life among residents are associated with the use of best practices. Previous research among regulated health professionals working in acute care has identified associations between contextual factors such as leadership, access to resources, organizational culture, and use of audit and feedback reports with research uptake. In the longitudinal, multi-level Translating Research in Elder Care (TREC) program we are studying contextual factors associations with the uptake of best practices. Methods: One component of TREC is a cross sectional survey administered annually that measures, among other things, eight dimensions of organizational context using the Alberta Context Tool (ACT) with a series of Likert like scales. Use of best practices is measured using a single item (5-point scale) assessing overall research use. For this analysis data descriptive and correlational statistics were used. Results: Of 320 HCAs (in nine LTC facilities) who completed the first quarter survey, 87% had completed high school, 63% had English as first language, and the majority (55%) was older than 44 years. Overall, the HCAs reported supportive care managers ( $m=3.8/5$ ), strong positive cultures ( $m=3.9/5$ ), and moderate use of audit and feedback (evaluation  $m=3.5/5$ ). They reported strong use of best practices ( $m=4.3/5$ ). Supportive leadership was positively associated with higher self-reported use of best practices ( $p=0.04$ ). Conclusion: Strategic allocation of resources to modifiable contextual factors may facilitate the uptake of best practices. Managers in LTC facilities have an important role for increasing the quality of care. Future waves of data collection will enable the identification of causal associations between contextual factors and the research uptake by HCA, as well as, multi-level analyses and the inclusion of resident outcomes.

**PB8 445 THE ROLE OF TREATMENT CULTURE ON PRESCRIBING IN NURSING HOMES FOR OLDER PEOPLE**

A. DONNELLY\* (Queen's University Belfast, Belfast, United Kingdom)  
B. MCCORMACK(2) - (2) University of Ulster (Newtownabbey, United Kingdom)

Introduction Prescribing of psychoactive medications in nursing homes is often poor in quality. One factor that may influence prescribing of these drugs is the treatment culture of the nursing home. This project sought to categorise a sample of nursing homes into one of three treatment cultures i.e. resident-centred, traditional or ambiguous by using a validated questionnaire. Methods and materials After obtaining ethical approval, questionnaires were mailed to the nursing home manager in a stratified random sample of nursing homes ( $n=149$ ) in Northern Ireland, who distributed them to all nurses working in the home. Data were collected in relation to the staffing characteristics, staff turnover and size of each home, demographic and professional characteristics, along with a descriptive account of staff's views on psychoactive prescribing. Treatment culture (resident-centred, traditional or ambiguous) was measured from questions in three domains: medication use; pharmacist involvement; and the involvement of the psychiatry of old age team. Results The response rate was 47% ( $n=70$  homes). Nine nursing homes were classified as resident centred, 57 were classified as having an ambiguous culture and the remaining four homes were classified as being traditional. Most of the nurses (94.5%) and nurse managers (98%) either agreed or strongly agreed that psychoactive medication should only be initiated for behavioural problems after alternative interventions have been tried and evaluated. Conclusion The data suggest that a minority of homes possess a resident centred treatment culture with the majority having an ambiguous culture. However, most nursing home staff agreed that psychoactive medication should only be initiated when other approaches had failed. These results suggest that assessment of treatment culture by a quantitative questionnaire may lead to conflicting findings. Therefore, treatment culture may need to be assessed using qualitative methods to uncover unconscious and embedded beliefs and values that the staff hold about psychoactive prescribing.

**PB8 446 HEALTH OF HEALTH CARE AIDES IN RESIDENTIAL LONG-TERM CARE**

S. SLAUGHTER\* (University of Alberta, Edmonton, Canada)  
P. NORTON(8), A. BOSTROM(1), J. SQUIRES(1), G. CUMMINGS(1),  
D. MORGAN(2), L. DEGNER(3), S. DOPSON(4), N. STEWART(5), J. RYCROFT-MALONE(6), G. TEARE(7) - (1) University of Alberta (Edmonton, AB, Canada); (2) University of Saskatchewan (Edmonton, AB, Canada); (3) University of Manitoba (Edmonton, AB, Canada); (4) University of Oxford (Edmonton, AB, United Kingdom); (5) University of Saskatchewan (Canada); (6) University of Wales (United Kingdom); (7) Health Quality Council of Saskatchewan (Canada); (8) University of Calgary (Canada)

Introduction: The world-wide shortage of health care aides (HCAs) in residential long-term care (LTC) is in part affected by their health and well-being in relation to their work context. There is evidence to suggest that work factors predict sickness absence and turnover of HCAs. The objective of this study was to examine the association between organizational context and HCAs' well-being in the three western Canadian provinces. Methods: A cross-sectional survey is one component of the longitudinal and multi-level Translating Research in Elder Care (TREC) research program examining the role of

organizational context on resident, provider, and system outcomes in long-term care facilities of three Canadian provinces. Three organizational context variables (e.g., leadership, culture, evaluation) and three HCA well-being measures (Health Status Short Form-8TM (SF-8), and the Maslach Burnout Inventory (MBI), job satisfaction) were collected as part of a larger survey of health care providers. Data were analyzed using descriptive and correlational statistics. Results: Of the 320 HCAs from 9 not-for-profit facilities who responded to the first quarterly survey in 2008, 37% spoke English as a second language and 87% completed high school. Over half (55%) were older than 44 years. Leadership, culture and evaluation were positively correlated with job satisfaction ( $p < 0.001$ ) and SF-8 ( $p = 0.001$  to 0.1), but were variably and negatively correlated with the three MBI components – exhaustion, cynicism and efficacy (p-values range: 0.01 to 0.79). Conclusion: Modifiable contextual factors associated with the self-reported well-being of HCAs in LTC can be used to guide managers to improve HCA work environments and thereby reduce staff turnover. All three context variables look promising as modifiable conditions of the work place. Future waves of longitudinal data may identify causal associations between contextual factors and HCA well-being.

**PB8 447 MEDICATION USE IN NURSING HOMES IN ICELAND. THREE YEAR RETROSPECTIVE OBSERVATION STUDY**

H. HANSDÓTTIR\* (Landspítali University Hospital, Reykjavík, Iceland)  
P. GU'MANSSON(1) - (1) landspítali university hospital (Reykjavík, Iceland)

Objectives: To describe medication use in nursing homes in Iceland over 3 years. Methods: A pharmacy database over 3 years was used from 2002 to end of 2004. Data on constant use, periodic use and prn prescription were gathered. Results: Data from 10 nursing homes was gathered on 1408 individuals, 909 women and 499 men comprising 60% of registered nursing home beds in Iceland. Average age was 83 years. Total prescription rate was 8,88 ( $\pm 4,0$ ) increasing to 9,91 ( $\pm 4,3$ ) on average, not including PRN prescription. Women used on average 1 more total prescription than men (8,24 vs 9,23  $p < 0,001$ ). Use of psychiatric medications is high overall with only 12,2% men and 6,4% women who never got prescribed any psychiatric drug ( $p < 0,01$ ). Antipsychotics, antidepressants and anxiolytics/hypnotics were prescribed more often for women than men (39,1% vs 31,7%  $p < 0,01$ ; 70% vs 61,5%  $p < 0,01$ ; 86,6% vs 80,2%  $p < 0,05$  respectively). Women were prescribed significantly more often drugs for acid related disorders (46,9% vs 38,1%  $p > 0,01$ ), vitamin D (72,3% vs 59,1%  $p < 0,00$ ), calcium supplements (47,8% vs 15,2%  $p < 0,00$ ), diuretics (64% vs 52,3%  $p < 0,00$ ), thyroid supplements (22,4 vs 8%  $p < 0,02$ ), opiates (32,1% vs 27,7%  $p < 0,00$ ), and paracetamol (72,3% vs 61,3%  $p < 0,00$ ). Men were prescribed more often drugs for diabetes (14% vs 5%  $p < 0,00$ ); warfarin (10,6% vs 5,1%  $p < 0,00$ ); cholesterol lowering agents (7,8% vs 4%  $p < 0,01$ ); anti parkinsons agents (13,8% vs 8,4%  $p < 0,05$ ). There was no significant difference between men and women for prescriptions for platelet inhibitors (30,5%), digoxin/amidarone (15,8%), antihypertensives (35,4%), beta blockers (37,1%); NSAID (17,1%), coxibs (13,7%), antiastmatics (16,1%) or antiglaucoma medications (15%). Conclusion: Medication use in Icelandic nursing homes is high and rising. Women use more medications than men, especially for psychiatric conditions.

**PB8 448 TRADITIONAL VERSUS POD-STYLE: AN EXPLORATION OF THE EFFECTS OF ARCHITECTURE ON QUALITY OF CARE IN NURSING HOMES**

H. COOKE\* (University of Victoria, Victoria, BC, Canada)  
A. SMITH(1) - (1) University of Victoria (Victoria, Canada)

Introduction: Although pod-style nursing homes are designed to minimize depersonalized care, little is known about the impact of their architectural features on quality of care when compared to traditional homes. This study seeks to address this gap in knowledge by investigating care provision in both types of homes. Methods: Data were collected from a pod-style and traditional home through observations of care routines and interviews with a care aide from each home. Results: Several architectural features were identified as decreasing quality of life in the traditional home. Multi-occupant bedrooms had limited bathroom space, resulting in toileting taking place at the bedside. This resulted in a loss of dignity that was compounded by an irregular use of privacy curtains. Activities took place in areas designed for quick access and efficient monitoring of residents. The dining room and lounge were located at opposite ends of the home, which made residents dependent on the availability of care aides for transportation. The care aide in this home recognized the negative effects of these features but appreciated the ways in which they facilitated the efficient delivery of care to frail residents. By contrast, the pod-style home had a home-like feel. Features included carpeted hallways, individual bedrooms, and a lounge and dining room in close proximity with laminate flooring and comfortable chairs. The private bedrooms were equipped with an electronic monitoring system that alerted care aides when residents woke up and tried to get out of bed. This allowed the aides to schedule care around the residents' own routines. The care aide from this home felt that these features increased the level of personalized interactions with residents, thus improving their quality of life. Conclusion: Overall, this study offers valuable insights into the impact of architectural design on the provision of long-term care to nursing home residents.

**PB8 449 ASSESSMENT TOOLS, STANDARD PRACTICES AND INTERVENTION PROGRAMS IN RESIDENTIAL SETTINGS: A SPANISH STUDY.**

E. CABRAS\* (Autonomous University of Madrid, Madrid, Spain)  
M. CAPRARÀ(1), R. FERNÁNDEZ-BALLESTEROS(1) - (1) Autonomous University of Madrid (Madrid, Spain)

Introduction. In order to introduce in the SERA (Sistema de Evaluación de Residencias de Ancianos), a new scale for assessing standards protocols in residential settings, standard assessment tools, protocols and intervention programs were analyzed in Residential settings for the elderly in Spain. Methods and Materials. We assess a total of 30 residential settings (26 privates, 4 publics; 26 mixed, 4 assisted living centres). Average of residents was 110 residents by residence (with a range of 24 elderly in smallest residence to 370 residents biggest one). For every residence, we collected records, like forms and registers, and finally any other material that could be considered remarkable. 22 residences were able to provide materials for assessment. Results. Protocols were classified in three categories: 1) Assessment instruments, scales used were the following: Barthel Index (13), Lawton Scale (6), Mini-Mental State Examination (8), Geriatric Depression Scale (7) and the Mini Examen Cognoscitivo (5), finally, in 11 residences realized a complete geriatric assessment; 2) Standardized Practices, protocols more used were entry rules (13), rules and regulations (13), falls (8), pressure sores (7); 3) Intervention programs, programs more used were group animation (8), cognitive stimulation (7) and Activities of Daily Living (5). Conclusions. Although 8 centres on 30 didn't provide materials useful to the goals of assessment, we found a general consensus with standard protocols used in residential settings.

**PB8 450 THE ACTIVIST MEDICAL DIRECTOR: IMPROVING QUALITY CARE IN THE NURSING HOME VIA CQI PROCESS. EXPERIENCE FROM THE USA.**

S. VON PREYSS-FRIEDMAN\* (University of Washington, Seattle, Washington, USA, Seattle, United States)  
W. MCCORMICK(1) - (1) University of Washington (Seattle, United States of America)

Introduction: In the United States, federal legislation stipulates the presence of Physician Medical Directors in Skilled Nursing Facilities. This role has recently been more extensively delineated and gives the Medical Director the opportunity to positively influence care delivery for nursing home patients. While there is longstanding experience of Skilled Nursing Homes in Western Europe and North America, significant demographic and cultural changes in other parts of the world are leading to rapid and newly emerging needs for skilled nursing facilities. This presentation introduces the important role of the Medical Director in improving patient care and outcomes in Skilled Nursing Facilities. Methods and Materials: Setting: Multiple Skilled Nursing Facilities in Seattle, Washington, USA. Content: The federal regulations in the United States regarding the role of the Medical Director will be described. The active role of the Nursing Home Medical Director in applying Continuous Quality Improvement theory and methods to commonly encountered challenges and indicators of care will be outlined.. Results: The Medical Director has the unique opportunity to initiate and guide CQI processes on the indicators of quality. Special focus will be on the process the Medical Director employs to change outcomes of nursing home care: i.e. Pressure sores, physical and chemical restraints, infection surveillance, including catheter associated infections, weight loss, adverse outcomes of medications, pain management and physician supervision, resulting in significant improvement in outcomes as measured by Facility and Medicare Data (Facility QI Data). Conclusion: The actively involved Medical Director of Skilled Nursing Facilities in the United States enhances care delivery and quality outcomes in Skilled Nursing Home settings and may be a good model to emulate in other countries, especially those with evolving nursing home populations.

**PB8 451 WHAT PREDICTS PSYCHOTROPIC USE IN RESIDENTIAL CARE: PRESCRIBER AND ORGANISATIONAL CHARACTERISTICS**

N. KERSE\* (University of Auckland, Auckland, New Zealand)  
J. HOEM(1), S. MOYES(1), S. SCAHILL(1), K. PERI(2) - (1) University of Auckland (Auckland, New Zealand); (2) Princess Margaret Hospital (Christchurch, New Zealand)

BACKGROUND: In residential care facilities, the attitudes of staff and adoption of certain organizational cultures seems to relate to quality of care. The objective was to establish associations between the attitudes of staff, organisational characteristics of residential care facilities and psychotropic medication use of the residents. METHODS: The study population included residents aged 65+ years in residential care who were not terminally ill along with health care assistants, registered nurses (RN), nursing managers and General Practitioners (GPs) working in these facilities. From the resident files individual demographic data: number of diagnoses, medications, falls and functional status data were collected. Organisational characteristics were established by interview with the managers. Treatment culture (attitudes to prescribing) were gauged by administering a treatment culture survey to RNs and GPs in all facilities. Logistic regression models were built to determine the relationship between organisational characteristics and medication use whilst controlling for individual resident health and demographic factors. RESULTS: The study population included 533 residents, 147 health care assistants, 57 nurses and nursing managers and 14 GPs. Preliminary results suggest that psychotropic medication use was associated with age and presence of disruptive behaviour of the resident. Being a dementia unit, a commercial chain ownership type of facility, staffing levels and length of time the GP had been at the facility contributed to the model. Neither treatment culture of the GP nor the nurses were independently related to psychotropic medication use. CONCLUSIONS: This study provided preliminary evidence to suggest that the organisational structure had an impact on the level of psychotropic medication used eve

when controlling for individual resident characteristics. Knowledge of and attitudes to psychotropic medication was not associated with use of psychotropics in this case.

**PB8 452 DIETARY INTAKES IN NURSING HOME RESIDENTS**

B. LESOURD\* (Département de gériatrie, Clermont-Ferrand, France)  
C. BOUCHICHE(1), K. SOULIER(1) - (1) Département de gériatrie, faculté de médecine (Clermont-Ferrand, France)

Introduction: Undernutrition is a frequent disease in nursing homes and is a prognosis factor for residents. This study was designed to obtain exact measurements of food intakes and nutritional status of all residents of 4 nursing homes. Methods: Food intakes were quantified in 195 residents, ( $85.3 \pm 8.2$  y.o.) using left over quantification for 3 consecutive days. Nutritional status, eating difficulties, gerontological status, pathologies and drug intakes were simultaneously quantified. Results: Average food intakes were  $27.0 \pm 6.7$  kcal/kg/d with  $0.89 \pm 0.3$  g of proteins/kg/d. Lipids represent  $37.3 \pm 5.4\%$ , carbohydrates  $45.9 \pm 6.9\%$  and protein  $16.2 \pm 2.0\%$  of total energy intakes. Only 28.2% of residents eat at least 30 kcal/kg/d which represent the French RDAs for elderly and 13.3% eats less than 2/3 of these RDAs. Using the MNA as an index of nutritional risk, 94.8% of the residents are at risk of undernutrition (MNA<24/30). The following table indicates nutritional status in residents eating RDAs or more or less than 2/3 of it. Conclusion: In nursing homes 2/3 of the residents do not cover their nutritional needs, in spite of sufficient food provided. Whatever the weight, resident consumption is almost similar. Lower consumption is associated with number of diseases and/or drugs but not to ADLs.

**PB8 453 SAFETY AND MOBILITY OF CLIENTS WITH DEMENTIA IN INSTITUTIONAL CARE. IMPLEMENTATION OF A MULTIPROFESSIONAL GUIDELINE**

D. BÄUERLE\* (Hans-Weinberger-Akademie (München), München, Germany)  
M. FROMMELT(1), C. HEISLBETZ(1) - (1) Hans-Weinberger-Akademie (Bremen, Germany)

Care for clients with dementia in institutional long term care is the common product of many different stakeholders and professions: Internal professions such as care persons, care management and social work etc. contribute to care as well as external stakeholders like informal care-givers, doctors and therapists etc. An indispensable multi-professional cooperation is characteristic to many health- and social-services. The recommendation Rec(2001)13, approved by the Committee of Ministers of the Council of Europe claims: While developing and implementing medical guidelines, all relevant professions need to be integrated. The "BUKO-QS Qualitätsniveau I", an evidence based provisional-standard dealing with "Mobility and Safety of cognitively impaired Persons in Institutional Long Term Care", progressively follows this recommendation. This guideline is presently implemented by 20 German care institutions. In accordance to the European Council recommendation, different strategies of implementation are combined: The Break-Through-Method is applied to allow cooperative learning among the protagonists of the different institutions. This allows a fruitful exchange of found solutions. To assist the implementation, the institutions' quality circles are provided with the research results obtained by qualitative and quantitative instruments. These instruments show beneficial and hindering factor during the implementation. Questionings and group discussions are carried out on the quality management and audits of the client-specific care process are accomplished. Assignments and the level of implementation are shown systematically. We find a broad variety among the participating institutions concerning the pre-existing procedures regarding the object of the guideline and regarding the quality management in general. We also find big differences in the use of quality assuring instruments and we see how the Break-Through-Method helps to implement the guideline creatively and efficiently. Rather challenging tasks of the guideline are related to the attitude of the care persons to mobility and safety and to the willingness of physicians for cooperation.

**PB8 454 OBESITY IN NURSING HOME RESIDENTS – FUNCTIONALITY AND MORTALITY**

R. KAISER\* (Institute of Biomedicine of Aging, Nuremberg, Germany)  
K. WINNING(1), K. MATTHIAS(1), W. UTER(2), P. STEHLE(3), S. LESSER(3), C. SIEBER(1), J. BAUER(1) - (1) Departement of Geriatric Medicine, University of Erlangen-Nuremberg (Nuremberg, Germany); (2) Department of Medical Informatics, Biometry and Epidemiology, University of Erlangen-Nuremberg (Erlangen, Germany); (3) IEL-Department of Nutritional Physiology, University of Bonn (Bonn, Germany)

Background: Studies on the relevance of obesity in nursing home residents are rare. Aim: The present study analysed the influence of obesity on functional parameters and mortality in nursing home residents. Method: 200 residents of two Nuremberg nursing homes (f 147, m 53, age  $85.6 \pm 7.8$  y, BMI  $26.2 \pm 5.3$  kg/m<sup>2</sup>) were included in the present study. BMI, waist circumference, handgrip strength, the timed up and go test and mortality were recorded at baseline and during a one year follow-up. Results: Prevalence of obesity (at least 30 kg/m<sup>2</sup>) was 23.5%. Undernutrition (<20 kg/m<sup>2</sup>) was present in 8.5% of the residents. A significant correlation existed between BMI and handgrip strength ( $0.327^{**}$ ), whereas the correlation between BMI and the timed up and go test was not significant. The odds ratios for mortality, comparing the lowest and the highest quartile, was for BMI 4.7

for men, respectively 3.1 for woman, for waist circumference 2.4, respectively 6.3, for triceps skin fold thickness 1.1, respectively 2.9 and for calf circumference 8.8, respectively 6.6. One-year mortality was lowest in obese residents >30 kg/m<sup>2</sup> (12.8 %), highest in the undernourished group (<20 kg/m<sup>2</sup>) (58.8%). None of the very obese elderly BMI >35 kg/m<sup>2</sup> (12 residents) died during follow-up. Conclusion: Obesity may be seen as an indicator of better survival among nursing home residents in addition higher weight may not always be associated with decreased functionality.

**PB8 455 COMPARING PREVALENCE OF MALNUTRITION AND NUTRITIONAL CARE IN CARE HOMES IN GERMANY, AUSTRIA AND THE NETHERLANDS**

N. VAN NIE\* (Maastricht University, Maastricht, The Netherlands)  
J. MEIJERS(1), S. BARTHOLOMEYCYZIK(2), C. LOHRMANN(3), S. REUTHER(2), J. SCHOLS(4), R. HALFENS(1) - (1) Maastricht University (Maastricht, The Netherlands); (2) Universitat Witten Herdecke (Witten, Germany); (3) Medizinische universität Graz (Graz, Austria); (4) Maastricht University (Maastricht, The Netherlands)

Introduction Malnutrition is a major problem in care homes all over the world. However, no information on international level is available about the prevalence and quality of nutritional care within long term care settings for the elderly. We carried out a prevalence measurement in Germany (G), Austria (A) and the Netherlands (NL). Method and materials In this cross-sectional multi centre international prevalence study, malnutrition was measured in 3446 patients of 49 care homes (G=2444, A= 221, NL= 781). A standardised questionnaire was used, divided in three levels: on institutional level and ward level relevant aspects of nutritional care were assessed, on patient level demographic data, care dependency, nutritional screening as well as treatment interventions for malnutrition were assessed. To measure malnutrition prevalence, nutritional status of patients was assessed using Body Mass Index, undesired weight loss and nutritional intake. Results Nutritional screening at admission occurred more frequent in Germany (99.1%) than in the Netherlands (95.5%) and Austria (77.8%). In care homes in Austria the prevalence of malnutrition (28%) was higher than in the Netherlands (27%) and in Germany (26%). In all countries in less than 50% of all malnourished patients nutritional interventions were undertaken (G= 46%, A= 40%, NL= 46%). In Germany and in Austria in less than 50% of the malnourished patients a dietitian was consulted (G=17%, A=29%) In the Netherlands a dietitian was consulted in 66.5% of all malnourished patients. Conclusion Malnutrition is a problem in approximately one in every four care home patients in each country. Despite the fact that nutritional screening is rather frequently performed, nutritional interventions are carried out in less than 50% of the malnourished patients. This multi-centre large scale international study is unique since a standardized method has been used to compare results between countries. In the future this international measurement will be carried out annually and expanded to more countries.

**PB8 456 DESIGN OF A STUDY ON THE QUALITY PERCEIVED BY PATIENTS HOSPITALIZED AT HOME**

M. GROSSO\* ( San Giovanni Battista Hospital, Torino , Italy)  
M. AIMONINO RICAUDA (1), V. TIBALDI (1), O. DAVINI (2), A. BEUX(4), R. CERRI(3), C. DI NOVI(5), D. MINNITI(2), I. DI MARCO(3), O. BERTETTO (4) - (1) University of Torino, Department of Medical and Surgical Disciplines-Geriatric SectionSan Giovanni Battista Hospital (Torino , Italy); (2) Hospital Medical Direction San Giovanni Battista Hospital (Torino , Italy); (3) Customer Care Service San Giovanni Battista Hospital (Torino , Italy); (4) Regional Agency for Health Services (AReSS), Piedmont Region (Torino , Italy); (5) University of Oriental Piedmont- Department of Public Policy and Public Choice (Italy)

Introduction The term "hospital at home" commonly refer to a unit administering clinical care and technology normally delivered in hospital, so the essence of hospital at home is to substitute for treatment in an acute care hospital. A Geriatric Hospital at Home Service (GHHS) is carried out, since 1985 ,by the University Division of Geriatrics of San Giovanni Battista Hospital of Torino. The GHHS team is multidisciplinary and involved in the care of frail elderly patients mostly affected by cardiopulmonary, cerebrovascular, metabolic and neoplastic diseases. The purpose of the study is to assess the satisfaction of home hospitalized patients undergoing instrumental examinations (e.g., X-ray, ultrasound,...) at their home in order to identify critical issues and areas for improvement. The caregivers will be also included in the survey. Materials and Methods Eligible subjects are acutely ill elderly patients treated by the GHHS from June 2009 to December 2009, and their caregivers. The project is divided into three phases. 1) Construction of the instrument of detection. Using SERQUAL as a benchmark system, the following dimensions of quality have been identified: tangible aspects, reliability, responsiveness and empathy. The measurement instrument is a questionnaire which will be properly submitted to validate the content. 2) Survey. All GHHS patients undergoing instrumental examinations at home, and that have recently performed instrumental procedures by transport to hospital, are included in the study. 3) Analysis of data. A qualitative method will be used, considering positive the results with satisfaction increased by 80% (gold standard). Conclusions Due to the frailty of patients involved in the study positive results are expected either direct (e.g., greater satisfaction related to the comfort of a domiciliary provision of instrumental

examinations) or indirect (e.g., greater satisfaction related to a better quality of life depending on the avoided trauma of "abandonment" of the home).

**PB8 457 COMORBIDITY, AGE AND DRUG PHARMACEUTICAL LIQUID FORMS IN INSTITUTIONALIZED ELDERLY PEOPLE WITH DYSPHAGIA**

L. CARBONERO DE LA LLAVE\* (MAPFRE QUAVITAE , Madrid, Spain)

J. CAMPOS DOMPEDRO(1), J. SACEDO GOMEZ(1), J. GAYOSO PARDO(1), M. ARROYO ZARATE(1), I. SAEZ IZQUIERDO(1), L. REMONDO PRIETO(1), V. VALVERDE MOYAR(1), M. SERRANO SANCHEZ(2), D. SIERRA CARRASCO(1) - (1) MAPFRE QUAVITAE (Madrid, Spain); (2) MEDICAL Dept. GRUNENTHAL (Madrid, Spain)

**Introduction:** Dysphagia (swallowing difficulties) is relatively common in the nursing home population, but the prevalence increases with age and poses particular problems in the older patient, potentially compromising nutritional status, complicating the administration of solid medications, increasing the risk of aspiration pneumonia and undermining the quality of life. The aim of this study was to evaluate the relationship between co-morbidity, age and drug pharmaceutical forms in institutionalized elderly people with dysphagia. **METHODS and materials:** Cross-sectional multicenter study of ten Spanish geriatric centers. One hundred and twenty-four elderly nursing home patients with dysphagia (female 75.6%; mean age 84; SD 7 years) were selected for investigation treatments and drug pharmaceutical forms. Logistic model was adjusted to evaluate the likelihood of use a drug pharmaceutical liquid form, in oral administration. We show adjOR "adjusted odds ratios" and its 95% confidence interval (CI). SPSS ver 15 was used as statistical software. **RESULTS:** Of the 652 drugs administered to 124 patients, 93.8% were oral administration. Solid presentations were 76.8% and 17.0% liquid. 17.1% of these were pain drugs. El 47.6% had dementia and 46.0% cerebrovascular disease's sequelae. 33/124 patients taking an analgesic drugs and 29/33 patients these was administrated as liquid. Variables introduced into the model were comorbidities, age and sex. Only neurological diseases (adjOR 2.7; 95%CI 0.8-9.0;p=0.09) and depression (adjOR 4.2; 95%CI 1.1-15.4; p=0.03) were associated to the likelihood of use a drug pharmaceutical liquid form in these patients. It was noted an increased use 5.0% for each lineal increment one years of age (adjOR 1.05; 95%CI 0.9-1.1;p=0.13) adjusted by comorbidity. **CONCLUSION:** Only comorbidity, neurological diseases and depression, were significant associated with the use of liquid drugs in patients with dysphagia. Awareness of dysphagia in the elderly, the diagnostic procedures, and treatment options available should be increased among the medical profession.

**PB8 458 GROWING OLD HEALTHY IN WITTEN, GERMANY**

E. SIRSCH\* (Witten/Herdecke University , Witten, Germany)

D. PLEYER(1), D. JORDAN(2), P. GESCH(3), P. BARTHOLOMEY CZIKI(4) - (1) Witten/Herdecke University (Witten, Germany); (2) Witten/Herdecke University (Witten, Germany); (3) Witten/Herdecke University (Witten, Germany); (4) Witten/Herdecke University (Witten, Germany)

The study is a project of the Interdisciplinary Center of Health Care Research (IZVF) at the Witten/Herdecke University. In the study are involved the Institute of Nursing Science and the Faculty of Dental and Oral Medicine. The study focuses on oral health and nutritional status of residents living in nursing homes. It is conceptualized as a pilot study investigating the feasibility of design and methods. The oral health care for elderly people living in nursing homes has been described as inadequate during the last years. It also turned out that they often have a poor nutritional status. The causal reasons for this situation have not been analyzed satisfactorily yet. Oral health state and a lack of masticatory function have an influence on the nutritional status. Over a period of one year basic data about the association between oral health and nutritional status will be collected. Research questions are: • Can oral health be improved after a special training of the nurses? • Does the training lead to a better cooperation between dentists, physicians and nurses? • Does the treatment after this special training improve the nutrition state of residents in Nursing homes? This study uses a Pre-Post Design with Control Group. The intervention is a special training programme for nurses in nursing homes. Period: September 2008 until August 2009 Oral health and the Nutritional status is assessed by a dentist and nurses both using standardized instruments. The residents will be interviewed using the GOHAI (Hassel et al.2008) an instrument assessing oral health. Nurses caring for these people have to answer a questionnaire, developed during this project. The Kayser-Jones Brief Oral Health Status Examination's (1995) will be used to evaluate the oral health status by nurses. The first results are expected in April 2009 and will be presented during the conference.

**PB8 459 CONTRACTURE: THE NEED FOR A CLEAR DEFINITION**

I. GNASS\* (University Witten/Herdecke, Witten, Germany)

G. BARTOSZEK(1), G. MEYER(1) - (1) Universitay Witten/Herdecke, Institut of Nursing Science (Witten, Germany)

**Introduction:** The reported prevalence of contractures ranges between 15 and 70%. The wide variation might be explained by different definitions and diagnostic criteria, settings and participants' characteristics. In Germany, contracture risk assessment and prevention

has recently been defined as a quality indicator of nursing home care regularly to be monitored by expert raters of the medical service of the statutory health insurance system. We reviewed international clinical trials dealing with contractures in order to find out if there is clear definition of contracture. **Methods and Materials:** A systematic literature search on clinical trials investigating contracture as primary, secondary or adverse outcome was conducted enfolding the databases PubMed, CINAHL, Embase, and Cochrane Library. The search was limited to articles published after 1985 and German and English language. Publications were excluded if they had investigated animals or children and scar contracture. Two reviewers independently screened the abstracts and the full publications. Disagreement was solved by consensus. **Results:** Initially, 544 publications were identified; 63 were included. A total of 51 studies investigated contracture as primary outcome, seven as secondary outcome, and five as adverse outcome. Ten studies clearly define the term contracture. However, all these definitions are different, but most often the functional arc of the investigated joint implicated as degree in range of motion is integral part of the definition. In 48 studies only the diagnostic criteria are mentioned and five studies neither mention a definition nor specific diagnostic criteria. **Conclusion:** The majority of clinical trials investigating contractures as outcome parameter do not clearly give a definition. However, the success of contractures' prevention and treatment in clinical trials and practice could only be judged in the presence of a solid definition. Thus, consensus on an accepted definition of contracture remains a challenge.

**PB8 460 HOW EFFECTIVE CAN A 500 &MICROG ORAL SUPPLEMENT OF VITAMIN B<sub>12</sub> FOR JUST 28 DAYS BE FOR INSTITUTIONALIZED ELDERLY**

U. ALBERS\* (Facultad de Ciencias de la Actividad Física y del Deporte -INEF, Universidad Politécnica de Madrid, Madrid, Spain)

R. PEDRERO-CHAMIZO (1), A. MELENDEZ(1), M. CASTILLO(2), K. PIETRZIK(3), M. GONZALEZ-GROSS (1) - (1) Facultad de Ciencias de la Actividad Física y del Deporte - INEF, Universidad Politécnica de Madrid (Madrid, Spain); (2) Grupo Effects 262. Facultad de Medicina. Universidad de Granada (Granada, Spain); (3) Institut für Ernährungs- und Lebensmittelwissenschaften, Rheinische Friedrich- Wilhelms-Universität Bonn (28040, Germany)

**Introduction** Because of increasing life expectancy in developed countries the percentage of elderly living in nursing homes is permanently rising. Between 5-40% per cent suffer from cobalamin (Cbl) deficiency mostly due to food Cbl malabsorption or drug interactions. This could lead to consideration of routine supplementation among this population. Some studies were performed on the effectiveness of oral Cbl as an alternative to intramuscular treatment, but the minimal effective dose has not yet been established. **Methods and materials** The aim of this study was to prove the effect of a 500 µg daily oral supplement of cyanocobalamin (Vitasprint®right) for 28 days on improvement of Cbl status, total Homocysteine (tHcy) reduction, and also to include functional and cognitive parameters. Vitamin B<sub>12</sub> status was determined by means of serum Cbl and active B<sub>12</sub> (Holotranscobalamin) status in 64 institutionalized elderly from Madrid, Spain (24 men, 40 women, mean age 82 ± plus minus 7 years). Statistical analyses used were: paired t-test or Wilcoxon test as normal distribution was given and One-Way-Anova to compare the mean values among the quartiles. Results SCbl like its more sensitive marker active B<sub>12</sub> increased whereas tHcy decreased (all p<0.001) in the total group as well as in each quartile with the greatest effect in the lowest quartile (101% per cent, 172% per cent and -14% per cent, respectively). MMSE scores did not change significantly in any of the quartiles neither did hand grip strength. Conclusion A 500 µg Cbl supplementation during 28 days was effective in increasing Cbl and in decreasing tHcy levels. An outright control of Cbl status, including biomarkers as well as functional and mental parameters, should be considered to maintain a healthier status in the elderly. Routine supplementation could be necessary in this population group. Financial support: Axis-Shield Diagnostics Ltd (Oslo, Norway), Abbott Científica S.A. (Spain), Asociacion de Familiares de Enfermos de Alzheimer (AFAL)

**PB8 461 MY ELDER CARE (MEC): HOW TO ENSURE THE CARE AND CONTINUOUS IMPROVEMENT IN THE CENTERS MAPFRE QUAVITAE**

S. JULIA\* (MAPFRE QUAVITAE, Madrid, Spain)

S. JULIA C.(1), C. JOSE RAMÓN(1), C. LAURA(1), G. JOSE LUIS(1), A. MARIA(1), S. ISABEL(1), R. LAURA(1), S. MAR (2), S. DOLORES(1) - (1) MAPFRE QUAVITAE (Madrid, Spain); (2) MEDICAL Dept. GRUNENTHAL (Madrid, Spain)

**Introduction:** The software in which the Company MAPFRE QUAVITAE supports management processes at its residential centers, My Elder Care, comes as a result of the need to monitor, review and improve the management and care for people in a situation of dependency that is being provided in our residential care centers. The software MEC allows to share information on assessments and interventions by the different areas (medical, nursing, physiotherapy, occupational therapy, psychology, ...) in a quick and easy way, and cross data, providing professionals advance in their findings and draw new plans of care for users, thus providing better planning of care as well as treatments on users. **Methods and Results:** We show some features of the software by images of screens which show how information is integrated (multicenter study of Spanish geriatric centers). The software stands out for its interdisciplinarity, the integration of those baseline data on the evolution of users and promoting comprehensive care. **Conclusion:** MEC allows instant

access to all validated assessment tools and validated scales (Barthel, Norton, Mini Mental, ...), to display relevant information for health care, adjust the care plan automatically, know the Geriatric Syndromes and vital sing development of the person and the overall population. MEC helps maintain updated all the treatments, control the Center pharmacy and the stock of drugs per user, or automatically generate orders, also improving the processes of economic management. The management of time working professionals is also facilitated by professional agendas which can be customized sessions and intervention groups. In addition to these welfare benefits, high turnover of professionals in the care centers for elderly people in Spain, among other reasons justifying the need for a software like this to ensure continuity of care and standardization processes and protocols.

**PB8 462 PREVENTIVE TRAINING IN GERIATRIC NURSING HOMES: MULTILEVEL DEVELOPMENT AND RE-AIM BASED EVALUATION.**

M. BRACH\* (University Muenster, Muenster, Germany)

F. NIEDER(1), U. NIEDER(1), H. MECHLING(1) - (1) German Sport University Cologne (Cologne, Germany)

Problem Consistent with other social discrimination, there are few opportunities of preventive exercise for highly aged people in need of care. For example, highly aged people would not be able to easily go to training facilities; standard exercises may be too intensive and so be harmful to them; the increased prevalence and incidence of orientational disorders like dementia will exacerbate individuals and groups in following instructions and keeping exercises going on. Approach Interventions on the individual, social, institutional and policy-cultural level were conducted during 2 years. For evaluation, the RE-AIM framework of Glasgow (2002) was used. Results Reach: In 5 politically predefined areas of the state Northrhine Westfalia in Germany, 9 model nursing homes were chosen through quality criteria. The programme reached 11% of potential residents, with an overall drop-out of 54% after one year. Effects: Strength and flexibility improved clearly after months. The participants' expectations referring to well-being were superimposed. Adoption: After the end of the project, all institutions adopted the programme at their own expense. Some started additional training groups. Implementation: A certain quality management made sure that even non-professional trainers were able to lead the training groups. Maintenance: Long term effects showed stable motor skills. A 16 month follow up on the institutional level is also carried out. Diskussion / Perspectives Exemplarily, preventive exercise has been established for a neglected target population. On one hand, there were positive evaluations on the individual and institutional level. On the other hand, on the political level, there is an incentive scheme for German care providers, that rewards care demands more than care prevention.

**PB8 463 AN IRT-BASED ASSESSMENT OF PACSLAC**

S. VAN NISPEN TOT PANNERDEN\* (Maastricht University, Maastricht, The Netherlands)

M. CANDEL(1), S. ZWAKHALEN(1), J. HAMERS(1), P. CURFS(2), M. BERGER(1) - (1) Maastricht University (Maastricht, The Netherlands); (2) Academic Hospital Maastricht (Maastricht, The Netherlands)

Introduction: Previous research showed that the PACSLAC observational checklist is very useful to measure pain in nursing home residents with dementia. PACSLAC was translated into Dutch and the number of items was reduced by applying classical test theory to pain ratings of a researcher (PACSLAC-D). The aim of this study is to reduce the number of items in PACSLAC on the basis of the ratings of nursing personnel by applying more advanced analysis techniques, namely item response theory and confirmatory robust maximum likelihood factor analysis. Methods and materials: Nursing personnel observed 128 nursing home residents during rest, the influenza vaccination and a patient-specific moment of potential pain. Item response theory was used to test the psychometric properties of the items in PACSLAC and to detect biased items by testing for differential item functioning (DIF). Confirmatory factor analysis was applied to determine the factor structure of the selected items. Results: Of the items that nursing personnel frequently registered, 2 items showed DIF when comparing pain scores of residents with mild dementia to pain scores of residents with severe dementia. One item showed DIF when comparing ratings of registered nurses to those of enrolled nurses and nurses' aides. Ultimately, 18 valid and reliable items remained, of which 14 items were also selected for PACSLAC-D. This finding confirms that these items are valid and reliable indicators of pain in older people with dementia. Confirmatory factor analysis showed that the data could not be ascribed to pain as a general factor, but rather to 3 components of pain: 'Negative reactions to pain', 'facial/ vocal/ emotional expressions of pain' and 'resistance to pain'. Conclusion: A refined version of PACSLAC was created that nursing personnel with different educational backgrounds might use to assess pain in older people with varying degrees of dementia.

**PB8 464 ELDERLY PEOPLE AND OPIODS: THREE METHODS OF ADMINISTRATION**

T. DIDIER\* (Hopital sainte perine, Paris, France)

K. FANNY(1), P. ANNIE(1), D. MICHEL(1), G. JEAN MARIE(1) - (1) Hopital Sainte Perine (Paris, France)

Introduction: Many elderly people suffer from nociceptive pain (even today some 70% of subjects in institutions). Opioids are relatively often necessary, and their use becomes more frequent. Often there is a lack of knowledge of administration modes, however, hindering an effective and secure handling. Method: More than 5800 specific consultations of a mobile team with 1560 elderly patients were carried out during 10 years in rehabilitation and long term care departments in a geriatric hospital (average age 85 years). Misappreciations persist, which explain the difficulty in taking charge of pains : -the essential prerequisites to initiate an opioid treatment (tolerance, secondary effects, monitoring) aren't known to the medical personnel -the three ways to administer the opioids according to the time critical aspects of pain aren't still well mastered. Results and discussion: A technical fact sheet that is easy to understand has been worked out, defining and synthetizing the following notions: 1. Steps to be taken before initializing a morphine treatment among the elderly subjects (sheet "assessments before morphine") 2. The three methods of use: - continous treatment - pre-medication - interdose (sheet "methods of use of morphine"). Conclusions: If the lack of knowledge and of methodology prevail over the bad use of morphine, one should not forget that the fears linked to the prescription and administration of this medicine are still deep-rooted. This explains for a good part the difficulties in handling morphine in geriatrics. This precise sheet, for nurses and physicians, is intended to structure the reasoning and to avoid the drifts based on fears and ignorance.

**PB8 465 TARGETING PAIN IN OLDER PEOPLE IN THE ACUTE CARE SETTING**

I. HIGGINS\* (University of Newcastle, Callaghan, Australia)

C. PHELAN(1), F. HODSON(1), P. SUMMONS(2), J. DOUGLAS(1), L. RITCHARD(1), D. BRUCE(1), G. MABBOTT(1), P. DOBSON(1) - (1) Hunter New England Health (Lambton, Australia); (2) University of Newcastle (Callaghan, Australia)

Introduction Research shows that hospitalised patients experience unacceptable levels of pain. Assessment of pain by healthcare staff is rarely documented and may contribute to poor pain management. Pain may hinder recovery and prolong hospitalization. Unrelieved pain is associated with depression, anxiety, cognitive impairment, decreased appetite and weight loss, disturbance to sleep, gait, general activity, mood and relationships with other people. The aims of the project reported here were to: improve the comfort and safety of older people in the acute care setting in relation to pain; facilitate practice change by use of media promotion, clinical protocol and multidisciplinary team education; and to determine whether "Targeting" pain media and multidisciplinary education improves the detection and management of pain in older people. Methods A pre post test evaluation design was used for this pilot study including audit mechanisms; patient and staff interviews to determine experience and satisfaction with pain and the "Targeting" pain project respectively. Results There was an increase in the assessment of pain by nurses and an increase in the use of analgesics. Nurses noted the effectiveness of pain badges. Conclusion Whilst the findings from the study showed a shift towards improved pain assessment and management of older people there were many challenges associated with the study including engaging the multidisciplinary staff in the education process and the absence of guidelines for managing pain in this group.

**PB8 466 USE OF BUPRENORPHINE PATCH FOR PAIN CONTROL IN ELDERLY PATIENTS WITH PUBIC RAMI FRACTURE - AN OBSERVATIONAL CASE SERIES**

S. MUKHERJEE\* (East Kent University NHS Trust, Margate, Kent, United Kingdom)

M. RAJEEV(1) - (1) East Kent University NHS Trust (CT9 4AN, United Kingdom)

Introduction Achieving adequate pain control is a major limiting step for rehabilitation and mobilisation in elderly patients with pubic rami fracture. Use of traditional pain control drugs such as codeine containing compounds can be associated with significant side effects in elderly patients. We describe an observational study using Buprenorphine patch for pain control in these cohort of patients in an Acute rehabilitation unit. Method Assessment of pain before and after introduction of Buprenorphine patch was done by Visual Analogue Scale (0-10, with 0=no pain and 10 being maximal pain)(VAS). The weekly patch dose used was either '5' or '10' releasing 5 micrograms/hour or 10 micrograms/hour respectively. Once pain control was achieved, rehabilitation was started by the physiotherapists and goals and objectives established. Barthel ADL index was used to monitor progress. Results 10 patients with pubic rami fractures were observed. Dosage of patch to achieve pain control – Patch '5' in 6 patients and '10' in 4 patients Mean age 85(Range 82-90) Mean pain score on VAS 1. before patch 7.6(range 6-9) 2. at discharge 1.4 (range 1-2) Average ADL on discharge 16(Range 12-18) Mobilisation after patch administration – average 5.2 days(Range 2 -14) All patients received treatment for osteoporosis. No untoward side effects including respiratory depression, confusion or constipation were observed in any patient. Patients were followed between four to six weeks after discharge from hospital. Conclusion Buprenorphine patch was found to be very helpful in achieving pain control in patients with pubic rami fracture. Adequate rehabilitation potential was achieved and led to shorter inpatient stay in the rehabilitation unit. As a patch was used, the complications from use of codeine containing drugs and their associated side effects were avoided and compliance from patients was excellent.

**PB8 467 STUDY OF TEMPOROMANDIBULAR JOINT DISORDER IN THE ELDERLY PATIENTS BY MAGNETIC RESONANCE IMAGING**

S. KRALJEVIĆ ŠIMUNKOVIC\* (School of Dental Medicine, Zagreb, Croatia)  
T. BADEL(1), M. MAROTTI(2), S. KOCIJAN LOVKO(3), J. KERN(4), I. KROLO(2) -  
(1) School of Dental Medicine (Zagreb, Croatia); (2) Clinical Hospital "Sestre milosrdnice" (Zagreb, Croatia); (3) Zabok General Hospital (Zabok, Croatia); (4) School of Public Health "Andrija Štampar" (Zagreb, Croatia)

**Introduction.** The aim of this study was to compare characteristics of elderly patients in the sample of general population of the patients with temporomandibular joint disorders. **Methods and materials.** A prospective study was done between January 2001 and December 2008 and it included 141 patients with TMJD. The whole sample of patients was divided in two groups: 31 patients aged over 60 (median age 67.9, ranging from 60-82) and the remaining 110 patients (median age 36.3, ranging from 12-59) who were seeking treatment. Diagnostics was based on clinical examination and it was confirmed by magnetic resonance imaging of all patients TMJs. Pain intensity was rated on a visual-analogue scale (AVS 1-10). The psychological assessment was carried out by Spielberger's State-Trait Anxiety Inventory (STAI). Data were analyzed by t-test. **Results.** There is no statistical difference between average pain in elderly patients (6.2) and patient aged up to 59 (5.7) evaluated by AVS ( $p=0.900$ ). Higher values of anxiety in both examined populations were shown as well as higher values in elderly patients, however without statistically significant difference: the mean scores in STAI 1 (anxiety as subjective state) were 39.7 for elderly and 44.5 for patients aged up to 59 ( $p=0.547$ ). In STAI 2 (anxiety as relatively stable individual characteristic) the scores were 40.3 for elderly and 45.7 for patients aged up to 59 ( $p=0.376$ ). There was a statistically significant difference ( $p=0.002$ ) in pain duration: elderly reported shorter duration of experienced pain (7.8 months) than patients aged up to 59 (12.2 months). **Conclusion.** Incidence of TMDs is the most frequent between 18 and 40 years of age, however in this study it was found that 22% were elderly patients. A higher level of anxiety was shown in both patients' group, regardless of shorter pain experience in the elderly patients.

**PB8 468 TREATMENT OF PERSISTENT NON-ONCOLOGIC PAIN IN ELDERLY**  
G. GAMBASSI \* (Università Cattolica del Sacro Cuore Roma, Rome, Italy)  
S. AQUILA(1), M. TOSATO(1), G. GAMBASSI(1) - (1) Centro di Medicina dell'Invecchiamento Università Cattolica del Sacro Cuore (Rome, Italy)

**Introduction:** Non-cancer pain is a common condition among the elderly. Long-term treatment with NSAIDs, Coxibs or paracetamol is associated with several adverse effects. This has sparked renewed interest in the use of opioid analgesics for the management of chronic non-cancer pain. The purpose of this study was to compare the efficacy and tolerability of NSAIDs-based treatment with an innovative formulation of rapid-release oxycodone, in a cohort of elderly patients suffering from persistent non-cancer pain. **Methods and materials:** We conducted a preliminary analysis in 70 patients enrolled in the study "SIGG-Progetto Anziani Doloro" in 5 centers (Ferrara, Florence, Genoa, Rome, San Giovanni Rotondo). These patients were 70-year-old or older, with persistent non-cancer pain from moderate to severe intensity assessed by the Brief Pain Inventory scale. Patients were randomized to receive open-label either NSAIDs or oxycodone+paracetamol. Primary outcome was to evaluate the safety and tolerability during 6 months of follow-up. The intensity of pain, pain-related ADL impairment, pain relief and functional status were used to evaluate treatment effectiveness. **Results:** Patients had a median age of  $78 \pm 6$  years and women were 80%. Fifty-three percent of the participants received NSAIDs, primarily ibuprofen ( $n = 44$ ), nimesulide ( $n = 10$ ), diclofenac ( $n = 18$ ). Participants randomized to oxycodone+paracetamol were 47%, of whom 65% were given a daily dose of 15 mg of oxycodone in t.i.d. Forty percent ( $n = 56$ ) of the participants withheld from the study, mainly because of the development of side effects nausea, vomit, epigastric pain, confusion. Drop-out rates were no significant different between NSAIDs and oxycodone+paracetamol. **Conclusion:** Our data indicate that the use of low-dosage of oxycodone+paracetamol may be a safe and effective option for the treatment of persistent non-cancer pain in elderly patients.

**PB8 469 FACTORS RELATED TO INCOMPLETE FLEXIBLE SIGMOIDOSCOPY AMONG ELDERLY TAIWANESE**  
S. CHOU\* (Fooyin University Hospital, Pingtung County, Taiwan)  
M. CHOU(1), C. LIANG(1), L. CHEN(2), K. HSUEH(3), L. YEN(4), Y. LIN(1), M. TU(3) - (1) Geriatric Medicine Center, Kaohsiung Veterans General Hospital (Kaohsiung, Taiwan); (2) Center for Geriatrics and Gerontology, Taipei Veterans General Hospital (Taipei, Taiwan); (3) Department of Family Medicine, Kaohsiung Veterans General Hospital (Kaohsiung, Taiwan); (4) Department of Emergency Medicine, Fooyin University Hospital (Pingtung County, Taiwan)

**Introduction:** Flexible sigmoidoscopy is effective in the screening of colorectal cancer, but incomplete examinations may overlook colonic pathologies and delay diagnosis. The aim of this study was to explore risk factors for incomplete flexible sigmoidoscopy among elderly Taiwanese. **Methods and Materials:** Healthy elderly participating in the health check-up in a tertiary medical center were invited for study. Subjects were recruited when they had fully consented and agreed to participate. Factors related to incomplete flexible sigmoidoscopy were evaluated and multivariate logistic regression was used to determine independent risk factors. **Results:** In total, 245 subjects (mean age  $73.5 \pm 5.5$  years, range 65-87 years, male/female =176/69) were enrolled and 70 (28.6%) incomplete examinations

were recorded. Univariate analysis showed that habitual exercise (odds ratio [OR]: 0.55; 95% confidence interval [CI]: 0.31-0.96,  $p = 0.036$ ), history of previous pelvic or abdominal surgery (OR: 13.3; 95% CI: 1.07-165.6,  $p = 0.044$ ), and body mass index (BMI)  $< 25 \text{ kg/m}^2$  (OR: 2.28; 95% CI: 1.19-4.35,  $p = 0.013$ ) were related to the incomplete examinations significantly. Using a multiple logistic regression model, we showed that habitual exercise (OR: 0.53; 95% CI: 0.30-0.94,  $p = 0.031$ ) and BMI  $< 25 \text{ kg/m}^2$  (OR: 2.48; 95% CI: 1.27-4.83,  $p = 0.008$ ) were independent risk factors for incomplete flexible sigmoidoscopy. **Conclusion:** The habitual exercise and BMI  $< 25 \text{ kg/m}^2$  were independent risk factors for incomplete examinations of flexible sigmoidoscopy. Elderly with risk factors may consider the alternative modalities for colonic examination.

**PB8 470 PREDICTORS AND CORRELATES OF GERIATRIC TRAUMATIC BRAIN INJURY**

H. THOMPSON\* (University of Washington, Seattle, WA, United States)  
J. VOSS(1), N. TEMKIN(1), S. DIKMEN(1) - (1) University of Washington (Seattle, WA, United States of America)

**Introduction:** Preexisting comorbidities are risk factors for gerotrauma and negative health outcomes. The goal of this study was to examine risk factors of older adults for developing traumatic brain injury (TBI), and to determine which comorbidities influence functional outcome [functional independence measure (FIM)] at hospital discharge controlling for initial injury severity (Injury Severity Score, Glasgow Coma Scale), age and gender. **Methods:** Secondary data analysis was conducted and available clinical and outcome trauma registry data were obtained for subjects aged 55 and older with TBI ( $n=222$ ). Medical records were reviewed for comorbidities. Relationship between comorbidity, age and mechanism of injury were evaluated with Chi-square comparisons. Linear regression analyses were conducted to assess for the influence of comorbidities on discharge FIM. **Results:** The three most prevalent comorbidities in older adults with TBI were hypertension (41.4%), alcohol abuse (25.3%), and cardiac arrhythmias (18.9%). When age was factored in to the analyses, the oldest old (85+) with a diagnosis of CHF were more likely to have a motor vehicle crash ( $p=0.005$ ); and were more likely to experience a fall if they had a comorbid visual problem ( $p=0.042$ ). There was a trend ( $p=0.054$ ) that elderly with neurological disorders were more likely to experience falls as the mechanism of injury. Of injury-related and demographic variables, only injury severity score was predictive of discharge function ( $p=0.009$ ). Women had higher mean FIM scores than men (9.6 vs. 8.2;  $p=0.06$ ). Only alcohol abuse added significantly to the model, explaining an additional 3% of the total variance. **Conclusion:** Primary TBI prevention efforts in older adults must consider the impact of comorbidities in interventions including vision problems and CHF, particularly in the oldest old. Alcohol abuse is common in older adults with TBI; screening should be conducted on all patients and interventions developed towards at risk elderly for prevention of future injury.

**PB8 471 PRESSURE ULCER PREVALENCE AND INCIDENCE -MEASURING OUTCOMES AND EDUCATION**

M. HARLAND GREGOIRE\* (Covenant Health, Edmonton, Canada)  
M. VARGA(1), M. HARLAND GREGOIRE (1) - (1) Covenant Health (Edmonton, Canada)

**Introduction** A baseline pressure ulcer prevalence and incidence study conducted in September 2007 identified a 34.2% prevalence and 28.9% incidence rate within a mid size western Canadian hospital. An evidence-based education program from the Canadian Association of Wound Care was introduced in 2007 to raise awareness and provide evidence-based preventative education to improve the quality of care delivered to prevent pressure ulcers. **Methods & Materials** A serial prevalence and incidence study was conducted in September 2008, with ethics and administrative approval, to measure the effect of this structured Interprofessional program. Informed patient consent was obtained with data collected from direct head to toe physical skin assessments. With a two hour educational preparation using the National Pressure Ulcer Advisory Panel staging guidelines, Interprofessional staff worked in teams to identify and stage the most severe ulcer and corresponding location. Results 184 out of 333 patients were included in this study with 44 cases of pressure ulcers identified equaling a prevalence rate of 23.9%. 10% of the cases were re-assessed determined an inter-rater reliability of 72%. Medicine/Stroke/Geriatrics demonstrated prevalence rates of 40% which are greater than the Canadian national average of 25%. The incidence study identified 9 new cases over one week for a 12.9% incidence rate. 45% of pressure ulcer patients were between the ages of 80-100 years old. Conclusion Awareness and education have decreased the prevalence and incidence of pressure ulcers. Local studies show changes in prevalence when prevention becomes a focus, but indicate that when the attention decreases, prevalence increases again. This would suggest that methods or programs for pressure ulcer prevention must focus on long term sustainability to be successful. A focus on accountability and adapting to a culture change from treatment to prevention will close the gap between intention and action in all areas from young to geriatric.

**PB8 472 TRAVELING WAVES AND PERCOLATIONS IN INFLUENZA TRANSMISSION AMONG UNITED STATES ELDERLY**

E. NAUMOVA\* (Tufts University School of Medicine, Boston, United States)

D. CASTRONOVO(1), N. FEFFERMAN(2), S. COHEN(3), J. WENGER(3), Y. NAUMOV(4), J. GORSKI(5) - (1) Mapping Sustainability, LLC (Jupiter, United States of America); (2) Rutgers University (New Brunswick, United States of America); (3) Tufts University School of Medicine (Boston, United States of America); (4) University of Massachusetts Medical School (Worcester, United States of America); (5) BloodCenter of Wisconsin (United States of America)

Introduction. The origin and spread patterns of seasonal influenza are still poorly understood. Seasonal waves of influenza travel over large spaces covering many climatic zones in a relatively short period of time arriving in late fall to early winter and dissipating in spring. Annual epidemics begin abruptly, peak within two to three weeks, and last from five to ten weeks and the precise mechanism for such patterns are unknown. Methods and Materials. We explored the influenza spatio-temporal dynamics in US older adults ( $\geq 65$  years old) for thirteen seasons (1991-2004) in 2,974 US counties utilizing over fifteen million Medicare hospitalization records. We also abstracted monthly records for minimum ambient temperature from over 380 monitoring stations. Results. Comprehensive dynamic mapping of weekly influenza hospitalization rates reveals that: a) while different regions of the US can host the first outbreaks, influenza emerges predominantly in rural, aging, or highly transient communities; and b) while initial outbreaks are just as likely in the south as in the north, the intensity of northern outbreaks is associated with preceding drops in ambient temperature. We observed synchronization in influenza transmission in a unique pattern when influenza cases emerged in multiple sites, then appeared in adjacent areas or percolated within one area, and then in a period of one week resulted in a large multi-site outbreak. Conclusion. The proposed methodology for generating dynamic maps in real time on a refined spatial scale along with supporting environmental and socio-economic information provides valuable information, which has a strong potential for facilitating preparedness of public health workers to mitigate influenza outbreaks on local, regional, and national levels. Furthermore, a better understanding of influenza seasonality provides insights for many aspects of influenza including pathogenesis, viral evolution, transmissibility, vaccination efficacy, and treatment options, especially for the frailest subpopulations.

**PB8 473 TUBERCULIN SKIN TEST VERSUS BLOOD IMMUNOLOGIC DIAGNOSIS OF LATENT MYCOBACTERIUM TUBERCLOSIS INFECTION AMONG OLD SUBJECTS**

A. JAMAÏ\* (Hôpital Erasme, Anderlecht, Belgium)

K. SCHEPERS(1), V. VERSCHEURE(1), J. HOUGARDY(1), S. DE BREUCKER(1), F. MASCART(1), T. PEPERSACK(1) - (1) Erasme (Bruxelles, Belgium)

Introduction: Among old subjects the development of a tuberculosis disease is often the result of the reactivation of latent tuberculosis. The people of more than 65 years are often infected by the pathogen. At this age, the clinical manifestations are poor and the forecast is bad with more than fifty per cent of death. The only test currently available for the diagnostic of latent tuberculosis is the tuberculin skin test(TST). New blood tests based on the immunologic response have been developed. Objectives: The purpose of this study are (1) to determinate the prevalence of positive tuberculin skin test among patients hospitalized in geriatric services and among voluntary old subjects; (2) to measure in a concomitant way the data of the immunological tests carried out at the laboratory (test QF-TB gold and Elisa); (3) to determine the predictive values of the TST and the new immunological tests, and (4) to determine the geriatric characteristics of the studied subjects and to analyze how these characteristics can influence the sensitivity of the TST and the immunological tests. Methodology: Hundred fourteen person of more than 65 years were included in the study between November 2006 and May 2007 (49 healthy volunteers and 65 in-patients). We performed on each patient a total geriatric evaluation (medical, functional, nutritional, social, and biological), a TST and a blood analysis (QF-TB gold and Elisa). Results: Only nine percent of the subjects presented a positive TST, 34% a positive test QF-TB gold, and 11% positive Elisa test. If we consider that the "gold standard" to confirm a contact with the bacillus of tuberculosis is the TST the sensitivity and the specificity of the QF-TB gold test are respectively 90% and 71%; its positive predictive value (PPV) and its negative predictive value (NPV) are respectively 24% and 99%. For the Elisa test, its sensitivity and its specificity are respectively 33% and 89%; its PPV and its NPV are respectively 15% and 86%. We did not observe a difference of prevalence of positive TST between the group of the voluntary subjects and the group of in-patients whereas a greater number of voluntary subjects presented tests QF-TB gold and Elisa positive compared to the group of in-patients. The group of in-patients is distinguished from the voluntary subjects in terms of age, Co-morbidity, functional dependence, denutrition increased. Discussion: If these new immunological tests prove to be promising, they cannot however replace the TST. Many studies on the place of these tests in the diagnosis of tuberculosis disease, latent tuberculosis and in the follow-up of the treated people must still be carried out; in particular among old people whose modifications of the

immune system and characteristics geriatric make the interpretation of the various observations more difficult.

**PB8 474 WELL ELDERLY II TRIAL RESULTS: EFFECTIVENESS AND COST-EFFECTIVENESS OF LIFESTYLE REDESIGN® IN COMMUNITY SETTINGS**

F. CLARK\* (University of Southern California, Los Angeles, United States of America)

M. CARLSON(1), S. AZEN(1), J. JACKSON(1), J. HAY(1), B. KNIGHT(1), D. MANDLE(1), J. BLANCHARD(1), C. CHOU(1) - (1) University of Southern California (Los Angeles, United States of America)

Introduction: The original Well Elderly Study demonstrated the efficacy and cost-effectiveness of the Lifestyle Redesign® intervention in improving health in diverse elders independently living in Los Angeles. In this presentation, we will report on the results of a more comprehensive randomized clinical trial which evaluated whether the outcomes of the first study could be replicated with: 1) a more heterogeneous sample, 2) greater variability in age, ethnicity, and socio-economic status, 3) across a much larger number of community sites, and 4) across more outcome domains. Methods and materials: Ethnically diverse elders ranging in age from 60 - 95 (n = 160) and recruited from 21 sites throughout Los Angeles were assigned to the Lifestyle Redesign® group or to a no-treatment control group over a six-month experimental period. Participants in the intervention groups received the lifestyle intervention, involving weekly group meetings at one of the study sites, community outings, and up to 10 individualized in-home consultations. The goal of the intervention was to enable the elders to develop a sustainable and customized healthy lifestyle in their daily life context. Results: The intent-to-treat analysis revealed that participants evidenced more positive change on the following SF-36 (VI) scores: bodily pain, vitality, social functioning, mental health, and composite mental functioning (p values < .05) as well as greater life satisfaction (LSI-Z, p < .03) and less depression (CES-D, p < .03) than control participants. Change scores on the cognitive measures revealed no intervention effect. The cost-effectiveness analysis estimating cost per QALY indicated the intervention was cost effective. Conclusion: The Lifestyle Redesign® intervention has beneficial effects and is cost-effective for ethnically diverse older adults recruited from a wide array of community settings. Because the intervention is cost-effective and widely applicable, it has the ability to improve the health of diverse elders while reducing health care costs.

**PB8 475 HUMAN BETA-HERPESVIRUSES IN CHRONIC PERIODONTITIS IN ELDERLY AND NON-ELDERLY PATIENTS**

R. THOMASINI\* (Faculty of Medical Sciences-UNICAMP and Herminio Ometto Foundation-University Center, Campinas/Araras, Brazil)

M. ROMEIRO(1), P. DURANTE(2), S. BONON(2), S. COSTA(2) - (1) Laboratory of Clinical Pathology - Herminio Ometto Foundation-University Center (Araras, Brazil); (2) Faculty of Medical Sciences - State University of Campinas-UNICAMP (Campinas, Brazil)

Introduction: Human chronic periodontitis (HCP) becomes more prevalent and severe with increasing of age. The most frequent interpretation to correlation between HCP and aging is that occur an irreversible loss of support tissue of teeth resulted from the accumulative effects of plaque and calculus. However, not all elderly as well as not all teeth in the elderly are HCP-affected and it cannot be considered as a single causative factor. Susceptibility to infections is increased in the elderly and reasons for it include immunosenescence, malnutrition and many age-associated physiological and anatomical changes. Betaherpesviruses that include Cytomegalovirus (CMV), Human Herpesvirus-6 (HHV-6) and Human Herpesvirus-7 (HHV-7) that remain latent in the host after primary infections might play a role in the pathogenesis of HCP but this fact remains controversial. Elderly is more susceptible to virus reactivation and therefore herpesviruses might present more significant periodontopathic outcome. This study aimed to evaluate betaherpesviruses-protein-expression in periodontal tissue obtained by biopsy using immunohistochemistry (IHC) in two groups of patients: elderly and non-elderly. Methods and materials: Twelve HCP patients (20 to 40 years-old) and 8 HCP patients ( $> 65$  years-old) were included in this study. One fragment of periodontitis-affected tissue was obtained by biopsy during odontological proceedings. The fragments biopsied were fixed on buffered-formalin and prepared using standard histotechnological practices regarding specificities to IHC techniques. IHC was performed using monoclonal antibodies against CMV, HHV-6 and HHV-7 followed by immunoperoxidase staining after endogenous peroxidase blocking. Results: All samples presented periodontal tissue with lymphocytic-histiocytic infiltration without others particular characteristics. None samples were positive by IHC for any viruses studied. Conclusion: The samples obtained presented chronic inflammatory process and no viral antigen expression was observed. Considering the limited sampling, our found data do not support the involvement of betaherpesviruses in human chronic periodontitis in the both groups of patients.

**PB8 476 HEALTH LIFESTYLE AND ITS DETERMINANTS AMONG OLD PEOPLE IN HELSINKI**

P. POHJOLAINEN\* (Age Institute, Helsinki, Finland)

T. SULANDER(1) - (1) Age Institute (Helsinki, Finland)

Introduction Health lifestyle consists of behaviors related to health, values, and attitudes that individuals and groups have assumed in the social, cultural, and economic

environment they live in. The most important lifestyle factors affecting health and lifespan appear to be smoking, alcohol consumption, nutrition, and physical exercise. The purpose of the study was to describe connections between different areas of health lifestyle among elderly, and to find out how health lifestyle was related to self-rated health. Material and methods A postal questionnaire was used to investigate the health lifestyle factors, education and self-rated health of 75+ residents of downtown Helsinki (456 men and 935 women). Health lifestyle factors included nutrition, smoking, alcohol consumption and physical exercise. Health status was described by self-rated health (alternatives included good, fairly good, average, fairly poor and poor). The levels of education were primary school, secondary school and high school. Results Among men 35 % and among women 38 % reported they ate vegetables daily. Alcohol consumption was more common among men (64 %) than women (47 %). There were no differences between men and women in smoking. 62 % of men and 59 % of women practised exercise (walking almost daily). Health was assessed good or fairly good more often among men (46 %) than among women (42 %). Self-rated health was connected with eating vegetables, alcohol consumption and physical exercise. Persons with better self-rated health ate more vegetables, drank more alcohol and exercised more often than persons with poor self-rated health. Education correlated with nutrition and alcohol consumption: persons with higher education ate more vegetables and consumed more alcohol. Conclusions The findings of this study indicate associations between self-rated health and many health lifestyle variables. This knowledge is important when we implement training programmes and recommendations for old people.

**PB8 477 SCREENING COGNITIVE IMPAIRMENTS BASED ON ELDERS PERFORMANCE IN LEARNING DIGITAL INSTRUMENTS**

A. JUNQUEIRA XAVIER\* (UNIVERSIDADE FEDERAL DE SÃO PAULO, SÃO PAULO, Brazil)  
E. D'ORSI(1), L. RAMOS(2), A. FAÉ(3), F. MARQUES(3), D. SIGULEM(4) - (1) universidade federal de Santa Catarina, departamento de saúde pública (Florianópolis, Brazil); (2) universidade federal de São Paulo, departamento de medicina preventiva (São Paulo, Brazil); (3) universidade do sul de Santa Catarina (Tubarão, Brazil); (4) universidade federal de São Paulo, departamento de informática em saúde (São Paulo, Brazil)

Introduction: Many cases of cognitive impairments progress undiagnosed because few practitioners screen patients regularly. Waiting for symptoms to become evident delays diagnosis and treatment. Learning digital instruments like personal computers and internet can include elder people in the information society and help to preserve independence, autonomy and citizenship. Difficulties in this process can be an early signal of cognitive impairments. Objective: To present a screening methodology for early cognitive impairments. Methods: Cohort prospective study in Santa Catarina and São Paulo, Brazil, to compare previously obtained mental status using Folstein's Mini Mental Status Examination (MMSE) to the performance in learning 4 basic digital instruments: "Mouse use", "Games use", "Browser use" and "e-mail use". The gold standard for cognitive impairments was MMSE up to 24 points. Workshops were developed to teach how to use the 4 digital instruments. The inclusion criteria were: community senior citizens above 55 years, not hospitalized, not in a nursing home, without previous contact and knowledge with personal computers and internet. The statistical parameters were: sensitivity, specificity and area under ROC curve, analysis in SPSS 15.0. Results: 76 individuals were included in the study, 55 women, 69 years-old average, 9.3 years of scholarship, 4.5 chronic pathologies and 4.4 continuous medications per participant. Each individual attended 20.48 workshop hours in average, the MMSE mean score was 25.23. The first task, "Mouse use" showed 100% specificity when compared to the gold standard and the last task, "e-mail use", showed 100% sensitivity. The best balance of sensitivity and specificity were found in the second task ("games use"), 87.50% and 93.33% respectively, and accuracy of 92.11%. The area under the ROC Curve was 0.95 (CI95%: 0.87-0.98). Conclusion: Personal computers and internet learning process can be used as a screening public health tool for early cognitive impairments.

**PB8 478 LOW-MOLECULAR-WEIGHT HEPARIN (LMWH): THE PROFESSIONAL PRACTICES IN GERIATRIC**

D. THOREZ\* (Hôpital sainte perine- rossini- chardon lagache, Paris, France)  
S. DE MONTGOLFIER(1), L. D'ARAILH(1), F. MULLER(1), B. LE DASTUMER(1), L. TEILLET(1) - (1) sainte perine-rossini-chardon lagache (Paris, France)

Context: The prevalence of venous thrombo embolism diseases increase with the advanced age like the prescriptions of anticoagulant with LMWH. Few studies have explored the prescriptions of the LMWH in the elderly population. The aim of this study is to describe the practices of professionals using HBPM in a geriatric hospital in Paris. Methods: It's a transversal study on all elderly treated by HBPM in geriatrics' hospital with 3 units cares: unit of acute care, unit of re-education, and unit of long term care. The data have been collected with a questionnaire about indications, dosing, durations of treatment, biologic's monitoring, by a geriatric doctor of the hospital. The security of prescription was defined by the association of 4 criteria: good indication, good duration of treatment, good dosing and good biologic's monitoring. Results: The prescriptions of LMWH concerned 13.5 % of patients who were hospitalised this day. Thirty eight percent were in re-education unit, 31.5 % of patients were in acute care and 4% in long term care. The indications concerned

the prevention of venous thrombo embolism in 76% of patients, mainly after surgery and 76% of indications were relevant. The doses were correct in 55.5% of cases, durations of treatment respected in 51.4% of cases, biologic's monitoring was maximum for 30.5% of cases. The security of prescription existed in 10% of patients. Conclusion: The LMWH are frequently used in geriatric but the supervision must be better. It's important to distribute the recommendations who exist and to use her according to the indications.

**PB8 479 INCIDENCE OF UNDIAGNOSED SKIN CANCERS IN A GERIATRIC HOSPITAL.**

S. MIELCZAREK\* (Hôpital Bichat, PARIS, France)  
J. FONTAINE(2), P. SENET(3), S. MEAUME(4) - (2) hôpital Charles Foix (Ivry sur Seine, France); (3) hôpital Charles Foix (Ivry sur Seine, France); (4) hôpital Charles Foix (Ivry sur Seine, France)

Summary: Background: The incidence of non melanoma skin cancers is closely correlated with age. The aim of this prospective study was to evaluate the prevalence of undiagnosed skin cancers among patients hospitalized in rehabilitation and long term care units in a geriatric hospital. Patients and methods: All the patients, resident in four rehabilitation and long term care units and for whom no dermatological advice has been given, were systematically examined by a dermatologist and a resident in general medicine. Clinical data included patient age at the time of the study, gender, relevant historical information, skin phenotype and description of the cutaneous lesions. Biopsies were performed for all lesions of suspicious appearance. Results: Three hundred and six patients (79.4% women and 20.6% men aged from 55 to 103 years) were included in the study. Among all the patients, 63.9% were hospitalized for more than one year. Skin phenotype was clear for 93.5% of the patients. Thirty two out of 306 patients (10.5%) presented 42 suspicious lesions and they were diagnosed by histological examination as 16 basal cell carcinomas, 7 squamous cell carcinomas and 2 in situ melanomas. Skin cancers were localized on the head and neck in 80% of cases. The prevalence of patients with skin cancers was 5.6% in this population. Conclusion: The prevalence of skin cancers among patients hospitalized in geriatric hospitals justifies improved training of geriatricians regarding early recognition and dermatological assessment of cutaneous tumours.

**PB8 480 PREVENTION PROGRAM "EQUILIBRE" ABOUT THE RELATIONSHIPS BETWEEN FALLS AND DEPENDANCE.**

B. TAVERNIER-VIDAL\* (CHU pole personnes âgées, DIJON, France)  
M. FRANCE(1), M. ISABELLE(2), M. PATRICK(1) - (1) CHU gériatries (DIJON, France); (2) ORS Bourgogne (DIJON, France)

In 1992, the Bourgogne-Franche-Comté region introduced a prevention program which then expanded all over France. Its objectives are to limit the risks, the frequency and the seriousness of falls and finally to limit fall consequences in terms of loss of autonomy of people aged 55 up to very old age. This campaign aims at improving the safety of movements and the autonomy of people in their own homes, decreasing the psychological impact of falls by learning how to get back to one's feet. The training of the stimulating staff meets precise specifications. This personnel is taught by professionals keen on prevention: Project designers, everyday-life assistants, and especially the stimulating personnel conducting a balance workshop are concerned by this training. At present, 400 people have been fully trained. The program offered may change over time depending on new scientific discoveries as well as on the ageing population. It is personalized thanks to a set of pre-and post-workshop tests. These tests make it possible to perform on-going evaluations along with a yearly final assessment. This action of prevention consists of ten one-hour long weekly sessions and individual exercises which can be performed straight from homes. 12000 people have already taken advantage of it. The profit on the quality of life is measured objectively in a forward-looking evaluation conducted by the Regional Observatory of Health. The cost price is highly competitive (1000 euros for the creation of the workshop and 700 euros for its renewal), partly financed by local authorities. The current program and its assessment have been largely financed by CRAM Bourgogne-Franche-Comté with also the creation of communication supports as posters, CDs and in 2008 a new DVD. Indeed, multiple partners have been working on this project and have brought together their own technical skills, making it a multidisciplinary approach.

**PB8 481 THE NURSING PROTOCOL DEVELOPMENT FOR OLDER ADULTS WHO NEED DAILY RHYTHM ADJUSTMENTS**

K. IIDA\* (Chiba University Graduate School of Nursing, Chiba, Japan)  
I. SAKAI(1), K. NEMOTO(1), S. SUWA(2), E. HAGINO(3), K. ISHIGAKI(4) - (1) Chiba University Graduate School of Nursing (Chiba, Japan); (2) Tokyo Dementia Care Research And Training Center (Tokyo, Japan); (3) Health Sciences University of Hokkaido (Ishikarigan, Japan); (4) Chiba University School of Nursing (Chiba, Japan)

Older adults in care facilities tend to suffer from dissonance of the daily rhythms. This is often caused by unnecessary or excessive medications because they are obliged to follow their facilities' daily schedule. Reducing unnecessary medications and providing adequate nursing care might improve older adults' quality of life, reduce the medical cost, and shorten the length of facility stay. The purpose of this study was to develop a nursing care protocol for older adults who suffer from disruptions in their daily rhythms, and to examine

the protocol's contents and its practicality. Method 1. Develop the protocol through the results from literature reviews and hearings from experts on Geriatric medicine, pharmacology, and nursing. 2. Conduct interviews with experienced nurses and care workers practicing at acute hospitals and long-term care facilities, and perform the content analysis focusing on the contents and practicality of the protocol. 3. Revise the protocol. Findings 1. The daily rhythm dissonance was categorised into four types. The protocol consisted of two parts: assessment strategies to identify the type, and care strategies for each type. 2. The attributes of the protocol voiced from nurses were: standardisation of care, an educational tool for the staff, and assurance for evidence-based care. 3. The factors that hindered practical use of the protocol were: the difference in older adults' physical status in each facility, time restraint to read and use the protocol, and the staff's resistance to the 'standards' and 'manuals'. Conclusion Although there were demands and necessity, it was indicated that the protocol needed refinement to be in use practically in a variety of settings. In order to achieve this, it was suggested that development of different versions of the protocol correspond to the different functions and characteristics of each care setting.

**PB8 482 HEALTH CONDITIONS OF ELDERLY JAPANESE RESIDENTS IN THE CITY OF SÃO PAULO, BRAZIL**

K. TAKO MARTINS\* (University of São Paulo, Maringá, Brazil)  
H. WADA AKEMI WATANABE(1), M. LEBRAO(1), Y. OLIVEIRA DUARTE(1),  
J. LICIO FERREIRA DOS SANTOS(2) - (1) University of São Paulo (São Paulo, Brazil);  
(2) University of São Paulo (Ribeirão Preto, Brazil)

Introduction. At the turn of the 19th to the 20th century Brazil adopted a posture receiving intensive immigrant to labour. Brazil is the country where there is the higher number of Japanese and their descendants outside of Japan. Some types of precarious conditions in childhood, associated with individual development factors, increase susceptibility to certain chronic diseases in old age. Methods and materials. In 2000, was held in São Paulo study knows – Health, Welfare and Ageing, research involving a sample of 2.143 people with 60 years, representing a sample expanded 836.223 elderly. The population of this study was composed of 43 persons who have declared was born in Japan corresponds to a sample expanded 11.854 elderly. The goal of this study is to correlate data concerning the conditions of health of older persons considered on the living conditions in childhood. Results. On the conditions of health in childhood, 100% of elderly people aged between 60 and 79 years old and 88% (80 years old and more) reported having excellent health condition before 15 years old. About the economic situation before the age of 15 years, 44,6% (60 - 79 years old) have evaluated as regular and 36,1% (80 years old and more) as good. Of all 11.854 Elderly Japanese evaluated 83,9% (60 - 79 years old) and 89% (80 years and more) have reported no childhood hunger. Approximately 50% informed that they had no diseases, 25,8% informed to have one and 26,6% two diseases. Self-reported diseases were Hypertension (43,9%), hearing impairment (29,1%), arthritis/rheumatism (15,4%), heart diseases (14%), urinary incontinency (12,7%) and diabetes (10,4%). Conclusions. There seems to be strong correlation with favorable conditions in childhood and better health conditions in old age, however, need to search more widely.

**PB8 483 PREDICTORS OF ALL CAUSE MORTALITY. – A 15-YEAR FOLLOW-UP STUDY IN THE GENERAL POPULATION**

S. WALTER\* (Erasmus MC, Rotterdam, The Netherlands)  
H. TIEMEIER(1), J. MACKENBACH(2), A. HOFMAN(1) - (1) Erasmus MC, Dept. of Epidemiology (Rotterdam, The Netherlands); (2) Erasmus MC, Dept. of Public Health (Rotterdam, The Netherlands)

Introduction: Research in the predictive value of variables from domains such as socioeconomics, diseases, physiology, and general health has a long tradition in epidemiological research. Genetic determinants are believed to have a decisive impact on mortality. Few studies, however, have analyzed conjointly in a prospective cohort and compared to each other with regards to their validity and differential potential in the epidemiologic investigations of mortality. Methods and Materials: Longitudinal analyses in the Rotterdam Study, a population-based cohort of 7983 elderly persons. Information on 200 risk factors plus 100 selected genetic markers, single nucleotide polymorphisms (SNP), were related to 15-year mortality follow-up. Selection of SNPs was based on the mortality analyses of a consortium of cohort studies. Results: In total 48 variables were identified that independently predicted mortality. Genetic determinants, at least when measured by single nucleotide polymorphisms performed worst as predictors of all cause mortality. Analysis using time dependent receiver operating characteristic curves indicated social economic indicators to display constant, predictive qualities over time (C-index (5y, 10y, 15y) = 0.7898, 0.7493, 0.7159). Markers for disease history and physiology were strongly superior in predicting mortality in a shorter time frame but failed to remain strong predictors for long term mortality estimation. Measures relating to general health, e.g. measures of anthropometry, exhibited strong age dependent predictive accuracy for all cause mortality. Conclusions: Age and sex remain the strongest predictors of mortality. The selection of predictor variables of mortality in research and other applications strongly depends on the intended prediction window. Social economic status as described by income, education, and occupational status is predictive of mortality across a 15-year time period. Physiologic variables are strongly predictive for short term mortality but lose their

strength when trying to predict long term mortality. Single nucleotide polymorphism cannot be used to predict all cause mortality.

**PB8 484 OBSTIPATED ELDERLY: SYSTEMATIZATION OF INTERDISCIPLINARY TEAM INTERVENTIONS IN LONG STAY INSTITUTIONS, RESIDENCIAL ALBERT EINSTEIN. SAO PAULO-SP, BRAZIL**

R. SANTOS\* (Hospital Israelita Albert Einstein, São Paulo, Brazil)  
B. TATIANA COSTA(1), G. FABIO MELLO FRANCO(1), S. LUCIANA ALVES(1),  
R. MIRIAM IKEDA(1), O. MARIA TERESA APARECIDA SILVA(1), S. DÉBORA CRISTINA OLIVEIRA MELO(1), P. NIVIA RAIMUNDA(1), J. ALESSANDRO F(1) - (1) Residencial Israelita Albert Einstein (São Paulo, Brazil)

A prospective study of intervention was held aiming the improvement of the intestinal functioning of elderly in Long Stay Institution, reducing the use of invasive techniques for the relief of constipation, enabling a better quality of life. The average age was 85 years, being 100% dependents according to Katz Scale and for the mobility held by FIM. A survey was held indicating the number of Fleet Enemas® (a drug prescribed for constipation – invasive method) consumed from January to March 2007. It was verified that out of the 146 Residents at the institution 48 have been prescribed with this medication because of the constipation (every time the duration was ≥ 4days). Therefore, the "Obstipation Group" was formed by the interdisciplinary team and it was established a routine registration and forwarding of information about the constipation among the group, an adaptation of the menu, a follow up of the diet and the insertion of laxative juice at breakfast and the afternoon tea, training of the team and the introduction of laxative medication. It was noted that the action and intervention of the interdisciplinary team are of extreme importance in obstipated elderly as the use of invasive Fleet Enema method is reduced, being replaced by laxative non-invasive medication and non-pharmacological actions, such as the adequacy of diet, laxative juice and increase in hydric ingestion, improving the intestinal habit, which can reflect in a better quality of life.

**PB8 485 BENEFICIAL HEALTH EFFECTS OF DEEP BREATHING-BASED TAI CHI TRAINING IN POST-MENOPAUSAL WOMEN**

A. PALASUWAN\* (Université de Nice Sophia-Antipolis, Nice, France)  
D. SUKSOM(2), I. MARGARITIS(1), S. SOOGARUN(2), A. ROUSSEAU(1) - (1) Université de Nice Sophia-Antipolis (Nice, France); (2) Chulalongkorn University (Bangkok, Thailand)

**BACKGROUND:** Menopause and aging increase the risk of metabolic diseases related to oxidative stress. This risk is further increased with physical inactivity. Although physical activity has many health benefits, some exercises are not suitable for women with the advancing age. We hypothesized that a Tai Chi training program based on deep breathing improves lung function, antioxidant capacity, and reduces cardiovascular risks in post-menopausal women. **METHODS:** Seven pre-menopausal and 7 post-menopausal Thai women participated in an 8-week Tai Chi (TC) training program (4 sessions/week; 1 hour/session). Long-deep inhalations rhythmed by the signal of a Chinese music were combined with rotational TC postures. Dietary intakes, physical activity, functional assessments, and blood collections were analysed before and after the program. Routine biochemical measurements, total antioxidant status (TAS), erythrocyte- and plasma-glutathione peroxidase activities (GPx), erythrocyte superoxide dismutase activity (SOD), plasma malondialdehyde (MDA) and plasma homocysteine (tHcy) concentrations were determined. **RESULTS:** In both pre-and post-menopausal women, TC training significantly improved physical fitness (balance, flexibility, leg extension) and lung function (tidal volume, vital capacity). Percentage of fat mass and LDL-cholesterol were decreased. Plasma TAS and erythrocyte GPx activity were higher after the TC program while erythrocyte SOD activity and plasma MDA concentrations remained unchanged. Plasma total homocysteine concentrations - a cardiovascular risk marker - were lower (-17% in post-menopausal women) after the TC training. **CONCLUSION:** These preliminary results show that in addition to the well-known effects of Tai Chi training on balance, muscular strength and flexibility, the addition of slow and deep breathing to rotational movements of Tai Chi postures could be a suitable and acceptable physical activity design for menopausal women to improve lung function and prevent cardiovascular and other oxidative stress-related diseases.

**PB8 486 TROPICAL TUBEROUS ROOT VEGETABLES: ARE THEY SOMETIMES HARMFUL?**

B. LYONS\* (Long Island University, Brooklyn, United States of America)

Introduction Tropical tuberous root vegetables (TRVs) used by many Caribbean and Latino Immigrants are abundantly available today in a variety of food markets in areas such as New York City. The consumption of high potassium TRVs can complicate late-stage chronic kidney disease (CKD) among those who are on hemodialysis. National databases and Tables of Food Composition (TOFC), including the U.S.D.A. Standard Reference, on which nutrient lists for the C.D.C. and the U.S. Renal Data System are based, have not kept pace with the importation of foods to the U.S. Hence, these published sources are not comprehensive and do not include some TRVs. Cross-racial data indicate that compared to their White counterparts, Black older adults in the U.S. including Caribbean immigrants

are four times more likely to develop CKD. Also, CKD is expected to quadruple in some developing Caribbean and Latin American countries. Many older adults at risk for and/or diagnosed with CKD in such countries immigrate to the U.S. Thus, the increasing prevalence of CKD in those countries negatively affects U.S. healthcare expenditures as well as the quality-of-life of affected persons. Methods and Materials The purpose of this poster is to raise the awareness of health care professionals, particularly policy makers of TRVs. This will be accomplished by: 1) picture illustrations of TRVs; 2) explaining potassium reduction methods (leaching) of TRVs; 3) comparing existing national and international tables of nutrients in foods. Conclusion Increased awareness of this issue will influence the modification of U.S. national TOFC. Comprehensive U.S. food lists will promote culturally appropriate nutrition education and therefore influence fruitful outcomes. Caribbean and Latino immigrants affected by CKD will benefit immensely. Other immigrants to the U.S. such as Vietnamese, South East Asians and Pacific Islanders will also benefit since these groups also consume TRVs.

#### **PB8 487 THE SIX MINUTES WALK TEST AFTER HIP OR KNEE SURGERY AFTER 80 YEARS OLD**

H. RANDRIANJAFY\* (Centre Hospitalier d'Aubusson, Aubusson, France)  
J. TARDIEU(1), M. MUÑOZ(2), T. DANTOINE(3) - (1) CH Aubusson (Aubusson, France); (2) CHU Limoges (Limoges, France); (3) CHU Limoges (Limoges, France)

**INTRODUCTION:** The Department of Physiotherapy in the Hospital of Aubusson (Creuse; FRANCE) receives more and more persons over 80 years old, which have had a surgery of the hip or the knee. We want to find a way to know if the length of the stay in the hospital can be predicted by the use of the test of the six minutes walk. **METHODS:** When a person over 80 years old arrives in the Department after a surgery, most of the time a prosthesis, of the hip or the knee, the physiotherapist measures the length that the person is able to walk during six minutes, with or without a technical help. An other test is done at the end of the stay. **RESULTATS:** A relation exists between the results and the length of time needed for the Physiotherapy and the stay in the Hospital. It is linked to the fragility and the other pathologies of the person. This test may help the medical and social team to prepare the return at home, with the necessary helps, a long time before the person leaves the hospital. **CONCLUSION:** Avery simple test can help to predict the length of an hospitalisation and to prepare the helps needed at home.

#### **PB8 488 CLIMATE CHANGE AND THE HEALTH OF OLDER PEOPLE**

J. GOODWIN\* (University of Loughborough, UK, Loughborough, United Kingdom)

**INTRODUCTION.** Demographic change in Europe will see fundamental changes in the age structure of all member nations, with a clear trend towards population ageing. This trend appears to be inexorable, with all forecasts of the UN and other global authorities consistently underestimating the rate of growth. Co-incident with population ageing is the phenomenon of climate change which carries with it the increased risk of low-incident high impact events such as heat waves, episodic extreme cold, hurricanes and other disaster related incidents. Therefore Europe faces simultaneously an increase in climate change induced risks to health and an increase in the numbers of vulnerable older people. **METHOD.** A literature review was undertaken to assess (1) the extent to which models examining and quantifying the effects of climate change on public health had factored in the specific vulnerabilities of older people; (2) the preparatory and responsive measures, if any, which are in place in Europe to mitigate the effects of extreme events on the older population (3) the research which is required to provide data to underpin public responses to the effects of climate change on the health of older population **RESULTS AND CONCLUSIONS.** Studies on the effects of climate change on health of older people are few. Many models provide categories of high confidence for the prediction of health effects and for their quantification, eg WHO 2000. However, few papers collectively report on the severe high risk consequences of ageing physiology and the increased prevalence of frailty amongst the older population. Many governments, eg France, have taken steps to install Heat Health Watch systems but the effectiveness of these systems have not been systematically tested. Some other governments, eg UK, have made advances in health forecasting and more research is required to demonstrate their validity and reliability.

#### **PB8 489 COMPARISON BETWEEN SUBJECTIVE AND OBJECTIVE ASSESSMENT OF VISION AND HEARING IMPAIRMENT**

H. KIM\* (Seoul National University School of Public Health, Seoul, Republic of Korea)  
K. NA(1), H. CHUN(2), J. SUNG(1), K. SON(3), B. CHO(4), J. CHANG(5), S. CHO(1) - (1) Graduate School of Public Health, Seoul National University (Seoul, Republic of Korea); (2) Institute of Health and Environment, Seoul National University (Seoul, Republic of Korea); (3) Seoul National University Hospital (Seoul, Republic of Korea); (4) College of Medicine, Seoul National University (Seoul, Republic of Korea); (5) KLoSA Team, Korea Labor Institute (Republic of Korea)

Introduction. Vision and hearing impairments are common physical handicaps among the aged, associated with limitation to quality of life and social roles. These impairments are often assessed by subjective report without actual measurement. The aim of the present study is to evaluate the agreement between subjective and objective assessment of vision and hearing impairment. Methods. Cross-sectional study was conducted in 516 elderly

subjects (223 males, 293 females) aged 47-94 (mean 64.2) selected from nationwide sample of Korea Longitudinal Study of Ageing (KLoSA) in 2008. Trained nurses measured visual acuity with standard eye chart and hearing with pure tone audiometry (0.5, 1, 2, and 4 kHz). Impairment was defined by 0.5 or lower score in the better eye, and by failure to hear average tone of 40-dB at 0.5, 1, 2 and 4 kHz in the better ear. Corrective devices were used if needed. Subjective impairment was defined by self-rating of the lower 2 of 5 point scale. Kappa coefficient and logistic regression were used for data analyses. Results. Overall agreement was poor ( $\text{Kappa} < 0.4$ ) for both vision and hearing. Self-rated impairment tended to be less frequent than objective impairment. Disagreement increased significantly with age, but was not associated with education or poor performance in MMSE (mini-mental status examination), for both vision and hearing. Compared to the younger group (47-54), the oldest group (75+) was associated with increased odds ratio (OR) for disagreement: 4.2 (95% CI 1.9-9.3) for vision and 6.0 (1.7-21.0) for hearing, adjusting for covariates. Conclusions. There were poor agreements between self-rated and measured vision and hearing status. Disagreement was greater for the oldest old group. Older persons may adapt to the vision and hearing impairment and may become less aware. Objective measurement may reduce undetected impairments restricting quality of life.

#### **PB8 490 DESIGNING THE EVALUATION OF HEALTH PROMOTION PROGRAMMES INTENDED FOR AGING AND « HEALTHY AGING » : LEARNING FROM ONE REGIONALIZED COMPONENT OF A NATIONAL PROGRAMME IN FRANCE**

P. DUPRAT\* (Metis institute, Paris, France)  
J. AQUINO(1), A. KIEFFER(2), A. TAHRRAT(3), O. DUPONT(4), G. BERRUT(5), O. MICHEL(6) - (1) clinique porte verte (France); (2) cnsa (France); (3) Ministère DGAS (France); (4) Ministère DGS (France); (5) CHU Nantes (France); (6) CHU Rennes (France)

**Context :** Like most of health promotion activities, the evaluation of « healthy aging » programmes raises challenges for performing value-added evaluation. But next to the common issue of measuring impact of health promotion in complex and multifactorial environments, the stakes for the domain of « healthy aging » may be further complicated by important time lags in expected results, by multiple interventions around aging people, by important intervening factors such as social or economic status. However, the evaluation process of such programmes is key for improving their efficiency and their relevance in a near future. In the context of a national evaluation process of a regionalized component of the 2005-2006 « healthy aging » programme in France, a dedicated project was conducted. **Methods :** In order to design a comprehensive model, a review of both the evaluation literature and the different national programmes was realized. The diversity of components of such programme required the mobilization of several approaches to cover the different issues. We finally took the option of a multilevel approach associating both qualitative et quantitative approaches. A single database was created with the 364 projects, in order to facilitate programme analysis and evaluation. A serie of interviews was conducted and analyzed with a selected list of experts and main stakeholders. Systematic field visits were organized with the totality of the 22 regions involved with a project review and rating, and additional interviews were organized with a selection of project holders in order to further assess the perceived outcomes of the programme. **Results :** The literature did not provided evidence of a single model to address the diversity of areas and concerns related to the programme. Next to the usual set of opinion-based qualitative analysis and indicators, we found that a set of semi quantitative tools derived from strategic analysis can facilitate the evaluation process and communication among stakeholders. It was also found that the necessity for project holders to perform an autoevaluation required further preliminary approaches and simpler tools. We propose a concurrent evaluation standardized approach, which may fit more closely to the context, and may provide both better project follow-up and impact measurement.

#### **PB8 491 EVALUATION OF A PROJECT-TARGETED COMPONENT OF A NATIONAL HEALTHY AGING PROGRAMME IN FRANCE: METHODOLOGICAL ISSUES, PRELIMINARY FINDINGS AND IMPLICATIONS FOR STAKEHOLDERS**

J. AQUINO\* (Metis institute, Paris, France)  
A. KIEFFER(1), O. DUPONT(2), A. TAHRRAT(3), G. BERRUT(4), O. MICHEL(5), P. DUPRAT(6) - (1) cnsa (France); (2) ministere DGS (France); (3) ministere DGAS (France); (4) CHU Nantes (France); (5) CHU rennes (France); (6) Institut Metis (France)

**Context :** In the recent years, most countries have implemented national initiatives on « healthy aging », focusing on the importance of health promotion and social links in preparing and experiencing the old age. Such programmes are linked to other components of national policies on ageing. International agencies (WHO, OECD, European Commission...) advocated such commitment for member states which developed answers through various projects at the national level and/or through regional networks. In France, a national programme was initiated in 2005 and 2006, expanded in the following years through a national Plan on « Healthy Aging ». Various dimensions were selected (health, environment, intergenerational link). Based on a decentralized process, 364 projects in 22 regions were selected and funded for the years 2005 and 2006. These projects were proposed by a highly diversified set of institutions and professional bodies. **Methods:** A global evaluation project was launched and conducted in 2008, in order to assess the various components of the programme, and to optimize further national initiatives on the

matter. Various steps were completed for defining methodology and tools. After the definition of the evaluation model, a multilevel approach was conducted. Next to the procedural and descriptive components of the evaluation, several factors have been investigated such geographical variations, quality of self-evaluation, associations of themes. A review of indicators was conducted, and approaches for identifying success factors were developed. Results : Several recommandations stem from the evaluation project performed : reinforcing knowledge and training on Healthy Aging at the local level, integrating more systematically such programme in the regional public health framework, reinforcing the commitment and participation of geriatric caregivers, promote the method of concurrent evaluation. Further international comparisons projects could also foster the impact of healthy ageing programmes and their social integration in national systems.

**PB8 492 OUTBREAK OF A VAN A STRAIN OF ENTEROCCOCUS FAECIUM IN A GERIATRIC WARD : ABOUT 91 CASES.**

M. LAURAIN\* (Service de Gérontologie - CHU Nancy Brabois, Vandoeuvre les Nancy, France)  
N. DIGUIO(2), M. DAVAL(2), C. PERRET-GUILLAUME(1), J. DEIBENER(1), A. BENETOS(1) - (1) Service de Gérontologie (Vandoeuvre les Nancy, France); (2) Service d'Hygiène (Vandoeuvre les Nancy, France)

Introduction : Glycopeptid resistant enterococci first emerged in the United State and more recently in Europe. Vancomycin resistant enterococci (VRE) have emerged in our hospital as a significative problem in February 2005. Outbreak of VRE colonization associated with a clonal strain of enterococcus faecium Van A affected some units like nephrology, hematology, hepatogastroenterology and our geriatric unit. An active surveillance was initiated from February 2005 to limit dissemination. Methods and materials : rectal swab surveillance cultures was performed for all patient admitted in the geriatric unit (47 beds); retrospectively, demographic and clinical data (underlying diseases, antibioticotherapy) were collected for patients from whom VRE were isolated and analyzed. Results: 91 patients were colonized (mean age 83 + or - 7 years) ; 33 % of men, 48,4 % come from community but 51,6 % were hospitalized in the last 6 months. 12 % have malignancy pathology, 29,7% chronic digestive pathology. Before colonization, 46,2 % have had antibioticotherapy in the last month ; antibiotics was préciséd in 87 patients : 19,8 % cephalosporin, 17,6 fluoroquinolone and only 3,3 % glycopeptide. In 11 %, previous multiresistant bacteria has been identified. Death occurred in 23,1 % but none was related to a VRE infection. Conclusion : Geriatrics patients are at a high risk of colonization because of multiple comorbidity, susceptibility to infections leading to use several classes of antibioticotherapy, and longer hospitalization ; overuse of antibioticotherapy, may favorise emergence of resistances and guidelines for administration of antibioticotherapy should be developed.

**PB8 493 ASSESSMENT OF PHYSICAL CONDITION IN ELDERLY AND RELATION WITH THE LEVEL OF PHYSICAL ACTIVITY.**

A. VUILLEMIN\* (Nancy University, Vandoeuvre, France)  
T. FAUCHARD(1), J. FOURNIER(2), N. JUGE(3), F. FRIEMEL(1), F. LE CREN(1) - (1) Fédération EPMM Sports pour Tous (Paris, France); (2) INSEP - Mission Recherche (Paris, France); (3) Gydle Inc. (Canada)

Introduction With the ageing population, maintaining independent living of the elderly is a major public health concern for which physical activity can play an essential role. To meet the needs of this population it is necessary to adapt physical activity programs according to their wishes and their physical condition level. It is therefore essential for the professionals to have easily applicable tools for evaluation in the field and/or clinical practice. The objectives of this study is to measure the level of physical condition of elderly in order to establish French references values for the different "Senior Fitness Test" elaborated in the United States and to investigate the relation between the level of physical condition and the level of physical activity. Methods and Materials Between February and April 2009, 1200 men and women, aged 60 to 94 years, will be involved in the study. The subjects are recruited by the Sports for all French Federation in various counties in France among their members or during action of physical activity promotion within the general population. A questionnaire to assess the physical capacity to realize the tests and a questionnaire to assess physical activity level will be administered. The subjects will be weighed, measured and the 7 physical condition tests will be administered in a predetermined order. Results and Discussion The preliminary results will be presented. The discussion will notably concern the interest to use these tests in a physical activity promotion strategy in everyday life, both for the elderly and for the professionals. The reference values will allow determining the physical condition level of a subject with regard to subjects of the same age and the same sex and will be useful for a better counseling in the practice. A French guide of administration and interpretation of the tests has been developed and offered to the professionals of physical activity and health professionals. The development of a specific system of data collection (on-line or off-line) will allow the follow-up of the subjects.

**PB8 494 RECRUITMENT STRATEGIES IN THE MULTIDOMAIN ALZHEIMER'S DISEASE PREVENTION TRIAL (MAPT):LESSONS FROM THE ACCEPT STUDY**  
V. GARDETTE\* (Département d'Épidémiologie et de Santé Publique CHU de Toulouse, Université de Toulouse, INSERM U55, Toulouse, France)

N. COLEY(2), C. ARANDJELOVIC(3), D. BRIOUDE-CONIASSE(4), T. FOURNIER(3), V. IGIER(4), J. POULAIN(3), B. VELLAS(5), A. GRAND(1), S. ANDRIEU(1) - (1) Département d'Épidémiologie et de Santé Publique CHU de Toulouse, Université de Toulouse, INSERM U558, gérontopôle (Toulouse , France); (2) INSERM U558 (Toulouse , France); (3) Université de Toulouse 2 Laboratoire CERTOP UMR CNRS 5044 (Toulouse Cedex 9, France); (4) Université Toulouse le Mirail OCTOGONE EA-4156 CERPP (Toulouse, France); (5) Service de Médecine Interne et Gérontologie Clinique, Gérontopôle, Unité INSERM U558, CHU de Toulouse (France)

Introduction Despite the growing number of trials conducted among older adults, recruitment remains difficult because of the specific limitations observed in this population. Recruiting elderly persons to trials involving pharmacologic agents, especially OTC drugs, is particularly problematic. Prevention trials are highly challenging because of the larger sample size required and the need to maintain elderly persons in a placebo-controlled trial for several years. Nevertheless, achieving recruitment goals is crucial to provide sufficient statistical power. The aim of this study was to compare recruitment rates of different recruitment strategies in a cognitive decline prevention trial. Material and methods The ACCEPT study, which is an ancillary study of the MAPT study, aimed to assess factors associated with acceptance or refusal to participate in a cognitive decline preventive trial. MAPT is a 3-year randomized, placebo-controlled trial assessing the efficacy of omega-3 fatty acid supplementation and a multi-domain intervention on cognitive functions. It was planned to recruit across 4 centers 1200 frail elderly subjects aged 70 years or older, living in the community. A GP network and memory clinics participated in the enrollment process. Conferences (senior centers, community centers, retirement communities) were organized. Mass media was also used (press release in newspaper and television).The main outcome measure was recruitment rates; secondary outcome was achievement of target recruitment. Results So far, among 228 subjects who agreed to participate in MAPT, 201 accepted to provide their reasons for participation. Moreover, 121 refused to participate, among whom 68 accepted to provide their reasons for refusal. The recruitment rates of each recruitment strategy will be presented, and the reasons for refusal or acceptance to participate. Conclusion This study will provide data concerning barriers to participation in a cognitive decline prevention trial, and may help to design appropriate interventions in order to improve future recruitment of elderly persons.

**PB8 495 SCREENING FOR MODIFIABLE RISKS FACTORS IN ELDERLY PEOPLE: PRELIMINARY RESULTS OF MAPT STUDY**

F. LALA-MONTAURIOL\* (TOULOUSE UNIVERSITY HOSPITAL, TOULOUSE, France)  
G. ABELLAN-VAN KAN(1), S. GILLETT-E-GUYONNET(1), I. CARRIE(1), P. OUSSET(1), B. VELLAS(1) - (1) Toulouse university hospital (Toulouse, France)

Rationale: Epidemiological studies suggest that occurrence of cognitive decline and neurodegenerative diseases such as Alzheimer's disease could be modulated by lifestyle factors even in elderly people. Methodology: Multi-domain Alzheimer Prevention Trial (MAPT) study is a large intervention trial aiming to compare the efficacy of omega 3 fatty acids and/or non pharmacological intervention for preventing cognitive decline in frail elderly subjects. This study is undergone in 4 university hospitals in France and should recruit 1200 frail elderly people over 70 for a 3 years follow-up. At year 1 and year 2, a screening for modifiable risk factors is planned in the intervention group. Assessment includes visual or hearing testing, screening for mood disorders, nutritional assessment, gait and balance evaluation, and screening for vascular risk factors. We report here the results of the 30 first screening assessments made in the frame of MAPT study. Results: We examined 30 subjects, 13 men (mean age=75 years), and 17 women (mean age=77 years). We found no significant affective disorder or gait impairment. 5 of the 30 subject (17%) suffer from obesity. 1 case of uncontrolled diabetes, and 8 cases of uncontrolled hypertension were observed. 4 unknown and untreated cases of hypertension were found. Conclusions: systematic screening allows detecting some treatable conditions that represent potential risks factors for cognitive decline. This assessment could be generalized in order to increase the awareness of elderly people and their GP for lifestyle factors in prevention strategies.

**PB8 496 RETRIEVED DROPOUT VISITS: ADVANTAGES AND LIMITATIONS IN PREVENTION TRIALS FOR ALZHEIMER'S DISEASE**

N. COLEY\* (INSERM U558, Toulouse, France)  
S. ANDRIEU(1), H. MATHIEUX-FORTUNET(2), P. GARNIER(2), B. VELLAS(3) - (1) INSERM U558 (Toulouse, France); (2) Ipsen Innovation (Les Ulis, France); (3) CHU Toulouse (Toulouse, France)

Context Prevention trials involving elderly persons are becoming increasingly common. Alzheimer's disease (AD) prevention trials are of long duration and involve large numbers of elderly subjects. Dropouts are frequent due to participant age, and the progressive nature of AD. Methods Missing data must be taken into account during analysis. LOCF is commonly used, but is unsuitable in AD prevention trials due to the underlying assumptions (missingness mechanism; no change after dropout). Other more sophisticated methods are available which do not require data to be missing completely at random, but none are perfect. It is therefore important to limit missing data. Various strategies can be

employed, but in particular due to the burdensome nature of assessments in AD prevention trials, there will always be some dropouts. A retrieved dropout visit (in person or telephone) can be proposed at the theoretical end of follow-up to try and obtain a minimum amount of relevant data, for example concerning the primary outcome (dementia conversion), vital status, and living arrangements. Results Typical attrition rates in prevention trials involving elderly participants will be presented, along with the percentage of studies reporting the use of a retrieved dropout visit. The success rate of retrieved dropout visits (% of participants accepting) will also be presented. Conclusions Retrieved dropout visits may be a useful way of minimising missing data and several authors have now highlighted the need for retrieved dropout visits in AD trials. However, there are certain limitations, as only a minimum amount of information is collected at only one time-point. Not all subjects who dropout will agree to the retrieved dropout visit, meaning that there will still be an element of selection bias. Furthermore, dropouts will occur at different stages of the trial, and so subjects will have different durations of exposure to the treatment under study.

#### **PB8 497 SECONDARY PREVENTION OF FALLS AMONG OLDER PEOPLE IN PRIMARY HEALTH CARE**

S. TEERI\* (Satakunta University of Applied Sciences, Pori, Finland)  
H. LAMMINEN(1), H. HYTTINEN(1), M. SALMINEN(2), S. KIVELÄ(2) - (1) Satakunta University of Applied Sciences, Faculty of Social Services and Health (Pori, Finland); (2) University of Turku, Institute of Clinical Medicine, Family Medicine (Turku, Finland)

One in three persons over 65 years of age experiences a fall at least once a year. There may be several internal and external risk factors behind the falls. External risk factors include slippery walking surfaces and poor lighting. Internal risk factors include various illnesses, the use of psychopharmaceuticals or medication affecting the central nervous system, poor muscle strength, poor balance, impaired vision, depression and alcohol use. This research is based on a study on the prevention of falls among the elderly conducted in Finland in 2003-2006. In connection with the study, a fall prevention programme aimed at risk groups and a scale for charting risk factors were developed. The feasibility of the programme is being tested in Finnish basic health care. During the first phase, a scale including the internal risk factors of falling is constructed based on previous research data. Three nurses are then trained as Fall Nurses; all patients over 65 who come to the health care centre after having a fall are referred to them. For each patient, the Fall Nurse charts the internal risk factors related to the fall and provides information based on the risks discovered. The project involves a one-year follow-up on fall risk factors, the guidance provided by the Fall Nurses and the efficacy of counselling and the measures taken. After this, the prevention programme will be re-evaluated. During the next phase, the scope of activities will be expanded to cover several municipalities. The goal is for every municipality to have a nurse, with special competence in falls working in close cooperation with other professional groups. The activities of the Fall Nurse have an impact on the prevention of falls among the elderly, working in close cooperation with other professional groups in an active manner and showing initiative.

#### **PB8 498 A NEW PATH IN GERIATRIC HOSPITALISATION : THE POST-ACUTE GERIATRIC UNIT.**

V. REVEL DA ROCHA\* (Hopital de PAU, PAU, France)  
M. SARASIBAR(1), P. BIGOT(1), J. BOULE(1), F. DE LA FOURNIERE(1) - (1) CH PAU Pôle geriatrie (PAU, France)

Introduction: faced with a shortage of hospital geriatric care, new structures have been created: the post-acute geriatric units. One of these opened in 2006 at the Hospital of Pau (South-West of France). It has 12 beds and operates with a higher staff ratio than other "more classic" geriatric medicine departments. Materials and Methods: we present here the specific mode of operation and the activity of this unit during 2007 as well as the study of the readmission rate at one and six month during that year. Results: admission criteria in this unit are: an age>75, patients coming exclusively from emergency departments, patients whose "forecasted" length of stay does not exceed 4 to 5 days, and for whom a return where they used to live is favoured. In 2007, 822 patients were admitted, their mean age was 86. The most frequent pathologies were: falls(27%), lung diseases(16%), gastroenterology(14%), neurology(11.5%), cardiology(10.5%). The mean length of stay is 4.4 days and the occupation rate is 82 %. 75 % of patients return where they used to live before their hospitalisation. The readmission rate at 1 month is 11.5 %, at 6 month 30.4%. Conclusion: post-acute geriatric units offer a new orientation path and geriatric care. They allow, in spite of a short length of stay and a return at the patient's usual home in three-quarters of cases, to obtain readmission rates similar to those seen in classic geriatric medicine units. However a number of readmissions remain avoidable and in future other medico-social structures such as geriatric Hospital at Home care or autonomy homes will probably have to be developed. This will enable us to act earlier for frail older people who are at risk of physical or mental decompensation.

#### **PB8 499 POLYMBODIDY IN ELDERLY: CONTRIBUTION OF PREVIOUS SURGICAL PROCEDURES**

M. DUBRAVA\* (Comenius University, Faculty of Medicine, Bratislava, Slovakia)  
P. LABAS(1), J. JANOSIOVA(1), S. KRCMERY(1), P. KAZIMIROVA(1), A. CVEJKUSOVA(1) - (1) Comenius University, Faculty of Medicine (Slovakia)

**INTRODUCTION:** Polymorbidity is generally considered as a typical geriatric phenomenon. Unfortunately only scarce data on true polymorbidity are published. Almost no data are available on the contribution of previous surgical interventions (PSIs) to the cumulative polymorbidity in later age. At the same time many patients require further close follow-up, pharmacological substitution, rehabilitation and/or psychological support after PSIs. **METHODS:** In a retrospective open study polymorbidity was evaluated in patients being discharged during one year from acute geriatric department in a university hospital. We assessed 1028 pts., 65 – 102 yrs. old (average/median age 78.2/78 yrs.), M/F 36.4/63.6%. All diagnostic data were extrapolated from the discharge reports manually. **RESULTS:** The average number of PSIs in one patient was 1.69 (SD 1.4; range 0 - 7), median number was 2. More PSIs were documented in women (M/F 1.6/1.8, p 0.02). Only 21.9 % of patients had no previous surgery, but 23.5 % of patients had 3 or more surgeries. PSIs represented 8.1 % of all diagnoses at discharge. During one year 168 different PSIs were present. There were eight PSIs with prevalence higher than 5 % (highest: cholecystectomy – in 26.7 % pts.), representing 56.2 % of all PSIs. Most frequent PSIs were those concerning the gastrointestinal tract (41 % of all PSIs). There was no significant correlation between age and number of PSIs, but the age-dependent rate was visible in some surgeries. Higher than average mortality was observed in patients with previous hip replacement. **CONCLUSION:** The contribution of PSIs to the polymorbidity of elderly is remarkable. Physician in an acute geriatric department is confronted with a wide range of PSIs in his patients. Our data could be of importance not only for gerontology, but especially for practical clinical approach and health care management.

#### **PB8 500 THE IMPORTANCE OF THERAPEUTIC CLASSIFICATION ON DRUG COMPLIANCE IN THE ELDERLY.**

A. BÓS\* (Pontifical Catholic University of Rio Grande do Sul, Porto Alegre RS, Brazil)  
A. OLIVEIRA(1), C. WERLANG(1), F. MORRONE(1), C. FERREIRA(1), G. DECARLI(1), N. TERRA(1) - (1) Pontifical Catholic University of RS (Porto Alegre RS, Brazil)

Introduction: Aging process presents many features that can interfere in the efficacy of drugs in the elderly patients. Since elderly patients are the most prescription-drug consumer aged group, drug compliance is a great concern for health professionals, particularly for the pharmacists. This study aimed to understand if different therapeutic class of the medication interferes in the compliance of the drugs in the elderly. Methods and materials: Using the data from a population based study in Porto Alegre, Brazil, participants answered a questionnaire assessing drug consumption and compliance. Using the Anatomical-Therapeutic-Chemical Classification System to classify the most consumed drugs we measured the risk of each classification group of been compliant to the drugs. Number of drugs (polipharmacy), age and gender were confounders used in the models. Results: 438 participants (355 women, 159 men), mean age 70.2 (range 60 to 96 yo), answered the questionnaires. Only 36.3% of the subjects were compliant with the treatment. Cardiovascular ( $p=0.053$ ) and musculoskeletal ( $p=0.007$ ) were significantly associated with compliance. However, only musculoskeletal drugs remained significant ( $p=0.035$ ) when adjusting for polipharmacy. Conclusion: compliance is a major problem in the elderly, polipharmacy is a strong predictor of compliance failure. Drugs affecting symptoms may positively affect compliance. Health professionals should be aware about the difficulties an elderly patient faces when taking multiple drugs.

#### **PB8 501 ANEMIA IN THE ELDERLY**

E. FICHTINGER\* (Medical University of Graz, 8036 Graz, Austria)  
S. HANS-JÜRGEN(2), W. GERHARD(1), T. ERWIN(3), W. SANDRA(4), D. DORIS(5), R. REGINA(1) - (1) Dept of Internal Medicine, Medical University Graz (MUG) (Graz, Austria); (2) Clinical Institute of Medical & Chemical Laboratory Diagnostics, MUG (Graz, Austria); (3) Institute of Physiological Chemistry, MUG (8036, Austria); (4) Institute of Pathophysiology (Graz, Austria); (5) Dept of Transplant Surgery, MUG (Austria)

**Abstract Background:** Anemia in elderly is not caused by physiologic ageing process and should be seen as part of the frailty syndrome leading to increased secondary morbidity. Symptoms of anemia in elderly are not specific and therefore often neglected. It was the aim of this study to evaluate the prevalence of anemia in elderly and to investigate its causes in elderly patients submitted for various reasons into a University Hospital. **Methods:** 2 391 patients older than 65 years were seen for further treatment at different Departments at the Medical University of Graz from March 1st to March 31st 2007. Computed patient's records were followed for medical history as well as laboratory measures. **Results:** Out of 2 391 elderly patients 601 followed the criteria "anemia" as defined by the World Health Organization (WHO) indicating a prevalence of 25.1% for anemic patients. 272 of 355 anemic patients (76.6%) were malnourished according to serum albumin levels measured in patients (threshold level for malnutrition according to literature <3.5g/dL). In 61% of our patients with low serum- hemoglobin- concentrations

indicating anemia due to WHO standards the diagnosis of anemia was not listed in the discharge letter. Discussion: Our data indicate the clinical impact of anemia in elderly patients submitted for further treatment to a University Hospital. Leading cause of anemia in our cohort of elderly patients was "anemia associated with malnutrition". The awareness of the clinical impact and diagnostic procedures in elderly patients in the University Hospital Setting seems to be, at least in our hands, rather low. The underreporting of anemia in combination of malnutrition in elderly patients in the acute care hospital reflects the needs for further training of doctors in the field of geriatric medicine and frailty.

**PB8 502 ADMITTING ELDERLY PEOPLE TO A GERIATRIC SHORT STAY: DIRECT ADMISSIONS VERSUS ADMISSIONS BY THE EMERGENCY DEPARTMENT (ED).**

C. GIROUX\* (Centre Hospitalier de Valenciennes, Valenciennes, France)  
F. HEQUET(1), E. PROYE(1), P. DUFOUR(1), G. GOMMEZ(1), D. DAMBRE(1),  
C. GOZE(2) - (1) Court Séjour Geriatrique - Centre Hospitalier de Valenciennes (Valenciennes, France); (2) Service Urgences-SMUR - Centre Hospitalier de Valenciennes (Valenciennes, France)

Introduction: The increasing number of elderly people and the fact that the ED are likely to get jammed require to optimize the way we take care of old patients in amount of hospital. It is necessary to favour direct admission to hospital for those old frailty and polypathological patients. Methods and materials: Retrospective study of all patients who were hospitalized in the geriatric short stay in the hospital complex in Valenciennes (North of France) from the first of November 2006 to the twenty-eighth of February 2007. We compared the patients who were admitted directly to the ones who went through the ED. Results: Both groups were old and mostly composed of women. The patients who were directly admitted were more living in nursing homes ( $p=0.01$ ), stayed less in hospital ( $p=0.005$ ), underwent 45% less complementary examinations ( $p<0.001$ ). Direct admissions included more patients with dementia ( $p=0.02$ ). The exit diagnosis showed no significant difference except for cardiovascular, nephritic diseases and for behavioural troubles. The evolution of both groups was similar even for the mortality rate. Conclusion: These two groups of patients had little differences in their demographic characteristics as well as in their pathologies and evolutions. Direct admissions proved to be more beneficial: • The average length of stay, the number of complementary examinations and therefore, the costs of hospitalizations were reduced. • It was taken care of patients with dementia in a faster and more suitable way. We have to keep general practitioners informed of the advantages of direct admissions to strengthen the town-hospital network. We also need to improve the way the ED deals with elderly patients who could not be directly hospitalized.

**PB8 503 THE UNDERREPRESENTATION OF INDIVIDUALS 80 YEARS OF AGE AND OLDER IN CHRONIC DISEASE GUIDELINES**

L. COX\* (The University of Western Ontario, Grand Valley , Canada)  
M. KLOSECK(1), R. CRILLY(1), C. MCWILLIAM(1) - (1) The University of Western Ontario (Grand Valley, Canada)

Introduction: Quality improvement is a priority for health care in the 21st century and many evidence-based clinical guidelines have been developed to ensure high standards of care for chronic disease management. Underrepresentation and low participation of elderly in intervention studies, clinical trials and clinical practice guidelines, however, is a significant concern given population aging worldwide, limiting both generalizability and clinical usefulness of findings. Purpose: The purpose of this study was to analyze 5 Canadian chronic disease guidelines (CDGs) to determine whether CDGs and evidence used to create CDGs includes individuals 80 years of age and older, the population segment with the greatest impact on health utilization and cost. Methods: 2008 diabetes, hypertension, heart failure, 2006 stroke and 2002 osteoporosis guidelines were analyzed to identify recommendations for individuals  $\geq 65$  years,  $\geq 80$  years and those with multiple chronic conditions. This was followed by analysis of all references in the 5 guidelines (diabetes n=1883, hypertension n=63, heart failure n=201, stroke n=100, osteoporosis n=394) to determine representation of older individuals. Non-human, non-intervention studies (n=704) and those not reporting a mean age (n=367) were excluded, leaving a total reference sample of n=1570 (diabetes n=1118, hypertension n=25, heart failure n=111, stroke n=31, osteoporosis n=285). Results: While 4 of 5 guidelines provided specific recommendations for individuals  $\geq 65$  years, none provided recommendations for individuals  $\geq 80$  years. Furthermore, only 12 of 1570 studies used to support guideline recommendations reported a mean age of  $\geq 80$  years, even though this group forms the predominant population who suffer from these conditions. Conclusion: There is very low representation of individuals in advanced old age in CDGs and the studies upon which these guidelines are based. Because of the complexity of medical and functional problems in the very old, the applicability of current chronic disease guidelines to this sector of the population is doubtful.

**PB8 504 IMPROVING THE PRIMARY CARE PRESCRIPTION OF HYPNOTIC AND ANXIOLYTIC DRUGS IN THE FRENCH ELDERLY**

A. DESPLANQUES -LEPERRE\* (French National Authority for Health (HAS), Saint denis la plaine, France)  
A. DESPLANQUES-LEPERRE(1), N. RIOLACCI-DHOYEN(1), S. BUSCAIL(1), M. ERBAULT (1), S. ROYANT-PAROLA(2), J. DOUCET (3), S. LEGRAND(4) -

(1) Haute Autorité de Santé (Saint Denis La Plaine, France); (2) Clinique du Château (Garches, France); (3) Centre hospitalo-universitaire de Rouen (Rouen, France); (4) Hôpital Bretonneau -Université Paris-Diderot (Paris, )

**INTRODUCTION** The remit of the French National Authority for Health (HAS) is to improve quality and safety of care. The prescribing of hypnotic and anxiolytic drugs (H/A) is often inappropriate and higher in France than in other European countries, especially in the elderly, more exposed to side-effects. To monitor prescribing practices and to identify corrective actions, specific data of H/A in the elderly and comprehensive analysis of the real life situations of prescription are required. **METHODS AND MATERIALS** In close collaboration with geriatrics, psychiatrics and general practitioners, the circumstances of prescriptions in insomnia and anxiety were analysed in order to identify (i) the reasons of prescriptions (ii) the drugs used. The H/A consumption overall the elderly French population was measured using the National Health Insurance database. The data were analysed with health professionals to elaborate implementation tools for good practices. **RESULTS** In 2007, 3,498,826 people over the age of 65 (34.8%) had long term H/A prescription, respectively 27.6% in the 65-74 y.o., 39% in the 75-84 y.o., 46.8% after 85 years. New prescriptions of benzodiazepines concerned 358,738 people after 65 years (3.5%) between the 1st of September and the 31st of December 2007. To improve practices in the elderly in ambulatory setting are proposed : (i) implementation tools for good practices (reminders, clinical cases, diagnosis tools, guidelines for the discontinuation of BZD in the elderly), (ii) professional sessions to discuss about clinical experiences; (iii) press conference to promote key messages. All reports, figures and tools are available in a dedicated section of HAS website (has-sante.fr). **CONCLUSION** The H/A overuse is confirmed: key actions to reduce first and renewal prescriptions have been undertaken and the H/A consumption will be followed each year. However, a media campaign on the H/A in order to sustain the changes in practice is probably necessary.

**PB8 505 THE 'OLDEST OLD' AS RESEARCH PARTNERS: A CRITICAL REVIEW OF PARTICIPATORY RESEARCH WITH PEOPLE AGED 80 AND OVER**

C. DAUM\* (University of Alberta, Edmonton, Canada)  
V. HOLLIS(1) - (1) University of Alberta (Edmonton, Canada)

Introduction: Various approaches facilitate client involvement in research. Participation can range from that of research subject to active partner in all elements of the research process. A recent review found that older adults are increasingly involved as partners in health research to inform policies and services. The extent of participation by the oldest old, a fast growing segment of the older population, is unknown. This review evaluated the scholarly literature on actively partnering with people aged 80+ in health research. Methods: Electronic databases (Medline, CINAHL, PsycINFO, Scopus, Ageline, Abstracts in Social Gerontology, Embase, AMED) identified peer-reviewed English language papers, 1995-2008. Papers reporting persons aged 80 as active partners in any part of the research process were included. Bibliography reviews identified further articles. Two reviewers evaluated papers using the McMaster Critical Review Tool and a template for data extraction. Results: Over 780 citations met some of the inclusion criteria. Many papers had limited details regarding participant involvement; others did not state ages. Various terms described active research involvement (e.g., community-based participatory research, user-involved research), pointing to the need to clarify these terms. Four papers reported involving people aged 80+ as active research partners. Participation included determining research priorities, providing feedback on instruments, collecting data, developing interventions, and using findings to stimulate action. Emerging themes indicated the importance of participatory research in reflecting the interests of older adult. Conclusions: Researching with, rather than on, communities is continually promoted, but few studies engage with the oldest old as active partners. Most papers reviewed here grouped all older adults as 65+. The paucity of evidence makes it difficult to confirm the value of participatory research with this group. More studies are needed to evaluate the outcome of participatory research with the oldest old in terms of achieving specific community and systems change.

**PB8 506 THE INTERVENTIONS TO REDUCE LENGTH OF STAY AT THE EMERGENCY DEPARTMENT OF GRENOBLE UNIVERSITY HOSPITAL ARE EFFICIENT FOR ELDERLY PATIENTS.**

C. MILLET\* (Grenoble University Hospital, Grenoble, France)  
B. LUCHE(1), C. PAQUIER(1), P. COUTURIER(2), F. CARPENTIER(1) - (1) emergency department of Grenoble University Hospital (Grenoble, France); (2) geriatric university clinic of Grenoble University Hospital (Grenoble, France)

Introduction. Patients older than 75 years represented 20 % of admissions in Emergency Department of Grenoble in 2008. Risk of complications increases with their length of stay at Emergency room. This study aimed at assessing the efficiency of changes in care management at the Emergency room on the length of stay of elderly patients. Materials and methods. In 2007, an audit identified causes of time wasting in care management at the Emergency department of Grenoble University Hospital and defined improving interventions. Monthly data on care management and length of stay of patients attending the Emergency Department were compared before and after implementation of corrective measures, respectively in April 2006 and in April 2008. Benefit according to age (patients aged 15 to 75 years versus older than 75 years) was assessed. Results. In 2008, 16% of

patients attending the emergency room were older than 75 years (no difference with 2006). A length of stay decrease (-10%) was observed among all patients and was higher among elderly ones (-18 %, with a reduction of almost 75 minutes). Delay before first medical management was improved (decreasing from an average of 3 hours to an average of 1 hour , representing of 67 % reduction), the absolute gain being the highest among elderly (with an average 3 hour reduction). Home discharges or admissions in specialized services occurred before the sixth hour for 80% of elderly patients in 2008. Conclusion: Elderly patients had more benefit than younger ones from care reorganization at the Emergency department. Reduced length of stay represents a chance to reduce adverse health outcomes. To decrease complications linked to unplanned admissions, other factors have to be considered: opportunity of direct admissions in geriatric medicine units, availability of equipment to prevent immobilization complications and availability of beds in geriatric medicine units.

**PB8 507 OSTEOPENIA AND OSTEOPOROSIS IN POSTMENOPAUSAL WOMEN**

M. SAINTRAIN\* (Universidade de Fortaleza, Fortaleza, Brazil)

Z. VIEIRA BRUNO(1), J. VASCONCELOS FILHO(2), A. CARVALHO ALBUQUERQUE(2), J. DE OLIVEIRA BRAGA(2), V. SUZANNE(2), D. MARIA DAGMAR(2), D. ROSÂNGELA AUGUSTA(2) - (1) Universidade Federal do Ceará (Fortaleza, Brazil); (2) Universidade de Fortaleza (Fortaleza, Brazil)

Introduction: Osteoporosis is a high prevalent disorder characterized by predisposed people who have damages in the bones mass. Presuming that this damage begins in young women, the present study had as an objective to identify the prevalence of osteopenia and osteoporosis in women whose ages vary from 45 to 59 and from 60 or more. Material and Method: The study analyzed the secondary data of the patient's files referred to the years of 2000 to 2006, under the approval of COETICA- #164/2006, related to: age, the first and the last appointment's dates, the result of the bones mineral's density (DMO) classified by the categories: normal, osteopenia and osteoporosis. Results: The osteopenia was detected in adults and elderly women in the initial exam and in the last diagnostic. However, after the treatment, it was detected an increase in the osteopenia and a decrease in the osteoporosis's cases in elderly women. In patients aged 60 years and over the osteopenia increased from 47.1% to 56.6% in this age group, and the decrease in cases of osteoporosis (42.5% to 33.0%), observed data with statistical significance (qui square=160, 595, p = 0.000). Conclusions: In terms of Public Health, these findings are reasons for a precocious detection, warning to have a routine evaluation that is justified by the concern that osteoporosis should not be involved not only in the specialties but in all the levels of the services of health.

**PB8 508 MEDICAL STUDENT EDUCATION IN GERIATRIC MEDICINE, A HANDS-ON APPROACH**

A. GARCIA\* (Baylor College of Medicine/Michael E. DeBakey VA Medical Center, Houston, United States of America)

J. GAMMACK(1), J. CULBERSON(2), L. MORRISON(2), M. CARREJO(3), G. SALMERON(2) - (1) St. Louis University (St. Louis, United States of America); (2) Baylor College of Medicine (Houston, United States of America); (3) Michael E. DeBakey VA Medical Center (63104, United States of America)

Introduction: Studies have shown that as medical students advance through their training, there is an increased negative bias in the treatment of geriatric patients. In an effort to improve the exposure of medical students to geriatric syndromes early in their medical school education, a 4 month curriculum was created targeting nine key areas in geriatric education, including gait and balance, wound care, functional assessment, end of life issues and mental status evaluation. Second-year medical students enroll in the program on a voluntary basis. A pre-test is given prior to the start of the course. The students participate in 1.5 hour workshops biweekly, with segments composed of a 20 minute didactic session and a one hour practicum. At the end of the course, a post-test is given to assess improvement from baseline knowledge. The post-test is identical to the pre-test. Methods and Materials: Data was collected since the initiation of the course in 2003. A total of 91 2nd year medical students have completed the course, as well as both the pre- and post-test. The overall scores on the pre- and post-tests were compared using paired t-test analysis. Students demonstrated significant improvement on knowledge assessment, with mean scores increasing from 59.5% on pre-test to 79.5% on post-test ( $p < .0001$ ). Results: Analysis of the pre/post-test data shows a clear improvement in overall scores. In addition, course evaluations indicated that students felt the course improved their overall knowledge in geriatric syndromes and should be continued as an elective within the medical student curriculum. Conclusion: The introduction of geriatric medicine early in the course of medical student education is an effective way to expose students near the beginning of their training to geriatric patients and geriatric syndromes and positively influence both knowledge and attitudes in the treatment of the elderly.

**PB8 509 RETOOLING FOR AN AGING AMERICA – THE NATIONAL INSTITUTE ON AGING RESPONSE**

M. BERNARD\* (National Institute on Aging, Bethesda, MD, United States)

C. LIGGINS(1), K. REED(1) - (1) National Institute on Aging (Bethesda, MD, United States of America)

Introduction: In April 2008, the Institute of Medicine (IOM) released "Retooling for an Aging America: Building the Health Care Workforce." The report noted that there is a need for more specialists in geriatrics who can train other health care providers and generate new knowledge. It also recommended that new models of care be developed. The National Institute on Aging (NIA) is the primary NIH institute tasked with aging research funding and has been a leader in preparing the nation's aging research workforce. In response to the IOM's recommendations, NIA conducted an analysis of NIH's investment to establish a baseline for future activities, determine gaps in critical areas, and identify opportunities for collaboration. Methods: A retrospective review of funded grants using CRISP and two internal portfolio search applications was conducted using various combinations of the search terms aging, geriatric, workforce, geriatric care, staffing, personnel, caregiver, physicians, nurses, certified nurse assistants, nursing home, long-term care, recruitment. Results: Since 1977, 194 grants have been funded by NIH with a primary focus in keeping with the search terms. Of those, NIA accounted for 70%. From 1999, approximately 68 grants have been funded by six NIH institutes (NCI, NIA, NIDCR, NIMH, NINR, NLM) focused on the search terms. Of these, 60% were focused on training. 73% were funded by NIA. Analysis of these portfolios indicates significant investment in developing evidence-based models of care for older adults. Conclusions: NIA has a long and accelerating history in leading initiatives responsive to the 2008 IOM report. Much of NIA's responsiveness has been through training of scientists in aging research. Future steps in implementing the IOM recommendations will require recruitment of additional scientists for NIA/NIH training programs, effective dissemination of established findings, and focus on areas that have not previously been addressed.

**PB8 510 EVALUATION OF THE OMISSION OF TREATMENT IN ELDERLY**

A. JUNQUEIRA DOS SANTOS\* (Faculdade de Medicina de Ribeirão Preto - USP, Ribeirão Preto, Brazil)

L. BARRADAS CALADO(1), T. FEROLA NUNES(1), R. REBOUÇAS LOBO(1), J. DE FREITAS FARIAS(1), J. PRESTO CAMPOS REZENDE(1), P. FERNANDES FORMIGHIERI(1), J. DE SÁ RORIZ FILHO(1), E. BORGES DE OLIVERIA(1), N. KILSA DA COSTA LIMA(1), J. CÉSAR MORIZUTI(1) - (1) FMRP-USP (Brazil)

INTRODUCTION The acts of omission i.e. failure to prescribe drugs when indicated is a prevalent problem in elderly. START is an instrument that helps in identification of the omission. The aim of this study is evaluate the omission of treatment enclosed in START in the first attendance and after follow up in a clinic of geriatrics. METHODS AND MATERIALS Medical records of the patients who had the first attendance on the clinics between 2005-2007 are revised. START was filled with the data of the first and the last attendance. The diseases enclosed in the instrument were atrial fibrillation, coronary, cerebral or peripheral disease, hypertension, heart failure, myocardial infarction, chronic angina stable, asthma, COPD, respiratory failure, Parkinson's Disease, depression, gastroesophageal acid reflux, diverticular disease, rheumatoid disease, osteoporosis, diabetes and its respective treatments. RESULTS and CONCLUSION Were revised 109 medical records. The mean age of the patients was 75 years, 76% were females, 59% had been directed of the proper hospital. The mean time of follow up was 18 months. In the first attendance was found one or more omission in 74.3%. There was no relation between omission, age and sex. The most common omissions in order were statins in atherosclerotic disease, inhaled steroid in moderate-severe asthma or COPD and the antidepressant in the presence of depressive symptoms. Patients following clinic had an increase of 19% in the diagnostic number. In only 25% of the cases there was treatment omission, without association with sex or age, with a significant reduction in the omission in relation to the first attendance. Most common omission was B2-agonist or anticholinergic agent and inhaled steroid for mild to moderate asthma or COPD and ACE inhibitor for myocardial infarction. The lapsing omission is an important problem in elderly. This population benefits of follow up in a clinic of geriatrics.

**PB8 511 SLEEP APNEA IN ELDERLY**

A. HESHMAT\* (Private practice, Derwood, United States of America)

Obstructive Sleep Apnea in the geriatric population has been grossly under diagnosed by the primary care physician. More often than not it is specialty making the diagnosis of OSA many years after the initial symptoms have progressed to cause multi-system complications. Therefore the patients quality of life and cognitive ability could be preserved much longer with early diagnosis and treatment of OSA. The research data which include extensive literature and case studies of the geriatric patient and the complications of OSA. Studies are available that highlight the benefit of CPAP therapy and adherence to the treatment plan. Evidence based data spanning over two decades indicate that undiagnosed, and untreated OSA in the non demented population causes cognitive impairment, excessive daytime somnolence, and diminished mood thus leading to decreased quality of life. In some instances patients that have been diagnosed with delirium whom are found to have untreated OSA, delirium disappears with CPAP therapy. The frequency of such cases is not known, but the fact that some individuals have dramatic functional and neuropsychometric improvement with CPAP therapy, and the high prevalence of OSA in the elderly is cause for every geriatric physician to be vigilant in the screening for OSA. Because of the decrease of oxygen saturation and the increase of intracranial pressure during apneic events the elderly patient is at greater risk for stroke, cardiac arrhythmia, congestive heart failure, and pulmonary hypertension. Quality of life

issues arise ,as does depression,risk of falls ,and irritability due to day time somnolence. The importance of early diagnosis of OSA and treatment by the primary care physician are paramount especially in the geriatric population . Many of whom already present with decreased quality of life and cognitive impairment caused by OSA.

**PB8 512 MANAGEMENT OF ELDER OUTPATIENT ANTICOAGULATION BY A MULTIDISCIPLINARY TELEPHONE-BASED SERVICE**

M. SILVA AUGUSTO\* (St Helena Healthcare, Santo Andre, Brazil)  
P. LEAO(1), L. PATRICIA AMARAL(1), R. KALAF(1) - (1) St Helena Healthcare (Santo Andre, Brazil)

Introduction: As the population ages, an increasing number of people take warfarin. Because of warfarin's narrow therapeutic index and its many drug and dietary interactions, patients who take warfarin must have their international normalized ratio (INR) monitored and their warfarin dose adjusted on a regular basis. This study describes and analyzes elder outpatient anticoagulation by a multidisciplinary telephone-based service. Materials and Methods: Retrospective analysis of the database in Excel of patients on anticoagulation from January 2006 to September 2007, enrolled in a program of interdisciplinary care with telephone-based anticoagulation service. We considered the results after 2 months of monitoring. Patients receiving frequent calls from nursing, checking adherence to treatment, administration of warfarin's correct dose, complications, and control scheduling of examinations. Telephone calls were made fortnightly and monthly according to the INR. The examinations were performed by the same laboratory and they were checked by the nurse. If INR was outside the therapeutic range, the doctor adjusted warfarin's dose, and the patient was communicated by telephone. Results: In this period 39 elderly people were followed, aged 60 to 94 years and the median 79. This group was formed by 22 women and 17 men, and the diagnoses for anticoagulation: FA (20), DVT (12), cardiomyopathy (4), TEP (2) and valve metal (1). 267 connections were made by the telephone, on average 12.7 calls per month. The examinations have tested outside the therapeutic range, 70% had the dose of medication early corrected by telephone service. Regarding complications, there was no case of thromboembolism and only 7 episodes of bleeding in 5 patients (12.8%) during follow-up, and none of clinical severity. Conclusion: The monitoring of elder outpatient anticoagulation by a multidisciplinary telephone-based service enabled adjustment of the medication early, reducing number of complications.

**PB8 513 MANAGEMENT OF A MIXED OUTBREAK BY CLOSTRIDIUM DIFFICILE AND NOROVIRUS IN A GERIATRIC WARD**

E. KAROUBI NORDON\* (Hôpital Paul Brousse, Villejuif, France)  
K. EDOUARD(1), C. NADIA(2), K. NAGIBY(3), H. MARC(4) - (1) hospital Paul Brousse (villejuif, France); (2) hospital Paul Brousse (villejuif, France); (3) hospital Paul Brousse (villejuif, France); (4) clinique de la porte verte (versailles, France)

Introduction Clostridium difficile acute diarrhea (CDAD) continues to be the most common cause of nosocomial diarrhea. Noroviruses are an important cause of ambulatory gastroenteritis world-wide. We describe a mix CDAD and Norovirus outbreak and its control in a geriatric unit. Methods Delarue building is one of the two geriatric sites of Paul Brousse Hospital in Villejuif (France). It consists of 161 beds located on 5 levels and includes beds of acute, rehabilitation and long care unit. A diarrhea outbreak progressively extends in the overall ward. CDAD was diagnosed by fecal toxin A detection with a qualitative rapid immunoassay. Feces were conserved for CDAD search by pcr. Results The diarrhea outbreak involved in 49 of 161 patients in the 5 geriatric wards on 15 days. The overall 49 patients were considered as positive for CDAD by the rapid search of toxin A detection. We initially managed those patients in this supposed diagnosis by cohorting, linking and isolating patients detected as positive. Clinical symptomatology and outbreak extention did not matched with CDAD outbreak. A second verification by pcr was research has been achieved. CDAD was only confirmed in two cases. 10 cases revealed Norovirus infection and no infection in the 37 lasts cases involved. The confusing factors were: a defected test for rapid toxin A detection, excessive use of laxatives, a false definition of the diarrhea by the staff, a stress situation and healthy chronic carrier of Clostridium among geriatric patients. Those factors explain the aggressive and quick spread of the outbreak though measures of contact isolation, restriction movement and cleaning measures. Conclusion Definition of the diarrhea, control of antibiotic prescription and clinical symptomatology of CDAD allowed to distinguish viral infection in the overall diarrheas despite positive toxin A detection.

**PB8 514 DISAGREEMENT OF SF6D WITH EQ-5D INDEX IN AGEING POPULATION IN KOREA AND ASSOCIATED FACTOR WITH THE DIFFERENCE**

K. SON\* (Seoul National University, Seoul National University Hospital, Seoul, Republic of Korea)

S. PARK(1), S. CHO(2), H. CHUN(2), J. CHANG(3) - (1) Department of Family Medicine, College of medicine, Seoul National University, Seoul National University Hospital (Seoul, Republic of Korea); (2) Graduate school of public health, Seoul National

University (Seoul, Republic of Korea); (3) KLoSA team, Korea Labor Institute (Seoul, Republic of Korea)

Introduction: SF-36 and EQ-5D are frequently used survey tools to evaluate Health Related Quality of Life (HRQOL) and correlation between them was well-established. In addition, both of their utility indexes (SF6D and EQ-5D index) are frequently used to calculate Quality Adjusted Life Year (QALY). We compared these indexes in ageing population, and investigated factors associated the difference between them. Method and material: Cross-sectional survey was performed in randomly selected 534 elderly subjects of nationwide sample of Korea Longitudinal Study of Ageing (KLoSA) in 2008. We calculated correlation coefficient and compared the means and 95% confidence intervals of SF6D and EQ-5D index. Then we performed multiple regression analysis to elucidate associated factors with the difference multiplied by 100 between two indexes for significant variables in univariate analysis. Included variables in univariate analysis were sex, age, education, occupation, marital status, current cigarette smoking, alcohol intake, Short-Physical Performance Battery, Brief Fatigue Inventory, family APGAR, calorie consumption calculated by International Physical Activity Questionnaire-short form. Results: Of 534 subjects, 427 subjects who completed both questionnaires were included in analysis. The correlation coefficient of the utility scores was 0.663 ( $p<0.01$ ). The mean utility score of SF6D was 0.738 (95% confidence interval 0.726 – 0.751) and that of EQ-5D index was 0.863 (95% confidence interval 0.851 – 0.873). The factors associated with the difference between the utilities were Brief Fatigue Inventory-Korean version ( $\beta=1.70$ , 95% confidence interval 1.24 – 2.17) and alcohol intake( $\beta=-0.73$ , 95% confidence interval -1.25 – -0.20). Conclusions: SF6D and EQ-5D index utility scores were moderately correlated but were significantly disagreed in ageing population in Korea. This difference was exaggerated when subjects were more fatigued or habitual alcohol drinkers.

**PB8 515 WRITING, READING AND INTERNET USE IN RELATION TO MENTAL HEALTH IN THE 65 OVER.**

J. JUANOLA-COSTA\* (Health Catalan Institute, Mataró , Spain)  
R. CANTERIA(1), O. MIGILYOVA(1), Y. RAMIREZ(1), J. JUANOLA-PLA(1), J. DOMENECH(1), M. SASTRE(1), N. JUANOLA-PLA(1), T. JIMENEZ(1), S. CID(1), J. MONTERO(1) - (1) CAP Ronda Prim (Mataró, Spain)

Introduction Aim. Describe the reading habits and mental activities of people over the 65 and the presence of mental illness, particularly anxiety and depression. Methodes and materials Design Descriptive study Scope Urban Health Center, with postgraduate education. Population Study 65 seniors who visited the primary care during the months of October, November and December 2008. Methodology. After informing the study and obtaining verbal consent, applying a sheet of data collection. Posterior chart review to quantify the presence of mental health problems (anxiety, depression or mixed). Results Attended the 322 people, 6 refused to participate. Study population 316. Women 213. Perform some activity 85 women, 55 men and 39.90%, a 53.39%. As readers is a mental pathology 27.7% of females and 8.3% of men. In the reader there is no mental pathology in 49.50% of women and a 38.46% of men. Women read more books and magazines, male sports journalists. Internet use is low in these age groups. There is a 9.6% men and 5.25% of women said to connect a minimum of 3 times per week. Conclusions. In our study, it seems that there is a lower tendency to suffer mental disorder in those who have an intellectual activity. We need to make further study and apply statistical techniques to prove or disprove hypothesis is. Internet facilitates the relationship between people and can help improve the isolation suffered by some elders. This study encourages us to continue in Primary Health Care Studies and stimulate intellectual habit to all our patients. Keywords. Mental activities, mental health, people over the 65 years old.

**PB8 516 OLDER HOME CARE CLIENTS' AND PROFESSIONALS' PERCEPTIONS OF CARE**

S. ELORANTA\* (University of Turku, Turku, Finland)  
A. WELCH(2), S. ARVE(3), H. ISOAHO(4), M. VIITANEN(5), P. ROUTASALO(6) - (2) School of Nursing, Queensland University of Technology (Australia); (3) Turku City Health Care (Finland); (4) Statecon Ltd (Finland); (5) Department of Medicine, University of Turku (Finland); (6) Department of Clinical Medicine, University of Helsinki (Finland)

Introduction. With advancing age, many older people require home care support to be able to remain in their own homes. The aim of this study was to explore and compare older home care clients' (65+) and their professionals' perceptions of care and to identify possible differences in these perceptions. Methods and materials. A postal questionnaire was distributed to 200 clients and 570 social and health care professionals. The response rate of both questionnaires was 63%. The questionnaire included the questions concerning respondents' perceptions on physical, psychological and social care provided by professional carers. The differences in responses between clients and professionals were analysed using cross-tabulations, Pearson Chi-Square Test and Fisher's Exact Test. Results. There were statistically significant differences between the two groups on care; overall the level of satisfaction of the client group with the quality of physical, psychological and social care assessment was rated lower than the professional group ( $p<0.05$ ). The client group had significantly more often criticism, for example, dental, hearing and eyesight care, the level of support in facilitating them to be able to move

outside of home as well as motivating them to engage in the same age community groups than the perceptions in the staff group. Conclusion. In general, the clients appreciated the support they received from services. In this study, the clients have also criticised those areas on basic care, which are have been seen satisfied in earlier studies, for example, assessing in daily functions. There is a need to discuss, whether the quality of care and services has weakened. In order to be able to support clients continue to live at home, staff need to take better account of the perceptions of the clients themselves and listen to what kind of care and help their clients need and adopt their own approach accordingly.

**PB8 517 MODIFIABLE CARDIOVASCULAR RISK FACTORS AMONG THE OLDEST PATIENTS OF PRIMARY CARE**

B. GRYGLEWSKA\* (Jagiellonian University, Medical College, Kraków, Poland)  
B. WIZNER(1), J. SULICKA(1), M. FORNAL(1), T. GRODZICKI(1) - (1) Department of Internal Medicine and Gerontology, Jagiellonian University, Medical College (Kraków, Poland)

Introduction Aim of the study was to assess prevalence of modifiable cardiovascular (CV) risk factors detected during single visit in unselected octogenarians of primary care (PC) depending on their blood pressure level. Material and methods The study was performed in 256 units of PC in 2004 and 2005 year. Clinical interview and blood pressure (BP), weight, height, waist circumference measurements were obtained from patients over 80 years old visiting general practitioners. Prevalence of selected CV risk factors was analyzed: 1) obesity ( $BMI \geq 30 \text{ kg/m}^2$ ), 2) visceral obesity (waist  $\geq 88 \text{ cm}$  for women and  $\geq 102 \text{ cm}$  for men), 3) smoking habit, 4) diabetes, 5) coronary heart disease (CHD) 6) presence of  $\geq 2$  risk factors. The prevalence of risk factors was estimated and compared among 5 groups of patients with different BP levels: optimal BP (n=141), prehypertension (n=43), mild (n=785), moderate (n=1063) and severe hypertension (n=581). Results Mean age of the sample (3003 patients) was  $85.1 \pm 5.3$  years and 37.9% were male gender. The prevalence of CHD was similar among studied groups (about 50%), but of other risk factors significantly differed (\*- p<0.05) compared with patients with optimal BP (obesity: 7.8 vs 15.2% vs 19.4% vs 22.9% vs 27.0%; visceral obesity: 12.1 vs 19.2% vs 20.3% vs 21.5% vs 27.5%; diabetes 18.4 vs 15.2 vs 24.3 vs 28.2% vs 26.1%; smoking: 6.4 vs 9.7 vs 10.4 vs 15.1% vs 13.4%). A quarter (24.2%) of the oldest patients of PC had 3 or more modifiable CV risk factors but the frequency of risk factors rise along with increase of BP values (8.1 vs 32.7% vs 34.8% vs 44.1% vs 46.3%). Conclusions Even without laboratory findings the estimation of CV risk revealed that among the octogenarians the severity of hypertension is still associated with other cardiovascular risk factors.

**PB8 518 MAXIMUM STEP LENGTH AS A POTENTIAL SCREENING TOOL FOR FALLS AND DISABILITY IN NON-DISABLED OLDER ADULTS LIVING IN THE COMMUNITY**

J. LIM\* (Seoul National University Hospital, Seoul, Republic of Korea)  
K. SON(1), K. BOO(2), S. CHO(2), H. CHUN(2), S. PARK(1), B. CHO(1) - (1) Department of Family Medicine (seoul, Republic of Korea); (2) Graduate school of public health (seoul, Republic of Korea)

Background: Falls and disability are common problems in aged people. Impaired physical function is known as a good predictor of future falls and disability. Among various assessment tools, we evaluated the relationships the relationships between two tests of maximum step length (MSL) and short physical performance battery (SPPB). Method: Cross-sectional survey was performed in randomly selected 534 elderly subjects of nationwide sample of Korea Longitudinal Study of Ageing (KLoSA) in 2008. MSL and SPPB were completed in 506 participants (95%). Spearman's correlation coefficient was calculated to evaluate association between MSL and SPPB. Results: The mean of MSL (average of six direction of MSL) was 63.9cm and standard deviation was 21.5. All of six direction of MSL were highly correlated with mean MSL. The mean MSL was highly correlated with total SPPB score and each of 3 sub categories score of SPPB (balance, walk speed, chair stand up) (<0.01). Conclusion: MSL was highly correlated with SPPB and one direction MSL was highly correlated to full set of six directions MSL. Thus one direction MSL could be used as brief test to evaluate physical function for predicting future falls and disability in community-dwelling older persons.

**PB8 519 PREVALENCE AND ASSOCIATED FACTORS ON COMPLEMENTARY AND ALTERNATIVE MEDICINE USE IN TAIWAN: A POPULATION BASED SURVEY**

Y. HUANG\* (Department of Family Medicine, National Cheng Kung University Hospital, Tainan city, Taiwan)  
J. WU(1), Y. YANG(1), C. CHANG(1), F. LU(1) - (1) Department of Family Medicine, National Cheng Kung University Hospital (Tainan city , Taiwan)

Introduction: As a result of increased consumer awareness, personal preference, and limitations of conventional medicine, the use of complementary and alternative medicine (CAM) has become increasingly popular in recent years. In Taiwan, there are series of studies on factors related to the utilization of traditional Chinese medicine (TCM), but little focus on CAM, especially in the community elderly. To investigate the prevalence and associated factors of CAM use in the elderly, a community-based study is conducted in

Southern Taiwan. Methods and Materials: With stratified randomized systematic cluster sampling of households throughout the Tainan city, the oldest city of southern Taiwan, a total of 910(505 men and 405 women) elderly aged over 65 were included from May 2004 to November 2005. All subjects were interviewed according to a structured questionnaire by trained interviewer. The questionnaire included demographic variables, medical history of chronic diseases, activities of daily living (ADLs), instrumental activities of daily living (IADLs), and clinical characteristics of CAM use. Results: The prevalence of CAM use is 74.2%. The CAM use increased with age, but it was not significantly different between male and female gender. The most frequent item in CAM use is Vitamin (31.6%), and the next two are Glucosamine(25.3%), fish-oil(8.5%). The major information source of CAM use comes from him/herself and families. The major purpose of CAM use is nutrition supplement(45.9%). Over two-third elderly utilize CAM per day and most of the users expend averagely less than 20 \$/wk. Although 43.5% elderly felt CAM effective, most of them didn't introduce CAM to others. Multivariate analysis showed medical history of chronic diseases and disability in ADLs were independently related to CAM use. Conclusion: The prevalence of CAM use is 74.2%. Medical history of chronic diseases and disability in ADLs were the associated factors of CAM use in the elderly in southern Taiwan.

**PB8 520 THE CLINICAL INTERPRETATION OF THE OLD PATIENT WITH COMMUNITY-ACQUIRED PNEUMONIA**

N. BLAJA-LISNIC\* (State University Of Medicine and Pharmacy, Moldova, Chisinau, Chisinau, Republic of Moldova)  
A. NEGARA(1) - (1) National Center of Geriatrics and Gerontology (Chisinau, Republic of Moldova)

Introduction A comparative study of the community-acquired pneumonia (CAP) in the elderly and the younger adults has been realized to elucidate the clinical and paraclinical particularities in correlation with the immunity changes. Methods and materials 149 old patients and 89 patients younger than 65 years old with CAP have been examined. All the patients passed the following examinations: clinical examination, blood and urine analyses, biochemical analyses, ECG, radiological exam of the lungs, bacteriological exam of the phlegm, immunoenzymatic blood analyses, the estimation of lymphocyte populations (CD3+, CD4+, CD5+, CD8+, CD16+, CD19+, CDH1A DR+), the immunoglobulins A, M, G determination. Results In the elderly the main pathogen remain to be the Streptococcus pneumoniae (21.4%), followed by the Streptococcus pyogenes (17.3%) and Staphylococcus aureus (14.7%). The Pseudomonas aeruginosa, the Klebsiela pneumoniae, the Moraxella catarrhalis have a small incidence. Chlamidia pneumoniae is not observed in the etiological structure in the elderly, the Mycoplasma pneumoniae can be seen in 37.8%. The clinical picture has the classical manifestations in 35.6% of the elderly and in 62.9% of the younger adults (p<0.001). The 64.3% old patients presented only a fatigability, dry cough, subfebrility or a dispnoea. The objective manifestations of the CAP are practical the same in the old and the younger patients. The leukocytosis were determined respectively in 33.6% and 27% (p>0.05), the lymphopenia – in 52.4% and 44.3% (p<0.01), the C-reactive protein – was increased in 35.8% and 33.3% (p>0.05), the fibrinogen – in 36.6% and 47.7% (p>0.05), the urea – in 35% and 16.2% (p<0.01). The immunity examination revealed an important decreasing of the cellular immunity – the values of the lymphocytes are – CD19 –  $2.9 \pm 0.3\%$  et  $4.5 \pm 0.4\%$  (p<0.01), CD3 –  $48.5 \pm 1.6\%$  et  $55.9 \pm 2.4\%$  (p>0.05), CD4 –  $29.1 \pm 1.3\%$  et  $38.3 \pm 1.7\%$  (p>0.05), CD8 –  $17.4 \pm 1.2\%$  et  $21.1 \pm 1.7\%$  (p>0.05), CD5 –  $34.9 \pm 1.6\%$  et  $43.1 \pm 2.6\%$  (p>0.05), CD16 –  $17.7 \pm 1.1\%$  et  $19.2 \pm 2.1\%$  (p>0.05), CD HLA DR  $16.2 \pm 1.0\%$  and  $13.6 \pm 0.9\%$  (p>0.05), CD4/CD8 –  $1.96 \pm 0.14$  et  $2.03 \pm 0.19$  (p>0.05), respectively and modifications in humoral immunity - IgA –  $3.5 \pm 0.2 \text{ g/l}$  et  $3.4 \pm 0.3 \text{ g/l}$  (p<0.01), IgM –  $1.75 \pm 0.2 \text{ g/l}$  et  $1.77 \pm 0.2 \text{ g/l}$  (p>0.05), IgG –  $16.9 \pm 0.5 \text{ g/l}$  et  $4 \pm 0.5 \text{ g/l}$  (p>0.05), respectively. Conclusions The main pathogen in CAP in old people is Streptococcus Pneumoniae. As a rule the old people has a less expressed picture of pneumonia. The elderly with CAP show an important decrease of cellular immunity, modifications of the humoral immunity, a decreased regulatory function and a low capacity of infection control in the presence of the associated pathologies. Pneumonia has a poor picture and a protracted evolution when the severe disturbances of the immunity exist. When the immune response is preserved, the old patient develops a classic pneumonia.

**PB8 521 IMPLICATIONS ON A CONTINENCE CARE CENTER FOR THE ELDERLY WITHIN A CONTINENCE-CENTER**

K. BECHER\* (University Erlangen/Nuernberg, Nuernberg, Germany)  
P. GUNDACKER(1), S. BERNHARD(1), S. CORNEL(1) - (1) Medizinische Klinik 2 Geriatrie (Nuernberg, Germany)

Urinary and fecal incontinence are part of the giants of geriatric syndroms. It is more frequent in women, increasing with age, and is particularly common amongst those in residential care (Hunskaar 2002). Prevalence rates vary from 5 up to 40 % in elderly community living people. But figures are unlikely to reflect the true scope of the problem because embarrassment and other factors may lead to under-reporting. Only 10% of elderly people in Germany living in the community with continence-problems consult their doctors. Incontinence in geriatric patients is not only a problem of the lower urinary tract. Embarrassment, shame, missing knowledge and also exacerbation of chronic disease are reasons for underreporting and undertreatment of incontinence. As part of the Continence-Center of the Klinikum Nuernberg we now established a continence consultation board for

elderly patients in our Geriatric clinic and in a next step also for outpatients-advice. The interdisciplinary consultation-center is co-organised by a Geriatrician and a nurse with specific postgraduate trainings in continence. We started in summer 2008 and screend the first 75 patients with our continence-screening-tool. The poster dicusses the first results and outlines the advantages and drawbacks after the first year of implementation.

**PB8 522 ASSESSMENT OF DAYTIME SLEEPINESS IN THE ELDERLY**

F. ONEN\* (Hôpital Bichat, APHP, Paris, France)  
T. MOREAU(2), C. PETIT(1), B. FALISSARD(3), S. ONEN(4) - (1) Hôpital Bichat, APHP (Paris, France); (2) INSERM U-780 (Villejuif, France); (3) INSERM U-669 (Paris, France); (4) Hôpital A. Charial, HCL (Francheville, France)

Introduction : The Epworth Sleepiness Scale (ESS) is a simple 8-item questionnaire widely used in quantifying daytime sleepiness in sleep apnea syndrome (SAS) patients. Usually in the elderly, the SAS is characterized by daytime sleepiness (ESS score >10), snoring and an apnea-hypopnea index (IAH)>15 /h. However, in geriatric practice the ESS may be inaccurate and may not reflect the severity of SAS if the patient has little awareness of his/her own daytime sleepiness or believes that it is part of normal aging. The purposes of this study were 1) to investigate the agreement between patient and caregiver perceptions of the patient's sleepiness, 2) to assess the correlation between ESS scores and IAH. Methods: One hundred and eight older adults (79 yo ± 6.1) and their caregivers rated patient sleepiness by answering the ESS. All patients were assessed with MMSE and polysomnography. Agreement between ESS scores (patient versus caregiver) was measured using the Bland&Altman method. A multivariate regression analysis was performed to identify factors influencing score differences between patients and caregivers. The correlation between the ESS scores and the IAH was calculated (Spearman). Results: The SAS was diagnosed in 68 patients. Patients rated their sleepiness lower (7.1 ± 4.4) than their caregivers did (9.8 ± 5.2) ( $p<0.0001$ ). According to multiple regression analysis the two factors influencing the ESS score difference between patients and caregivers were cognitive impairment and increasing in age. The only correlation was found between caregivers ESS assessment and IAH. Conclusion: To improve the relevance of ESS in the elderly, caregivers should rate the questionnaire, since the sleepiness is easily observed by other persons. This approach is particularly useful to evaluate the sleepiness of older patients with cognitive impairment.

**PB8 523 RELATIONSHIP BETWEEN THE SELF-CARE AND QUALITY OF LIFE OF OLD INDIVIDUALS WITH OSTEOARTHRITIS**

H. TEL\* (Cumhuriyet University Health Science Faculty , Sivas, Turkey)  
S. HIZMETLI, H. TEL, M. YILDIK

Introduction: Osteoarthritis is one of musculoskeletal disorders that is very common among old individuals and causes physical inefficiencies. Pain and limitation of movement ability affect individuals' situation of performing self-care and quality of life. Methods and materials: The study has been carried out as an illustration with the aim of investigation about the relationship between the competency in self-care and life quality of old individuals with diagnosis of Osteoarthritis. 90 old individuals who are treated in a physical therapy hospital with diagnosis of osteoarthritis and accepted to participate in the study exemplify this research. In the collection of data "Descriptive Information Form", "Self-care Scale", and "WHOQOL-Bref quality of life scale" were used. Results: Patients' average of age was 69.72±4.12 and 62.2% were women, 28.9% were illiterate individuals. The average self-care points of patients were defined as 124.85±12.35. Self-care competency points of patients who are women, 70 or more years old, use adjuvant apparatus, take 5 or more drugs a day were detected to be low. Quality of life points of patients who are 70 and more and women patients were also found to be low. It has been found out that there is a positive significant relationship between the points of self-care competency and quality of life and psychological, environmental and national environmental areas of quality of life scale. It has been determined that points gained from all other dimensions except bodily area were high in the patients whose points for self-care competency were high. Conclusion: According to these research results; self-care competency points of old individuals with osteoarthritis demonstrate a good competency of self-care. However, quality of life points are slightly above the average. There is a significant relationship between good self-care competency and points of psychological, environmental and national environmental areas of quality of life scale.

**PB8 524 STUDY OF CGA36 ON ELDERLY PATIENT IN JAPAN**

E. HIDETOSHI\* (National Center for Geriatrics and Gerontology, Obu, Japan)  
H. MIMIURA(1), S. SATAKE(1) - (1) National Center for Geriatrics and Gerontology (Obu, Japan)

Introduction: New health insurance for over 75years has staryed in Japan since 2008. This system was requested CGA for elderly patients. We made a novel comprehensive geriatric assessment which was a simple and short version of assessment for elderly patient when admitted in acute hospital. This assessment was made for to easy use for detect triggers for new inpatients and to make care plan for each patient. Methods: The purpose of this study was to examine the tool. It took 10 to 15minitsue for examination. This assessment was composed from 18 domains and 36 questions. 46 patients were studied in this study.

Results: There ware 18 triggers in average of 36 questions for each patient. There were 10 triggers of 18 domains in average for each patient. Major triggers were cognitive dysfunction, hearing loss, and decline of ADL and IADL. Conclusion: In conclusion, this assessment sheet is good for evaluation of elderly patients. We will study further sensitivity and reliability.

**PB8 525 ASSESSING THE SUITABILITY OF STAY IN GERIATRIC UNITS BY MEAN OF THE APPROPRIATENESS EVALUATION PROTOCOL (A.E.P.)**

P. FONTAINE\* (University Hospital of Liège, Liège, Belgium)  
D. GILLAIN(1), J. PETERMANS(2), P. KOLH(1), P. GILLET(3) - (1) Medico-Economic Informations Department (Simé), University Hospital (CHU) of Liège (Liège, Belgium); (2) Geriatric department, University Hospital (CHU) of Liège Belgium (Liège, Belgium); (3) University of Liège (Liège, Belgium)

Background: the evolution of hospital costs leads the Belgian public authorities to encourage measures of limiting length of stays. According with the growing ageing of the hospitalised population, the geriatric units are particularly observed. Moreover, hospitals are now financed in relation with the number of their admissions, and the corresponding pathologies. In this context, the use of a tool which could assess the proportion of inappropriate admission and days, as well as their causes, is highly interesting, especially for the public authorities and hospital managers who try to reduce their average length of stay without damaging the quality of care.. Materiel and methods: the selected tool in this research is the Appropriateness Evaluation Protocol (AEP). Three successive cross-sectional surveys were led from 2003 till 2005, in 23 Belgian hospitals, in internal medicine, surgery and geriatrics units. During this period, 12,000 hospitalization days, including 4,164 oldest patients (over 75 years) and 1,686 in geriatric units, were audited by means of AEP. Results: the proportion of inappropriate days in geriatrics wards was 36.3 %, while other units show only 23.1%. Among oldest patients, 44% (against 29% for other patients) of inappropriate days are due to a lack of extra-hospital structures ( resting homes, rehabilitation places, day clinics, day center,...). Internal causes of inappropriate days are mostly due to a lack of coordination between the care units and some technical services. Conclusion: AEP is usefulness as a tool of internal audit to measure the proportion of non-justified days especially in old patients, and their causes turns out to be possible. Results have provided some accurate and interesting informations, specific to each hospital, and also globally for the public health authorities. It confirms that social complexity and coordination of cares are major problems influencing the discharge of geriatric patients.

**PB8 526 GEOGRAPHICAL VARIATIONS IN THE USE OF THREE ELECTIVE SURGICAL PROCEDURES IN THE ELDERLY**

J. JACQUES\* (University Hospital of Liège, Liège, Belgium)  
D. GILLAIN(1), J. PETERMANS(2), P. KOLH(1), P. GILLET(3) - (1) Medico-Economic Informations Department (Simé), University Hospital (CHU) of Liège (Liège, Belgium); (2) Geriatric department, University Hospital (CHU) of Liège (Liège, Belgium); (3) University of Liège (Liège, Belgium)

Background: geographical differences of the use of hospital resources are illustrated in the international literature for decades. The probability of undergoing a surgical procedure depends partially on the place where we live. This issue is important since it reflects problems of accessibility to care or contrasting the possibility of potentially inappropriate care. We study the incidence of three surgical procedures in the old person, very important to improve their functional status, especially in terms of mobility, total hip replacement (THR) and total knee replacement (TKR), or in eyesight (cataract intervention). Materiel and methods: we considered the administrative data of all hospital admissions in Belgium (classical and one-day hospitalizations) on the concerned surgeries between 1997 and 2002. These data contain clinical and socio-demographic informations. For each of the three selected procedures, a perimeter of definition was built by combination of criteria of inclusion (APR-DRG, ICD-9-CM procedures) and exclusion (diagnosis and procedure ICD-9-CM codes). Results: the geographical variability of the admissions, studied on the town of residence of the patient, is observed through standardized admission ratio (SAR). In an attempt to explain the observed geographical disparities, we study the effect of supply variables (hospital equipment, numbers of physicians) and demand variables (accessibility - rurality, comorbidity) in a multiple regression model. There was significant growth in incidence rates for these elective surgeries between 1997 to 2002. Regional variations of SAR are limited for cataract; nevertheless, for THR and TKR, we detect an east-west split. These differences seem to be influenced by the density of the medical offer. Conclusion: the regional variations, although significant, are moderated; moreover, the intraregional differences are often also important as the interregional ones. As for the explanatory power of regression models, it remains low, which still raises many questions about the appropriateness of care and differences in medical practice.

**PB8 527 POTENTIALLY DRUG-DRUG INTERACTIONS AMONG ELDERLY POPULATION UNDER THE NATIONAL HEALTH INSURANCE IN TAIWAN**

S. HWANG\* (Taipei Veterans General Hospital, Taipei, Taiwan)  
Y. CHEN(1), H. LAI(1), T. CHEN(1), M. LIN(1), L. CHEN(1) - (1) Taipei Veterans General Hospital (Taipei, Taiwan)

**Introduction:** As the population ages and there is often high drug consumption among older people, potentially inappropriate medication for elderly people is a common and serious public health issue worldwide. Elderly patients are at high risk of having drug-drug interaction (DDI), and potentially lead to adverse drug reactions. Because the actual prevalence of DDIs is not well documented, we aimed to elucidate these DDIs in the elderly population in Taiwan by analyzing the National Health Insurance (NHI) claim database.

**Materials and Methods:** Ambulatory claim visiting files in the year 2006 from the NHI were extracted, and prescriptions for beneficiaries aged 65 and above were evaluated. The analyses included drug combinations that should be avoided in the elderly population according to the Beers and McLeod criteria. Techniques used in analyzing the database including data mining, associate rules and cluster analysis.

**Results:** Among 27,788 elderly people under warfarin treatment, the number and percentage of concomitant drug use of aspirin, dipyridamole, non-steriod anti-inflammatory drug, ticlopidine and cimetidine were 5,143 (18.5%), 4,334 (15.6%), 2,303 (8.3%), 527 (1.9%), 483 (1.7%), respectively. Totally, 10,504 (37.8%) of elderly warfarin users had potentially harmful DDIs. Our results were significantly higher than 6.6% reported from the United States. Age and polypharmacy were significantly correlated with these DDIs. Among 1,166 elderly monoamine oxidase inhibitor users, 66 (5.7%) had concomitant drug use of selective serotonin reuptake inhibitor.

**Conclusion:** While elderly patients are at high risk of DDIs, most of them are preventable and manageable. Our results demonstrated a high percentage of potentially DDIs in older people under the NHI in Taiwan. Our results will remind physicians to recognize the potentially drug-drug interactions when prescribing medications to the elderly.

#### **PB8 528 MEASURE OF NURSING TIME INTERVENTIONS FOR HOSPITALIZED ELDERLY PATIENTS**

O. THONON\* (University Hospital of Liège, Liège, Belgium)

D. GILLAIN(1), W. SERMEUS(4), K. VAN DEN HEEDE(4), P. VAN HERCK(4), J. PETERMANS(2), P. KOLH(1), P. GILLET(3) - (1) Medico-Economic Informations Department (Simé), University Hospital (CHU) of Liège (Liège, Belgium); (2) Geriatric department, University Hospital (CHU) of Liège (Liège, Belgium); (3) University of Liège (Liège, Belgium); (4) Centrum voor Ziekenhuis- en Verpleegingswetenschap KULeuven (Liège, Belgium)

**Background:** Belgium is one of the only countries where the activities of nurses contribute to determine the financing of the hospital. The level of these activities is measured by means of a belgian adaptation of the Nursing Interventions Classification (NIC) instrument. To improve the current system, a study was led at the request of federal authorities. The final result will be a two-step nurse costing model: (1) a list of nursing interventions and their relative weights that contribute to nursing time needs as a proxy for costs, (2) a model will be build in linking and explaining nursing costs with Diagnosis Related Groups (DRGs) and other related variables. Nursing time was assessed by a Delphi study in which nurse interventions are evaluated for specific patient cases. Materiel and methods: We study the effect of patients' age on nursing workload. We tested the model of the nursing interventions times on a database of more than 10 000 inpatients in 66 Belgian hospitals, on voluntary base, and in specific wards. A balanced sample was obtained for the following specialties: geriatrics, intensive care, revalidation, general internal medicine and general surgical procedures. Results: There is no difference in the burden of nursing care according to age. The same observation is obtained for oldest patients. However,, within care programs, an age effect is noted, only in geriatrics. On the other hand, in all cases, the comorbidity is a determinant pattern , justifying the intensity of nursing care. Conclusion: unlike comorbidity, age does not influence the time of nursing activities throughout care programs analyzed, except for geriatrics where nursing time correlates with the age of the patients(65+). These findings should be interpreted in relation to demographic changes in Western societies, but also according the quality of care for old hospitalised patients.

#### **PB8 529 MULTIPLE CHRONIC CONDITIONS AND MEDICINES – CHALLENGES IN SELF-MANAGEMENT SUPPORT IN HOME CARE**

G. MÜLLER-MUNDT\* (University of Bielefeld, Bielefeld, Germany)

D. SCHAEFFER(1), G. GEUTER(1), J. HASLBECK(1) - (1) University of Bielefeld (Bielefeld, Germany)

**Introduction:** Chronically ill patients often have to manage pharmacotherapies to control their disease(s) and obtain quality of life. Although socio-epidemiological trends stress the importance of self-management support, patient education and counseling is still lacking in German health care, especially for elderly people with multiple chronic conditions. The aim of the research project\* was to explore the challenges inherent in living with longterm pharmacotherapy, and to assess the potential of home care nurses to provide self-management support taylorlored to the patients needs. Methods and materials: A multi-perspective qualitative research design was adapted, covering semistructured interviews with 26 health professionals in primary care and in-depth interviews with 27 chronically ill. Data collection and analysis were guided by empirical strategies of the Grounded Theory approach. Results: The day to day management of medication regimes is a lifelong challenge in chronic illness. Symptom perception and communication, health and medication beliefs, daily routines, and social support are important factors influencing the medication management. The data stress the need of self-management support in a coaching manner. Respecting the experiences and expertise of the chronically ill and their

relatives as well as the increasing complexity of the challenges they are faced with in the course of the illness trajectory seems to be crucial in the care of the elderly. Conclusions: Promoting the patients ability to manage their medication is an essential of care in chronic illness. Nurses should take an active role to provide self-management support in primary care, especially for elderly patients with multiple chronic conditions. Like other health professionals nurses have to be prepared adequately. Based on the results an intervention has been developed consisting of a qualification training and a practise guideline. To evaluate the intervention a control study\*\*) is carried out, in which 50 home care nurses are taking part. \*) The project is part of the nursing research network "patients' perspectives in chronic illness – new concepts of health care", funded by the German Federal Ministry of Education and Research 2004 to 2010 (AZ 01GT0315 / 01 GT 0615). \*\*) The control study was approved by the Ethical Commitee of the Medical Council Westfalian-Lippe and the Medical School, Wilhelms-University Münster (AZ: 2007-241-f-S).

#### **PB8 530 ARE THE FALLS OF ELDERLY PEOPLE DUE TO BAD USE OF MEDICATION ? PRESENTATION OF A CASE CONTROL STUDY IN A FRENCH RETIREMENT HOME**

V. HUROT\* (Centre hospitalier Roland MAZOIN, SAINT JUNIEN, France)

D. PLATS(1), C. CUBERTAFOND(1), S. CHAUSSONNAUD-BOYER(2), A. MARCHEIX(2) - (1) Centre Hospitalier Roland Mazoin (Saint Junien, France); (2) EHPAD (Saint Junien, France)

In retirement homes, drugs are sometimes crushed before their administration to the residents, without taking care of the pharmacokinetics. Moreover, elderly people are often victims of falls. So, we made a case control study during 11 months, to attempt to highlight a link between falls and administration of crushed tablets. All the residents were randomized in two groups, whether they fell or not. We noted several parameters : age, sex ratio, number of medicines, including those which cause adverse effects like vertigo, orthostatic hypotension, disorientation, ... We classified the medicine whether the release was extended or not, and if the tablet could be crushed. The number of residents included was 108 : 57 fell, 51 didn't fall. The cases and the control were similar concerning age (85,2 vs 85,5 years old), sex ratio (16 men and 41 women vs 11/40), the dependence assessment score, the number of medicine taken (5,5 vs 6,5) and those who cause secondary effects (3,4 vs 3,2). Whatever the treatment, the risk of falling was higher when the tablets were crushed (OR = 3,41 IC 95 :[1,54;7,54]). If the tablets were wrongly crushed (manufacturer's recommendations, extended release, ...) the risk was multiplied by four. The most frequently involved medicine are antihypertensive drugs, treatments of Parkinson's disease, alpha blockers in benign prostatic hyperplasia, ... These results suggest a link between falling and taking crushed tablets. To reduce this misuse, we decided to increase the number of appropriate forms (patches, orally disintegrating tablets, solutions, ...). For each concerned medicine, we wrote a special mention in our medical software. If the tablets have to be crushed, the decision is now taken by the staff and not by only one person. We will make soon another study to confirm our theory with more residents, and with studying the underlying pathologies.

#### **PB8 531 IDENTIFYING KNOWLEDGE TRANSLATION TOOLS TO ASSIST FAMILY PHYSICIANS WITH DEMENTIA ASSESSMENT AND DIAGNOSIS: A REVIEW FOR THE NATIONAL INITIATIVE FOR THE CARE OF THE ELDERLY'S (NICE) DEMENTIA THEME TEAM**

S. SAPERGIA\* (National Initiative for the Care of the Elderly, Calgary, Canada)

**Introduction** The Dementia Theme Team of the National Initiative for the Care of the Elderly (NICE) undertook to identify knowledge translation tools to assist Canadian family physicians with dementia assessment and diagnosis. Two literature review findings are reported. Methods and Materials Review one: Assessment and diagnosis instruments for dementia. Review two: Educational tools for dementia knowledge uptake. Search strategy included: MedLine, PubMed, Ageline, and PsychINFO databases were searched up to December 2006. A web search of grey literature, and interviews with key informants using a snowball approach, captured unpublished programs and tools. Results Review One: 13 papers yielding 11 individual instruments and two reviews of assessment tools. Canadian family physicians assessed cognitive function most often with the MMSE instrument. While several other instruments were identified that take less time to administer and have good validity in clinical settings, these have not been as widely adopted. Review Two: Yielded seven papers, including six papers comparatively evaluating educational programs developed in the United Kingdom (UK), with only one UK-based review. Survey of key informants uncovered five targeted Canadian programs or tools, including two continuing medical education (CME) programs, one educational website, and two CD-ROM or DVD-based tutorials. Of these, only the two CME programs had been evaluated for physician satisfaction. The comparative effectiveness of these Canadian programs in terms of improving physician knowledge has not been examined. Conclusion Selecting an optimal knowledge translation tool to assist family physicians with dementia assessment and diagnosis is challenging. Reasons for the failure of shorter cognitive assessment tools to be widely adopted, in spite of considerable time pressures faced by family physicians, are not well understood. Second, rigorous evaluations of the impact of the identified Canadian

education programs on physician knowledge is required in order to identify the most effective knowledge translation tool.

**PB8 532 ABDOMINAL PAIN IN ELDERLY PATIENTS ASSISTED AT A GERIATRIC EMERGENCY SERVICE**

F. LIMA NOGUEIRA\* (HOSPITAL MATER DEI, INSTITUTO AURUS-IEPE, NELO HORIZONTE, Brazil)  
A. BARRETO VIEIRA(1), M. TONIDANDEL BARBOSA(1), J. BARBOSA MACHADO(1) - (1) Hospital Mater Dei (Belo Horizonte, Brazil)

**INTRODUCTION** To describe the frequency of abdominal pain found in elderly patients assisted at an emergency service, as well as its final diagnosis. **MATERIAL AND METHODS** Evaluation was performed of the final diagnosis of all the 269 patients complaining of abdominal pain assisted at the geriatric emergency service , from March 2005 to March 2006. Collection of data was retrospective and was originated at the notebook where registration is made of all the assistance performed at this unity. **RESULTS** The elderly patients are mostly women (57.2%), at an average age of 74.5 years, and represented 7.15% of all the patients. The main diagnosis were: diverticulum disease (5.2%); biliary tract disease (4.8%); nephrolithiasis (4.4%); urinary tract disease (4.4%); fecaloma (4.0%); diarrhea (4.0%); pancreatitis (2.9%); dyspepsia (2.9%); cancer (2.9%); hernia (1.4%); and appendicitis (1.1%). In 49.8% of the cases, the diagnostic cause was not established at the emergency service, and 38.0% of those patients with no diagnosis were admitted for further exams. **CONCLUSION** The observed data coincide with those supplied by the literature, which report complaints of abdominal pain in 5% to 10% of elderly patients assisted at emergency units, with a 50% need of admission of these patients. Six out of the 11 more frequent diagnosis (diverticulum disease, biliary tract disease, appendicitis, pancreatitis, cancer and hernia) are among the seven more frequent diagnosis of abdominal pain in elderly patients who come to the emergency services, according to the literature. The practitioner ought to be aware of a possible scarcity of symptoms in some situations of severe diseases in elderly patients, as well as of the difficulty at the initial diagnosis. Therefore, cases of abdominal pain with no diagnosis should be re-evaluated either at the outpatient department or in admission, with a less restrict use of image examinations.

**PB8 533 TRANSCUTANEOUS POSTERIOR TIBIAL NERVE ELECTROESTIMULATION TO TREAT URINARY INCONTINENCE IN OLDER WOMEN.**

I. GOMES\* (Pontifícia Universidade Católica do Rio Grande do Sul, Porto Alegre-RS, Brazil)  
L. SCHREINER(1), M. KNORST(1), T. SANTOS(1) - (1) Pontifícia Universidade Católica do Rio Grande do Sul (Porto Alegre-RS, Brazil)

Introduction. The frequency of urinary incontinence increases with age, especially in women. Due to disability it causes, especially social, and the risks and complications of surgical treatments, is of great importance to develop non-invasive management strategies for the elderly population, when conservative treatment is not effective. The aim of this study was to examine the efficacy of transcutaneous posterior tibial nerve electrostimulation to treat urinary incontinence in older women. Methods and materials. The study design was a randomized clinical trial conducted in 45-60 years) with urinary urge incontinence. All were ≥elderly women (treated with 12 days of bladder and pelvic floor muscle training, while 23 were randomly selected to receive electrical stimulation also. The cases were evaluated by the number of 3-day incontinence episodes (3-IE), the Incontinence Quality of Life (I-QOL), and a personal satisfaction questionnaire (ICQ). Results. The study population had a mean age of 68 years, and about half lived with a partner, 60% had previous treatment, and 80% had associated stress incontinence. These characteristics and measures of urinary loss and quality of life prior to treatment were similar in the groups. Both groups showed significant improvement in ICQ, in most areas of the I-QOL, and in urgency 3-IE, but not in stress 3-IE. However, there was a greater improvement in the group treated with electrical stimulation. The areas of the I-QOL that showed significant differences between groups were: Incontinence Impact, Role Limitations, Physical Limitations, Emotions, Sleep/energy, and Severity Measures. Conclusion. It was seen in our study that transcutaneous posterior tibial nerve electrostimulation is efficient to treat urinary urge incontinence in older women. This therapy should be considered a good alternative in the treatment of elderly.

**PB8 534 INDEPENDENCE AND SOCIAL BEHAVIOURAL IN OLD PEOPLE**

M. REIS\* (University of Madeira, Funchal, Portugal)  
C. PAÚL(1) - (1) University of porto (Porto, Portugal)

**INTRODUCTION** Aging is a challenge for individuals and society and it's necessary to be prepared to face it with success. It is important to know the profile (status and needs) of old people in order to help them to maintain independence as long as possible. **METHODS AND MATERIALS** Aims: To evaluate independency and the contribution of bio behavioural and social factors. Our study is descriptive and analytic using non probabilistic sample, with a proportional quota sample strategy, that included 384 individuals with 55 years and over. People were interviewed, using a questionnaire that include measures of

Independency – Activities of Daily Living (ADL), bio behavioural (Self-perception of Health and the presence of disease) and social factors (loneliness and social network - Lubben, 1998). **RESULTS** Independence (ADLs) was higher in younger old people ( $p < 0.05$ ) and in men ( $p < 0.05$ ). High Personal Activities average were related with eating, use toilet, dressing, grooming and the lowest were walking and rise and go down stairs. Instrumental Activities had lowest average levels. There were differences between independence and Self-perception of health, people with more negative perception of health tends to be 'less independent (& 'Qui2' & '74,997 p < 0,001) and those who had a diagnosed disease tends to be less independent ('& 'z -4,907 p < 0,001). People that had more control over their health tend to be less independent ('& 'z -2,521 p < 0,05). Independence correlates positively with social support networks ('& 'rs 0,145 p < 0,005) and also feeling loneliness ('& 'Qui2 10,316 p < 0,05). **CONCLUSIONS** The authors emphasize the importance of bio behavioural and social variables (namely self perception of health or self reported diagnosis health, social support networks and loneliness) to independence, and the need for health, social and psychological interventions to prevent morbidity and mortality.

**PB8 535 REVIEW OF THE EVIDENCE FOR A COLORECTAL CANCER SCREENING PROGRAMME IN ELDERLY PEOPLE**

C. QUARINI \* (Royal Berkshire Hospital , Reading , United Kingdom)  
P. GOSNEY (1) - (1) Royal Berkshire Hospital (Reading , United Kingdom)

Introduction Colorectal cancer is a major public health issue, being the second leading cause of cancer deaths in Europe and the USA. It mainly affects elderly people. A National Health Service screening programme for colorectal cancer in people over 60 is being introduced across the UK throughout 2009. Other countries have also recently introduced screening programmes e.g. Finland (2006), France (2007). Aims of this work were to review evidence for colorectal cancer screening and determine how much this applies to elderly people. Methods+Materials MEDLINE database was searched for articles published from 1990-2007, using search terms colorectal neoplasms, mass-screening, faecal occult blood, colonoscopy, sigmoidoscopy. Articles included were limited to those in English and in which data or discussion included people over 70 years. 251 abstracts were eligible and full articles for 249 of these were read. Results Evidence for the benefits and complications of screening for colorectal cancer are well-known. However, no article dealt with screening only in elderly people, and very little was found specifically on screening the elderly. Most discussed several age groups, including the elderly, without analysing this group's needs separately. This is surprising as many health authorities advise screening older people. Most define an age at which to begin (e.g. 50 in USA; 55 in Australia) but not an age for reviewing recommendations. Conclusion More research is needed into the differing benefits and limitations of screening in older people compared to younger people. Screening procedures detect bowel polyps many years before malignant transformation, so is there an age after which screening benefits do not outweigh risks? There are no clear guidelines on specific screening programmes for elderly people, which given their increased susceptibility to the disease, but decreased likelihood to benefit from preventative measures decades before the onset of symptoms, is an area which deserves further research.

**PB8 536 EXPERIMENTAL PROJECT CONCERNING CLINICAL PHARMACY IN GERIATRIC WARD**

N. BERG\* (CHBAH, Liege, Belgium)  
A. PASSANISI(1) - (1) CHBAH (Seraing, Belgium)

Introduction Involving a pharmacist in a multidisciplinary team is granted by Belgian health services in a geriatric ward of the CHBAH. The target is to improve pharmaceutical cures and elderly patient's autonomy, patients who usually suffer multi diseases and have several drugs. This new vision developing itself in Belgium is worthwhile observing in order to demonstrate its pertinence. Methods and materials Evaluating pharmacist's job has been done, listing his actions performed in a 24 beds geriatrics ward of the CHBAH during 2008. The job consists of a pharmaceutical history, the medicine following through during the hospital stay, and improving patient's autonomy in the coping of his treatment at discharge. Results 368 pharmaceutical interviews were performed. They usually reveal auto medication. 515 interventions viewing every pharmaceutical treatment were performed during the very period. They can be described as follows: identification of medicine interacting (26 %) undesirable effects (18%), therapeutic recommendations (18%), adjustments of directions of use, depending on creatinine clearance (13%), suggestion of stopping medicine (9%), propositions of taking drugs again after stopping them in hospital (10%), changes of galenic forms. (7%). Furthermore, in order to encourage patient's autonomy with the coping of their treatment, the pharmacist takes care in evaluating and education of self management of medicine procedures as well as using broncho-dilatators. At discharge, treatments were explained to patients or to their relatives in order to improve the patient's compliance. Conclusion. Clinical pharmacist has been included in a medical geriatric team as he definitely brings a plus in coping with patients. Rich exchanges of view between the pharmacist and the other members of the team are

observed. They bring the elderly patient a better health, autonomy and quality of life, as well in hospital and at home.

**PB8 537 PRESENTATION OF A TYPOLOGY OF HEALTH IN THE ELDERLY: TITAN (TIPOLOGIA TOTAL DEL ANCIANO)**  
J. LOPEZ\* (Universidad Nacional de Colombia, Bogota, Colombia)  
C. GRANADOS, R. SANCHEZ

**Introduction:** A typology could be useful given the heterogeneous character of elderly people what makes chronological age a bad system of classification for health purposes.  
**MATERIALS AND METHODS:** We present a typology of health for elderly patients in order to help in decision making, diagnosis, prognosis and treatment of elderly persons in hospital, nursing home and ambulatory set. **RESULTS:** We included 269 persons over 65 years. 113 outpatients; 76 nursing homes residents and 80 inpatients in a geriatric acute care service. Mean age was 79, 8 years (range: 65 – 100) 65% female. TITAN is a classification for elderly person according to physical and mental health and physical function. In short TITAN 1 equals successful aging, TITAN 2: Organic pathology of easy control for instance mild hypertension. 3: Complex organic pathology like heart failure NYHA I or II. 4: dementia GDS 4 or 5; TITAN 5: advanced disease for instance renal failure requiring dialysis. 6 Patients with 4 + 5 or 3; TITAN 7: Bedridden persons. In our group we found 0,7% TITAN1; 19,7 T2; T3 43,5%; T4 5,2%; T5 14,5%; T6 9,3% and T7 7,1%. **CONCLUSION:** In our preliminary experience TITAN, a novel typology of health, seems to be very useful in the follow –up, prognosis and decision making process for clinicians caring for elderly patients

**PB8 538 EFFECTS OF ACUPUNCTURE TREATMENT ON QUALITY OF LIFE OF ELDERLY PATIENTS**  
Y. GARCIA\* (Medical School from São Paulo University, São Paulo, Brazil)  
M. TIBO(1), T. CAMPOS(2), C. PAGANI(3), M. UEDA(1), V. SANTOS(1), M. AUGUSTO(1) - (1) Medical School of São Paulo Univesity (São Paulo, Brazil); (2) Odontology School of São Paulo University (São Paulo, Brazil); (3) Odontology School of São Paulo State University (São Paulo, Brazil)

**Introduction:** acupuncture treatment is potentially interesting for elderly population, particularly for the possible avoidance of drug use. A way to measure the positive effects of it is to evaluate of its impact on quality of life Methods and materials: the results of a pilot study performed with patients of the Geriatrics Service pf Clinics Hospital of Medical School of São Paulo University are described. The study included 13 patients. All were out-patients, aged 65 or older. They were evaluated 10 weeks before the beginning of the treatment, at the first, 10th and last day of treatment and 3 months after the end of it. Needling occurred weekly during 20 weeks and evaluation of quality of life was performed using the WHOQOL – brief scale, translated and validated to Portuguese. This instrument includes four domains: physical, psychological, social, relationships and environmental. Results: ten patients, nine females, completed the study. Their scores at the previous interview, the first, 10th and last day of treatment and 3 months latter were, respectively: for the physical domain – 51,07; 50,36; 56,79; 67,14; 58,43; psychological domain: 54,58; 57,50; 60,00; 65,08; 60,83; social domain: 67,50; 70,00; 71,67; 75,00; 769,17; environmental domain: 54,38; 52,81; 57,99; 63,44; 62,50. Score differences were significant better between first and 20th needling section at physical domain ( $p=0,001$ ), psychological ( $p=0,002$ ) and environment ( $p=0,001$ ); decrease was significant between 20th needling and first interview 3 months later at physical domain ( $p=0,027$ ). Conclusion: improvement in WHOQOL-brief scores was observed at physical, psychological and environmental domains; that improvement did not persist on physical domain at first control after the end of the treatment.

**PB8 539 PHARMACIST EXPERIENCE WITH MEDICATION REVIEWS IN ONTARIO, CANADA**  
L. DOLOVICH\* (McMaster University, Hamilton, Canada)  
A. GAGNON(2), C. MCAINEY(2), L. SPARROW(4), S. BURNS(3) - (2) Hamilton Family Health Team (Hamilton, Canada); (3) St. Joseph's Healthcare (Hamilton, Canada); (4) Dell Pharmacies (Hamilton, Canada)

**Introduction:** Community pharmacists in Ontario are now compensated for providing a Medication Review Service (MedsCheck) to residents of the province of Ontario in Canada taking three or more chronic medications. The service mainly targets older adults. The objectives of this study were to identify barriers and facilitators to implementation of MedsCheck by pharmacists and identify factors predicting the number of MedsCheck reviews completed. **Methods:** A sequential explanatory mixed methods study design was used, consisting of administration of a semi-structured mailed survey followed by an in depth telephone interview using open-ended questions with a random sample of community pharmacists across all regions of Ontario. Regression was conducted to determine the factors predicting the number of MedsCheck reviews completed. **Results:** Completed surveys were received by 217 pharmacists. Twelve pharmacists were interviewed. The majority (98.6%) of pharmacists had completed at least 1 MedsCheck review. The average time to complete a review was 50.9 (SD, 22.2) minutes. Key facilitators to implementation included scheduling reviews by appointment and during

slower times or when pharmacist coverage was available, reducing documentation, having a private counselling room, maximizing use of technicians, and motivating patients regarding the value of the service. Factors predicting an increase in MedsCheck reviews reported were having a target number of MedsChecks at the store, not reimbursing individual pharmacists for MedsChecks, using computers, being from northern Ontario, and a longer time since pharmacy graduation. **Conclusions:** MedsCheck was well received by pharmacists in Ontario. Practical suggestions to improve the delivery of MedsCheck or similar services were identified. Further research can assess uptake of the program as well as the effectiveness (and cost-effectiveness of the program) to optimize medication use in older adults.

**PB8 540 UNEXPLAINED UNINTENTIONAL WEIGHT LOSS OF OLDER PATIENTS**  
S. CHEN\* (Taipei Veterans General Hospital , Taipei, Taiwan)  
L. CHEN(1), M. LIN(1), S. HWANG(1) - (1) Department of Family Medicine, Center for Geriatrics and Gerontology, Taipei Veterans General Hospital (Taipei, Taiwan)

**Background** Unexplained unintentional weight loss (UWL) in older patients is frequently multifactorial and poses a diagnostic challenge to physicians. This problem is associated with increased morbidity and mortality, irrespective of underlying pathologies. The main purpose of this study was to explore underlying pathologies of older patients with UWL in Taiwan. **Methods** From January 2006 to December 2007, data of patients aged over 65 who were admitted to the geriatric evaluation and management unit of Taipei Veterans General Hospital were collected for analysis. UWL was defined when subjects had documented weight loss of at least 5% of their baseline body weight. A 12-month follow-up was conducted after the index admissions. **Results** In total, 50 geriatric patients (mean age =  $78.8 \pm 4.7$  years, 82% males) were enrolled for study. The mean weight loss was  $8.7 \pm 4.6$  kg or  $14.1 \pm 6.6\%$  during 0.5–24 months. Overall, 82% patients were related to organic causes, including malignancies in 3 (6%), benign gastrointestinal pathologies 11 patients (22%), and psychiatric disorders in another 11 patients (22%). However, no particular etiologies could be identified in 9 patients (18%) despite extensive investigations during the study period. **Conclusions** In Taiwan, 82% of older patients with UWL were caused by organic pathologies, which were mainly non-malignant diseases. Familiarity with the spectrum of disorders associated with UWL in older patients may facilitate the diagnosis and care in these patients.

**PB8 541 OBSERVATION-BASED NOCTURNAL SLEEP INVENTORY (ONSI) FOR ELDERLY**  
S. ONEN\* (Hôpital A. Charial, Hôpitaux Civils de Lyon, Francheville, France)  
C. DUBRAY(2), E. DECULLIER(3), T. MOREAU(4), F. CHAPUIS(3), F. ONEN(5) - (2) CIC INSERM-501, CHU de Clermont-Ferrand (Clermont-Ferrand, France); (3) Hôpitaux Civils de Lyon, Pôle Information Médicale Evaluation Recherche, (Lyon, France); (4) Hôpital Paul Brousse, (Villejuif, France); (5) Hôpital Bichat, APHP (France)

**Introduction :** Sleep apnea syndrome (SAS) is characterized by recurrent episodes of cessation of respiratory airflow with a consequent decrease in oxygen saturation and sleep fragmentation. If unrecognized and untreated, SAS is associated with cardiac disease, stroke, cognitive decline, and impaired quality of life. The prevalence of SAS, defined as an apnea-hypopnea index (AHI) of 15 or greater per hour of sleep, is about 20% in the elderly. Despite its high prevalence and clinical significance, SAS in geriatrics is often overlooked and under-diagnosed. The aim of the study was to validate the Observation-based Nocturnal Sleep Inventory (ONSI) in discriminating between elderly patients likely or not likely to have SAS. **Methods :** Cross-sectional blinded study. A total of 115 consecutive patients aged 70 and over suspected of having SAS underwent simultaneously polysomnography and ONSI assessment. The ONSI was performed by nurses during the overnight polysomnography. The validation process was completed in 111 patients. **Results:** Polysomnography identified 68 patients as having SAS and 43 patients as not having SAS. In comparison with polysomnography data, the ONSI demonstrated a high level of sensitivity (90%), positive predictive value (88%), specificity (81%) and negative predictive value (83%). **Conclusion:** The ONSI is the first valid SAS screening tool proposed for elderly hospitalized patients. This study demonstrates that the ONSI provides accurate information, is a simple, easy-to-use bed-side tool, and is highly sensitive and specific in screening SAS, when compared with overnight polysomnography results. The ONSI may be useful in a number of settings, such as assessment for referral to a sleep center, sedation and any type of anesthesia that can affect respiratory drive and clinical research.

**PB8 542 SHIFT FROM CONSULTATIVE TO COLLABORATIVE PRIMARY CARE OF GERIATRIC PATIENTS WITH CHRONIC DISEASES**  
E. NAH\* (Singapore Health Services , Singapore, Singapore)  
A. PURANI(1) - (1) Singapore Health Services (Singapore, Singapore)

**INTRODUCTION:** Chronic diseases in the tripling rising population of an aging population is exhaustive on Singapore's resources. Nurses can do far more in strategic methods of disease counseling to improve outcomes, in partnership with doctors. **METHODS:** Based on a study of cultural preferences and trends, a unique method of

communal interactive co-counseling and human resource development equipping methodologies were tested with a population of 120 Singaporean elderly patients. RESULTS AND CONCLUSIONS: It was found that one of the new methodologies with the local cultural preference taken into consideration has demonstrated a lowering of blood pressure readings by 20mm/hg for 80% of the population and a drop of 1-2mmol/L in diabetic patients after a 8-month trial. Other methodologies employed had a 30-50% improvement, as compared with the usual one to one counseling done by nurses.

**PB8 543 ONE-LEG BALANCE TEST IN A GENERAL GERIATRIC POPULATION: RESULTS OF TWO STUDIES IN FRANCE**

O. MICHEL\* (Metis institute, Paris, France)

J. THOMAS(1), L. BRESSANUTTI(2), H. GOARIN(3), C. HUMBERT(4), R. BATAILLON(6), P. DUPRAT(5) - (1) CSPS (cap sizun, France); (2) CNPS (cap sizun, France); (3) AROMSA (cap sizun, France); (4) URCAM bretagne (cap sizun, France); (5) metis institut (France); (6) urml bretagne (France)

Context: Falls are a major public health concern among the elderly, as well as is malnutrition. In France, estimates show that 9000 deaths are annually associated with a fall in people over 65. The regional social insurance union (URCAM) and the regional union for liberal medicine (URML) decided in 2004 to set up a study concerning the nutritional status of people 75 or over in Brittany. Two small neighbouring cities in a rural coastal area of Brittany, Brest and Etables (BE) were chosen for the experiment. Different factors with a likely influence on the nutritional status were concomitantly checked with a mini standardized geriatric evaluation (SGE), including the risk of fall. The One-leg balance test (OBT) was selected for that purpose, in competition with the get up and go test which was considered more complicated and less reliable. In order to harmonize the realization of the tests, all the participating nurses were trained simultaneously. In 2006, URCAM and URML decided to repeat the study on a larger scale in Pont Croix (PC), an area also located in Brittany. Population All individuals 75 or over in the area, identified from the electoral rolls and on home care nurses registers, were invited by newspaper and individual letter to participate in the study. For those who accepted to participate, a nurse gave the mini SGE at home (individually or collectively). If the score was found abnormal, people were referred to their usual medical practitioner for further evaluation. In BE, 724 people out of 767 (mean age 83,1) accepted to enrol the study. In PC, 838 out of 939 (mean age 84,2). Refusals came generally from the families, spouses or children, who were rather reluctant to let an outsider evaluate the way they cared for elderly relatives. Results In BE, 501 one-leg balance tests were normal (69,2%). Abnormal or impossible : 213 (30,8%). At home, 187/665 (28,1%); in sheltered houses : 26/59 (44,1%) In PC, 500 tests were normal (59,7%). Abnormal or impossible : 338 (40,3%). At home 215/690 (31,1%); in sheltered houses : 19/59 (30,6%); in nursing homes : 104/119 (87,7%) Discussion The difference observed in the two population samples can be explained by the existence of a nursing home, where disabled elderly are commonly accepted. If we exclude this subgroup, there is no significant difference for the two sites (p value less than 5%) with 70% of the general ambulatory population in our two samples have a normal one-leg balance test. Conclusion A study about nutritional status of a general elderly population included the one-leg balance test. A comparison to the literature was not possible, as no reference was found by the authors regarding OBT for such a population in PubMed, using the keywords: balance, one-leg balance test, elderly. Correlation of the OBT was found for several parameters. Further studies should be made to examine the determinants of possible future discrepancies.

**PB8 544 IS THERE AN ASSOCIATION BETWEEN IRON DEFICIENCY AND COLORECTAL ADENOMA IN SYMPTOMATIC HOSPITALIZED OLDER PATIENTS?**

J. MEEUWISSEN\* (University Hospitals Leuven, Leuven, Belgium)

H. VANDEWINCKELE(1), M. HIELE(2), E. JOOSTEN(1) - (1) University Hospitals Gasthuisberg MD, department of internal medicine, division of geriatric medicine (Leuven, Belgium); (2) University Hospitals Gasthuisberg MD PhD, department of internal medicine, division of gastro-enterology (Leuven, Belgium)

Introduction: Iron deficiency anaemia (IDA) is a common problem in older patients. Gastrointestinal endoscopic investigations are the most appropriate way to find the cause. Aim of this study is to investigate whether colorectal adenomas (CRA) were associated with iron deficiency (ID) and IDA in older hospitalised symptomatic patients. Methods and materials: We retrospectively investigated 247 consecutive hospitalized, symptomatic geriatric patients (160 women, 87 men, mean age 83 years): 186 with normal colonoscopy, 61 with at least 1 histologically confirmed CRA. Patients with arteriovenous malformation, colitis, ulcer, diverticular bleeding, colorectal carcinoma were excluded. Indication for colonoscopy was based on clinical grounds (haematochezia, melena, change in bowel habits, unexplained diarrhea, constipation, weight loss, IDA, unexplained anaemia, abdominal pain, suspicious lesions found during another technical investigation). Laboratory tests were analysed with routine measurements. Anaemia was defined as a haemoglobin level <13 g/dl for men and <12 g/dl for women, ID as a serum ferritin level < 50 µg/l. Statistical analyses were done with student's T-test, Mann-Whitney U test, ANOVA, chi-squared test and a stepwise logistic regression analysis. Results: Serum ferritin, haemoglobin levels and the prevalence of ID and IDA were not significantly different between the control group, patients with small (1 or more polyps < 10 mm) and

large (at least 1 polyp >= 10mm) CRA. Prevalence of CRA was similar between patients with a serum ferritin < 50 µg/l (27%), between 50 and 100 µg/l (29%) and > 100 µg/l (20%) (p=0.4). In a logistic regression model, haemoglobin and serum ferritin were not found to be independent risk factors for CRA. Conclusion: Our study could not demonstrate that symptomatic older patients with small and large colorectal adenomas have a higher prevalence of iron deficiency with or without anaemia as compared to a control group.

## Track C – Behavioural and Psychological Sciences

**PC8 545 LONG-TERM EFFECT OF A FLOOD ON PSYCHOSOCIAL HEALTH AND VALUES OF ELDERLY: A QUESTION OF RESILIENCE**

D. MALTAIS\* (Université du Québec à Chicoutimi, Chicoutimi, Canada)

G. SIMON(1), L. LISE(1) - (1) Université du Québec à Chicoutimi (Chicoutimi, Canada)

In 1996, in Saguenay (Canada), a flood caused a lot of damage and several people, a good number of which were 50 years old and over, suffered personal losses. After this event, some people developed health problems of a physical or psychological nature, received support from members of their family and developed good intervention strategies to overcome their emotional, family or financial difficulties. Two and three years after the flood, studies were carried out in urban municipalities (in urban communities it was two years after the flood and in farming communities, it was three years after the events). A group of 124 people (50 years old and over), victims of this catastrophe, and 107 people non disaster victims, of the same age group, took part in a mixed longitudinal study integrating quantitative and qualitative research methods. Eight years after the flood, 62 disaster victims and 44 non disaster victims were met once again. These individuals then answered various closed or opened questions about their physical and psychological health as well as the impact that the flood had on their life and personal values. The results of this longitudinal study show that in spite of the mid and long term presence of negative effects on the psychological health of the participants and in other aspects of their life (personal, social family and matrimonial life, etc.) the health of the study subjects improved over time (less significant differences between disaster victims and non disaster victims over time and higher score on the various measurement scales used in this study). On the level of the changes brought in their personal values, some elderly realized that unsuspected qualities and forces lived in them, enabling them to solve their problems and defend their interests against authorities sometimes recalcitrant to recognize the needs of disaster victims.

**PC8 546 HOLOCAUST SURVIVORS IN THE FOCAL POINT OF THERAPEUTIC A. YOUNGER\*** (Bait-balev, Hod Hasharon, Israel)

OVERVIEW Some 250,000 Holocaust survivors live today in Israel. Of this number, 40% are hospitalized. "Bayit Balev" (Hebrew for "Home in the Heart") identified a need in training the caregivers on the special characteristics of Holocaust survivors and providing them with tools to address the specific difficulties of this population. OBJECTIVES • Expose the caregivers to the special characteristics of Holocaust survivor population through training and provision of tools for identifying and resolving difficulties. • Provide sensitive, customized, professional and effective treatment to Holocaust survivors. THE TARGET POPULATION • All the social workers (21) and multidisciplinary teams in sheltered homes, supportive housing and hospitalization departments of the Chain. METHODS / PROCESS • Mapping the Holocaust survivors among the tenants of sheltered homes who are hospitalized. • Appointment of an experienced, Chain-wide coordinator who took the relevant courses and has acquired additional extensive knowledge. • Hold a workshop for all social workers on the treatment of Holocaust survivors. OUTCOMES • Approx. 35% of the tenants and hospitalized tenants are Holocaust survivors. • A kit with articles, clip, treatment guidelines and information about special rights. • Comprehensive seminar for all the social workers of Bayit Balev. • Training sessions as part of the team meetings in the sheltered housing and hospitalization departments • Employees report on feelings of confidence and knowledge in respect to treating Holocaust survivors. • Assisting the survivors in completing their personal testimonial for the Yad Vashem Holocaust Memorial project. • Help survivors exercise their rights through better use of the Holocaust Survivor Fund. CONCLUSIONS • Increasing the awareness to the special characteristics of Holocaust survivors is important. • Teams are currently more sensitive and aware of the special needs of this special adult population. • The establishment of "My Life Journey" - a group of Holocaust survivors in the sheltered housing, facilitated by social workers

**PC8 547 ONGOING EXISTENTIAL THREATS ON OLD HOLOCAUST SURVIVORS: NEEDS AND UNIQUE CHARACTERISTICS DURING WAR.**

A. LOWENSTEIN\* (Haifa University, Israel, Haifa, Israel)

D. PRILUTZKY(1), A. LOWENSTEIN(1), B. RAPAPORT(1), D. HALPERIN(1) - (1) Haifa University (Haifa, Israel)

**Objective:** to examine needs and difficulties (functional and emotional) of Holocaust survivors under the missiles attack during the second Lebanon war in order to plan immediate and future responses to urgent needs. **Method:** 110 men and women, Holocaust survivors that lived in communities under missiles attack in northern Israel, and received home care services after acute hospitalization, were interviewed by telephone. Data was collected with a structured instrument that included measurements of anxiety, somatization, depression and loneliness, health status, and services received from different agencies. In addition, an in-depth interview which included issues related to personal, emotional and functional needs of the survivors. The interviewees were Hebrew and Russian speakers, and were interviewed in their mother language. Findings reveal higher rates of anxiety, depression and somatization among the newer immigrants (less than 18 years in Israel), and among residents of the periphery. Women, unmarried older survivors, residents of the periphery and the newer immigrants reported more loneliness. There were many complaints of physical functioning and health problems. Survivors reported an increased use of tranquilizers. The survey revealed some instrumental-care problems: Paid home carers did not come to work; a shortage of food and medications. The coping patterns that were identified included mutual help; use of past memories for strengthening (the resilience model); for others, prior trauma reduced the ability to withstand the additional stress (the vulnerability model). **Conclusions:** It is of major importance to provide for basic needs in times of emergency. The elderly Holocaust survivors have a small and fragile support network that was partly paralyzed during the war. Agencies in the community were not always available which impacted on personal care, supply of food and medications. It is necessary to activate informal and formal support systems and to develop programs that will respond to the survivor

**PC8 548 DISASTER PREPAREDNESS OF NURSING HOMES: WHAT HAS BEEN DONE AND IS IT ENOUGH?**

K. FITZGERALD\* (Swansea University, Swansea, United Kingdom)

Nursing home disasters around the world have demonstrated that nursing home residents are a highly vulnerable population. In major events, the safety and well-being of residents may be threatened and deaths may occur. While the public sector in the United States and several other countries has begun to address emergency preparedness issues, in many cases nursing homes have not participated in this planning process. Further, the limited amount of research on nursing home emergency preparedness indicates that little attention has been placed on evaluating the effectiveness of facility disaster plans. This study examines how facilities in Massachusetts have prepared for disasters and identifies key areas for improvement. Data was collected using four sources: a review of thirty state nursing home disaster regulations, survey of all Massachusetts nursing home administrators, case studies of four facilities, and an analysis of facility disaster plans. Study findings suggest that Massachusetts's facilities are not adequately prepared for a major disaster and that steps should be taken to enhance existing plans. Training and communication were two areas identified as needing improvement. For example, while administrators conduct some emergency training, they need to increase education to improve staff knowledge of disaster plans. Second, disaster communication within and outside of the organization was often limited or non-existent. While it is possible a facility will not be completely prepared for a disaster, the results suggest that facilities may benefit from clear guidelines that identify the minimum requirements needed to prepare for a major event. Findings can be used to enhance facility disaster preparedness and increase awareness of the importance of preparedness to improve the safety of residents. This presentation will discuss how facilities in Massachusetts currently prepare for disasters, it will address areas identified for improvement, and it will reflect upon whether they have sufficiently prepared.

**PC8 549 DISASTER PREPAREDNESS AND OLDER ADULTS LIVING IN RURAL COMMUNITIES.**

E. JURKOWSKI\* (Southern Illinois University Carbondale, Carbondale, Illinois, United States)

C. GREEN(1) - (1) Supporting People in Need (Murphysboro, United States of America)

Older adults living in rural communities, who are low income will be at risk when impacted by disaster due to the remote nature of rural communities. The purpose of this study was to examine how this target population living in rural communities perceive disasters, and to what level are they prepared. Nine focus groups were conducted, along with a survey instrument (MEPS) examining perceptions of difficulty for preparedness in the areas of planning, utility, knowledge and supply. Focus group questions solicited responses related to perceptions of disasters, perceptions of community's action in case of a disaster, barriers to preparation and knowledge about disasters and family disaster planning. Variables included demographics, perception of readiness and perception of difficulty for preparedness. Respondents identified the top three types of disaster to include tornados, floods and earthquakes. Over half of the respondents did not have disaster kits prepared or available. More than one third of respondents (34.8%) felt that a disaster would not happen to them, while other barriers included time and finances. There was a significant difference between income level and having items to be prepared, including batteries and flashlights. Findings suggest that people are not prepared in case of a disaster and also the lower the income level, the less prepared people are. Older adults could recount anecdotally about previous disasters, but this experience had no correlation with preparedness. **Implications:** Educational interventions targeting information and

preparation for low income groups will be an essential first step in the preparation process for disasters. In addition, community based agencies may need to consider alternatives to personal preparation, and assist low income communities to develop community preparation plans. These findings also suggest the need for further exploratory work through survey strategies targeting people that frequent resources such as food banks and thrift stores.

**PC8 550 A PATIENT-CENTRED COMMUNICATION TRAINING INTERVENTION: A PILOT STUDY**

K. MCGILTON\* (Toronto Rehabilitation Institute, Toronto, Canada)  
S. SIDANI(1), E. ROCHON(2), M. FOX(3), R. SORIN-PETERS(4) - (1) Ryerson University (Canada); (2) Toronto Rehabilitation Institute (Canada); (3) York University (Canada); (4) Sunnybrook Health Sciences Centre (Canada)

**Introduction:** Clients with aphasia, as a result of dementia or a stroke, are left with difficulties in understanding, talking, reading and writing. This severely limits their ability to communicate effectively with their family and care providers, resulting in adverse effects on their social interactions and quality of life. This pilot study was conducted with 2 aims: (1) to evaluate the effects of the patient-centred communication intervention (PCCI) on patient and nurse outcomes; and (2) to examine the nurses' perception of the helpfulness of an individualized client plan and communication strategies in enhancing interactions with clients with communication impairment. **Methods and Materials:** A quasi-experimental, no control group design, was conducted in a selected long-term care facility in Canada. Data were collected at 2 time periods: baseline and one-month post-intervention. The intervention included developing communication care plans for each patient based on individualized assessments of the clients by a Speech Language Pathologist, followed by support for nursing staff to implement them into their care. **Results:** Nine residents and 18 nurses consented to participate. The PCCI was successful in improving the nurses' communication abilities ( $p = .037$ ) and their knowledge of communication impairments ( $p = .001$ ). Following the one-month intervention patients' satisfaction with care ( $p = .024$ ) and their well-being ( $p = .024$ ) improved. Nursing staff also found the individualized communication care plans were very helpful in terms of understanding the patients needs, thus, enhancing their efficiency. **Conclusion:** Individualized communication care plan is an effective method to foster nurse-patient communication and assists to improve the relational care between nurses and patients with stroke living in LTC.

**PC8 551 WHY IS IT MORE INTERESTING TO ASK TO AN ALZHEIMER'S PATIENT TO READ THAN TO WRITE?**

L. LEFEBVRE\* (University of Mons, Mons, Belgium)

**INTRODUCTION** Allowing to patients with dementia to establish a good communication is essential for keeping friendly relations with them, understanding their needs and more generally, improving the quality of life of the patient and his family. However, it is well-known today that the language ability is impaired at different stages of the disease. Defining preserved abilities in order to maintain relations between the patient and his environment is then crucial. **METHOD AND MATERIALS** We met Alzheimer's patients at an early phase (S1), at an intermediate level (S2) and at the end (S3) of the disease, and evaluated them with a language evaluation battery. All verbal and written aspects of the language were tested. **RESULTS** Results clearly show a loss of language proficiency correlated with the degree of the disease. Notably, it seems that S1 patients are only characterized by writing difficulties at different levels. For S2 patients, oral spheres (production and comprehension) become impaired but the reading proficiency is preserved. Finally, for S3 patients, the reading skill becomes the last efficient communication channel. **CONCLUSION** These results tend to prove some dissociation between the different aspects of the language in the Alzheimer's disease. We show that impairments in language vary with the degree of the disease, but equally that some abilities remain preserved until the term of it. For example, the reading proficiency stays efficient for S3 patients, and could represent an interesting channel for keeping some relations with them. We think that it is important for therapists to have a clear representation of the preserved language abilities in order to adequately adapt their relations and activities at the most efficient level. The aim of our next researches should now be to develop a short language battery specifically adapted for neurodegenerative pathologies.

**PC8 552 EMOTIONAL THERAPY FOR PATIENTS WITH DEMENTIA**

H. SASAKI\* (Akita Nursing and Welfare University, -, Japan)  
H. AKIKO(1), H. REIKO(1), F. YUMIKO(1), F. MASAHICO(1) - (1) Akita Nursing and Welfare University (Japan)

**Introduction:** Preserved plasticity of cognitive processes raises the intriguing possibility of appropriately designed cognitive training regimens. Problem is what kind of activities will help cognitive decline in dementia patients. We studied if emotional therapy for patients with dementia by retired high school teachers improved cognitive function. The emotional therapy consists of thematic story of various areas cited from well written books. The present emotional therapy is not simply reminding events happened to the patients like reminiscence therapy but feeling emotions by thematic story. **Methods:** forty six patients

were entered into the study of usual care plus emotional therapy (n=15, 78±4 (mean + SD) year, 10/5, F/M) or usual care without emotional therapy ( n=31, 79±4 (mean + SD) year, 22/9, F/M). Emotional therapy was performed in Tomizawa Hospital, Sendai, Japan by retired high school teachers in a class of 5-10 patients, each 1 to 1.5 h, once or twice a week. Results: After 12 months of emotional therapy ,MMSE increased from 16±4 (mean + SD) to 19±5 (mean + SD)(p<0.01). In control group, MMSE changed from 16±4 (mean + SD) to 13±5 (mean+SD)(p<0.01). Barthel Index did not change from baseline in both groups. Conclusion: Emotional stimulations might be one way of stimulating the remaining cognitive functions of the brain

**PC8 553 AZELASTINE HYDROCHLORIDE ON BEHAVIORAL AND PSYCHOLOGICAL SYMPTOMS IN DEMENTIA PATIENTS**

F. MASAHIKO \* (Sendai Tomizawa Hospital, -, Japan)

A. HATAKEYAMA(1), A. SATOH(1), H. SASAKI(1) - (1) Akita Nursing and Welfare University (Japan)

Introduction: Antipsychotics have been used for behavioral and psychological symptoms of dementia patients (BPSD), but these drugs often induce other adverse events such as extrapyramidal symptoms, falls and aspiration pneumonia. We found that azelastine hydrochloride, which has been used for the anti-allergic diseases of asthmatics, allergic rhinitis and atopic dermatitis, might show sedative effects for BPSD in the elderly. Methods: Thirty patients with dementia (11 men and 19 women; 78±10 (mean +SD) years, MMSE 13± 8 (mean +SD) were studied. BPSD was assessed and evaluated using the Neuropsychiatric Inventory (NPI: lower scores indicate better performance). Patients were randomly assigned azelastine hydrochloride 1mg two times a day (n=14) or no active treatment (n=16) and were observed for 4 weeks. Results: Significant improvements in the score for NPI ( from 29± 11 to 17± 13, p<0.01) was observed in the azelastine hydrochloride group, where NPI in the control group ( from 31± 12 to 28±13 ) did not change significantly. Barthel index and MMSE did not change significantly in both groups. Conclusion: Azelastine hydrochloride has been proved to penetrate the blood brain barrier. Patients with BPSD might suffer some brain injuries and anti-leukotriene and anti-histamine medicine might be benefit to subside these injuries.

**PC8 554 OLDER AUSTRALIANS WITH LIFE LONG INTELLECTUAL DISABILITY: EXPERIENCE AND EXPECTATIONS OF 'ACTIVE AGEING'**

L. BUYS \* (Queensland University of Technology , Brisbane, Australia)

'Active ageing' as a construct is increasingly gaining international currency. However, as we are only now seeing the first substantial group of older adults with lifelong intellectual disability reach old age, how this group perceive and experience the process of ageing is unclear. Thus, this qualitative research utilises an active ageing framework to explore how older Australians with lifelong intellectual disability experience ageing, their goals and expectations for the future, and the facilitators and barriers to active ageing. Method Using purposive sampling, disability or aged care service providers for people with intellectual disabilities were asked to service users who were aged older than 50 years and able to communicate verbally. Semi-structured interviews were conducted with 16 service users; 16 service providers and 16 key informal network members from regional/rural and urban areas in two Australian states (Queensland & Victoria). Results Active ageing for older people with lifelong intellectual disability means having a sense of empowerment, being actively involved in their communities, having a sense of security in terms of finances, emotional wellbeing and future care, having opportunities to learn and maintain skills, having congenial living arrangements, having optimal health and fitness, being safe and feeling safe, and having satisfying relationships and support. Conclusions Older people with lifelong intellectual disability wanted to "keep on keeping-on" in areas of life that gave them pleasure, rather than discontinuing them because of age. They wanted more control over issues affecting their lives and to be given meaningful roles. Mental stimulation, companionship, reliable support and safety were valued. Critically, they want to have a sense of control, be included in decision making and be empowered to lead the lifestyle they choose to lead in their older age.

**PC8 555 COMMUNICATION WITH NURSING HOME RESIDENTS WITH DEMENTIA: A SYSTEMATIC REVIEW OF THE LITERATURE**

E. VASSE\* (Radboud University Nijmegen Medical Centre, Nijmegen, The Netherlands)

Background: People with dementia develop more and more difficulties in communicating as the disease progresses. Their way of communicating changes from verbal to nonverbal, and such communication difficulties are considered a trigger of neuropsychiatric symptoms. This review studies the effects of non-pharmacological interventions in nursing homes on communication between residents with dementia and nursing staff, as well as on the neuropsychiatric symptoms of residents with dementia. Method: Pubmed, PsychInfo, Web of Science, the Cochrane Library, and reference lists from relevant publications were systematically searched to find articles describing a controlled, communicative intervention. Meta-analysis was performed when data allowed pooling. Results: A total of 19 intervention studies, were included. The two common types of interventions were interventions for residents at set times (e.g., life review) and interventions teaching nursing staff to apply communication techniques during daily care activities (e.g., sensitivity to

nonverbal communication). A meta-analysis of four of the set-time studies revealed significant effects for communication outcomes (standardized mean difference, 0.73; 95% confidence interval, 0.08–1.37; p = 0.03), but none for neuropsychiatric outcomes for residents with dementia. Interventions conducted during daily care activities also showed positive effects on communication outcomes. Conclusion: Results of this review indicate that it is possible to significantly improve communication in nursing homes when interventions are structured and interactive. Multi-task interventions are not any more effective than one-on-one attention. No positive effects have been found for neuropsychiatric symptoms. Future research should focus on effects leading to the positive behavior of residents instead.

**PC8 556 MECHANISMS OF PSYCHOMOTOR SLOWING IN ALZHEIMER DISEASE AND LEWY BODY DEMENTIA**

M. ROUSSEL\* (Hospital, AMIENS, France)

O. BAILON(1), A. RAHNEMA(1), A. ROUTIER(1), O. GODEFROY(1) - (1) Hospital neurology (Amiens, France)

Psychomotor slowing has been documented in dementia, however, they did not examine separately rapidity of processes involved in RT tasks such as perceptual, motor, decisional processes and attention. The objective of this study was to determine whether RT lengthening in Dementia with Lewy Bodies (DLB) and Alzheimer's disease (AD) is due to global slowing or specific alteration of perceptual, motor, decisional processes or of attention. 19 mildly demented patients (AD: n=11; DLB: n=8) with a MiniMental Score ≥20/30 and 19 age and education-matched controls were included. 4 tasks were used to assess rapidity of motor processes using finger tapping test; visual processes using Visual Inspection time (VIT); perceptuo-motor integration and attention using Simple RT (SRT); and binary decision processes using Choice RT (CRT). Analyses of variance showed slowing of (1) finger tapping in AD (p<0.02) (3.85±1.2 Hz); (2) Visual Inspection time in both AD (267±183 msec) and DLB (477±75 msec) patients (p=0.0001, both); (3) SRT both in AD (406±126 msec) and DLB patients (457±131 msec) (p=0.03 and p=0.02, respectively); (4) CRT both in AD (916±179 msec) and DLB patients (810±182 msec) (p=0.0001 and p=0.02, respectively) with increase of error rate in DLB patients (9.7±8%). Additional analyses of SRT distribution indicated that SRT lengthening in AD patients was mainly due to slowing of perceptuo-motor index (p=0.03) whereas it was due to impaired attentional index (p=0.004) in DLB patients. This study supports the presence of psychomotor slowing in both AD and DLB but indicates that it is due to different mechanisms with a prominence of perceptuo-motor slowing in AD and disorders of attention and visual processes in DCL.

**PC8 557 PRAYER AS AN INTERVENTION FOR AGITATION AND QUALITY OF LIFE IN LATE-STAGE DEMENTIA**

L. SMITH\* (University of New Mexico, Corrales, New Mexico, United States)

This study explored the use of spirituality as a coping strategy for dementia residents with agitation. A prayer exercise was used as a concurrent integrative approach for nursing home residents with agitation to facilitate stress reduction and improve quality of life. Caring for a person with Alzheimer's disease or other types of related dementias poses unique problems, one of those being the presence and management of agitation and aggression. Using a mixed-methods experimental research design, nursing home residents with moderate to late-stage Alzheimer's disease or related dementias were assessed before and after the use of a prayer exercise. A multivariate analysis of covariance was used to identify significant differences between a control group and a treatment group who received the prayer exercise. Quality of life and 10 domains of neuropsychiatric symptoms of dementia were measured with pre- and post-tests developed specifically for persons with dementia. Additionally, journal entries for each intervention were qualitatively analyzed to illustrate the experience of prayer with a nursing home population with dementia. Four themes were identified through this process: gratitude, reverence, satisfaction, and familiarity. Multivariate analysis of covariance and subsequent univariate tests identified a statistically significant mean difference between the two groups for quality of life, indicating a higher quality of life for the treatment group. No statistically significant mean differences were found between the two groups on neuropsychiatric symptoms; however, there was a slight improvement in the mean scores for the treatment group. Findings from both quantitative and qualitative analysis demonstrated that quality of life was improved for those residents in the treatment group. The spiritual activity of prayer was an effective intervention among the demented elderly in this population. The findings underscore the importance of researching interventions that benefit quality of life for persons with dementia.

**PC8 558 EVALUATION OF A TELEPHONE HELP-LINE FOR CHALLENGING BEHAVIOUR ASSOCIATED WITH DEMENTIA**

M. BIRD\* (Greater Southern Area Health Service, Queanbeyan, Australia)

T. CALDWELL(1) - (1) Australian National University (Canberra, Australia)

Introduction: An evaluation was conducted into the effectiveness of the Australian National Dementia Behaviour Advisory Service (NDBAS), a telephone help-line run by Alzheimer's Australia for home carers and health professionals dealing with challenging

behaviour associated with dementia. Procedure and Materials: The calls of interest were where an NDBAS consultant provided a clinical intervention. For these, callers were invited to complete a questionnaire over the phone. Participants were contacted again three and six weeks after the initial call. Measures included nature and frequency of behaviour, disruption, stress caused by the behaviour, and satisfaction with NDBAS. Demographic data, level of dementia of the person manifesting the behaviour, and emotional state of the caller were assessed at baseline. Results: Of 571 calls received during the evaluation period, 68% involved challenging behaviours and, of these, 31% involved a clinical intervention. Eighty-seven callers (56%) of these agreed to participate in the research. Most calls were from a family member. The mean age of the person with dementia was 81, most were still living in the community and in the mild or moderate stages. The most common behaviours were: resistance to care; paranoia/suspicions/accusations; and, aggression/violence/anger. With few exceptions, callers were extremely distressed at baseline, with emotions in the anxiety spectrum more pre-dominant than depression. Satisfaction with NDBAS was high, and the findings showed a significant and sharp decline in behaviour frequency. A third of behaviours did not occur at all six weeks after the initial call and, overall, 66% to 70% of behaviours had improved in frequency, stress and/or disruption. Discussion: The evaluation suggests that this relatively low cost intervention can be effective in assisting home carers with challenging behaviour. Specialised telephone help-lines for this population remain part of dementia services funded by the Australian Government.

**PC8 559 EVALUATING THE PSYCHOMETRIC PROPERTIES AND THE CLINICAL FEASIBILITY OF A CHINESE VERSION OF THE DOLOPLUS-2 SCALE AMONG COGNITIVELY IMPAIRED OLDER PEOPLE WITH COMMUNICATION DIFFICULTY**

C. YIHENG\* (Institute of Clinical and Community Health Nursing, Taipei city, Taiwan)  
L. LIN(1), R. WATSON(2) - (1) Institute of Clinical Nursing (Taipei, Taiwan); (2) The school of nursing and midwifery (Sheffield, United Kingdom)

Background A variety of behaviourally observed tools have been developed to assess pain among cognitively impaired older people with communication difficulty. However, no adequate pain observed instrument is available for this group in Taiwan. Objective The study was undertaken to translate the French version of the Doloplus-2 scale into Chinese and to evaluate the psychometric properties and the clinical feasibility of the translated instrument. Methods The Doloplus-2 scale was translated into Chinese using the back-translation technique and pilot testing was performed to determine the comprehensibility and the initial psychometric characteristics. A total of 241 subjects with moderate and severe dementia were recruited and registered nurses in charge of these residents rated pain using the translated scale. Internal consistency and inter-rater reliability was evaluated by Cronbach's alpha and intra-class correlation coefficient. Based on the known correlated validity model, the association between C-Doloplus-2 and empirically supported correlates of pain such as the past pain history, the presence of pain related condition, functional disability, agitation and depression was examined using the Pearson correlation coefficient for validating the construct validity. Furthermore, factor structure was investigated using the Principal Components Analysis. Results The internal consistency was adequate for the total scale (alpha 0.74) and the subscales (alpha range 0.67-0.87). The intra-class correlation coefficient of the total scale was 0.81 and of the subscales ranged from 0.60-0.81. The association between pain latent variable and disability or depression was proved, partial supporting the construct validity. Three factors were extracted to confirm the original three-dimensional structure perfectly, accounting 65% of the total variance. Conclusions The psychometric qualities of Chinese Doloplus-2 were supported. Further research is needed to assess the clinical value of the translated scale performed in the institutions.

**PC8 560 INTERACTIONAL PERSPECTIVE ON THE IMPACT OF NURSING STAFF'S BEHAVIOUR ON RESISTIVENESS TO CARE IN DEMENTIA**

G. BELZIL\* (Université Laval, Québec, Canada)  
J. VÉZINA(1) - (1) Université Laval (Québec, Canada)

Introduction Resistiveness to care (RTC) in patients suffering from dementia is a complex phenomenon in which patient-nursing staff interaction is considered critical, yet poorly understood. The aim of the present study is to describe, in an interactional perspective, the impact of an exhaustive set of nursing staff's behaviours on RTC during morning hygiene care manifested by institutionalized dementia patients. Methods and material Five residents suffering from severe dementia and exhibiting RTC on a weekly basis, and 25 caregivers, were recorded on video during 30 hygiene care sessions each, for a total of 150 sessions. Videotapes were rated using a real-time coding program (The Observer 5.0) specifying nursing staff's and patient's behaviours in accordance to a predefined coding scheme. Sequential analyses were used to analyze patient's RTC in five-second periods immediately following the onset of nursing staff's physical (instrumental and expressive touch) and verbal behaviours (neutral, positive or negative utterance, positive or negative instruction, distraction). Their relative impact on RTC behaviours was assessed considering the patient's behaviour at the onset of the caregiver's behaviour. Results Nursing staff's behaviours that were significantly ( $p<0.001$ ) associated with the onset of RTC include: instrumental touch, neutral, positive and negative utterances and both types of instructions. While these behaviours can trigger RTC, the magnitude of their effect is

dependant on the patient's preceding behaviour. Their relationship with RTC is moderate to strong when the patient is already exhibiting RTC while it is weak to moderate when the patient is collaborating or in a neutral state at the onset of the caregiver's behaviour. Conclusion This observational study is the first to describe with such precision the nature of interaction associated with RTC. Theoretical and clinical implications are discussed.

**PC8 561 THE PSYCHOSOCIAL IMPACT OF MULTIMEDIA DIGITAL BIOGRAPHIES ON PERSONS WITH COGNITIVE IMPAIRMENT**

E. MARZIALI\* (Baycrest, Toronto, Ontario, Canada)  
R. BAECKER(2), T. DAMIANAKIS(2), K. SMITH(2), M. NISHIHATA(2) - (2) University of Toronto (Toronto, Canada)

Purpose: The aim of this project was to observe cognitively impaired patients' responses to personalized, multimedia digital biographies (MBs). Media-related technology procedures were used to construct in DVD format multimedia biographies of six persons with Alzheimer's disease (AD) and six persons with mild cognitive impairment (MCI). Participant responses while viewing their MBs were filmed and submitted to analysis so as to extract the psychosocial impact on the participants and their families. Methods: An interdisciplinary team consisting of multimedia biographers and social workers interviewed family members of persons with AD and MCI and collected archival materials that best captured the patients' life histories. We filmed patients' responses to watching the MBs, conducted follow-up interviews with the families at three and six months following the initial viewing. Qualitative analytic strategies were used for extracting themes and key issues identified in both the filmed and interview response data. Results: Analysis of the interview and video data showed that the MBs evoked long term memories that stimulated and enhanced social interactions among patients, family members, and with formal caregivers. Family members reported changes in acceptance of their relative's impairment and engaged in interactions with the relative that they had previously believed untenable. Conclusions: This study demonstrated the feasibility of producing MBs for individuals with Alzheimer's disease or mild cognitive impairment, and their families. Extracted content from feedback interviews and videos of the participants viewing their own multimedia biographies showed how user-friendly technological strategies can be used to develop biographies that hold special meaning for persons with Alzheimer's, MCI and their families.

**PC8 562 CHANGING THE TRANSACTIONAL PROCESS BETWEEN THE ELDERLY WITH DEMENTIA AND THEIR FAMILIES: SPECIFIC SKILLS AND MEASUREMENT METHODS**

Y. OHSHITA\* (Prefectural University of Hiroshima, Mihara-city, Japan)  
T. OGAWA(1), K. KAMO(2) - (1) Yamaguchi Prefectural University (Yamaguchi-city, Japan); (2) Prefectural University of Hiroshima (Mihara-city, Japan)

The study aimed to demonstrate the relationship between the transformation of a Deviance Amplifying Feedback Loop (DAFL) of an elderly person and their family for the improvement of their health status. The process of transforming DAFL was shown by a three-dimensional graph. Enhancing the adaptive functions within a family is one of the most important aspects of promoting health. The case study shows the concrete process of change in a DAFL. The client was a woman who had taken care of her elderly father with dementia. She complained about her father's problematic behavior and her physical symptoms. Data related to meaning construction and behavior selection were collected through interviews using a tracking technique. The data were assessed following the paradoxical mechanism of DAFL. The fathers problematic behavior became pathological symptoms, although the daughter tried to improve her fathers problematic behavior. The data of DAFL were sorted based on Baless categories (Bales, 1950), which were used to analyze the interaction process. The dynamic processes were illustrated by a three-dimensional graph. Based on this graph, an intervention point was chosen and specific skills were selected. Post-intervention data were collected and graphed following the same procedure as for pre-intervention. From using circular questions to change the point where the DAFL mechanisms operated, the process of DAFL within a family was transformed. Post-intervention, the clients complaints discontinued. Moreover, the elderly father's problematic behavior did not worsen. By analyzing the pre- and post-intervention graphs, the transformation process was shown quantitatively. We concluded that the effectiveness of the intervention activity to transform DAFL mechanisms within a family to promote the health of an elderly person and their family was empirically proved.

**PC8 563 LET'S DANCE DANZÓN! THE EFFECT OF DANCING ON PEOPLE WITH DEMENTIA LIVING IN CARE HOMES: A PILOT STUDY**

A. GUZMAN\* (Newcastle University, Newcastle upon Tyne, United Kingdom)  
I. JAMES(1), J. HUGHES(1), L. ROCHESTER(1) - (1) Newcastle University (Newcastle upon Tyne, England, United Kingdom)

Introduction: Recent findings suggest health benefits of exercise programmes for older adults with dementia. This study aimed to investigate the effects of a psychomotor intervention based on Danzón, a form of Latin ballroom dancing. Methods and materials: A qualitative-quantitative longitudinal pilot study took place in 2 care homes in Newcastle upon Tyne, UK. An external observer used evaluation forms to measure the training units

during the dancing session. Thirteen participants with dementia were observed and later interviewed as well as carers who participated. Results: Quantitative results showed that participants could perform and exhibiting learning a sequence of four simplified Danzón steps over a session lasting 35 minutes, two days per week during 6 weeks. Grounded theory was used in the qualitative arm; a model emerged from residents and carers. It was stated that Danzón had a beneficial impact on the participants, mainly in terms of behaviour, affect and mobility. Moreover, carers reported positive outcome for themselves and the residents. Conclusion: The results of this study indicate that Danzón was enjoyed by both participants and staff, and that Danzón overall had a positive impact in the study settings. Therefore, this form of psychomotor intervention warrants further research. We plan a more in-depth study of the effects of the intervention in the Care Home.

**PC8 564 COST-EFFECTIVENESS OF A FUNCTIONAL PROGRAM TO INCREASE QUALITY OF LIFE IN COMMUNITY-DWELLING OLDER ADULTS**  
E. JUTKOWITZ\* (Thomas Jefferson University, Philadelphia, United States)  
L. GITLIN(1), L. PIZZI(1), T. BUNZ(1), M. DENNIS(1) - (1) Thomas Jefferson University (United States of America)

Introduction: This paper examines the cost-effectiveness of a randomized clinical trial of a 12-month home-based intervention (Advancing Better Living for Elders; ABLE) to improve quality of life in community-dwelling elders with functional difficulties. Cost-effectiveness studies of functional improvement programs are important to advance standards of care for this underserved vulnerable population. Methods and Materials: We used an incremental cost-effectiveness ratio (ICER), to determine cost per quality-adjusted life-year (QALY). The ICER represents the additional costs to bring about one additional unit of benefit (QALY) from the intervention compared with no intervention. QALY was measured by the EQ-5D index weighted for U.S. societal preferences. Decision tree and probabilistic sensitivity analysis was conducted to test robustness of the model. Of the original 319 ABLE randomized sample, 301 African American and White older adults 70 years of age and older with functional difficulties with complete baseline and 12-month data were included. Of these, 152 were in intervention and 149 were in a usual care (no treatment) control group. The intervention involved occupational (OT) and physical therapy home and telephone contacts and implementation of home modifications (e.g., grab bars, raised toilet seats, monitors, rails) to reduce functional difficulties and improve quality of life. Results: The intervention cost was \$941.88. The cost for an additional QALY compared to no treatment (ICER) was \$16,052.12. The cost for the ABLE intervention group was less than \$50,000 per participant per year. Results were most sensitive to changes in home modification costs and in-home OT sessions. Conclusion: ABLE is cost-effective compared to usual care (no treatment) based on a willingness to pay of \$50,000 suggesting that a societal investment in home-based programs to improve function is worthwhile.

**PC8 565 REFLECTIONS FROM A COMMUNITY-BASED DENTAL EDUCATION IN LONG-TERM CARE FACILITIES: STUDENTS' VALUES**  
M. BRONDANI\* (University of British Columbia, Vancouver, Canada)

Background: In 2007, Faculty of Dentistry at University of British Columbia formally introduced the course 'Professionalism And Community Services' – PACS in the dental curriculum. PACS has Community-Services Learning – CSL as an experiential learning pedagogy in different community sites including long-term care facilities where the students developed, applied and assessed health promotion activities. While experiencing this community-based dental education, students kept a reflective journaling. Objective: to illustrate how continuing reflections impacted students' learning in the context of their first experience in a long-term care facility site. Methods: Students were encouraged to reflect 'before', 'during' and 'after' the development of their CSL projects. 121 students provided and are still providing individual reflections through email, password protected intranet site (WebCT), or handwriting. Reflections were not graded and students were stimulated to favor thinking over description in at least 150 words per reflection. 83 students were from two classes of second years and 39 from one class of first years. Reflections were analyzed thematically for essential themes and categories. Results: Students not only appreciated the community experience in a long-term care setting, but also pondered about their own learning as health care providers for that population in the future. Before reflections emphasized 'expectations' and 'feelings of belonging', whereas during and after reflections promoted the discussion of 'challenges and struggles', and of 'ongoing engagement', respectively. Conclusions: Reflective activity helped students to better understand the struggles and rewards in working in a long-term care environment. It also enabled them to appreciate a community learning experience in a dental curriculum. It allowed them to gain additional value from a community-based education with a positive impact on their attitudes about services, themselves, and the long-term care in which they developed their CSL projects.

**PC8 566 ILLICIT DRUGS PATTERN UTILIZATION IN A PUERTO RICAN BABY BOOMERS SAMPLE.**  
N. LABAULT-CABEZA\* (University of Puerto Rico-Public Health, San Juan, Puerto Rico)  
R. DÁVILA(1), V. REYES(2) - (1) University of Puerto Rico-Public Health, MC Health Program (San Juan, Puerto Rico); (2) Walden University (San Juan, United States of America)

Introduction: A relationship exists between use of illicit drugs, exchanging needle and contracting HIV/AIDS. Individuals within the baby boom cohort have engaged in riskier sexual and drug-related behaviors as opposed to previous cohorts. Projections reveal that in approximately 20 years the number of older adults in need of substance abuse treatment will double; however, substance abuse related disorders have been overlooked and under treated. This study sought to describe the drug usage pattern in a Puerto Rican Baby Boomers sample. Methodology: A cross-sectional exploratory pilot study, with a non-probabilistic sample of 50 individuals (25 females and 25 males) participating in a Needle Exchange Program was conducted. Face to Face interviews were performed in a survey to determine the drug and alcohol usage pattern. Results: 90.5% are currently using street drugs and prescribed drugs. The most common drugs used are: cannabis (65.8%), crack (60.5%), cocaine (56.4%), heroine (53.8%) and speedball (48.6%). 90 % of the participant started using street drugs at 15 years old and have been using drugs for more than 10 years. Starting age of injecting drugs also shows a similar pattern among participants (15 years old or more). Needle usage varies from 9 to 10 per day; with an injecting pattern of 5 to 7 times per day. It should be noted that although participants are in a needle exchange program 40.7% shares needles, and 59.3% shares "cookers". Last, 53.6% mix their drugs with horse anesthesia. Conclusions: The participants' drug consumption patterns show high risk behaviors for HIV/AIDS infection. The population studied, are using adulterated street drugs as they are using veterinary products. There is no previous study performed that describe baby boomers drug usage profile in the Puerto Rican population, however more research needed.

**PC8 567 IMPACT OF AN INTEGRATED HEALTH EDUCATION, PATIENT-CONSULTATION, AND EXERCISE PROGRAM ON FUNCTIONAL PERFORMANCE AMONG WOMEN WITH KNEE OSTEOARTHRITIS**  
S. AREE-UE \* (Faculty of Medicine Ramathibodi Hospital,Mahidol University, Bangkok, Thailand)  
S. VANAVANANT(1) - (1) Ramathibodi School of Nursing, Faculty of Medicine Ramathibodi Hospital, Mahidol University (Bangkok, Thailand)

Background: Knee osteoarthritis (OA) is known as a health problem affecting adults and older adults. A limited function caused by joint pain, crepitus, and stiffness leading to psychological dysfunction and socio-economic costs. The intervention that can be improved a limited function, is needed. Objective: The aim of this study was to examine the impact of an integrated health education, patient-consultation, and quadriceps-exercise training on functional performance in terms of improving joint range of motion (ROM), muscle strength, functional ability, reduction of pain, and weight reduction. Methods: A total of 73 patients with knee OA were recruited for the study. Participants were given health education class-based sessions three times, quadriceps exercise training followed by home-based exercise adherence for 12 weeks of three times a week, and individual counseling by telephone or meeting at the orthopedic out-patient clinic for 12 weeks of once a week. Data were collected at baseline, 8-and 12-week follow-ups. Statistical analysis was performed by using repeated measures ANOVA. Results: Results showed that ROM, muscle strength, and functional ability were significantly improvement after enrollment. Participants also had a statistically significant decrease in pain and joint stiffness; however, weight reduction did not achieve significance. Conclusions and recommendations: Findings from this study suggest that this integrated intervention program can be recommended to patients and health care providers for the management of knee OA. Moreover, further study needs to emphasize what strategies promote weight reduction that is commonly associated with osteoarthritis of the knee.

**PC8 568 THE INFLUENCE OF THE SOCIAL COMPETENCE IN DEMENTIA CARE ON THE OCCUPATIONAL STRESS OF NURSING HOME STAFF**  
J. HABERSTROH\* (Klinikum der Johann Wolfgang Goethe-Universität Frankfurt a.M., Frankfurt a.M., Germany)  
K. NEUMAYER(2), B. SCHMITZ(2), J. PANTEL(1) - (1) Klinikum der Johann Wolfgang Goethe-Universität Frankfurt a.M. (Frankfurt a.M., Germany); (2) TU Darmstadt (Darmstadt, Germany)

Nurses for the elderly are a group at high risk of burnout syndrome. Problems associated with dementia care are major reasons for occupational stress in nursing home staff. To analyse the influence of the social competence in dementia care on the occupational stress of nursing home staff, a theoretical model was designed and evaluated. From this model interventions to prevent burnout can be deduced. A training program was developed on basis of the above mentioned model. Purpose of this intervention was to reduce occupational stress of nursing home staff with training special social competencies in dementia care. The training was implemented and evaluated in two controlled training studies using multiple control group designs and process measurement. Participants were 79 nursing home professionals in the first and 39 in the second study. All participants were in daily contact with residents suffering from dementia. The trainings of both studies focused on problems and strategies in the communication with dementia patients and the communication with colleagues. The training evaluation supports effects for all relevant variables: The "social competence" of the caregivers increased and their "occupational stress" decreased while the "well-being of residents suffering from dementia" increased. Furthermore the results of multivariate time series analysis show that the effects for "occupational stress" and "well-being" can be attributed to the increased "social

competence" of the caregivers. The results of this study corroborate clearly the influence of social competence on the occupational stress of nursing home staff and the well-being of residents suffering from dementia. It can be concluded that training nursing home professionals in social competence is an indirect method to reduce their work stress and increase dementia patients' well-being. Therefore, the introduced training provides an opportunity to improve the situation of dementia care in nursing homes and to prevent burnout.

**PC8 569** PROMOTING HEALTH THROUGH AN INTERGENERATIONAL CAMP: PUERTO RICO GERIATRIC EDUCATION CENTER EXPERIENCE (PRGEC)  
M. BIDOT-SAN ANTONIO, MPHE\* (University of Puerto Rico-Medical Sciences Campus, San Juan, Puerto Rico)  
P. VALLES-RAMOS(1), D. ROSADO-MATOS(1) - (1) University of Puerto Rico-Medical Sciences Campus (San Juan, Puerto Rico)

Introduction: The generation gap is a visible phenomenon in our society. The older adult and youth generations are growing, living and playing in a parallel way due to the myths and stereotypes that both populations can have about each other. The intergenerational summer camp initiative, respond to: break generational gaps between older adults and youth, and to allow opportunities to come together across generational lines. Older adults in Puerto Rico represent 15.4% of the total population according to the US Census, 2000. This population is characterized by heterogeneity, poverty, isolation and the prevalence of chronic conditions, such as hypertension, arthritis, and diabetes mellitus. The inadequate management of these chronic conditions can result in impairment, disability or death. To countercheck these possible results it is necessary the application of health promotion and disease prevention strategies for older adults. Methodology: The PRGEC in coordination with public and private community organizations, designed and have been implementing an intergenerational summer camp within a health promotion approach in a faith based organization during the past six years. Youth and children are trained on basic aspects of aging, normal changes, myths and stereotypes of aging. The activities for older adults include lectures on health promotion topics based on a need assessment, exercises, excursions, a field day and handcrafts. Results: A total of 616 persons, represented by three generations were impacted. Ninety eight percent of older adults evaluated the experience as excellent. Thirty six conferences on health topics and health fairs were held. Eighty eight percent of older adult increased their physical activity. Respect and good disposition to share which each other was expressed in focus group interviews. The success of the initiative is the result of many collaborative efforts. Conclusions: Besides the opportunity of promoting health, the intergenerational learning experience allows changes in attitudes between

**PC8 570** ANALYSIS OF COMPUTER GAME GENRE AND OLDER ADULTS (50+)  
H. MARSTON\* (University of Teesside, -, United Kingdom)  
C. FENCOTT(1), P. VAN-SCHAIK(1) - (1) Univesity of Teesside (United Kingdom)

Computer games have significantly evolved since they were first developed in the 1960s. The knowledge and skills that have developed over the years have seen many young people adopt this form of entertainment as part of a life style. Baby boomers may remember when the first computer game was released or recall even playing it, but what about now in the 21st Century? Would older adults consider playing games with their children/grandchildren or within other social networks given the current technology and game content? This study investigated the notion of game content through a step-by-step approach of individuals designing their own game idea related to a hobby or interest. Qualitative and quantitative data reported positive results from participants in relation to computer/game usage, design ideas and whether the respondents would play games given the opportunity. Examples of positive results from the workshops included: 1) "The computer game for the elderly must encom! pass an exercise element and purpose;" 2) "I would like to play computer games to play with my grand-daughter;" 3) "If a game was of help to any particular hobby I could be interested. Come a time when I am not very active, computer games could have a place in my life;" and 4) "I still think that playing games is educational and fun". Although gaming has become popular due to the marketing of the Nintendo DS and Wii to older people, the findings from this study indicate game content needs to be further addressed by the games industry if additional marketing towards older adults is to increase. Data from this study supports the hypothesis that with the improvement in game content it is possible older adults may adopt gaming as part of their life style similar to that of younger audiences.

**PC8 571** INTELLECTUAL AND SOCIAL POTENTIAL UPDATE DURING OLD AGE  
L. JORDÃO\* (Universidade do Estado do Rio de Janeiro, Rio de Janeiro, Brazil)

The promotion of a healthy aging is complex, which includes the achievement of a good quality of life. It is vital to broaden awareness about the aging process and the importance of health maintenance during it. Quality of life, health promotion and potential update of the elderly is our challenge in education. Our goal is to promote the integration of the elderly to the social environment, providing the expansion of their knowledge and

intellectual skills by means of activities such as: workshops, lectures, seminars, round-tables, forums and celebrations, allowing the elderly to discuss matters of great contemporary importance, aiming at expanding their personal and academic knowledge, developing a critical and significant consciousness in the social field. By taking advantage of the trainees' academic potential, the activities' organization and the deepening of the theoretical content are scheduled. A field research is done in order to evaluate the quality and impact of the events and from that the contents and the activities done in class are prepared. The main materials used are: booklets, CDs and DVDs, in short, printed materials and audiovisual. With the opening of space for the elderly production, by means of cultural workshops and internal and external presentations, old people's value and their active inclusion in society are recognized successfully. It is evident that the activities developed by the UnATI/UERJ are crucial to a healthy and harmonious coexistence among the students, which is extremely important to the search for a more productive and socialized old age. As for the trainees, the exchange of experience with the elderly is an excellent resource towards professional maturity and consciousness, providing a better interdisciplinary social interaction.

**PC8 572** SELF-MANAGEMENT SUPPORT PRACTITIONER TRAINING IN PRIMARY CARE: THE BRITISH COLUMBIA APPROACH  
P. MCGOWAN\* (University of Victoria, Delta, Canada)

Introduction Health care systems have evolved around the concept of infectious disease, and they perform best when addressing patients' episodic and urgent concerns (Geneva: WHO; 2002). In these situations, the "expert practitioner" and "compliant patient" relationship has been effective. However, with changing global demographics, this acute care paradigm is no longer adequate, especially as people grow older, experience chronic health conditions, and have limited access to practitioners and services. Changing the way health practitioners interact with patients (especially seniors) to an empowerment model is fraught with barriers at the policy, organizational, administrative, educational, and individual levels. Methods British Columbia's approach to fostering collaborative practitioner/patient relationships is strengthened by the Chronic Care Model in which self-management support is a key component. At the policy level, BC's philosophical orientation to care is highlighted in a Primary Health Care Charter which calls for the development and delivery of policies, provider education and regional supports in efforts to implement "a patient as partner" systems approach. Results With the foundation of the Chronic Care Model and the Primary Health Care Charter, initiatives have included modified fee structures, mapping strategies, and integrated health networks. Single- and multi-session group sessions, internet and e-based technologies are available to practitioners through community in-service education and to students at training institutions. At the individual and family levels, interventions and programs are delivered by both health practitioners and lay leaders. Conclusion Bringing about collaborative relationships between practitioners and patients is difficult, especially in organizations influenced by the Acute Care paradigm. Progress is being made but success will require multilevel approaches over time. Support at the policy and individual levels exists but difficulties persist at the organizational level. Practitioner training at the Primary Care level will lead to productive practitioner/patient relationships experienced by seniors.

**PC8 573** IMPROVING THE COOPERATION BETWEEN GENERAL PRACTITIONERS AND COMMUNITY NURSES IN DEMENTIA CARE  
H. VAN DEN BUSSCHE\* (Institute of Primary Medical Care, Hamburg, Germany)  
A. ERNST(1), A. JAHNCKE-LATTECK(1), U. SCHRAMM(1) - (1) University Medical Center Hamburg-Eppendorf (Hamburg, Germany)

Introduction In Germany, some 75% of patients with dementia live at home, supported and nurses primarily by family caregivers. In addition, GPs and community nurses play an important role in the care, either directly towards the patient or indirectly through supporting the family caregivers. It can be forwarded that an optimal communication and cooperation between GPs and nurses would be beneficial for the family caregivers in the sense of burden reduction and thus indirectly for the person with dementia. In Germany however, this cooperation is far from optimal, as the two professions have almost no contact to define common care objectives and evaluate the effects of their care. Methods The objective of the study is to develop a toolbox of instruments to improve the cooperation between the two professions and to test the effects of these instruments in a complex intervention evaluated within a randomized controlled trial in Hamburg. The toolbox contains interventions on different levels, e.g. clinical conferences together with the caregivers, measures to increase accessibility, common documentation formats etc. In the RCT, 30 nursing services working under the umbrella of the Protestant Church and covering the whole territory of the city were allocated at random to the intervention and the control arm. In the intervention arm the complex intervention will be tested over 12 months, whereas in the control group treatment as usual will take place. The project covers some 600 patients and their caregivers. Evaluation will be done by means of attitude questionnaires and case documentation. The project is actively supported by the Department of Nursing of the University of Applied Sciences, the Alzheimer Association,

the Association of GPs and the Association of Nurses. The project is funded by the Federal Ministry of Health Results and conclusions Will be available at the congress.

**PC8 574 "AGEISM EVALUATION DURING THE CAREGIVERS TRAINING PROGRAM AT THE BUENOS AIRES NATIONAL UNIVERSITY"**

D. MINGORANCE\* (U.B.A. Buenos Aires National University, Buenos Aires, Argentina)

**Introduction** The research is about knowing the influence of the caregiver's training. The study investigate if the caregiver's training sessions influence the student's old age image, the presence of prejudices, stereotypes and implicit theories about old people. The subject is studied from the Gerontology as a field of study of aging, taking into account the contributions made by the psychogerontology. Method and materials The research describes how the University of Buenos Aires training sessions influence the caregiver's ageism, theories and stereotypes about old age. At the same time, the utilized design was a qualitative one. We used two surveys as collecting data instruments. The first one was done at the beginning of the training course and the second one at the end of it. Results From the first part of the research, the surveys discover that there are prejudices about old age and about old people resources. Analyzing problematic situations, the study found signs of showing overprotection attitudes, intimacy invading and stereotypes about old age. The research in the second part can find that there were changes in the caregiver's students after they completed the training sessions. Conclusions The evaluation is relevant for didactic objectives and for social preventive intervention project behind the strict academic concern. If we find that prejudices about old age are significant, then we recommend the need to emphasize the review of them during the training courses, together with the teaching of the contents refered to caring.

**PC8 575 EVIDENCE-BASED HEALTH PROMOTION FOR OLDER ADULTS: NCOA'S ONLINE TRAINING MODULES**

M. ALTPETER\* (University of North Carolina at Chapel Hill, Chapel Hill, United States)  
E. ROSENBERG(1) - (1) Appalachian State University (Boone, United States of America)

**Introduction** Evidence-based health promotion programming for older adults is a rapidly growing area of aging services delivery, yet not all service providers in the US or elsewhere feel knowledgeable or adequately prepared to deliver such programming. Easy to access training and materials are thus needed to enhance provider and partner capacity to assure quality in program planning, implementation and ongoing maintenance of older adult health promotion programming. Methods/Materials This session showcases the six self-paced, online modules titled, "Introduction to Health Promotion for Older Adults" series produced by the National Council on Aging. The modules provide all of the basic concepts, frameworks, tools, strategies and resources that providers and their partners can use to implement evidence-based health promotion and prevention programs. Module 1 focuses on making the case for health promotion and aging; Module 2 focuses on explaining what evidence-based health promotion is; Modules 3-6 focus on the five components of the RE-AIM model (REACH, EFFECTIVENESS, ADOPTION, IMPLEMENTATION, MAINTENANCE) which is a prominent framework in the US for systematically planning, implementing and evaluating public health programs. Results These modules have been tested nationally in the US and are recommended by the Administration on Aging as basic training on evidence-based practice in aging services. They can be used for in-service training or general orientation with a number of audiences, including: administrators and line staff in aging, health, human services, or other community agencies; potential funders and other community sponsors of health promotion programs; volunteers recruited to participate in health promotion programs, and students in gerontology or other health disciplines. Conclusions Discussion will include ways to apply the content, tools and resources to various audiences and challenges and opportunities for cross-cultural application.

**PC8 576 SOCIAL WORK AND OLDER ADULTS: IMPACT OF THE HARTFORD PARTNERSHIP PROGRAM FOR AGING EDUCATION ON MSW STUDENTS**

R. WEILER\* (Indiana University, Indianapolis, IN, United States)  
D. PARDASANI(1) - (1) Fordham University Graduate School of Social Service (New York, NY, United States of America)

"The US is undergoing a demographic transformation - by 2030, the number of people aged 65 and older is expected to double - to 70 million. This growing older adult population will create an unprecedented demand for aging related programs, policies and services." (Retrieved from <https://www.socialworkers.org/aging.asp>, January 6, 2009) The demand for trained, credentialed social work graduates who serve older adults and their families will far exceed the availability if the supply is not increased, ie more students do not pursue careers in aging. Several surveys have found that students are reluctant to consider careers in aging due to their lack of knowledge about, and limited exposure to, the opportunities in this field. The Hartford Partnership Program for Aging Education was specifically created to promote learning opportunities for social work students in the field of gerontology. The aim of this educational initiative is to expose students to the diversity of the aging arena through enhanced field practicum experiences across multiple populations and disciplines, strategic mentoring by trained field instructors, and the development of leadership potential (Retrieved from <http://www.nyam.org/initiatives/swli.shtml>, January 6, 2009). Indiana

University School of Social Work was one of the 72 graduate schools awarded a grant sponsored by the Social Work Leadership Institute. IUSSW developed a consortium of community organizations working in the field of gerontology to provide expanded field practicum opportunities for the students selected into the program. As an incentive, students received a stipend for participating in this initiative. This presentation will provide - • A blueprint for developing and enhancing university-community collaborations in the field of aging. • Ideas for recruiting and retaining students. • Guidelines for the recruitment and training of gerontological field supervisors. • Preliminary findings of the competencies gained by students and satisfaction with their practicum experience.

**PC8 577 LONG-TERM CARE DECISIONS FOR OLDER PEOPLE: A RESEARCH-BASED THEMATIC ANALYSIS OF STAKEHOLDERS' VALUES AND PRIORITIES**

L. DENSON\* (University of Adelaide, Adelaide, Australia)  
H. WINEFIELD(1) - (1) University of Adelaide (Adelaide, Australia)

**Introduction** Discussions and decisions about long-term care (LTC) for older people are stressful and can result in conflict between older people, their families and health professionals. This combined methods (qualitative and quantitative) project investigated psychological values and priorities concerning older people's need for long-term care and the LTC decision-making process. Methods and materials Using research-based thematic analysis and chi-square, responses to a semi-structured interview and hypothetical vignette were used to compare the values and priorities of three types of stakeholder : 10 frail older people living at home, 8 younger relatives of frail older people, and 18 health professionals engaged in discharge planning for older people. Results Findings were complex: older people valued autonomy for themselves, but suggested safer and more restrictive options for the hypothetical older person in the study vignette, perhaps adopting the stance of a proxy decision-maker. Younger stakeholders (relatives and health professionals) endorsed less restrictive options for the older person in the vignette, but expressed conflicted ethical views about the relative value of safety (or beneficence) and autonomy for older people needing LTC. Asked what was most important when making difficult LTC decisions, older people emphasised balance, relatives emphasised planning, and health professionals emphasised timing. Conclusion Older and younger people have different values concerning LTC needs. Thus in clinical settings, discussions of LTC would likely be effective and less conflictual if focused on priorities valued by older people, such as autonomy, balance and control. Accordingly, health professionals' training could incorporate more sophisticated models of values and ethical practice including both psychological and physical safety. Most importantly professionals, educators, policy-makers and legislators must be guided by the priorities of older people with regard to LTC decisions.

**PC8 578 IS EXERCISE EFFECTIVE IN PROMOTING MENTAL WELL-BEING IN OLDER AGE? A SYSTEMATIC REVIEW**

G. WINDLE\* (Bangor University, Bangor, Gwynedd, United Kingdom)  
D. HUGHES, P. LINCK, R. IAN, W. ROBERT T

**INTRODUCTION:** Mental health promotion for older people has been a neglected area. This paper examines the effectiveness and cost effectiveness of exercise and physical activity interventions on the mental well-being of people aged 65+. **METHODS:** a systematic review, meta-analysis and economic model were developed. Reports/papers published in English were identified by searching data bases, websites and references lists of other reviews. Eligible studies were those with a comparison or control group or offering qualitative evidence; exercise and physical activity interventions for people aged 65 and over living at home, in the community, in supported housing or in residential care homes; including outcome measures of mental well-being, not simply measures of depression or anxiety. Low quality studies were excluded from the data synthesis. Results: 13 robust papers, including one qualitative paper and one cost effectiveness paper were included. An overall effect of combined exercise on mental well-being was found (effect size =0.28; CI=0.15-0.40). The interventions were designed for older people, targeted those who are sedentary and delivered in a community setting primarily through a group based approach led by trained leaders. Firm conclusions about the number of sessions, their length and intensity are difficult to ascertain. As a minimum, the evidence indicates two sessions per week, each of 45 minutes duration. There is some indication that exercise can also improve the mental well-being of frail elders. Economic evidence indicated incremental cost-effectiveness ratios (compared with minimal intervention) in the range of £7,300 to £12,100 per QALY gained. **Conclusions:** Mental well-being in later life is modifiable through exercise and physical activity. The wider social benefits of group exercise activities in later life are an important factor in a population where social isolation and loneliness is commonly found.

**PC8 579 A THEORETICAL FRAMEWORK FOR MOBILITY IN OLDER ADULTS**

S. WEBBER\* (University of Manitoba, Winnipeg, Canada)  
V. MENEC(1), M. PORTER(1) - (1) University of Manitoba (Winnipeg, Canada)

**Introduction.** Mobility is fundamental to active aging and is intimately linked to health status and quality of life. Although there is widespread acceptance regarding the importance of mobility, none of the existing conceptual frameworks for mobility adequately addresses the multitude of factors relevant to older adults. The purpose of this

paper was to develop a comprehensive model of mobility in older adults. Methods. Literature relevant to measuring and describing mobility in older adults was reviewed. A new, broader framework was then developed. Results. Gait speed, stair-climbing and other lower extremity strength and power measures have been used to describe physical aspects of mobility. Life space diaries and questionnaires, videotaping, pedometers, accelerometers and global positioning systems have been employed to measure mobility in the community. Mobility has been conceptualized in different forms; along a continuum of function, among concentric rings of life-space locations, and by mapping walking ability relative to different environmental factors. For this paper, mobility was defined as the ability to move oneself (independently, with assistive devices or by using transportation) to different areas of the home, neighborhood, service community and regions beyond. Mobility was conceptualized through five fundamental dimensions (psychosocial, environmental, physical capabilities, financial resources, cognition and knowledge), encompassed by gender and cultural influences. Each dimension was devised to include an increasing number of factors, demonstrating greater complexity associated with mobility further from the home, further from the neighborhood, etc. Conclusion. A new theoretical framework for mobility in older adults has been developed to encompass the dimensions and underlying factors relevant to those living independently in the community as well as to those requiring specialized assistance or care. The framework illustrates how mobility impairments can lead to limitations in accessing different life-spaces and the interconnectedness of factors that influence mobility.

**PC8 580 SELF-MANAGEMENT HEALTH BEHAVIORS AND RELATED FACTORS AMONG DISABLED ELDERLY**

Y. TING\* (Asia University, Taichung, Taiwan)

H. HSU(1), Y. HSIEH(1), H. TUNG(1) - (1) Asia University (Taichung, Taiwan)

Purpose: This study aimed to investigate the self-management healthy behaviors and related factors among disabled elderly. Methods: Data was collected by face-to-face survey from the day care, rehabilitation outpatient and long term care institution users who were aged 60 or over with physical disabilities. There were 563 persons interviewed, and 505 of them completed the survey, with completion rate of 89.7%. Self-management health behaviors included exercise and rehabilitation, dietary behavior, leisure activity change, and spiritual coping behavior. The predictors included demographic characteristics, health status, social support, assistive device use and home modification, and external resources. Logistic regression analysis was applied. Results: The disabled elderly who lived in the community ( $OR=10.233$ ), had more community resources ( $OR=1.087$ ) and used more assistive device ( $OR=3.890$ ), performed more exercise and rehabilitation. Those living in the community ( $OR=2.229$ ), having more community environment resources ( $OR=1.157$ ), and less applying home modification ( $OR=0.636$ ) performed diet management. Those who had more community environmental resources ( $OR=1.170$ ) and less physical disabilities ( $OR=0.863$ ) changed more leisure activities for health management. Being male ( $OR=3.299$ ), lived in the community ( $OR=2.361$ ), having more community environment resource ( $OR=1.074$ ), more media information ( $OR=1.080$ ), and less physical disabilities ( $OR=0.881$ ) were more likely to performed spirituality coping behavior. Conclusions: The disabled elderly living in the community performed more self-management of health behaviors than the institutional elderly, which indicates the passive attitude or lower autonomy of the institutionalized elderly. External resources provide supports to self-management behaviors and would be helpful to successful aging.

**PC8 581 THE SENSE TO RECREATE THRU THE AGEING PROCESS AND THRU ESTHETIC EXPERIENCE**

C. DE GRADO\* (Universidad Maimónides , Buenos Aires, Argentina)

Introduction The use of art in the intercourse with older adults is a proposal that appears often in our time. Today, more than ever, the different expressions of art are accessible to public. Our times of image value and spread acoustic, visual, tactile and kinetic expressions everywhere. A theoretical approach to this question is developed considering central contributions from Psychoanalysis, Esthetics, as part of philosophy, and Psycho gerontology. This reflection is given when the concept of "subject" is installed in society. "Subject", the idea of an autonomic fellow, of "being involved" as an individual, as center, place of decision and "creator of one's world". But at the same time, the idea of "not have been finished", of having the need to be completed by some one else, of being recreated in one's relationship with other. Methods To build conceptually three figural circles that represent different areas of knowledge: Psychoanalysis, Esthetics, and Psycho gerontology to explain the meaning of recreation in the constitution of the "subject", in the approach of a piece of art and in the processing of ageing. Conclusion The elderly, conscious of the fact that time goes by, of his own future death may active transmission and achieve intergenerational intercourse favoring his possibility of future. Considering the esthetic experience in relation with the capacity to recreate one self and create world explains why changes in behavior are observe thru educational and therapeutical proposals.

**PC8 582 ARE EPISODIC INTERVIEWS ADEQUATE FOR INTERVIEWING NURSING HOME RESIDENTS?**

W. HERRMANN\* (Charite Universitätsmedizin Berlin, Berlin, Germany)

U. FLICK(1) - (1) Alice Salomon Hochschule (Berlin, Germany)

It is important to research subjective perceptions of the aged to meet the old peoples' needs in daily practice of geriatrics. Understanding and emphasizing those subjective perceptions

may lead to a person-centered gerontology. This seems to be especially important for institutionalized old people as their personal perspective is easily forgotten. Due to frailty, cognitive impairment and hearing loss it seems difficult to interview nursing home residents. Although older people like to narrate especially, the classic narrative interview does not seem to be convenient for nursing home residents, regarding its length. In order to survey nursing home residents' subjective concepts we therefore consider the episodic interview to be adequate. In our study we research nursing home residents' subjective concepts about sleep and sleep disorders. Thus it is important to ask whether episodic interviews are adequate for interviewing nursing home residents. We conduct episodic interviews with 30 nursing home residents about their subjective conceptions of sleep and sleep disorders. We include nursing home residents older than 65, who have been living for at least six months in a nursing home and are oriented to place, person and situation. The interviews are recorded and transcribed. We especially focused on how the interviewees manage the interview situation. For this purpose we also ask the interviewees to evaluate the interview. In this talk we will be able to present first results, whether the episodic interview is adequate for interviewing nursing home residents. We expect the episodic interview to work quite well with nursing home residents. It is important that the interviews are short and the interviewer speaks clearly and loudly. We expect nursing home residents to appreciate especially the possibilities to narrate during the episodic interview. To conclude, the episodic interview is appropriate for interviewing nursing home residents about their personal and subjective perspectives.

**PC8 583 THE HEALTH PROFESSIONALS POINT OF VIEW ABOUT HUMAN AGING AND THE INTERFERENCES IN COMMUNICATING WITH THE ELDERLY**

T. PROCHET\* (Universidade De São Paulo, Assis - São Paulo, Brazil)

M. SILVA(1) - (1) Universidade De São Paulo - Escola De Enfermagem (São Paulo, Brazil)

Introduction: The lack of disseminating geriatric communication knowledge among health professionals has contributed to difficulties in the therapeutic approach for the elderly. This situation led to developing a non-verbal communication-training course about gerontology for professionals. One course objective was to identify comprehension about human aging and factors that interfere in elderly communication. Methods and materials: Quantitative, exploratory, field study developed in two hospital centers in São Paulo State after Ethical Committee approval. The twelve-hour course was offered to forty health professionals. A questionnaire was used to verify previous perceptions about aging and elderly communication interference factors. Results: Human aging was understood as: a) an evolution process with shared experiences; b) a phase where progressive transformations lead to fragilities, limitations, and incapacities requiring more health care attention; c) an unavoidable stage that brings unacceptable exhaustion and prejudice; d) valorization of care and respect. Difficulties in elderly communication were: 70% exclusively on their response, due to sensory problems, slow thinking, and pathologies; 10% on professional attitudes, with limited time and insufficient for to necessity recognition; 7.5% said both are responsible for the difficulties (elderly + professionals); 2.5% cited physical environment and 10% didn't respond. Facilities recognized for elderly communicating were: 47.5% associated it with the fact that they are affectionate and needy, therefore needing the professionals; 25% stated interpretation of elderly desires is not restricted to words, or to the use of simple vocabulary, interaction time and charismatic attitudes and attention shown, bring confidence and connection, thus aiding communication; 15% concluded that both are responsible for interacting, and 12.5% didn't respond. Conclusion: The professionals presented a pessimistic attitude about human aging before the course. There is a misunderstanding of papers and of recognition of communication functions, professionals leave interaction responsibility to the elderly.

**PC8 584 AUTONOMY AND INDEPENDENCE OF THE ELDERLY IN HOSPITALS: STRATEGIES IDENTIFIED BY THE HEALTH PROFESSIONALS.**

T. PROCHET\* (Universidade De São Paulo, Assis-São Paulo, Brazil)

M. SILVA(1) - (1) Universidade De São Paulo - Escola De Enfermagem (São Paulo, Brazil)

Introduction: Gerontological care encompasses several participants: the elderly, their families, the caretakers, the community, and the health care team. Everyone must act interrelated and focused on integrated care; those that respect individuality, autonomy and that maintain or maximize elderly independence. Moved by this statement, a training course was developed to discuss non-verbal communication for health professionals in gerontology, where one objective was to identify strategies that could contribute to autonomy and independence of the elderly in the hospital. Methods and materials: Quantitative, exploratory, and field study developed in two hospital centers in the interior of the São Paulo State, after receiving Ethical Committee approval. The twelve-hour course was offered to forty healthy professionals, where they were questioned about their contribution to provide autonomy and independence to the elderly. Results: Each participant was able, during the required response on the first day of the course, to cite at least one strategy that could favor the independence and autonomy of the elderly. The answers were organized in three groups: a) ethical values (exerting principles such as patience, care, dignity, and respect; explaining their rights as citizens); b) technical knowledge (encompassing the aging process; updating geriatric information; planning facilities and home furnishing installations; evaluating the functionality and dependency

levels); c) communication (paying attention to details that were not said; not interrupting when someone is talking; knowing how to listen; encouraging to decide by their own accord; “wasting time” with communication and making it a validation process). Conclusion: The aspects connected to verbal and non-verbal communication were the most cited as strategies for contributing to maintain or maximize autonomy and independence of the elderly in hospitals. The ethical dimension with little elaboration indicated that it was necessary to be worked on throughout the course.

**PC8 585 AUTONOMY AND RISK IN OLDER PEOPLE**  
S. MCDERMOTT\* (University of New South Wales, Sydney, Australia)

The principle of autonomy, which emphasises self-determination and individual control over decision-making, is a central concept in professional ethics. Although professionals have a duty to uphold the principle of autonomy, this principle is limited by the capacity of clients to make decisions and the extent to which the decision places the individual and others at risk of harm. While much has been written about the conflict between these principles in theory, their interpretation in practice is less often addressed. This study explored the ethical decision-making processes of 24 professionals working in the community with older people who were labelled as self neglecting or living in squalor. Semi-structured, qualitative interviews were conducted with participants and results were analysed using NVivo. The research found that participants adopted two different interpretations of autonomy. The six health professionals who were interviewed espoused a strict view of autonomy based on a medical test of capacity. If a client who was self neglecting or living in squalor was found to be capable of making decisions, these participants respected the service refusal and did not advocate for further intervention. For these participants, decision-making capacity overrode concerns about risk, particularly in situations that involved squalor. The other 18 professionals in this research believed that a high amount of risk exists in situations of self neglect, hoarding and squalor. Because of this, they considered it to be important to intervene to minimise this risk even in situations where an individual was capable of making decisions. These two interpretations of risk led to different resolutions of ethical dilemmas in situations of self neglect and squalor, indicating that it is necessary to further explore the ways in which risk is understood by professionals who work with older people.

**PC8 586 THE PATIENT'S PRIVACY IN THE CARE OF ELDERLY PEOPLE AND ITS CORRELATION WITH SATISFACTION IN EMERGENCY DEPARTMENT**  
N. DEHGHAN NAIERI\* (Tehran University of Medical Science, Tehran, Islamic Republic of Iran)  
M. AGHAJANI(1) - (1) Tehran University of Medical Science (Islamic Republic of Iran)

Background: Privacy is as basic human principle and one of basic right of each person. Patient's privacy and satisfaction are seen as quality of care indexes and one of the basic goals of health services system. Patient's privacy is a cultural concept and only few studies have been done in this issue in developing countries. Aim: The objective of this study was to determine the rate of observe patients Privacy by treatment team and its correlation with patient's satisfaction in an Emergency Department. Methods & Material: This was a cross-sectional correlation study that 260 hospitalized elderly patients in census method were recruited in Emergency Department of selected hospital of Tehran, Iran. Data were collected using a questionnaire included various dimensions in patients privacy and satisfaction. Data were analyzed using descriptive and analytic statistical methods by SPSS software. Results: Half of patients perceived that their privacy observed at poor to medium level. About 49.4% of patients reported that their privacy was observed at near to excellent level. Also about 1/3 of patients perceived that physical privacy and psychosocial privacy observed in medium level and their good information privacy. Satisfaction of 76.4% patients was low and medium. However satisfaction 50% of patients in physical privacy and 58.6% in information privacy was low. There is a strong correlation between level of privacy observed and satisfaction in various dimensions. There was significant correlation between some of the demographic variable and observes of privacy and satisfaction. Conclusion: In regard to observe of privacy and satisfaction of the most of patients is not in good level thus it is need to specific attention of clinicians and educators to this point. Also interventions is need for better observe of privacy and patients satisfaction.

**PC8 587 A FIVE YEARS' EXPERIENCE OF A FRENCH ALZHEIMER'S ETHICO-CLINIC WORKSHOP**  
C. MONTANI\* (Chu de Grenoble , Grenoble, France)  
M. MOLINES(1), O. MOREAUD(1), A. MEMIN(1), A. FRANCO (1) - (1) CMRR (Grenoble, France)

Introduction: Encouraged by the national Alzheimer's disease plan, several "ethico-clinic workshops" are created in Memory Centers. After five years of experience, it is a good time to assess this workshop. Methods and materials: We have recorded 60 monthly coordination meetings, 10 have been held through videoconferences with various participants. Most of the time, clinical situations that are experienced in our daily activities are brought up and exposed for a collective discussion. Also, we organize the meetings through critical readings of the legislation texts or through comments about articles dealing

with Ethics. Results: We retain four main ethical topics: the acceptance of the person, the balance of benefit / risk, the information given to the patient and his family, and one's individual ethics as opposed to the ethics of a group. Thanks to the diverse experiences and activities of each participant (doctors, psychologists, social workers, nurses, family's members association, jurist, theologian, students...), discussions about Ethics reach a high quality. Conclusion: Although this ethical center is not a source of deontologies, as a place of shared arguments/thoughts, it could constitute a reference to be used to come to decisions with complex situations. Besides the importance of ethical questions that are raised, it should encourage open-minded attitudes and enrich the professional involvement in daily situations. Finally these workshops could be a field of research for theses, dissertations and could answer to the training and research needs in a Memory Center.

**PC8 588 LISTENING TO MUSIC AS A COPING RESOURCE IN MIDDLE AND OLDER AGE**  
B. LEIPOLD\* (Universität Hildesheim, Hildesheim, Germany)  
T. LOEPTHIEN(1) - (1) Universität Hildesheim (Germany)

Introduction Most adults are involved with music in some way in their leisure time. Some findings show that in early adulthood (about 25 years onward) people have less time to listen to music; however, it remains unclear whether this negative age trend also applies to how people listen to music. In addition, there is scarce evidence on its relevance to coping processes over the life course. The present study investigated two questions related to four different types of listening functions (emotional listening; structural-listening; everyday coping; social function). First, age-related differences in listening functions were investigated. Second, we investigated whether coping resources (rumination, tenacious goal pursuit, flexible goal adjustment) were related to the various functions listening to music has. Methods and Materials Over 370 participants took part in this cross-sectional questionnaire study (age range 19-96 years). Structural equation models were used to examine the proposed questions. Results At first glance, older adults showed lower mean levels in most listening functions. However, our findings do not suggest an inevitable decrease in listening functions over the life-span. The effects were small and can be explained by the fact that the amount of people who have learned to play a musical instrument is much higher among the younger adults. Higher structural-listening was associated with higher tenacious goal pursuit as well as flexible goal adjustment. Emotional listening was correlated with rumination. Furthermore, listening to classical music (which is more pronounced in middle and old age) was also related to flexible goal adjustment. Conclusion Music is important to people at older ages, however, our results underscore the role of societal influence. We interpret our results in the context of life-span theories and in view of their relevance for advanced age.

**PC8 589 LONELINESS AND LIVED EXPERIENCES OF ELDERLY INDIVIDUALS LIVING INDEPENDENTLY: HERMENEUTIC PHENOMENOLOGICAL APPROACH.**  
P. ABAS\* (Sisters of Mercy of the Americas, Rochester, NY, United States)

Abstract Loneliness is a pervasive human experience. It is a subjective experience that is influenced by one's personality and situational variables. Loneliness has been recognized as a public health problem that requires the attention of clinicians and researchers both as a condition in itself and its relationship to other conditions. The study examined and generated an in-depth understanding of loneliness as experienced by eight individuals (65 years and above) living independently. A hermeneutic-phenomenological approach was used to describe and interpret the meaning of loneliness in the lived experience of elderly individuals. These interpretations were made possible through the support of the incidental themes, which were formulated by the participants' descriptions of their experiences of loneliness. Through interpretation, four themes emerged from explanations of how the elderly individuals interpreted loneliness. First, the participants experienced the existence of a painful void. Second, the participants experienced a state of being overwhelmed with work and emotion. Third, participants experienced a state of emotional pain. Fourth, the participants experienced a state of no direction. These findings affirmed that negative feelings were associated with loneliness according to the participants' descriptions. Understanding the common themes and meanings of the lived experience of these elderly individuals provides an effective base for the therapeutic relationship between counselor and the elder. The strengths and limitations of the study, and significant implications of the findings and future research, practice and education in counseling, were identified.

**PC8 590 HOW LIFE REGRETS CAN INFLUENCE ADAPTIVE OUTCOMES IN RETIREMENT: A LONGITUDINAL STUDY OF ACTIVITY ENGAGEMENT**  
J. FARQUHAR\* (Concordia University, Montreal, Canada)  
C. WROSCH(1), D. PUSHKAR(1), K. LI(1) - (1) Concordia University (Montreal, Canada)

Introduction: This study examined trajectories of retirement outcomes and attempts to determine the role played by psychological factors. Specifically, we examined whether the experience of life regrets can motivate activity engagement among recent retirees. While research has shown that the experience of regret can be associated with a variety of psychological and physical complications in old age (e.g., depression, physical health problems; Wrosch et al., 2005, 2007), we reasoned that regrets may also, at times, provide

the basis for new goals and thus may predict adaptive outcomes (Epstude & Roes, 2008). Such an association should occur in particular when retirees are both capable and motivated to actively address their life regrets. Method: To test this hypothesis, we asked 317 recent retirees to record their most severe life regret, as well as their perceived opportunity and motivation to undo the regret. We also asked retirees to report their current level of activity engagement across three years (Years 1 – 3). In addition, we asked retirees to retrospectively report their pre-retirement level of activity engagement. Results: Trajectories of activity showed engagement in optional activities (i.e., activities of personal interest and investment; e.g., volunteering, traveling) increased significantly from pre-retirement to the post-retirement measurements, whereas maintenance activities (i.e., obligatory activities; e.g., chores, finances) remained stable. As hypothesized, regret predicted adaptive outcomes in retirement. Specifically, having both favorable opportunities and being motivated to undo the regret predicted high levels of optional activities at Year 1 (when controlling for pre-retirement levels) and high levels of optional activities at Year 3 (when controlling for Year 2 levels). Conclusion: These findings imply that regret can play an adaptive role in later life such as influencing engagement in activities of personal interest and investment.

**PC8 591 CLINICAL, SOCIAL AND DEMOGRAPHIC FACTORS ASSOCIATED TO THE PAIN LOCUS OF CONTROL OF COMMUNITY-DWELLING ELDERLY**  
**L. PEREIRA, SM\*** (Universidade Federal de Minas Gerais, Belo Horizonte, Brazil)  
**R. FERREIRA SAMPAIO(1), R. CORREA DIAS(1) - (1)** Universidade Federal de Minas Gerais (Belo Horizonte, Brazil)

The problems associated to disability, among which stand out the algic symptoms, common in the elderly people with chronic dysfunctions, are an important worldwide concern regarding the population aging phenomena. Pain is considered a multidimensional experience, involving various aspects. The objective was analyse the perception of pain locus of control (LC) in elderly individuals along with its association to clinical, demographic and social variables. Design: A cross-sectional observation study. Participated in the study 162 elderly Brazilians (71.8;6.6 years) with chronic musculoskeletal pain living in the community, selected by convenience and with no cognitive difficulties. A structured clinical-socio-demographic questionnaire, assessment of self-perception of health, Form C of the Multidimensional Health Locus of Control Scale (Pain Locus Control - PLOC-C), visual analogue scale (VAS) for pain, geriatric depression scale (GDS) and the Timed Up and Go test (TUG) were administrated. The Kruskal-Wallis test, Mann-Whitney test and multivariate linear regression were employed to analyze pain LC and associated clinical-socio-demographic variables. The elderly preferentially perceived pain LC in healthcare professionals and internal. Low schooling and a higher GDS score were associated with a greater perception of chance pain LC (adjusted R<sup>2</sup>= 0.13). Being separated, using only medication to control pain and a worse TUG performance were associated to a lower perception of internal pain LC (adjusted R<sup>2</sup>= 0.10). Being evaluated at healthcare services was associated to a greater perception of pain LC in healthcare professionals when adjusted for the VAS score (adjusted R<sup>2</sup>= 0.04). Not living alone and a worse GDS score were associated to a greater perception of pain LC in others (adjusted R<sup>2</sup>= 0.10). These findings strengthen evidence of the influence of clinical-socio-demographic factors in the perception of chronic among elderly community individuals.

**PC8 592 THE CONCEPT OF MOBILITY REVISITED**  
**R. BRUNNETT\*** (University of Ballarat, Ballarat, Australia)  
**M. HASSELER(1), S. STRUPEIT(2), C. DENEKE(2) - (1)** University of Ballarat (Ballarat, Australia); (2) University of Applied Sciences Hamburg (Hamburg, Germany)

1 Introduction Mobility is a precondition of autonomy, independence and quality of life for elderly. A loss of mobility in age is a potential risk for care need. Despite the risks and threats of frailty the elderly value their independence, sense of individuality, self-worth and their freedom to decide what activities to undertake. Current research indicates that findings on falls prevention are inconclusive. Traditional falls prevention programs have focused primarily on the physical aspect of mobility and not taken into account the subjective perspective and individual needs of the elderly. This lack of understanding is of particular concern given that falls are very common and often result in serious complications such as fractures or even death. Therefore, efforts to maintain and support independence and prevention of care need are paramount. This project is funded by the German Ministry of Research and Education within the program "Healthy Ageing" (chair of consortium Prof. von Renteln-Kruse). 2 Methods Episodic-narrative interviews were conducted with elderly in a geriatric unit in Germany. The sample was recruited on the basis of the theoretical sampling (Glaser/Strauss 1967). The data analysis was carried out on a procedure of content analysis (Mayring 2008) and – in case of the existence of narrative structures – on a modified procedure of the narrative analysis according to Schuetze (1983). 3 Results The results indicate that strategies and experiences of mobility of the current elder generation in Germany are to a high degree influenced by gender-specific experiences of the second world war and of its aftermaths for family relations. 4 Conclusion Mobility is to a high degree influenced by subjective, biographic experiences and their social context. New programs are needed which integrate the empirical evidence

of research findings with the subjective perspective of the elderly creating an individual-centred approach.

**PC8 593 ELDER'S PERCEPTION OF CRISIS AND DIFFICULT TIMES AND THEIR RESPONSE TO THESE.**

**A. ALMENAS\*** (Sociedad de Gerontologia de Puerto Rico, San Juan, Puerto Rico)  
**J. ORTIZ(1), J. NIEVES(1) - (1)** Sociedad Gerontologia de Puerto Rico (Bayamon, Puerto Rico)

A survey of persons 65 yrs or older attending day activities centers in four geographical areas was tested with the Mini-Mental of Folstain. Those having a result of 21 pts or more were surveyed orally. The survey was administered by the researchers and included close and open questions. Those elders living in metropolitan areas were more educated, informed and alert than those who lived in rural and small towns. Hardly any one had taken care of children other than their own and mostly all lived from the Social Security income. Their idea and examples of what a crisis is was influenced by the local discussion of the economy in the news and hardly any one saw in personal terms. The answer to their difficult times and what effect it had on their personality was varied but most said they had changed little and were now satisfied with their life as a whole. It was noted that difficult times was answered sometimes from childhood experiences and it was not related to historical or social events in the country.

**PC8 594 THE PERSONALITY DOMAINS AND STYLES OF THE FIVE-FACTOR MODEL PREDICT INCIDENT DEPRESSION IN MEDICARE RECIPIENTS AGED 65 TO 100**

**A. WEISS\*** (The University of Edinburgh, Edinburgh, United Kingdom)  
**A. SUTIN(1), P. DUBERSTEIN(2), B. FRIEDMAN(2), M. BAGBY(3), P. COSTA(1) - (1)** National Institute on Aging (Baltimore, MD, United States of America); (2) University of Rochester Medical Center (Rochester, NY, United States of America); (3) Centre for Addiction and Mental Health (Toronto, ON, Canada)

Introduction: Few prospective studies have examined personality and depression in older adults. We investigated whether the Five Factor Model (FFM) of personality traits — Neuroticism, Extraversion, Openness to Experience, Agreeableness, and Conscientiousness — and trait combinations (styles) predict incident major or minor depression. Methods and materials: Prospective data were gathered on a community sample of 512 older adults with disability and a history of significant health care utilization who were enrolled in a Medicare Demonstration Project. Personality and depression were assessed at baseline; depression was assessed again at approximately 12 and 22 months. Participants free of depression at all three assessments were compared to participants who developed major or minor depression at either follow-up. Results: High Neuroticism and low Conscientiousness were risk factors for major and minor depression. Combinations of high Neuroticism with low or high Extraversion or high Openness conferred risk for major depression as did combinations of low Conscientiousness with low or high Extraversion, high Openness, or low Agreeableness. Three trait combinations, all involving low Conscientiousness, predicted risk for minor depression: high Neuroticism, high Agreeableness, and low Openness. Conclusion: The present findings highlight the importance of examining combinations of personality traits or personality styles when identifying those who are most at-risk for geriatric depression. Since other personality domains may modify the risk related to high Neuroticism and low Conscientiousness, the prevention, diagnosis, and treatment of depression could be greatly improved by assessing older patients not only on all five domains of personality but in terms of their combinations.

**PC8 595 CLINICAL AND PSYCHO-SOCIAL OUTCOMES FOR A LARGE POPULATION OF ELDERLY COCHLEAR IMPLANT RECIPIENTS.**

**M. BRAY\*** (Sydney Cochlear Implant Centre, Sydney, Australia)  
**H. SANLI(1), R. STAWSKI(1), C. AMOS(1), C. RAMSAY(1), J. KENYON(1) - (1)** Sydney Cochlear Implant Centre (Sydney, Australia)

Introduction Considering the increased longevity, health and expectation of quality of life of the elderly in our industrialised societies, deafness need not hinder access to communication through cochlear implantation, which also serves to mitigate the effects of ageing and concurrent disabilities. Our clinic has well over 200 recipients above age 70 and the number of candidates seeking the procedure is increasing every year. Methods and materials A retrospective study of pre and post-implant speech perception data of elderly recipients was compared to a sample of younger adults aged 50 to 69. Data regarding surgical complications and co-morbidities were also examined. In addition, an expanded version of the International Outcomes Inventory for Hearing Aids (IOI-HA) was used to survey psycho-social and otological outcomes specific to the procedure. Clinical contraindications were considered. Results The post-operative speech perception outcomes of the elderly confirm significantly improved ability to comprehend speech, comparable to the younger adult group. Surgical complications of both groups were minimal, making it a safe option for the elderly. The survey on quality of life and perceived benefits indicate that the vast majority have realised their expectations, while otological side-effects such as vestibular function and tinnitus were not significantly affected. Conclusions The elderly

population should be as eligible to the cochlear implant procedure as younger adults. The survey results provide first-hand accounts of the range of experiences, benefits and limitations, as well as answers to frequently asked questions to assist clinicians to counsel prospective candidates. Age alone is not a contraindication, as it provides clear benefits not only to the recipient but to their family, social circle and professionals who deal with them, provided there is thorough candidacy evaluation and strong emphasis on pre-operative counselling to optimise potential functional outcome and satisfaction.

**PC8 596 EFFICACY OF A NEED-ORIENTED INTERVENTION TO REDUCE VERBAL AGITATION IN PATIENTS WITH DEMENTIA**

P. LANDREVILLE\* (Université Laval, Québec, Canada)

A. BÉDARD(1), P. VOYER(2), R. VERREAULT(3), J. VÉZINA(4) - (1) École de psychologie, Université Laval (Québec, Canada); (2) Faculté des sciences infirmières, Université Laval (Québec, Canada); (3) Département de médecine sociale et préventive, Université Laval (Québec, Canada); (4) École de psychologie, Université Laval (Québec, Canada)

**INTRODUCTION** Verbal agitation (VA), which includes behaviours such as screaming and repetitive questioning, is amongst the most prevalent behavioural symptoms associated with dementia. The need-driven dementia-compromised behaviour model suggests that disruptive behaviours are expressions of unmet needs or goals. VA may serve to express internal needs, especially for social interaction, sensory stimulation and comfort, which the patient cannot express otherwise. We have developed a need-oriented intervention aimed at reducing VA in patients with dementia. The main objective of this study was to test the efficacy of this intervention. **METHODS AND MATERIALS** The sample (N=26) was composed of residents of long-term care facilities with a diagnosis of dementia and presenting VA several times a day. A single-group repeated measures design using four six-day phases (P1: pre-intervention, P2: intervention; P3: post-intervention, and P4: follow-up) was used. Participants continued to receive their usual treatments throughout the study. The intervention, which combined different techniques to provide social interaction and sensory stimulation activities and to reduce discomfort, was individualized and applied during 30 minutes sessions conducted by a trained therapist. The comfort component was applied first as long as necessary. The remaining time was split evenly between the social interaction and stimulation components. Duration and frequency of VA were recorded by trained observers. **RESULTS** Duration of VA was significantly lower ( $M=40\%$ ) during P2 than during P1 ( $p<.01$ ) whereas frequency was significantly lower during P4 than during P1 ( $p<.05$ ). Duration of VA reverted near P1 level during the 30 minutes after the intervention was terminated. Fifty-four percent of participants showed a reduction of at least 50% of VA duration during P2 compared to 23% and 34% at P3 and P4, respectively. **CONCLUSION** The intervention is effective in reducing the duration of VA.

**PC8 597 THE IMPACT OF A SEMI-STRUCTURED REMINISCENCE PROGRAMME ON EGO INTEGRITY AND ON DEPRESSIVE DISORDER IN ELDERLY PORTUGUESE**

B. BUENO\* (Universidade da Beira Interior, Covilhã, Portugal)

R. AFONSO(2) - (2) Universidade da Beira Interior (Covilhã, Portugal)

This study analysed the impact of a circumscribed, semi-structured individual programme of reminiscence on ego integrity and depressive disorder in older Portuguese adults. A quasi-experimental design was produced for this study, in which 90 individuals over 65 years old participated, diagnosed with depression disorder, deprived of anti-depressive medical treatment and showing no signs of dementia. Each individual was assigned to one of the following three groups: (1) experimental group (reminiscence therapy sessions); (2) control group or (3) control-placebo group (weekly sessions of relaxation). Pretest and posttest evaluations of depression disorder were conducted according to the CES-D Scale (adapted by Gonçalves and Fagulha, 2000-2001, from the original by Radloff, 1977) and the ego integrity (adapted by Silva, Novo y Peralta, 1997, from the original by Ryff e Heincke, 1983) of all individuals with the same time gap. The results indicated significant improvements on depressive symptoms of the experimental group ( $t(29)=19,70$ ;  $p<0,01$ ); the average value dropped from 39,87 ( $DT=7,90$ ) to 13,60 ( $DT=5,14$ ), and significant improvements on the ego integrity ( $t(29)=-12,62$ ;  $p<0,001$ ); the average value increased from 28,60 ( $SD=9,01$ ) to 42,80 ( $SD=7,22$ ). In the control group depression symptoms tend to worsen and there are no significant differences regarding ego integrity. In the control-placebo group the depressive symptoms decreased, although they were less significant than in the experimental group, and ego integrity tends to diminish. The study also highlights the negative associations between the depression disorder with ego integrity in the pretest ( $\rho=-0,36$ ;  $p<0,01$ ), which are enhanced in the posttest moment ( $\rho=-0,63$ ;  $p<0,001$ ). The results support the use of the reminiscence programme as a therapeutic tool.

**PC8 598 EFFECTS OF GROUP LOGOTHERAPY PROCEDURE ON DECREASING OF DEPRESSION AND INCREASING OF MEANING IN LIFE ON FEMALE OLDER ADULTS.**

T. POUREBRAHIM\* (Shahid beheshti university , Tehran, Islamic Republic of Iran)  
R. RASOULI(1) - (1) I Yazd, Islamic Republic of Iran

**Abstract** Introduction:Over the last couple of decades , controlled research studies have been completed that confirm the effectiveness of psychotherapy for depression of older

adults.The purpose of this study was to effects group Logotherapy procedure on decreasing of depression and increasing of meaning in life on Older adults. Method and materials: research sample were 30 women Older adults that resident in a sanatorium. Research instruments was GDS (Geriatric Depression Scale) and MLQ (Meaning in Life Questionnaire). GDS and MLQ were administrated as the pre-test and post- test. Older adults that took 15 score or more in GDS, selected randomly as 1 group experimental and 2 groups control. Hypotheses indicated that groupe logotherapy has efficiency on decreasing of depression and increasing of meaning in life. Results: The results of post-test covariance analysis showed that there was no significant differences between experimental group and control groups GDS post-test scores but there was significant differences between effects of groupe logotherapy on increasing meaning in life. Conclusion: The psychotherapy of the the adult olders gets increasingly widespread and important. finds, in this research,confirmed Sheikh(1996).Sheikh didn,t find significant differences in depression scores of controlled and randomly researches in sanatoriums. Since groupe logotherapy could increase meaning in life but couldn,t decrease depression,so meaning in life could not decrease depression in older adults that resident in senatrum merely, because there are another factors that impression on depression such as withdrawal from their family and somatic or biologic diseases. Key words:Groupe logotherapy,Depression,Meaning in life,Older adults.

**PC8 599 DETECTION OF EARLY COGNITIVE DISORDERS IN OLD PEOPLE WITH PARKINSON'S DISEASE WITH THE FAB SCALE**

P. KOSKAS\* (Hôpital Bretonneau, Paris, France)

O. DRUNAT(1), Y. WOLMARK(1) - (1) hôpital Bretonneau (Paris, France)

Early cognitive changes in patients with Parkinson's disease are often subtle and influenced by factors that interact with the disease process, including age of disease onset. Executive function deficits are the most frequently reported cognitive problems. The aims of this study was to confirm the frequency and pattern of cognitive dysfunction in old patients with newly diagnosed Parkinson's disease with the use of the FAB scale. A cohort of 56 consecutive patients with newly diagnosed PD underwent a detailed clinical evaluation with included assessments of Parkinsonians signs and cognitive status. 3 groups were compared : < 75 years old ( group 1,23 patients),  $\geq 75$  years (group 2, 33 patients) and witness  $\geq 75$  (group3, 30 patients). The patients of the group 2 have more frequently non amnestic mild cognitive impairment than group 1 and 3 and the FAB scale was performant to detect it. This finding may have important clinical implications for the patients and their caregivers.

**PC8 600 A 'CBT' GROUP FOR FRAIL VERY OLD RESIDENTIAL CARE RESIDENTS**

K. ANDERSON\* (Greater Southern Area Health Service, Queanbeyan, Australia)

M. BIRD(1), A. BLAIR(1) - (1) Greater Southern Area Health Service (Queanbeyan, Australia)

**Introduction:** There is a high prevalence of depressive and anxiety disorders in residential aged care and a body of evidence suggesting older people can benefit from psychological therapy. However, few studies have explored group psychological therapy in an old, old sample in residential care. The current study was pilot, aimed at exploring the logistical and therapy issues involved in providing a group CBT program for older (>80 years) people experiencing mild to moderate depression and/or anxiety. **Method:** Six residents participated in 8 weekly group sessions based broadly on CBT principles. **Results:** Two participants demonstrated a reduction in depressive symptoms. All reported that the group addressed the general lack of validation they experienced in their daily lives, by providing a safe forum to discuss their feelings. Logistical issues included difficulty recruiting residents and defining a target group, privacy and confidentiality within residential care, size and location of venue, reminding and assisting physically frail residents to attend, working around other facility priorities, and appropriateness of standard measures for old, old people. All participants engaged comfortably with the group rules and processes, though the process was adjusted to accommodate the need for some participants to talk a lot and focus primarily on the past. Additionally, participants' preoccupations differed from our *a priori* assumptions based on standard diagnoses. Sleep, pain, worry about children, boredom and loss of independence were the most pertinent issues for them. **Conclusion:** Once the logistical issues of conducting therapy in residential care were resolved, these very elderly, frail residents responded extremely well to the group process, and appreciated the chance to openly discuss their concerns in a confidential and validating environment without having to endure the reassuring platitudes they normally received. Some showed improvement on depressive symptoms, indicating that this real world sample can benefit from group therapy.

**PC8 601 WHO KNEW GRANDPA SNORTED COKE?**

P. ABADIR\* (Johns Hopkins University, Baltimore, United States)

M. GRANT(1), T. FINUCANE(1) - (1) Johns Hopkins University (Baltimore, United States of America)

**Substance use, abuse, and dependence are elusive constructs when it comes to assessing problem behavior among Geriatrics patients. Gerontology literature pays slight attention to**

alcohol problems and none to drug problems of the elderly. Mr. HR is a 68y male with complicated medical history. He was admitted to the hospital for abdominal pain and had duodenal ulcer repair. After surgery he became hypotensive and tachypneic, was intubated and started on pressors. Subsequently, despite being off sedation, he remained unresponsive for three days. He eventually regained consciousness and complained of severe pain and discomfort all over his body, a pain consult was requested. For the next few days patient continued to complain of severe pain 10/10 on pain scale despite being on Oxycodone, a Fentanyl patch and Ativan. However it was noted by the nurse that he was sleeping in between pain medicine doses and was missing his physical therapy sessions. Accidentally, while cleaning his room, a bag of cocaine was found in his belongings. While in the hospital his granddaughter also found drug paraphernalia in his house. Confronted with evidence, patient admitted to the use of cocaine and several other substances. This case underscores the problem of drug and substance abuse in the elderly. The substance abusing elderly individual may be seen as a nice little old man/lady who could not possibly have a drug or alcohol problem. No data exist to quantify drug use, abuse, and dependence patterns in the geriatric population. Lack of awareness of substance abuse as a potentially important problem for older adults, failure to obtain and/or record accurate drug histories, reluctance to ask potentially embarrassing questions and lack of initiation of any action regarding an older adults substance use may result in suboptimum medical treatment and potential complications.

#### **PC8 602 INTERDISCIPLINARY RESEARCH AND EDUCATION FOR HEALTHCARE STUDENTS ABOUT PERSON-CENTRED DEMENTIA CARE**

J. PATERSON\* (Flinders University of South Australia, Adelaide, Australia)  
A. DE BELLIS(1), P. GUERIN(1), S. BRADLEY(1), A. WOTHERSPOON(1), B. WALTER(1), M. CECCHIN(2) - (1) Flinders University of South Australia (Adelaide, Australia); (2) South Australian & Northern Territory Dementia Training Study Centre (Adelaide, Australia)

Introduction: An educational resource for undergraduate healthcare students across disciplines was developed on how to interact with people with dementia. Person-centred care provided the theoretical underpinning of the project through a community-based, interdisciplinary approach. Participants were actively engaged in contributing to and developing filmed re-enacted case scenarios together with an accompanying workbook containing reflective exercises for students. Methods and Materials: The community-based, interdisciplinary research approach involved participation and collaboration with an advisory group of 20 healthcare professionals from 14 disciplines across 15 organisations. Following ethical approval, the advisory group considered the educational needs of undergraduate students in correlation with developing the theoretical content for the educational resource. Interdisciplinary case studies were scripted into five re-enacted scenarios that interrelated with the workbook and reflective exercise questions. Results: The collaborative interdisciplinary process produced 35 case studies that were then scripted into five docu-dramas demonstrating positive person-centred care as well as negative interactions in care. The results of the final evaluation by key academic personnel across disciplines in four universities in Australia, as well as multiple cohorts of undergraduate healthcare students, will be discussed. The value of an interdisciplinary educational resource for teaching and student learning in educational programs and the importance of a community-based methodology will be explored. Conclusion: This educational resource used an innovative approach of interdisciplinary, community-based involvement to demonstrate to students how to interact with people with dementia. It was evaluated by students and educators in a wide range of disciplines for its usefulness in teaching, student learning and practice. Educational resources are more likely to be utilised across undergraduate programs when their creation involves interdisciplinary participation at all stages. The resource has been converted into an online module for access by undergraduate students across disciplines both nationally and internationally.

#### **PC8 603 DEPRESSION LITERACY AMONG MIDDLE-AGED AND ELDERLY CHINESE-CANADIANS**

Y. TIEU\* (University of Calgary, -, Canada)  
C. KONNERT(1) - (1) University of Calgary (Canada)

Introduction: Mental health literacy has been defined as "knowledge and beliefs about mental disorders which aid their recognition, management, or prevention" (Jorm et al., 1997). However, previous mental health literacy studies have failed to address age and cultural factors simultaneously. Methods: Depression literacy (correct identification of depression, perceived efficacy of treatments, perceived etiology, and prognosis), stigma, and attitudes toward seeking mental health services among middle-aged (55 to 65 years-old) and older (66 to 87 years-old) Chinese-Canadians were assessed through interviews (N = 53) conducted in Cantonese and Mandarin. To examine cross-cultural differences, responses of Chinese-Canadians were compared to a sample of same-aged residents of Alberta who had completed a depression literacy survey over the telephone (N = 869; Wang et al., 2007). Results: Of the Chinese-Canadians interviewed, 11.3% could correctly identify depression as presented in a case vignette. Day-to-day problems and being a nervous person were considered the most likely causes of the case vignette's problems. Psychiatrists and close family members were considered as being the most helpful, while becoming more physically active and psychotherapy were considered the most helpful interventions. Significant differences in depression literacy between the Chinese-Canadian

and Albertan samples were noted, especially rates of correct identification of depression and degree of stigma against depression. Conclusion: Middle-aged and elderly Chinese-Canadians were less adept at identifying depression depicted in a case vignette, than same-aged residents of Alberta. Using existing community organizations, culturally-appropriate mental health education efforts are needed for older Chinese-Canadians to improve knowledge regarding depression.

#### **PC8 604 THE RELATIONSHIP BETWEEN EDUCATION OLDER ADULTS MEMORY COMPLAINTS**

D. VIANNA-PAULO\* (Universidade de São Paulo USP, São Paulo, Brazil)  
M. YASSUDA(1) - (1) Universidade de São Paulo USP (São Paulo, Brazil)

Introduction: It is plausible that older adults with memory deficits may complain about memory more frequently. Memory complaints may be more frequent among older adults with lower education, due to greater vulnerability to cognitive decline. Objectives: To investigate if memory complaints vary as a function of education, and to evaluate if memory complaints are associated with cognitive performance, anxiety and depressive symptoms. Methods and materials: 67 older adults (between 60-75 years) were divided into 3 groups: 1 - 4 years of education (n=23), 4 - 8 years (n=20), and 9 or more (n= 24). Protocol included Brief Cognitive Battery BCB (memorization of 10 pictures, Verbal Fluency Animal Category VF, Clock Drawing Test TDR), a questionnaire about frequency of forgetting, the Memory Complaint Questionnaire MAC-Q, the Beck Anxiety Inventory BAI, the Geriatric Depression Scale GDS, and the Mini Mental State Examination MMSE. Results: Significant differences were found among the 3 groups for picture recognition, VF, CDT, and MMSE. No significant differences were found among the groups for frequency of forgetting and MAC-Q, and there was no association between complaints, cognitive performance and depressive symptoms. Complaints were associated with anxiety symptoms. Conclusions: memory complaints and frequency of forgetting were not related to education, cognitive performance, or depressive symptoms, yet they were associated with anxiety symptoms. Key-words: memory complaints, aging, education, elderly, depression, anxiety.

#### **PC8 605 PREDICTION OF SYMPTOMATIC DEPRESSION BY DISCRIMINANT ANALYSIS IN THE JAPANESE COMMUNITY-DWELLING ELDERLY.**

O. KAZUSHI\* (Aichi Prefectural College of Nursing and Health, Nagoya, Japan)  
Y. HARASAWA(1) - (1) Department of Gerontological Nursing, Nagoya City University School of Nursing (Nagoya, Japan)

Background: Although a number of studies have examined risk factors of depression for the elderly, little attention has been paid to the prediction of individuals at risk. The aim of this study is to construct a predictive model of individuals who are at a higher risk of the occurrence of depression in the Japanese community-dwelling elderly, using linear discriminant analysis Methods: Data were collected from 754 non-institutionalized elderly men and women aged 65 years and older living in community in Japan, using face-to-face interviews in 2002. Linear discrimination analysis was used to construct a predictive model to select individuals who have a higher risk of depression. Results: All of the 5 predictor variables (hearing problem, less appetite, less financial leeway, low emotional support and less subjective usefulness) selected were independently associated with the risk of depression. The discriminant analysis yielded a statistically significant function ( $\lambda=0.816$ ;  $\chi^2=113.0$ , df.5, p<0.001). This function showed that the rate of correct prediction was 78.2% for depressed. Limitation: Due to cross-sectional data, the causality could not conclude. Conclusion: The calculated discriminate function based on hearing problem, less appetite, less financial leeway, low emotional support and less subjective usefulness is useful for detecting individuals at high risk of depression and preventing the development of depression among community-dwelling elderly persons. Prospective studies are needed to confirm validity and feasibility of the model for earlier screening for the occurrence of depression in the Japanese community-dwelling elderly.

#### **PC8 606 CAREGIVERS' COMMUNICATION WITH PATIENTS ABOUT ILLNESS AND DEATH: INITIAL VALIDATION OF A SCALE**

Y. BACHNER\* (Ben-Gurion University of the Negev, Beer-Sheva, Israel)  
E. DAVIDOV(1), S. CARMEL(2) - (1) University of Cologne (Germany); (2) Ben-Gurion University of the Negev (Israel)

Caregivers of terminal cancer patients experience substantial communication difficulties with their loved ones about their illness. Existing communication scales focus on communication as perceived by the patient and do not include items that refer to his close death. The current study describes the development and initial validation of an instrument aimed at measuring caregivers' communication with patients about their illness and death. Two hundred thirty-six bereaved primary caregivers of cancer patients were recruited over a period of 18 months. The psychometric properties of the scale were explored by confirmatory factor analysis. Results provided support for a one factor solution. The discriminant and convergent validity of the responses to the scale were also supported.

Future studies should further establish the validity of the scale with larger sample sizes and different populations of caregivers of patients with other terminal diseases.

**PC8 607 PATTERNS OF COGNITIVE CHANGES IN HOSPITALIZED ELDERLY PATIENTS DURING AND SIX MONTHS POST HOSPITALIZATION**

C. CHEN\* (National Taiwan University, Taipei, Taiwan)

G. HUANG(2) - (2) Institute of Statistics, National Chiao Tung University (Taiwan)

**Introduction:** The objective of this study was to describe patterns of cognitive changes during and 6 months post hospitalization and to identify predictors for different patterns of changes, using cluster and multinomial logistic regression analyses. **Methods and Materials:** A prospective cohort study was conducted at five surgical/medical units of a 2000-bed tertiary medical center in northern Taiwan. We enrolled 351 hospitalized elderly patients in which 82.9% (291 subjects of 138 women and 153 men, with a mean age of 71.6 years) completed all four schedule assessments. Cognition was measured by the Mini-Mental State Examination (MMSE) over four time-points (admission, discharge, and 3 and 6 months post discharge). **Results:** Four cognitive changes patterns were identified. A deep V-shape with a mean fluctuation of 3.9 MMSE points was observed in dip and back group (n=47) while there was little changes in stay low group (n=83). Both high-end declining (n=66), and low-end declining (n=95) showed a persistent and accelerated decline with starting mean MMSE scores being 29.1 and 25.5 points, respectively. The multinomial logistic regression revealed that age, year of education, cardiovascular co-morbidities, number of medications, functional scores, depressive symptoms, surgical treatment, and hemoglobin level <12 g/dL upon admission were independently and significantly associated with different patterns of cognitive changes. **Conclusion:** Patterns of cognitive changes in hospitalized elderly is heterogeneous and factor identified will prompt effective targeting. There remains a need to understand how preventive, group-specific interventions aimed to maintain cognition should be structured at hospital settings in order to improve quality and care.

**PC8 608 APPROPRIATENESS OF PSYCHOTROPIC DRUG PRESCRIBING IN GERIATRIC PSYCHIATRY INPATIENTS.**

F. WESTPHAL\* (E.P.S. Alsace Nord, Strasbourg-Brumath, France)

C. NONNENMACHER(1) - (1) E.P.S. Alsace Nord (Strasbourg-Brumath, France)

**INTRODUCTION:** Inappropriate use of psychotropic medications in the elderly is commonly reported. The aim of the present study was to evaluate the prevalence of potentially inappropriate psychotropic medications in the geriatric psychiatry inpatients of a 470-bed teaching psychiatric hospital. **METHODS:** The study consisted of a one-day cross-sectional review of all the ongoing drug regimens in the geriatric psychiatry inpatients ( $\geq 65$  y) of the hospital, repeated on three separate days one year apart. Data were gathered for analysis. Inappropriate psychotropic medications (IPM) were classified into three categories: medications with unfavourable benefit-to-risk ratio (A), medications combining unfavourable benefit-to-risk ratio and questionable efficacy (B), and psychotropic-containing hazardous/contraindicated (H/C) drug combinations (C). The screening tools for reviewing drug regimens were the French consensus criteria defining inappropriate medications in elderly patients and the drug-interactions knowledge basis of the French Agency for Medicinal Products. **RESULTS:** The 227 elderly inpatients present on the study days were included. Median age was 72 y (range 65-93). Taking all inappropriateness categories together, 68% (n= 154) of the patients received at least one IPM, and 28% of these patients received at least two IPM. The total number of IPM was 260, including 126 in category A, 115 in category B, and 19 in category C. Psychotropic medications with anticholinergic properties accounted for 69% of IPM in category A. Supratherapeutic doses of short/intermediate half-life benzodiazepines accounted for 68% of IPM in category B. Half of the H/C drug combinations was accounted for by QT-prolonging antipsychotic polypharmacy in category C. **CONCLUSION:** Results of this study seem to confirm that inappropriate utilization of psychotropic medications is highly prevalent in elderly patients, even in mental healthcare setting.

**PC8 609 EMOTIONAL RESPONSES TO AWARENESS OF DEFICITS IN DEMENTIA**

M. DOURADO\* (Federal University of Rio de Janeiro, Rio de Janeiro, Brazil)

**Objective:** This study aimed to assess the emotional responses in Alzheimer's disease (AD) patients according to their awareness of cognitive deficits. **Method:** The mild to moderate patients and their caregivers (n=52) were evaluated by a questionnaire-based method for deficit awareness and for the presence of its emotional response. MMSE, CDR, and Cornell for cognitive status, severity of dementia and depression, respectively. **Result:** The mild AD patients (52.2%) showed a more preserved awareness of cognitive deficits than the moderate group (17.2%). Most of the moderate patients (82.7%) do not recognize the impact of the symptoms. However, the assessment showed that 65.3% of the total dyads were aware of their emotional responses to the cognitive impairment and life changes. When compared by severity of disease there was no difference between CDR groups ( $p=0.47$ ). The most frequent explanation they presented was that anger, sadness, and/or anxiety were related to the current inability to say or do things correctly. **Conclusions:** Mild and moderate patients presented emotional responses to the perception of memory decline

and changes in life. Anxiety, sadness, and irritation were recognized as such in this group of patients, although awareness of deficits was more prevalent in the mild group.

**PC8 610 COULD THE REALIZATION OF MEANINGFUL PERSONAL GOALS PREVENT SUICIDAL IDEATIONS?**

S. LAPIERRE\* (Université du Québec à Trois-Rivières, Trois-Rivières, Canada)

M. DUBÉ(1), M. ALAIN(1), L. BOUFFARD(1) - (1) Université du Québec à Trois-Rivières (Trois-Rivières, Canada)

**Introduction.** Reasons for living and meaning in life are incompatible with suicide. Is it possible to increase these protective factors to improve psychological well-being and decrease depression among people with suicidal ideations? A 12-week goal management intervention program was offered to early retirees ( $M = 56.7$  years) with adaptation problems to the retirement transition. The objective of this program was to promote mental health and increase subjective well-being and quality of life after retirement. The weekly group meetings were centered on helping participants set, plan, pursue, and realize meaningful personal goals. **Method.** A sub-sample of 21 participants with suicidal ideas was identified from a larger sample ( $N = 354$ ) of retirees living in the community who took part in the study to evaluate the program. The experimental ( $n = 10$ ) and control ( $n = 11$ ) groups were compared on their answers to 16 goal and psychological well-being questionnaires. **Results.** To test the improvement hypothesis, we performed 2 (Group) X 3 (Time) repeated measures analyses of variance on these psychological variables. By the end of the program, the experimental group had improved significantly more than the control group on hope, goal realization, serenity, flexibility, and had a positive attitude toward retirement. The levels of depression and psychological distress significantly decreased. These gains were maintained six months later. **Conclusion.** These positive results, obtained with an intervention program centered on protective factors for suicide, could lead to an innovative way to help older adults with suicidal ideations. The program is easily adaptable to older adults living other types of losses or life transitions that require changes in goal priorities, like death of a spouse, chronic illness, divorce, or loss of abilities following a stroke.

**PC8 611 EVIDENCE UPDATE OF THE PSYCHOSOCIAL IMPACT OF VISION LOSS IN OLDER PEOPLE**

S. NYMAN\* (University of Reading, Reading, United Kingdom)

M. GOSNEY(1), C. VICTOR(1) - (1) University of Reading (Reading, United Kingdom)

**Introduction** Sight loss is common in old age and is projected to rise as a consequence of our ageing population. We systematically reviewed the literature that assessed the psychosocial impact of sight loss in older people. **Methods and materials:** An existing review (Burmedi et al., 2002) was updated. We identified 181 published quantitative papers in English from 2001 to July 2008 that included one or more of our eight outcome measures: depression / mental health, anxiety, experience of complex visual hallucinations, quality of life, social functioning, social support, loneliness, and psychosocial evaluation of rehabilitation and interventions ( $N=295$  outcomes analysed). Sight loss included both reduced vision and visual functioning. **Results** Reduced visual functioning was associated with an increased likelihood of depressive symptoms ( $OR=4.25$ ) more so than loss of vision (prevalence=23.4%,  $OR=1.88$ ). Vision loss was associated with more diagnoses of clinical depression (prevalence=20.57%,  $OR=1.53$ ), and high levels of emotional distress (prevalence=46.0-55.8% on GHQ), but not anxiety compared to sighted peers (prevalence=19.32%). Only with the vision-specific NEI-VFQ was sight loss associated with reduced mental health ( $MD=20.17/100$ ,  $r=0.37$ ) and social functioning ( $MD=18.37/100$ ,  $r=0.34$ ). A study found perceived adequacy of social support from family and friends was associated with lower levels of subthreshold ( $OR=0.77$ ) and major ( $OR=0.68$ ) depression. Two RCTs found promising results for group-based problem-solving and self-management training to prevent depression up to two and six months respectively. **Conclusion** Further research is required to investigate the longitudinal onset, development, and persistence of the psychosocial impact of vision loss in older people, how psychosocial variables are related, and how to best prevent and reduce the psychosocial impact of vision loss.

**PC8 612 THE EXPERIENCES OF ELEMENTARY STUDENTS OF THE ELDERLY HOSPICE**

A. MOHSEN\* (Kashan university of medical sciences, Kashan, Islamic Republic of Iran)

E. AMINOLROAYAEL-YAMINI (2) - (2) Kazraee School (Kashan, Islamic Republic of Iran)

**Introduction** As the population ages a greater willing to elderly hospices is expected. However, the quality of care in these centers has not been studied enough. This research conducted with the aim of assessing the elementary students' experiences how visited of these centers or had a family member over there. **Methods** A qualitative study conducted using a purposive sample of 10 students who were studying in grade four of one of elementary schools in kashan, Iran. All had visited an elderly hospice or had a family member over there. The students' teacher wanted them to write their memories from such experiences. Content analysis method was used for data analyzing. **Results** All students defined the elderly hospice as a place for keeping the alone, ill and disabled people. They

had a sense of pathos to the people living there. They used phrases such as: "Desperate", "they have not anybody", "their chilides have no visit of them", "I want to cry when remember them". The students believed that "these elderly were disabled and had nobody to care them", "their breed are selfish and have forgot their parents sufferings". Some of students had experiences of transmitting of an aged people to the elderly hospice with his/her consent, but some others had experienced a transmission with japerity or obligation. Conclusion Overall experiences of students were negative to the quality of keeping in elderly hospices. Inappropriate arrangements of these centers, keeping aged people alongside with the handicapped people augmented such bad experiences. The authorities should pay more attention to the arrangement and quality of care within the elderly houses.

#### **PC8 613 ALCOHOL USE AMONG OLDER ADULTS IN FINLAND – PREVALENCE AND ASSOCIATED CHARACTERISTICS**

S. SEPPÄNEN\* (Espoo Health and Social Center, Espoo, Finland)  
J. VALVANNE(1), K. PITKÄLÄ(2) - (1) Espoo Health and Social Center, Elderly care Unit (Espoo, Finland); (2) Helsinki University (University of Helsinki, Finland)

Introduction: Recognition of alcohol use and its related health problems among elderly people is challenging. The aim of the study was to examine the prevalence and at-risk drinking patterns in community-dwelling older adults and their associations with sociodemographic and health related factors and older adults' own reasoning for their alcohol consumption. Methods: The data were collected with a postal questionnaire from a random sample of 2100 elderly people ( $\geq 65$ ). The response rate was 71.6% from the community-dwelling sample. We defined at-risk drinking by 1)having >7 drinks/wk 2)>5 drinks on typical day when alcohol is consumed or 3) using >3 drinks several times/wk. Results: Of the respondents, 8.2% (N=114) were at-risk drinkers. At-risk drinking was associated with younger age and male sex, higher level of education, good income, living with a spouse, good functioning and current smoking. Although frequency and quantity of alcohol consumption declined with age, 19% of men aged 71-80 years and one 10% of men aged 81-90 years could be defined as at-risk drinkers. At-risk drinkers had as often as the non-risk group comorbidities and multiple medications. A significantly larger proportion in the at-risk drinking group admitted they had fallen or injured themselves (5.3% vs. 0.7%,  $p<0.001$ ) or forgotten their medications because of the use of alcohol. Most common reason for using alcohol was for having fun (56%). At-risk drinkers reasoned their alcohol consumption more often than the non-risk drinkers as a relief for meaningless life (OR3.5), depression (OR5.8), anxiety (OR2.8) and loneliness (OR3.0). Conclusions: Alcohol use, including at-risk drinking among older adults is prevalent, particularly among males despite comorbidities and multiple use of medications.

#### **PC8 614 THE INFLUENCE OF PHYSICAL EXERCISE ON DEPRESSIVE SYMPTOMS AND FUNCTIONAL FITNESS IN ELDERLY RESIDENTS OF SOUTH BRAZIL**

T. BENEDETTI\* (Universidade Federal de Santa Catarina, Florianópolis, Brazil)  
L. BORGES(1), G. MAZO(2) - (1) Universidade Federal de Santa Catarina (Florianópolis, Brazil); (2) Universidade do Estado de Santa Catarina (Florianópolis, Brazil)

Introduction: The objective of this study was to investigate the influence of physical exercise on depressive symptoms and functional fitness in a sample of elderly people enrolled on a physical exercise program run by public sector Health Centers in Florianópolis, Brazil. Methods: The sample comprised a total of 118 elderly people (101 women and 17 men), who had been receiving treatment for up to 1 year and 4 months and were assessed at predefined intervals, up to a maximum of five times. Evaluations were carried out using the Geriatric Depression Scale (GDS-15); International Physical Activity Questionnaire (IPAQ) and the physical test battery proposed by AAHPERD (American Alliance for Health, Physical Education, Recreation and Dance). Results: A tendency for depression scores to reduce was observed. However, a statistically significant difference ( $p=0.008$ ) was only detected among those elderly people who attended 75% or more of the treatment sessions. Analysis demonstrated that the tendency for overall mean functional fitness to increase was statistically significant ( $p<0.001$ ). Inverse relationship were detected between functional fitness and depression scores at five assessment ( $r= - 0.235$ ,  $p=0.059$ ;  $r= - 0.206$ ,  $p=0.099$ ;  $r= - 0.158$ ,  $p=0.110$ ;  $r= - 0.068$ ,  $p=0.565$ ), although only one assessment had statistical significance ( $r= - 0.226$ ,  $p=0.033$ ). Conclusions: The results demonstrated a positive effect from physical exercise in reducing depressive symptoms and improving functional fitness, suggesting that there is an inverse relationship between these variables.

#### **PC8 615 A TRIAL FOR THE IMPROVEMENT OF DEPRESSIVE STATUS WITH THE IMPROVEMENT OF FUNCTIONAL CAPACITY IN THE ELDERLY**

J. YU\* (The Dia Foundation for Research on Ageing Societies, Tokyo, Japan)  
F. YU(1), H. HAGA (1), Y. SUZUKI (1) - (1) Institute of Aging and Human Development, Obirin University (Tokyo, Japan)

Introduction: Depression is the most common mental health disorder in elderly people. Depressive status is directly associated with the impairment elderly. The present study examined whether improvement of functional capacity brought about the improvement of depressive status based on an intervention study. Method: Subjects were 172 elderly

residents suspected of having depressive status according to the criteria determined by the Ministry of Health, Labor and Welfare (MHW) in N city of Niigata prefecture, Japan. Functional capacity was assessed by the MHW Checklist. The 172 subjects were assigned into two groups: the intervention group (n=62) and the control group (n=110). The intervention group underwent the program following the guideline as devised by the MHW for 6 months. The intervention groups were given Physical exercise and/or Oral Health Education and/or Cognition Improvement programs in small groups twice or fours a month. Control group received no intervention. The intervention group comprised the residents who wanted to undergo the program. Thus, the present study is not a randomized control trial. Results: ANOVA with repeated measures dealing with age as covariate revealed that the improvement of depressive status was directly associated with the improvement of functional capacity in the intervention group alone. On the other hand, this association was not found in the control group. Conclusion: It is suggested that the programs have a positive effect on both functional capacity and depressive status in the elderly living in the community.

#### **PC8 616 SOCIAL SUPPORT AND COPING STRATEGIES TO DEPRESSIVE SYMPTOMS FOR THE DISABLED ELDERLY**

P. HSU\* (Asia University, Taichung, Taiwan)  
H. HSU(1), H. TUNG(1), Y. HSIEH(1) - (1) Asia University (Taichung, Taiwan)

Purpose: This study aimed to investigate the effect of social support and different types of coping strategies on depression among the disabled elderly. Methods: Data was collected by face-to-face survey from long term care institution users who were aged 60 or over with physical disabilities. Totally 444 persons were analyzed in this study. Difficulties of physical function, coping strategies (problem solving coping behavior, emotion discharge and avoidance coping behavior, and seeking support coping behavior), and social support were hypothesized to have an impact on depressive symptoms. Pathway analysis was applied. Results: Among the three coping strategies, the elderly performed the problem solving and the venting and avoidance coping behaviors had higher depressive symptoms. The elderly having more physical disabilities were more likely to sow venting and avoidance coping behavior, and further increased the depressive symptoms. The elderly who had higher social support were more likely to use the seeking support coping strategy. Conclusions: Avoidance is not the best policy for the disabled elderly to cope with disability, which may influence their psychological health. In addition, the institutionalized elderly may hold too much expectation of problem solution but fail to recover totally from disability, and thus feel frustrated and depressed. Social support showed the direct and indirect effect through seeking help coping behavior of reducing depressive symptoms. The intervention for mental health of the disabled elderly are suggested.

#### **PC8 617 SPIRITUAL BELIEF, SOCIAL SUPPORT, PHYSICAL FUNCTIONING AND DEPRESSION AMONG OLDER PEOPLE IN BULGARIA AND ROMANIA**

P. COLEMAN\* (University of Southampton, Southampton, United Kingdom)  
I. PETROV(1) - (1) Bulgarian Association of Gerontology (Sofia, Bulgaria)

Introduction: Older people in Eastern Europe have suffered major losses since the fall of communism and this is reflected in higher mortality and morbidity rates. The present investigation examined whether spiritual belief might contribute to resilience to depression in older people in Bulgaria and Romania, two neighbouring countries of similar socio-economic status and cultural-religious background. Methods and materials: The investigation was carried out in two comparable sets of villages in both countries. Participants (160 in each country) were contacted by door to door knocking and were interviewed by means of a questionnaire involving measures of depression, physical functioning, recent life events, social support, and spiritual belief. Refusal rates were modest (20% in Romania, 34% in Bulgaria). Repeat interviews with the same participants were conducted a year later in Bulgaria. Results: Significantly higher rates of depression and lower rates of spiritual belief were found among older people in Bulgaria compared with Romania. Rates of spiritual belief in Romania were found to be especially high by European standards. Strength of spiritual belief could be shown to have a negative association with depression in Bulgaria even when age, gender, and levels of physical functioning and social support were taken into consideration, but this was not the case in Romania, perhaps because of the low level of variance. Social support was a more important factor in Romania than in Bulgaria. Conclusions: Spiritual belief and practice are significant factors in protection against depression in later life, and more work needs to be conducted on developing adequate measures of such variables, and investigation of the means by which they might influence resilience to depression. Spiritual belief varies greatly across the continent of Europe, even between countries with similar religious histories as Bulgaria and Romania. This is rarely taken into account in cross-European research.

#### **PC8 618 LONG TERM OUTCOMES OF OLDER ADULTS IN DRUG AND ALCOHOL TREATMENT**

D. SATRE\* (University of California, San Francisco, CA, United States)  
J. MERTENS(1), C. WEISNER(1) - (1) Kaiser Division of Research (Oakland, CA, United States of America)

**Introduction:** The health and social consequences of drug and alcohol abuse for older adults are substantial. An increase in the proportion of older adults in the U.S. and Western Europe in coming decades, combined with greater drug and alcohol use in the cohorts approaching old age, is expected to increase treatment demand. Yet few investigations have examined clinical characteristics and treatment outcomes of older adults, long-term outcomes or gender differences. This study addresses these important issues. **Methods and Materials:** We report 9-year outcomes of chemical dependency patients ages 55 and over at treatment entry, compared with patients ages 40-54 and 18-39 in a large private outpatient program in a managed care health plan in Sacramento, CA, USA. Measures included alcohol and drug use and dependence, health status, psychiatric symptoms, length of stay in treatment; and outcomes and social networks at 9-years. The sample included 1204 participants at baseline and 808 completed telephone interviews at 9 years. **Results:** Older adults were less likely to be drug dependent and more likely to be alcohol dependent at baseline; had longer retention in treatment, and were more likely than younger adults to be abstinent at 9 years. Length of stay in treatment, which was greater for older women than for men, was associated with abstinence. Additional analyses examine age and gender differences in substance use patterns, depression and anxiety, and use of Alcoholics Anonymous. Multivariate analyses of interviews over 9 years consider treatment readmissions, mortality, medical and psychiatric services. **Conclusions:** Results demonstrate that older adults are responsive to chemical dependency treatment and that abstinence can be maintained over time. Clinical and social network differences between older, middle-aged and younger adults inform treatment strategies and aftercare for older women and men with drug and alcohol problems.

**PC8 619 WELL BEING, SOCIAL EXCLUSION, RACIAL AND ETHNIC DISCRIMINATION IN ELDERLY PEOPLE IN CANADA**  
D. LAI\* (The University of Calgary, Calgary, Canada)

**Introduction:** Literature has consistently indicated the socioeconomic and health consequences of racial and ethnic discrimination, with little research focusing on elderly immigrants and ethno-cultural minorities. This study examined the relationships of racial and ethnic discrimination, social exclusion and well-being of immigrant seniors and ethno-cultural minority seniors in Canada. **Methods:** Data from the Ethnic Diversity Survey, a 2002 national telephone survey in Canada using a representative sample of the Canadian population, was analyzed. The survey collected information on the ethnic and cultural background of people in Canada and how it relates to their lives. Data from participants ( $n = 6,575$ ) 65 years of age and older were used. Racial or ethnic discrimination was measured by asking whether the participant had experienced discrimination or been treated unfairly by others in Canada because of their ethnicity, race, skin color, language, accent, or religion. Well being was represented by life satisfaction. Social exclusion included variables of voting in election, social group and organization participation, sense of belonging, feeling out of place, sense of trust, and worry about being victim of a hate crime. Hierarchical logistic and multiple regression analyses were used in data analysis to examine the effect of immigrant and visible minority status on discrimination and the effect of discrimination on the well being and social exclusion variables. **Results:** Immigrant and visible minority status were the most important correlates of discrimination. Consistent with previous literature, discrimination further reduced life satisfaction of immigrant and visible minority elderly people and further increased social exclusion. **Conclusion:** Immigrant status and colour does matter as they affect well being and social exclusion. Enhancing elderly people's well being should extend from addressing health and financial needs to racial or ethnic discrimination, particularly for immigrants and visible minorities.

**PC8 620 SEX AND INTIMACY ABOVE 50 YEARS OLD**  
E. MESSELIS\* (Higher Institute for Family Sciences, Schaarbeek (Brussels), Belgium)  
I. VAN DE VELDE

In 2007, the Higher Institute for Family Sciences, Lachesis (Office of Expertise on Ageing and Gender) and Sensoa have conducted a scientific descriptive research in Flanders concerning sex and intimacy above 50 years old. The main research questions were: how does their sexuality looks like? Who are they talking to about sex? Where are they looking for information when having problems? Are they informed about the physical changes in women and men? How satisfied are they about their sexual life? 1.147 respondents filled out a written questionnaire on a 50-plus fair in Antwerp. 1.037 questionnaires were valid for data collection (53% men and 47% women with a mean age of 60 years old). 50+ people do have sex. Most preferred sexual actions are caressing naked breasts, kissing.... Coitus is only the 8th most important sexual act. The older the persons, the less they talk about sex. For men and women: the partner is the most important interlocutor. 74% of the respondents are looking actively for information when needed. Males have their partner as primary source, females are looking into magazines. Men and women don't know each others bodies and the physical changes not very well. Most of the respondents are satisfied with their sexual life but men would like to have more sexual activity. There is a tendency that women appreciate more intimacy than men. As a conclusion: 50-plus people do have sex and they enjoy sex. The older they become, the less different sexual actions they have,

the less they speak about sex and the less they ask for information. But the majority of our respondents is happy with their sexual life.

**PC8 621 OUTCOMES IN PSYCHOSOCIAL WELLBEING OF ISRAELI CAREGIVERS OF STROKE SURVIVORS: A LONGITUDINAL STUDY**  
Z. NIR\* (Ben-Gurion University, Beer- Sheva, Israel)  
C. GREENBERGER, Y. BACHNER

**Introduction:** Caregiving to stroke survivors can impact on physical and emotional health, due to caregivers burden, frustration and lack of confidence in their ability to fulfill their role. **Aims:** 1) to describe the socio-demographic characteristics of Israeli caregivers of stroke survivors; 2) to observe changes in caregivers' physical and emotional health, social support, burden and quality of life (QOL) during the first 6 months following stroke occurrence, and 3) to identify the predictors of caregiver's QOL for that period. **Methods:** 140 caregivers were interviewed within the first week of admission of their stroke survivors to the Geriatric Rehabilitation Ward (baseline data), and after three and six months. Instruments measured demographic variables, depression, perceived and objective of health status, burden, social support components, and QOL. Correlations, ANOVA with repeated measurements, and stepwise regression tests were used. Results revealed that during the 6-month period, caregivers' objective health status remained stable. After 3 months, depression, and the need for instrumental support decreased ( $p<0.01$ ;  $p<0.05$  respectively). Nevertheless, satisfaction with informal support and family relationships decreased ( $p<0.05$ ), as did QOL. Burden decreased consistently at 3 and 6 month intervals ( $p<0.01$ ). After 6 months, perception of health status and QOL increased ( $p<0.05$ ), the need for help and advice decreased ( $p<0.01$ ), while the others variables remained stable. These results indicate that overall, the caregivers adapted to their caring role over the 6-month period. At each of the 3 intervals, QOL was explained by the same 4 variables, although with differential weights: number of diseases, confidence in the support system, burden and sharing a household with the survivor. **Conclusion:** The results contribute to health providers' ability to identify caregivers at risk, and develop appropriately timed interventions for empowering caregivers in their role.

**PC8 622 CAREGIVING TO ADVANCED CHRONIC ILLNESS (CHF/COPD) PATIENTS**  
A. WILKINSON\* (Edith Cowan University, Joondalup, Australia)  
S. BERRY(1) - (1) RAND Corporation (Santa Monica, United States of America)

**Background.** The cost and responsibility for much of the care of seriously ill, elderly persons living in the community with advanced, eventually fatal, chronic illness has been shifted onto family members. Chronic organ system failure presents a distinct illness trajectory with an erratic and unpredictable course characterized by episodes of acute illness and periods of relative stability set against a background of gradual, progressive decline. Current caregiving research has not yet described the challenges, stresses, and rewards that accompany caregiving for individuals with advanced chronic organ system failure. This project sought to describe the factors that influence caregiver outcomes in caregiving to advanced CHF and COPD patients. **Methods:** We conducted a series of 9 focus groups (3-10 adults each), 18 years or older, who were currently providing care for a patient with advanced chronic CHF or COPD. Focus group discussion topics were identified from the literature on cancer and Alzheimers disease caregiving , characteristics of the illness trajectory (e.g., the erratic pattern of CHF/COPD), patient/caregiver knowledge of prognosis/disease course, CG tasks, reactions to caregiving, and patient and caregiver interactions with the healthcare system. Initial analysis resulted in a classification system for major topics derived from the material and a second analysis by both researchers determined a final set of themes. **Results:** Five major themes were identified: (1) how caregivers describe their experience, (2) prognosis/uncertainty impacts, (3) objective burden (tasks), (4) role conflict/reversal, and (5) subjective burden. Findings from this exploratory work suggest that interventions should provide information about topics of specific relevance to CHF/COPD caregivers (e.g., disease processes, prognosis, what to expect, symptom and self-management), and should address caregiver/patient social isolation. Implications for future research and intervention policy will be discussed.

**PC8 623 THE ART GALLERY ACCESS PROGRAMME FOR PEOPLE WITH DEMENTIA**  
S. MACPHERSON\* (Greater Southern Area Health Service, Queanbeyan, Australia)  
M. BIRD(1), A. KATRINA(1), D. TERRI(1), B. ANNALIESE(1) - (1) Aged Care Evaluation Unit, Greater Southern Area Health Service (Queanbeyan, Australia)

**Introduction:** People with dementia often have decreased opportunities to engage in higher level intellectual or sensory activities. We sought to address this deficit by implementing the Art Gallery Access Programme. **Method/Materials:** Seven people with mild dementia from the community and eight with moderate to severe impairment from residential care attended the National Gallery of Australia (NGA) once a week for six weeks. They viewed and discussed artworks with NGA educators, who had received training in dementia skills. Sessions were filmed and level of engagement analysed using time sampling methods. Focus groups provided qualitative feedback. **Results:** Regardless of level of impairment, participants were engaged in the process from the outset, with no significant increase over

time. They became animated, gained confidence and were able to discuss and/or interact with the artworks and the social process. This included the more impaired groups from residential care, who were more withdrawn or behaviourally disturbed in their usual environment, raising the concept of excess disability. Community participants remembered the programme with pleasure and were surprised at what they had achieved in an intellectual and artistic activity. Educators spoke about how much they had learned; some had even changed their presentation style with other groups as a result. Conclusion: The Art Gallery Access Programme went beyond many common dementia activities. Despite lack of evidence for lasting effects, all participants wanted the programme to continue. The sense that a programme is worthwhile if it gives pleasure to people with dementia for the time it is running was encapsulated by a carer who said: "You do it for the moment". The finding that people with dementia could take part in and enjoy a "normal" if higher level activity has led to the programme being rolled out across other Australian sites.

**PC8 624 A MARRIAGE OF METHODOLOGY: WAYS OF EXAMINING SEXUAL DESIRE IN OLDER AGE**

S. GLEDHILL\* (Queensland University of Technology, Brisbane, Australia)  
J. ABBEY(1), R. SCHWEITZER(1) - (1) Queensland University of Technology (Brisbane, Australia)

Introduction Improved social and economic environments have had a positive effect on health resulting in increased longevity and improved general health. Social stereotyping, ageism and negative attitudes towards older people have contributed, however, to the invisibility of the older person as a sexual being. Furthermore, research that explores the sexual desires of the older person and the implications for health remains virtually unknown. Illumination of the experiences of older age sexual desire will increase an understanding of the sexual needs of the older person that can be used as a basis for the provision of holistic health care in the future. Methods and Materials This paper will report on the methodology and methods developed to explicate and compare narrative and phenomenological themes from interviews about sexual desire experienced by a sample of older people in the community. In-depth interviews were conducted with 36 people (21 men and 15 women) aged 62 years and over. Results Several themes surrounding sexual desire experienced in older age were developed using a hermeneutic interpretive methodology to compare the results from a narrative and a phenomenological method of analysis. Each approach serves to validate the other. Conclusion A marriage of methodology between the presentation of narrative stories and the essential features of the phenomena was successful in providing a rich understanding of the experience of sexual desire and ageing; an under-researched area of the experience of ageing.

**PC8 625 SOCIAL NETWORK TYPES AND IMPLICATIONS FOR HEALTH AMONG AGEING NEW ZEALANDERS.**

F. ALPASS\* (Massey University, Palmerston North, New Zealand)  
C. STEPHENS(1), J. NOONE(1), A. TOWERS(1) - (1) Massey University (Palmerston North, New Zealand)

Introduction: International evidence has consistently demonstrated the physical and mental health benefits of engagement with social networks. Network type (not simply network size) assesses both support and social participation and is related to health outcomes. This study investigates the health effects of changes in network types reported by a representative sample of young-old in New Zealand. Methods and Materials: Longitudinal data were collected by questionnaire survey from a representative sample (N = 3,200) of the New Zealand population on two occasions: when they were aged 55-70 years and then 57-72 years. These data include categorisation of network types (using Wenger's 1997 categorisation), their relationships with self-reported health (SF 36 physical and mental health scores), interactions with structural factors such as age and ethnicity, and changes across time. Results: Analyses showed that most people are involved in social network types that are understood to be beneficial. Among those with restricted or potentially limiting social networks there are no effects on physical health. However, restricted networks are associated with poorer mental health and there are differences in these relationships according to ethnicity and age. The younger age groups were most likely to report more restricted networks and these trends continued across time. Conclusions: Findings suggest a cohort effect of increasing numbers of people with restricted networks in our society. These restricted networks are not related to poor physical health among the young-old but are already related to poor mental health. This has implications for the support and health for these people as they age. Our longitudinal study aims to clarify these relationships with future data waves.

**PC8 626 DIABETES, DEPRESSION, AND COGNITIVE DECLINE IN OLDER ADULTS**

E. HELMES\* (James Cook University, Townsville, Australia)  
T. OSTBYE(2), R. STEENHUIS(3) - (2) Duke University (Durham, NC, United States of America); (3) Private Practice (Canada)

Introduction. Recent studies suggest an association between diabetes and decline in cognitive function. We evaluated changes in cognition in elderly with diabetes (compared with elderly without diabetes) from a national sample of otherwise healthy older

Canadians. Methods and materials. Data from the comprehensive clinical assessment in the first 2 waves of the nationally representative Canadian Study of Health and Aging provided neuropsychological data on cognitive functioning in 83 seniors with diabetes and 661 without. Measures of long- and short-term memory, abstract reasoning, judgment, language, agnosia, and construction skills were contrasted for the two groups using analysis of covariance with age and gender as covariates. A parallel set of analyses used test scores from wave 1 and the Geriatric Depression Scale score as additional covariates to predict scores from wave 2 among 385 individuals tested as cognitively intact on both occasions (5 years apart). Results. At the first wave, elderly with diabetes scored lower only on the construction test. In the second set of analyses, elderly with diabetes scored lower than those without on a measure of short-term memory. Age was a significant covariate for the measures of short- and long-term memory, language, and construction skills. Depression was a significant covariate for seven measures, excluding only two reasoning measures and a colour naming test, whereas the wave 1 measure was a significant covariate for 9 of the 10 variables excepting only one measures of agnosia. Conclusions. Diabetes was not associated with generalized cognitive dysfunction. With advancing age, the results suggest that measures of short-term memory are most sensitive to the influence associated with diabetes on cognition. As expected, depression influenced most of test scores. In this group, selected for good health, the presence of diabetes appears to have modest influences upon cognitive functions.

**PC8 627 MATERIAL DOMAIN AND LIFE SATISFACTION: THE ELDERLY LIVING ALONE**

G. PEREIRA\* (University of Aveiro, Aveiro, Portugal)  
L. SOUSA(1) - (1) Department of Health Sciences, University of Aveiro (Aveiro, Portugal)

The material domain has impact in people's life satisfaction, but how it occurs depends in particular of ideologies regarding material possessions and money and how that is translated into behaviour. This exploratory study aims at characterize the material domain profile (values, attitudes and behaviors towards money and material possessions) of elderly men and women living alone (usually a more vulnerable group) and how it is affecting their life satisfaction. A questionnaire was administered to a sample of 96 elderly men and women, from the low, medium and high socioeconomic classes. Findings suggest that: the participants are moderately satisfied with life, tend to be not materialistic and focus their money ethic and behaviour on budget and savings. The satisfaction with life is not correlated to materialism or money ethic and behaviours; however the income is positively correlated with the satisfaction with life in particular in the high socioeconomic class. In old age people seem to be more attached to possessions symbolic and relational meanings.

**PC8 628 IMPORTANCE OF CONCEIVING LIFESTYLE AND AGENCY IN THE LIFE COURSE**

L. HATCH\* (Ohio University, Athens, Ohio, United States of America)  
J. HENDRICKS(1) - (1) Oregon State University (Corvallis, OR, United States of America)

Explanations in social gerontology frequently note the importance of socioeconomic status, structural local, and social network characteristics in determining well-being of aging individuals. Despite such statements, the mechanisms by which they color aging patterns is under-explored. Lifestyles are key to both the explanatory framework and to late life well-being. An array of personal and social resources comprise lifestyles and this paper conceives of these factors in terms of a personal resource model argued to be the mechanism by which macro- and micro-level attributes come together to influence personal well-being and sense of identity. Our personal resource model accounts for both indigenous and exogenous factors and how they are integrated to shape the experience of aging. Lifestyles are the active linkages between contextual variables and late life outcomes. The Weberian approach outlined in the paper brings together status groups and individual experience yet moves away from merely focusing on roles in the labor market or economically productive realm as global patterns of production shift the relative balance of factors influencing life course patterns.

**PC8 629 EFFECTS OF ANIMAL ASSISTANT LEISURE ACTIVITY TO REST HOME ELDERS' PSYCHOLOGICAL AND SOCIAL HEALTH**

L. PAN\* (Fu Jen Catholic University, , Taoyuan County, Taiwan)  
H. CHANG(1), Y. YE(2) - (1) Chang Gung University, Chang Gung Memorial Hospital (Taipei County , Taiwan); (2) National Taiwan Sport University (Taipei County , Taiwan)

The purpose of this study is to determine the psychological and social effects by applying animal assistant leisure activity (AALA) and provide another choice of leisure activity to rest home elders. The researcher conducted a longitudinal AALA experiment to the experimental group one hour a time and 6 times a week for 6 weeks. Questionnaires, interview, and on-site observation were applied for both experiment group (participated in AALA) and control group (did not participated in AALA) in comparison. Based on the results, from the psychological health aspect, the experiment group's had improved much well than the control group. From the social health aspect, the behavior of the experiment group was better than the control group. The researcher concluded that the elders perceived

psychological and societal health benefits by applying AALA. According to the findings, the researcher suggests that rest home may be set in the community area for the convenience of visiting and may have animals or pets in the rest home for the companionship. For the government policy shall be proposed to encourage the AALA promotion, ministrant animal training and license certification. For the future research, the researcher suggested to apply AALA by different objects and the research techniques. Keyword: Animal assistant leisure activity, Rest home elder, Psychological and social health.

**PC8 630 COGNITIVE PREDICTORS OF UNSAFE DRIVING IN OLDER DRIVERS: A META-ANALYSIS**

J. MATHIAS\* (University of Adelaide, Adelaide, Australia)

M. JANE(1), E. LARISSA(1) - (1) University of Adelaide (Adelaide, Australia)

Introduction: Older drivers are at a higher risk of being involved in motor vehicle accidents. However, on-road assessments of all older drivers are impractical, highlighting the need for cognitive tests to identify potentially unsafe older drivers. This study undertook a meta-analysis of research examining the cognitive predictors of driving ability in older drivers in order to provide an evidence-based method for driver screening. Method: A comprehensive search of the PubMed, PsycINFO, and CINAHL electronic databases was undertaken to identify studies that examined the cognitive predictors of driving ability in older drivers. All studies were screened using detailed inclusion and exclusion criteria, with data from 21 studies undergoing analysis. Cohen's d effect sizes were used to measure differences in the cognitive performance of older drivers who either passed or failed a driving assessment (on-road driving, driving simulator, driving problems). 95% confidence intervals determined statistical significance, and Fail-safe N's assessed the potential impact of the bias toward publishing significant results. Results: The best predictors of on-road driving were the Ergovision and Useful Field of View (UFOV) tests, a complex RT task, Paper Folding task, Dot Counting, WMS Visual Reproduction, and Computerised Visual Attention Task. Simulator driving performance was best predicted by the Benton Line Orientation Task, Clock Drawing, a Driver Scanning task, the UFOV, WAIS Picture Arrangement and MMSE. Finally, the Trail Making Test, Stroop, UFOV, WAIS Block Design, and Automated Psychophysical Test were good predictors of driving problems. Conclusions: A number of different cognitive tests identify at-risk drivers who may be in need of a comprehensive driving assessment; the exact choice of which will depend upon the criterion measure for determining driving ability (on-road driving, driving simulator, driving problems) and whether a computerised or paper-and-pencil task is required.

**PC8 631 GRANDPARENT INFLUENCE AND INTERGENERATIONAL RELATIONSHIPS IN CHILDHOOD, ADOLESCENCE, AND EMERGING ADULTHOOD**

R. WISE\* (Istanbul Bilgi University, Istanbul, Turkey)

A. METINDOGAN WISE(1) - (1) Bogazici University (Istanbul, Turkey)

Introduction: Research demonstrates that grandparents (GP) are important actors in grandchildren's (GC) identity development in adolescence and emerging adulthood (EA), including GC's development of life goals. The current study investigated two areas of GP-GC's relationships and GP goal influence. First, we examined developmental change in GP-GC shared activities. Second, we examined the contribution of shared activities in each developmental stage to current perceptions of GP goal influence. Methods: Data were collected from over 400 emerging adult GC using a nonprobability sampling method. In addition to demographic information, GP goal influence was assessed using goal categories from the Aspiration Index (Williams, Cox, Hedberg, & Deci, 2000), while GP-GC shared activities were measured using a modified version of the Shared Activities Scale (Kennedy, 1992). Results: Overall shared activities exhibited a positive linear relationship with GP influence. An analysis of the type of shared activity contributing to the regression models indicated that shared emotional activities exhibited a significant positive relationship with grandparent goal influence. For maternal grandmothers, shared emotional activities during adolescence exhibited a significant relationship with GC's perceptions of GP goal influence in EA. Shared emotional activities in adolescence and EA were positively and significantly related with maternal grandfather goal influence in EA. Although the models for paternal grandmothers and grandfathers were significant, the contributions of individual predictors did not reach significance. Conclusion: When examined across childhood, adolescence, and emerging adulthood, a trend emerged whereby shared emotional activities in adolescence and EA contributed more towards explaining the total shared variance in goal influence than shared behavioral activities in any age period, or shared emotional activities in childhood. Results are interpreted within a developmental framework.

**PC8 632 IMPACT OF CHRONIC DISEASE AND LIFE EVENTS TO SUCCESSFUL AGING**

H. HSU\* (Asia University, Taichung, Taiwan)

Introduction: Chronic disease and life events are two common health risks for the elderly in their later life. The purpose of this study was to examine the risks of the incidence of

chronic disease and life events to successful aging. Methods: A longitudinal data of 10-year follow-up was used. Successful aging indicators included basic and advanced physical function, depressive symptoms, cognitive function, emotional support, participation in productive activities, and life satisfaction. The stressors included life events and morbidity years of ten chronic diseases. Results: Loss of offspring increased the risk to of physical health, psychological health, and life satisfaction. Being newly widowed was related to depressive symptoms, while being newly divorced increased the risk of poor social support. Morbidity years increased the risk of failure in successful aging, especially for stroke, respiratory system disease, diabetes and cancer. Conclusions: Emotional health for the elderly should be carefully monitored after onset of life events and incidences of chronic disease. Helping the elderly with chronic disease not to lose further successful aging is important.

**PC8 633 COMPENSATION AND OPTIMISATION IN FUNCTIONAL COMPETENCE IN A SAMPLE OF LONG LIVED PERSONS**

J. DUVVURU\* (Sri Venkateswara University, Tirupati, Tirupati, India)

Introduction: One of the objectives of gerontology is to minimize the dependency as a result of disability and maximize competence in daily self-help skills in the later years of life. To make the later years as successful, it is important to maximize the gains and minimize the losses depending on the individual's resources. An attempt has been made in the present study to examine Paul Baltes concept of selective optimization and compensation in a sample of community dwelling elderly in India with special reference to ADL and IADLs. Method and Material: A sample of 120 older adults living in the community were randomly drawn from the panel of older persons available in the Centre for Research on Ageing. Persons who had low and moderate functional competence in the age groups of 70-79, 80-89 and 90+ years were drawn. Older adults with severe restrictions in ADLs were excluded. Their performances on ADL and IADLs capacities were assessed through standardized scales (Ramamurti et al., 1997) and also observed individually. They were interviewed to findout their physical and psychological resources towards optimization and compensation of their daily activities. Results: The results showed that 67 percent of the sample made successful compensation in ADL activity and optimized their functionality. Different people adopted different strategies of compensation showing wide individual variations. Subjects who are in their 90's show good selection, compensation strategies to optimize their functional capability. Conclusion: The methods of compensation and optimization varied across individuals indicating need for adoption of strategies through training.

**PC8 634 APPLYING A LIFE COURSE PERSPECTIVE TO MENTAL HEALTH PROMOTION FOR AGING COMBAT VETERANS**

M. GIBSON\* (St. Joseph's Health Care London, London, Canada)

Introduction: Epidemiologists estimate the number of deaths in the 25 largest military conflicts of the 20th century at 39 million soldiers, most of whom died during WWI and WWII. Many more soldiers survived to become veterans. In addition to the experience of war zone exposure itself, it is well recognized that the transition from a combatant role to a civilian identity post-deployment can be associated with significant psychological distress. The Life Course perspective (Elder and colleagues) promotes a holistic understanding of lives within changing historical and social contexts. This paper explores the thesis that the Life Course perspective offers a useful paradigm for understanding and mitigating the risk of late life mental health problems for veterans. Methods: This paper presents a convergence of three lines of research: 1) the literature that documents that war-related experience is associated with increased risk of mental health problems; 2) studies that show numerous social and behavioural factors influence long term psychological adaptation for veterans; and 3) evidence that the processes of aging may increase vulnerability to mental health problems. This synthesis is interpreted within the framework of the Life Course perspective. Results: Each of the five main principles of the Life Course perspective – life span development, agency, time and place, timing and linked lives – has practical application for mental health promotion for aging and elderly veterans. Conclusions: Older veterans may be at particular risk for psychological distress in old age when the normal processes of aging interact with their history of combat exposure, however, the Life Course perspective offers a useful orienting framework to encourage research, knowledge exchange and policy development in the interest of mental health promotion for this population.

**PC8 635 QUALITY OF LIFE OF OLDER PEOPLE: CONTRIBUTIONS OF MUSIC.**

C. SOLÉ\* (Facultat de Psicologia, Ciències de l'Educació i de l'Esport Blanquerna. Universitat Ramon Llull, Barcelona, Spain)

M. MERCADAL(1), S. GALLEGOS(1), M. RIERA(1) - (1) Universitat Ramon Llull (Barcelona, Spain)

Introduction: Despite the fact that there is a popular consensus about the benefits of music to improve quality of life, up to the present time we do not have knowledge of any research that demonstrates this influence with healthy older adults. The objective of this research is two-fold: 1. To evaluate and to compare the impact of three music programs (choir, music appreciation and preventive music therapy sessions) on the quality of life of older adults 2.

To identify the motivations as well as the difficulties that the seniors encounter to carry out this type of activities in order to come up with recommendations and strategies for the design of appropriate programs for older adults. Methods and materials: A pre-posttest quasi-experimental design without equivalent control group was used in this project. The sample included 83 persons, older than 65 years. The sampling was intentional. The data collection was carried out through an ad hoc questionnaire that included the four aspects of the construct of quality of life (physical health, subjective health, psychological well-being and social support), a questionnaire of motivations and one on satisfaction about the program. This last questionnaire was administered twice: at the beginning of the programs (pre-test) and at the end (posttest). Results and conclusions: The results of this study indicate that the participants perceived improvements in some aspects of their quality of life. In addition the main motivations to participate in these musical activities are to broaden their social net and to acquire new knowledge. The results are discussed in light of the challenges of the active and satisfactory ageing.

#### **PC8 636 CONTENTMENT AMONG THE ELDERLY IN COMMUNITIES: THE HAPPINESS; THI-15**

S. CHOMMANARD\* (Institute of Biomedical Science of Abel Salazar, University of Porto, Porto, Portugal)  
C. SUMNGERN(1), Z. AZEREDO(1), R. SUBGRANON(2), N. SUNGVORAWONGPHANA(2) - (1) Institute of Biomedical Science of Abel Salazar, University of Porto (Porto, Portugal); (2) Faculty of Nursing, Burapha University (Thailand)

Introduction: Happiness is an individual emotional or affective state that is characterized by feeling of enjoyment and satisfaction related to the elderly which means successful aging resulting in a good life. Method and Material: To study happiness in the elderly different regions of Thailand including reasons which affect the happiness in older adults, Thai Happiness Indicator (THI-15) was used in this study of 306 participants 60 years of age and older in rural, suburban, and urban regions. The elderly were chosen among those in Senior Thai Clubs by chance. Results: The elderly perceived their happiness as "Good", "Fair", and "Poor" respectively 12.4%, 37.9%, and 49.7%. There was a difference in happiness perception among the regions: poor happiness perception (64.5%, 61.2%, and 22.8% in rural, suburban, and urban areas respectively) ( $p < .001$ ). We also verified that there was a difference in poor happiness perception between male (57.9%), and female (42.2%) ( $p < 0.01$ ). There were differences in the happiness perception among people with different levels of education. ( $p < 0.01$ ). There was also difference between happiness perceptions as related to occupation: the results showed elderly who were not working had a better score of happiness perception than the elderly who had to work; the farmers had highest percentage in poor happiness perception. Conclusion: Happiness could be one of the indicators of mental health among the elderly in the community that health care providers should be concerned about using the proper interventions and/or activities in order to alleviate the mental health problems among the elderly in the community, especially the elderly who were indicated with "Poor Happiness".

#### **PC8 637 MARITAL SATISFACTION OF JAPANESE ELDER COUPLES- CAN THEY STAY MARRIED HAPPILY EVER AFTER?**

T. KUSAKA\* (JF Oberlin University, Tokyo, Tokyo, Japan)

When the average life span gets longer, Japanese elder couples spend longer years together, happily or unhappily. When elder couples spend more time together after retirement from work, their marital satisfaction will be the key element to determine their quality of life, to make the remaining life a pleasure of golden age or burden of in-house divorce. Consequently, the marital satisfaction of elder couples is getting even more important. Previous studies found marital satisfaction factors such as financial situation, living condition, life stage, health condition, but these factors are not easy to be controlled for elder couple themselves. This study focused on finding self-controllable factors that increase or decrease marital satisfaction. The semi-structured interviews were conducted on eight Japanese elder couples, who have retired from work, are in empty nest period, are living in urban community. Marital Needs Satisfaction Scale, Transactional Analysis evaluation sheet (egogram), Solitude Scale, and Depression Scale are used. Interviewees are encouraged to talk freely about their marriage. Questions including address terms, communication styles are asked at the interview to find out ingredients of marital satisfaction, especially self-controllable factors. In search of the relationship between personality and marital satisfaction, couples' egogram patterns are studied as well. The study found 1) wives are more satisfied, 2) neither address terms nor communication styles have much to do with marital satisfaction. The interview also revealed they share and practice traditional gender roles. Because of small number of samples, the outcome of this study cannot be generalized, but it shows traditional Japanese values die hard. The second stage of research is followed.

#### **PC8 638 IMPROVEMENT OF SELF-MANAGEMENT IN FRIENDSHIP: EFFECTS OF A FRIENDSHIP ENRICHMENT PROGRAM FOR OLDER WOMEN**

N. STEVENS\* (Radboud University Nijmegen, Nijmegen, The Netherlands)  
C. MARTINA(1), G. WESTERHOF(2) - (1) Radboud University Nijmegen (Nijmegen, The Netherlands); (2) University of Twente (Enschede, The Netherlands)

Introduction: Previous research has demonstrated that participants in a Friendship Enrichment Program for older women were able to improve their friendships and subjective well-being within six months and reduce rather high levels of loneliness within a year after following the program. This study examines whether improvement in self management abilities in friendship is characteristic of participants. The theory of self management of well-being identifies six self-management skills or attitudes that contribute to well-being: self-efficacy, a positive frame of mind, taking initiative, investment behaviour, achieving multifunctionality and variety in resources. Five of these skills are emphasized in the friendship enrichment program. Methods and materials: Data from a pre-test post-test follow-up control group design was examined to compare outcomes on self-management abilities. Sixty women over age 55 took part in the intervention; 55 women of similar age were involved in the control group. Instruments included personal convoys, questions on companionship, emotional and instrumental support from friends, a control-orientation in friendship questionnaire, and the Inventory of Interpersonal Situations. Data was collected at baseline, at the end of the program (3 months later), and 6 months after the program (9 months later). Results: Participants improved significantly on four of the five relevant abilities (taking initiative, investment behaviour, achieving variety in friendship and self-efficacy) at the 6 month follow up, compared to members of the control group. Conclusion: This study demonstrates that older women are able to improve self-management abilities in friendship and that the Friendship Enrichment Program is effective in stimulating self-management abilities.

#### **PC8 639 THE EFFECTS OF AEROBIC EXERCISE ON HEART RATE VARIABILITY AND EXECUTIVE FUNCTION IN THE ELDERLY**

C. ALBINET\* (Université de Poitiers - CNRS UMR 6234, Poitiers, France)  
G. BOUCARD(1), M. AUDIFFREN(1) - (1) Université de Poitiers (Poitiers, France)

INTRODUCTION: Aging is associated with decreased heart rate variability (HRV), notably high-frequency (HF) power, and reduced executive functioning. Moreover, recent research has suggested that better aerobic fitness is linked to high HRV and that high HF power could lead to better executive performance. The aim of this study was to assess the influence of a 12 weeks aerobic training program of on various HRV parameters and on executive functions in previously sedentary elders. METHOD: Twenty-four (13 women, 11 men) sedentary older adults ( $70.7 \pm 4.2$  years) were randomly assigned to an aerobic or a stretching program for 12 weeks (3 times a week). Resting HRV and Wisconsin Card Sorting Test (WCST) performance were evaluated before and after the physical activity programs. RESULTS: There was no effect of gender on HRV parameters. A significant Test X Group interaction ( $p < 0.05$ ) was revealed for HF power. HF power increased from pre-test to post-test for the Aerobic group, but decreased for the Stretching group. Only women in the Aerobic group improved their performance on the WCST from pre-test to post-test ( $p < 0.05$ ). They reduced their total number of trials and number of errors to complete the task. Performance for all the other participants did not vary after the 12 weeks programs. DISCUSSION: A 12 weeks aerobic program can increase HRV and particularly HF power in older previously sedentary adults. A concomitant increase in executive performance was only seen for women who participated to the aerobic program but not for men. These results will be discussed in light of recent data concerning gender differences in the exercise/cognition relationship.

#### **PC8 640 SUBJECTIVE WELL-BEING AND DEPRESSION LEVELS OF WORKING VERSUS RETIRED OLDER ADULTS BETWEEN THE AGES 65-75.**

H. SOYA\* (Florida Institute of Technology, -, United States of America)  
M. BETH KENKEL(1), C. LANG(1) - (1) Florida Institute of Technology (United States of America)

Introduction: This research examined the effect of employment status on subjective well being (SWB) and depression in older adults after the age of retirement. Method: This study used the Health Retirement Studies (HRS) and RAND archival data. The final sample consisted of 1065 individuals between ages 65-75, who are currently working or have a history of working, and completed the related questions. Results: The results indicate a strong relation between work and depression levels. Retirement-age adults who are employed demonstrated significantly fewer depressive symptoms ( $M = .81$ ,  $SD = 1.34$ ) than retirement-age adults who are not working ( $M = 1.41$ ,  $SD = 1.94$ ). The results indicated that employment status did not significantly contribute to SWB when all other independent variables were considered ( $\beta = -.17$ ,  $p = .05$ ). This finding supports Atchley's (2003) Set-Point theory which implies that subjective well-being is relatively stable over time. Important information was found! in the analysis of the factors related to SWB and depression. Self perceived health was primarily related to depression ( $\Delta R^2 = .15$ ,  $p < .01$ ) and subjective well-being ( $\Delta R^2 = .12$ ,  $p < .01$ ). In previous research self perceived health and health condition had been used interchangeably. However, this research had shown that individuals rated their self perceived health differently than their health condition. Conclusion: The results indicates that it is better for older adults to work during the retirement age, as working adults demonstrated lower levels of depression. Analysis of factors showed that personal perception of one's health was primarily related to depression and subjective well-being. In previous research, self perceived health and diagnosed health

condition had been used interchangeably. However, this research had shown that individuals rated self-perceived health differently than their diagnosed health condition.

**PC8 641 WHEN INDIVIDUAL DIFFERENCES MATTER: INTERDEPENDENCE MODERATES AGE DIFFERENCES IN SOCIAL RELATIONSHIPS AND COGNITIVE PROCESSING**

H. FUNG\* (Chinese University of Hong Kong, Hong Kong, Hong Kong)

The psychology and aging literature usually describes the processes of aging as static and universal. This paper challenges this assumption by reporting two studies whose results show that the typical patterns of age differences in social relationships and memory can differ, according to individual differences in interdependence (seeing the self as interconnected with others). Study 1 examined age differences in social network composition among 596 Hong Kong Chinese, ranging in age from 18 and 91 years. The stability of the number of emotionally close social partners in social networks across age, typically found in Western studies, was replicated only among Hong Kong Chinese with lower interdependence. In contrast, those with higher interdependence exhibited a positive association between age and the number of emotionally close social partners. Conversely, the negative association between age and the number of peripheral social partners, well-documented in the Western literature, was found only among Hong Kong Chinese with lower interdependence but not those with higher interdependence. Study 2 examined recall and recognition memory for positive, negative and neutral images among 114 younger (18 - 31 years old), 94 middle-aged (38 - 58 years old) and 103 older (64 - 95 years old) Hong Kong Chinese. Older Hong Kong Chinese with lower interdependence showed both the positivity enhancement effect (i.e., remembering the positive better than the neutral) and the negativity reduction effect (i.e., remembering the neutral better than the negative), like their American counterparts did in prior studies. Yet, older Hong Kong Chinese with higher interdependence showed the positivity enhancement effect only, but not the negativity reduction effect. Findings are discussed in terms of the plasticity of adult development.

**PC8 642 PSYCHOSOCIAL AND ANTHROPOMETRIC PREDICTORS OF THE MINI NUTRITIONAL ASSESSMENT**

J. DAVIDSON\* (Bradley University, Peoria, United States)

M. GETZ(1) - (1) Bradley University (Peoria, United States of America)

Introduction. The purpose of this study was to examine predictors of nutritional status in 155 community-dwelling elderly in the Midwest, USA. Methods and Materials. Our outcome variable, the Mini-Nutritional Assessment (MNA), assessed the overall quality of participants' nutritional status. To identify whether measures of anthropometric and psychosocial predictors were associated with the MNA measure, we conducted a hierarchical regression on MNA total score with three blocks of predictors, entering first, a block of demographic or control variables before assessing the influence of other predictors. Results. Collinearity tests and other diagnostics revealed that no OLS assumptions appeared to be violated. In our model, the first block consisted of six control variables (age, gender, race, education level, marital status, and mental status). Results for this block were  $F(6,116) = .473$ ;  $p = .827$ . None of the control variables were significant individual predictors. The second block consisted of three unrelated anthropometric predictors (waist circumference, fat-free mass index and body fat percentage). For this block,  $F$  change ( $3, 113$ ) =  $.753$ ;  $p = .534$ ; and again, no individual predictors were significant. Our last block introduced two psychometric assessments; one for depression (GDS), and one self-report of health, activities and anxiety (SF-12 Health Survey). The  $F$  change was significant;  $F(2, 111) = 20.178$ ;  $p < .001$ . When this block was added to the overall regression model,  $R^2$  was .298 and the overall model fit was  $F(11,111) = 4.28$ ;  $p < .001$ . SF-12 was a significant predictor ( $\beta = -.449$ ;  $p < .001$ ) and both GDS ( $\beta = -.17$ ;  $p = .096$ ) and MMSE ( $\beta = -.182$ ;  $p = .062$ ) approached statistical significance. Conclusion. Thus, we suggest SF-12, and possibly GDS and MMSE be included in routine community assessments of elderly nutritional status in addition to MNA to assist in planning interventions.

**PC8 643 ONE BODY, THREE HANDS AND TWO MINDS: THE INTERTWINED EVERYDAY ACTIVITIES OF AN OLDER COUPLE AFTER STROKE**

F. VAN NES\* (VU University Medical Center, Amsterdam, The Netherlands)

U. RUNGE(1), H. JONSSON(2) - (1) - (Denmark); (2) Karolinska Institutet (Sweden)

Introduction Following a stroke, a person's pattern of activities is disrupted and he/she will often obtain help from his/her partner. This care giving can have a great impact on the partner's health. Little is known about the everyday activities for both partners following a stroke. However, it is important to gain an understanding of everyday activities after a stroke from a couple's perspective, because performing meaningful activities positively influences the health and well-being of both partners. This exploratory case-study aims to understand an older couple's experience of their everyday activities following a stroke. Methods The participating couple were both over 80 years old. Data were collected with 10 individual and joint in-depth interviews through multiple home visits over a period of seven months, three years after the wife's stroke. Analysis followed a narrative approach, resulting in the construction of two personal stories and one joint story, showing the meaning they both attached to their experiences. The validity of the findings was optimised

through data triangulation, the use of a research diary, by a peer-review and through a member-checking process. Results The main finding is that the couple functioned like one entity with coordinating parts. For almost 24 hours a day, their everyday activities were fully intertwined. Their functioning as one entity was conceptualised as 'one body, three hands and two minds'. The timing, coordinating, balancing, orchestrating and assisting of their everyday activities was done by this entity and together they maintained their independence at home. Conclusion The findings suggest that in practice more attention should be given to the interdependency of people and their close social environments. The findings also point towards the need for the development of assessments and interventions that address these complex family systems.

**PC8 644 THE OLD FOLKS AT HOME: VIEWS OF AGING IN CHILDRENS LITERATURE**

M. DONOHUE-SMITH\* (Elmira College, Elmira, United States)

Introduction: Attitudes toward aging develop early in life. Researchers found negative attitudes toward the elderly even among preschoolers. Children's books can promote realistic, positive views of what it means to be "old," particularly in cultures where intergenerational interaction is limited. Unfortunately, in many children's books, the elderly play secondary characters who are irritable and frail, living unexciting lives. Older "characters" situations are also frequently negative (e.g., illness, social isolation, depression). This paper examines children's literature and: 1) summarizes the research on portrayals of aging; 2) reviews strategies for identifying ageism; and; 3) describes how children's literature fails to reflect accurately the contemporary ecology of aging. Methods: Fifty picture books were selected from the bibliographical sourcebook, A to Zoo: subject access to childrens picture books. Only books currently in circulation at the local public library were included. Portrayals of aging in these books were rated using the Ageism in Literature scale. Elements of plot and social contexts were also analyzed. Results: Negative themes and attributes related to aging are disproportionately represented. Loss, disability and separation are common storyline elements, and characters reside in nursing home in greater numbers than their "real world" counterparts. The differential effects of socioeconomic class and ethnicity on the aging experience are not well-delineated. In addition to the restricted range of social roles in which older characters are cast, the books illustrations also represent a relatively narrow range of the continuum of physical appearance and ability. Conclusions: Meaningful disparities exist between the literary picture of aging and its reality that remain to be resolved. One is left with significant questions about how broadly the concepts, "aging" and "elderly," are even defined. Recommendations are included to assist authors in understanding and incorporating the new patterns of aging anticipated among baby boomers.

**PC8 645 SOCIAL RELATIONSHIPS AND DEPRESSION AMONG PEOPLE 65 YEARS AND OVER LIVING IN RURAL AND URBAN AREAS OF QUEBEC**

D. MECHAKRA-TAHIRI\* (Université de Montréal, Outremont (Québec), Canada)

M. ZUNZUNEGUI(1), M. PRÉVILLE(1), M. DUBÉ (1) - (1) Université de Sherbrooke (Montréal, Canada)

Introduction: Studies on prevalence of depression in the elderly population have produced conflicting results with respect to context of daily living. This study compares the prevalence of depressive disorders in the elderly living in rural, urban and metropolitan area of Quebec and examines the association between social networks and depression, according to area of residence. Methods: We used data from the ESA survey, conducted in 2005-2006 on a representative sample of 2670 community dwelling people over 65 in Quebec. Depressive disorders (including major and minor depression) were measured by the DSM-IV criteria using the ESA questionnaire developed by the research team. Social relationships were measured by aspects of social networks (marital status and diversity of ties), engagement in community social activities (religious attendance, frequenting social centers, volunteerism), social support, perception of usefulness and presence of conflict in the relationships with spouse, children, siblings and friends. Multiple logistic regressions were adjusted to estimate odds ratios and their 95% confidence intervals. Results: Prevalence of depression was higher among those living in rural (17%) and urban areas (15.1%) of Quebec compared with metropolitan Montreal (10.3%). Social relationships did not modify these differences between areas. Volunteerism, social support and not having conflict with the spouse were associated with lower frequency of depression independently of the area of residence. Independently of all factors considered, those living in urban areas (OR:1.75; IC95 %:1.25-2.45) and those living in rural areas (OR:2.01; IC95 %:1.59-2.68) were more depressed than those living in the metropolitan area. Conclusion: Given the scarcity of Canadian studies on depression prevalence among the elderly population, these results on depression and its associated factors provide important information for clinicians and decision makers for planning and targeting of services by area of residence

**PC8 646 THE EFFECT OF LIFE REVIEW GROUP PROGRAMS IN THE ELDERLY IN TAIWAN**

K. CHOU\* (Taipei Medical University, Taipei, Taiwan)

Objective: This study was aimed at evaluating whether a Life Review Group Program (LRGP) improved the self-esteem and life satisfaction in the elderly. Methods and

materials: This randomized, controlled trial consisted of 75 elderly males from a Veterans' Home in Northern Taiwan, 36 of whom were in the experimental group and 39 of whom were in the control group. The subjects in the experimental group participated in an 8-week LRGPs. Data were collected before and after the LRGPs and again 1 month after the end of the program. Results: The study subjects had a mean age of 78.13 years. The generalized estimating equation was used to compare alterations in the self-esteem and life satisfaction of the elderly before and after the intervention. The alterations in self-esteem and life satisfaction in the experimental group after the LRGPs were significantly improved compared to the control group. One month after the LRGPs was completed, the self-esteem and life satisfaction of the experimental group continued to improve when compared with pre-intervention levels. Conclusions: Based on these results, the LRGPs can potentially improve the self-affirmation, confidence, and self-esteem of the elderly and promote short-term life satisfaction. The results of this study provide a model for clinical evidence-based therapy, serving as a reference for related studies and evaluation of health-promoting programs, as well as improving the health and quality of care of the elderly.

**PC8 647 SUCCESSFUL AGEING: LIFE SATISFACTION AND EXERCISE IN OLDER ADULTS (50-80 Y.O)**  
 I. GUSE-BRENNFLECK\* (SamSa Consulting Group Pty.Ltd., Kallista , Australia)  
 C. LOVELL(1) - (1) University of Ballarat (Ballarat, Australia)

Introduction In view of an internationally ageing population it is important to attend to the generally negative perception of the ageing process and how this process can be improved in terms of life satisfaction. Various models of successful ageing have been presented to date and definitions include aspects such as freedom from disease, continuing autonomy and personal development. The WHO in its Active Ageing Policy has highlighted the relevance of a biopsychosocial model of successful ageing rather than a biomedical model. As there is no current valid and accepted measure of successful ageing, it was decided to apply existing measures of life satisfaction as the most suitable instrument. The present study was conducted to investigate whether high levels of exercise engagement results in significantly higher scores for life satisfaction, meaning, self-concept and goal orientation in comparison to moderate or no exercise engagement. Method and Materials: The study involved 121 participants, male/female, 50-80 y.o. from Outer East Melbourne, Australia. Three levels of exercise engagement were established: heavy, moderate and non-exercisers. The questionnaire package included the Satisfaction with Life Scale (SWLS) and the Life Satisfaction in Elderly Scale (LSES) with subscales meaning, self-concept and goals orientation. Results: More women than men were involved in exercise. Aerobic exercise participation outweighed participation in strength/stretch exercise. Engagement in heavy exercise was present across the 50-80 y.o. The scores for LSES and meaning of heavy exercisers were statistically significantly higher than those of non-exercisers. However, scores for the SWLS, self-concept and goals were not significantly different. Conclusion: Higher levels of exercise engagement are positively related with higher levels of life satisfaction and meaning. However a positive relationship between higher levels of exercise and global life satisfaction (SWLS), self-concept and goals was not supported.

**PC8 648 ARE BENEFITS OF PHYSICAL ACTIVITY ON COGNITIVE FUNCTIONS THE SAME FOR YOUNG AND OLDER ADULTS ?**  
 P. MAILLOT\* (UFR STAPS Laboratoire L3P EA 2494, Orsay cedex, France)  
 A. PERROT(1), C. GAGNON(2), J. BERTSCH(1) - (1) UFR STAPS Laboratoire L3P EA 2494 (Orsay cedex, France); (2) Cognitive Health and Aging Research Lab Université du Québec à Montréal, Institut universitaire de gériatrie de Montréal (Montréal, Canada)

Introduction: The present study was conducted to examine whether the impact of physical activity on cognitive functions in older and younger adults is dependant of the presence of a time constraint in a cognitive test. Methods and materials: Thirty-one young adults and 31 older adults, assigned to active or inactive groups, according to their amount of regular physical activity were tested on 2 performance cognitive tests, having no time pressure or constraint and 2 speed of processing cognitive tests, presenting high time pressure. Results: For older participants, results revealed that performance scores on the four tests were significantly higher for active older adults than for their inactive counterparts. For younger participants, results showed that young active participants did not obtain higher performance scores than young inactive participants on performance cognitive tests but obtained higher performance scores on time constraint cognitive tests. Conclusion: This preliminary study suggests a dual intervention of physical activity, dependant of cognitive functions characteristics. Physical activity would allow a general alleviation of age-related cognitive deficits and a specific optimization at all ages of cognitive functions requiring high speed processing component.

**PC8 649 A PSYCHOANALYTIC INTERVENTION FOR ADULTS OVER 65 YEARS WHO ARE DEMENTIA CAREGIVERS**  
 G. DONOHUE\* (University College Dublin, Dublin, Ireland)

Existing caregiver interventions fall into two general categories: interpersonal peer to peer support and instruction based support. Peer to peer support involves learning from others in an informal, discussion oriented setting. Most Alzheimer Association support groups are built around this experience. Instruction based support, in contrast involves focused and

organised discussion around an instrumental or psychoeducational topic or theme. What has not been looked at in any great detail is a psychoanalytic intervention looking specifically at the notion of loss, which has only recently been identified as the single biggest barrier for dementia caregivers even before hands on care, lack of support and financial burden is taken into account. This notion of loss and how it is represented via the ageing caregiver and the articulation of their experience is what the focus of this research rests on. How the articulation of this often traumatic experience can aid in the reduction of overall felt burden is the question and if it does what are the implications for future treatment. This research looks at a short-term psychoanalytic intervention in adults over 65 years who are caregivers to spouses with dementia.

**PC8 650 INTEREST OF VISUAL RECOGNITION MEMORY TASK TO DIFFERENTIATE CORTICAL AND SUBCORTICAL PATTERNS OF DEMENTIA.**  
 K. MONDON\* (CHRU de Tours, Tours, France)  
 B. AMAND(1), E. BEAUFILS(1), F. CHALANSON(1), D. BEAUCHAMP(1),  
 A. GOCHARD(1), B. DE TOFFOL(1), C. BELZUNG(2), T. CONSTANS(1),  
 C. HOMMET(1) - (1) CHU de Tours (Tours, France); (2) INSERM U930 (Tours, France)

INTRODUCTION: to determine the ability of DMS48 test to differentiate cortical and subcortical patterns of dementia. METHODS AND MATERIALS: 11 Alzheimer's disease patients (AD) (cortical dementia), 10 Parkinson patients with dementia (PDD) (subcortical dementia) and 10 Parkinson patients without dementia (PD). RESULTS: Patients with AD had poorer performances than patients with PDD ( $p<0.01$ ) or PD ( $p<0.001$ ). PDD and PD patients had similar performances. Comparison showed a tendency for PDD patients to make more errors than PD patients when unique items were presented ( $p<0.0505$ ). CONCLUSION : The DMS48 is a useful test for differentiating patterns of dementia.

**PC8 651 AWARENESS OF ONE'S FUTURE LIMITATION AND WELL BEING TESTING CARSTENSEN'S MODEL IN 23 EUROPEAN COUNTRIES**  
 G. COUDIN\* (Université Paris Descartes, Boulogne-Billancourt, France)  
 L. LIMA(2) - (2) ISCTE (Portugal)

Introduction: As people move through life they become increasingly aware that time is in some sense "running out." According to the socio-emotional selectivity theory (Carstensen, 1991) those who have a limited perspective about their future (as opposed to those who see their future as open-ended) have to adapt in order to optimise their resources. The perception of time plays a central role in the prioritisation of social goals and subsequent preferences for social partners. Although there is an association of this FTP with age, this is a variable with a distinctive path, as the same pattern of results is found in young samples with health problems. Methods and materials: Using some questions of the European Social Survey (ESS3, 2006) on 43000 subjects from 23 European countries, an indicator was constructed to discriminate between those with different FTP. Results: An open-ended FTP is negatively associated with age ( $r=-.200$ ;  $p<.001$ ) and sickness ( $r=-.217$ ;  $p<.001$ ). This open-ended vision of the future is associated with social acceptance and autonomy, while a limited vision of the future promotes emotional regulation and the transmission of knowledge and values to the next generations (generativity). These results reproduce quite well those obtained by Lang et Carstensen (2002). The association between FTP and well-being (controlling for age) was also considered. Although those with an open-ended FTP show slightly higher levels of subjective well-being ( $M=7.2$ ) as compared to those with a limited one ( $M=6.9$ ), the effect size of this variable is neglectable ( $\eta^2=0.001$ ) as compared with the congruence of goals ( $\eta^2=0.11$ ). Conclusion: Those with open-ended FTP, autonomous and with a strong social life, and those with a limited FTP who can implement generativity and emotional regulation strategies are equally happy.

**PC8 652 NEIGHBORHOOD ENVIRONMENT AND PHYSICAL ACTIVITY OF OLDER ADULTS: DEVELOPMENT OF AN AUDIT TOOL AND USE OF PHOTVOICE**  
 H. CHAUDHURY\* (Simon Fraser University, Vancouver, Canada)  
 A. SARTE(1), A. MAHMOOD(2), Y. MICHAEL(3) - (1) Simon Fraser University (Canada); (2) Oregon State University (United States of America); (3) Oregon Health & Science University (United States of America)

Introduction: Interest in environmental determinants of physical activity has prompted development of instruments to measure physical environmental features in neighborhood settings. However, the majority of the existing audit tools are not designed to address the specific needs and issues of older adults. Also, there is no study examining the interrelated role of the neighborhood's physical and social environments on physical activity for older adults. The goal of this study was to examine the effect of neighborhood physical environment and social capital on the physical activity of older adults. Methods: Eight neighborhoods were selected across Vancouver, British Columbia and Portland, Oregon regions that represent variation in residential density and mixed land-use. Phase I entailed development of an environmental audit tool "SWEAT-R" (Seniors Walking Environmental Audit Tool – Revised) and assessment of 160 and 197 street segments in the selected Portland and Vancouver neighborhoods, respectively. Phase II employed photovoice technique whereby older adults directly engaged in the research process by photographing and journaling their unique perceptions of their neighborhood environment in relation to

physical and social barriers and facilitators to being physically active. Results: Inter-rater reliability of the revised Seniors Walking Environmental Assessment Tool (SWEAT-R) indicate that percent agreement between paired observers was 95% or higher for more than 80% of SWEAT-R items across both regions. SWEAT-R reliability was highest for Safety and Destination items and lowest for Aesthetic items. Photovoice-based themes identify neighborhood settings that are multipurpose, such as malls, community centres, etc. that attract older adults for socialization, shopping, walking etc., and importance of transportation options. Conclusion: SWEAT-R is a reliable environmental audit instrument that can be used in different regional contexts and neighborhoods. Also, photovoice data indicate the interrelated nature of neighborhood physical and social aspects in affecting physical activity.

**PC8 653 MAIN FACTORS EVOLUTION OF THE MINI-MENTAL STATE EXAMINATION (MMSE) IN THE COGNITIVE IMPAIRMENT**

V. DUARTE CAMARA\* (Universidade Federal Fluminense, Niteroi, Brazil)  
J. ALMEIDA MACHADO CORREA LIMA(1), Y. MOREIRA BOECHAT(1),  
L. SILVA(1) - (1) Universidade Federal Fluminense (Niteroi, Brazil)

Introduction: The items of the MMSE protocol link themselves to reveal latent factors of dementia process. Some factors are more important than other ones in the explanation of the process. This study investigates the main factors present in the scores of MMSE for old people classified as no dementia, questionable dementia and mild dementia. Methods and materials: A sample of 180 aged people classified as no dementia, questionable and mild of the Clinical Dementia Rating had the underlying factors of MMSE identified through the Factor Analysis of Principal Components. Results: Preliminary results show no dementia with low scores because of temporal disorientation (Year, Day of the Month, Day of the week and Month), questionable dementia with commit items of the most refined tasks of Language (reading, writing and copying) and mild dementia with commitment of items of temporal-spatial orientation (Place, specific Place, Week, Year, Month). Conclusion: The last three items of MMSE Language section constitutes the main factor of identification of dementia questionable cases. Items of temporal and spatial orientation constitute the main factor for mild dementia. The analysis of the evolution of the factors allows notice the evolution of MMSE items that are committed with the process evolution.

**PC8 654 THE MEDIATING ROLE OF COPING STRATEGIES ON GERIATRIC MENTAL HEALTH AND QUALITY OF LIFE**

R. GAUTAM\* (Indian Institute of Technology Kanpur, Kanpur, India)

Old age is the most challenging period of one's life that coalesce physical, social, emotional, and spiritual challenges. Successful and meaningful aging involves psychological well-being, life satisfaction, and a health-promoting lifestyle. All of it demands continued growth despite overwhelming odds. This remarkable ability, referred as resilience, also seems to have spiritual anchor in various cultures. Although an individual's emotional and psychological well-being has been correlated to resilience and spirituality, the dynamics of it needs to be explored, especially in civilizations with strong religious underpinning. The aim of this study was to explore the mediating effect of coping strategies on the relationship between resilience and bent towards religion and two indicators of mental health (cognitive competence and fear of aging) and quality of life. Resilience and bent towards religion were the independent variables whereas mental health (cognitive competence and fear of aging) and quality of life were the dependent variables. Coping strategies were the mediating variable in this study. 390 subjects (198 males and 192 females) with the age ranging from 50-90 years ( $M = 64.85$ ,  $SD = 9.63$ ) participated in the study. The resilience scale, ways to religious coping, proactive coping inventory, clinical assessment scale for the elderly and quality of life index were administered to them. The data was analyzed to see the mediating effect of coping strategies on the relationships between the independent and dependent variables through regression analysis. Results showed that preventive, strategic and reflective coping strategies mediated the relationship between resilience and mental health (cognitive competence and fear of aging) whereas proactive coping strategy mediated the relationship between resilience and quality of life. Preventive and emotional coping strategies emerged as mediator between religiosity and mental health. None of the coping strategies mediated the relationship between religiosity and quality of life.

**PC8 655 THE MEANING OF FEAR OF FALLING AMONG COLOMBIAN ANDES-MOUNTAINS ELDERLY PEOPLE**

C. CURCIO\* (Centre de recherche sur le vieillissement, CSSS-IUGS, Sherbrooke, Canada)  
C. HELENE(1), B. MARIE(1) - (1) Centre de recherche sur le vieillissement, CSSS-IUGS (Sherbrooke, Canada)

Background: Fear of falling ranks as the most important fear of older adults living in community dwellings. Even though fear of falling is a significant health problem among the elderly, little reported research was published that investigated this issue in participants' viewpoints and the meanings and perceptions of the elders' experiences of the fear of falling. Objective: The purpose of this study is to explore the underlying theoretical framework of fear of falling among Andes-Mountains elderly people. Methods: A

grounded theory approach was used. Theoretical sampling was used to saturate the emergent concepts. Individual open, semi-structured and in-depth interviews were conducted with 32 community-based participants who reported fear of falling. Interviews were audiotaped as agreed by the participants. Analysis: Data was analyzed following the grounded theory principles: open coding and memos for conceptual labelling, axial coding and memos for category building, and selective coding for model building. Results: Fear of falling is described as an experience often linked with fear of incapacitation, fear of disability, fear of dependence and lack of autonomy. Four themes emerged from data analysis: aging process, activity restriction and limitations in social activities, adjustment of behavior and geographic and architectural environment. Conclusion: This study's findings reveal that fear of falling is not related to the physical functioning. Furthermore, fear of falling does not only has negative aspects, such as psychosomatic symptoms and activity restraints, but it has also positive aspects, such as risk prevention, behavioral and environmental adaptations,, and new resources development by seeking help.

**PC8 656 THE ROLE OF COGNITIVE FUNCTIONING IN OLDER ADULTS' TERROR MANAGEMENT STRATEGIES**

T. PYSZCZYNSKI\* (University of Colorado at Colorado Springs, Colorado Springs, United States)  
M. MAXFIELD(1), J. GREENBERG(2), S. SOLOMON(3), H. DAVIS(1) - (1) University of Colorado at Colorado Springs (Colorado Springs, United States of America); (2) University of Arizona (Tucson, United States of America); (3) Skidmore College (Saratoga Springs, United States of America)

Terror management theory posits that awareness of death influences diverse human behavior. In research with younger adults, reminders of death result in diverse outcomes including harsher judgments of moral transgressors. Recent research has shown that contrary to these findings with younger individuals, older adults respond to death reminders by making more lenient judgments. Based on diverse theories that posit developmental accommodations to cope with increasing age, we interpreted this as suggesting that more tolerant and open attitudes might help older adults cope with their increased proximity to death. If this leniency is part of an adaptive accommodation, it would be most prominent among persons with superior cognitive functioning. However, if it is a result of cognitive decline, it would be most prominent among those with cognitive impairments. Older adults who had previously completed a diverse array of cognitive measures were randomly assigned to reminders of either death or an aversive control topic. Next, participants read vignettes describing violations of social norms and were asked to indicate the severity of the wrongdoing and harshness of an appropriate punishment. Level of executive functioning was of particular interest, as this includes complex cognitive tasks, such as inhibition and moral reasoning. Following reminders of death, older individuals with higher levels of executive functioning (as measured by the artificial grammar and self-ordered pointing tasks) were significantly less punitive than controls; those lower in executive functioning tended to be more punitive than controls. Executive functioning appears to contribute to the development of new strategies for coping with mortality. The present results raise the possibility that older adults with greater capacity for complex thought and reasoning, as suggested by higher scores on tasks of executive functioning, may be better equipped to accept their mortality, or at least respond to it with more tolerance of deviant others.

**PC8 657 MORTALITY SALIENCE EFFECTS ON CONCERN ABOUT COGNITIVE IMPAIRMENT AND PERFORMANCE**

M. MAXFIELD\* (University of Colorado at Colorado Springs, Colorado Springs, United States)  
T. PYSZCZYNSKI(1), J. GREENBERG(2) - (1) University of Colorado at Colorado Springs (Colorado Springs, United States of America); (2) University of Arizona (Tucson, United States of America)

Many older adults worry about cognitive problems. Terror management theory suggests that humans' cope with their awareness of death, in part, by exaggerating their well-being. This suggests that death-related fears might encourage denial of fear of cognitive decline among older adults. Previous research has shown that older adults typically do not show the same defenses against death reminders that younger adults do. This study investigated the possibility that older adults are still threatened by death, but defend against this fear in domains of particular relevance to their lives. We hypothesized that death reminders would influence older but not younger adults' concern about cognitive impairment and performance on a cognitive screen. Younger and older adults (from communities that either encouraged continued intellectual engagement or did not) were randomly assigned to death reminder or control conditions and rated their fear of developing cognitive impairment. Older participants were given a brief cognitive screen following the study. Older adults reported greater concern about cognitive impairment. The age x prime interaction was significant. Older adults reminded of death reported lower concern about cognitive impairment compared to older adults in the control condition. Younger adults were unaffected by this prime. Older adults from the community emphasizing education made fewer errors when reminded of death, while older adults from the community without requirements made more errors when reminded of death. The reduction in concern about cognitive impairment after reminders of death in older adults likely reflects a defensive denial of this concern, which helps minimize existential anxiety; this was not found in

younger adults because cognitive decline is likely less threatening for them. The fact that older adults in an environment that encourages cognitive engagement responded to death reminders with improved cognitive performance provides further evidence of the importance of cognitive functioning for existential security.

**PC8 658 MEANING OF SEXUALITY AND SEXUAL WELL-BEING IN INDIVIDUALS AGED BETWEEN 65 AND 78 AND LIVING IN COUPLE IN QUEBEC, CANADA**

A. BOUCHER\* (University of Sherbrooke, Longueuil, Canada)

G. LECLERC(1), A. BRASSARD(1) - (1) University of Sherbrooke (Sherbrooke, Canada)

**Introduction:** In the Western society, values of productivity, youth and beauty are deeply rooted in the everyday life of people of all ages, stressing out the necessity of sexual activity and performance, even in old age. Also omnipresent in research and clinical gerontology, this attitude is jeopardizing the development of senior's sexual well-being, which is nevertheless known to be a key component of healthy personal development, overall well-being and happiness (APA, 2007). The lack of studies on sexuality and sexual well-being in aging generates the need for an intimate, comprehensive analysis of this reality. **Methods and materials:** This study explores the meaning given to sexuality and sexual well-being in in-depth individual interviews conducted with five healthy, retired individuals aged between 65 and 78 and living with their spouse in Quebec, Canada. Data are analysed qualitatively according to the iterative technique of Miles and Huberman (2006). **Results:** Sexuality has meaning into a loving relationship, and encompasses self-giving behavior, feeling of intimacy, sexual intercourse, caresses and kisses, and communication. Seniors reported that feelings of sexual well-being were created by emotional and physical sexual satisfaction, self-esteem and esteem of the loved one, as well as affection and tenderness. **Conclusion:** Among the elderly, meaning given to sexuality is very broad, sexual well-being going much beyond feelings of physical satisfaction related to sexual activity. Sexual well-being is conceived as an important element of love, life meaning and happiness.

**PC8 659 THE LONGITUDINAL ASSOCIATIONS BETWEEN FUNCTIONAL DISABILITIES, GOAL ADJUSTMENT CAPACITIES AND DEPRESSIVE SYMPTOMS IN OLDER ADULTS**

E. DUNNE\* (Concordia University, Montreal, Canada)

C. WROSCH(1) - (1) Concordia University (Montreal, Canada)

**Introduction:** The rising life-expectancy in industrialized nations creates an increased potential for the experience of age-related challenges in older adulthood. One important aspect of older adults' lives that may be affected by age-related challenges, such as functional disabilities, is their ability to pursue goals. While making progress towards goals can contribute to subjective well-being (Carver & Scheier, 1990), goals that have become unattainable may lead to emotional distress (Wrosch et al., 2003). Therefore, individuals must be able to adapt to changes in opportunities across the lifespan, and adjust their goals accordingly in order to avoid the negative consequences associated with failed goal progress. In this way, goal disengagement capacities ("letting go" of unattainable goals) and goal reengagement capacities (identifying and pursuing new goals) may help older adults adaptively cope with age-related challenges and maintain their emotional well-being. Such emotional resources may, in turn, play an essential role in maintaining older adults' capacities to adjust to subsequent challenges. **Method:** We examined the longitudinal associations between older adults' goal disengagement and goal reengagement capacities, depressive symptomatology (CES-D), and functional disabilities (ADLs). Three waves of data, spanning four years, were collected using questionnaires from a sample of community-dwelling older adults (NT1=215, NT2=184, NT3=164), aged 63 and older. **Results:** Regression analyses indicated that baseline difficulty with goal disengagement contributed to two-year increases in depressive symptoms, particularly among those older adults who experienced an increase in functional disabilities. Additionally, older adults who developed greater depressive symptoms over the first two years subsequently experienced more difficulty disengaging from unattainable goals. These findings indicate that self-regulation capacities and emotions can reciprocally influence each other: Problems with goal disengagement can contribute to depressive symptomatology, and these depressive symptoms may subsequently deplete older adults' capacities to disengage.

**PC8 660 ITEM STORAGE VS ORDER PROCESSING IN OLDER ADULTS' PERFORMANCE ON SERIAL RECALL TASKS**

R. BAKER\* (The University of Queensland, Brisbane, Australia)

G. TEHAN(2) - (2) University of Southern Queensland (Brisbane, Australia)

**Introduction** Forward and backward serial recall tasks frequently appear in tests of cognitive function. Although it has been shown that forward recall is easier than backward recall, and that both show a decline with ageing, the memory processes involved in such tasks remain little understood. Specifically, it is not known to what extent any decline in performance on serial recall in ageing is due to a decreased ability to retain items in short-term memory, and/or to the ability to retain or manipulate the order of the items. **Methods and materials** Participants are 30 adults aged 17-29 and 30 healthy adults aged 60-75. To investigate the relative demands of item storage and order processing in both forward and

backward serial recall, their performance is compared on two task formats: (i) a standard serial recall format, in which the words to be repeated (or re-ordered) must be remembered; and (ii) an order reconstruction format, in which the words remain visible during production of the required sequences. **Results** Data will be presented showing the difference in performance between younger and older adults, and the extent to which older adults' recall of word sequences is facilitated by provision of the items to be reproduced. The demands of item storage will thus be teased apart from the demands of order repetition (in forward recall) or order manipulation (in backward recall). **Conclusion** The results will provide insight into specific memory processes affected by age-related change, and implications will be drawn for the provision of environmental support to maximise memory function in ageing.

**PC8 661 DYSFUNCTIONAL ALCOHOL CONSUMPTION IN THE CONTEXT OF DEPRESSIVE SYMPTOMS, LEISURE ACTIVITY, AND 4-YR CHANGES IN PHYSICAL HEALTH SYMPTOMS AMONG ELDERLY MEN**

R. RUEGGEBERG\* (Concordia University, Montreal, Canada)

C. WROSCH(1), F. AMARI(1) - (1) Concordia University (Montreal, QC, Canada)

The adverse impact of depressive mood on physical decline and increased mortality risk can be more pronounced among elderly men as compared to women (Kaarin, 2002). Furthermore, the association between depressive symptoms and physical health may be influenced by individuals' engagement in lifestyle activities. In this regard, depressed men but not depressed women have been shown to regulate their mood by participating in leisure activities that co-occur with health-compromising behaviors (e.g., alcohol abuse, Angst et al., 2002). Since alcohol consumption can predict increases in physical symptoms over time (Moore et al., 2003), any health benefits gained through leisure activities may be undermined among depressed men. Thus, in order to identify factors that influence the association between depressive symptoms and health decline among elderly men, the aim of this study was to investigate the impact of depressive symptomatology and leisure activities on their physical health. We hypothesized that only those elderly men who report low levels of depressive symptoms, but not those who report high levels of depressive symptoms, would benefit from the positive impact of leisure activities on physical health. Further, it was hypothesized that the interaction effect between depressive symptoms and leisure activities on physical health would be mediated by levels of alcohol consumption. To test these hypotheses, 164 older adults from Montreal were examined three times over a period of four years. This study assessed physical symptoms, depressive symptomatology, leisure activities, alcohol consumption, and sociodemographic characteristics. In support of the hypotheses, men who reported low levels of depressive symptoms and engaged in leisure activities showed significant lower increases in physical health problems over time, as compared to their counterparts who engaged in leisure activities but reported high levels of depressive symptoms. Moreover, the analyses showed that this interaction effect was mediated by alcohol consumption.

**PC8 662 ART OF LIVING IN OLDER ADULTS: A CONCEPT EXPLORATION AND CONSTRUCTION OF A MEASUREMENT INSTRUMENT**

C. SMITS\* (Windesheim University of Applied Sciences, Zwolle, The Netherlands)

J. POLS(1), G. WESTERHOF(2), A. BERGSMA(2) - (1) University of Amsterdam (Amsterdam, The Netherlands); (2) Universiteit Twente (Enschede, The Netherlands)

**INTRODUCTION** The concept Art of living reflects the way people live their lives gracefully. This study aims to explore the concept Art of living [In Dutch: Levenskunst] and construct an Art of living scale that can be used in research that may reveal the ingredients of a good life. **METHOD** In three studies we aimed to obtain answers to our questions: 1. In a qualitative study participants and program coaches of four Art of living programs were interviewed and observed. 2. A concept map meeting was organised to explore the concept art of living. This mapping group discussion resulted in a working definition that was used for the construction of an Art of living scale. 3. This Art of living scale was used in a survey with older adults and in a web based survey amongst national newspaper readers. **RESULTS** Two groups of older adults participate in Art of living programs: "Life artists" and "Seekers". Two Art of living dimensions were distinguished: "control" and "receptiveness". The concept map study resulted in definitions with nine related dimensions. The survey (n=173) and web based data show that older adults rate their personal Art of living positively. Art of living is not associated with age, sex or education. A positive (high) Art of living score is associated with less mental health complaints and high Mastery and Happiness scores. **CONCLUSION AND DISCUSSION** Art of living has various dimensions that can be translated into an Art of living questionnaire with acceptable psychometric characteristics. Art of living thus quantified is related to concepts as Mastery and Mental Health, but can also be clearly distinguished from them. Further research into Art of living as a concept and scale can be of use in interventions based on positive psychology approaches.

**PC8 663 QUALITY OF CARING RELATIONSHIPS IN SOMATIC NURSING HOMES: THE RELATION OF NEED-FULFILLMENT WITH WELL-BEING OF RESIDENTS.**

A. CUSTERS\* (Radboud University Nijmegen, Nijmegen, The Netherlands)  
. WESTERHOF(1), D. KUIN(2) - (1) University of Twente (Enschede, The Netherlands);  
(2) Radboud University Nijmegen (Enschede, The Netherlands)

Introduction: Quality of life in nursing homes is becoming more important in both research and practice. Although it is assumed that quality of life is highly influenced by caring relationships, there are still few empirical studies on long-term care for somatic patients. In the present study this topic was investigated using the self-determination theory. Satisfaction of the basic psychological needs of autonomy, relatedness and competence in the caring relationship was expected to relate positively to the subjective well-being of residents. Methods and materials: 81 residents (50- 97 years old), residing in six nursing homes in the Netherlands, were interviewed. Subjective well-being was measured using the Geriatric Depression Scale and the Satisfaction With Life Scale. Residents' perceptions of need fulfillment in the caring relationship and need fulfillment in general were measured with Dutch translations of the Basic Need Satisfaction in Relationships Questionnaire and the Basic Need Satisfaction in Life Scale. Results: The mean perceived amount of need fulfillment in the caring relationship is relatively high. Need fulfillment in the caring relationship is positively related to need fulfillment in general, as well as to subjective well-being. Need fulfillment in general partially mediates the relation of need fulfillment in caring relations with subjective well-being. The relations remain significant after controlling for personality, health status and demographic variables. Conclusion: Satisfaction of residents' needs for autonomy, relatedness and competence is related to their subjective well-being. The quality of caring relationships is thus an important topic for further study. However, residents appeared to be hesitant to criticize their caregivers. Therefore observational studies are needed to contribute to our knowledge about the quality of caring relationships and its effects on well-being of residents. A longitudinal observational study concerning the three needs in caring relationships is presently being carried out.

**PC8 664 IMPACT OF LIFELONG EDUCATION ON QUALITY OF LIFE AT LATE ADULTHOOD: A BASELINE REPORT OF THE 3-YEAR LONGITUDINAL STUDY**

B. LIU\* (The Open University of Hong Kong, Kowloon, Hong Kong)

Introduction Capacity Building Mileage Programme, a project for enhancing the quality of life of adults, was launched in Hong Kong in 2004. Up to March 2008, 6,541 students enrolled to study in the programme, and 720,000 audiences listened to the radio broadcasts. Methods and materials The longitudinal study, started in 2008, examines the changes of participants' quality of life over time. Measurements included General Self-Efficacy Scale, Sociopolitical Control Scale, Quality of Life Ladder (QoLL), Somatic Complaint Scale, Perceived Health, and List of Threatening Experience. Results 15.3% of the participants (n=1003) returned the questionnaire. The mean age was 50.6 (SD=7.8, range: 18-78), and 96.9% of them were female. On average, they studied 6.3 courses (SD=7.5, range: 1-49) since 2004. Respondents age 55 to 59 took more courses ( $p<.001$ ), but those age 60 and over had more interest for further study after graduation than others ( $p<.001$ ). 33.1% of them perceived their health better than before. Respondents reported, on average, having 8.6 somatic complaints (SD=3.2, range: 1-12), and those at late adulthood suffered fewer numbers of somatic complaints ( $p<.05$ ). The mean score for QoLL is 6.4 (SD=1.6, range: 1-10), and those age 55 to 59 achieved better than others ( $p<.05$ ). Multiple regression analysis shows that a higher score of QoLL of those respondents age 60 and over was attributed to their higher score in leader competence ( $p<.01$ ) and planning for further study ( $p<.05$ ) (adjusted  $r^2=.11$ ,  $p<.001$ ). Conclusion Findings suggest significant relationships between older adults' quality of life with self-efficacy and interest for further study. Lifelong education to older persons may be effective to enhance their biopsychosocial well-beings.

**PC8 665 IMPROVING OUTCOMES OF DRIVING CESSION FOR OLDER PEOPLE: EARLY RESULTS FROM A RCT OF THE UQDRIVE GROUPS.**

L. GUSTAFSSON\* ( University of Queensland, Brisbane, Queensland, Australia)  
J. LIDDLE(1), N. PACHANA(1), G. MITCHELL (1), M. HAYNES(1) - (1) University of Queensland (Brisbane, Australia)

Introduction: Driving cessation has been recognised as having substantial negative impact on the community mobility, role participation, health and wellbeing of older people. The UQDRIVE (University of Queensland Driver Retirement Initiative) group program was developed based on interviews with over 250 older drivers, retired drivers, family members and health professionals. It includes community based interventions to improve lifestyle and quality of life of older people facing driving cessation. A randomised controlled trial of UQDRIVE is underway in South East Queensland, Australia. Methods and materials: People aged 60 years and above, living in the community, who had permanently ceased driving or were planning to do so were randomised to either the UQDRIVE intervention or current practice (no intervention). Measures of wellbeing and lifestyle outcomes were undertaken prior to the intervention, immediately after the intervention and three months later. For intervention participants, individual transport and lifestyle goal setting and evaluation using the Canadian Occupational Performance Measure (COPM©) were

undertaken pre and post the intervention. Results: Preliminary results after 12 months of data collection will be described. Goals set by group participants included adjustment to driving cessation, driving safety, and role participation. Preliminary analyses of COPM scores indicate significant differences pre and post in perceived performance (mean difference = 3.22 points;  $t = 7.11$ ;  $df = 19$ ;  $p < 0.0001$ ) and satisfaction with performance (mean difference = 3.53 points;  $t = 6.52$ ;  $df = 19$ ;  $p < 0.0001$ ) scales. Comparison between control group and intervention group scores on episodes away from home, depression, anxiety and life satisfaction will also be reported. Conclusion: This paper provides an overview of the UQDRIVE program, the randomised controlled trial currently underway and presents preliminary findings.

**PC8 666 AGE EFFECT ON MEMORY SELF-CONFIDENCE**

A. SHIMANOUCHI\* (Meiji Gakuin University, Tokyo, Japan)  
S. SATO(1) - (1) Meiji Gakuin University (Tokyo, Japan)

[Introduction] The purpose of this study was to develop a metamemory scale on memory self-confidence which could apply to the elderly in comparison with young adults. Then we will examine other memories using this scale. [Methods and Materials] Participants were 277 young university students ( $20.6 \pm 0.5$  years of age) and 94 old-age students learning at school for the elderly ( $72.0 \pm 0.4$  years of age). We used a newly-developed scale measuring the degree of self-confidence on subjective memory performance called metamemory (15 items, 4 judgments: Metamemory Scale of Self-Confidence, MSSC). At the same time, we examined each of the highest three items in factor loadings from five factors (totaling 15 items) in a multiphasic metamemory questionnaire by Kawano (1999). [Results and Conclusion] Factor analyses of MSSC: We examined three factor analyses for the data set of young participants, elderly participants and all of participants. In every analysis, one factor structure was appropriate. Item analysis of scale: We examined items by mean (and SD) of each item, item-total relationships, coefficient of determination (multiple correlation coefficient of square), Cronbach's alpha, and factor loadings. The results showed that two items were somewhat problematic, but we did not delete them immediately. Cronbach's alpha of MSSC for all of participants was 0.82 (young participants: 0.81, elderly participants: 0.86). Investigation between age and sex: An analysis of ANOVA on age (young, elderly)?sex (male, female) as a dependent variable used the total item score. Only the main effect of age was significant ( $F(1, 367)=7.94$ ,  $p<.01$ ). The result suggested that old-age students had higher self-confidence on memory performance than young university students.

**PC8 667 LIFE SATISFACTION OF OLDER PERSONS: DOES DAILY ACTIVITY PARTICIPATION MATTER?**

S. NG \* (University of Malaya, Kuala Lumpur, Malaysia)  
T. HAMID(1) - (1) Institute of Gerontology, Universiti Putra Malaysia (Serdang, Malaysia)

The daily activity participation refers to the varieties and categories of productive activities participated by older persons in a typical day. Productive activities include paid and non-paid activities. The activity theory developed by Robert Havighurst in 1960s postulates that regardless of types of activities, older persons who are active will be more satisfied with life than less active older persons. The purpose of this paper is to determine the effect of the varieties and categories of daily activity participation on life satisfaction of older Malaysians living in the community. Data from the 1999 Survey on Perceptions of Needs and Problems of the Elderly on older persons aged 60+ were used. The varieties of daily activity participation is computed by counting the number of productive activities participated in a day, while the categories of daily activity participation refers to the combination of productive activities participated in a day. The life satisfaction score is constructed based on the respondents' responses to 10 questions adopted from LSIA. Multiple regression analysis is used to estimate the expected life satisfaction of respondents according to the varieties and categories of daily activity participation, controlled for socio-demographic factors and self-esteem. The multiple regression analysis showed that the varieties of daily activity participation had a statistically significant positive coefficient, indicating the more the varieties of daily activity participation, the higher the life satisfaction. Thus, the results supported the activity theory. The participation in different categories of activities yielded different level of life satisfaction. On average, daily participation in paid work only achieved the lowest life satisfaction, while higher life satisfaction was achieved by participating daily in leisure activities only or together with other activities. It is concluded that the varieties of daily activity participation, and daily participation in leisure activities had positive effect.

**PC8 668 THE PSYCHOLOGICAL, COGNITIVE AND PHYSIOLOGICAL EFFECTS OF HORTICULTURAL THERAPY ON ELDERLY PEOPLE LIVING IN A NURSING HOME IN JAPAN**

S. SUGIHARA\* (University of Hyogo, Japan, Awajishi, Japan)  
M. ASANO(1), H. AOYAMA(1) - (1) Occupational Therapy Major, Department of Rehabilitation Sciences, Nishikyushu University (Kanzakishi, Saga, Japan)

Introduction: Previous research reports have shown that horticultural activities therapeutically improved psychological functions. In Japan, horticultural therapy (HT) has

been used since the 1990s. However, no empirical research has been undertaken to evaluate the immediate and sustained inclusive effects of HT. The purpose of this study was to examine the psychological, cognitive and physiological effects of HT for the elderly. Method: We conducted HT for 10 subjects and the control group without any intervention included 8 similarly matched subjects. The study design of this research formed a quasi-experimental design that we believe could be used in a clinical setting. We assessed the psychological and cognitive functions before and after once-a-week therapy during a three month period with The Philadelphia Geriatric Center Morale Scale (PGC), the Geriatric Depression Scale (GDS), and the revised version of Hasegawa's dementia scale (HDS-R), and the Frontal Assessment Battery at the bedside (FAB). Chromogranin A (CgA) was used as the physiological evaluation. Results: The post scores of all assessments in the HT group were significantly better than the initial scores. These results suggested that contact with the natural environment and plants made all subjects lively, and reduced the depression which they felt in their everyday lives. A significant numerical decrease of the CgA was shown in the HT group. On the other hand, some numerical values rose in the control group. It means that stress could be reduced during activity using plants of horticultural therapy. Conclusion: This study suggests that the elderly people who participate in the horticultural therapy show positive results scores of quality of life and the effects of the HT group represent an activity with real meaning for the care of the elderly.

**PC8 669 ANGER AND RELIGION/SPIRITUALITY: THE RELEVANCE OF TWO UNDERSERIALIZED ELEMENTS IN CAREGIVERS' STRESS PROCESS**

J. LOPEZ\* (Universidad San Pablo CEU, Boadilla del Monte , Spain)  
M. MÁRQUEZ-GONZÁLEZ (2), R. ROMERO-MORENO(3), N. ANAYA(3), A. LOSADA(3) - (2) Universidad Autónoma de Madrid (Boadilla del Monte (Madrid), Spain); (3) Universidad Rey Juan Carlos (Boadilla del Monte (Madrid), Spain)

Introduction. Dementia is commonly associated with distressing behavioural problems. Past research has clearly documented the high prevalence of depression among caregivers; however, the extent of anger feelings needs more research. Although it's widely recognized that religion is an underexplored area in scientific research, the majority of caregiving studies report no or a mixed association between religion and depression. However, there has been less focus on the role that religion might play in caregivers' anger. Methods/materials. A cross-sectional design was employed. The sample consisted of 128 dementia caregivers who were assessed by standardised questionnaires. Self-reported levels of anger were assessed with State-Trait Anger Scale (Spielberger et al., 1983), spiritual meaning was assessed with Ultimate Meaning Subscale (Farran et al., 1999) and support obtained from the religious or spiritual community was assessed with Social Support Subscale (Holland et al., 1998). Path analyses were used to explain the influence of anger and religion/spirituality on caregivers' stress consequences. Results. Positive and significant associations were found between frequency of behavioural problems and depression, on the one hand, and appraisal of behavioural problems and anger, on the other hand. Negative and significant associations were found between spiritual meaning and appraisal of behavioural problems and between support from the spiritual community and anger. Conclusion .Support from the spiritual community might provide a way to canalize anger feelings. With regard to spiritual meaning, its association with anger is more distant and it is mediated by caregivers' appraisals of problem behaviours. This finding suggests that spiritual attributions might help caregivers to appraise care recipient's behavioural problems as less stressful. Our data also suggest that the relationship between appraisal of problem behaviours and depression is mediated by anger. So, developing interventions that reduce angry feelings might help to alleviate caregivers' depression.

**PC8 670 PARTICIPATING IN THIRD AGE UNIVERSITIES: MOTIVATIONS AND GAINS**

F. VILLAR\* (University of Barcelona, Barcelona, Spain)  
S. PINAZO(2), C. TRIADÓ(1), C. SOLÉ(3), M. CELDRÁN(4), J. MONTORO(5) - (1) University of Barcelona (Spain); (2) University of Valencia (Spain); (3) Ramon Llull University (Spain); (4) Rovira i Virgili University (Spain); (5) California State University (United States of America)

Introduction Higher education programs for older people have been increasingly popular in the last decades. This research is aimed at exploring the motivations to attend, how older learners evaluate these university programs, and what kind of gains in their life have been stimulated by program attendance. Methods and material The sample was composed of 40 people of 55 years old and over with at least one year of experience in third age universities. Participants were interviewed, their answers were recorded, transcribed and analysed using NVivo qualitative analysis software. Results For some people, reasons to attend university courses were related to vital transitions (retirement, widowhood, care of frail relatives) and attendance were a kind of therapy to manage new situations or forget problems. However, most people emphasized motivations that had nothing to do with loss: desires of fulfilling a long-lasting dream to attend university or growing and accumulating more knowledge and culture. In relation to gains, apart from the knowledge-related gains, participants highlighted gains in social relationship (e.g. creating new social networks, improving their relationship with family members, and particularly with grandchildren) and emotional and motivational gains (e.g. finding new meaning and new goals in life, changing their attitude towards life). Conclusion Our results suggest that, far from being only a way to fill time after retirement, higher education in older age might be a changing-

life experience and motivate gains in many domains, ranging from increasing skills and competences to promoting a more engaged and active style of living

**PC8 671 RESIDENTIAL TRANSITIONS AMONG OLDER COUPLES IN THE AUSTRALIAN LONGITUDINAL STUDY OF AGEING**

P. EDWARDS\* (Flinders University, Adelaide, Australia)  
R. WALKER(1), M. LUSZCZ(1) - (1) Flinders University (Adelaide, Australia)

Introduction: There is little research examining how changes in living arrangements amongst older people are impacted on by the couple relationship itself, and the transitions that occur within this relationship over time. Furthermore, little is known about how intentions to move predict subsequent re-location. Methods: Data from couples in the Australian Longitudinal Study of Ageing (ALSA) (n= 565, mean age 76) were examined to determine how intentions to move were associated with subsequent residential location over a period of 2 years. Of particular importance was the influence of the transition to widowhood, changes in health status and contextual influences such as socioeconomic status and social support. Results: Overall, there was considerable concurrence in terms of husbands and wives' intentions to move, with most not planning to move. In most cases couples' intentions matched subsequent outcomes, e.g. they either planned to move and moved or were not considering moving and stayed in their current residence. However, the group whose intentions were not met tended to be somewhat older, widowed, and to have moved into residential care. Socioeconomic characteristics and availability of social support did not tend to play a role in whether residential objectives were met. Conclusions: These findings suggest that most older couples' plans for residential location and actual outcomes tend to be fulfilled, at least in the short-term. The transition to widowhood appears to be the main catalyst in the disjunction between plans and outcomes.

**PC8 672 SUCCESSFUL AGING: RESOURCES AND PATTERNS OF COPING WITH LOSSES AT THE FOURTH AGE**

H. TOVEL\* (Ben-Gurion University of the Negev, Beer-Sheva, Israel)  
P. CARMEL(1) - (1) Ben-Gurion University of the Negev (Beer-Sheva, Israel)

Introduction One of the main challenges of aging societies is maintaining quality of life in the face of unavoidable losses of old age. The purpose of this study was to examine the role of the elders in shaping their future by exploring the contribution of various accumulated personal resources and the coping patterns to their successful aging, while facing decline in health/functioning. Methods The study was based on a sample of convenience, comprised of 262 persons aged 75 and above, community-dwelling and functionally independent. Data were collected by two home interviews, carried out at an interval of 12 months (only 16 persons dropped out from the second interview). The structured interviews were based on a questionnaire consisting of closed-ended questions. The dependent variable was successful aging assessed by a number of measures, and the independent variables included decline in health and functioning, personal resources (education, economic status, self-efficacy) and coping patterns (proactive and reactive). Results Personal resources, especially general self-efficacy and loss-based self-efficacy, had a positive effect on successful aging in the presence of a decline in health and function. Resources had an indirect effect by way of their association with coping patterns. Among such resources, high self-efficacy was significantly associated with the use of reactive coping, and with an avoidance of proactive behaviors. Reactive coping had a positive effect on successful aging, whereas proactive coping had no effect on successful aging. Consistently, avoidance of proactivity had a positive effect on successful aging. Conclusions Findings indicate that elders have the ability to shape their futures by their personal resources and by using the appropriate coping patterns. Controlled and supervised interventions can help the aged obtain these important resources and coping skills, hereby promoting a more successful aging process.

**PC8 673 EMOTIONS IN ELDERLY INSTITUTIONALIZED PEOPLE**

G. CESÀ-BIANCHI\* (University of Milan, Milan, Italy)  
C. CRISTINI(1) - (1) 1 (Brescia, Italy)

Introduction: emotions, in old people living in nursing home, often don't receive deep listening and attention, which could promote a better communication. This paper examines the emotions and quality of life in elderly institutionalized people. Methods: Hypotheses: a) men present less maladjustment than women; b) over eighty years old have a better adjustment. Materials: 1) Questionnaire presented in semistructured interviews; 2) Self Depression Scale of Zung W.W.K. (SDS); 3) Geriatric Depression Scale (GDS); 4) Mini-Mental State Examination. 74 over seventy-five years old, classed by sex (39 F., 35 M.), age (< or >80 years old), living in nursing home of North Italy, were interviewed. Not autonomous people were excluded. Results: 60,16% are satisfied of autonomy, 52,70%, mostly men, of health, 70,27% of sleep quality; 48,65% taking hypnotic drugs. Sickness is felt as a natural experience (especially over eighty years old), misfortune (especially women under eighty years old), handicap. The present condition of life stimulates self-acceptance and serenity. 64,86% are glad of life, 74,32% of grandchildren and sons, 60,81% of friends. Future evokes worry (36,48%), serenity (24,32%, mostly men), sadness and fear. It is wished a good death (especially oldest-old), health and consciousness (mostly oldest-old women), desires and emotions are expressed. Sexual attraction is mostly

indicated by men. 36,67% express angry (especially men); women fear incomprehension, aggression and abandonment; 60,81% feel consideration by other people. Many people would be more young, healthy and efficient. SDS and GDS present more depression in women. Conclusions: elderly people express their emotions in according to gender, experiences, culture and age. Men have a better adjustment to nursing home, feel more reassured about their life needs; women seem to be more sensible and conscious about their condition.

#### **PC8 674 THE LAST CREATIVITY**

C. CRISTINI\* (University of Brescia, Brescia, Italy)  
G. CESABIANCHI(1) - (1) 1 (Milan, Italy)

Introduction: life-span represents a creative way, from the beginning to the end. Every day we write our biography. Creativity makes up our mind to learn, to face unknown and new things. At the end the last creativity appears. Methods: we have examined the works of many great scientists and artists: musicians, writers, painters, sculptors, architects. In this paper we present the last creativity of some great painters and sculptors. Results: Donatello: his last work, at 80 years, is The pulpit of S. Lawrence (Florence), where he sculputres the resurrection of Christ by a new conception; not a resurrected triumphant, glorious Christ, but Jesus appearing tired, suffering. Michelangelo, at 89 years, realizes the Pietà Rondanini (Milan); two days before his death, he inserts the body of the son in that one of his mother. Tiziano, almost blind, paints using directly fingers his last masterpieces (The Pietà, The punishment of Marsia) at 84 years. Goya, at the end of life, with serious problems of sight, realizes masterpieces as The milkwoman of Bordeaux, at 81 years. The old Monet, becoming blind, paints masterpieces as The house between the roses, at 85 years. The clouds, at 86. Matisse, sick, realizes, at 82 years The tree of life, considered his masterpiece. The old Picasso changes the interpretative and expressive patterns of the painting: at 87 years he realizes 347 engravings; at 91 years he paints The Musketeer, a work that represents his desire to dare fate. Chagall, at 93 years paints The painter and his fiancée, expressing feeling of opening and novelty. Conclusions: in the last years of life, many great artists have realized masterpieces, with innovations, often introducing a new style. Until the end they have expressed their last creativity, their self-realization.

#### **PC8 675 A CROSS-CULTURAL STUDY OF SPORT, PHYSICAL ACTIVITY AND ELDERLY SUBJECTIVE WELL-BEING**

O. TUNGTHONGCHAI\* (University of Porto, Porto, Portugal)  
E. ROSENBERG(1), M. ALTPETER(2) - (1) Appalachian State University (Boone, United States of America); (2) University of North Carolina - Chapel Hill (Chapel Hill, United States of America)

Given the growth of older populations in most nations and the importance of subjective well-being (SWB) to the lived experience of elders, continued research is merited on factors related to elderly SWB. Much research links sport and physical activity participation to better health, and better health to SWB. In this study we directly compare levels of sport and physical activity participation to SWB in a self-administered survey of younger (age 60-74) and older (age 75+) Portuguese, Thai, and Americans. Data came from the Satisfaction With Life Scale (SWLS), the Positive and Negative Affect Schedule (PANAS), and the Behavior Inventory from the University of Porto's Sport Psychology Laboratory. Preliminary statistically significant ( $p < .05$ ) findings include: 1) a decline in sport/physical activity with age; 2) younger subjects had higher positive affect scores than did older subjects; 3) sport participation was positively related to higher SWLS and positive affect scores; 4) age-group differences in the relationship between physical activity and positive/negative affect; 5) age-group differences in the relationship between sport participation frequency and positive/negative affect. The results are interpreted in the context of cultural differences (e.g., religion: Thailand is predominantly Buddhist, Portugal predominantly Catholic, America predominantly Protestant). Implications for the role of sport and physical activity in overall health promotion for elders, recommendations for promoting sport and physical activity in different cultures, and the potential effects of sport and physical activity on elderly SWB in different cultures, are presented.

#### **PC8 676 FAMILY INTEGRITY IN LATER LIFE: THE IMPACT OF INSTITUTIONALIZATION**

D. FIGUEIREDO\* (University of Aveiro, Aveiro, Portugal)  
F. MARQUES(1), H. VICENTE(1), L. SOUSA(1), M. PATRÃO(1), S. GUERRA(1), A. BARBOSA(1) - (1) University of Aveiro (Aveiro, Portugal)

The topic of elderly institutionalization has generated significant research; however studies have miss to explore its consequences on the sense of family integrity. Family integrity (vs. disconnection and alienation) refers to an older adult's ultimate sense of meaning, connection and continuity within the multigenerational family. It constitutes a normal developmental challenge that is crucial to elderly person's well-being and highly influenced by family relational processes. This study aims to explore the impact of institutionalization in the construction of a sense of family integrity among institutionalized elderly. Data were collected through a semi-structured interview (based on King and Wynne, 2004) to 21 institutionalized elderly living in four residential care facilities. Interviews were submitted to content analysis and involved two independent judges. Main

findings suggest that: (i) the older persons moving towards family integrity recognize neutral or positive impacts of institutionalization, as it maintains or increases emotional proximity and the frequency of contacts; they feel that they preserve a respected and meaningful place within the family; besides, they accept and adjust positively to the current living arrangement by searching and valuing positive aspects of institutionalization; (ii) the older persons moving towards family disconnection or alienation perceive neutral or negative impacts, mainly because institutionalization maintains or increases emotional distance, promotes new conflicts and makes them feel in an non-meaningful place within the family; the adjustment process is difficult, and feelings of sadness, loneliness, and uselessness occur; however, some of the elderly considered institutionalization as an opportunity to replace emotional ties. These findings highlight important challenges to residential care dynamics and practices in order to help and assist residents and families to identify ways of improving a sense of family integrity, otherwise disconnection and despair become increasingly salient and may adversely interfere in elderly well-being.

#### **PC8 677 CONTINUITY AND DISCONTINUITY OF INTIMATE RELATIONSHIPS AMONG ELDERS: THE CASE OF SECOND COUPLEHOOD IN OLD AGE**

C. KOREN\* (University of Haifa, Hod Hasharon, Israel)

Alongside the increase in life expectancy, the need for alternative intimate relationships in old age is expected. While this takes place more and more, it is still not the normative path in old age (Koren & Eiskovits, under review), and not perceived as continuous with older persons' life plan. This paper examines how those who created second couplehood in old age perceive it as continuous and/or discontinuous to their first couplehood and to the rest of their life course. It is based on a larger qualitative study on second couplehood in old age designed in existential-phenomenological tradition. A theoretical sample of twenty couples was chosen according to the following criteria: men who created second couplehood at age 65+ and women at age 60+, following termination of first couplehood due to death or divorce. Forty individual semi-structured interviews were conducted, recorded and transcribed verbatim. The findings are arranged along a continuum with continuity at one end and discontinuity at the other. Most participants perceive the phenomenon as discontinuous of their first couplehood with continuity being an exception. Most participants perceived second couplehood either positively or simply different. Continuity and discontinuity were identified by three themes: 1. the meaning and purpose of second couplehood compared to the first by: a) Fulfillment of the fantasy of an optimal couplehood, b. Change and/or preservation of "self", c. Choice and love versus obligation and commitment. 2. The meaning attributed to spouses offspring. 3. Sex life and sexuality. These finding raise questions related to what can be considered developmental change in relation to the concepts continuity and discontinuity. Issues such as continuity being perceived as normal ageing and discontinuity as pathological ageing will be discussed in relation to theories such as Atchley's (1989) continuity theory and Lomaranz's (1998) a-integration perspective.

#### **PC8 678 SEXUALITY, DYADIC ADJUSTMENT AND PSYCHOLOGICAL DISTRESS IN ELDERLY COUPLES**

G. TRUDEL\* (Université du Québec à Montréal, Montréal, Québec, Canada)  
L. VILLENEUVE(1), M. PRÉVILLE(2), R. BOYER(3), V. FRECHETTE(1) - (1) Université du Québec à Montréal (Montréal, QC, Canada, Canada); (2) Université de Sherbrooke (Canada); (3) Université de Montréal (Canada)

This presentation examines the link between psychological distress, marital and sexual aspects in elderly couples. Many studies have examined the relationship between psychological distress and marital life. It seems that there are higher levels of psychological distress in the presence of marital discord. Other authors have discussed the link between marital and sexual functioning. Satisfactory sexual aspects (e.g. sexual communication, satisfactory orgasm) were related to positive marital functioning. However, few of these studies have examined these relationships in the elderly. In view of this lack of information, the following presentation gives preliminary results about the association between psychological distress, sexual and marital aspects from the Quebec Survey of Health in Elderly (Enquête sur la santé des aînés au Québec). In this study, 511 francophone couples (511 women, 511 men) aged 65 years old and over answered many questionnaires about psychological distress (e.g. Psychological Distress Index), marital (e.g. Dyadic adjustment scale) and sexual aspects (e.g. Derogatis Sexual Functioning Inventory, International Index of Erectile Function, Female Sexual Function Index). Participants answered at home in the presence of the interviewer and they answered the questions on their own on a computer to assure confidentiality between spouses. We expect the sexual variables to be directly related to dyadic adjustment in elderly and psychological distress to be related to marital functioning and satisfaction and sexual functioning and satisfaction. The final results will be presented at the congress. These results will allow for a better understanding of marital dynamics in elderly couples who live together.

## Track D – Social Research, Policy and Practice

### PD8 679 SOCIAL IMAGES AND FEAR OF OLD AGE IN CHILEAN UNIVERSITY STUDENTS

D. THUMALA DOCKENDORFF\* (University of Chile, Social Sciences Faculty, Social Observatory on Age and Aging in Chile, Santiago de Chile, Chile)  
M. ARNOLD CATHALIFAU(1), A. URQUIZA(1) - (1) University of Chile, Social Sciences Faculty, Social Observatory on Age and Aging in Chile (Santiago de Chile, Chile)

Introduction: Chile, with a population of 16.3 million, is undergoing major demographic changes. It is aging quickly and in this matter stands out in Latin America. In societies such as ours, which have not given the new senior citizens a role in society and which are dominated by individualization processes with perceptions of uncertainty, the presence of negative social images on old age should not surprise. In this scenario, we wondered what images the senior citizens of the future, today's youth, have of old age and whether these perceptions are associated with a fear of reaching this stage of life. This work deals with the link between the social images that young Chilean university students attribute to old age and their fear of aging. Methods and materials: A study was carried out that applied an adaptation of the Osgood's Semantic Differential to 682 university students of both sexes and later with two focal groups. Results: The results indicate an extended negative image projected onto old age that is associated with the fear of aging that the students reported in the study. Conclusion: The analysis was based on currents of gerontological thought that emphasize that most of the handicaps of older people come more from their social exclusion than from factors associated with the condition of their organisms or mental state. We suggest that this exclusion is generated by a society that doesn't know how to give meaning to and integrate a stage of life that has expanded considerably in the last decades. The evidence obtained shows the importance that social stereotypes have on the way in which today's young students imagine their own future, affecting their expectations of well-being and reinforcing the cultural idealization of youth and non-aging behaviors of a "gerontophobic" society.

### PD8 680 SITUATED AGE – SITUATIONS THAT MAKE ELDERLY PEOPLE FEEL ESPECIALLY OLD AND/OR YOUNG

M. SJÖLUND\* (Social work, Umeå, Sweden)

Introduction It is important to know more about elderly peoples possibilities and limitations as it appears to them in relation to their own agendas, expectations and emotions. One aspect is to highlight situations that make elderly people feel old and/or young. What situations make 65- and 75-year olds feel particularly young or especially old in Sweden and Finland? What are the key aspects of feeling young and/or old among the sample of elderly? Methods and materials The empirical material contains the answers from two different but corresponding open questions in the GERDA-survey. The respondents were asked to verbalize situations in which they feel especially old and situations in which they feel especially young. A qualitative situational analysis was applied on the material with a focus on perceptions of feeling young and/or old. Results The survey questions gave 407 open answers about "feeling-young-situations" and 282 "feeling-old-situations", 111 individuals answered both open questions. Totally 689 age related situations to deal with in the material given by 578 different individuals. The results reveal a complex pattern of "feeling old-situations" and "feeling young-situations" containing the mind-body self as much as other people and activities. Conclusion Situations in which elderly people feel especially young contains interaction with other people and managing to live smoothly. To feel young is much about freedom and success within the mind-body self and in interactions with others. Situations in which elderly people feel especially old often contains frustration and otherness in relation to the mind-body self and to the society in several different ways. Feelings of being old are analysed as a risk of feeling alienated in ones own eyes or in the eyes of others. To feel old is much about representing otherness.

### PD8 681 THE EFFECTS OF SPECIFIC EDUCATION AND DIRECT EXPERIENCE ON IMPLICIT AND EXPLICIT MEASURES OF AGEISM

P. NASH\* (Swansea University, Swansea, United Kingdom)  
I. STUART-HAMILTON(1), P. MAYER(1) - (1) University of Glamorgan (Pontypridd, United Kingdom)

There are two attitude subsets; implicit which are formed through the sum of evaluations associated with salient outcomes of observed behaviours and explicit which are formed through a process of normalisation. Commonly, Likert scale measures have been employed taking a measure of explicit attitudes and not the underlying implicit beliefs. More recently, Implicit Association Tests (IAT's) have been used to measure implicit attitudes in ageing and together with explicit measure studies indicate pervasive wide reaching ageist attitudes. With this negative attitude being held in the social conscious, research has illustrated that care of older people may be less than that given to younger people. Of concern is that medical students' implicit and explicit scores were no different from those negative attitudes held by the general populous and did not improve after completion of medical training. This study investigates the strength and prevalence of implicit and

explicit attitudes amongst several populations. The primary longitudinal investigation will assess implicit and explicit attitudes held by 40 psychology students and 34 nursing students upon commencement, midpoint and completion of their degree programmes (age range of 18-40 years). This investigation uses a bespoke IAT measuring implicit attitudes and the Fraboni scale for explicit attitudes, assessing effects of gerontological education and nurse training. Analysis from the course commencement data indicates no correlation between explicit/implicit measures ( $-0.73$ ,  $p=0.538$ ) with implicit results being significantly more negative ( $F = 10.162$ ,  $p \leq 0.002$ ). Nursing students demonstrated significantly more positive attitudes in both explicit and implicit measures. Findings illustrate a stark difference between implicit/explicit measures of ageing where individuals can employ impression management and self monitoring techniques. Midpoint data indicates no implicit benefit of current age specific education suggesting a need for more effective intervention measures to address negative attitudes and associated behaviours.

### PD8 682 THE IMPACT OF THE AUSTRALIAN AGE DISCRIMINATION ACT 2004 ON HEALTH CARE FOR OLDER PEOPLE

N. MONAGHAN\* (University of Sydney, RYDE, Australia)  
I. CAMERON(1), N. FAIRHALL(1), C. AGGAR(1), S. KURRLE(2) - (1) University of Sydney (RYDE NSW, Australia); (2) Hornsby Ku-ring-gai Hospital (RYDE NSW, Australia)

Introduction Ageism can directly influence the quality of health care that older people receive. Greater choice and control for older people should be key components of measures to reduce ageism in health care. The Age Discrimination Act 2004 (ADA) was enacted as a catalyst for attitudinal change and to address individual cases of age discrimination throughout Australia. Methods and materials Scrutiny of the ADA was undertaken to analyse its impact on the wellbeing of older people. Results The emphasis of the ADA is the protection of workers older than 45 against discrimination in the workforce. It contains some provisions, ss 28 and 29, relevant to health care for older people which allow positive discrimination such as the provision of services specifically for older people e.g. Transition Care. The Act also provides an exemption (s42) which can be construed as an extension to positive discrimination rather than an opportunity to (lawfully) discriminate against older people for economic or other reasons including perceptions of their relative worth or the needs of other people. The determination of discrimination is to be based on the ability of the older person to "benefit" from goods or services rather than be disadvantaged. However s42 can also be construed as permitting discrimination due to uncertainties surrounding the standard of evidence and professional knowledge of the medical decision maker. The ADA is silent as to other reasons for the decisions of clinicians or health managers such as negative stereotyping and resource limitations. Additionally the exemptions under the ADA include overtly discriminatory provisions such as the retention of the insurance provision known as Lifetime Healthcover. Conclusion The ADA provides uncertain and incomplete protection against age discrimination for older people who require health care. Amendments to the ADA should be enacted to specifically address the protection the wellbeing of older people.

### PD8 683 PERCEPTIONS OF BIRTHDAY CARD MESSAGES: NEGOTIATED, CONTRADICTORY AND COUNTER-HEGEMONIC MEANING

F. SNELLMAN\* (Umeå University, Umeå, Sweden)

Age and ageing related humour expressed in birthday cards has been suggested to support negative attitudes towards aged people. Little attention has been paid to how retired people themselves experience these messages. The objective in this presentation is to depict some of the perceived meanings of age related messages envisioned in birthday cards. The empirical material consists of six focus group interviews collected in Sweden (3) and Finland (3) in 2007-2008. Retired women and men, urban and rural, living at home and institutionalized informants of different ages have participated. In the interviews different cards were used as focus- or questions to achieve a "...culturally appropriate instrument that accurately reflected the community's life experiences" (Willgerot, M.A. 2003, Western Journal of Nursing Research; 25[7]: 798-814) with regards to ageism as a phenomenon. Results indicate that informants negotiate consensus to the meaning of the age related messages in greeting cards within groups. Contradictory perceptions occur between groups. Perceptions of the messages in the cards appear both positive (good) and negative (bad). There is a notion of individual discrepancy in that individuals do not conform to neither of the two mentioned. This is discussed in terms of counter-hegemonic meaning and as counteracting ageism in everyday life. It can be concluded that negative attitudes are supported according to some people, but this does not give us the complex picture. Other people, other voices explicitly claim otherwise. There is a greater picture of meanings that are perceived in birthday cards if we look at the ways in which people actually relate to the cards in everyday life. This brings to the fore the issue of human agency and the freedom we have as humans to act according to existing norms, or to resist, or simply to live.

### PD8 684 SOCIAL STRATIFICATION, AGE DISCRIMINATION AND HEALTH

T. MAXIMOVA\* (National InstitutePublic Health, Moscow, Russian Federation)

Introduction: The aim of the study was to evaluate the prevalence of main health, medical and social problems elderly people. Method and materials: For calculation (SPSS)

intensive rates peculiarities of health in different social groups the database of World health survey (WHO) was used, containing the results of population questioning in more than 70 countries (Russia - 1704 persons 60+), important for comparison and discovering universal regularities and specific problems. Results: 41,5% women and 28,7% men 60+ self-reported their health as bad, 8,3-11,6% correspondingly as good and very good, 3% indicated good health at 70+. Part of persons, self-reported good health, is significantly larger among successful (17,8%) than in poor families(5,2%),11,7% in the middle , bad health more often among poor. Highest prevalence of pain, aching, stiffness in joints indicated 55,9% poor people and 43,0% opposite,arthritis-41,7% and 26,7% correspondingly. More often poor people lost all their natural teeth, had difficulties in moving around , self care and other age dependent diseases and health problems. Age dependent diseases start earlier among people from low strata, their biological age is higher than contemporaries, it means accelerated ageing in poor conditions. In Russia as in other countries co-morbidity was revealed. Such diseases as diabetes, arthritis, angina pectoris, cataract were the only among 7-15%persons 60+. Most of population 60+ needed and received medical care, 14,2% were hospitalized. 85,9% were satisfied health care providers skills,66,5%- in hospital equipment, only 51,2% - drug supplies. New problems are age and wellbeing discrimination : 15,7% of patients felt they were treated worse because of their age and 13,9%-lack of money. Conclusion: Health problems of population 60+ reflect social gradient in ageing. Insufficient medical care in connection with age and financial situations is real social problem, influencing on quality of life and life expectancy.

**PD8 685 A NATIONAL CANADIAN COMPARISON OF SPOUSAL ABUSE IN MID AND OLD AGE: IS ELDER ABUSE SIMPLY A CASE OF SPOUSAL ABUSE GROWN OLD?**

Y. YON\* (Simon Fraser University, Langley, Canada)

A. WISTER(1), G. GUTMAN(2), B. MITCHELL(3) - (1) Simon Fraser University (Vancouver, Canada); (2) Simon Fraser University (Vancouver, Canada); (3) Simon Fraser University (Vancouver, Canada)

Objectives: Comparison studies on spousal abuse among different age groups are limited on a national level. Spousal abuse in older populations is often overlooked by health practitioners and is generally perceived as a problem associated with younger couples. Understanding spousal abuse or intimate partner violence (IPV) in older population is important in raising awareness of elder abuse and crucial to the development of specific interventions for older adults and their family members. Methods and materials: The study used a national pooled dataset from the Canadian General Social Survey (GSS) 1999 and 2004 to compare spousal abuse between mid-age adults (45-59 years) and older adults (>60 years). Two types of abuse: emotional/financial and physical/sexual are examined. Three regression models on personal, relationship and environmental explanatory factors are examined to determine the most salient predictors of spousal abuse for each age group. Results: The study from multivariate logistic regression has found differences and similarities in predicting abuse for both age groups. In general, the differences reflect the complexities of an aging population indicating the importance of social network such as participation in social activities and community size. Moreover, the associations between disability status and spousal drinking habits for both age groups are found significantly associated with abuse indicating evidence of spousal abuse grown old. Additionally, separate analysis have found that when compared to non-medical users, survivors of past IPV from both age groups are more likely to use medication to help them sleep, calm and deal with depression. Conclusion: This study is first of its kind to examine IPV among younger and older population on the national level. While there are similarities, the results have indicated that spousal abuse among older populations are different and require special attentions. Previous intervention programs for IPV victims may not be generalizable to the older populations.

**PD8 686 SELF-ASSESSMENT OF NEGLECT OF PSYCHOSOCIAL AND MATERIAL NEEDS AND HEALTH-RELATED QUALITY OF LIFE IN OLDER PEOPLE. A CRACOW STUDY.**

P. BRZYSKI\* (Jagiellonian University Medical College, Krakow, Poland)

B. TOBIASZ-ADAMCZYK(1), M. BRZYSKA(1), M. KOPACZ(1) - (1) Jagiellonian University Medical College, Chair of Epidemiology and Preventive Medicine, Dept. of Medical Sociology (Krakow, Poland)

Based on Exchange Theory and Bergtson's model of intergenerational solidarity, this study examined the relationship between perceived neglect of older people's needs and differences in their health-related quality of life (HRQoL). Materials and methods Face to face interviews examined how 403 community-dwelling older people perceived their needs as being realized and how they felt their expected level of psychosocial and material support was being neglected by younger generations. A "neglected needs scale" was developed based on these interviews. Particular dimensions of HRQoL were defined as low provided their score was below the median. The risk of a low score was measured using logistic regression modeling with SPSS 15 for Windows for two models: (1) a general evaluation of how older people's needs are neglected and (2) the above mentioned scale. Results Individuals who reported that older people in Poland are not treated well were at a 2.09 times higher risk of poor self-rated health (95%CI=(1,26;3,45)). This risk was 1.21 times greater for those scoring higher on the neglected needs scale (95%CI=(1,01;1,41))

[2.5 times higher (95%CI=(1,55;4,31)) in individuals with a secondary or lower level of education]. The risk of restricted functional status due to health problems was  $\approx 2$  times greater in individuals who believed that neglect of older people's needs is a problem in Poland ( $ExpB=1,92$ ; 95%CI=(1,16;3,17)). This risk was 1.25 times greater (95%CI=(1,02;1,53)) in those scoring higher on the neglected needs scale or in those who believed that they were being emotionally neglected ( $ExpB=1,65$ ; 95%CI=(1,00;2,71)). This risk was 1.8 times greater in widows/ers (95%CI=(1,02;3,19)). The risk of restricted functional status in one's social life rose 1.65 times in individuals who scored higher on the neglected needs scale (95%CI=(1,36;2,0)). Conclusions Select dimensions of HRQoL are decreased when older people perceive their needs as not being met.

**PD8 687 AGEING IN SPARSELY POPULATED AREAS OF THE BARENTS EURO-ARCTIC REGION: SOCIAL-DEMOGRAPHIC CONTEXT**

E. GOLUBEVA\* (Pomor State University, Arkhangelsk, Russian Federation)

A. EMELYANOVA(1) - (1) Pomor State University (Arkhangelsk, Russian Federation)

Arctic Human Development Report (2005) declares an essential gap in demographic knowledge of the Barents Euro-Arctic Region (BEAR) profile requiring attention in the nearest future. In respect of the development of globalization process, comparative researches which permit comparing changes in ageing structure of the population in the European North of Russia and northern regions of the Nordic countries and regional differentiation of elderly population's indicators are becoming to be of urgent importance. The objective of the research is to define transformation of ageing structure of elderly population in sparsely populated areas of the BEAR in comparative aspect in order to formulate a scientifically proved concept of gerontosocial policy for the Russian part of the BEAR. To carry out the research the official data of the Russian Committee for Statistics and statistics agencies in Finland, Norway and Sweden have been used. A fractional scale of characterizing elderly population has been used to provide additional comparative analysis. The study of a number of social-demographic indicators shows that the ageing process is sufficiently expressed and is characterized by a considerable regional differentiation of indicators in the areas belonging to the BEAR. Ageing process in the northern regions of Russia is less marked than in neighboring Nordic countries of the BEAR and crossed by other negative social-demographic processes in the Russian Federation (decrease of average life expectancy, depopulation of the northern regions connected with youth migration from the northern regions, low level of life quality of the population, etc.). In the northern regions of the Nordic countries changes in ageing structure resulting in increase of elderly population are smoother and evolutionally forward. The obtained data can be used in developing regional social programs, regional concept of gerontosocial policy based on implementation of the Madrid International Plan of Action on Ageing.

**PD8 688 ACTIVE LIFE EXPECTANCY FOR JAPANESE ELDERLY POPULATION BY CHEWING ABILITY AND NUMBER OF TEETH**

I. NASU\* (Nihon University School of Dentistry at Matsudo, Matsudo, Japan)

S. YASUHIKO(1) - (1) Nihon University Advanced Research Institute for the Sciences and Humanities (Tokyo, Japan)

Introduction Panel interview surveys, named Nihon University Japanese Longitudinal Study of Aging, of nationally representative elderly people aged 65 years or above in Japan were conducted four times since 1999 to estimate health expectancy according to their chewing ability and number of teeth. Methods and materials Multistate life table methods were applied to estimate active life expectancy (ALE). Living respondents considered to be in an "inactive state" were "very difficult" or "unable" for performance of at least one of ADLs or IADLs. Otherwise to be in an "active state". 4,135 sampled persons were included in the study. Using ImaCh we computed ALE. Based on estimated transition probabilities between active and inactive states, and active and inactive states to death, population based multistate life tables were constructed by chewing ability (Group A: able to chew hard foods at the baseline, Group B: able to chew soft ones), and number of natural teeth (Group A': having 20 teeth or over, Group B': 19 teeth or less). Results a) Chewing ability: In multistate life tables at age 65, total life expectancy (TLE) was 22.1 years for Group A and 20.3 years for Group B ( $P<0.05$ ). ALE was 18.5 and 15.8 respectively ( $P<0.001$ ). b) Number of teeth: At age 65, TLE was 24.9 years for A' and 20.8 years for B' ( $P<0.001$ ). ALE was 20.6 and 16.7 ( $P<0.001$ ). Both in chewing ability and in number of teeth, statistically significant differences were observed between the two groups both in terms of total life expectancy and active life expectancy. Conclusions The results indicate those who have better chewing ability or have 20 or more teeth can expect to live longer, and also live longer in the active health state.

**PD8 689 POPULATION AGEING IN CENTRAL AND EASTERN EUROPE AS AN OUTCOME OF THE SOCIO-ECONOMIC TRANSITION TO CAPITALISM**

A. HOFF\* (University of Oxford, Oxford, United Kingdom)

The aim of this article is to find an explanation for the extraordinarily rapid demographic change in Central and Eastern Europe (CEE) during the 1990s and 2000s. It will be argued that population ageing in CEE is an unintended side effect of the socio-economic transition from 'communist' to 'capitalist' societies. An unprecedented drop in fertility in

combination with the emigration of many young people and improvements in life expectancy has resulted in an extraordinarily rapid ageing of the CEE populations. First, evidence for the interaction between socio-economic crisis and demographic change will be presented based on a literature review and Eurostat data. Clear evidence for rapid population ageing in CEE will be provided and how three demographic factors – mortality, fertility and migration – are driving this ageing process. Finally, implications of this joint transition and ageing process for the CEE societies and their people will be discussed.

**PD8 690 TRAVEL IN ELDERLY PATIENTS: MYTH OR REALITY ?**

M. BRIHIER\* (APHP, UPMC Paris 6, Paris, France)  
F. DE CATELAN CATELANI(1), M. GODARD(1), M. VERNY(1), J. BODDAERT(1) - (1) Geriatric department, APHP UPMC Paris 6 (Paris, France)

Introduction : Increase in life expectancy and modern travel access are associated with ageing of travellers. However, there are few data about travel in elderly population, and, to our knowledge, no data about travel in frail and comorbid elderly patients. We performed a study to analyse travel frequency and adverse outcomes in a cohort of elderly patients. Methods: Monocentric descriptive retrospective study. A questionnaire was sent to all patients followed for the last two years in a geriatric department (Pitié-Salpêtrière, Paris, France). Patients were asked to describe their travel pattern (distance, length of stay, outcome). In case of cognitive impairment, the questionnaire was completed by the caregiver. Results: 539/1301 (41%) patients or caregivers answered to the questionnaire. Mean age was  $82 \pm 7$  years, sex ratio (f:m) was 2.6:1, previous diseases was  $4.5 \pm 2.1$  and treatment  $5.4 \pm 2.8$ . Dementia was reported in 61 %, stroke in 22%, heart failure in 19%, and coronary disease in 15%. MMS was  $22 \pm 6$ , IADL  $10 \pm 4$  and/or ADL  $5 \pm 2$ . Travel concerned 64 % of patients, in holiday home (33%), France elsewhere (36%), and abroad (28%) in the last 5 years. Patients who reported no travel (36%) were more frequently women (69 vs 56%, p=.00119), with more treatments (5.8 vs 5.1, p=.0097), lower ADL (4.7 vs 5.2, p=.0375), lower MMS (21 vs 23, p=.001), and lonely home living (55 vs 39%, p=.001). Those patients used to travel before (93%), and would like to travel again (47%) but considered travel difficult (75%), and stopped for health problem (64%), loneliness (22%), and financial reasons (15%). Conclusion Despite numerous comorbidities, elderly patients conditions still travelled, or would like to, but are limited by health and social conditions.

**PD8 691 TWENTY YEARS OF GEOGRAPHIC CHANGE IN THE ELDERLY POPULATION: THE CHALLENGES OF DELIVERING FORMAL AND INFORMAL CARE**

M. ROSENBERG\* (Queen's University, Kingston, Canada)

Introduction: Between 1986 and 2006, the Province of Ontario, Canada's elderly population grew from 10.9 percent of the total Ontario population to 13.6 percent. Growth, however, was not evenly distributed. Methods: First, using the 1986 and 2006 Censuses of Canada, how the Ontario elderly population grew and its geographic distribution changed are analysed. Cycle 3.1 of the Canadian Community Health Survey (CCHS 3.1) is then used to analyse what are the implications for the delivery of formal and informal care. Results: The main finding of the analyses is that there is a spatial mismatch between the geographic distribution of the elderly population and the delivery of informal and formal care. Conclusions: The policy implications of the failure to take into account spatial mismatches are issues that the Province of Ontario, Canada and indeed other jurisdictions where the elderly population is growing need to consider.

**PD8 692 AGEING OF THE POLISH POPULATION - MEDICAL, PSYCHOLOGICAL, SOCIOLOGICAL AND ECONOMIC ASPECTS**

M. MOSSAKOWSKA\* (International Institute of Molecular and Cell Biology in Warsaw (IIMCB), Warszawa, Poland)  
P. BŁĘDOWSKI(1), A. BARTOSZEK(2), A. DABROWSKI(3), T. GRODZICKI(4), A. MILEWICZ(5), A. WIECEK(7), T. ZDROJEWSKI(8) - (1) Warsaw School of Economics (Poland); (2) Silesian University of Technology (Poland); (3) University of Physical Education in Warsaw (Poland); (4) Jagiellonian University (Poland); (5) Medical University in Wrocław (Poland); (7) Medical University of Silesia (Poland); (8) Medical University of Gdańsk (Poland)

Introduction: The PoSenior Project is a largest interdisciplinary gerontological project in Poland related to various aging-related problems. The Program involves specialists in medicine (geriatricians, cardiologists, neurologists, nephrologists, psychiatrists, endocrinologists, epidemiologists, rheumatologists), molecular biology, sociology, psychology, economics and epidemiology and over 40 different research institutions. The scientific aims of the program are to assess health status and environmental determinants of ageing and to collect biological material for evaluation of aspects of aging, including genetic factors. 5800 patients older than 55 randomly selected from the Polish General Electronic System of Population Register will participate in a survey divided into 7 age-groups: one cohort of the pre-old-age(55-59) and six cohorts of respondents: 65-69, 70-74, 75-79, 80-84, 85-89 and 90+ years old. Moreover 1500 patients in 10 regions will be examined by geriatricians within the framework of this project. Geriatric assessment will include ECG, pulse wave velocity, spiroometry, pulsoxymetry, orthostatic trial, a hand grip

strength. Patients with cognitive function disorders will be referred for computed tomography and neuropsychological assessment. Detailed health status information will be obtained by nurses filling the questionnaire including: medical history, socio-economic status, nutritional habits and quality of life. The scope of medical examination is much wider that in the routine screening health status assessment and includes: blood pressure measurements, anthropometric measurements, collecting of the blood samples for laboratory and molecular tests. Mental status of the responders is assessed using Mini-Mental State Examination, Clock Drawing Test and Geriatric Depression Scale. Functional status evaluation is performed according to Activities of Daily Living and Instrumental Activities of Daily Living scales. Additionally, health habits and hazards are assessed. Final goal is to define the needs of the aging population in terms useful for social policy, health care and future decision-making.

**PD8 693 CENSUS DATA-BASED RESEARCH ON SEVERE DISABLEMENT IN BRAZIL**

A. GOIS\* (UERJ, Rio de Janeiro, Brazil)  
A. BATISTA DE GOIS(1), R. PEIXOTO VERAS(1) - (1) UERJ (Rio de Janeiro, Brazil)

The increase in the number of senior citizens who show incapacity to go about tasks regarded as normal comes out as irrefutable reality in numerous countries. Lack of information on disablement prevents efficient governmental action upon the functional health of the elderly. Therefore, this study has aimed at identifying the percentage of severe disablement among the elderly in Brazil, in the year 2000. Methodology: Evaluation study of the information obtained out of the census data basis. Data was collected from the 2000 IBGE Population Census. Results: 47% of Brazilians with severe disablement are found to be elderly, and 29% of the Brazilian elderly show severe disablement. With the results provided by that research source, conclusions show that half of the Brazilian population with severe disablement is elderly and that out of the families with elderly in the household, 1/3 of them have to deal with a home cared bed-bound elderly with severe disablement, dependent on third parties, unproductive, and in need of home-care – that is, of physiotherapy. The highest concentration of those cases can be found in the states of Paraíba, Rio de Janeiro, Pernambuco, and Rio Grande do Sul; female epidemiological profile, aged between 60-70 years. A governmental management in health is advisable to ensure access to physiotherapy treatment in the private and public spheres, whether in assistance or prevention. This way, the elderly population can become more participative and less dependent in the future. Keywords: physiotherapy, elderly, disablement.

**PD8 694 CHALLENGES FACED BY IMMIGRANTS GROWING OLDER AWAY FROM HOME**

A. SCHWINGEL\* (Univ of Illinois at Urbana-Champaign, Champaign, IL, United States of America)  
W. CHODZKO-ZAJKO(1), L. MALAVASI(1), C. PARK (1), K. KIM (1) - (1) University of Illinois at Urbana-Champaign (Champaign, IL , United States of America)

INTRODUCTION: A complex interaction of social, cultural, and environmental factors through which an individual passes during the life course can have a profound impact on an individual's perceptions of quality of life and health. A growing body of research has begun to examine how these factors are impacted by the challenges and opportunities experienced by immigrants as part of their aging process. The intent of this study was to examine a number of socio-cultural factors that influence the health and well-being of older adult immigrants. METHOD: Data for this presentation were gathered from a study of 333 older Japanese-Brazilian return migrants to Japan. A self-reported questionnaire including a number of social-economic factors, identity (assessed by ethnic preferences for food, music, clothes, and language), and health concerns were assessed. RESULTS: The results show that older Japanese-Brazilians living in Japan are conscious of the differences between themselves and the general Japanese population. Many Brazilians shy away from situations that might demand close contact and protracted interactions with the Japanese natives. Paradoxically, although many Japanese-Brazilians are physically indistinguishable from native Japanese, they are often considered to be typically Brazilian from a cultural and social perspective. These factors often lead to a sense of displacement and alienation. In addition, there is a lack of health professionals (physicians and dentists) who are able to communicate in Portuguese and understand the Brazilian culture. The results suggest that this can be a substantial barrier to primary care access in Japan, and it may result in a lack of preventive care programs for immigrants in Japan. CONCLUSION: These results indicate that language and other cultural differences are strong barriers that limit access to health care, and ultimately, impact the health and well-being of immigrants growing older away from home.

**PD8 695 THE ROLE OF CONFIDANTS IN SOCIAL NETWORKS AND SELF-RATED HEALTH IN LATER LIFE**

H. BOOTH\* (Australian National University, Canberra, Australia)  
P. MATHEWS(1) - (1) Australian National University (Canberra, Australia)

Introduction It is well-known that social networks and social support are important determinants of health status and mortality among the elderly. It is also well-established that self-rated health predicts mortality. However, the nature of the relationship between

social networks and self-rated health is less well researched. This paper uses cross-sectional data to examine the relationship between social network characteristics and self-rated health in older adults (aged 65+). Methods and materials Data are drawn from the nationally-representative 2006 General Social Survey and include 2365 Australians aged 65+. Using regression analysis we examine the association between self-rated health and both the number of non-coresidential confidants and the relative composition of confidants between family and friends. We included separately the effects of having just one confidant and then each additional confidant. Covariates include demographic and socio-economic variables, as well as disability status and frequency of face to face contact with the wider social network. Results Among Australians aged 65+, 32% report fair or poor health. The difference in self reported health between those who have none or one confidant is not statistically significant. However each additional confidant after the first is significantly related to self-rated health: the larger the number of confidants, the less likely to rate own health fair or poor. Further, the relationship between social network composition and self-rated health is not significant. Conclusion Number of confidants (above one) is an important statistical determinant of self-rated health in older Australians, but it is not important whether confidants are friends or family members.

**PD8 696 AGEING IN RUSSIA AND IMPLEMENTATION OF THE MADRID INTERNATIONAL PLAN OF ACTION ON AGEING**

L. KOZLOV\* (St.Petersburg Institute of Bioregulation and Gerontology, St.Petersburg, Russian Federation)

O. MIKHAILOVA(1), G. SAFAROVA(1) - (1) St.Petersburg Institute of Bioregulation and Gerontology (St.Petersburg, Russian Federation)

Russia is ageing rapidly on a background of country's population size decrease. Population ageing has major consequences for all facets of country's life. The Madrid International Plan of Action on Ageing (MIPAA) marked a turning point in how the world addresses the challenge of building a society for all ages. The study aims at analyzing demographic aspects of ageing in Russia in comparison with developed European countries and highlighting national efforts to implement the MIPAA. To characterize the situation with ageing in Russia a number of conventional ageing indicators have been computed for the period 1989 - 2007 based on censuses and vital statistics. Materials of the Council of Europe, Eurostat, the UN DESA, Human Mortality Database (Max Plank Institute for Demographic Research) have been used. The study is focused on the following directions of the MIPAA implementation – institutional infrastructure, human resources and policies. It is found that, on the one hand, there are similarities between ageing in Russia and in developed countries. On the other hand, unlike developed countries, this process in Russia is determined by fertility reduction only due to unacceptable high mortality. Besides, it has some pronounced specific features, e.g. significant gender differences (which are more marked than in developed countries) and great regional differentiation. Advantages and shortcomings in elaborating policies and programmes in Russia aimed at coping with challenges of ageing, and how these policies and programmes respond to the MIPAA have been analyzed. Results of the study may contribute to better understanding about ageing development in Russia within European context and to enhancing effectiveness of policies and programmes concerning ageing and the elderly.

**PD8 697 SOCIAL CAPITAL AND RURAL-URBAN SETTINGS AMONG ELDERLY JAPANESE PEOPLE**

T. NAKATA\* (Hokusei Gakuen University, Sapporo, Japan)

The aim of this study is to examine the relationship between the degree of social capital and the rural-urban settings of the respondents. It is said that social capital is a concept which means the extend of trust, norms and networks in a community. The length of residence is known as one of the determinants of social capital. But type of the local settings are also important, because generally, it is thought that the rural areas are livable. Therefore local settings are investigated both as a determining factor and as a control variable on the length of residence. A cross-nation survey assessed 1029 respondents who were 65 years old or more from all the prefectures in Japan. Social capital, which was measured by five items scale, is used as a dependent variable. And age, sex, educational background, self-rated health, marital status, occupational status, the length of residence and the type of local setting were used as independent variables. The key results of ANOVA are as follow; 1) the length of residence has an effect on social capital, 2) the local setting itself is not significant, although urban living tends to decrease social capital, and 3) the interaction effect of the years of residence and the type of local settings affects social capital. This results says that the elderly Japanese people have a tendency to prefer the place that are sparsely populated and where one has lived for a long time.

**PD8 698 ADVOCACIES FOR FRAIL AND INCOMPETENT ELDERLY IN EUROPE**

R. KOELLER\* (ISG - Institute for social research and social politics, Cologne, Germany)

D. ENGELS(1) - (1) ISG (Cologne, Germany)

In ageing societies, questions of participation of elderly people in social life and the possibilities of a self-determined life in old age are of high importance. It is a matter of fact that old, incompetent and frail people remain involved in many legally based matters and

participate in public and social life. Against the background of the demographic development, the requirements concerning advocacies for frail and incompetent elderly, who are in need of provisions to secure their legal protection and participation, increase. In addition to the demographic development, the family - traditionally the main institution with respect to the proxy of the elderly - more often adopts a background position in this context (changing structure of the private households, etc.). Thus, the state increasingly is confronted with the task of protecting personal rights of older and incompetent people. Societies have developed diverse institutions of advocacy for these people. With the rising needs and requirements, institutions - which have been delegated to take over responsibilities and tasks in this field - as well as the authorities themselves are under pressure to fulfil the growing demand. At the same time, they are forced to rationalise and to improve the use of alternative resources while simultaneously assuring the quality of the guardianship and advocacy. This scenario is largely the same all over Europe. The project "ADEL – Advocacies for frail and incompetent elderly in Europe" compares how different European countries secure legal protection and participation of frail and incompetent old people. First results of the project will be presented in order to contribute to the question how an adequate system of advocacy for ageing societies should be designed.

**PD8 699 LONG-TERM MORTALITY REDUCTION AND SUPPLY OF KIN OVER THE LIFE COURSE IN POLAND**

P. SZUKALSKI\* (University of Lodz, Lodz, Poland)

Introduction: Long-term changes in families' size and structure are well documented in the Polish demographic and sociological literature. Due to many works done by historians of the family we could observe how the number of kins changed in particular circumstances as result of reduction both in mortality rates and the fertility ones. But – at the same time – there's no research focused on large-scale effects of mortality changes for family structure. Methods and materials: The presented study is aimed at determining how the mortality decline affect kin availability in the case two stages of the individual life-course – infancy and childhood, and senility. Using Polish period life tables I estimated probability that an individual could rely on living kins – partner, (grand)parent(s), (grand)child(ren). Results and conclusions: The results are consistent with results presented in works devoted to the supply of kin over the life-course in many other countries, but indicated the Polish specificity, i.e. lack of success in mortality reduction during the last 30 years of socialism in Poland.

**PD8 700 FUEL POVERTY: ASSOCIATIONS WITH HEALTH AND WEALTH AMONG OLDER ADULTS LIVING IN ENGLAND**

J. HARRIS\* (National Centre for Social Research, London, United Kingdom)

S. MCMANUS(1), (1) - (1) National Centre for Social Research (NatCen) (London, United Kingdom)

Introduction: The UK government introduced winter fuel payments to those aged 60 and over in an attempt to ease the number of older adults in fuel poverty and meet its target of eradicating fuel poverty in vulnerable groups by 2016. However, energy inefficient housing, coupled with increasing fuel bills means that it is unlikely to meet this target. Furthermore, increasingly high fuel bills mean this issue is likely to come to the fore as a public health issue across developed countries even where the housing stock may be more efficient. Method: This project involved analysis of the Adult Psychiatric Morbidity Survey, a random sample of private households in England. A representative sample of 2,639 adults aged 60+ were interviewed in person. Trained interviewers asked questions about housing conditions and financial strain, encompassing indicators of fuel poverty, doctor diagnosed health conditions and administered standardised assessments of mental health (ICD-10 or DSM-IV criteria). Experts in each field were involved in question development and selection. Detailed information was also collected about other current and lifetime risk factors. Results: Just over 1 in 6 of older adults was found to be in cold and/or damp housing conditions, and 1 in 7 said they had used less fuel due to worry about cost. The presentation of detailed results is currently prohibited because the findings are under embargo but a profile of housing deprivation will be presented exploring associations with poor mental and physical health, and income and financial strain. Regression analysis will be used to examine complex interactions. Conclusion: More needs to be done in to assist older adults in fuel poverty particularly vulnerable groups identified by this analysis. This presentation will attempt to demonstrate that fuel poverty should be a concern to clinicians and policy makers concerned with geriatric health.

**PD8 701 "I LOST MY JOB": MONETIZING LOST WAGES OF ELDERCARE PROVIDERS**

J. FAST\* (University of Alberta, Edmonton, Alberta, Canada)

D. DOSMAN(1), G. ROWE(2) - (1) University of Alberta (Edmonton, Alberta, Canada); (2) StatisticsCanada (Ottawa, Ontario, Canada)

Canada, like other developed economies, has competing policy goals: shifting more responsibility for caring for an aging population from the public sector to family and friends; and forestalling labour shortages by pressuring working age adults to enter and stay in the labour market regardless of caregiving demands. Consequently more people face competing employment and eldercare demands and experience work-family conflict.

Many respond by reducing their paid work. Yet little is known about the long term monetary consequences of such decisions, nor how caregiving demands, stage of life course, gender, and employment decisions might interact to lead to differential costs. Using Statistics Canada Labour Force Survey data for 1997 to 2006, we estimate that the annual aggregate lost wages for all Canadians reporting employment disruptions because of eldercare responsibilities increased from \$207 million to \$359 million per year over the last 10 years. We also found that the number of employees who lost wages because of eldercare has nearly doubled over the last 10 years, that women are three times more likely than men to report lost wages, and that the economic costs generally increase in later life when earning power is highest. These findings have important policy implications. While the magnitude of wages lost is modest when job adjustments involve absenteeism and decreasing hours of employment, some households will not easily absorb these costs and financial hardships will follow. For those who left their jobs entirely to accommodate eldercare demands, financial consequences are much more severe. In fact they are substantially higher than the maximum government benefit provided for care-related work interruptions. And, since many caregivers are not eligible for this benefit, and those who are eligible rarely received the maximum amount, the real difference the benefit makes to employed caregivers is small compared to their actual costs.

**PD8 702 NEW A.G.G.I.R. FRENCH NATIONAL TOOL FOR EVALUATION OF THE LOSS OF AUTONOMY AND DETERMINATION OF THE LEVEL OF CARE**  
J. VETEL\* (Hôpital du Mans, Le Mans, France)  
J. DUCOUDRAY(1), P. PREVOST(1) - (1) CHM (Le Mans, France)

The Autonomy-Gerontology Iso-Resources Group (A.G.G.I.R.) system comprises three components. 1/10 discriminant items scored on a 3-points scale, enable evaluation of the degree of gerontological autonomy of elderly subjects : these 10 discriminant and relevant items are those essential for evaluation of the loss of autonomy in the elderly. Each item supposes 3 possible modalities : - A Performs a function totally - B Performs a function partially, - C does not perform or perform with help To ameliorate the quality of coding we have introduced in the NEW AGGIR a binary cotation of the adverb that where badly taken in count in the previous rating scale Spontaneously Y/NO Completely Y/NO Regularly Y/NO Correctly Y/NO ∂ 7 domestic and social items coded the same way, very useful to establish the health care plan, but they are not taken in count to determine the Iso-Resource Group ∂ 3/ The Iso-Resources Group computer program is a grouping program which enables each patient to be assigned to one of six groups that are iso-consumers of work load (time and penibility) in the context of geriatric dependence management. A table enables detection of the main signs characterizing each of the iso-resource groups but, in case-by-case routine practice, the computer program is essential to assigns the patients, immediately and precisely, to the correct groups. The Mean Pondered Iso resource Group is also calculated by the computer program, it indicates the mean loss of autonomy of a population For a nursing home, the amount of money given for the basic care is related to the mean AGGIR score

**PD8 703 PATHOS FRENCH NATIONAL MODEL FOR EVALUATION AND FINANCING THE LEVEL OF MEDICAL AND TECHNICAL CARE.**  
J. VETEL\* (CHM, Le Mans, France)  
J. DUCOUDRAY(1), P. PREVOST(1) - (1) CHM (Le Mans, France)

The PATHOS model is an information system on the care requirements necessary to ensure good practice treatment of pathological conditions in the elderly that was compiled in liaison between the French National Association (Syndicat National de Gerontologie clinique) and the medical department of the French National Health Insurance Organization (CNAM). It forms a complement to A.G.G.I.R. which evaluates basic care. The system enables : - identification, on a pre-compiled list, of 50 « pathological conditions », that or those best summarizing the set of disease entities with which the patient presents on the day of the survey. - completion of the clinical status description by a « care requirement profile » selected from 12 possible profiles which indicates the gravity and the level of technical care needed. Each pathological condition previously identified is associated with the corresponding care profile, - determination of an indicator expressing the global care level for a patient to be implemented for the 8 types of identified actor of care: geriatrician, psychiatrist, nurse, physiotherapist, psychologist, biology, other examinations, medications. The PATHOS system does not globalize the various types of resources by computing a single indicator. It has been defined as an analytical tool rather than as a simplifier. The data processing algorithm is complex and necessitates computerized processing . THE PATHOS INDICATOR BOARD : These indicators, constituted at different times, show the evaluation and evolution of the required resources as these are affected by the course of patients' pathologies. For a nursing home, the amount of money given for the medical care is related to the mean PATHOS score .

**PD8 704 FINANCING THE CARE IN NURSING HOMES : THE FRENCH WAY**  
J. VETEL\* (CHM, LE MANS, France)  
P. PREVOST(1), J. DUCOUDRAY(1) - (1) CHM (LE MANS, France)

The financing system (beside the accommodation fare) is built for the nursing and medical care on the 2 tools previously described :AGGIR and PATHOS. So the care budget of the retirement house is the result of a mathematical equation : Budget=14Euros(GMP+2,59PMP)

per bed per year. So the budget is close to the mean loss of autonomy and mean seriousness of the diseases of the whole residents of the institution. We finance the group but not every person+++ This budget is adjusted every 2 years when a new « cut » is realized by the nursing home and then controlled and validated by the social security. For the institutions of 60 beds and more we can see that the GMP and the PMP are steady on the year, if the recruitment channel is stable.. For smaller institutions it is possible that just few patients throw the balance on the GMP or on the PMP, in these situations an appeal is possible to the social security to explain the special problem. With the budget thus obtained it belongs to the manager to recruit in correlation to the typologies of the pathologies of the residents the type of personnel they need :nurses, psychologist, physiotherapist and so on.

**PD8 705 WHAT ARE THE FACTORS INFLUENCING PATIENTS' COST IN COMMUNITY NURSING SERVICES (CNS) FOR FRAIL ELDERLY IN FRANCE?**

S. LUCIER\* (Urc Eco IdF, AP-HP, Créteil, France)  
K. CHEVREUL(1), S. LUCIER(1), S. BAHRAMI(1), S. CANAPE(2), L. COMRUELLE(3), Y. EON(4), P. GABACH(4) - (1) URC Eco IdF (Créteil, France);  
(2) Ministère du travail, des relations sociales, de la famille, de la solidarité et de la ville (Créteil, France); (3) Irides (Créteil, France); (4) Cnamts (Créteil, France)

In order to face the expected relative shortage of nursing homes, the development of services providing comprehensive, coordinated and integrated range of personal and maintenance care in the frail elderly's home have been encouraged. In France, this was called, the « maintaining at home » policy of which Community nursing services (called SSIAD) are a cornerstone. These currently provide care to 92 000 elderly and cost over €1 billion per year. However, many services are facing a financing problem. Therefore, this work conducted for the ministry of health aims to study the cost of CNS patients, to understand its structure and to identify its main determinants. Methods: 2179 elderly in 36 services were included in a one-week survey. The cost of patients' care is calculated through a micro-costing approach gathering information on type and quantity of care provided to patients. A two-level hierarchical statistical model is conducted to identify factors explaining differences in the patients' cost of care. Results: Patients' annual average cost of care is €10,323 which is very close to the per capita funding (€10,500). However, wide variations exist among elderly, their cost ranges from €1,135 to €36,659. Our model explains 52.1% of these differences. It finds that 11.6% are related to differences among services organisation and 88.4% to differences among patients. Patients' cost depends on 14 characteristics describing their level of disease, their level of disability (AGGIR scale, the technical devices they need, specific deficiencies...) and the additional helps received from informal and formal helpers. Conclusion: Thus, CNS services financing problem is mainly related to bad resources allocation mechanisms rather than to an underestimated national budget. Services are funded on a fixed per capita basis when cost variations ranges from 1 to 36. Using determinants of cost showed in our results could help to build a better financing method.

**PD8 706 AUDIT OF THE AWARENESS OF ELDER ABUSE (EA) AMONG MEDICAL STUDENTS**

H. ALAO\* (St George's University of London, London, United Kingdom)  
M. KHPAL(1) - (1) St George's University of London (London, United Kingdom)

EA is common but frequently unrecognised. Aim is to define ability of medical students at St George's University of London to recognise, report EA, and recommend how this ability, if inadequate, could be improved. Materials and method: Standards of acceptable level of knowledge agreed, questionnaires formed to consider: • Preclinical and clinical students • Perception of training in EA • Ability to recognise and report EA • Knowledge of nationally publicised paediatric abuse case in UK (Victoria Climbié) vs. geriatric abuse case (Margaret Panting) • Most common form of abuse, most likely abuser and most likely place of abuse • Month of World EA Day Cross-sectional audit of students using confidential questionnaires, handed to students at varied stages of training, at beginning of unrelated lectures. Results analysed using SPSS. Results: Response rate was 85% (639/750). Number of preclinical students 61.5% while clinical students 38.5%. 22.5% felt they had previous training, 41.6% felt they could recognise and report EA. 28.2% recognised Victoria Climbié, 5.2% recognised Margaret Panting. 4% recognise both. 26.6% recognised psychological abuse as most common form of abuse, however 54% said neglect. 62% recognised family members as most likely abuser while 24% thought health and social workers. 65% said abuse occurs at home while 25% thought residential and nursing home. 94% would report abuse to social services. 62% did not know month of world EA day. When asked about signs of types of abuse, 55% did not attempt question. Conclusion: Generic training and common sense of most medical students allows them to make sensible judgements on EA. However, underlying knowledge is poor. There is little understanding of presentations of EA and potential cases could be missed. Comprehensive training is required throughout undergraduate curriculum to ensure newly qualified doctors are fully equipped to deal with EA

**PD8 707** DISCLOSURES OF AGING PROCESS WITH QUALITY OF LIFE: THE ELDERS PERCEPTION

L. ZENEVICZ\* (Universidade Comunitária Regional de Chapecó - UNOCHAPECÓ, Chapecó, Santa Catarina State, Brazil)

K. CELICH(1), J. GOLDIM(2) - (1) Universidade Reional integrada (Erechim, Brazil); (2) Pontifícia Universidade Católica do Rio Grande so Sul (Porto Alegre, Brazil)

**INTRODUCTION:** The twentieth century was marked by a spectacular advance in science and technology, resulting in a huge development of humanity on several aspects, being the demographic aging among them. The challenge is formed by granting longevity with quality of life. **METHODS E MATERIALS:** This was a transversal study that had as purpose to identify the factors which contribute to aging with quality of life in the elders' perspective. 670 elders in age between 60 and 93 years old, members of third age groups in the city of Erechim (BRAZIL), participated of the study within the period from July to December of 2007. **RESULTS:** The data were categorized, where seven disclosures were obtained. Dignified retirement: the possibility of healthy aging. Relationships as important social mediations. The family: fundamental element in the elder's quality of life. Physical and mental health: essential condition to quality aging. Freedom to manage his/her own life. Spirituality: another essential disclosure to the quality of life. The necessity of governmental politics. **CONCLUSIONS:** To age is a dynamic and heterogeneous process that is part of all stages of life, and to take in consideration the several dimensions of the individual's life, which are intimately connected to a group of values, principles, rules, past experiences that guide the individual, is extremely important, where the assumed life style and public insertion and support to elders politics are essential to the maintenance of quality of life in the old age. **Observation:** This work does not present conflict of interests.

**PD8 708** VALIDITY OF A MODIFIED FUNCTIONAL HEALTH LITERACY TEST IN ELDERLY ADULTS IN CANADA: A PILOT STUDY

H. PENG\* (University of Alberta, Edmonton, Canada)

P. JENSEN(1), K. LECHELT(1), S. SIMPSON(1), B. WILLIAMS(1), S. HAGGARTY(2) - (1) University of Alberta (Edmonton, Canada); (2) Capital Care (Edmonton, Canada)

**Introduction:** Health literacy is the ability to access, process and comprehend health information to make health care decisions. Low health literacy is associated with less knowledge of disease, lower quality of life, poorer health outcomes and higher hospitalization rates. The Test of Functional Health Literacy in Adults (TOFHLA) only applies to US residents, rendering it inadequate for Canadians. The primary purpose of the study is to test the validity of a modified health literacy survey, by measuring the correlation between our modified TOFHLA and the Rapid Estimate of adult Literacy in Medicine (REALM); measuring the correlation between our modified TOFHLA and health-related quality of life (EQ-5D); and using subject responses to estimate the prevalence of poor health literacy of elderly residents in Edmonton, Alberta. **Methods:** A cross-sectional interview survey of community-dwelling elders seeking health/social care will be completed using a convenience sample: N=250 Inclusion Criteria Alberta resident  $\geq$  65 years of age Able to consent & read English Exclusion Criteria Cognitive impairment with MMSE  $\leq$  24 Inability to read English Participants complete our modified TOFHLA, the REALM, and EQ-5D questionnaires and demographic information. The correlation between the modified TOFHLA and REALM is assessed with the Spearman correlation coefficient. **Results:** Preliminary findings based on the first 30 participants show: 1) A strong correlation between our modified TOFHLA and REALM; 2) The correlation between the modified TOFHLA and EQ-5D are within the range of other studies; 3) There is a trend toward poor health literacy among elderly residents in Edmonton, Alberta. **Conclusion:** At this interim analysis, it appears that our modified TOFHLA retains similar properties as the original instrument. If these observations hold following completion of the full study sample, the modified TOFHLA will enable us to explore the relationship between health literacy and health care utilization

**PD8 709** INTEGRATION OF INTERDISCIPLINARY WORK IN TRAINING IN AGING RESEARCH: THE FORMSAV EXPERIENCE

S. PROULX\* (Institut sur le vieillissement et la participation sociale des aînés de l'Université Laval, Québec, Canada)

R. VERREAU(1), H. PAYETTE(2), Y. JOANETTE(3) - (1) IVPSA (Québec, Canada); (2) Institut universitaire de gériatrie de Sherbrooke (Sherbrooke, Canada); (3) Institut universitaire de gériatrie de Montréal (Montréal, Canada)

Research on aging requires an interdisciplinary approach involving collaboration between researchers from a wide range of disciplines, from biological to social sciences. Efficient interdisciplinary work is complex and needs to be integrated early in research training curricula. FormSaV (Formation Santé Vieillissement) is an innovative training initiative supported by the Canadian Institutes of Health Research and the Réseau québécois de recherche sur le vieillissement (RQRV), arising from the collaboration of three French language Canadian Universities (Laval, Montréal, Sherbrooke). The objectives are to provide graduate students and post-doctoral fellows in aging research with an opportunity to meet and experiment interdisciplinary activities. Since 2004, FormSaV has offered workshops in the format of Saturday schools and summer schools to graduate students in aging research from all disciplines and graduate programs. These workshops focus on areas of interest common to all areas of aging research: the challenge of aging in modern society,

interdisciplinarity, ethics, grant writing, peer review, knowledge transfer. Workshops include exercises and discussions, supervised by experts. They provide graduate students with a unique opportunity to meet with other students from other disciplines and initiate interdisciplinary collaboration. Since 2004, 250 students enrolled in the program and over 100 trainees have completed at least five training workshops. Students come from all disciplines involved in aging research, including fundamental, epidemiologic, clinical, evaluative and social research. Workshops offer learning abilities and skills which are not readily available through standard disciplinary programs. FormSaV is a unique opportunity for students to place their research project in a more global aging perspective and to welcome contributions from other fields. The present work describes how FormSaV contributed to improve the interdisciplinary approach among participating graduate students and post-doctoral trainees, using data from questionnaires to trainees on satisfaction about workshops and activities provided by FormSaV.

**PD8 710** SOCIAL HOME CARE AS NATIONAL VOCATIONAL QUALIFICATION

D. HROVATIČ\* (Gerontology Association of Slovenia, Ljubljana, Slovenia)

Social home care is playing an important role for population of elderly, especially for those who need constant help in their own homes within housekeeping, personal care and social contacts. Although the need for social home care has been growing up lately, the question whether a formal qualification for such work is needed, remains open. The first social home carers in Slovenia were working within temporary public programs, where its duration took six months to a maximum of one year. Home Care Centers had difficulties to organise the service for elderly with enough qualified people under above circumstances. Most carers are women in middle age with lack of recognized qualification, whose backgrounds are related to different working and life experiences. New National Vocational Qualification Act in 2000 appeared to be a felicitous solution to above situation. Within this act an Accreditation of Prior Experiences and Learning for acquisition of National Vocational Qualification was introduced. During past years the evaluation of social home care has been implementing. Qualitative research about home care service was implemented and catalogue of knowledge and skills for NVQ was analyzed. Results are important for future development of job, care services and quality of life for elderly. Within NVQ were defined nine main working areas, including twelve vocational competences. NVQ was proposed within forth level of qualification framework. With regard to acquisition of qualification, portfolio method and counseling process were recognised as two most important methodological approaches. Even the NVQ took place a further training for social home carers seems to be very important due to constant improving of home care service. At the same time social home carers need to have professional support in order to prevent burning out syndrome. The home care service profession is becoming complex and important in the life of elderly people.

**PD8 711** SEXUAL IMAGE OF PUERTO RICANS OLDER ADULTS IN THE MEDIA

M. SANTOS-ORTIZ\* (Graduate School of Public Health- University of Puerto Rico, San Juan, Puerto Rico)

A. HERNANDEZ-RIVERA(1), Y. VAZQUEZ-GUZMAN(1) - (1) Medical Science Campus- UPR (San Juan, Puerto Rico)

**Introduction** As in other countries in Puerto Rico, older adults' population is increasing. Middle and older adults' sexual behavior have become an important issue in Public Health efforts. Of all HIV cases reported through June 2003 to December 2007, 11.4% were from people 50 years and older: 8.1% from 50-59 years old and 3.3% from 65 years and older (Puerto Rico's Health Department, 2009). The most common form of transmission was related to sexual contact (heterosexual, male to male/bisexual). The availability of erectile dysfunction medications and health insurance companies' mass media campaigns in Puerto Rico has contributed to validate sexual expression among this population. Health communication needs to take this into consideration, when designing interventions to promote sexual health. This research analyzes the sexual image of older adults in the mass media. Methods and materials Content analysis of the media images (TV, movies, newspaper ads and postcards) that portraits sexual expression of older adults. Results Media is an important influence in how older people perceive themselves as sexual beings. It also changes the awareness of older people sexual expression in health professionals and community. There has been a gradual change in the media, towards a more positive approach to sexual expression of older adults. They are presented as more spontaneous, attractive, vigorous and interested to express their sexuality. This validates sexual expression as a positive component in health among this population. Conclusion These results confirm the importance of validating sexual rights in this population. Sexual health promotion and prevention interventions for older adults of different sexual orientation should be incorporated in health services. Academic curriculum and continuing education activities for health professionals must include this component. Mass media must recognize their impact and importance in promoting a positive and responsible sexual behavior among this group.

**PD8 712** 14-YEAR LONGITUDINAL STUDY: PROGRESSIVE DEVELOPMENT OF ONLINE GERONTOLOGICAL DISTANCE LEARNING  
G. MISIASZEK\* (University of Southern California, Los Angeles, United States)  
E. SCHNEIDER, M. HENKE

Since the advent of the World Wide Web in the early 1990s, the use of the Web continues to proliferate at an astonishing pace. The application of web-based technologies in higher education has also developed and grown, ranging from recruitment tools to complete post-baccalaureate degrees offered in cyberspace. While much has been written about the advantages of web-based education or those of distance learning in general, there little is critically known about the effects of various online distance learning approaches all within the same academic institution over an extended period of time. Although fourteen years in many research studies might not constitute a "longitudinal study," for online distance education covers almost the entire time length of its existence. Questions that will be focused upon are the following: what were the successes and failures of various distance learning endeavors, how are successes and failure measured, what are the positive and negative aspects of following the trends of distance education, how was knowledge disseminated and re-disseminated for different audiences using various online technologies, and how did all these questions relate to the challenges of developing distance learning models for age and culturally diverse audiences. All three of this paper's authors have been the leading members of the vision, funding, management, marketing, design, and development of the distance learning program throughout all fourteen years. The authors include the former dean who was the executive director of the Davis School during the initial development of the online distance learning program, Dean Emeritus Edward S. Schneider; program manager, Maria Henke, and director of distance learning, Greg Misiaszek. Discussed will be not only their perspectives on the programs tenure but also perspective from students, faculty, and staff throughout.

**PD8 713** NURSING KNOWLEDGE IN ELDERLY CARE: CHALLENGES AND TENDENCIES  
M. COSTA\* (Instituto de Ciências Biomédicas Abel Salazar, Universidade do Porto, Porto, Porto, Portugal)  
M. MARTINS(1), B. GOMES(1), M. PARREIRA(1) - (1) Escola Superior de Enfermagem do Porto (Porto, Portugal)

1-Summary The research is a meta analysis and was developed in a Portuguese University in the North of Portugal. The materials used in the research were the texts of Master Thesis about elderly people, in Nursing Sciences that were approved in public examination in the period between 1995-2006. 2-Main Goal The aim of this research was: - to analyze produced knowledge in elderly nursing care during Post graduated education. - to analyze tendencies and future scenarios for nursing elderly care and education. 3-Methods Content analysis of: introduction, methodology, conclusions and suggestions (Huberman and Miles, (1991) and also quantitative analysis. 4-Results - 52% of the studies were carried on in hospitals and the research object was centered in elderly disease, emphasizing; breathing disease and heart and cardiovascular diseases; - The analysis about elderly pain was studied with different scales and results also evidenced the need of standards in nursing practice education in order to solve suffering problems; - The presence of elderly members in the family is an important stress source and influence the quality of life of all the members of the family; - A lack of nursing studies and geriatric specialization was identified. 5-Results Discussion and Conclusion Nursing practices in health community have not quality standards which difficult a deeper analysis of community care (Costa, 2005). Nurses have a very important role if their practices are centered in the patient and not in the technique and education is playing an important role about (Costa, 2005); - Geriatric nurses are needed and multidisciplinary studies are advising the development of team education in elderly care. Discussing groups among professionals can be useful to share doubts, to study professional practice. - Learn together to work together is a challenge in modern society applicable to elderly care.

**PD8 714** VICTORIAN GERIATRIC MEDICINE TRAINING PROGRAM  
B. KATZ\* (St George's Hospital, Kew, Australia)  
J. SCHWARZ(1), C. LLOYD(2) - (1) Western Health - Sunshine Hospital (St Albans, Australia); (2) Victorian Geriatric medicine Training Program (Kew, Australia)

Introduction: There is no consensus as to the best way to expand the workforce to cater for the needs of an ageing population. Faced with this challenge the Victorian Department of Human Services in Australia supported a proposal by the Australian and New Zealand Society for Geriatric Medicine to make a career in geriatric medicine more attractive by enhancing the specialist training program, and to redress a maldistribution where most training was occurring in a few major centres. Methods: The first step in the restructure of specialist training was to create an environment of collaboration between all accredited training sites aiming to enhance recruitment rather than compete for a limited number of trainees. The next step was to enhance the quality of training through a statewide training program, complemented by local training programs. This was followed by the development of internet training programs for junior doctors and medical students. The scope of the education programs on the internet is now being expanded to other health professional groups. Results: There has been an increase in the quality of training and enhanced spirit of collegiality among trainees. Recruitment into specialist training has increased by 75%

since the program commenced in 2006 and by 25% in the number of sites where training takes place. Evaluation of the internet education programs is currently being undertaken. Conclusions: A well resources and integrated training program has been associated with a significant growth in recruitment into specialist training. The success of this program has resulted in the expansion of the education program to other medical, nursing and allied health groups involved in aged care.

**PD8 715** THE GERONTOLOGICAL EDUCATION DEVELOPMENT IN TAIWAN  
T. KUO\* (Central Taiwan University, Taichung City, Taiwan)

Taiwan, like many Asian countries, is considered one of the fastest aging states in the world currently. During the past 8 years, gerontological education has undergone rapid development in Taiwan. For example, over 15 programs were established at the levels of associate, undergraduate and graduate degrees. The purpose of this paper is to analyze the development of gerontological education in preparing for various types of aging specialists needed in Taiwan. The data came from the official website information about the gerontological programs, curriculums as well as personal interviews with the directors of the programs. All curriculums were collected, evaluated and analyzed by comparing to a 12-category competency scale. Results showed that the gerontological curriculums and programs varied by its departmental origin, faculty specialty and the strengths of the universities where they are known by. Among the different types of degrees, differences were not observed significantly, suggesting that most programs were more likely to cultivate gerontological generalists rather than specialists. In addition, competencies in health care skills, care management, and policy understanding were the focus of most programs while competencies fostering team-work, leadership, and technological advancement were not observed as much. In conclusion, Taiwan is at the state in need of aging specialists and generalists. Although it is a good sign having many programs established in such a short period of time in Taiwan, many still lack a central mission and faculty members specializing in teaching gerontology. Therefore, for Taiwan to have a comprehensive system in both community-based and institution-based services, it is urgent for all programs to be in communication and/or to have specializations so future aging specialists can be developed and ready for the needs of the future aging population.

**PD8 716** NEWSPAPER IN EDUCATION(NIE) PROGRAM FOR THE ELDERLY  
G. LEE\* (Silla University, Busan, Republic of Korea)

The purpose of this study is to develop NIE program and evaluate its effects for the elderly and to investigate whether NIE can be applied to the senior education. The procedures of the study include reviewing the concepts and effects of NIE through the related materials, and developing the NIE program for the elderly. Then I analyzed the program effect in view of quality and quantity method. The results of this study are as follows: Firstly, senior educational program using NIE was developed for the first time. The meaning of application of NIE to senior educational program seems to be great. Secondly, after the program was put into practice, the melancholy trend, self-respect and the degree of life satisfaction of the participating seniors showed meaningful difference. That is, as a result of controlled - experimental comparison and before and after statistics of experiment group, the degree of life satisfaction and self-respect improved while melancholy trend decreased. In the after-evaluation of experiment group, life satisfaction improved on the average from the emotional and experienced point of view, and likewise melancholy trend improved psychologically and physiologically. In other words, NIE is effective educational method for the senior education. Therefore, to generalize NIE a variety of learning preparations and education program considering senior quality should be developed. In conclusion, as NIE using newspapers as a learning material turned out effective for the senior education, it should be used positively afterwards. To attain this purpose, various technique development and effect examination which can be applied professionally and systematically by trained instructor is required.

**PD8 717** THE MEDIATING EFFECT OF SELF-EFFICACY ON THE RELATIONSHIP BETWEEN HEALTH LITERACY AND HEALTH STATUS IN KOREAN OLDER ADULTS  
S. KIM\* (Kyungpook National University, Daegu, Republic of Korea)  
E. CHOI(1), E. LEE(1) - (1) Kyungpook National University (Daegu, Republic of Korea)

Introduction: Although limited health literacy has been shown to be associated with worse health status, research to date has not elucidated the factors that mediate the relationship between low literacy and adverse health outcomes. The purpose of the study was to examine the mediating effect of self-efficacy on the relationship between health literacy and health status in Korean older adults. Methods and Materials: A cross-sectional study of 103 community-dwelling Korean older adults was conducted from June 2007 to September 2007. Data were collected by using the Korean Test of Functional Health Literacy, the General Self-Efficacy Scale, and the subscales of the Medical Outcomes Study 12-item Short-Form Health Survey (SF-12). The causal steps method developed by Baron and Kenny was performed to analyze the pathways linking health literacy and health status. Results: The study showed that low health literacy was associated with worse physical and mental health status, and the effects of health literacy on physical and mental health status were mediated through self-efficacy. Conclusions: Because older individuals with low

health literacy are at increased risk for poor health, assessing health literacy in health care practice is warranted. Also, the approaches to improve delivery of care for older adults with low health literacy need to include not only improving readability of health information material but also enhancing self-efficacy of each individual.

**PD8 718 INNOVATIVE TRAINING FOR THE AGED CARE WORKFORCE-THE AUSTRALIAN EXPERIENCE**  
L. POULOS\* (Aged Care Channel, Belrose, Australia)

In 2003 as a result of the identification of the particular needs of staff working in aged care homes in Australia, a satellite television medium was established to provide live interactive education sessions to staff on site. This is now the primary tool for education for over 55% of the aged care homes across the nation. Staff are provided with current evidence based practice information using real live footage of clients and scenarios in the work place. A leading expert is the guest panelist on each program and staff phone in for a live interactive question and answer session at the end of each program. Web based resources are provided and sessions can be recorded and used for staff education across all shifts. During this presentation case studies will be presented on the outcomes of this medium of education and research that supports why the short course/interactive type of education is effective as opposed to self directed distance learning. Staff who would normally not have access to the latest research or evidence on a particular topic have been able to review practice and change where appropriate. Recognition of Prior Learning (RPLs) are granted for staff who wish to complete aged care certification.

**PD8 719 THE CURRENT SITUATION OF LEISURE ACTIVITY FOR THE ELDERLY IN NORTH CHUNGCHEONG PROVINCE, SOUTH KOREA**  
M. CHO\* (Seowon University, Cheongju, Republic of Korea)

Introduction: Participation in leisure activities is associated with a life satisfaction and an improvement in quality of life in the elderly according to the result of precedent study. The participation in leisure activities is related to the frequency with regard to our socio-demographic change. The purpose of this study is to investigate various factors that affect leisure activities with focus on the leisure participation of the elderly living alone or living with their spouse. Methods : We examined the leisure life to provide some suggestions from perspective of the well-being of the elderly. The prospective cohort of 244 subjects older than 65 years of age resided in the province. Data collected through a questionnaire designed for this study consist of multiple-choice questions with items constructed to represent the operational definition for each variables. Data analysis used in this study were utilized t-test, one way ANOVA, multiple-classification analysis. Results: The kinds of participation activities are as follows : 1. sports and health activities, -jogging, walking ,free gymnastics- 2. hobbies and cultural activities -cooking, gardening, reading, playing the instrument, singing a song- 3. appreciation and inspection activities - watching TV, listening to the radio, listening to music- 4. recreation and social activities -visiting friends or relatives, social group activities such as club activities, all sort of training, alumna associations. The elderly who were living alone or living with their spouse frequently participated in time-spending activities such as watching TV and family-oriented activities. The structure of leisure participation differed significantly according to the respondent's age, educational level, health status, and monthly average income. Conclusion: The significant independent variables influencing the participation of the elderly were educational level and monthly average income, and future, the most important variable in influencing the elderly leisure participation was the educational level.

**PD8 720 „HEALTH PROMOTION FOR FAMILY CAREGIVERS“ - IMPLEMENTATION OF AN ASSESSMENT IN ESTABLISHED STRUCTURES -**  
A. BUDNICK\* (Charité-Universitätsmedizin Berlin, Berlin, Germany)  
K. KUMMER(1), S. BLUEHER(1), D. DRAEGER(1) - (1) Charité-Universitätsmedizin Berlin (Berlin, Germany)

introduction: European and German studies identify family caregivers as an important target group that have, due to various burden, high needs for health promotion and prevention. Established offers rarely have preventive character and seldom reach the target group. Studies have identified numerous shortcomings in established offers, e. g. proper ways towards the target group and a lack of need orientation. Referring to these scientific results an assessment-instrument was developed in the project "Health Promotion for Family Caregivers". This instrument determines the needs of health promotion for the target group. The implementation of the instrument in established structures of the co-operation partner, a German national health insurance, constitutes a new way towards the relevant group. method: A CATI-software was developed to carry out the assessment. The software was implemented in the IT-network of the insurance. Before starting the assessment the interviewer was instructed intensively: 1. standards of quality, usage of the CATI-software; 2. strategies of argumentation for promotion of offers; 3. supervision of the start-up phase. In addition to the assessment-instrument a matrix of classification was developed consisting of three partitions (psychological, social, and physical profile). This classification summarizes family caregivers into groups that are equal regarding psychosocial and physical self-estimation. There are nine types in the matrix of classification. According to the placement in the matrix a family caregiver receives an offer for health

promotion that is submitted since January 2009 via the health insurance. results: The analysis of the phase of implementation delivers differentiated knowledge about the willingness of the target group to participate in the assessment, about the placement of the relevant group in the matrix of classification as well as the usage of offers. conclusion: The data allows a first feedback of the preferred way towards the target

**PD8 721 VALIDATION OF A TOOL FOR DETECTION OF DOMESTIC ABUSE AND SELF-NEGLECT(EDMA SCALES)**

T. CARMEN\* (Universitat de les Illes Balears, Palma De Mallorca. Islas baleares, Spain)  
P. CARMEN(1), S. MARIA PAZ(2) - (1) Escuela Universitaria Cardenal Cisneros (Universidad De Alcala) (Alcala De Henares. Madrid, Spain); (2) Escuela Universitaria Cardenal Cisneros (Universidad De Alcala) (Spain)

Introduction: The Scales for Detection of Domestic Elder Abuse and Self-neglect (EDMA) is a tool designed for use by social service professionals to identify people at risk of abuse by their caregivers, family and / or people nearby, or by themselves (self-neglect). It consists of two scales: the scale of the older person and the scale of the person who allegedly exercised abuse. Depending on the type of suspicion (domestic abuse and self-neglect or domestic abuse or only self-neglect), the type of information that can access (pertaining to the elderly, to the potential perpetrator, or both), and / or the time available, the professional can choose to use both scales, only one of them, or some aspects of both. Methods and Materials: The objective was to test the psychometric properties of the EDMA. 46 professionals were involved and allowed us to access a sample of 278 cases. In addition to the scales, we used the "Indicators of Abuse (IOA) Screen (Reis and Nahmias, 1995; and Nahmias Reis, 1998 Reis, 2000). The validation study was conducted in several stages: 1rst. Presentation, 2nd. Training of professionals, 3rd. First application, 4th. Second implementation, 5th. Analysis of results and 6th. Presentation of results. Results: The statistical analysis made evident how the two scales and their corresponding dimensions have shown appropriate indexes of reliability. They have also shown evidence of validity to distinguish people might not be abused and people might be abused and predict the type of treatment and its possible suspected risk. Data also shows an adequate sensitivity and specificity. Conclusions: The present EDMA psychometric properties are comparable to other similar instruments. In the future, it would be useful to repeat the investigation with a representative sample of the Spanish population.

**PD8 722 FAMILY SUPPORT IN BRITAIN: A QUESTION OF NEED, CULTURE OR ENABLING FACTORS?**

R. WILLIS\* (King's College London, London, United Kingdom)

Introduction There is a perception that particular ethnic groups have a stronger sense of filial responsibility than is found in Western European societies, which has led to a belief that formal services are not required by minority groups in Britain. However, it has been suggested that some minority ethnic older people are actually in greater need of support than the white majority in Britain, because of factors such as poorer health and lower socio-economic status. Methods and materials National statistics from the Home Office Citizenship Survey 2005 were used in order to identify whether there were ethnic differences in informal support in old age while controlling for the demographic factors which affect support provision. Results Logistic regression using an adaptation of the Andersen behavioural model of health service use was employed. Ethnic differences in levels of support persisted once demographic factors had been controlled for. However, these ethnic differences were in the opposite direction to that predicted by the popular perceptions. The Black Caribbean, Black African and Mixed groups all had significantly lower odds of receiving support from relatives outside the household when compared to White British older people. Moreover, Indian older people had significantly lower odds of giving support to relatives outside the household when compared to White British older people. Demographic factors which were significantly associated with both support provision and receipt regardless of ethnicity included being female and having children. Furthermore, those with a limiting long-term illness or disability were significantly less likely to give support regardless of ethnicity. Conclusions Ethnic differences in provision of informal support in old age do exist in Britain, even when important demographic factors have been accounted for. These differences are contrary to those which would be expected if the popular assumptions were true.

**PD8 723 ADAPTING TO FOOD RELATED ROLE CHANGES: THE EXPERIENCES OF MALE CARE PARTNERS AND WIVES WITH DEMENTIA**

E. ATTA - KONADU\* (University of Guelph, Guelph, Canada)

H. KELLER

Male care partners and their wives with dementia encounter challenges as they deal with food-related role changes. There are very limited studies on challenges faced by male care partners who adopt food roles previously performed by their wives and none on these wives who progressively lose their food roles to their husbands. This study explores the experiences of nine male care partners and their wives as they adjust to these role changes. Theoretically sampled participants were interviewed (dyad and individually) as part of the Eating Together 1 Study, a longitudinal project looking at the experience and meaning of food and mealtimes for families living with dementia. Using grounded theory

methodology, three years of interview data from these participants were analyzed. The emerging theory describes the process of sliding into food-related roles. This shifting of roles results from a progressive handing over of roles where wives transition from being in control of cooking and other food roles to coaching their husbands to take over some food roles and finally to a point where she loses complete interest in cooking and the male care partner is fully in control. Male care partners slide into roles previously performed by their wives by reciprocating the nurturance they have received from their wives and keeping the domestic standards set out by their spouses. A gendering of the food-related role impacts how successful the transition occurs. Male care partners and wives with dementia found the process of sliding into roles less challenging when they were successful in promoting each others' self-worth and preserving identities throughout the process. This study shows the need to provide support to male care partners and their wives with dementia in the area of food roles. Strategies used by participants will be discussed to help with knowledge

**PD8 724 FAMILY, QUALITY OF LIFE AND CARETAKERS OF SENIORS WITH ALZHEIMER**  
L. CAPAVERDE BULLA\* (Pontifícia Universidade Católica do Rio Grande do Sul, Porto Alegre, Brazil)

**Introduction:** The aging of the population is a world concern and motivates the development of several areas of the science that study that phenomenon. Among the problems of health found in the age, the Disease of Alzheimer presents an accentuated increase in its incidence. With this study, it was looked for to deepen knowledge, to identify the caretakers' difficulties and the nets of social support, besides offering subsidies for the development of social policies. **Methods and materials:** 100 relatives were interviewed, with a semi-structured instrument that evaluated the situation of taking care. For the evaluation of the life quality the instrument WHOQOL was used and to analyze the stress symptoms the inventory of Lipp it was used. The qualitative data were analyzed according to the Method of Analysis of Content of Gagneten and the quantitative ones by the Lexical Sphinx Program. **Results:** The family caretaker is, generally, the wife, the daughter or daughter-in-law, that suffers physical, social, emotional and economic pressures and can develop several types of diseases. To face the stress, the relative develops material and emotional strategies, that facilitate the situation of taking care and decrease the stress. Among the strategies, the relatives mention the search of spiritual support, the participation in the support groups to the patients' families with Alzheimer and the assistant's recruiting, but most of the families cannot pay that service. **Conclusions:** The participation of the family is fundamental in the seniors' care with Alzheimer, a chronic and degenerative disease. The deficiency of the public Brazilian politics causes the relatives' overload. The situation affects, especially, the poorest population than, besides the disease, faces economic, psychological and social difficulties. It is urgent the creation of services for the sick seniors, home services, day-care centers, public centers of health and other resources.

**PD8 725 ELDER MISTREATMENTS, CRISIS SITUATION, NOSOCOMIAL LOSS OF ABILITIES: A MULTIFACTORIAL GERONTOLOGICAL SYNDROME**  
R. MOULIAS\* (ALMA, Grenoble Cedex, France)  
S. MOULIAS(1), A. FRANCO(2) - (1) CHU A. Paré (Boulogne, France); (2) Laboratoire Interuniversitaire de Gérontologie de Grenoble pavillon E Chatin CHU (La Tronche, France)

The experience of the listening association ALMA (more than 6000 files of mistreatments each year) demonstrates analogies of etiologic factors between mistreatments, quick nosocomial loss of abilities, and "crisis" situation in geriatric care. Study of related factors shows similar causes, even if all mistreatments do not lead to crisis and if crisis are not always preceded by mistreatments, neglects are inescapable in pre crisis periods. Uneducated hospital staff leads to same results. Main elements of this syndrome are: • Victims: they depend from the perpetrator, either familial or professional, for their daily life, and present behavioural or mood disorders. • Perpetrators have some ascendancy over the victim, but also lack of training and education for their task (professional or familial). They are isolated without access to competent advices. Often they are not aware of the needs of the victim or of his pathological state. • Surroundings are inappropriate for the needs in care and helps. • Witnesses, if working or living in the same routine than the family or the professional team, are not aware of the mistreatment. Only witness with a new look on the situation or with professional competence may alert on the mistreatment and/or on the risk of crisis. Changing only one among these factors (disabilities, behaviour, mood, training, education of helpers, awareness, inappropriate surroundings, witness with a new look), may suppress mistreatment and limit the crisis risk. Mistreatment, loss of abilities and "crisis" are aspects of a common, multifactorial socio-medical syndrome. Better knowledge of those factors may strongly decrease mistreatments, loss of abilities and crisis situations and decrease in the same way needs for emergency hospitalizations in non geriatric wards and institutionalizations. Further studies on this common syndrome could lead to better care for frail populations and important decreases of costs.

**PD8 726 KINSHIP CAREGIVERS: DOES HEALTH INTERFERE WITH CAREGIVING?**  
D. MONAHAN\* (Syracuse University, Syracuse, New York, United States of America)  
C. SMITH(1), R. GREENE(1) - (1) Syracuse University (Syracuse, New York, United States of America)

**Introduction.** In almost every culture grandparents have served as child care resources for families experiencing stress. A recent trend in American child welfare and in the general population is the reliance on relative care in the face of social forces that have left a large number of children in need of care. The care of grandparents has been leveraged to support the child welfare system in the formal system and has stressed families outside of the system in informal arrangements. Although, as a group, these grandparents are younger (early to late 50s), they face a number of health, social and policy challenges that require attention to maintain the well-being of these caregivers and their grandchildren. The purpose of this paper is to examine the consequences of kinship care on the health of caregivers. **Methods.** Data from this study of kinship caregivers (N=102) were analyzed using SPSS. Their mean age was 57.51 years, the majority were female, they were racially diverse, 30% were married, and 37% completed high school. The research was funded by the Childrens Bureau-DHHS. **Results.** In the logistic regression analysis using the variable, "my health interferes with caregiving," as the outcome variable (1=yes, 0=no), caregiver age, monthly income, hours they provided care, number of children in care, and total hours employed were not significant predictors of negative health consequences of caregiving. However, total pressures score and the total family service needs score were found to be statistically significant negative health predictors and the classification table correctly predicts 77.4% of the cases. **Conclusions.** Practitioners should be aware of the importance of family service needs when working with kinship caregivers, if they expect to reduce the potential negative health effects of caregiving. Helping caregivers reduce their "pressures" of caregiving is also essential.

**PD8 727 'I DON'T FEEL USELESS AT ALL': SOCIAL ACTIVITY AND WELLBEING OF AUSTRALIAN BABY BOOMERS**  
K. O'LOUGHLIN\* (University of Sydney, Lidcombe, Australia)  
N. HUMPEL(1), M. SNOKE(1) - (1) University of Sydney (Lidcombe, Australia)

**Introduction** Individuals and governments are becoming increasingly aware that baby boomers' retirement from the workforce will have a major bearing on their economic and social wellbeing and the future of younger generations. This study is part of a larger Ageing Baby Boomers in Australia project. The aim of this qualitative study was to explore boomers' retirement planning with the focus on their current and expected level of social activity and wellbeing. **Method** Participants aged 50 to 62 years were recruited to 15 focus groups (n = 73; m= 29, f = 44) conducted throughout Australia. The groups were organized by work/retirement status, gender and geographical location. The data were analyzed using NVivo software to identify the range of views and any variation by the selected study variables. **Results** Boomers, whether retired or still working, emphasized the importance of staying active in their retirement years as a means of maintaining both physical and mental health. The majority of participants reported high levels of social activity including voluntary work and travel. Many are engaged in voluntary work in their communities and those planning retirement indicated the likelihood of increasing involvement in voluntary work. Boomers are well traveled and reported that travel plans had been factored into their financial planning for retirement. Other areas of activity identified included providing support/care for elderly parents and, to a lesser extent, for grandchildren. Very few had a direct caring role; rather they supported elderly parents in managing finances and home maintenance. Conclusion Boomers are keen to maintain their health and to stay socially active as long as possible. Findings from this study will give governments and communities knowledge on baby boomers' expectations to guide their responses to societal ageing, contribute to a new vision of positive ageing and help relieve pressure on health expenditure

**PD8 728 CONSUMPTION CHOICES AND PRACTICES IN LATER LIFE – EXPLORING SUBJECTIVITY, SOCIALITY AND SPATIALITY**  
J. MANSVELT\* (Massey University, Palmerston North, New Zealand)

**Introduction:** Limited research has been conducted on relationships between ageing and consuming. In order to understand the significance of these relationships, it is important to examine the experiences of older people and to consider how consuming practices shape social relations, identity formation and place in later years. **Methods and Materials:** The research was conducted with 12 elders dwelling in the Manawatu region of New Zealand. Participants were chosen according to highest and lowest scores on a standardised living index. Methods included audio recorded in-depth qualitative interviews, participant observation of shopping trips, and participants' photographs of shopping spaces and purchases. Three forms of commodities (groceries, clothing and electrical appliances) reflecting differing necessity, durability, positional status, and shopping practice were used to explore decision making, provisioning and commodity use and the social and spatial networks which enabled or constrained consumption. Interviews and fieldnotes were coded thematically and subject to critical discourse analysis. **Results:** Across all participants consumption was demonstrated to be a moral and sometimes contradictory activity. It was also a relational activity with commodity choices formed in the context of familial,

intergenerational and peer relationships. For each commodity form studied, consumption provided a means of self-identification and belonging. Consuming practices afforded opportunities for sociality and spatial mobility and were frequently associated with resourcefulness and resilience, a means of retaining autonomy and choice in ones later years. Conclusion: Much more than either a mundane or hedonistic activity, consumption is a complex set of moral practices which have a significant role in establishing ageing subjectivities, well-being , inter-generational and social connections and life-course opportunities. In addition consumption also plays a significant role in crafting a place to be and to 'become' in later years of life.

**PD8 729 THE POLICY OF 'AGEING IN PLACE' – DILEMMAS IN THEORY AND PRACTICE**

G. HAMMARSTRÖM\* (Department of Sociology, Uppsala University, Uppsala, Sweden)

One of the pillars of Swedish old age care policy is the idea of 'ageing in place', which means that old people should live in their own home as long as possible and get their needs of help and care met by publicly organized and financed home-help services. Even if the public sector has the main responsibility for the old age care, the care of old people is in fact a shared responsibility between the public sector and the family. The aim of this presentation is to shed light on some of the dilemmas that the goal of 'aging in place' generates, in relation to the elderly themselves and to their adult children. The presentation is based on three different studies on i) elderly home help recipients, ii) old people with complex and severe illnesses and their relatives, and iii) needs assessors. The studies show that the well-being of old home help care recipients more or less presupposes complementary assistance from adult children; that old people's adult children are rather dissatisfied with their relations with the home-help services because of lack of influence; that the needs assessors are, in turn, ambivalent toward old people's adult children. The studies show also that the goal of 'ageing in place', which more or less presupposes complementary help from adult children, and the Social Service Act, which diminishes adult children's influence, operate as contradictory principles which pose various dilemmas for both the elderly and their adult children. This presentation argues that these dilemmas stem from the fact that Swedish old age policy works with two distinct family constructs. The goal of 'ageing in place' is based on the extended family network across family generations, whereas the Social Service Act rests on a legal construct which excludes adult children.

**PD8 730 EVALUATING HOME-BASED DEMENITA CARE PRACTICES: A CRITICAL ANALYSIS**

A. OUDSHOORN\* (University of Western Ontario, London, Canada)  
C. WARD-GRIFFIN(1), C. MCWILLIAM(1), D. FORBES(1), O. ST-AMANT(1), R. DEFORGE(1), N. BOL(1), M. KLOSEK(1), J. MOWAT(1) - (1) University of Western Ontario (London, Canada)

Background: Because care is most accurately understood as relational, relationships between and among seniors with dementia, their family caregivers, and formal care providers need to be better understood. Examining how these relationships are negotiated and how the care process influences the health and well-being of all those involved in home-based dementia care will potentially improve the quality of care for seniors with dementia. Purpose: A critical ethnographic study examined the values, beliefs and social power relations of community dwelling seniors living with dementia, their family caregivers, and care providers and how they negotiated the provision of homecare. Methods: A purposeful sample of 9 dementia care networks, including 9 seniors living with dementia, 25 family caregivers and 12 homecare providers, was obtained. Semi-structured interviews were conducted with all participants providing/receiving dementia care. For each field visit, researchers recorded their perceptions, insights and observations of the dementia care network. Findings: Our analysis yielded four integral relational care processes: managing care resources, making care decisions, reifying care norms and evaluating care practices. This presentation will focus on the evaluations of dementia care practices as perceived by clients, caregivers and providers. The type and quality of evaluations was dependant on the participants' position within the dementia care network. Caregiving contributions of self and others were evaluated according to taken-for-granted, but often conflicting values of care and caregiving relationships. Further, the practices and policies of the homecare system were rarely appraised, particularly by family caregivers and in-home providers. Conclusions: With the increasing emphasis on homecare in Canada, findings provide vital information about the complexity of relational care processes within dementia homecare. Healthcare providers, administrators and policymakers need to attend to the potential negative outcomes of hierarchical roles within homecare that value some care practices over

**PD8 731 THE CASE-MANAGER: WHAT SUPPORT FOR THE INFORMAL CAREGIVERS? AN ACTION-RESEARCH TO PROMOTE CASE MANAGEMENT AT HOME IN FRANCE**

N. BLANCHARD\* (Géronto-Clef, Montpellier, France)  
A. COLVEZ (1), S. BERTHIÉ(1), J. PARIS (2) - (1) Géronto-Clef (Montpellier, France); (2) Institut régional du travail social (Montpellier, France)

**INTRODUCTION:** Within the framework of an Action-Research to promote help to disabled elderlyin (Languedoc-Roussillon), a case manager was appointed to each household including a disabled elderly and his informal caregiver. The objective for the case-manager would be to contact the household and act as a go-between, coordinator and support. He would be identified by the disabled elderly and his family as a professional able to answer their needs for support. In the project the case-manager was in charge of the evaluation of the informal caregivers' needs in the context of the daily support given by the spouse or relative. One of the objectives was to assess the recognition of the case-manager by thecaregivers and identify the required conditions to promote this procedure on the longterm. **MATERIAL AND METHODS:** 1. Choice of case-managers in cooperation with the local centers for information and coordination (Clic) in 4 gerontological areas. This procedure is based on voluntary acceptance from social workers and their institutions (Conseils généraux, Social security, local hospitals ) 2. Training of case-managers, control sessions. 3. Methodological support: conception and availability of follow-up and evaluation tools. **RESULTS:** The Reluctance of informal caregivers to accept to be helped is confirmed by professionals that pointed out the difficulty to act, except when they are clearly asked. It is important to reexamine care-plans and to work with all the professionals involved into help. Professionals need to improve their skills and to gain an official recognition to collaborate with others professionals in the area. **CONCLUSION:** Additional work will be necessary to determine which time is the more appropriate to offer the case-manager intervention in relation with other professionals involved in help. It is also important to set up relevant criteria to select suitable professionals.

**PD8 732 THE DENATURALIZATION OF CARE FOR OLDER PARENTS: THE NEW CULTURE OF CARE AMONG BABY-BOOMER CAREGIVERS**

J. LAVOIE\* (CSSS Cavendish, Côte-St-Luc, Canada)  
N. GUBERMAN(1), I. OLAZABAL(2), A. GRENIER(3), L. BLEIN(2) - (1) Université du Québec à Montréal (Montréal, Canada); (2) CREGÉS (Côte-St-Luc, Canada); (3) McGill University (Montreal, Canada)

Baby-boomers are now at a stage in their lives where many of them, mostly women, need to face their older parents' impairments. This generation is known for its culture of freedom, feminism and individualism. Now that many baby-boomers have to care for their older parents, do they view themselves as different from former generations of caregivers? Are they bringing forth a new culture of care? In Quebec, these women's life trajectory is very different from previous generations owing to their participation in the labour force, their fertility and their move away from traditional marriage. We conducted two studies with 70 baby-boomer caregivers, mostly women. Half of the participants were interviewed on the organization of care in their family, their attitude about care and its impact on their lives. The second half participated in focus groups and discussed their relationships and expectations with service providers. According to our results, care doesn't appear to fit in with their present life trajectories nor their plans for retirement. Also, contrary to their parents, care isn't central to their core identity. This denaturalization of care leads these women to categorize themselves as caregivers rather than simply as wives and daughters.

**PD8 733 THE IMPACT A HOMECARE PROGRAM ON ELDERLY' CARETAKERS QUALITY OF LIFE AT A BRAZILIAN HEALTH CARE SERVICE**

E. MORAIS\* (Federal University of Rio Grande do Sul, Porto alegre, Brazil)  
L. PASKULIN(1), F. COSTA(1) - (1) Federal university of Rio Grande do Sul (Porto Alegre, Brazil)

The enhanced aging of the Brazilian population results in a growth of elders that are dependent, and that overload the family. In this scenario, some changes are needed within the health care model, with greater focus on the actions directed to homecare. With this aim, the Basic Health Care Unit at the IAPI Health Care Center (Porto Alegre/Brazil) has launched the In-bed Homecare Program (IHP) in 2002. The objective of this research is to evaluate the quality of life of 'main elderly' caretakers who attend this program. It is an interventional, longitudinal, non controlled study (POLIT, 2004). The population of the study comprehends the main caretakers of elders enrolled in IHP. Data collection has been conducted in two moments: before entering IHP, and four months after the first interview, from August 2008 to December 2010. The interview consists of the application of a multidimensional tool that contains social-economic and demographic variables, and aspects about health and the delivered care. WHOQOL-BREF will be used to evaluate the quality of life, and for the caretakers who are 60yrs-old or more, the WHOQOL-OLD will also be applied. The caretaker overload will be measured by the Overload Evaluation Scale (ZARIT, 1980). A descriptive and comparative analysis will be performed (Wilk's lambda test – ANOVA-; Bonferroni test and t-Student's test). The project was approved by the Ethics Committee from the Health Secretary of Porto Alegre. Preliminary results obtained until January 2009 showed that between the 15 caretakers already interviewed, most of them are women (73.3%), daughters (60%), with ages from 32 to 73yrs-old. The results of this study will be used to reinforce or adapt IHP focusing on integrative care of the family of in-bed patients, pursuing a better quality of life for them.

**PD8 734** "I DON  
H. MACRAE\* (Mount Saint Vincent University, Halifax, Canada)

As depicted in popular culture, Alzheimer's disease is a "ravaging" and "mangling" disorder that robs persons of their minds and destroys former selves. Adopting a symbolic interactionist perspective, and drawing on data obtained from face-to-face, in-depth interviews with nine individuals living with the illness, this paper examines the impact of early-stage Alzheimer's disease on identity. It investigates the extent to which persons who have Alzheimer's fear "loss of self" and whether identity is actually dramatically transformed. The findings show that despite the losses they have experienced individuals living with the disease do not necessarily view their identities as having changed very much, nor do they appear to be overly concerned about the potential loss of former selves. Some even manage to create new selves. The paper attempts to explain how persons with Alzheimer's are able to maintain continuity of self despite the substantial changes they have experienced. Suggestions are offered concerning how others can support persons with early-stage Alzheimer's to maintain identity.

**PD8 735** THE IMPACT OF PERCEIVED SERVICE BARRIERS ON CAREGIVING BURDEN  
D. LAI\* (University of Calgary, Alberta, Canada, Calgary, Alberta, Canada)  
C. THOMSON(1) - (1) University of Calgary (Calgary, Canada)

Introduction: Research has shown that formal service interventions for family caregivers can be effective in alleviating caregiver stress and burnout, yet, family caregivers often underutilize these services. Several studies have identified the need to address the barriers that affect family caregivers' accessibility and use of formal supports. Few empirical studies have examined the effect of service barriers on caregiving burden. This study aimed to examine the effects of family caregivers' self-reports of service barriers on caregiving burden. Methods: Data were obtained through telephone interviews using a structured questionnaire with a random sample of 340 family caregivers of older adults aged 65 years and older residing in Calgary, Canada. Caregiving burden was measured by the Zarit Burden Interview. Service barriers were measured by a list of 15 items identified in previous literature and from feedback of community service providers. Results: Exploratory factor analysis using the principal component analysis was conducted. The findings revealed four types of service barriers: personal attitude and experience, administrative problems, circumstantial challenges, and cultural incompatibility. Hierarchical multiple regression was conducted to examine the effects of these four types of service barriers on the level of caregiving burden of family caregivers. When controlled for caregivers' demographics and number of illnesses of care recipients, more barriers related to personal attitude and experience, administrative problems, and circumstantial challenges correlated significantly with a higher level of caregiving burden, with the first two barrier factors being the most important. Conclusion: The findings estimate the direct linkages between service barriers and caregiving burden. Policies and programs to address these barriers, particularly with respect to personal attitude and administrative problems of service delivery should be developed.

**PD8 736** RESPONDING TO THE NEED FOR CAREGIVERS FOR OLDER PEOPLE IN UGANDA: EXPERIENCE OF A SMALL LOCAL NGO  
R. CUMMING\* (University of Sydney, NSW, Australia)  
R. SEMANDA(1), N. FREDERICK(1) - (1) The Aged Family Uganda (Kampala, Uganda)

Introduction: There are currently more than 1.3 million persons in Uganda aged 60 years and over. Many of these older persons need professional caregivers trained in the field of geriatrics but the health and social service system in Uganda is unable to provide such care. This paper reports the response to this situation of a small local NGO, The Aged Family Uganda (TAFU). Methods and materials: Three projects were conducted. First, in 2006, TAFU and Age Concern Devon were brought together by the International Federation on Ageing to carry out a survey of the lives and experiences of 382 isolated older persons living in seven regions of Uganda. Second, TAFU worked with the African Palliative Care Association to carry out a situation analysis of the needs of older persons. Third, TAFU, with financial help from Unie KBO, used the findings of the first two studies to develop a training program to empower caregivers with basic geriatric knowledge and skills. Results: The survey of 382 older people confirmed that most older Ugandans live in extreme poverty and suffer from a variety of age-related conditions. The situation analysis highlighted the pressing need for geriatric care in Uganda. The caregiver training programme has so far involved 218 community caregivers, including local council leaders, who have been trained on how to care for older persons, especially the isolated. To date, 75 households are beneficiaries of the programme. Conclusion: The projects conducted by TAFU demonstrate the contributions that a small local NGO can make to improving the health and wellbeing of older persons in sub-Saharan Africa.

**PD8 737** JAPAN'S ISSUE OF SUPPORTING ELDERLY'S HOME-BASED FAMILY CAREGIVERS  
M. GOTOU\* (Yamaguchi Prefectural University, Yamaguchi, Japan)  
M. TANAKA(1) - (1) Yamaguchi Prefectural University (Yamaguchi, Japan)

Introduction As today's recent situation of aging society in Japan, there is an eminent policy to curtail medical care expenses for elderly requiring medical care, and a movement

to promote a shift from public medical care to community care. It is expected, therefore, that a larger number of elderly requiring medical treatment will be relocated to local areas and that their family caregivers will have to care for them. The extent of support for family caregivers, key role players in the family care issue, is far from satisfactory. We are going to clarify the facts related to the business of home nursing visits as the underpinning of homecare, and then study the matter of supporting family caregivers involved in nursing visits. Method We interviewed seven visiting nurses registered with a home nursing visit station in accordance with a roughly structured plan. We explained to them in writing about the purpose, method and ethical aspects of this study and interviewed only those consenting to the interview. Result Those home visits nurses have been tackling the issue of care burden and health problems of family caregivers but they have failed in providing effective support. As a partial factor behind this situation may be that the service provided by those home visits nurses is not aimed at supporting family caregivers. Conclusion In order to promote the policy of homecare service in the future, it is important that family caregivers get support. For materialization of the plan, we thought it necessary to focus on family caregivers in the process of assessment and to work toward development of a program aimed at reducing care expenses.

**PD8 738** EVALUATION OF A SMART HOME FOR INDEPENDENT LIVING, ACCESS TO CARE, SAFETY AND SOCIAL CONNECTIVITY.  
A. LIVINGSTONE\* (University of Southern Queensland, Toowoomba, Australia)  
J. SOAR(1), S. WANG (1) - (1) University of Southern Queensland (Toowoomba, Australia)

Introduction QSHI (Queensland Smart Home Initiative), a consortium of selected organisations, established a Smart Home in an aged care facility in Brisbane, Australia. The objective was to demonstrate technology, research, inform and educate stakeholders. Information from the project informed a subsequent phase and research program. Methods and materials An independent living unit (ILU) in an aged care complex was provided to the QSHI which consisted of technology providers, government, consumer body, aged care provider, a property developer and universities. Complementary products were installed. Visits were organised from consumer, care provider and policy organisations. At each of the visits the technologies were demonstrated and comments invited. Over 12 months 230 people visited the home. Workshops with stakeholder organisations discussed comments received from the Smart Home visits. Results There was great interest in the Smart Home as demonstrated by the number of visits. There was enthusiasm on the part of care providers and consumers for adopting the technology. There was uncertainty about cost and affordability, return on investment, availability of technical support; and a lack of awareness of avenues to obtain the technology and support services. Conclusion The need for smart home environments and assistive technologies is evident in the high rates of adverse events and conditions such as medication problems, falls, maintaining independence, social isolation and problems of cognitive decline. Technology has huge potential to assist individuals and their carers. The technology is becoming ever more sophisticated. There is however a gap in the means for assessing an individual's needs, specifying a suitable suite of products, installation, professional monitoring of signals and in demonstrating the Return on Investment. The Research program informed by the Brisbane Smart Home is focused on these issues.

**PD8 739** THE ECONOMIC IMPACT OF CAREGIVING ON RETIREMENT  
L. MCDONALD\* (York University, Toronto, Canada)  
N. TIMOSHKINA(2) - (2) York University, School of Social Work (Toronto, Canada)

The purpose of this study was to examine the economic consequences of retiring to caregive. In Canada, 1.7 million adults aged 45-64 provide unpaid care to 2.3 million older adults with chronic disabilities; 7%-9% of older Canadians retire and about 3% quit work to provide care. Yet few studies examine the economic relationship between caregiving and retirement. This paper presents the qualitative findings from a large multimethod study which examined the experiences of older adults who had retired from the labor force to care for relatives, and for whom caregiving has ended. The qualitative methodology was consistent with the phenomenological tradition. In-depth, semi-structured interviews were conducted with 62 former primary caregivers (31 women and 31 men), aged 45-78. Purposive sampling was used to select participants who had retired to caregive and for whom the caregiving was over. The interviews lasted 2.5 hours on average, were digitally recorded, transcribed, thematically coded and analyzed using NVIVO software. The findings indicated that the caregivers' transition into early retirement took two routes: the first was precipitated by a crisis and viewed as temporary; the second was planned and permanent and was related to deteriorating work conditions but justified by the need to caregive. At the conclusion of the caregiving, most "crisis" caregivers lived in abject poverty while the "planners" reported adequate income. The main post-caregiving survival strategy was work re-entry without any prospect of retirement due to economic losses sustained from retiring to caregive. Understanding the intersection of caregiver and retirement trajectories is necessary for planning financial services for retiring caregivers and for developing social policy that mirrors their lives. Although the caregiving may be

over, the continued intervention of professionals is warranted to avoid the distressing economic consequences resulting from retiring to caregive.

**PD8 740 SPOUSAL SUPPORT IN THE CONTEXT OF ADULT DAUGHTERS CARING FOR ELDERLY PARENTS**

D. HALPERIN\* (University of Haifa, Rishon LeZion, Israel)  
L. ARIELA(1), K. RUTH(1) - (1) University of Haifa (Haifa, Israel)

**Introduction:** This research examined the moderating impact of spousal support in the context of multiple roles of working adult daughters caring for their elderly parents. The relationships between role strain, role conflict, role stressors and marital quality, according to role theory were examined. Especially in midlife, in our modern world, many women are holding simultaneously multiple roles in the family and as part of the workforce. With the increase in the aging population, the caregiving role for an elderly parent is added to the multiple roles of midlife women. Husbands can be a source of support vs. hindrance in this context. **Design and Method:** The sample included 100 employed married women, caring for a dependent elderly parent, at least four hours per week, using a convenience sample. Data were collected through personal interviews with a structured questionnaire which included the following areas: work-care conflict, work-family conflict, care burden, spousal support and marital quality. In addition, 10 women were interviewed used semi structured interviews, for deeper understanding of the meaning of spousal support in the context of parent caregiving. **Results:** The results revealed that while stress feelings were negatively correlated to marital quality, spousal's support was a partial mediating variable between total stress feelings and marital quality. Women who are caregivers in addition to their other roles, subjectively experience stress feelings resulting from role strain and inter-role conflict. In addition, only work and caregiving extent (hours/time) were found to be directly correlated to subjective work-caregiving conflict. **Conclusion:** The main findings point to the importance of spousal support in time of caring for an elderly parent, usually at midlife. Therefore, creating support groups for couples might be effective to increase spousal's awareness to their wife's stress feelings and the importance of their support.

**PD8 741 ELDERLY IMMIGRANTS IN NORWAY - CARE SERVICES AND CULTURAL SENSITIVITY**

R. INGBRETTSEN\* (Norwegian Social Research, Oslo, Norway)

**Introduction:** As the older immigrant population in Norway is increasing, a crucial question is how to give elderly immigrants equivalent care services. The main aims of this project are to describe how the care services for elderly immigrants work, point to problems and plan for further research and practical implications. Regarding cultural sensitivity, user preferences and cooperation between staff and family-carers are major concerns. **Methods and materials:** Care service staff, elderly users in nursing homes and day care centres and their family members are interviewed (N=30). The interviewees have varied cultural background and residence time in Norway. **Results:** Three issues are in need of attention: (1) Information, language, and communication, (2) Adaptation of services to immigrants expectations, and (3) Staff training in cross-cultural care. Case analyses show various patterns of expectations and cooperation between the care systems and families. Families often try to help according to their customs, but they experience dilemmas and burdens. Elderly immigrants in need of help do not always have available informal care. The expectations of elderly and their family members often are expressed as ordinary wishes for caregiver stability, reliable appointments and staff-cooperation together with culturally adapted care. Individualized, tailor-fit care is a central motto for staff. Communication and cooperation with family is important to get to know the person and cultural norms, and to share considerations about treatment. **Conclusion:** Listening to the expectations of a multicultural group of care users and adapting care services to their needs is a continuous process. A multicultural staff may ease the process. Close cooperation between the care systems and families and between different agencies in the care systems is crucial to follow up minority ethnic elderly in need of care. The ideal of cultural sensitivity can otherwise be replaced by exaggerated caution.

**PD8 742 CARING TO GRANDCHILDREN: DIFFICULT BEHAVIOURS, HELP RECEIVED AND SATISFACTION WITH THE ROLE BY GRANDPARENTS IN SPAIN**

C. TRIADÓ\* (University of Barcelona, Barcelona, Spain)  
F. VILLAR(1), M. CELDRÁN(2), S. PINAZO(3), C. SOLÉ(4), J. CONDE(1) - (1) Universitat de Barcelona (Barcelona, Spain); (2) Universitat Rovira i Virgili (Tarragona, Spain); (3) Universitat de Valencia (Valencia, Spain); (4) Universitat Ramon Llull (Barcelona, Spain)

Older people are increasingly more involved in regular tasks of caring their grandchildren as a way of helping their adult children to balance work and family life. The aim of this study is to look at what are the most difficult grandchildren's behaviours grandparent face in their care tasks, who help grandparent to do better this role and how satisfied grandparent are caring for their grandchildren. Three hundred and twelve grandparents (240 women and 72 men) participated in this study from Barcelona and surroundings. Those grandparents took care regularly at least one grandchild till 12 years of age. The instrument created includes different areas of this role as well different consequences of this role. For

this paper frequency of grandchildren's behaviour difficult to handle by grandparent (9 items), from how grandparents receive help (6 items) and what kind of satisfaction grandparents perceived (11 items). Results indicated that 80% of grandparents perceived three different behaviors: being naughty, disobedient and moved. The main assistance is received by their partner, lesser from their children and nearly nothing from public institutions. Finally, satisfaction with caring grandchildren is very high, both emotional and cognitive satisfaction. Results are discussed in the light of successful aging theory and generativity of the elderly. \* This research was funded by a grant from the Spanish Education and Science Ministry (SEJ2005 – 04154 / PSIC)

**PD8 743 HIV/AIDS: IMPACTING THE ROLE OF THE ELDERLY IN THE AFRICAN COMMUNITY**

E. LEKALAKALA-MOKGELE\* (North-West University, Potchefstroom, South Africa)

**HIV/AIDS: impacting the role of the elderly in the African community** **Introduction:** The status of older adults in Africa occupies a small but rapidly expanding share of the global aging literature. The issue of HIV/AIDS pandemic has generated a new focus on the changing role of the elderly in the communities that have been affected by AIDS. In sub-Saharan Africa where millions are projected to be infected with HIV, with about 2 million deaths recorded annually among the traditionally productive adults; children and the elderly are made to take up unusual responsibilities when there is such loss of parents or breadwinners. This paper reviews the findings on the impact of HIV/AIDS on the elderly population, with a particular focus on the changes in the roles of the aged that have survived the deaths of their younger ones. **Methods:** A systematic review literature on the elderly and HIV/AIDS provided the analysed data for this paper. Access to the database were mainly via EBSCO ([www.ebsco.co](http://www.ebsco.co)) that allowed search in 7 electronic databases representative of major databases and search engines useful in an academic setting for finding and accessing articles in health and health related academic journals, repositories and archived reports. The findings were grouped, categorised and summarised using the RAPID software that assist with critical appraisal of evidence from reviewed articles. **Findings:** Preliminary finding show an increase in grandparent-headed households due to HIV/AIDS. An escalating financial burden on these aged who have to share their social grants with their sick children, and stretched resources that compromised the quality of life of these elderly in affected communities. **Conclusion:** It was concluded that the challenges of HIV/AIDS for the elderly in Africa are many. More also need to be done to articulate the knowledge

**PD8 744 THE TRANSITION OF PEOPLE WITH DEMENTIA TO SPECIALIST CARE UNITS: EXPERIENCES AND VIEWS OF RESIDENTS AND CAREGIVERS**

A. BOBERSKY\* (Trinity College Dublin, Dublin, Ireland)  
S. CAHILL(1) - (1) Trinity College Dublin (Dublin, Ireland)

**Introduction** Numbers of Irish people diagnosed with dementia will increase over the coming years. One consequence is that more specialist dementia care units (SCUs) will be needed. SCUs have only recently become a part of the Irish long-term care system. Thus, there is a lack of knowledge about the process of admission and relocation to SCUs and its immediate and more long-term outcomes. This study will explore in depth the experiences and views of people with dementia and their informal and formal caregivers of relocating to a specialist dementia care unit. **Methods and materials** A qualitative exploratory design is being used. The methodology is guided by a hermeneutic-phenomenological approach. Qualitative measures will include: 1) Individual interviews with people diagnosed with dementia, and 2) Focus Groups with family caregivers, SCU care staff, and SCU management. Interviews and Focus Groups will be conducted prior to and following the move. Quantitative measures will include: 1) cognitive and memory testing - MMSE, 2) a socio-demographic questionnaire for caregivers, and 3) a nursing home documentary analysis. These measures will provide additional information about participants' living contexts, and will help better understand individual transition experiences. **Results** To date, no results are available. A pilot study, to pre-test instruments for the main study is about to take place. The main study will commence in April 2009. Preliminary findings will be ready for presentation in July. **Conclusion** Results of the study will generate new and original findings about the transition process into SCUs for people with dementia and its short-term and more long-term effects. The findings will be used to inform care practitioners, policy makers and planners about best practice in relation to the relocation of people with dementia to SCUs.

**PD8 745 THE SAVVY CAREGIVER PROGRAMME. AN INTERVENTION ON FAMILY MEMBERS OF ALZHEIMER PATIENTS**

L. BARTORELLI\* (Sacro Cuore Roma, Roma, Italy)  
A. FIANDRA(1), R. SILVIA(1), I. BRUNELLA(1), G. FRANCO(1) - (1) Sacro Cuore (Italy)

It is known that support interventions given to family caregivers have favourable impact on themselves, on the disease itself and on the life quality of the whole family. The programme experimented a method aiming at the research of an effective, assessable and reproducible psycho-educational approach to the caregiver. The Sacro Cuore Alzheimer Unit of Rome has organised a course for caregivers. A geriatrician and 2 psychologists,

knowing the stage of the disease, were responsible for the course. A "Caregiver Manual" for the family caregivers and a Trainer's Manual for the trainers were distributed to the attendants. The manuals contained the whole programme: its effects on behaviour; the purpose of care giving; management of daily treatments and of difficult behaviour; strengthening the family as a resource. The programme contained practical indications as to cope with assistance and relation problems as they emerged. The caregivers response was excellent. The data show an improvement of the depressive state of the caregiver and the lesser behavioural disturbances of the patient are also relevant in the corresponding sections of the self-administered questionnaire. The final data of the study will be presented during a congress. Beyond the results exhibited, the programme, proposed to the trainers as well as to the caregivers, is "strategic", and represents a personal approach to self-knowledge and to the difficult relations growing in the whole family environment, among assistants, patients and caregiver. Bibliography 2. "Studio Eurofamcare: l'assistenza a familiari anziani affetti da demenza (dementia caregiving) in Italia. Risultati preliminari. Giorn. Geront. Vol. 52, , 256 , 2004. 5. **PD8 746 TELE-TECHNOLOGIES TO FACILITATE AGING IN PLACE**

J. SANFORD\* (Georgia Tech, Atlanta, United States)  
C. WINEGARDEN(1) - (1) Georgia Tech (Atlanta, United States of America)

Tele-technologies offer great promise for facilitating aging in place for older adults who require rehabilitation services, particularly those who live in remote areas or who have difficulty traveling to a clinic. A study was undertaken to compare the effectiveness of in-home rehabilitation delivered by interactive teleconference and in-home visit to older adults who were new users of walkers or wheelchairs. The two intervention groups (Tele- and In-home Care) received a 4-visit rehabilitation intervention aimed at six transfer and mobility tasks. A Usual Care Group (UCG) received no intervention. The intervention, developed by an interdisciplinary team, included in-home assessment of mobility and transfer skills, treatment recommendations for home exercises and adaptive strategies (i.e., skill training, provision of assistive technology, and recommendations for environmental modifications). The intervention was delivered by an occupational or physical therapist (PT/TOT) via teleconference from the clinic or in the home. Primary study outcomes were the number of performance deficit problems and recommendations for adaptive strategies (baseline to 6-weeks), and changes in Task Self Efficacy (confidence in performing routine tasks) and ADL performance. A total of 65 of the 82 subjects who were enrolled completed the 6-week protocol. Intervention delivery by Tele- versus In-home showed a trend for more problems to be identified ( $p = 0.13$ ) and more recommendations made in-person ( $p=0.20$ ). However, this was due to differences in the mobility tasks where the Tele-group had significantly fewer problems ( $p=0.003$ ) and recommendations ( $p=0.005$ ). In contrast, there were no significant differences in the transfer tasks for either the mean number of problems/patient ( $p=0.68$ ) or recommendations/patient ( $p=0.68$ ). Moreover, when compared to the UCG, the combined Intervention Group (Tele- and In-Home) had significantly improved FES scores ( $p<0.05$ ). These data provide evidence that interactive teleconferencing technology can facilitate aging in place. Currently a follow-up, 4-site clinical trial is being conducted with stroke patients.

**PD8 747 TRANSDISCIPLINARY PRIMARY CARE FOR THE CAREGIVERS OF INDIVIDUALS AFFECTED BY ALZHEIMER DISEASE**

D. KICENIUK\* (Mount Saint Vincent University, Halifax, Canada)  
N. NATARAJAN(1), L. ROBINSON(1), J. HOCKERT(2), S. MCEVENUE(3) - (1) Dalhousie University (Halifax, Canada); (2) Capital District Health Authority (Halifax, Canada); (3) Mount Saint Vincent University (Halifax, Canada)

Introduction: Caring for individuals with Alzheimer Disease (AD) poses significant challenges to family/friend caregivers. To provide care that is meaningful and appropriate, it is necessary to provide health services directed at the needs of caregivers. The main objective of this research was to generate knowledge about issues concerning primary health care for caregivers of individuals with AD and to develop primary health care model for family caregivers of individuals affected by Alzheimer Disease and related dementias. In particular, we examined how health care professionals currently work together to provide care for caregivers and barriers to accessing and providing this care. Methods and Materials: Recruitment of participants was conducted using mixed methods including mailed invitations, gate keepers, advertisements in professional newsletters and email lists, and snowballing. The sampling frame was designed to recruit participants from a wide range of perspectives including primary care providers, government representatives, community organizations, and family caregivers. One-on-one interviews were conducted and transcribed verbatim. Questions were designed to explore the availability of services and support for caregivers, barriers to accessing and providing care, and ideas for pragmatic changes to the current primary health care system. Data was coded using MAXQDA software. Results: Themes resulting from coding and data analysis included support services available, regional differences in approach to care, barriers to health professionals providing care, barriers to caregivers accessing care, individual roles on the care team, interdisciplinary collaborations, and primary care model development. Conclusions: The results of the study may be used to advise health care providers and

policy decision-makers regarding the primary health care and support needs of family caregivers of individuals with AD in Canada and elsewhere.

**PD8 748 EVALUATING THE UCLA AND DE JONG-GIERVELD LONELINESS SCALES FOR RESEARCH ON AGING**

M. PENNING\* (University of Victoria, Victoria, Canada)  
L. FUNK(1), G. LIU(1) - (1) University of Victoria (Victoria, Canada)

Introduction: The UCLA and the de Jong-Gierveld Loneliness Scales are two of the most frequently employed measures of loneliness across the life course. Both have given rise to short-forms intended for use in large-scale cross-sectional and longitudinal surveys. However, despite extensive testing, questions remain regarding the relative reliability and validity of these measures, particularly when used to assess loneliness across age groups and over time. Methods and Materials: This paper reports the results of a study conducted to assess the reliability (internal consistency, two-week test-retest) and validity (convergent, divergent, factor structures, and factorial invariance with respect to age and time) of these two scales. Data were obtained from interviews (baseline, 2-week follow-up) conducted with a sample of 253 respondents aged 45 to 84 living in British Columbia, Canada. Results: Findings reveal that both measures, including their short- and long- forms, display satisfactory reliability. However, confirmatory factor analyses do not indicate overall good model fit. As well, the analyses provide little support for assumptions of measurement invariance across age groups. Conclusion: Our results suggest that age group comparisons and longitudinal changes in loneliness scores be interpreted with caution.

**PD8 749 THE EXPERIENCES AND EXPECTATIONS OF CARE AND SUPPORT AMONG OLDER PEOPLE FROM DIFFERENT ETHNIC GROUPS**

M. CATTAN\* (Leeds Metropolitan University, Leeds, United Kingdom)  
G. GIUNTOLI(1) - (1) Leeds Metropolitan University (Leeds, United Kingdom)

Introduction A large volume of research has explored older people's perceptions about their health and support needs and experiences of services. However, little is known about how older people from different ethnic groups experience services and what their preferences are. A common assumption is that older people from different ethnic groups have more differences than similarities in their service and support needs. Our study set out to investigate the needs and experiences of older people and their carers from different ethnic communities, particularly regarding accessibility and acceptability of services. Methods and materials The qualitative research consisted of 22 focus group and 53 narrative interviews with older people and their carers from ten ethnic groups (including White British) in Bradford, UK. A total of 144 older people and 48 carers were included in the study. We present findings from the interviews with older people. Results The study found a distinction between older people's expectations at macro and micro level. Experiences and expectations of services were described as complex constructs of macro and micro level needs and experiences. At macro level all groups, irrespective of ethnic background, expressed three service expectations: high standards of good practice; cultural understanding; responsiveness to individual expectations. For all groups accessibility to services was greatly improved through the provision of relevant and repeated information. At micro level the experiences and needs were culturally distinct and described in more detail, for example regarding food acceptability or language preference. Conclusions This study indicates that older people describe the same experiences, expectations and needs of services at macro level, irrespective of what ethnic group they belong to. It would seem that services are often more concerned about meeting micro level needs leading to fragmented and uncoordinated service provision. Where satisfaction was expressed about services, macro level needs had been met.

**PD8 750 CHARACTERISTICS OF THE SOCIAL SUPPORT NETWORKS OF ELDERLY PARTICIPANTS AND NON-PARTICIPANTS OF A PHYSICAL EXERCISE PROGRAM IN THE BRAZILIAN PUBLIC HEALTH SYSTEM IN FLORIANÓPOLIS, BRAZIL**

G. MAZO\* (Santa Catarina State University, Florianópolis, Brazil)  
A. CARDOSO(1), T. BENEDETTI(2) - (1) Santa Catarina State University (Florianópolis, Brazil); (2) Federal University of Santa Catarina (Florianópolis, Brazil)

Introduction: This cross-sectional study aimed to compares the characteristics of the social support network of elderly participants and non-participants of programs of physical exercise. Methods: Sample was composed by 81 aged people enrolled in three Health Centers in the city of Florianopolis, SC, that were participating in the program Floripa Ativa (GP) and that were not participating in this program, nor in any other formal group activities (GNP), selected in a non-probabilistic way. The GP was composed by 55 elderly patients with a mean age of 69.6 years ( $SD=7.3$ ) and the GNP by 26 elders with a mean age of 70.6 years ( $SD=5.7$ ). The instruments used in data collection and applied in the form of individual interview were: sheet identification data, Social Support Scale, Minimum Chart of Relationships, Family APGAR and Perceived Stress Scale. The data were processed by descriptive and inferential statistics, respecting the precepts of normality on distributions. In all inferential analysis was adopted a significance level of 5%. Results: The elderly of both groups showed no significant differences in their socioeconomic characteristics, health status and level of stress. In general, the elderly from the GP group

have more contacts available for financial aid ( $p=.009$ ) and in daily activities ( $p=.001$ ). These seniors also perceive a greater availability of overall social support ( $p=.009$ ) and in its most dimensions: affective ( $p=.016$ ), emotional ( $p=.039$ ) of positive social interaction ( $p=.026$ ) and informative ( $p=.041$ ). The elderly of the GP group, also had a more balanced family environment, with improved functionality of the family ( $p=.047$ ), besides being more satisfied with the adaptation ( $p=.049$ ) and family's development ( $p=.004$ ). Conclusion: The elderly participating in the Floripa Ativa program had a significant better social support network which can contribute for the maintenance of the health and for a better care of these elderly.

#### **PD8 751 OLDER ADULTS' PERCEPTIONS ABOUT PHYSICAL ACTIVITY OPPORTUNITIES IN THEIR LOCAL ENVIRONMENT**

L. MALAVASI\* (University of Illinois at Urbana-Champaign, Urbana, United States)  
K. KIM(1), C. PARK(1), A. SCHWINGEL(1), W. CHODZKO-ZAJKO(1) - (1) University of Illinois at Urbana-Champaign (Urbana, United States of America)

**INTRODUCTION:** Recent research suggests that reconfiguring outdoor environments can encourage older adults to spend more time outside and to discover new and enjoyable ways to build more physical activity into their everyday life. For several years researchers from our laboratory have participated in projects that redesign outdoor spaces surrounding retirement communities in order to encourage residents to be more active. **PURPOSE:** Seniors living in a retirement community which had recently been redesigned were asked to comment on their perceptions of the value of the newly renovated outdoor space. Our goal was to examine how older adults respond to alterations to the environment that are designed to promote active lifestyle choices. **METHODS:** A qualitative research design was used to explore in depth the perceptions and reactions of older adults to a purposeful redesign of their community. **RESULTS:** Several distinct cohorts of older adults were identified: (1) individuals who were highly positive about landscape redesign; (2) individuals who were much less supportive of changes to the environment; as well as (3) individuals who both value and regularly use the outdoor environment; and (4) non-users of outdoor space who do not value or participate in outdoor activities. Similarities and differences in reaction to environmental change between the various cohorts were identified. **CONCLUSION:** Changes to the built environment have the potential to be viewed in different ways. Older adults differ considerably with respect to how they react to alterations to the environmental space that surrounds them. It is important to carefully study the preferences and opinions of older persons prior to embarking on any strategy to redesign the environment. Engaging older adults as participants in all stages of the design, build, and implementation of environmental change is essential.

#### **PD8 752 COULD ELDERLY PEOPLE LIVING AT HOME IMAGINE LEAVING IT FOR A RETIREMENT HOUSE WHEN GETTING OLDER ?**

D. DEFAUT\* (Gerontopole, Dijon, France)  
A. GENG(1), L. LENFANT(2), M. DION(3), P. PFITZENMEYER(4) - (1) Gerontopole (Dijon, France); (2) Centre gerontologique de Champmaillot (Dijon, France); (3) université de Bourgogne Département de Sociologie (21000, France); (4) Centre Gérontologique de Champmaillot CHU Dijon (Dijon, France)

Introduction To explore this problematic, elderly people living at home in French rural environment were interviewed. Material and method Thirty-five people aged 75 years and over, living around Nevers (Burgundy, France) were interviewed by 2 of the authors in September 2008. Results Most of them want to stay in their home. They can only consider to leave their home if they would suffer from dementia. Thus, moving in a retirement house appears to be the last solution.Three main arguments sustained this idea. First, they have a negative image of retirement house. Second, the cost of living in a retirement house is viewed as far too expensive compare to their income. Third, they argued that their children would not agree to let them leave for a retirement house, and would prefer their parents stay as long as possible in their home. However, for most of them, they do not plan their future. Conclusion As usually observed, moving in a retirement house appears to be a difficult moment, and is rarely desired.The present study showed that the crisis induced by leaving home would be emphasized by the belief that children support their parents'desire to stay at home. The expectation of the elderly that their children support them could induce culpability in the children when in the last resort they would have to take the decision to move their parents in a retirement house.

#### **PD8 753 VOLUNTEERING WITH SENIORS RECEIVING END-OF-LIFE HOME CARE: A QUESTION OF BALANCE**

A. SÉVIGNY\* (Centre d'excellence sur le vieillissement de Québec, Québec, Canada)  
A. MICHELE(1), D. SERGE(2), T. ANDRÉ(3) - (1) Université Laval-FMED (Québec, Canada); (2) université Laval-SVS (Québec, Canada); (3) Centre d'excellence sur le vieillissement (Québec, Canada)

Introduction: In response to the aging population and the challenges brought on by the organization and delivery of care for the increasing number of seniors approaching death, the Quebec government (Canada) chose to adopt three strategies: development of home care services, promotion of interdisciplinary approaches and implementation of integrated palliative care programs. These choices go hand in hand with seniors' expressed desire to

live at home as long as possible, insofar as their needs are fulfilled. The participation of all stakeholders (professionals, patients' families and volunteers) is fundamental to answering these multifaceted needs. In Quebec, volunteers play an important and increasing role in palliative and end-of-life care, particularly in hospices and other health institutions. However, their involvement in home care has been scarcely developed. This study aimed to explore the factors that facilitate or hinder volunteers' participation in end-of-life home care for seniors. Methods and materials: Qualitative methods were used, based on Giddens' theory of structuration, which takes into consideration the dynamic interactions between the actions undertaken by individuals and the socio-structural context within which these actions take place. Thirty-one interviews were conducted with seniors receiving end-of-life home care, informal caregivers, volunteers and professionals. Results: Volunteer's participation results from reaching a balance between different components: 1) developing a confidence-based relationship while keeping a certain distance between volunteer and senior; 2) following existing rules aimed at guiding volunteer's action while respecting the flexibility needed for volunteer's and professional's action to co-exist; 3) establishing formal channels of communication while creating spontaneous and informal ties. Conclusion: Volunteers' contribution to seniors' end-of-life home care is contingent upon the careful equilibrium between liberty and flexibility – fundamental characteristics of volunteering – and the regulations that restrain them. This study has produced useful information that may contribute to the development of integrated, coordinated, and complete end-of-life home care.

#### **PD8 754 DO ELDERLY WITH DEMENTIA SHOULD BE SEPARATED FROM ELDERLY WITHOUT DEMENTIA?**

A. GENG\* (Gérontopole, Dijon, France)  
D. DEFAUT(1), L. LENFANT(2), M. DION(3), P. PFITZENMEYER(2) - (1) Gérontopole - Centre Gérontologique de Champmaillot (Dijon, France); (2) CHU - Centre Gérontologique de Champmaillot (Dijon, France); (3) Université de Bourgogne- Pôle AAFF (Dijon, France)

In a previous study conducted in an EHPAD (specialized medical structure for elderly dependant people only) opened to any pathologies (83% dementia), among the 43 people not suffering from dementia, only 20% admitted that living closed to people with dementia was difficult to cope with. However, 64% of them would prefer to stay in a structure without people suffering from dementia. The present sociological study aimed at exploring the same question in medical structures in which patients are separated according to their pathologies. patients and method : The present study took place in 2 EHPAD. Thirteen interviews were conducted between January and March 2008: i.e., 12 individual interviews and 1 collective interview. During the interviews, the authors aimed at understanding what would be the ideal retirement house. Among this topic, they explored if elderly people would ask to be separated from people suffering from dementia. Results : During individual interviews, 2 distinct categories emerged clearly. On one hand, some people were strongly against the fact of living with people suffering from dementia, while on the other hand, some were ready to be mixed with people suffering from dementia because it may help them and allows to put their own problems in perspective. However, during the collective interview, the idea of living with people suffering from dementia was largely rejected. Conclusion: Living with people suffering from dementia is problematic for elderly people without dementia. thus, as a consequence, they can only be resigned when brought to live in a mix environment.

#### **PD8 755 TRANSITIONS IN FORMAL CARE AND INFORMAL. THE NORDANSTIG PROJECT -A LONGITUDINAL SWEDISH POPULATION-BASED STUDY**

A. SKÖLDUNGER\* (KI-Alzheimer's Disease Research Center, Huddinge, Sweden)  
B. SJOLUND(1), L. JOHANSSON(2), G. NORDBERG(3), E. VON STRAUSS(1) - (1) Aging Research Center (ARC) (Stockholm, Sweden); (2) Socialstyrelsen (Stockholm, Sweden); (3) Svenskt Demenscentrum (Stockholm, Sweden)

Introduction: The care for the elderly includes a complex interaction between formal services, informal care, morbidity and disabilities. Population based longitudinal studies of transitions are rare. The aim is to describe the care patterns longitudinally of non-demented and demented elderly people in a rural area in Northern Sweden. Methods and materials: People 75 years and older participating in the Kungsholmen-Nordanstig Project (n=919) was followed up 3 years later (n=579). The transitions are presented as patterns of informal and formal care, institutionalization and mortality. Number of hours of informal and formal care was examined by the Resource Utilization in Dementia instrument (RUD). Descriptive statistics as well as regression models were applied with age, gender, ADL, cognition, habitation and care patterns as covariates. Results: The mortality was 34% and 12 % of the survivors living at home at baseline were institutionalized. The sub group who had formal care but no informal care were institutionalized to the greatest extent (29%; chi-square  $p<0.05$ ). The relation between informal care and formal care for demented was more prominent at baseline (5.8 and 1.0 hours per day respectively) than at the follow up (3.2 and 1.6 hours per day respectively). In logistic regression models, dementia severity in terms of CDR had the strongest association with institutionalization (OR 8.41; 95% CI 4.08-17.31). People with mild cognitive decline (MCI) and no support at all at baseline had a great risk of being in need of care (formal or informal or institutionalized) or dead at follow up compared to CDR 0 (no cognitive decline) (OR 11.0; 95% CI 1.37-89.3).

Conclusion. The amount of informal care of demented was lower at the follow-up than at baseline, probably due to selection effects (institutionalization and mortality). Having MCI indicated a risk of being in need of care or dead at the follow up.

**PD8 756 THE TEAM**

N. MATOS\* (Secretaria de Saúde do Distrito Federal, Brasília - Distrito Federal, Brazil)  
M. VALE, I. SANTOS

Introduction: The aging process has become a concern of humankind, causing limitations and the emergence of chronic degenerative diseases, leading to dependency. The responsibility of the family as caregiver and the formal appearance of familiar conflicts are recurrent. Purpose: Develop a methodology at work in team to be developed in units of Health for mediation of disputes between families and the elderly. Method: quantitative-qualitative social research in accordance with the action research method. Meetings with team and pilot study with cases of family disputes in the Mixed unity of Health of Taguatinga – Federal District - Brazil, 2008. Results: The proposed methodology is to hold family reunion along with team multiprofessional at least two professionals who mediate in the cases of family disputes with older people, guided by health professionals, with report of the specific situation. It shows the team, family and the reason for calling. It explained the status of the elderly and / or the care of specific pathology. The team conflict and the media directs the pact of responsibilities that it is for each family member, according to the proposals raised by relatives. The meeting is recorded in deed and signed by all the final. The monitoring of cases will be by phone contact, home visits, individualized attention or call for new meetings. Having exhausted the negotiating viable the case will be forwarded to the minutes the prosecutor or its equivalent. Conclusion: the methodology of mediation of conflicts between family and elderly through meetings can be used in the Basic Health Care, as it is easy to apply methodology, which requires a small number of professionals involved.

**PD8 757 RESIDENTIAL HOMES “THE BIG CHALLENGE IN MONTERREY MEXICO”**

D. GAMEZ\* (Centro Regional para el Estudio del Adulto Mayor, Monterrey, Mexico)  
I. OLIVA(1), R. SALINAS(1), B. GONZALEZ(1), X. ORTIZ(1), A. VAZQUEZ(1) - (1) Centro Regional para el Estudio del Adulto Mayor (Monterrey, Mexico)

Introduction: The operation of residential homes has been a subject of multiple discussions, but at the same time, has been kept in political obscurity in public health. Salinas et al in 1991 published the problematic of residential homes in Monterrey. In this study, we evaluated 10 residential homes to determine the current situation. Material and Methods: This is a qualitative, descriptive and transversal study during a 6 month period. The sample was selected randomly from 36 residential homes. The survey was carried using variables such as medical services, nursing, psychology, regulations, facilities and occupational activities. Results: 10 residential homes with 397 residents were evaluated. During the analysis, we found that 30% showed deficiencies such as stairways between floors, 20% bad hygiene in bathrooms, 30% neglect in maintenance of the facilities, 50% had no safety equipment, 50% had no permanent medical personnel, and 20% had no private medical institution that regularly cared for the patients. 100% have at least one nurse on day and afternoon shifts and 30% do not have a nurse on the night shift. All have personnel trained in first aid, but 30% could not demonstrate CPR certificates neither training to evaluate the mental status. As to psychology and therapy, only 60% have stimulation and/or occupational therapy. In regulations area, 80% do not have operations manuals and are not registered with the Ministry of Health. Conclusion: The deficiencies found confirm the data gathered in the study performed in 1991 which means that we have not made any progress in bettering the quality of the service given. We suggest that quality standards and laws to regulate the development of new and existing institutions be created so that these areas of opportunity in business can turn into areas of quality in gerontological care.

**PD8 758 PHYSICAL RENOVATION OF AN ASSISTED LIVING FACILITY AND ITS IMPACT ON RESIDENTS, FAMILIES, AND STAFF**

D. ROCKEMANN\* (Provision Living, St. Louis, United States)  
M. PERKINSON(1) - (1) Saint Louis University (St. Louis, United States of America)

Physical settings, as well as their inhabitants, undergo the process of “aging in place.” As the initial “cohort” of assisted living facilities grows older, the need for physical renovation becomes inevitable. Although the physical remodeling of a residential setting can present significant stresses to residents, families, and staff, little is known about its effects and optimal ways to ameliorate negative aspects of this process. Field observations and in-depth interviews with key participants were used to document the impact of a 10-month major renovation of an assisted living facility on its residents, their family members, and facility staff. Strategies used to minimize the stress generated by the renovations included regular meetings with all involved, a monthly newsletter on construction updates, and the hiring of a “moving liaison/counselor” to facilitate adjustment to temporary moves within the facility. Residents were polled in regard to their environmental preferences, and their feedback was incorporated into renovation plans. The positive role of construction workers

in the adjustment process was an unanticipated finding. Recommendations for facilitating residents’ adjustment to physical remodeling of assisted living facilities will be shared.

**PD8 759 DIFFERENTIAL OUTCOMES OF CAREGIVING**

A. BOER DE\* (The Netherlands Institute for Social Research | SCP, Den Haag, The Netherlands)  
M. BROESE VAN GROENOU(1) - (1) VU University Amsterdam (Amsterdam, The Netherlands)

INTRODUCTION: Many studies reported on the negative consequences of informal caregiving. Less is known about positive evaluations and wellbeing among caregivers. This study explores determinants of burden, positive evaluations and wellbeing. METHODS AND MATERIAL: Data are used from the 2007 nationally selected sample of adult informal caregivers of people aged 65 and over in the Netherlands (N = 1403). Caregiver burden was examined using a 14-item scale on time restrictions and emotional involvement. Positive evaluations were indicated by eight items such as feeling appreciated, learning new things, feeling close to the care receiver. Respondents were asked to indicate their change in wellbeing through providing care: 1) change in perceived health; 2) change in psychological health; 3) change in happiness. RESULTS: Multivariate regression analyses showed that burden and declined perceived health were strongly associated with the complex care situations and higher care intensity. Positive evaluations and increased happiness were associated with personal characteristics of the caregiver and a strong motive to provide care. Higher burden increased the risk for declined subjective and psychological health. Positive evaluations contribute to increased feelings of increased happiness. CONCLUSION: Positive and negative outcomes of care giving are weakly associated and are to a large extent determined by different factors. The accumulation of burden and negative health outcomes points at a vulnerable group of carers.

**PD8 760 INFORMAL CARE-GIVING FOR THE ELDERLY: ON THE REGULATION OF PSYCHOSOCIAL WELL-BEING**

T. MICHELS\* (University of Luxembourg, Walferdange, Luxembourg)  
I. ALBERT(1), T. RIES(1), T. BOLL(1), D. FERRING(1) - (1) University of Luxembourg (Walferdange, Luxembourg)

Introduction Intergenerational family support has been identified as a key element in dealing with last decades' demographic and societal changes. In this regard special attention has been paid to the role of informal caregivers by highlighting their contribution in relieving social health care systems but also by investigating possible sources of burden and strain associated with care-giving. In a first step, the present study aimed at identifying predictors of psychological distress in care-giving by focusing on (1) characteristics of the care-giving person (e.g. age, gender, subjective health status), (2) characteristics of the care-receiving person (e.g. familial lineage), (3) the duration and contents of the care-giving task, and (4) care-related familial and financial problems. In a second step, a resource oriented approach was adopted by examining moderating influences of supportive family networks and care-giving experience on the relationship between care-related strain and psychological distress. Methods and materials A total sample of N = 270 male and female respondents was asked to complete a standardized questionnaire containing personal characteristics, information on the care-receiving person, indicators of psychological and physical strain, care-giving activities and familial relationships. The research questions were tested using hierarchical OLS regression models and structural equation modeling. Results The results underlined the differential importance of personal health, supportive family relationships, and the satisfaction with financial resources for the regulation of care-related strain. Conclusion The obtained results are discussed in view of the implementation of supportive structures for informal caregivers

**PD8 761 RESIDENTIAL ENVIRONMENTS, HEALTH CONDITIONS AND QUALITY OF LIFE IN OLD AGE IN SPAIN**

K. AHMED-MOHAMED\* (Spanish Council for Scientific Research, Madrid, Spain)  
F. ROJO-PEREZ (1), G. FERNANDEZ-MAYORALAS(1), F. MARIA JOAO(2),  
M. PABLO(3) - (1) Spanish Council for Scientific Research (Madrid, Spain); (2) Carlos III Health Institute (Madrid, Spain); (3) Carlos III Health Institute (Spain)

Introduction. As people age, the residential environment mean a place where living as well as sharing relationships with family, neighbours and friends. But housing designed and owned for younger families could become not suitable for old people, and especially for those with a declining level of competence related to health and functional ability. Within this context, residential characteristics associated with the house (standards and facilities, maintenance, ...) and the neighbourhood (perceived problems in the area, accessibility to services provision, social relationships ...) could be important factors to preserve personal autonomy as people grow older. The goal of the paper is to examine the relationships between residential environment and health conditions, both measured by means of objective and subjective indicators, and their effects on Quality of Life among the older people. The assumption underlying the analysis is that better personal and living conditions (based on socio-demographic features, level of competence related to health and functioning, and residential environment) are associated with a higher Quality of Life. Methods and material. The data derive from a survey on Quality of Life carried out in 2008

to 1,100 interviewees representing people aged 60 years old and more living in family housing in Spain (random sampling method). To analyse the structure of the data set, reduce its dimensionality and find out effects between variables, bivariate and multivariate statistical techniques are applied (Cluster Analysis, Factor Analysis, Categorical Regression Analysis). Results and conclusions. Homogeneous groups of people are defined based on health and residential environment conditions. We expect to find out differences in Quality of Life due to the adjustment status between residential environment conditions and the level of competence related to health and functional ability.

**PD8 762 TOWARDS MORE INCLUSIVE URBAN COMMUNITIES FOR OLDER PEOPLE? FINDINGS FROM THE CALL-ME PROJECT**

T. SCHARF\* (Keele University, Keele, United Kingdom)

M. MURRAY(1), S. MASLIN-PROTHERO(1), R. BEECH(1), F. ZIEGLER(1) - (1) Research Institute for Life Course Studies, Keele University (Keele, United Kingdom)

Introduction: A growing body of research highlights the challenges faced by older people in disadvantaged urban communities. This group is disproportionately prone to ill health, poverty, social isolation and loneliness, vulnerability to crime, and a lack of opportunities to engage in civic activities. In contrast to a growing evidence base highlighting the challenges associated with ageing in disadvantaged communities, there has been relatively little work exploring ways in which community action by older people can help to improve community well-being. This paper presents findings from the interdisciplinary Community Action in Later Life (CALL-ME) project being undertaken in socially deprived communities in four neighbourhoods of Manchester, England. Methods: The study adopts a participatory action design, involving a cycle of research built around four different forms of community initiative: a community welfare advice initiative; a community arts initiative; a community health technology initiative; and a community health initiative. Key to the project's success is the active involvement of older people and other community stakeholders at each stage of the research process. A key partner is Manchester City Council's Joint Health Unit. Findings: The paper reports findings from initial fieldwork in the study communities, identifying not only some of the strategies that have been successful in engaging with older research participants and community stakeholders, but also those that have been less successful. The paper emphasises the challenges of interdisciplinary research in ageing, especially in relation to participatory action research designs. Conclusion: The paper concludes with a discussion of the implications of the study's findings for future studies of ageing in disadvantaged urban communities.

**PD8 763 UNDERSTANDING A DIAGNOSIS OF DEMENTIA: THE ROLE OF FAMILY CARERS**

K. BRITTAINE\* (Newcastle University, Newcastle Upon Tyne, United Kingdom)

C. BAMFORD(1), L. ROBINSON(1), E. MARTIN(2), B. JOHN(1) - (1) Institute of Health and Society and Institute for Ageing and Health (Newcastle upon Tyne, United Kingdom); (2) Institute of Health and Society (Newcastle upon Tyne, United Kingdom)

Introduction: Studies of the disclosure of a diagnosis of dementia have primarily focused on the role of health care professionals. Much of the work on understanding the meaning of the diagnosis, however, takes place within the family. Methods: Qualitative interviews with people with dementia (n=15) and family carers (n=19) will be used to illustrate how dementia is constructed within families. Results and Conclusions: The interviews confirm that family members often share professionals' reluctance to openly speak about the diagnosis. Consequently, the extent to which shared meanings of the diagnosis are achieved within families is variable. While some families are able to discuss the diagnosis openly as an accepted aspect of everyday life, in others, the diagnosis remains unspoken and unspeakable. The implications for professionals and how they might support families to jointly make sense of a diagnosis of dementia will be explored.

**PD8 764 IMPROVING RESPITE CARE PRACTICE : THE CHALLENGE OF OPENING A DAY CARE CENTRE ON 365 DAYS PER YEAR**

P. DAURE\* (FEDOSAD, Dijon, France)

Introduction Developing a wider offer of respite care is a priority of the French Alzheimer plan that's why FEDOSAD decided to create a day care centre open on 365 days a year. Reaching potential users when they need help is possible through a 24h/24 phone number. The coordinator makes a visit at home in the 48h. The person can test one day in the centre before to integrate the group. A "homelike" building, with a secured garden gives a friendly atmosphere. Day care activities rely on a trained and qualified team. Method In order to meet the needs of people with dementia and their family carers an individual activity program is designed maintaining abilities and person's capacities, enhancing verbal or non verbal communication and offering an increased social life. A support group is offered to families carers A satisfactory questionnaire is used, 3 evaluation meetings per year with staff and families, and feedback from outsider professionals helping people in their home gives us the following results. Results For the persons with dementia, it's about a feeling of "nice place to go" with pleasure to meet other persons. From early stage to severe dementia the participants like to have activities giving pleasure and self esteem. Friendship and social links between the users For families, less guilty a better understanding of the disease, and a relation with professionals based on confidence are

observed. Conclusion: Opening the day care centre 365 per year is a challenging project which success is based a strong networking process of integrated care as well as a person centered care implies a trained and committed team.

**PD8 765 OLD PEOPLE'S TECHNOLOGY ROOMS**

J. HAGBERG\* (Linköping University, Norrköping, Sweden)

Å. LARSSON

Introduction Old people's relation to technology is poorly understood in gerontology research. There is a lack of empirical studies, which address the wholeness of individuals' use of new and old artefacts and systems and how they themselves value different technological objects. The theoretical underpinning of the research area is further more limited to a few perspectives, typically human factor based theories and/or person-environment fit models. Within environmental gerontology there has been an attempt to broaden the perspectives, which should have relevance for the study of technology and ageing. Several have argued for the necessity to integrate physical, social and cultural dimensions and adopt a time perspective. Our study of old people's technology rooms is a contribution in that direction as we use life course theory and incorporate concepts from technology studies, e.g. studies of the social shaping of technology. Methods and materials The study was done in a middle-sized Swedish city. 29 individuals, born 1913 to 1940, were interviewed on three occasions during 2004-2006. The data was collected by the use of a semi-structured questioner and a form designed to document when and how different technological objects were appropriated. Results Eight technology objects have had special importance during the participants' life course as they have been loaded with significant social and cultural values: the radio, the washing machine, the telephone, the refrigerator, TV, the car, the mobile phone and the Internet. The oldest participants (85+) have not appropriated mobile phones and Internet (2005). Conclusion The analysis supports the assumption that decisions on how technology should be used and valued are shaped by the individual's techno-biography, present needs, capabilities and future life expectations. Changes are negotiated with partners, relatives (e.g. children and grandchildren) and with peers. All participants have as old rethought their use of new and old technological objects. The attitude towards changes is pragmatic.

**PD8 766 HOUSEHOLD ARRANGEMENTS OF OLDER-ELDERLY OF THE COMMUNITY**

E. PEDRAZZI\* (University of São Paulo, Ribeirão Preto, Brazil)

I. ROSSET(1), S. COLEHO FABRÍCIO-WEHBE(1), T. TAVAREZ DELLA MOTTA(1), V. JOSÉ HAAS(1), R. PARTEZANI RODRIGUES(1) - (1) University of São Paulo (Ribeirão Preto, Brazil)

Introduction: The older-elderly aging context needs to be taken into account due to the redefinition of family as social institution. Methods and materials: This is an epidemiological, cross-sectional study that characterized the household arrangement of 147 older-elderly resident in Ribeirão Preto, SP. Home interviews were carried out with specific instruments for data collection. Results: Ages between 80 and 84 years predominated. The majority receives retirement pension, from one to three minimum wages, and owns their house. They have 4.08 children and live with 2.8 people in average. Men live with their partners, while women live by themselves. Great part of households is headed by the elderly. The most frequent arrangements were families with two and three generations. Conclusion: Regarding the household arrangement, there was equivalence in the results between the ones that moved into the house of the elderly and cases when the elderly moved into the family's house, reinforcing family as protector and caregiver of the elderly.

**PD8 767 GERONTOLOGY AND THE INVISIBILITY OF OLD AGE**

G. DEBERT\* (Universidade Estadual de Campinas, São Paulo, Brazil)

Up until the 1970s, medical doctors in Brazil who focused their practice on older adults or claimed knowledge on aging were generally seen by other doctors as charlatans of sorts. At the same time, social movements promoting the rights of the elderly transformed old age into a broad based social concern, and therefore gave Geriatrics a new respectability among Brazilian medical specialists. More recently, the Brazilian Geriatric Society, in association with international geriatrics associations, offered specialization courses in Gerontology, and granted medical doctors certification as specialists in the area of Geriatrics. Drawing its examples and content analysis from the contemporary images produced by the mass media on Geriatrics and Geriatric specialists, this paper points to how representations of old age in these mass media forms relate to new conceptions of the body and health practices that characterize the contemporary Brazilian urban context. Applauded by both a general public interested in the new technologies of rejuvenescence, and a state bureaucracy that seeks to reduce health costs by educating the public against body neglect, old age is transformed into a problem of failed consumers who are incapable of adopting appropriate lifestyles and forms of consumption targeted at combating bodily deterioration and decay.

**PD8 768 QUALITY OF LIFE OF ELDERLY RIVERSIDE.**

M. NUNES\* (Centro Universitário São Camilo, Santa Barbara D Oeste, Brazil)  
L. BUIN(1) - (1) Centro Universitário São Camilo (São Paulo, Brazil)

With an aging population arises the importance of research on quality of life (QoL) in old age. This study investigated the factors that influence QoL, as measured by the WHOQOL-Bref instrument, and the impact of these factors in each QoL domain (environmental, physical, psychological and social) of elderly residents in a riverside community, in Brazil. This is a descriptive and cross-sectional study. For the analysis of the data, the WHOQOL-Bref scores were presented in relation to the following socio-demographic and health characteristics: gender, illiteracy, monthly income, marital status, occupational activity, living alone, presence of systemic hypertension and use of local Health Services versus Health Services in the capital in case of an emergency. Fifty-three elderly people were interviewed: 58.5% were female; 47.1% were aged between 65 and 74 years; 49.1% had a stable union; 64.2% were illiterate and 50.9% earned a minimum wage for retirement. The results have shown that for marital status there was a significant difference ( $p=0.038$ ), for the environment domain: a married person had a higher score (better QoL) on that domain compared to an elderly who was single, separated or divorced and widower. Users of the local Health Services presented lower scores compared to those who did not use this service in case of an emergency and there was a significant statistical difference ( $p=0.01$ ) for the physical domain. Although there were no significant statistical differences in the QoL domains for the other factors studied, in general the QoL of the interviewees were in a good to a very good level (scores  $\geq 60$ ). This study has shown that housing conditions, illiteracy and a low monthly income did not have a negative impact in the QoL of the elderly residents in the community studied.

**PD8 769 RELIGIOSITY AND THE QUALITY OF LIFE OF POST-OPERATIVE COLON CANCER PATIENTS**

B. WOZNIAK\* (Jagiellonian University Medical College, Cracow, Poland)  
B. TOBIASZ-ADAMCZYK(1), D. ZAWISZA(1) - (1) Department of Medical Sociology, Chair of Epidemiology and Preventive Medicine, Jagiellonian University Medical College (Cracow, Poland)

**Introduction:** Religious coping resources play a significant role in overcoming various forms of stressful life situations, from family conflicts to dealing with illness. In this context, considering the various functions of religion, most often cited are explication and sensitization as well as healing. The aim of this study was to examine the relationship between individual religiosity and support-seeking through prayer in the course of illness and the results of colon cancer treatment and the quality of life (QoL) of post-operative patients. **Methods and materials:** The sample population consisted of patients from the Department of Gastroenterological Surgery in Cracow. Data was collected using a structured questionnaire administered during two face-to-face interviews after surgical treatment. In total, 562 individuals took part in the interview. The interview asked for the patient's opinion about the course of their illness and the determinants related to undertaking treatment as well as different dimensions of QoL following surgery. Statistical analysis was done using non-parametric tests (Mann-Withney and Kruskal-Wallis). **Results:** The results show a significant relationship between religiosity and QoL of patients following surgery. Scales used to analyze QoL include the QOLI, FILC, RAND, VAS, and COOP Charts. Religiosity was defined in terms of prayer frequency. Better QoL in QOLI and FILC scales was noted in individuals who did not change their prayer habits after the illness. There was a significant relationship between QoL in FLIC and RAND scales and self-rated religiosity, where those describing themselves as religious were found to have better QoL than those describing themselves as non-religious, non-practising, or even deeply religious. Respondents' attitudes to religion were also significantly related to mood, pain perception, and how they perceived their QoL using COOP Charts. No significant gender differences were noted between religiosity and QoL.

**PD8 770 DECONSTRUCTING OLDER WOMEN'S IDENTITIES: IMAGES OF "IDEAL OLD AGE" AND THE ROLES OF OLDER WOMEN IN MEXICAN SOCIETY**

M. MAKITA\* (University of Glasgow, Glasgow, United Kingdom)

**INTRODUCTION** In the West the dominant understandings of ageing construct old age as a burden, which reinforces the negative association of older people with disability, frailty, helplessness and weakness. This study with older people provides an interesting context. Mexico still has a relatively young population, in contrast to the demographic ageing of many developed countries. Previous research on ageing in Mexico has focused on older people as a social burden, rather than private experiences of growing old. There is a real necessity for a more in-depth exploration of how older women face this stage in the life-course. **MATERIALS AND METHODS** The research is a qualitative study based on multiple in-depth semi-structured interviews of 32 women aged 60 and over in Mexico. The research participants represent a wide range of social experiences. It includes women from all social classes: those with children and those without; those who cohabit with their family and/or partners; those who never married; those who live alone; and those who live in a nursing home. **PRELIMINARY FINDINGS** Analysis of these women's narratives presents 5 main and interconnected themes: (1) Self-identity; (2) relationships; (3) health; (4) activities; and (5) structural issues. All these impact on what they perceive to be a successful ageing. The ongoing analysis shows how, through their narratives, the elderly

women in this study are confronting their own self-understanding and social and cultural perceptions towards older people. It also shows how older women are not a homogenous group: amongst them there are multiple and multidimensional accounts of successful ageing which emerge from, and shape, their own identities. Definitely, what is needed is not just a shift to a feminist definition of ageing well or successfully, but rather an approach that takes into account not only gender differences and inequalities, but also the lived experience of culture and personal meaning, with a view of uncovering alternative forms and images of ageing. In this way I hope to debate, and potentially, transform the paradigm of the current ageing studies in Mexico.

**PD8 771 IRRUPTION OF THE ALZHEIMER**

Y. DOUCOT-HERMELIN\* (Medical Practice, Boulogne-Billancourt, France)  
J. BELMIN(1) - (1) University Paris 6 (Ivry-sur-Seine, France)

**Introduction:** As Alzheimer's Disease (AD) concerns an increasing number of patients, it is becoming a sociocultural fact. The objective was to analyse literary works on AD published in French between 1997 and 2007. **Methods and material:** Examination of the French National Library database (keywords: Alzheimer and literature), of online libraries databases or specialized Internet sites, and of editors database for the number of copies sold. Youth literature was excluded. Qualitative analysis of included works was then conducted. **Results:** 30 works - originally published in French or translated from another language - were identified including 14 personal narrations, 14 fiction books and 2 cartoons. Qualitative analysis of 6 personal narrations, 6 fiction books and 2 cartoons are presented. 7 works were sold at more than 10000 copies. **Conclusion:** The number of yearly-published non-scientific works about AD tends to increase during the period, in particular fictions, pointing up to the incorporation of this illness in the collective imagination.

**PD8 772 CLINICAL-STATISTIC DATES OF ATHEROSCLEROSIS PREVALENCE IN ST. LUKE HOSPITAL BUCHAREST BETWEEN 2005-2007**

A. CAPISIZU\* (St. Luke,s Hospital, Bucharest, Romania)

**Abstract:** Atherosclerosis is a chronic inflammatory complex present in the arteries with medium and great diameter and it is more often associated with hyperlipidemia and/or another risk factors. The symptomatic manifestations of atherosclerosis are particularly localised at the level of heart, brain, kidneys, small intestine or legs arteries and its main consequences are the myocardial and cerebral infarction and the aortic aneurysm. At the human body, atherogenesis develops over a long period of time, and the growth of the atherom plaques is discontinue with periods of relative quiet and rapid evolution. The extension and evolution of these lesions are accelerated by the risk factors and they prevail more stressed among the male population. The precocious increase of atherosclerosis lesions depends on age, sex, race, diet, smoking and social-economic conditions. A characteristic demographic fact, typical to Romania and as well as to developed countries, is that the number of people over 60 years old is increasing, but their health is in decline according to the data of the national inquiries. This investigation includes clinical and statistical data about the prevalence of cardiovascular and cerebral diseases and risk factors at the aged patients from St. Luke Hospital , Bucharest, between 2005 and 2007. **Conclusions:** 1. From the statistical analysis related to the groups of age, we notice that the greater prevalence is at the group of 70-79 years old patients, followed by 60-69 years old patients. 2. Females represents the biggest percent from patients analysed( over 60%). 3. As St. Luke is a Chronic Disease Hospital, we also have an important segment of patients from rural areas, reflected in the rates that are increasing from year to year up to 20%. 4. Of the total number of aged patients hospitalised in St. Luke Hospital between 2005 and 2007 over 1/3 (30%) represents patients diagnosed with cardiovascular and cerebral diseases: chronic ischemia disease, hypertension, stroke, vascular haemorrhage, vascular dementia, arteritis. They are followed by the patients with tumours. 5. Of the patients with vascular diseases, we can notice a modest yearly increase of those with angina pectoris and hypertension(2-5%) and a significant yearly increase of those with dementia(above 5%). 6. In the case of those patients diagnosed with stroke , a remarkable decrease of 10% occurred, reaching the rate of 30% of the number of patients diagnosed with cardiovascular diseases and being equal with those with hypertension. 7. Among the risk factors analysed occurred at the patients hospitalised, there are: hyperlipidemia, obesity, smoking, diabetes mellitus, and a spectacular increase of diabetes mellitus ( about 4 times more ) was noticed. 8. Hyperlipidemia as well as smoking are yearly subjected to continuous process of increase in medium rates and the obesity rate is constant (about 50%) at the aged patients.

**PD8 773 SELF-RATED HEALTH STATES: PROBABILITIES OF TRANSITION AMONG MEXICAN RURAL ELDERLY LIVING IN EXTREME POVERTY**

M. TELLEZ-ROJO\* (National Institute of Public Health, Cuernavaca, Mexico)  
A. SALINAS-RODRIGUEZ(1), B. MANRIQUE-ESPINOZA(1), L. MENDOZA-ALVARADO(1) - (1) National Institute of Public Health (Cuernavaca, Mexico)

**Introduction:** Self-rated health (SRH) has been associated with multiple health outcomes, including mortality. Several studies have shown associations between SRH and age, gender, marriage status, chronic illness, and functional status among others variables. In addition, longitudinal studies shows that an important predictor of SRH is precisely self-

rated health measured previously. Objective: To estimate the probabilities of transition among self-rated health states for rural elderly living in extreme poverty, and association with functional status. Methods and materials: We use self-rated health (good/very good; fair; bad/very bad) to estimate the probabilities of transition of SRH in an aging cohort of 3,144 rural and poor older adults –aged 65-74 years- enrolled in a governmental social pension program (70 y más) in Mexico. Participants completed a questionnaire with information about health and life conditions, and have two measurements, a base-line and follow-up eleven months later. Probabilities of transition were estimated using longitudinal ordinal regression models. Results: At the follow-up, 56% of older adults reported a SRH good/very good, 32% fair, and 12% bad/very bad. SRH was associated with different variables as such as functional dependence, sex, literate, and chronic illness. For these older adults, we found that it's more likely to be in the same health state for those who reported a SRH good/very good at base-line, and for those who reported a SRH fair or bad/very bad, we found that in follow-up reported a SRH good/very good and fair respectively, for both with and without functional dependence. Conclusions: SRH good/very good were the most frequent among this sample of rural and poor older adults. There was no differences in probabilities of transition in SRH according functional dependence, but a substantial proportion changed toward a better SRH, maybe for the effect of 70 y más.

**PD8 774** HEALTHY AGEING CONCEPTUALIZATIONS: OLDER MALAYS IN MELBOURNE, AUSTRALIA AND KLANG VALLEY, MALAYSIA.

N. TOHIT\* (Monash University, Notting Hill, Australia)  
H. RADERMACHER(1), C. BROWNING(1) - (1) Monash University (Notting Hill, Australia)

Introduction This paper reports on the qualitative findings of healthy ageing conceptualization among older Malays in Klang Valley, Malaysia and Melbourne, Australia, as part of a larger study on healthy ageing being conducted in Malaysia, China and Australia by the Healthy Ageing Research Unit at Monash University. Healthy ageing is widely promoted in service and research in Australia with strong government support. It is projected that by 2011 that nearly 23% of Australians aged over 65 will be from a culturally and linguistically diverse background. In Malaysia, an active ageing approach is adopted by the Ministry of Health in response to the aging population. The older Malays in Melbourne are a minority group of migrants, whereas Malay is the major ethnic group in Malaysia. This presentation will describe healthy aging conceptualizations among the older Malays aged 60 and above, ageing in place in Malaysia and another group of Malays ageing in foreign land in Australia. Methods and materials Focus group and individual interviews were conducted. Participants shared their opinions about ageing and ageing well. Factors contributing to age well and preparations to achieve healthy ageing were also being discussed. The transcripts were analysed using thematic analysis approach. Results Participants indicated that ageing occurs in stages and not merely chronological age. They experienced changes in conceptualization of ageing through the life process. The key issues identified constituting healthy ageing were physical, mental, social and spiritual well being, living arrangement, hope and purpose, adaptation, and participation. Similarities and differences can be discussed during the presentation. Conclusion Healthy aging concepts should be carefully interpreted according to culture and characteristics of each population. More studies on ageing in place and ageing in foreign land among the other ethnic groups are needed to inform the design of health promoting services for the ageing population.

**PD8 775** EXTENT AND CORRELATES OF DEPRESSION AMONG OLDER ADULTS IN SINGAPORE AND INDIA

A. LEE\* (National University of Singapore, Singapore, Singapore)  
S. CHOKKANATHAN(1) - (1) National University of Singapore (Singapoore, Singapore)

Introduction Research has established that depression is a serious problem in the elderly population. The objectives of the current study are to investigate the extent and social correlates of depression among older adults in Singapore and India. Method In India, the study area was Chennai, a metropolitan city in South India. Face-to-face interviews were conducted among randomly selected non-institutionalized older adults aged 65 years and above in Singapore (n =181) and India (n = 250). Among other instruments, a 15-item Geriatric Depression Scale (GDS), a social support scale, and several questions on social engagement activities were administered. Multiple regression analyses were conducted to find out the influence of demographic, familial, social, and health variables on depression. Results The GDS score for older adults in India (mean score = 6.06) was higher than those in Singapore (mean score = 2.6). The model as a whole explained 27% and 30% of variances associated with GDS score for Indian and Singaporean older adults, respectively. For both the countries, none of the demographic and social factors emerged significant. Both in India and Singapore, low levels of social support and poor health status increased the risk for depression. Conclusion Older adults who report physical health problems should be screened for depression. Moreover, there is a need to strengthen the family

support of older adults. The implications of findings are discussed within the socio-cultural milieu of the respondents.

**PD8 776** RELATIONSHIP BETWEEN QUALITY OF LIFE AND CONSTIPATION IN PATIENTS ATTENDING THE GERIATRIC CLINICS OF A BRAZILIAN TERTIARY HOSPITAL.

P. VILLELA\* (Faculdade de Medicina de Ribeirão Preto USP, Ribeirão Preto, Brazil)  
R. OLIVEIRA(1), E. OLIVEIRA(2) - (1) Faculdade de Medicina de Ribeirão Preto - USP (Ribeirão Preto, Brazil); (2) Sociedade Brasileira de geriatria e gerontologia (Brazil)

Introduction: Constipation is very common among elderly, the main objectives of the study were to determine the prevalence of chronic intestinal constipation (CIC) in patients attending the geriatric clinics of a Brazilian tertiary Hospital and verify the impact of CIC on the quality of life (QOL) of these patients. Methods and materials: All patients attended in the geriatrics clinics of the Hospital das Clínicas de Ribeirão Preto, Brazil from September 2006 to may 2007 were considered for inclusion in the study. Those with severe cognitive deficit, intense anxiety or another emotional or physical reaction in the beginning or during the application of the questionnaire, or who were bedridden were not included in the study. 620 patients, both genders, ageing 60 years and older, were interviewed with a structured questionnaire to identify chronic constipation according Rome II criteria, and data regarding gender, age, laxative use and duration of constipation were obtained. SF-36 was used to measure QOL of the last 120 patients interviewed, irrespective of the presence or absence of chronic constipation. Results: 306 (49,2%) of 620 patients presented CIC (228 females). Female gender was associated with chronic constipation ( $p=0.004$ ) and use of laxative ( $p<0.001$ ). The risk for developing CIC increase 2,3% each year in both genders ( $p=0.004$ ). The QOL was significantly lesser in constipated than non-constipated patients in all the dominions of SF-36: physical functioning, role-physical, pain index, general health perception, vitality, social functioning, role-emotional and mental health index. The consistence on Crombach's Alph was higher 0,8 on all domains. Conclusions: prevalence of CIC is high among elderly attending a geriatric clinics of a Brazilian tertiary hospital ; CIC is strongly associated with low QOL in the elderly.

**PD8 777** HEALTH CARE POLICY FOR THE ELDERLY AND THE RETIRED IN SENEGAL

M. COUMÉ\* (Ministry of Health and University of Dakar, Dakar, Senegal)  
K. TOURE(1), M. KA(2), T. DIOP(1) - (1) Universite Cheikh Anta Diop de Dakar (Dakar, Senegal); (2) Unite de Formation de Recherche des Sciences de la Santé de Thies (Thies, Senegal)

Senegal is living its demographic transition. Now the persons aged 60 years and over represent 7% of the population; life expectancy is 58 years. The elderly before the free health care program : In Senegal there are 3 categories of older persons according to their social status of having a pension or not : the older persons who depend to the public social security for pension funds ( FNR), the older persons affiliated to the Private Institution for pension funds ( IPRES). These two categories represent 30% of the elderly. The third category is represented by the older persons without social security and pension; they represent 70% of the elderly in Senegal. These elders pay for themselves to access the public health care Only the Private Institution for Pension Funds has an adequate policy of health care for the elderly with a national geriatric centre in Dakar, The Public Social Security for Pension Funds have an incomplete health care system because its pensioners still benefit from the public health system as they used when they were civil servants but pay for the drugs. The public health care policy for the elderly: In Senegal since November 1st 2006 the government started the national free health care program for the elderly called "Plan Sesame". The program is only applied in the public health system. It provides freely all the provisions available in the public system except prostheses, renal dialysis. The drugs of the program are essential drugs of Bamako initiative, not specific geriatric drugs. The only condition to access to the program is the new numerous identity card. The assessment of the program has shown its pertinence and has identified measurements to perpetuate it regarding the shortcomings. But in term this program must turn into a global national health insurance for the elderly

**PD8 778** A STUDY ON SOCIAL PARTICIPATION OF ELDERLY WITH STROKE-RELATED DISABILITY: EXAMINING MEDIATION EFFECTS OF FAMILY SUPPORT AND PROACTIVE COPING

S. MOON\* (Daejin University, Pocheon, Republic of Korea)

Introduction: The final goal of a successful rehabilitation for elderly with stroke related disability is to increase social participation associated with independent living. Especially, social Participation focusing on social role emphasizes the concepts of functional independence that represents as the indicator of quality of life for Elderly with stroke related disability. Therefore, the purpose of this study was to investigate factors related to social participation. Also, this study examined mediation effects of family support and proactive coping. Methods: Three hundreds eighty five elderly with stroke-related disability who is living in Seoul city were participated for this study. the Structural Equation Model was used to examine the direct effect of physical function and daily hassles of social participation and the indirect effect of family support and proactive coping

as a mediator. Results: The major findings of this study were as follow: First, the direct effect of physical function on social participation was statistically significant ( $p<.001$ ) while the effect of daily hassle on social participation was not statistically significant. Secondly, examining mediator effects, family support was not proved as a mediator, while proactive coping was shown to be a mediator between physical function and social participation. After that, examination of -difference and Sobel test were performed in order to reconfirm proactive coping as a mediator. As a result, it was proved to be a partial mediator model. Conclusion: In order to maximize social participation, it is valuable to have an integrated social service system which provides not only medical service focusing on increasing physical function but also psychosocial service that can enhance coping skills in a new environment. Also, it is necessary to develop community based social services providing on stop stroke management programs to be able to increase problem solving skills.

**PD8 779** GERIATRIC PSYCHIATRY HOME TREATMENT GHT – A PILOT STUDY ON OUTCOMES FOLLOWING HOSPITAL DISCHARGE FOR DEPRESSIVE AND DELUSIONAL PATIENTS

B. FUCHS-NIEDER\* (Gesellschaft zur Förderung seelischer Gesundheit, Association to Promote Mental Health, Graz, Austria)  
G. HERMANN(1), B. FUCHS-NIEDER (1), A. STIPACEK(1), H. ZAPOTOCZKY(2) - (1) Psychosocial Center Graz-East (Austria); (2) Association of mental health development (Austria)

Much worse outpatient care is offered to elderly people with mental health problems than to younger people. Despite the fact that health-promoting factors are known, there are hardly any studies on effective bio-psycho-social care models. The team of the Association to Promote Mental Health examined the effectiveness of geriatric psychiatry home treatment (GHT) on twelve depressive and delusional patients discharged from inpatient geronto-psychiatric care in a one-year longitudinal study. The participants received mental and social treatment and care at home for one year. The following instruments were used: Functionality was surveyed by means of the Global Assessment of Functioning Scale (GAF), psychiatric symptoms by means of the Brief Psychiatric Rating Scale (BPRS) and subjective quality of life (QoL) was surveyed by means of the WHOQOL-BREF self-report questionnaire. The main findings are as follows: 1) No patient had to receive inpatient psychiatric care or be admitted to a nursing home during the study period; 2) mental QoL had improved significantly after one year; 3) functionality remained stable; 4) the BPRS scores did not deteriorate. The results confirmed us that GHT is an effective instrument for extramural care of elderly people with psychiatric disorders. The limitations of the pilot study necessitated further studies to back up the findings. The study was published in Archives of Gerontology and Geriatrics, Volume 47, Issue 1, Pages 109-120 (July 2008). The follow-up study (RCT) with 30 patients in a treatment group and 30 in control group is already in progress. Key words: geriatric psychiatry, psychosocial functioning, quality of life, mental health, home treatment model, hospital discharge

**PD8 780** THE EXPERIENCE OF OLDER PEOPLE IN INTENSIVE CARE - A PHENOMENOLOGICAL INQUIRY

A. TEMBO\* (UNIVERSITY OF NEWCASTLE, Callaghan, Australia)  
I. HIGGINS(1), V. PARKER(2), D. SUNDIN(1) - (1) University of Newcastle (Callaghan, Australia); (2) John Hunter Hospital (Newcastle, Australia)

The purpose of this paper is to present the preliminary findings of a study that explored the experiences of older people who were critically ill and mechanically ventilated in intensive care (ICU). People aged 65 years and over make up a significant number of ICU admissions, a trend which is likely to continue into the next decade. Technological advances and evidenced practice have resulted in better outcomes for older people, but what do older people say about their experience of ICU and what meaning do they attach to it in their lives? Methods and Materials Five older people were recruited into the study from a 20 bed ICU at a tertiary referral hospital in regional Australia. The method for the study included In-depth face to face interviews at two weeks after discharge and repeated at six months. Interviews were audio taped, transcribed and thematically analysed. Significant statements were highlighted and categorised for emergent themes. Results Emergent themes include "encountering death", "bound and drowning", "feeling vulnerable" and "the goldfish in the bowl". Encountering death was the phenomenon of not being able to hear, feel or dream during sedation. Bound and drowning was about struggling for breath and being unable to move in order to "save themselves". Feeling vulnerable was described as feeling violated, unable to voice their concerns, feeling helpless and frightened. The goldfish bowl captures the experience of being watched constantly. Conclusion Although contemporary health care practices have resulted in better medical outcomes for older people, the experience of being in ICU and the meanings that older people attribute to this need to be addressed. Health care workers need to be sensitive to the varying levels of awareness during sedation periods. Further research is needed to explore ways in which older people's experience can be improved in ICU.

**PD8 781** COMPASSION AND CARE, EXPLORING THE DOMAIN. A STUDY ON NURSES' COMPASSION FOR OLDER PEOPLE WITH CHRONIC DISEASE.  
M. VAN DER CINGEL (TITLE: MSN, MASTER OF SCIENCE IN NURSING)\* (Windesheim University of Applied Sciences, Zwolle, The Netherlands)

Introduction: This study focuses on the effect compassion has on older people with chronic disease. The daily life of older people with chronic disease is characterised by a dependency on care as a constant and long-term factor. This study elaborates on compassion from the perspective of this dependency. The goal of the study is to describe the concept as the human aspect in care and eventually integrate compassion into a theory of care. Methods and materials: A literature review, aimed to explore the nature of compassion related to nursing care, has been performed. The review is a hermeneutic and philosophical search into the phenomenon of compassion but is conducted separately from the qualitative data collection (Annells, 2006). This qualitative phase of the study is conducted according to the principles of grounded theory and uses issues from the review for the in-depth interviews in three different care settings. Results: Specific issues on the nature of compassion will be presented and illustrated by results from the qualitative data-collection. Literature describes compassion as an emotion with a cognitive aspect but nurses and patients also emphasize the subconscious aspect. Moreover, compassion is about 'setting aside' one's own perspective in order to really see what is salient for the person taken care of. Conclusion: Compassion is an answer to suffering despite the fact that suffering will not disappear by it. The 'human aspect' in nursing care appears to be an important motivation for nurses in exercising their profession. Compassion has value for professionals in a domain that has the amelioration of suffering as its purpose. Compassion is indispensable in a practice of care where suffering exists and persists. Annells M. (1996), Hermeneutic phenomenology: philosophical perspectives and current use in nursing research, Journal of Advanced Nursing, 23, 705-713.

**PD8 782** HOW SHOULD SOCIAL SERVICE AND MEDICAL PROVIDERS COLLABORATE TO CARE FOR ELTERS? CASE MANAGERS' VIEWS

A. GUM\* (University of South Florida, Tampa, United States)  
F. SOUTHERS(1), T. SCHWIERS(1) - (1) Department of Aging Services (United States of America)

Introduction: Chronic care management of older adults' complex medical and mental health needs requires collaboration between social service providers in aging ("aging services") and primary medical care providers. Despite appeals and even federal mandates for joint working in some countries, little is known regarding specific strategies that foster successful collaboration across organizations. Methods and materials: Three focus groups were held with a total of 25 case managers working in an aging service agency in the southeastern United States. Participants were asked questions regarding general perceptions of collaboration, perceptions of aging services and primary care and barriers and facilitators to collaboration with primary care. Results: Overall, case managers desired to collaborate with primary care personnel and to involve clients as an active member of the "team." Uniformly, they perceived that primary care personnel do not understand the role or services provided by aging services. They recognized numerous challenges to collaborating with primary care, mostly related to lack of understanding about aging services, communication barriers, and time pressures of both primary care personnel and case managers. Case managers suggested several strategies they have found effective to enhance collaboration with primary care, including highlighting common goals with primary care personnel (i.e., helping the client and family), learning the specific contact person and preferred communication mechanisms at each clinic, rapport-building with the contact person, educating them about aging services, and simplifying requests. Conclusions: Training case managers to develop rapport with primary care providers, identify shared goals, and communicate clearly and succinctly may facilitate collaboration with primary care, thereby ultimately enhancing client outcomes. Additional research is needed to develop and evaluate training curricula for case managers.

**PD8 783** SOCIAL WORKERS AND THE ELDERLY: A TIME AND MOTION STUDY

N. DELLI-COLLI\* (Research Center on Aging, Sherbrooke, Canada)  
N. DUBUC(1), N. VEILLEUX(2), K. DUCHAINEAU(2), L. GAUTHIER(2) - (1) Research Center on Aging (Sherbrooke, Canada); (2) Health and Social Services Centre-University Institute of Geriatrics of Sherbrooke (Sherbrooke, Canada)

The increasing number of people aged 65 years and over, especially those in need of health and social services has a real impact on the number of clients seen and the types of activity performed by the social workers at the Health and Social Services Centre-University Institute of Geriatrics of Sherbrooke (HSSC-UIGS). In order to guarantee accessible and continuous services to the clientele, it is important to document the way services are organized and to identify the most relevant activities to respond adequately to the needs of the elderly. The aim of this study was to improve the work organization and the provision of social work services with reliable and valid data on time spent by social workers on different activities in three programs: Home Care, Geriatric Unit, Long-Term Care Facility. To collect precise information about activities and time, we first developed and validated a list of activities that includes direct and indirect therapeutic and non-therapeutic activities. We produced a preliminary list with the help of literature reviews and experts' opinions.

To validate this list of activities, six social workers collected, during two days, their activities without taking into consideration the time. This list was divided into two subsamples (A1, A2). Two senior social workers categorized the elements from the A1 to the list of activity. Since the agreement between social workers was moderate, we modified the list and used the A2 for recategorization. The final list included 77 activities, divided into 11 categories and was included in the electronic data capture software, running on handheld computer named TEDDI to conduct a time and motion study. The social workers used the TEDDI 12 consecutive days to record all of their activities. The results have been useful in supporting the decision-making for the management of services

**PD8 784 HOME BLOOD AND PLATELET TRANSFUSIONS OF HAEMATOLOGICAL PATIENTS REQUIRING HOSPITAL ADMISSIONS**

V. TIBALDI\* (Department of Medical and Surgical Disciplines, Geriatric Section, University of Torino, Torino, Italy)  
G. ISAIÀ(1), M. ASTENGO(1), M. LADETTO(1), M. BO(1), R. MARINELLO(1), I. AIMONINO(1) - (1) Department of Medical and Surgical Disciplines, Geriatric Section, University of Torino (Torino, Italy)

Introduction. The ever-increasing demand on acute hospital services requires alternative methods of delivering all aspects of health care. Hospital at Home Service (HHS) is as efficacious as a traditional ward for elderly and functionally compromised patients with acute illness. Methods and materials. A retrospective descriptive study enrolling patients admitted to the HHS needing an hospital admission from 1st January 2007 to 31st December 2007 and reporting an haematological discharge's diagnosis as primary or secondary diagnosis. HHS is a multidisciplinary team providing medical cares as a traditional clinical ward (blood tests, electrocardiogram, spirometry, pulse oximetry, respiratory therapies, intravenous fluids, blood transfusions, surgical treatment of pressure ulcers, echocardiograms, echographs, Doppler ultrasonographies and radiograms). Results. Fifty four patients were enrolled in the study over a total of 481 patients treated at home in 2007. The Emergency Department main admission's diagnoses were: 31.48% haematological acute illness, 24.1% chronic obstructive pulmonary disease or pneumonia, 11.1% heart related symptoms, 5.5% falls or fractures, 3.7% haemorrhage. The remaining 22.2% showed hypoglycaemia, temperature, porto encephalitic syndrome or pancreatic disease. As primary discharge's diagnosis 20 patients (37%) had anaemia and 7 patients (13%) had leukaemia; as secondary discharge's diagnosis 25 patients (46%) had anaemia and 4 patients (7%) had leukaemia. Two patients had a double haematological diagnosis (acute myeloid leukaemia and anaemia due to haemorrhage; anaemia and chronic lymphatic leukaemia). Mean age was  $80.9 \pm 9.6$  years. Of all patients enrolled, 34 (62.9%) needed an emocomponent transfusion for a total volume of 112 blood units and 49 platelet pools. Patients requiring at least one blood or platelet transfusion were more functionally compromised than non-transfused. Conclusion. Haematological subjects mainly frailty and highly functionally compromised with acute illnesses could be treated at home.

**PD8 785 CHARACTERISTICS OF THE VERY FRAIL COMMUNITY-DWELLING ELDERS IN INTEGRATED MODELS OF CARE**

M. DE STAMPA\* (Laboratoire santé vieillissement , Paris, France)  
I. VEDEL(2), E. BAGARAGAZZA(1), J. ANKRI(1), H. BERGMAN(2), L. LECHOWSKI(1), B. CASSOU(1) - (1) laboratoire sante vieillissement (France); (2) Solidage (Canada)

Background: identifying very frail community-dwelling elders in models of integrated care constitutes the first step of the case management process. Little has been written to judge which elders require these interventions. Objective: to define the characteristics of the very frail community-dwelling elders in an integrated model of care in France. Method: a comparative study of very frail elders was carried out in an integrated model of care named COPA (Coordination Personnes Agées) and in two control groups including a community-based health services and a group of elders without model of care and without health service. A total of 400 very frail community-dwelling elders (eligibility tool) in the 3 groups were compared using the InterRai instrument. Results: In the integrated model of care group (intervention group), community elders were younger with less caregivers and with a higher proportion of burn-out caregivers when they were present. In this group, elders had more cognitive impairments, had less incapacity in activities of daily living and had more difficulties for realizing the instrumental of daily living (answer telephone, take medications, transportation). In control groups, patients fell down less in last 180 days, were more painful and had higher pressure ulcers, shortness of breath and bladder incontinence. There were less influenza vaccinations and medicine prescriptions in the intervention group. Conclusion: in model of integrated care, the very frail elders were different comparing with those in the community-care services. This study permits to better define the characteristics of the population who need a case management follow-up in the community.

**PD8 786 A COMPARISON BETWEEN JAPAN AND SWEDEN WITH REGARD TO THE PROVISION OF LONG-TERM CARE IN RELATION TO NEEDS**

M. LAGERGREN\* (Stockholm Gerontology Research Center, Stockholm, Sweden)  
N. KURUBE(1), M. PARKER(2) - (1) Nihon Fukushi University (Japan); (2) Ageing Research Center (Stockholm, Sweden)

Introduction: Japan and Sweden share many features when it comes to the systems of care for frail elderly persons. Both countries have a high and increasing number of elderly people and both countries acknowledge a public responsibility to provide access to long term care and services for those in need. But there are also great differences in, e.g., social conditions, cultural traditions and the role of women and family. The differences and similarities make it interesting to make comparisons with regard to the provision of long-term care in relation to needs. Methods and materials: Using datasets collected in the assessment of care needs for the Japanese long-term care insurance system in Handa municipality, Japan, and data from the Swedish National Study on Ageing and Care, Kungsholmen district, the recipients of care in the two countries have been compared with regard to different variables describing needs. Moreover, a comparison has been made of the allotted care and services given these needs. Results: The comparison shows that on average the Handa care recipients are more dependent than the Kungsholmen-population. A possible explanation for this could be differences in household patterns with far fewer elderly persons living alone in Handa than in Kungsholmen. Patterns of services provision also differ substantially. In Handa, Japan, where many elderly people live with their extended family there are many more community services outside the home. In Kungsholmen, Sweden, where many elderly persons live alone the emphasis is on home help. The costs of care given level of disability are much higher in Sweden. Conclusion: Social and cultural differences between the two countries affect perceived needs as well as the patterns of service provision even if general conditions with regard to age structure and political ambitions are similar.

**PD8 787 MANY SMALL INTERVENTIONS BETTER THAN ONE OR TWO BIG ONES? THE EUROPEAN PERSPECTIVE**

G. SUNDSTRÖM\* (School of Health Sciences, Jönköping, Sweden)  
E. BOLL HANSEN(1), S. DAATLAND(2), K. HERLOFSON(2), L. JOHANSSON(3), B. MALMBERG(4), D. PUGA(5), M. TORTOSA(6) - (1) Anvendt kommunalforskning (Copenhagen, Denmark); (2) NOVA (Oslo, Norway); (3) Socialstyrelsen (Stockholm, Sweden); (4) Institute of Gerontology (Jönköping, Sweden); (5) CSIC (Spain); (6) Universidad de Valencia (Spain)

INTRODUCTION Overviews of public services for older people often limit themselves to reporting institutional care and Home Help/Home Care, be it for individuals in surveys, for a specific country or for international comparisons. Yet, these two 'major' services are in many countries supplemented by or substituted for by other, 'minor' services. The latter are services such as transportation, meals-on-wheels, alarm systems, day care etc., that also need to be considered. METHOD We use a number of surveys to provide data on all or nearly all these support programs for selected European countries: Denmark, Norway, Sweden, Germany, England, Spain. RESULTS When all types of support programs are considered, service coverage in these countries is ca. 50 - 100 % higher than by the 'major' programs alone, and target up to eight out of ten among the very old (90+). Persons who only use 'minor' services seem to have lesser needs for support than persons who use Home Help, confirming at least some degree of targeting. CONCLUSIONS The pros and cons of varying service strategies are discussed: do these 'minor' services serve the variable needs of older people better than the rigid choice between nothing, Home Help, or institutional care? Or, are 'minor' services used as inexpensive but inferior substitutes for the real thing? The data indicate that both scenarios are realistic.

**PD8 788 EVALUATING SERVICE NETWORKS FOR PEOPLE WITH DEMENTIA AND THEIR INFORMAL CAREGIVERS: THE "EVIDENT"-PROJECT**

M. REICHERT\* (TU Dortmund University, Dortmund, Germany)  
A. EHLLERS(1), M. GOLDMANN(2), V. LEVE(3), M. MENKE(3), B. MESCHKUTAT(2), K. MÜLLER(2) - (1) Social Gerontology and Life Course research at the TU Dortmund University (Dortmund, Germany); (2) Sozialforschungsstelle (sfs), central scientific institute of the TU Dortmund University (Dortmund, Germany); (3) Institute for Gerontology at the TU Dortmund University (Dortmund, Germany)

In an ageing society like Germany, efficacy of care provision and other support services for people with dementia and their informal caregivers is of particular importance. Against this background, the presented project "EVIDENT" aims to evaluate the work of six service networks in North Rhine-Westphalia (e.g., in the City of Cologne). Every network intends to link the different parts of dementia supply, including medical and nursing services, different types of support, consultation, self help and the involvement of volunteers. Their networking is to facilitate access to information about dementia services and to increase service use. Different research methods are used to answer the question, if these six networks reduce care-givers' burden and enhance quality of life for people with dementia. The project is based on a literature review of innovative concepts in dementia service provision, on case studies of the six networks, on in-depth interviews with experts of dementia care provision and on a survey of informal caregivers and people with mild dementia symptoms. Characteristics models of good practice are to be identified as well as options for improvement. Finally, recommendations for action are to be developed. Since the project is still in process (it ends in February 2010), preliminary results will be presented. They show the complexity of the evaluated networks, restrictions referring to institutional and financial framework and the high commitment of network actors. Findings of the survey and the in-depth interviews give insight in service use, caregiver

burden and assessment of network activities from the perspective of informal carers and people with dementia.

**PD8 789 SHOULD FIRST-GENERATION COMPREHENSIVE GERIATRIC ASSESSMENT INSTRUMENTS BE REPLACED BY THIRD-GENERATION? COMPARISON OF THE MINIMAL GERIATRIC SCREENING TOOLS (MGST) AND THE INTERRAI ACUTE CARE (INTERRAI-AC) IN ACUTE CLINICAL PRACTICE.**

N. WELLENS\* (Katholieke Universiteit Leuven, Leuven, Belgium)  
M. DESCHODT(1), J. FLAMAING(2), P. MOONS(1), X. BOMAN(3), J. COLLARD(4),  
A. LONDOT(4), C. GOSSET(3), J. PETERMANS(3), K. MILISEN(1) - (1) Center for  
Health Services and Nursing Research, Katholic University Leuven (Leuven, Belgium);  
(2) Department of geriatrics, University Hospitals Leuven (Leuven, Belgium); (3) Centre  
Hospitalier Universitaire (3000, Belgium); (4) Ecole de santé publique de l'université de  
Liège (Leuven, Belgium)

Introduction Comprehensive geriatric assessment (CGA) has evolved. - First, CGA consisted of a collection of single-domain, individually validated, measures. - The second-generation instruments introduced health setting-specific assessment with omni-comprehensive nature. - Improving data transfer in transitional care, third-generation CGA consists of instruments with a common set of standardized items across settings. The aim of the study is to compare the usability of the first-generation MGST and the recently released third-generation interRAI-AC in clinical practice. Methods and materials A comparison based on theory is validated by an expert panel of eight geriatricians. Results Both methods aim at multi-domain geriatric assessment, each with different scope and goal. InterRAI-AC, tailored for acute settings, intends to screen all geriatric domains. Based on systematic observational data, the method triggers risk domains and suggests clinical guidelines. Four observation periods outline the evolution of patients' functioning over stay. The simplicity of the method is appropriate for application on general medical and surgical wards, filling geriatric knowledge gaps. Its' uniformity facilitates data transition across care settings. MGST contains international validated instruments (e.g. Katz, Lawton, Cornell). Assessment is usually triggered by care givers' clinical impression based on geriatric expertise. In real terms, a selection of domains is assessed only once. The components of first-generation instruments imply profound examination and assessment requires specialized disciplines. Conclusion Both approaches are mutually exclusive. A cascade-system is proposed to integrate the complementary methods in practice. First, the systematic interRAI-AC assessment detects risk domains and suggests subsequent care tracks in the form of clinical protocols. Subsequently, domain-specific components of MGST conduct in-depth examination of care needs. The proposed method can be generalized to a variety of ward-types and the MGST can be substituted by a variety of first-generation assessment tools.

**PD8 790 THE DUTCH NATIONAL CARE FOR THE ELDERLY PROGRAMME: INTEGRATED CARE FOR FRAIL ELDERLY PERSONS**

C. JONKERS\* (The Netherlands Organisation for Health Research and Development, The Hague, The Netherlands)  
C. VAN AALST(1), C. BAKKER(1) - (1) The Netherlands Organisation for Health Research and Development (The Hague, The Netherlands)

Introduction: The Netherlands Organisation of Health Research and Development (ZonMw) has launched the ambitious National Care for the Elderly Programme (NPE) to improve care and support for elderly persons with complex needs. This four year programme is initiated by the Ministry of Health, Welfare and Sport and started in 2008. The budget is 80 million euro. The NPE is designed to ensure that care and support for frail elderly people are arranged (or rearranged) in such a way that it caters better for their demands. Those demands differ from one individual to another, and may encompass medical, psychological and social problems. Integrated care and coordination between the various parties involved should ultimately lead to improved patient outcomes for the elderly themselves. Methods: The programme consists of three subsequent steps. The first step involves the formation of regional networks. These networks comprise of all parties that can contribute to the organisation of care and support for frail elderly persons, including health care providers, welfare and informal care organisations, insurers, local authorities, and associations for the elderly. The second step is for the regional networks to develop innovative transition experiments and research projects. The final step is the dissemination and implementation of knowledge. Results: Eight University Medical Centres throughout the Netherlands took the lead in the formation of the networks. Their network proposals were formally approved by ZonMw in October 2008. Each network will continue to grow to provide as much regional cover as possible. The first transition experiments and projects of the eight networks have been developed and started in January 2009. Conclusion: The NPE has led to the formation of eight regional networks that aim to improve integrated care for frail elderly persons. Whether this approach leads to improved patient outcomes and better integrated care is still to be tested.

**PD8 791 HEALTH PUBLIC POLICIES TO ELDERLY PEOPLE: AN INTERNATIONAL LITERATURE REVIEW**

F. COTRIN LORO\* (Federal University of São Paulo, São Paulo, Brazil)  
A. PASSARELLA BRETAS(1) - (1) Federal University of São Paulo (São Paulo , Brazil)

The people aged 60 and over is about 600 millions in 2000; 1.2 billion in 2025 and 2 billion in 2050. About two-thirds of all older persons are living in the developing world

and in the developed world, the very old is the fastest growing population group. With people living longer, getting sicker and having a lot of others demands, think about public health policies is necessary and very important. This study aimed to recognize the public policies health to elderly people in an international literature since 1997 in indexed data bases. It shows that the health public policies to elderly people is poorly developed and studied, in developing world there is more publications about it than developed world and the need to study this theme is clear.

**PD8 792 MEMORY LANE CAFÉS: EVALUATING AN INTEGRATED APPROACH TO SOCIAL INCLUSION FOR PEOPLE WITH DEMENTIA AND THEIR FAMILIES**

B. DOW\* (National Ageing Research Institute, Royal Melbourne Hospital, Australia)  
B. HARALAMBOUS(1), C. HEMPTON(1), S. HUNT(1), D. LOGIUDICE(2),  
D. AMES(1), D. CALLEJA(3) - (1) National Ageing Research Institute (Parkville, Australia); (2) Royal Melbourne Hospital (Parkville, Australia); (3) Department of Human Services (Melbourne, Australia)

Introduction Memory Lane Cafés are a service funded by the Government of Victoria, Australia for people with dementia, their family carers or friends. The service is run by Alzheimer's Australia Vic (AAV) and aims to promote social connectedness and prevent isolation. It was adapted from the Alzheimer Cafés, first implemented in the Netherlands in 1997(Miesen and Blom, 2001). The Memory Lane Café model differs from the original in that: it is only accessible to people assessed as having dementia, their family carers or friends; the focus is social as well as educational; all clients have attended a six-week group program 'Living with Memory Loss', that aims to promote understanding of dementia and provide initial support and early education. Thus, new clients attend as a group, with others they already know. Methods and Materials The National Ageing Research Institute (NARI) was commissioned to evaluate the service in 2008. Evaluation included focus groups with clients, a survey of 136 clients, consultation with staff, and interviews with stakeholders. Results Clients and staff were highly satisfied with the service. Valued components included: · Integration with other services offered by AAV · Opportunity for people with dementia to attend a social activity with family carers or friends · Environment where behaviours associated with dementia are accepted. Main shortcomings of the service were: · Lack of access for people who had not completed 'Living with Memory Loss' · Under-representation of people from Aboriginal and Torres Strait Islander and culturally and linguistically diverse backgrounds. Conclusion The adapted Alzheimer Café provides a highly valued opportunity for people with dementia, their family carers or friends to interact with others in a similar situation and share their experiences. The evaluation recommended that the AAV service be further developed to meet needs of a wider group of clients.

**PD8 793 POLICY TO PRACTICE: THE ROAD TO AN INTEGRATED CONTINUUM OF CARE**

L. STEWART\* (University of Auckland, Auckland, New Zealand)  
M. PARSONS(1), J. KILPATRICK(1) - (1) University of Auckland (Auckland, New Zealand)

Introduction: Writing policy is relatively easy compared to ensuring policy impacts on practice. The New Zealand Health of Older People Strategy (2002) aimed to ensure an integrated continuum of care was implemented throughout New Zealand. This government policy provides a framework to guide regional District Health Boards (DHB) to align service provision with the objectives of the strategy. The expectation is that the integrated continuum of care programme for older people is implemented nationwide by 2010. This poster reports research that evaluated whether policy was being implemented in practice. Methods: A qualitative organisational evaluation that incorporated the balanced scorecard methodology was conducted. Phase I involved content analysis of the DHB Annual Plans, while Phase II involved interviews with three key stakeholder groups, Chief Executive Officers / Senior Executive Managers; Regional Older People's Health Service Managers and local consumer advocacy organisation managers. Data analysis was performed either in relation to the strategy objectives or through inductive analysis. Results: The key stakeholder groups were positive about the planning and progress being made towards implementation of policy, however, the DHB Annual Plans showed minimal evidence of planning. Inconsistencies in relation to the extent of service alignment and consumer satisfaction were also apparent. Resource shortages, time restraints, inflexibility of policy and internal and external organisational culture were identified as barriers to implementation. The dominance of a provider focus, fragmentation of internal and external organisational processes, a lack of collaboration, and minimal customer focused evaluation of services became evident as missing pieces to an integrated continuum of care. Conclusion: Some progress has been made towards implementing the strategy suggesting some commitment to policy; however misalignment between the perceptions of healthcare providers and consumers suggests that services are not yet fully aligned with the Strategy.

**PD8 794 COST ANALYSIS OF THE GERIATRIC RESOURCES FOR ASSESSMENT AND CARE OF ELDERS (GRACE) CARE MANAGEMENT INTERVENTION**

S. COUNSELL\* (Indiana University Center for Aging Research, Indianapolis, United States)

C. CALLAHAN(1), W. TU(1), T. STUMP(1), A. GREG(1) - (1) Indiana University Center for Aging Research (Indianapolis, United States of America)

**INTRODUCTION:** The GRACE model has been shown to improve quality and outcomes, and reduce acute care utilization in those at high-risk of hospitalization. Our objective is to provide a cost analysis of GRACE from the healthcare system perspective. **METHODS:** Randomized controlled trial of 951 adults aged 65 or older who received care at one of 7 community-based health centers of an urban public healthcare system. The GRACE intervention includes a nurse practitioner and social worker who provide in-home assessment and care management over two years in collaboration with the primary care physician and a geriatrics interdisciplinary team, and guided by care protocols for common geriatric conditions. Main outcome measures were chronic and preventive care costs (including intervention costs), acute care costs (ED and hospital), and total costs; in the full sample and predefined groups at low-risk (n=725) and high-risk (n=226) of hospitalization. Cost data were obtained from a comprehensive database that contains actual charges for all inpatient and outpatient services which were converted to costs using cost-to-charge ratios. **RESULTS:** Baseline characteristics were similar with mean age 72 years, 76% women, 60% black, 52% perceived health as fair/poor, and mean chronic disease count 2.7. In the full sample, mean two-year total costs for intervention patients was higher but not significantly different than costs in usual care patients (\$14,348 vs. \$11,834; P=.20). Total costs were significantly higher for intervention patients in the low risk group (\$13,307 vs. \$9,654; P=.01), and lower but not significantly different in the high-risk group (\$17,713 vs. \$18,776; P=.38). Intervention patients in the high-risk group had greater two-year costs for chronic and preventive care (\$9,724 vs. 6,210; P<.001), including intervention costs (\$2,691), but this was offset by reduced hospital costs (\$7,343 vs. \$11,731; P<.001). **CONCLUSION:** The GRACE care management intervention provides improved quality at similar cost when delivered to a vulnerable elder population at high risk of hospitalization.

**PD8 795 NEED OF A HOSPITAL PROVIDING INTEGRATED CARE FOR OLDER PATIENTS AND PATIENTS WITH CHRONIC DISEASES**

J. VAN KEMPEN\* (Radboud University Nijmegen Medical Centre, Nijmegen, The Netherlands)  
S. ROBBEN(1), B. VAN DER GIJSEN(2), M. BOEREE(3), M. OLDE RIKKERT(1) - (1) Radboud University Nijmegen Medical Centre, Department of Geriatrics (Nijmegen, The Netherlands); (2) Business Consultant (Amsterdam, The Netherlands); (3) Radboud University Nijmegen Medical Centre Department of Pulmonary Diseases (Groesbeek, The Netherlands)

**Introduction:** The Dutch healthcare system does not provide optimal care for older patients or patients with chronic diseases. Designing hospitals specialized in care for these patients might solve this problem. Little is known about how these patients perceive the need of such hospitals. In this small pilot study, we explored their views. **Methods and materials:** We conducted 29 semiquantitative interviews with patients (mean age 68, range 44-90) and their informal caregivers (mean age 58, range 26-80), who were either visiting the outpatient clinic or were inpatients of the department of Geriatrics of the Radboud University Nijmegen Medical Centre (RUNMC) or the University Lung Centre Dekkerswald (ULCD) in Nijmegen, the Netherlands. Interviews focused on how patients and caregivers perceived the need of hospitals delivering integrated care for older patients and patients with chronic diseases and how they perceived the need of coordination by a geriatrician. **Results:** 38% of patients and caregivers were positive about having a hospital specialized in integrated care for patients with chronic diseases. Amongst inpatients of the department of Geriatrics of the RUNMC (n=7), 71% responded positive, 14% scored indifferent and 14% did not respond. Coordination of care by a geriatrician, limited to aspects of care their general practitioner was not able to provide, was considered important by 79% of ULCD patients and caregivers (n=14) and 75% of RUNMC patients and caregivers (n=12). **Conclusion:** Overall, one-third of participants was positive about hospitals providing integrated care, yet almost all RUNMC inpatients were positive. Possibly, these inpatients had more complex health problems, and therefore greater need for integrated care, while ULCD patients already received more integrated care, fulfilling their needs. Most patients saw a task for geriatricians in coordination of care. These interviews support experiments changing the management of patients with complex health problems.

**PD8 796 THE HEALTH AND WELFARE INFO CARD: IMPROVING INFORMATION SUPPLY TOWARDS AND ABOUT OLDER PEOPLE WITH COMPLEX NEEDS**

S. ROBBEN\* (Radboud University Nijmegen Medical Centre, Nijmegen, The Netherlands)  
R. MELIS(1), S. ZUIDEMA(2), T. MOORS(3), H. SCHERS(2), M. OLDE RIKKERT(1) - (1) Department of Geriatrics, Alzheimer Centre Nijmegen, Radboud University Nijmegen Medical Centre (Nijmegen, The Netherlands); (2) Department of Primary and Community Care, Centre for Family Medicine, Geriatric Care and Public Health, Radboud University Nijmegen Medical Centre (Nijmegen, The Netherlands); (3) Stichting Maat (Nijmegen, The Netherlands)

**Introduction:** Western European care systems do not provide optimal healthcare and social services for older people with complex care needs. Lack of up-to-date patient information

hampers cooperation between professionals, and a suboptimal information supply towards older people with complex needs impairs their self-management abilities. Therefore this primary care transition project aims to develop, implement, and evaluate the Health and Welfare Info Card (HWIC). This is an individualized toolkit to be used by older people with complex needs, their caregivers, and professionals. It contains up-to-date information about the health, functional, and social situation of the older person with complex needs and, connected to this, personalized health education. Future users will be trained to utilize the HWIC. Purpose of the HWIC is to increase collaboration among professionals and to improve self-management skills of older people with complex needs and their informal caregivers. **Methods and materials:** We will develop the project following the guidelines of the Medical Research Council's framework for complex interventions, using Intervention Mapping to develop the HWIC. Future users will be involved in developing the HWIC. Using this approach, participatory problem-solving, during the development phase, increases feasibility of this healthcare transition. Information technology will be used to extract useful data from existing databases, to add new data, to keep information up-to-date, and to provide access to both professionals and older people with complex needs. The subsequent pilot phase involves implementing the HWIC for 125 older people with complex needs, as well as meticulous process evaluation. An effect evaluation will complete the project. **Results:** The project starts in March 2009. Results will be available in 2012. **Conclusion:** This study will establish whether the HWIC can improve quality of care and ultimately quality of life for older people with complex care needs.

**PD8 797 ACCREDITATION INSTRUMENT OF COMPETENCE CARE LEVEL FOR RESIDENTIAL CARE HOMES IN MACAO**

Y. CHEUNG\* (Hong Kong Association of Gerontology, Hong Kong, Hong Kong)

**Introduction:** According to the Social Welfare Bureau of the Macao Special Administrative Region (SAR) Government, the proportion of the population aged 65 and over is projected to rise markedly from 8.3% in 2005 to 11.95% in 2012 with an average annual rate of 0.42%. The Macao SAR Government has proposed several reforms of elderly services, in order to improve the quality of aged care service, to meet the rapid increase of the aged population. Therefore, the Social Welfare Bureau of the Macao SAR Government invited the Hong Kong Association of Gerontology (HKAG) to develop an accreditation instrument to assess the competence care level for the Residential Care Homes in 2006. Four aspects were included in the accreditation instrument. They are the environment, facilities, human resources and management and caring system. **Methods:** The HKAG developed the drafted accreditation instrument, which based on the residential care homes' experience in Hong Kong, Macao and oversea. Then, a group of experienced assessors of the residential aged care accreditation scheme were employed to test the drafted accreditation instrument in three residential care homes in Macao purposely. The assessors' advices were used to revise the drafted accreditation instrument and sent to those three residential care homes for improving their caring service. **Results:** The accreditation instrument is reliable and suitable to assess the competence care level for residential care homes in Macao. Based on the results of accreditation instrument, the residential care home in Macao can be divided into two types. The accreditation instrument is effective to match the older persons and residential care home suitably. **Conclusion:** The accreditation instrument contributes to assess the competence care level for residential care homes in four main aspects, which provides useful guideline for enhancing the quality of aged care service.

**PD8 798 INFORMATION ON SENIORS' MORBIDITY UPON INTERNMENTS ON THE BRAZILIAN UNIFIED HEALTH SYSTEM**

A. GÓIS\* (UERJ, Rio de Janeiro, Brazil)  
A. BATISTA DE GÓIS(1), R. PEIXOTO VERAS(1) - (1) UERJ (Rio de Janeiro, Brazil)

In view of seniors' high hospital costs, the present study aims at comparing the seven leading frequencies of hospital morbidity affecting seniors in 2005 and 1994, through the data on the Hospital Information System (SIH/MS). **Methodology:** Evaluation of information obtained from the Ministry of Health DataSUS database on seniors' morbidity upon internments, and calculation of standard rates adjusted by the standardization direct method with the Epidat 3.1. program. **Main results:** The diseases of the circulatory system predominated in 2005 (28%) and in 1994 (32%), with a reduction by 4% between those years; neoplasias were twice higher in 2005 (8%) as compared to 1994 (4%); infectious and parasitic diseases remained stable at 7%, in 1994 and 2005. In conclusion, hospital morbidity affecting seniors in Brazil is predominantly related to diseases of the circulatory system; at the same time, one can observe both the non-reduction of infectious and parasitic diseases, and the signaling of a recent increase in neoplasias. Comparative studies like this one are recommended as a useful tool in hospital management. **Keywords:** morbidity, senior, public health.

**PD8 799 PARTICIPATION OF FRAIL ELDERLY PERSONS IN THE DUTCH NATIONAL CARE FOR THE ELDERLY PROGRAMME**

C. VAN AALST\* (The Netherlands Organisation for Health Research and Development, The Hague, The Netherlands)  
L. WEEL(2), C. JONKERS(1), C. BAKKER(1) - (1) The Netherlands Organisation for Health Research and Development (The Hague, The Netherlands); (2) Centrale Samenwerkende Ouderenzorganisaties (Utrecht, The Netherlands)

**Introduction:** The National Care for the Elderly Programme (NPE) is designed to ensure that care and support for elderly people with complex needs caters better for their demands. Regional networks were formed consisting of all relevant partners, including (representatives of) the frail elderly persons, care providers and financiers. All partners together draw up innovative experiments and research projects to improve care and support. Starting point is the demand of the frail elderly persons themselves. Therefore, the program aims for an active participation of frail elderly persons in all steps of networks, experiments and research projects. **Methods:** Before initiating experiments in the NPE, all networks have to ensure that client participation is embedded in the network structure. Networks choose different methodologies for participation in the following steps: 1) assessing and prioritising the needs of frail elderly persons in the region, 2) translating needs into experiments and 3) participation during conduction of experiments and projects (monitoring and evaluation). Recently, a national support project "powerful client perspective in the NPE" is launched to guarantee a powerful participation of frail elderly persons in the networks. Before deciding on means of support, the current situation of participation in the networks is analysed. **Results:** Eight networks are working on active participation of frail elderly persons in the network and projects. Lessons can be learned from a comparison between the different participatory methodologies used in the networks. Means of support for participation will be put in practise in cooperation with associations of elderly persons by exchange of knowledge and experiences and using different media. **Conclusion:** To ensure that care improvements in the NPE meet the needs of the frail elderly, an active participation structure is organised in all networks, using different participatory methodologies.

**PD8 800 EVOLUTION OF CASE-FINDING FOR DISABILITIES WITH PRISMA-7 IN EMERGENCY ROOMS IN SHERBROOKE, QUÉBEC**  
**M. RAICHE\*** (CSSS-IUGS, Sherbrooke, Quebec, Canada)  
**R. HEBERT(1), M. DUBOIS(1), M. GREGOIRE(2), C. BUREAU(3)** - (1) Research Centre on Aging CSSS-IUGS (Sherbrooke, Qc, Canada); (2) CHUS-Centre hospitalier universitaire de Sherbrooke (Sherbrooke, Qc, Canada); (3) CSSS-IUGS (Sherbrooke, Qc, Canada)

The PRISMA-7 tool has been introduced with an opportunistic approach in two emergency rooms (ERs) in Sherbrooke to identify older people with significant disabilities. The 7 yes/no questions had been included in the triage instrument for people aged 75 and over. The positive cases were directed to the single entry point of the local health and social services centre, which then conducted assessment and eventually provided home care. The study's objective was to monitor the rate of PRISMA-7 use in ERs since its implementation (4 years ago) within the context of the population health approach recommended in Québec. During the first year of implementation, the rate of PRISMA-7 use gradually increased up to 50 to 60%, then remained stable during second and third years. This plateau can be accounted for, in part, by the scarcity of resources for assessing and delivering home-care services. It also led intervening parties to jointly decide, during the third year, to maintain rate of use in ERs at around 50%. However, the rate of PRISMA-7 use fell to 40% during the fourth year, which coincided with renovation of an ER and a shortage of nursing staff. The 50% objective remains in place. In home care, standardization procedures are ongoing for community-care waiting lists, along with a priority classification. The public-health principle stating that "treatment should be available for the screened condition," may be considered as being respected. The rate of case-finding appears logical with the services actually available for assessing functional autonomy and the corresponding home services required. In terms of the population-health approach for supporting functional autonomy, it highlights the challenges in reaching the population level. As suggested by Young & Turnock (BMJ 2001), some managers consider publishing community-care waiting lists to increase attention and, consequently, priority in the health system.

**PD8 801 WHAT LIES BENEATH: HEALTH CARE ACCESS FOR GAY AND LESBIAN SENIORS IN CANADA**  
**S. BROTMAN\*** (McGill University, Montreal, Canada)  
**B. RYAN(1)** - (1) McGill University (Montreal, Canada)

**Purpose of the Study:** This presentation reports on the findings of a study whose purpose was to examine the experiences of gay and lesbian seniors who currently live in the community and to identify issues, which emerged from an exploration of access and equity in health care services to this population. **Design and Methods:** The study used a qualitative methodology based upon principles of grounded theory in which open-ended interviews were undertaken with 38 gay and lesbian seniors living in three different cities across Canada. **Results:** Findings highlight several important themes including negotiation related to disclosing one's identity in a health care setting; expectations of gay and lesbian seniors in relation to access and equity in the health care system; the role that social stigma plays in the creation of these expectations and in the health care systems' responses to them. **Implications:** Several recommendations for change emerge which include: specific training within all aspects of health care settings to address the needs of gay and lesbian seniors; advocacy to ensure that all procedures and policies within mainstream health care institutions recognize the specific needs of gay and lesbian seniors; and attention to the

design of long term care services for gay and lesbian seniors that are appropriately responsive to their needs.

**PD8 802 AN ECOLOGICAL SERVICE DELIVERY FRAMEWORK TO PROMOTE WELLBEING FOR COMMUNITIES OF OLDER PEOPLE**  
**D. OXLADE\*** (Griffith University, Meadowbrook, Australia)  
**N. HARRIS(1), J. GROOTJANS(2), P. SYDES(3)** - (1) Griffith University (Logan, Australia); (2) University of Sydney (Sydney, Australia); (3) Wesley Mission Brisbane (Australia)

**Introduction:** It is an imperative for the retirement living and aged care sector to develop service delivery frameworks that promote healthy ageing, through compression of disease and facilitating a more productive, engaged and active older population. At the core of the evolution of this sector is the shifting emphasis from care to resident wellbeing. The application of a healthy settings approach provides a framework and processes to support this shift through an ecological approach. Within the literature relating to wellbeing of older populations there has been limited attention to understanding the determinants of health and how they shape wellbeing. This study sought to develop an ecological framework for wellbeing of communities of older people. **Methods and materials:** The research was conducted in collaboration with two retirement living and aged care providers. A three stage process was followed including analysis of resident satisfaction surveys, focus groups with industry stakeholders and interviews/forums with residents. A thematic analysis was undertaken utilising the theoretical framework of a "health promoting setting". **Results:** A number of resident identified topics significant to wellbeing were identified. These topics were clustered as the four domains of physical environment, social environment, governance and active living at the three levels of personal, communal and societal. The research suggests the four themes underpin and influence self perception of wellbeing. **Conclusions:** The domains have been constructed as an ecological framework for wellbeing of communities of older people. This framework, informed by a healthy settings approach, is now being utilised to plan, implement and evaluate service delivery.

**PD8 803 A LONGITUDINAL EVALUATION OF RESIDENT OUTCOMES IN LONG-TERM CARE INSTITUTIONS**  
**L. LIU\*** (Institute of Gerontology, College of Medicine, National Cheng Kung University, Tainan , Taiwan)

**Introduction:** The nursing homes and residential care homes in Taiwan have been launched by the health and the social authorities, respectively, and regulated under different laws. However, the role and function between these two types of institutions was frequently overlapped and less distinctive. This study aimed to explore the profiles of residents and examine the care performance between these two types of institutions by following up residents' health outcome. **Methods:** This is a longitudinal study design including four stages of face-to-face interviews: the baseline (I), the three month (II), the six month (III) and the nine month follow-up (IV) for the newly admitted residents. We had completed 325 residents' interviews at the baseline, and 231 of them have been completely followed up on four stages. The outcome measurements include: Socio-demographics, functional ability, health status, residents/families satisfaction toward institutions, the mortality, and relocations at follow-up. **Results:** At baseline, the mean scores of ADLs for newly admitted residents in nursing homes were significantly lower, and the MMSE were higher than those in residential care homes. Furthermore, the residents' satisfaction towards living rooms, environments, social interaction and participations, and the overall satisfaction to institutions were statistically higher for residents in residential care homes. However, after nine months' follow-up, it showed that the subjective views of residents' broad health status, especially the mental component scales (MCS) of SF-36, were significantly higher in residents of nursing homes when controlling for the characteristics of institutions, residents, and their health status at baseline, while other health outcome measures had become no significant difference. **Conclusions:** We found residents in nursing homes became more satisfied with their mental health status, while the other outcomes remained with no difference. This information could be valuable for the future development of long-term care in terms of policy making, resource allocation and integration.

**PD8 804 CLINICAL PHARMACIST AS AN INTEGRATED MEMBER OF THE TRANSITIONAL CARE PROGRAM IMPROVES PATIENT OUTCOMES; A PILOT**  
**K. ARUMUGAM\*** (The Queen Elizabeth Hospital, South Australia, Australia)  
**S. GOLDSWORTHY(1), S. YU(1), R. VISVANATHAN(2)** - (1) The Queen Elizabeth Hospital (South Australia, Australia); (2) Department Of Medicine, University Of Adelaide (South Australia, Australia)

**Background** The Transition Care Program (TCP) provides post acute, goal directed and multi-disciplinary short-term support for older people following acute hospitalization. In 2008, a part time Clinical Pharmacist was employed for 6 months with the aim of exploring the role of a Clinical Pharmacist as an integrated member of this multidisciplinary team. **Method** All patients entering TCP from August 2008 to February 2009 were clinically reviewed by the Pharmacist in the acute care hospital (>300 beds). A pathway that provides for effective and timely reviews and discharge planning was plotted. Follow-up visits in the community were conducted if required. **Results** A total of 30

patients were reviewed. 33% were male. The mean age was  $82.4 \pm SD 7.1$ . Time taken to see the patient from the point of referral was  $1.0 \pm 6.0$  (days) with pharmacist visits/patient  $2.5 \pm 0.86$  and total visit time/patient being  $2.9 \pm 0.69$  (hours). The number of medications on admission was  $8.9 \pm 3.2$  and medications on discharge were  $10.9 \pm 3.4$ . 121 interventions were recommended with 96% of interventions accepted and acted upon by the medical teams. This brings the number of interventions per patient to  $3.9 \pm 2.7$ . All patients were discharged with a medication transfer summary detailing medication changes and 90% received a dosing administration aid. Feedback from aged care facilities and other health professionals indicate the transfer summary was helpful in terms of longer term management. Conclusions This pilot project demonstrated that a Clinical Pharmacist was able to implement a medication management model for TCP patients successfully. Further funding has been made available based on the reduction in medication related problems and increased demand for the service. Assessment of the impact of interventions is planned.

#### **PD8 805 MULTIDIMENSIONAL NEEDS**

A. FABBIO\* (ASL Modena, Mirandola (MO), Italy)  
 A. TRAGNONE(1), G. ARCARO(2), C. CASTIGLIONI(3), C. CASTELNOVO(3), P. CERATO(4), C. HANAU(5) - (1) ASL BOLOGNA (Italy); (2) ASL SALERNO 3 (Italy); (3) MEDICASA ITALIA (Italy); (4) ARSAN CAMPANIA (Italy); (5) Università' Di Modena e Reggio Emilia (Italy)

**INTRODUCTION** Due to a general long term dependences and fragilities increase, in many countries professionals and policy makers will face huge challenges concerning health care planning. To address health care needs it's necessary to arrange different levels of care; home care services represent one of the most important points of the care net in geriatric settings especially. Although Italian health system has gained a considerable experience in the management of chronic diseases, there are just few evidences on real connections between needs' evaluation methods and Personalized Care Plan (PCP). Currently it isn't much clear which are the criteria that allow to assign a patient to a certain level of care. Often there isn't the systematic use of needs' evaluation method or some needs assessment's tools are applied (such as SMAF, CTMSP, MDS-HC, VALGRAF, combination of ADL, IADL, MMSE) but it's not clear which is the link with the PCP.  
**METHODS AND MATERIALS** The project - which involves as leader ARSAN CAMPANIA, as coordinator Medicasa Italia, the "Università di Modena e Reggio Emilia" and six public territorial health providers (A.S.L. = Azienda Sanitaria Locale) located in four regions in Italy (ASL of Biella, Bologna, Modena, SA3 and Palermo) – foresees the evaluation of 250 patients with different methods (the first is the method adopted by the local ASL and the second is through VALGRAF).  
**RESULTS** Results show the two main components of variability in the way of identification of PCP, in terms of professionals involved and quantity of care (measured as number of visits per week). Results show that instruments and composition of the evaluation's team have deep impact on PCP.  
**CONCLUSION** This first phase of the project has allowed to identify some criteria to ensure equity, adequacy, quality, comparability and measurability in home care services provided in different areas.

#### **PD8 806 IMPLEMENTING COMPREHENSIVE GERIATRIC ASSESSMENTS IN BELGIUM: IMPORTANCE OF TACKLING PREJUDGMENTS OF CAREGIVERS**

J. MELLO\* (Katholieke Universiteit Leuven, Leuven, Belgium)  
 D. VANNESTE(1), E. DETROYER(1), A. DECLERCQ(1) - (1) Katholieke Universiteit Leuven (Leuven, Belgium)

Introduction Comprehensive geriatric assessments gain importance in the health and social care for the elderly. A feasibility study was conducted on the use of the interRAI evaluation instruments in the Belgian health care system. This paper offers insight into the experiences of professional caregivers and tries to address their prejudices. Methods and materials As part of a national implementation process in Belgium 20 nursing homes and 14 community service providers participated in a pilot study using the interRAI LTCF Suite and HC Suite instruments (2007-2008). Participating caregivers were general practitioners, nurses, physical therapists, occupational therapists, social workers, speech therapists, etc. After using the instruments and testing their outcome variables (CAPs) semi-structured group interviews were conducted with these caregivers (Ngroups=30, Nparticipants=90) to explore their experiences. Results Most of the caregivers considered the instruments to be very useful in order to obtain a holistic view of their clients and to discover 'blind spots', risks or problems which were unknown to caregivers. However, the main obstacles mentioned by the caregivers were the length of the instruments and the considerably high amount of time-investment. In response, the researchers constructed a web based application which allows multidisciplinarity during and after the assessment. A unique feature of the Belgian instrument is that each caregiver fills in online parts of the instrument which are related to their area of expertise. Caregivers who used this application experienced multidisciplinarity and cooperation as a solution for the time burden. Moreover, the multidisciplinary aspect ameliorated communications among professionals and their sense of being heard. Conclusion This study demonstrated that combined efforts of researches, care providers, caregivers and decision makers improve the use of comprehensive geriatric assessment instruments. Elucidating the obstacles and

prejudgments expressed by caregivers is necessary for successful implementation and for enhancing the preparedness in using these instruments.

#### **PD8 807 PERSONAL CARE IN RESIDENTIAL HOMES AND STANDARDIZATION OF WORKING PROCEDURES: PROTOCOL FOR SUPPORT ON FEEDING**

J. PORTUGAL\* (ICBAS - University of Oporto, Porto, Portugal)  
 C. PIRES(1), I. MARTÍN(2) - (1) UnIFai/ICBAS-University of Oporto (Porto, Portugal); (2) Secção Autónoma de Ciências da Saúde - University of Aveiro (Aveiro, Portugal)

Standardization of working procedures is important to quality of the care provided. It helps out the training of professionals and the management of residential homes reaching the quality service improvement. The need arises from the low professionalisation of formal caregivers in Portugal: despite 57% of professionals are exclusively dedicated to caring for elders, a Portuguese research study (2008) found that only 33% has attended a training course on specific topics of gerontology and geriatrics before they began to work, and 70% of them didn't attend a training course in the past 12 months. In the scope of the project "Quality on Gerontological Equipments and Services" (UnIFai/ICBAS – University of Oporto, 2008), one of the main research areas developed a set of protocols of procedures of personal care. This process occurred in two phases: (i) revision of literature concerning the proper procedures; and (ii) analysis of the best practice codes on care for elder people (by direct observation). We developed a total of 40 protocols, organized on 6 main categories - feeding, hygiene, elimination, dressing, transfers, sleep and rest. Each protocol follows the structure of activity planning (material, space and person), intervention guidelines and activity evaluation (individual and the activity itself). These protocols of procedures are innovative, because they introduce a fresh set of techniques and establish a new model of care for elder people, practically inexistent in residential homes for elders. We present an example of a protocol for support on feeding, in its three ways, (i) supervision, (ii) partial support and (iii) total support, according to the level of dependency of the person.

#### **PD8 808 DISCHARGE OF GERIATRIC PATIENTS FROM HOSPITAL – BARRIERS TO COOPERATION AT THE INTERSECTION BETWEEN CLINIC AND OUTPATIENT CARE**

P. SCHÖNEMANN-GIECK\* (Universität Heidelberg, Heidelberg, Germany)  
 B. HAAS(1), J. WEBER(2) - (1) Community Services Office (Wiesbaden, Germany); (2) Community Services Office (Wiesbaden, Germany)

Introduction The rising economic pressure on hospital management has led to a noticeable shortening in hospital stays, and elderly people with slower convalescence are often discharged while still in poor condition. An operative aftercare system for these patients needs to be established rapidly as possible and needs to cope with requirements previously covered by hospital-based professionals. Materials and Methods The Heidelberg Institute of Gerontology conducted an analysis of the current status of the supply situation for the elderly following a hospital stay for the municipal Department for the Elderly in Wiesbaden. The focus was on the terms of cooperation at the interface between the care system for in- and outpatients. We conducted a questionnaire-based survey of 271 medical professionals, therapists, social workers and nurses in hospital departments and outpatient practices and service facilities. The objective was to examine the degree and the quality of cooperation between the professionals as well as to discuss drawbacks of this cooperation. Results Our analysis revealed considerable communication deficits. The interpretation of the quality of cooperation varied in part between the different groups of respondents. Conclusion Our results were fed back to the various groups and resulted in a range of activities designed to optimize interdisciplinary and intersectional cooperation.

#### **PD8 809 ANALYSIS OF THE LOAD OF NURSING JOB AND OF THE DAYS OF HOSPITALIZATION IN A DEPARTMENT OF CRITICAL AREA: COMPARISON AMONG PATIENT ELDERLY AND NOT**

L. PELUCCHI\* (A.O. , Milano, Italy)  
 M. FUMAGALLI (1), C. ANELLI(1), A. COVA(2) - (1) Department of Cardiotoracic Intensive Care Unit - A. O."Ospedale Niguarda Ca' Granda" (milano, Italy); (2) Department of Nursing Service - A. O. "Ospedale Civile" (legnano, Italy)

Purpose of the study has been to verify if the nursing assistance in patient with over 65 years can cause a great load of relief job in a department of intensive therapy and can determine more days of hospitalization, considering that with to increase some elderly population an increase of refuges of such subjects it is underlined. Analysis has been effected near the Cardiotoracic Intensive Care Unit appraising patient operated for cardiac, vascular and thoracic pathologies using the scale of NEMS (Nine Equivalents of nursing Manpower use Score). We have analyzed a total of 354 patients: 218 over 65 years and 136 with age among 18 – 64 years, in the period between June and November 2008. The patients between 18-65 years have been 73% men and 27% women; the operations effected more frequently have been: by pass 39%, cardiac valves 29%, vascular 8%. NEMS middle score has been 27.25, the days of middle hospitalization have been 3.25. The patients over 65 years have been 63.6% men and 36.4% women, the operations more effected have been: by pass 34%, cardiac valves 27%, vascular 11%. NEMS middle score 27.27, days of middle hospitalization 3.8. The data of the great elderly over 75 years (80 patients) NEMS

middle score 27.46, days of middle hospitalization 3.57; over 80 years (19 patients) NEMS middle score 27.28, days of middle hospitalization 4.1. The results gotten in 6 months of study show that the nursing load (NEMS score) and the days of hospitalization don't statistically vary in meaningful way in relationship to the age of the operated patients. What has determines a great nursing job and a great number of days of hospitalization it has been caused by the refuges of urgency and intensive care.

#### **PD8 810 STU-RET ILC: INTERGENERATIONAL LEARNING CIRCLES OF RETIREES AND STUDENTS**

A. MASEDA\* (University of A Coruña, A Coruña, Spain)  
T. LORENZO(1), I. GONZÁLEZ-ABRALDES(1), J. TUBÍO(1), P. MARANTE(1), J. MILLÁN-CALENTI(1) - (1) University of A Coruña (A Coruña, Spain)

Introduction: One of the priorities in the EU is that "Life Long Learning (LLL) must cover learning from pre-school to post-retirement age". In line with this strategy, the STU-RET ILC project titled "Students-Retirees Intergenerational Learning Circles" funded by the LLP, Grundtvig sectorial programme, is addressed to university/college students and retirees who learn in intergenerational learning circles so as to acquire skills and knowledge, as well as attitudes and values, from daily experience, from all available resources and from all influences in their own "life world". Methods and materials: This two-year project comprises 5 partner-organizations (Bulgaria, Cyprus, Spain, Finland and Poland). A supportive intergenerational learning environment where intergenerational learning circles of retirees and students participate was formed with the aim of sharing their cultures and respect diversity. Collaborative work will result in learning materials to improve some of the European key competences as well as the physical activity and health awareness. Results: Learning materials (printed and Internet version) in Social skills, Adapted Sport Games and Health Issues; Basic ICT and English Language Skills have been developed for teaching both students and retirees. These materials have been evaluated by external experts in the relevant project area, ensuring their interrelation to form a coherent learning system and each area has its specific role taking into consideration the needs of the target groups today and the demands of the European knowledge-based society. Conclusion: To conclude, European seniors are expected to be more active and better in health thus increasing their willingness to participate in social and economic life. To do so, they need to maintain the Lisbon key competences through their active participation in LLL in order to stay active in the European knowledge-based society.

#### **PD8 811 THE IMPLICATIONS OF AGEING ON INTERGENERATIONAL RELATIONSHIPS**

S. ANTONIO\* (ISCSP –Institute of Political and Social Sciences from Technical University of Lisbon - TULisbon, Lisboa, Portugal)

Introduction In the last half century, Portugal has experienced considerable demographic changes, derived from advances of medicine and quality of life with the consequent diminution of infant mortality rates. On the other hand, greater longevity and the reduction of fertility involve many alterations in the composition and internal functioning of families and an enlargement of co-existent generations. These changes in composition entail important role changes for grandparents and grandchildren alike. Today, adults perform the role of grandparents for longer periods than adults in previous generations. Likewise, children are spending more of their lives in the role of grandchildren than at any other time in recent history. Starting from these ideas we conduct an investigation, the propose was to examine the relations between the gender of grandchildren, and grandchildren-grandparents relationship. It is now our intention to present some of the results from our investigation. Methods The information was collected from a convenience sample of 259 young adult students at ISCSP – Institute of Political and Social Sciences, Technical University of Lisbon. Twenty-four college students (18 female and 6 male), with ages between 18 and 24 years old, participate on the survey by completing questionnaires about their relationship with their living grandparents. The precondition to select the participants was, having four living grandparents (maternal grandmother and grandfather and paternal grandmother and grandfather). Results The main results are, generally, that there are no qualitative differences between the relationships of grandchildren, granddaughters and grandsons, with maternal and paternal grandparents. Conclusions On scales of closeness, grandchildren rated maternal grandparents significantly higher than paternal grandparents. More particularly, grandchildren relations are more intensive with maternal grandparents - in terms of seeking, frequency of contact and affectionateness resulting in a "matrilinearity of affections".

#### **PD8 812 THE EFFECTS OF MUSIC ACTIVITIES USING TONE CHIMES ON THE ELDERLY LIVING AT HOME AND STUDENTS WHO SUPPORT THE ELDERLY**

M. ASANO\* (Nishikyushu University, Kanzaki, Japan)  
S. SUGIHARA(1), Y. KOMATSU(2), H. AOYAMA(2) - (1) University of Hyogo (Awaji, Japan); (2) Nishikyushu University (Kanzaki, Japan)

Introduction: Previous research reports have shown that music activities therapeutically effect elderly. Also, recently it has been shown that people who support the elderly during music activities are positively effect. The purpose of this study was to examine the effects

of participation in music activities using tone chimes on both elderly living at home and students who support the elderly. Methods and materials: Fourteen elderly living at home and nine occupational therapy students served as subjects in the present study. We assessed the psychology before and after a once a week music activities over a six week period for 1.5 hours. Students were evaluated using Quality of Life (QOL26) and General Self-Efficacy Scale (GSES), while at the same time, image of elderly evaluation using Semantic Differential method. The elderly were evaluated using Philadelphia Geriatric Center (PGC). The Mood Check List-Short Form 1 (MCL-S.1) was conducted before and after each music activity for the elderly. All scores were analyzed using a two-sample Wilcoxon test in SPSS13.0J. Results: The post PGC and MCL-S1 "pleasant feeling" "relaxation" of elderly and image of elderly scores of students were significantly better than the initial scores. However, QOL26 and GSES of students increased, but not significantly. Conclusion: The test scores are believed to be improved by the elders' consecutive communication with students, and a feeling of achievement in music which enable the elderly to feel pleasant and relaxed. The students' image of the elderly is believed to have changed due to witnessing the improvement in the elderly. This study suggests that elderly and students who participate in music activities together at the same time, show positive results scores of PGC and Mood increase for the elderly, and an improved image of the elderly was shown in the students.

#### **PD8 813 THE DEVELOPMENT OF LOCAL INTERGENERATIONAL CENTRES IN SLOVENIA**

J. RAMOVS\* (ANTON TRSTENJAK INSTITUTE OF GERONTOLOGY AND INTERGENERATIONAL RELATIONS, LJUBLJANA, Slovenia)  
K. RAMOVS

The concept of local intergenerational centres which are under development in Slovenia arises from two acute social needs. The first is concern for a quality aging in circumstances where the demographical balance between generations has been destroyed. An equally acute need exists for a strong new solidarity between generations in today's living conditions. The basis of the intergenerational centres is at the same time an example of a research follow-up of good practice. After 1990 the Anton Trstenjak Institute developed a number of new programmes in order to meet both of the above needs. The fundamental programme informs the entire population about quality aging and about intergenerational solidarity. What follows is various short seminars about quality aging and quality relations between the elderly and young in families, local communities, companies and senior citizens institutions. An important element is programmes to recruit, educate and organize volunteers for personal or group intergenerational socializing with the elderly – to date several thousands have been trained. Thus several places throughout the country have acquired a self-organized social network for quality aging and growing intergenerational solidarity. After 2000 we started to systematically prepare, involving political leaders and the public, specific strategies for quality aging and solidary coexistence between generations, and on the basis of these strategies to set up intergenerational centres. These are locally adopted institutions or public-private partnerships which synergistically connect the local authorities and administration, public and civil institutions, organizations, programmes and active individuals to form a local movement for quality aging and solidary coexistence among generations in the future, as well as perform such programmes themselves. An intergenerational centre is a demanding project of community social management. Three specific examples of introducing an intergenerational centre are described: in a small rural community, in a larger town, and a regional model within a large solidarity organization.

#### **PD8 814 MEASURING THE SUCCESS OF AN INNOVATIVE INTERGENERATIONAL PROGRAM: THE HOMESHARE NSW EXAMPLE**

S. FOGG\* (The Benevolent Society, Paddington, Australia)  
G. NELSON(1), A. ANDREW(1), S. BARBARA(1) - (1) The Benevolent Society (Paddington, Australia)

Introduction The Benevolent Society's innovative Homeshare NSW program matches older people (householders), who need some company and assistance around the home, with young people (homesharers), who need somewhere affordable to live. This paper describes an evaluation of the outcomes for participants, a cost efficiency analysis conducted by the program's funders, and some of the challenges involved in evaluating innovative programs from these very different points of view. Methods and materials Householders and homesharers were interviewed at key points in the program to gauge their satisfaction with the program and its impact on their lives. In addition, family members of the householders were surveyed about the Homeshare experience from the perspective of their older relative and themselves. Analysis of the data identified key impact themes. A series of quantitative targets were also set by the funder, such as, the number of new matches per year and cost per month of homesharing, and the program was evaluated against these. The funders were also interested in the program's potential for large scale impact if implemented on a wider scale. Results The client evaluation demonstrated that the program achieved very positive quality of life outcomes for the majority of participants. It also identified factors that influenced the success of the matches and highlighted a number of challenges. The results of the funder's evaluation were mixed and demonstrated some of the challenges of evaluating the early years of an innovative program, such as the setting of realistic goals and the importance of the potential for large

scale impact. Conclusions Evaluation of Homeshare NSW demonstrated some very positive outcomes for participants but also demonstrated the challenges associated with evaluating the early years of an innovative program, and one with participants of varied ages.

**PD8 815 INTER-GENERATIONAL RELATIONS AMONGST BANGLADESHI AND PAKISTANI MIGRANTS SETTLED IN THE UK**  
S. SAHA\* (University of Reading, Reading, United Kingdom)

**INTRODUCTION:** Intergenerational relationships in families within minority ethnic groups living in Britain have rarely attracted interest as a topic for research or in policy circles and consequently we have a limited understanding of how migration impacts on inter-generational relations. The study aims to elicit the nature of the support exchange that occurs between the older and younger generations and who provides what to whom, and why. **METHODS AND MATERIALS:** A qualitative, narrative case study was conducted with 6 multi-generational families from the Bangladeshi and Pakistani communities in Reading, Berkshire between July 2006 to March 2007. Access to the participants was gained through personal networks and home visits. Purposive sampling was used to recruit the sample of 21 participants aged 19 to 79. The number of participants per family ranged from 3 to 4. A thematic content analysis was carried out. **RESULTS:** The case studies revealed that a wide range of support transfers between generations including: financial, physical, emotional, personal care, religious teaching and cultural values. The transfer occurs as a result of implicit and explicit negotiations of family obligations, cultural norms and emotional attachments but these are evolving. The older generation's expectation for care creates obligations within the British born second generation which are often incompatible with their own aspirations and have to be negotiated. Who provides care and support is decided by negotiation within families and by the individual's relationship and commitment to their relatives. **CONCLUSIONS:** Narrative life stories are a powerful means to investigate social interaction and changes between the generations and people's perception of family life, and place. The findings show that the changing roles and cultural expectations leave the older generation fearful that their British born second generation will not be able or willing to fulfill their expectations in the future.

**PD8 816 INTERGENERATIONAL RELATIONS OF AFRICAN MIGRANTS IN POST-APARTHEID SOUTH AFRICA: IMPLICATIONS FOR OLDER PERSONS**  
M. DOUGLAS\* (North-West University, Potchefstroom, South Africa)  
V. ROOS(1), I. KALULE-SABITI(2), B. MBENGA(2) - (1) North-West University (Potchefstroom) (Potchefstroom, South Africa); (2) North-West University (Mafikeng (Mmabatho, South Africa)

**Introduction:** People migrating to South-Africa from other sub-Saharan African countries seem to be a continually increasing phenomenon. Initially, men migrated as mine workers to South Africa in search of work opportunities and a better life for themselves and their families. Later, the economic decline in some African countries, also motivated well-educated and highly skilled African people to migrate to South Africa. More recently, especially since the democratisation of South Africa, the political stability and the relative economic prosperity in relation to the instability in some other sub-Saharan African countries forced even more people to seek shelter and opportunities in South Africa. **Methods and materials:** The aim of this study was to qualitatively explore the experiences of migration and settlement in post-Apartheid South Africa as it relates to intergenerational issues, in the new country of residence, as well as, the country of origin. This study was conducted from the perspective of at least two generations residing in South Africa. Four focus groups and 30 in-depth interviews generated rich data of which the contents were thematically analysed. **Results:** The results obtained will be discussed from a phenomenological perspective. Specific focus will be placed on the intergenerational relations of African migrants to South Africa and on the implications thereof for older persons. **Conclusion:** Families undergo profound transformation on economic, political, social and intergenerational levels. Migration is often characterised by extended periods of separation between significant others, with severe implications for especially older persons and care management, whether remaining in their country of origin or new country of residence.

**PD8 817 INFORMAL CARE FOR OLDER PEOPLE BY THEIR ADULT CHILDREN: PROJECTIONS OF SUPPLY AND DEMAND TO 2041 IN ENGLAND**  
L. PICKARD\* (London School of Economics and Political Science, London, United Kingdom)  
R. WITTENBERG(1), J. MALLEY(1), D. KING(1), A. COMAS-HERRERA(1) - (1) London School of Economics and Political Science (London, United Kingdom)

**Introduction** This paper is concerned with informal or unpaid care provided by the adult children of older people. Over one in three disabled older people in England receives informal care from an adult child, yet the future supply of this form of care seems uncertain. The aim of the paper is to compare the supply of informal care to its demand in future years. **Methods and Materials** The study produces projections of informal care for older people to 2041 in England. The analysis focuses on the supply of intense care provided for 20 or more hours a week and on demand for social care by disabled older

people. Data sources include GHS data on both provision of informal care and receipt of care by people aged 65 and over. The research is part of a major study modelling ageing populations in future years, funded under the UK cross-council New Dynamics of Ageing Programme. **Results** The results show that, on the assumptions used, the supply of intense informal care to disabled older people by their adult children in England is unlikely to keep pace with demand in future years. Demand for informal care by disabled older people is projected to exceed supply by 2017, with the 'care gap' widening over the ensuing years. By 2041, there is projected to be a shortfall of around 250,000 intense carers or around 250,000 fewer disabled older people receiving intense informal care. The 'care-gap' is primarily driven by demographic changes. **Conclusion** The results suggest that, to keep pace with demand, either more adult children will need to provide intense informal care or more formal services for disabled older people will need to be provided. The research raises questions about long-term care policies that rely heavily on informal care in future.

**PD8 818 SELF-DEFINING BEING A VICTIM OF ABUSE IN RELATION TO THE HEALTH-RELATED QUALITY OF LIFE OF OLDER PEOPLE. A CRACOW STUDY.**  
B. TOBIASZ-ADAMCZYK\* (Jagiellonian University Medical College, Krakow, Poland)  
M. BRZYSKA(1), P. BRZYSKI(1), M. KOPACZ(9) - (1) Jagiellonian University Medical College, Chair of Epidemiology and Preventing Medicine, Dept. of Medical Sociology (Krakow, Poland); (9) ()

**Labeling theory** defines older age as secondary deviance, which, in consequence, increases the risk of different forms of abuse, predominantly from one's family environment . **Material and methods** This study examined the relationship between how being a victim of different types of abuse was defined by 252 older women and how this definition influenced their health-related quality of life (HRQoL). Data was initially collected in the homes of 403 older people using face to face interviews concerning their perception of different forms of abuse, as experienced by older acquaintances of the respondent, and their own self-definition of being a victim, based on experiences limited to older age. HRQoL was measured using the SF-36 test. Particular dimensions of HRQoL were defined as low provided their score was below the median. Risk of lower levels of HRQoL was done with logistic regression modeling using SPSS 15 for Windows. **Results** The risk of perceiving one's general health status as low was 6.6 times greater in women self-defined as victims of abuse perpetrated by their family in older age (95%CI=(1,04;41,7)). The risk of restricted functional status due to one's emotional state was 2.6 times greater in women who feel neglected by their family (95%CI=(1,03;6,7)). The risk of restricted functional status due to pain is 12.3 times greater in women who experienced physical abuse in older age (95%CI=(1,19;127)). The risk of restricted functional status in one's social life was 3.9 times greater in women who felt neglected by their family (95%CI=(1,27;11,8)). The risk of rating one's psychological health as low was 3 times greater in women who self-defined themselves as victims of psychological abuse perpetrated by their family in older age (95%CI=(1,16;7,71)). **Conclusions** The self-definition by older women of being a victim of different forms of abuse in older age significantly decreasing their HRQoL.

**PD8 819 CHANGES IN THE EMOTIONAL STATUS OF OLDER PEOPLE AS A CONSEQUENCE OF FEELING NEGLECTED. A CRACOW STUDY.**  
M. BRZYSKA\* (Jagiellonian University Medical College, Krakow, Poland)  
B. TOBIASZ-ADAMCZYK(1), P. BRZYSKI(1), M. KOPACZ(1) - (1) Jagiellonian University Medical College, Chair of Epidemiology and Preventive Medicine, Dept. of Medical Sociology (Krakow, Poland)

The relationship between feeling neglected by family members, as self-reported by older people, and emotional status is very important for evaluating general health-related quality of life (HRQoL) in older age. This study examined this relationship as a predictor of general HRQoL. **Materials and Methods** The study was conducted in a simple random sample of 403 older people, including 253 (62.8%) women. Face-to-face interviews were performed among older citizens of Cracow, focusing on feelings of different forms of neglect, in relation to characteristics of their social network and family environment. HRQoL was measured using the SF-36 test. Particular dimensions of HRQoL were defined as low provided their score was below the median. Risk of lower levels of HRQoL was done with logistic regression modeling using SPSS 15 for Windows. **Results** More than 75% of those sampled were aged  $\leq 75$  years, 42.5% were currently married, and 37.3% widowed. Approximately half of the sample interacted socially with 1-3 individuals weekly (i.e., not co-resident) and  $\approx 10\%$  were socially isolated. The risk of restricted functional status due to one's emotional state rose 1.26 times (95%CI=(1,05;1,51)) if the individual felt that the needs of older people were not being met. This risk is more than 2 times greater in women (95%CI=(1,37;3,52)), though lower among those who interacted socially with more than 4 individuals weekly ( $Exp(B)=0,58$ ; 95%CI=(0,37;0,93)). The risk of rating one's psychological health as low was also 1.6 times higher in women (95%CI=(1,00;2,48)), 2 times higher in individuals aged  $>75$  years, compared to those aged  $<70$  years (95%CI=(1,07;3,49)), and approximately 2 times higher in individuals reporting a secondary or lower level of education (95%CI=(1,11;3,17)). **Conclusions** Data

confirm the significant relationship between feelings of neglect and emotional status as a predictor of general HRQoL.

**PD8 820 THE EFFECTS AND CHALLENGES ON A BASIS OF NEW LONG-TERM CARE INSURANCE SYSTEM IN JAPAN.**

M. TANAKA\* (Yamaguchi prefectural university, Yamaguchi, Japan)

**Introduction** The long-term care insurance was launched in April, 2000 as a "system to support the care for the elderly as a collective effort of society.", in Japan. Its user population has expanded in the past five years and its usage has permeated among the people steadily. However, with these expansion and permeation, it is expected that the amount of insurance benefits and the premium which supports the former will increase substantially. Thus, the reform of the system is going to be focused on prevention. The purpose of this report is to delineate the new long-term care insurance system in Japan. I would like to present a few actual cases on the prevention of nursing care in Yamaguchi Prefecture and discuss their effects and challenges. Methods and materials The subjects were 900 elderly participant of long term care preventive enterprise in 2006. I would like to present a few actual cases on the prevention of nursing care in Yamaguchi Prefecture and discuss their effects and challenges. Results The effects of continuing prevention enterprises are highly evaluated. So, it is necessary to examine the drop-out group at prevention enterprises. It is costly to launch long term care enterprises for nutrition and oral care; as a result, there have been few such enterprises launched and also participants are on the decline. Conclusion Due to the advancement of ageing, the elderly's health building will become increasingly important. Because of the projected increase in single households and multiple households of the elderly, self-autonomy and its maintenance will become important for the elderly. In order to achieve this, it is necessary to consider training and education methods which are simple, do not depend on sophisticated tools and can be continued for a long time.

**PD8 821 CAREGIVERS IN ELDERLY CARE: WHICH POLICY INSTRUMENTS PROMOTE THE ATTRACTION AND RETENTION OF CARE STAFF IN ELDERLY CARE?**

A. HARPS-TIMMERMAN\* (Hogeschool Windesheim, university of applied sciences., Zwolle, The Netherlands)

C. SMITS(1) - (1) Hogeschool Windesheim, University of applied sciences (Zwolle, The Netherlands)

**Introduction** The shortage of workforce in elderly care appears to endanger the quality of care in most western countries. Various measures have been proposed but few have been fully tested in research and practice. This study aims to present an overview of instruments that Elderly care institutions use to retain and expand their workforce. The central question: Which instruments are used by managers to keep staff in the institution and what do they do to find new staff? This presentations shows a review of the literature on this problem and the solutions applied. Furthermore a study is presented of shows it outcomes of a practical research of the research group "innovation in elderly care" from Hogeschool Windesheim, University of applied sciences in the Netherlands. Methods and Materials A literature study was done in piCarta and Cinahl with keywords: shortage staff, elderly care, policy instruments period year 2000 till now. Ten semi-structured interviews where done by phone in the period October 2008 and January 2009 with managers of nursing homes and community Health Care. Interviews were taped and transcribed. Results The literature shows the shortage of care staff is not ubiquitous. Some regions have trouble finding adequate numbers of care staff, some don't and others have trouble finding the quality of workforce they need. Managers appear to use various management instruments to retain staff, such as listen to staff, being visible and accessible to the staff. However, they do not give a rationale for their strategy. Conclusion A shortage of workforce in elderly care is a problem for which various solutions are available. Managers are aware of the increasing urgency. Their choice of instruments needs to be more practice and evidence based.

**PD8 822 DOES LTC MARKET IMPROVE QUALITY OF SERVICE?: A CASE OF KOREAN LTC INSURANCE**

J. SEOK\* (Hallym University, Gangwon-do, Republic of Korea)

J. YOON(1) - (1) Hallym University (Gangwon-do, Republic of Korea)

1. Introduction This paper examines the radical change and its impact in service financing, provision, and governance as introducing of the Long Term Care Insurance for the Elderly in Korea. The first note worthy characteristic change is that LTC service has transformed from the very selective service which used to be applicable only to low income group to a universal service that is applicable to all income groups. The second notable change is that the service provision method has been changed from the service provision by non-profit organization that was entrusted by the state under monopolistic commission arrangement in the past to the introduction of a new open service provision arrangement in which free competition among service providers in service market and consumer choice will be emphasized. 2. Methods and Materials Analysis of quantitative and qualitative data on LTC Insurance 3. Results and Conclusion The Korean care market is wide open with minimum standards and their size will be determined by the market forces. In Korea, while control over service price is strong, the regulation of the labor market is relatively weak.

Therefore, it is very likely that there will be competition through labor cost reduction. This may lead to lower quality of service. Marketization is expected to empower care users and expand their choices. However, marketization is just one strategy out of several improvement strategies of service delivery. It does not secure service quality improvement and efficiency of resource allocation automatically. This role of the state defines the power of the liberal market: care market formation through care provider selection mechanism; control of market prices; regulation on the care labor market; system for monitoring and evaluating the quality of care services. The more the state adopts strong regulations and controls, the less the market wields its power.

**PD8 823 PLANNING FOR FUTURE LONG-TERM CARE NEEDS IN THE UNITED STATES: THE ROLE OF LIFE COURSE EVENTS IN THE DECISION TO PURCHASE PRIVATE LONG-TERM CARE INSURANCE**

E. ROBBINS\* (Miami University, Oxford, Ohio, United States)

Census projections estimate that by 2050 the United States will have nearly 88.5 million individuals age 65 and older; additionally, by 2020, nearly 12 million people 65 and over will need some form of long-term care. The current public mechanisms for paying for long-term care in the U.S. will not meet the increased demand. Therefore, understanding the ways in which individuals plan for care needs has been the focus of numerous research studies. These studies demonstrate the benefits of planning for long-term care and clearly conceptualize different types of planning behavior. However, missing from current knowledge of planning is an understanding of the life course events/circumstances that encourage individuals to engage in a particular planning outcome (e.g., establish a saving account, purchase LTC insurance). Additionally, most countries have national programs for acute care, but many, with notable exceptions like Germany and Japan, do not have provisions for LTC insurance. As such, this study tracks changes in individual circumstances to provide a detailed profile of those who plan for long-term care via the purchase of private LTC insurance in the U.S. Event history analysis was used to analyze data from five waves of the Health and Retirement Study (1998, 2000, 2002, 2004 & 2006), a nationally representative sample of individuals 51 and over in the U.S. Preliminary results show that health status and education are negatively related to the decision to purchase LTC insurance, whereas race and age are positively associated with the purchase of LTC insurance. Understanding the life course events associated with planning for care needs via the purchase of LTC insurance is useful for consumers, gerontologists and public policy makers who are interested in understanding the impact of this private market product on the financing of long-term care.

**PD8 824 DETERMINANTS OF GH RESIDENTS' WITHDRAWAL**

K. KISHIDA\* (Okayama University, Okayama, Japan)

S. TANIGAKI(1) - (1) Okayama University (Okayama, Japan)

**Introduction:** Group homes (GH) give dementia elderly care services in familylike atmospheres. GHs were introduced from Scandinavian countries and have been considered as fascinating alternatives to traditional care facilities like nursing homes. GHs have increased rapidly after the introduction of the public long-term care insurance. Originally, their residents were supposed to be not severe, so GHs aren't obliged to have doctors nor nurses. However, the GHs which spent several years are confronted with the aggravation of their residents' health status. The aim of this paper is to clarify determinants of GH residents' withdrawal. Methods and Materials: 6,064 group homes were selected randomly nationwide (the extraction rate is 70%). Our subjects are their residents and the ones who left within one year. We did multinomial logistic regression. Categories of the dependent variables are "1. living in GH at the time of the survey", "2. nursing home placement(NH)", "3. health care facility placement(HCF)", "4. sanatorium type medical care facility placement(Sanat)", "4. hospitalization(Hosp)". The independent variables are emergency medicine, nurse, visiting nurse, home call, entity of GH, GH's foundation year, subjects' age, sex, residence period, severity and family. Results: Our final subjects are 9309 residents and 1,447 ones who left from GHs (total 1,447). The breakdowns of the ones left are NH(228), HCF(144), Sanatorium(97), Hospital(978). HCF placements were decreased by the arrangement of nurses. Hospital admissions were decreased by the emergency medicine. We found the significant differences in the places in which ones who left from GHs move among entities of GHs. Conclusion: Corporation with medicine could be effective for GHs residents to continue to live there. The residents might chose GHs considering their strong points.

**PD8 825 THE GERMAN LONG-TERM CARE INSURANCE – HAS IT BEEN A SOCIO-POLITICAL SUCCESS?**

G. NAEGELE\* (Institute of Gerontology at the TU Dortmund University, Dortmund, Germany)

M. REICHERT(1) - (1) Social Gerontology and Life Course research at the TU Dortmund University (Dortmund, Germany)

Fourteen years after the German Long-Term-Care Insurance has been introduced, the Federal Parliament in Germany has recently structurally reformed this insurance. The first part of the paper tells the "story of success" of the German way to regulate the rising importance of long term care socio-politically and in doing this asks for both the positive

effects as well as deficits and problems – as they are currently discussed. It will be shown that the positive effects mainly refer to the situation of the persons concerned and their caring family members. The negative effects mainly refer to the financial stability of the German Long Term Care Insurance which is threatened by different factors out of which the rising numbers of recipients entitled as well as a change in the choice of benefits. The second part of the paper will analyse the reasons for the reform. Among of the most important political proposals and options that were discussed in this context, the following are of significance: raising of benefits in cash, indexation of the financial provisions, raising of the financial benefits for persons with cognitive impairments, improvement of the local care provision by bundling and integrating existing ambulatory care structures ("Pflegestützpunkte"), introduction of individual case- respectively care management ("Fallmanagement"), promoting of prevention and rehabilitation, promotion and facilitating of sheltered housing particularly for people with cognitive restrictions, improvement of quality assurance and promoting civic involvement.

**PD8 826 NUTRIENT CONTENT OF SERVING FOOD AND USAGE OF DIETARY REFERENCE INTAKES FOR JAPANESE IN LONG-TERM CARE FACILITIES FOR THE ELDERLY IN JAPAN**

N. KAWASHIMA\* (National Institute of Health and Nutrition, Shinjuku, Tokyo, Japan)  
A. MORITA(1), M. TUBOTA(1), T. TESHIMA(1), J. KAWAKAMI(2), N. AIBA(1), S. WATANABE(1) - (1) National Institute of Health and Nutrition (Shinjuku-ku, Tokyo-to, Japan); (2) Sagami Women's Junior College (Shinjuku-ku, Tokyo-to, Japan)

Introduction Elderly residents in long-term care facilities have suffered from some nutrient deficiencies. However, little is known about how much nutrient content is included in serving food in long-term care facilities for the elderly. In this study, we evaluated nutrient content of serving food for their residents in these facilities. Methods and Material We sent self-administrated questionnaire to dietitians of 2770 facilities during December 2007. The survey included questions to determine the energy and nutrient content of serving food each day in these facilities. It was also to identify the usage of Dietary Reference Intakes for Japanese (DRI-J) in planning the master menu. Result A total of 1640 facilities participated in this study. When referring to guidelines, many facilities used to the present DRIs-J. Sixty-five percent of facilities provided only one set of value for energy content to residents, regardless of age and sex. The mode value of energy content was 1600kcal, which corresponds to the energy recommendation for men with the lowest physical activity level in the DRIs-J. For nutrient content, the mode value of protein was 60g in both men and women, which was the recommended dietary allowance (RDA) for men. The mode value of iron was 6.5mg for men and 6.0mg for women, which were the values as a RDA. The mode value of salt was 10mg or less in both sexes, which was the tolerable dietary goal for preventing lifestyle-related diseases (DG) for men. Conclusion Long-term care facilities are for men and women in a wide age range from 60 to 100 or over. However, the nutrient content of serving food in these facilities is the same value in most respects, regardless of age and sex. Nutrient values coincided with the DRIs-J value for RDA or DG for either men or women at many facilities.

**PD8 827 EFFECTS OF THE GLOBAL ECONOMIC DOWNTURN ON AUSTRALIAN BABY BOOMERS' FINANCIAL PLANNING**

N. HUMPEL\* (University of Sydney, Lidcombe, Australia)  
K. O'LOUGHLIN(1), S. O'DWYER(2) - (1) University of Sydney (Lidcombe, Australia); (2) National Seniors Australia (Braddon, Australia)

Introduction Australia, like other developed countries, has a rapidly ageing population, and at the forefront is the baby boom cohort which has started to retire. This study is part of a larger Ageing Baby Boomers in Australia project. The aim of this qualitative study was to explore boomers' financial planning and sources of income in retirement in the context of the global economic downturn. Methods Participants aged 50 to 62 years were recruited to 15 focus groups ( $n = 73$ ;  $m = 29$ ,  $f = 44$ ) conducted throughout Australia. The groups were organized by work/retirement status, gender and geographical location. The data were analyzed using NVivo software to identify the range of views and variations by the selected study variables. Results Boomers planned for, or were drawing from, a range of income streams and wealth holdings. These included defined benefit (guaranteed income level) and market-linked accumulation (self-funded annuity) retirement funds and other private investments. The current economic downturn has affected the planning, timing and security of those approaching retirement and those recently retired, particularly those with market-linked accumulations funds. Those with a defined benefit plan were not affected, but those drawing on accumulations funds found their income level had dropped, to the point where some were concerned about their income security. For those still working, great concern was expressed about the reduced balances in retirement accounts prompting some to delay retirement. The majority of participants discussed the possibility of having to make lifestyle changes to accommodate the change in their income. Conclusion Individual efforts and government policies designed to support financial planning and security in retirement are being influenced by exogenous events such as the economic

downturn. Participants stated they would need to work longer, or return to work, but this may be problematic in these uncertain economic times

**PD8 828 PERCEPTIONS OF EFFORTS AND REWARDS IN VOLUNTARY WORK: A FOCUS GROUP INTERVIEW**

I. ÄYRÄVÄINEN\* (University of Jyväskylä, Jyväskylä, Finland)  
T. LYYRA(1), T. LINTUNEN(2), T. RANTANEN(1) - (1) Finnish Centre for Interdisciplinary Gerontology, Department of Health Sciences, University of Jyväskylä (Jyväskylä, Finland); (2) Department of Sport Sciences, University of Jyväskylä (Jyväskylä, Finland)

Introduction: A volunteer is someone who works for a community primarily because they choose to do so, and therefore volunteering may be a remarkable resource for advancing wellbeing of older people. Currently, knowledge about how volunteer workers perceive the efforts and rewards of their work is lacking. Methods and materials: We did a focus group interview among five 62-70 year old female volunteer workers to study the perceived efforts and rewards during a two month outdoor activity intervention they did with older community living people with severe mobility limitations. The tape-recorded interview was transcribed verbatim. In the preliminary analysis the first author inductively identified the key issues and themes relevant to the research question. Results: The rewards of the volunteer work arose from the sense of being useful and doing something meaningful and humane and from the social togetherness with the peers. An opportunity for personal growth was also perceived as a reward. The efforts included use of time for the activity. Conclusion: When organizing volunteer work, it is important to consider ways to display appreciation for the volunteer workers for their efforts while also providing them opportunities to share their experiences with peers. The time people are ready to invest in the volunteer work differs between individuals and this should be taken into account in order not to burden the volunteer workers too much.

**PD8 829 ELDERLY PEOPLE FLYING PRIVATE PLANES**

P. DE BERTRAND PIBRAC\* (EHPAD de Bellevue, Bourges, France)

Aeronautical aptitude is subject to sudden incapability while flying. Pilots, like everybody else, become old. Moreover more poly-pathologies may discreetly lead to a risk of accident. This article aims at detecting these poly-pathologies, mainly the disexecutive syndrome leading to a risk while flying. Two types of people are to be considered : - those flying solo - those flying with other people - instructors - pilots dropping gliders - air-démonstration pilots - pilots dropping parachutists - pilots using double control Finally, the Aviation doctor can rely on a certain number of "clues" to detect anomalies in the pilot's private life revealing aeronautical weaknesses. NOTION OF FRAGILITY Five criteria have been retained to define fragility: - Loss of 5 kilograms over one year independently of any particular diet - Exhaustion - Alteration of muscular strength - Reduced walking speed - Poor physical activity Out of these 5 criteria, being affected by 3 is enough to be classified in 'fragility syndrome' - The Get Up and Go test is easy to implement: From a sitting position, the patient must stand up, walk 5 meters, come back and sit down again in less than 20 seconds. If the test takes more than 20 s, the physician can consider the patient is developing putative weakness. - The Physical Performing Test established by Professor PFITENMEYER of Dijon (France) consisting of 7 tasks: - writing a sentence - simulating eating - taking a book and placing it on a shelf - putting on and taking off clothing - picking up an object and bringing it back - turning round - walking up and down 15 meters 4 points are assigned to each test with a total of 28 points The test is very useful in rheumatology to detect any deficiency. In aeronautics, mobility is essential when approaching an aerodrome, particularly if the pilot is informed of the presence of an aircraft in distress. Detecting discreet anomalies Personal and collective responsibilities of the pilots CONCLUSION Current standards for drugs and driving adapted to flying Out of the 8000 drugs quoted in the VIDAL medical dictionary, 2500 are signalled by a small car. Three colours rank the risks: - Yellow: be cautious when driving a ground motor vehicle - Orange: be extremely cautious driving a ground motor vehicle - Red: do NOT drive.

**PD8 830 AGING AT WORK UNTIL AGE 75 AND OVER / LESSONS FROM JAPAN**

M. HARIGANE\* (The Dia Foundation for Research on Ageing Societies, Tokyo, Japan)  
M. OKA(1), T. ISHIBASHI(2), H. OSADA(3), Y. KOMATSU(4) - (1) International College of Arts and Sciences, Yokohama City University (Japan); (2) Department of Health Policy and Management, School of Medicine, Keio University (Japan); (3) J. F. Oberlin University Graduate School of Gerontology (Japan); (4) The Dia Foundation for Research on Ageing Societies (Japan)

Introduction: Japan's Silver Human Resource Centers (SHRC) program is a post-retirement work program providing temporary and short-time jobs for persons aged 60 or older. This presentation aims at investigating conditions of successive employment in the latest years of life. Methods: Data were collected in 2006fy from 341 men and 99 women who were active members aged 75 and over belonging to a SHRC, located in the Tokyo metropolitan area. The independent variables were gender and the years of service or the active membership period. The moderate variable was age. The dependent variables were first, the number of job categories (v1) in which the members had engaged, and second, the

amount of pay (v2) which approximately represented working hours. Dependent variables were analyzed with a two-way ANOVA (gender ? three classifications of the years of active membership, i.e., less than 5, between 5-9, and more than 10 years). Results: With regard to v1, both of main effects and an interaction effect of independent variables were significant, i.e. women with more than ten years of service had engaged in significantly large numbers of job categories. As for v2, only a main effect of gender was significant, i.e. the amount of pay for men was significantly higher than the amount for women regardless of the years of service. Conclusions: The female retirees who had continuously engaged in SHRC jobs since their early sixties are likely to continue work in diversified ways even in their mid-seventies and over. It may suggest that workability of very old persons could be maintained and developed through continuous engagement in light and easy jobs in the earlier stage of their retirement life. It may also suggest that the SHRC program has been successful for developing diversified job opportunities for very old persons.

#### **PD8 831 ALL IN A DAYS WORK: WOMEN TRANSFORM RETIREMENT.**

J. BYLES\* (University of Newcastle, Callaghan, New South Wales, Australia)  
M. TAVENER(1), L. PARKINSON(1), C. EVERINGHAM(1), P. WARNER SMITH(1),  
D. STEVENSON(2) - (1) University of Newcastle (Callaghan NSW, Australia); (2) University of Western Sydney (Penrith South DC, Australia)

Introduction: Traditionally retirement has been seen as gateway between work and later life, implying withdrawal from productivity. This model is particularly inappropriate for women who are likely to have very disjointed working lives, and who may increase their involvement in work as they age. This research examined three different models of retirement which enabled women's diverse pathways into retirement to be identified and compared. Methods: In collaboration with the Australian Longitudinal Study on Women's Health, this work describes interview and survey data with mid-aged and older women who were either working, considering retirement, or already retired. Results: There were 59 interviews and 11 focus groups conducted. These data revealed three primary models of retirement (gateway, transitional and transformative models) and informed the development of the postal survey. The survey was sent to 900 women from the Australian Longitudinal Study on Women's Health, and 764 women responded (85%). Factor analysis of survey data identified three main domains of activity across the retirement models (social and active, engaged and purposeful, alone and quiet). While the majority of women felt fulfilled in retirement (75%), some felt overwhelmed (10%) and some felt lost (15%). Conclusions: Traditional models of retirement are increasingly seen as irrelevant to the experiences of many women, replaced instead with working part-time, working in a new or different field, or working under different arrangements. These findings show that retirement experiences for women can be eclectic, and are not necessarily the beginning of the end.

#### **PD8 832 AUSTRALIAN BABY BOOMERS' FINANCIAL SECURITY: PRIVATE VERSUS PUBLIC SECTOR EMPLOYMENT**

M. SNOKE\* (University of Sydney, Lidcombe, Australia)  
K. O'LOUGHLIN(1), H. KENDIG(1), D. BLACK(1) - (1) University of Sydney (Lidcombe, Australia)

Introduction Economic policy changes over the past five years have led to Australia's baby boomers redefining their retirement plans and expectations. This study is part of a larger Ageing Baby Boomers in Australia project. The aim of this quantitative study is to explore the relationship between employment sector and self-reported financial security as a key factor in the timing of retirement. Method The sample was drawn from Wave 3 of the national Household Income and Labour Dynamics in Australia survey (2003). Respondents (N=2,066) were aged 45 to 57 and in full-time employment. Variables of interest were age, gender (men N=1073, women N=993), employment sector, gross annual income and self-reported financial security. Results The majority of respondents (74%) were employed in the private sector. Preliminary results indicate that gross annual income was slightly higher for both men and women in the public sector; men in both sectors earn more than women on average; and the income gap between sectors for women (public higher by A\$10,000) was three times greater than for men (public higher by A\$3,300). In both sectors men on higher incomes rated financial security as important for timing of retirement. In contrast, women in both sectors on higher incomes rated financial security as not important for timing of retirement. Conclusion Differences in gender and sector of employment show that financial security for women maybe a significant factor in deciding when to retire and could be delaying retirement to increase their levels of financial security. With retirement income policy placing responsibility upon the individual, boomers employed in the private sector, and women in both sectors, appear to be at greater risk and may require targeted policies to achieve their desired retirement age and adequacy of standard of living.

#### **PD8 833 RETIREMENT AND PSYCHOLOGICAL HEALTH**

J. LOPEZ MARTINEZ \* (UNIVERSITY OF THE BASQUE COUNTRY, SAN SEBASTIAN, Spain)  
I. LIZASO ELGARRESTA(1), M. SANCHEZ DE MIGUEL(1), J. LOPEZ MARTINEZ(2) - (1) UNIVERSITY OF THE BASQUE COUNTRY (Spain); (2) UNIVERSITY OF THE SAN PABLO-CEU (Spain)

Introduction: The present study is based on the two most common retirement regimes in Spain today: regular compulsory retirement at age 65, and early pre-65 retirement schemes (voluntary, progressive, and pre-retirement). The primary aim of this study was to examine the relationship between different types of retirement - compulsory retirement (age 65) and early retirement schemes (voluntary or forced) - and the different psychological health indicators (depression, anxiety and life satisfaction). Methods and materials: Semi-structured interview: 119 retired persons (31.9% women and 68.1% men) over the age of 55 ( $M = 66.40$  years,  $SD=5.91$ , range= 55-82 years). Sociodemographic and psychosocial data: SPMSQ (screening for cognitive impairment), "Ad Hoc interview", GADS (screening for anxiety and depression disorders), PGC (life satisfaction), and COOP-WONCA (health-related quality of life). Results: Retirement age ( $M=59.96$  years,  $SD=5.13$ ); length of retirement ( $M=6.48$  years,  $SD=4.84$ ); married (73.1%); primary school education (39.5%); skilled worker (45.4%); pre-retirement retirement regime (34.5%); voluntary (19.33%), illness (18.49%), forced (16.81%) and early 10.92%; income  $>\text{€}1077$  (49.1%). Statistically significant differences were found in psychological health considering type of retirement, level of anxiety (GADS) and life satisfaction (PGC), but not between type of retirement and level of depression (GADS). Conclusion: Results show a possible relationship between age and type of retirement associated with enhancement or deterioration in psychological health.

#### **PD8 834 PSYCHO-SOCIAL FUNCTIONING OF RETIRED VOLUNTEERS AT A SERVICE CENTRE**

H. STRYDOM\* (North-West University, Potchefstroom, South Africa)  
S. VAN RENSBURG(1) - (1) Potchefstroom Service Centre for the Aged (Potchefstroom, South Africa)

INTRODUCTION The focus of this presentation is to determine the factors that play a role in the psycho-social functioning of retired volunteers at the Potchefstroom Service Centre for the Aged. The positive as well as the negative psycho-social functioning areas have been measured according to a standardised measuring instrument (The MSI scale). Three components of self-perception namely inner uncertainty, worthlessness and guilt feelings have been tested as well as eight components of work values. This was done in order to better understand the retired volunteer and to place him or her at the particular service where they can mean the most to the service centre as well as where they can personally benefit the most. METHOD A systematic sample of 33% of all retired volunteers of the Potchefstroom Service Centre for the Aged were drawn. In this manner 44 participants were involved in this study. The data was of a mainly quantitative nature within the exploratory paradigm. RESULTS The study proved that if the retired volunteer is known, adhered to their expectations, put at ease and matched with the correct field of service delivery they will become loyal and longstanding service providers to the service centre. If the correct matching can be done between the older person and the retired volunteer, the organisation as well as the service centre will benefit from their services. CONCLUSION By doing socio-metric measuring of the retired volunteer a profile of the psycho-social functioning of the volunteer can be drawn up that will benefit both the organisation and the individual volunteer.

#### **PD8 835 SLEEP DURATION AND SLEEP COMPLAINTS AS PREDICTORS OF DISABILITY PENSIONS AMONG AGEING EMPLOYEES**

T. LALLUKKA\* (University of Helsinki, Helsinki, Finland)  
. LAHELMA(1), O. RAHKONEN(1) - (1) Department of Public Health, University of Helsinki (Helsinki, Finland)

Introduction Among ageing employees sleep complaints are a prevalent public health problem, but their consequences are poorly understood. Early exit from work continues in turn to be a serious economic problem. This study examined whether sleep duration and sleep complaints predict subsequent disability pensions among ageing employees. Methods and materials Baseline survey was collected in 2000-2002 among ageing employees of the City of Helsinki (n=6373, 80% women). Data on disability pensions were obtained from the Local Government Pensions Institution and the State Treasury of Finland (2000-2004) and were linked to the questionnaire data. Sleep duration was categorised into short (5-6 hours), normal (7-8 hours) and long (9+ hours). Sleep complaints during previous month included troubles falling asleep and staying asleep, waking up several times per night, and non-restorative sleep. Respondents were categorised into those with severe sleep complaints, moderate sleep complaints and good sleepers. Cox regression analysis was used to calculate hazard ratios (HR) for disability pension. Results There were 217 (3%) disability pension events during the follow-up. Age adjusted severe sleep complaints (sleep onset insomnia, sleep maintenance insomnia, and non-restorative sleep) strongly predicted disability pensions (HRs 3.4 -4.7) among women and men. Short sleep also predicted disability pensions (HR 1.4). Baseline health and health behavior accounted for part of the effects. Conclusions Sleep complaints and sleep duration predict early exit from work through disability pension among ageing women and men. To support ageing employees maintain work ability until their normal retirement age, promotion of normal sleep and

early detection and prevention of sleep complaints should be emphasized in occupational health care.

**PD8 836 THE ABILITY OF OLDER FEMALE EMPLOYEES TO CONTINUE WORKING: PREREQUISITES AND CONSEQUENCES**

M. SCHMITT\* (Institute of Gerontology, Dortmund, Germany)

G. NAEGELE(1), M. SPORKET(1), V. LEVE(1) - (1) Institute of Gerontology (Dortmund, Germany)

Introduction: Although women are confronted with specific obstacles in the course of their working life (e.g., less opportunities for development and advancement, lower income, problems of combining work and family life, part-time arrangements) little is known about older women's ability to continue working when faced with the prolongation of working life. Therefore, the aims of the study were a) to examine the work and employment situation of older female employees, b) to evaluate their subjective ability to remain in the work force, and c) to identify risk groups. Methods and materials: The representative sample consisted of N=1,800 older female workers (born 1947-64). Using computer assisted telephone interviews, data on socio-demographics, responsibilities for child and elder care, educational and vocational training, previous working life, future work situation, transition to retirement, the work ability index, and individual activities to extend working life were gathered. Results: The rating concerning the ability to remain in work life until the new individual statutory retirement age depended on occupational status (positive ratings of blue-collar workers vs. white-collar workers: 50% vs. 60%), and individual sectors (more pessimistic appraisals among employees of the post, the railways, hotel and catering industries). Additionally, three risk types were identified including women with health-impairments (29% of the interviewees), women with low-qualification (9%), and women with additional care-giving duties (10%). Conclusions: If the extension of the working life is to be achieved for most of the older female employees, a wide range of measures is necessary, in particular concerning the organisation of working conditions and time arrangements. Although women have a strong sense of self-responsibility for maintaining their ability to work, it is primarily up to the companies to offer support, for they constitute the environments determining the risk situation of older female employees.

**PD8 837 IMPROVING THE UNDERSTANDING OF POOR SLEEP IN LATER LIFE THROUGH THE LEGACY OF POOR SLEEP IN EARLIER LIFE**

S. VENN\* (University of Surrey, Guildford, United Kingdom)

S. ARBER(1) - (1) University of Surrey (Guildford, United Kingdom)

Background It is widely believed that sleep worsens in later life. Trouble getting to sleep, staying asleep, waking early, and an increase in daytime sleepiness has a higher prevalence among older people. Therefore the focus on sleep in later life tends to be on the physiological changes that take place, rather than on the social factors that may influence sleep quality, such as caring for an ill partner in the night. As a result poor sleep in later life is largely regarded as originating in later life. Aims and Methods This paper offers a detailed understanding of older peoples' sleep through qualitative interviews (n=62) of older people's perceptions of sleep needs, causes of poor sleep quality, and strategies to improve sleep. Results Older people reported difficulty getting to sleep, having fragmented sleep, and waking early in the morning. However, they were also often able to identify social factors that contributed to their poor sleep. Further exploration as to the origin of these factors revealed that many of the influences on the quality of their sleep earlier in life had a continuing impact on their current sleep. Such factors included previous long term shift working, caring for partners with a long term illness, worries about work, and continuing health problems. Conclusions Whilst it is important to recognize that changes in sleep architecture may influence the quality of older peoples' sleep, it is also important to take into account how the legacy of poor sleep in earlier stages of the lifecourse may continue through into later life and impact on the quality of current sleep. Asking people to reflect on their attitudes to sleep and sleep habits through a lifecourse narrative approach may contribute to a better understanding of the complex mechanisms that influence poor sleep in later life.

**PD8 838 HEALTH INDICATORS OF ELDERLY'S INSERTED IN GOVERNMENTAL HEALTH PROGRAM MANAUS-AMAZONAS, BRAZIL**

E. RIBEIRO\* (Universidade do Estado do Amazonas, Manaus, Brazil)

R. VERAS(3), K. VIEGAS(2), C. CALDAS(3), M. ROCHA(4), C. CHAVES(1), A. SILVEIRA(4), O. FONSECA(1), I. JUNG(4), E. MAIA-RIBEIRO(1), I. CRUZ(4) - (1) Universidade do Estado do Amazonas (Manaus, Brazil); (2) Pontifícia Universidade Católica do Rio Grande do Sul (Porto Alegre, Brazil); (3) Universidade do Estado do Rio de Janeiro (Rio de Janeiro, Brazil); (4) Universidade Federal de Santa Maria (Santa Maria, Brazil)

Introduction: Studies about the elderly living in North's Brazilian Region are incipient and need to be performed to corroborate in health public policies. Objectives: the study presented here describe the methodological design about the Projeto Idoso da Floresta that analyze the main health indicators of the elderly inserted in the Estratégia de Saúde da Família (ESF-SUS) that is a Brazilian health public care program in Manaus-AM. Methods and materials: a two-stage epidemiologic study was conducted: (1º) selection of basic health

units (UBS) as unit selection; (2º) elderly selection as randomized sample unit from each UBS. Results: 1509 elderly were included in analysis, 810 (53.6%) women 6.9 years old). In $\pm$ 7.7 years old) and 699 (46.4%) men (66.8 $\pm$ 6.6 general, the elderly investigated here was married/widowed 94.8%), illiterates or with very lower education (46.5%), lived in houses (94.7%), received some external support (57.5%), was retired (64.5%) with without or lower economic income (67.9%). From the sample analyzed, 85.5% was independent and 10.3% reported to have > 04 morbidities. These results tended to be different in the Manaus's health districts. Conclusion: in general, the variable analyzed tended to be similar to results described in other Brazilian epidemiological studies. However, there are differences among districts that must be considered in the strategy of health and elderly care.

**PD8 839 CARE FOR THE ELDERLY AND DIVERSITY: A CHALLENGE FOR THE SCANDINAVIAN CARE REGIME**

S. JOHANSSON\* (Department of social work, Umeå, Sweden)

Introduction This paper focuses on diversity as a challenge to the Scandinavian care regime, which Hernes (1987) introduced as 'women-friendly', referring to the wide state responsibility for organising caring activities. Anttonen and Sipilä (1996) describe the Nordic social care regime as having extensive public care services for both children and the elderly and high female participation in paid labour. A new Anti-discrimination Act will combat discrimination on grounds of gender, transgender identity or expression, ethnic origin, religion or other belief, disability, sexual orientation or age. The Act will apply to most areas of society. This paper will concentrate on its consequences for the delivery of elderly care. Methods and materials To analyse the impact of the Act, a group of Swedish researchers will pool together and re-analyse data from several projects investigating the practice and organisation of work in paid elderly care. Research will be carried out on data covering demographic diversity, customer's choice and the value base of the care providers. Results In the Swedish context, diversity is a concept with a broader connotation than in international literature where it often is linked to demographic diversity. In social work it may be related to provision of care, to consumer (service user) choice and a diversity of care providers. Diversity could also mean diversity in values when meeting the demands of a client or a care recipient. Implementing diversity according to the Scandinavian care regime has uncovered some dilemmas connected to the structure of the Swedish public sector. Local autonomy has made it possible for each municipality to formulate its own administrative policy. This authority in public elderly care has been used to standardise services which is problematic in relation to diversity.

**PD8 840 DOES POOR HEALTH LEAD TO POVERTY AMONG UNATTACHED OLDER CANADIAN WOMEN?**

D. HASINOFF\* (University of Toronto, Toronto, Canada)

The link between poverty and poor health is well known. Many reports indicate that poverty is the agent in this causal relationship; that is, poverty is a determinant of poor health. Most researchers find that poverty is a predictor of poor health, but do not report the inverse relationship, that is, that health is a predictor of poverty. This research is important because the nature of this relationship should dictate the systemic solutions to this population's health and poverty problems. This poster describes a study that used path analysis to predict the impact of health status and self-rated health, level of education, dwelling ownership, and number of hours worked per week on the financial security of Canadian women ages 55 to 64 widowed, separated, and divorced living alone. Using a cross-sectional sample (n=212) from Cycle 3.1 of Statistics Canada's recurrent Canadian Community Health Survey (2005), it was found that, with respect to the proposed relationships between the exogenous measures and income, 23.7% of the variance in income in the sample can be accounted for by health, hours worked, education, and dwelling ownership. This study demonstrated that (1) poor health does affect the incomes of older widowed, separated and divorced Canadian women who live alone, that is, on average, income does vary based on health; (2) other variables, that is, dwelling ownership, education, and hours worked also affect incomes; (3) hours worked mediates the effect of education on income; (4) self-rated health mediates the effect of chronic health condition(s) on income; and (5) health is predicted by income.

**PD8 841 AGEING AND SOCIAL CAPITAL IN AN AUSTRALIAN COASTAL RESORT**

F. BARR\* (The University of Sydney, Nelson Bay, Australia)

C. RUSSELL(1) - (1) The University of Sydney (Lidcombe, Australia)

Introduction Australian policy makers have adopted the concept of social capital in framing welfare and health policies to refer to the assets of social norms, networks and trust available within communities, and have sought to identify enhancement strategies of particular relevance to older people. However little is known about how such resources might be differentially available and relevant to individuals and groups. Based on an understanding of social capital as something that is context-specific, this research describes the nature and specific features of social capital as it applies to older people in a coastal resort community. Methods and materials Data were collected in semi-structured interviews with 54 older residents, with broadly equal numbers of men and women in each

of two 5-year cohorts, 60-64 years and 80-84 years. Additional data from 103 responses to the questionnaire used to recruit the interview sample supplemented thematic content analysis of interview transcripts. Results Most older people in this study had referred to the resort area, moving away from established networks of family and friends. A few worked hard at retaining old connections and making new ones; most were more passive, with social circles more concentrated on local friends and immediate family. The group in their 60s were generally active in outdoor sports, church or social groups; those in their 80s had mostly withdrawn from active participation in such groups. Casual social contacts became more important as networks of family and friends were decimated by age-related frailty and death. Loss of access to private transport caused significant reduction in access to social activity. Conclusion Policies for older people should recognise that social capital available to an individual is a product of the social capital of the surrounding community and of the individual's own life history and circumstances.

**PD8 842 HEALTH INEQUALITIES AMONGST OLDER PEOPLE FROM ETHNIC MINORITY GROUPS IN BRITAIN**  
S. HOLDER\* (University of Southampton, Southampton, United Kingdom)

The ageing of the United Kingdom (UK) population is well documented; however the ageing of ethnic minority communities and the implications for health and health care needs has received far less attention. In fact 'ageing' and 'ethnicity' are rarely integrated within health research. There are over 4.6 million individuals belonging to minority ethnic groups in the UK, with a quarter million aged 60 years or over according to the 2001 UK Census. The ageing of these communities over the next two decades places greater emphasis on the importance of empirical evidence on their health status and the policy implications in providing older ethnic elders with appropriate health care. The research will explore the sensitivity of different measures of socio-economic status for understanding health inequality in later life. The proposed research will contribute original empirical research investigating the impact of different measures of socio-economic status on health using high quality national surveys (Health Survey for England). The findings would be useful in informing which national policies (e.g. health promotion campaigns, housing, occupationally based services, social assistance) and locally based interventions (e.g. health campaigns for Pakistani older women) would be better targeted at which ethnic groups of older men and women. Improving health inequalities can have a significant positive effect on the quality of life of older ethnic minorities

**PD8 843 INTERNET/EMAIL USEAGE AND WELLBEING AMONG 65-84 YEAR OLDS IN NEW ZEALAND: SOCIAL POLICY IMPLICATIONS**  
P. KOOPMAN-BOYDEN\* (The University of Waikato, Hamilton, New Zealand)  
S. REID(1) - (1) The University of Waikato (Hamilton, New Zealand)

New Zealand's Positive Ageing Strategy (Ministry of Social Development) includes a commitment to promoting the value and participation of older people in communities. Continued opportunity for "personal growth and community participation in older age" (Goal Ten) is seen to have potential benefits in terms of wellbeing at both the individual and societal level. One potential medium through which this could be achieved is internet/email technology. Research indicates that significant groups of older people are using internet/email technology. The current study aims to discover whether this usage benefits older people's wellbeing and social participation. Using the data from a 2007 random sample of 1,680 New Zealanders aged 65-84, predictors of internet/email use were investigated, and the impact of internet use on the wellbeing of older adults. Gender, age, education, household composition, income and work status were found to be significant predictors of internet/email use. A significant positive relationship was also found between internet/email use and wellbeing using two internationally recognised wellbeing measures, the World Value Survey question and the World Health Organisation Quality of Life Indicator. Internet/email use also related to better self-rated health and increased leisure and recreation participation and leadership. It is clear from these current research findings that specific groups within society are underrepresented amongst internet users. Research findings linking internet/use with wellbeing in older age suggest it would be beneficial to introduce further social policy initiatives through the Positive Ageing Strategy. These could be aimed at increasing internet/email usage among older people, specifically targeting disadvantaged older people, for example older women who live alone. To ensure continued participation and wellbeing

**PD8 844 CONCEPTUAL AND METHODOLOGICAL CHALLENGES IN DESIGNING A NATIONAL PREVALENCE STUDY OF ELDER ABUSE IN AUSTRALIA**  
E. OZANNE\* (The University of Melbourne, Melbourne, Australia)

Despite increased public policy interest in the phenomena of elder abuse, Australia lacks nationally validated prevalence data. The majority of studies that have been undertaken have been either state based and/or service located and do not give a valid picture of the extent of abuse. There are also major conceptual, methodological and cost challenges in designing a national study. In 2007 a national workshop was held sponsored by the Australian Research Council and National Health and Medical Research Council Ageing Well Research Network with researchers from several States and Professor Anthea Tinker

from UK, to review the state of elder abuse research in Australia and scope a forward research agenda. This group identified the priority need for a national prevalence study to be used as the basis for national planning as well as more detailed clinical intervention trials. Following this workshop a three state (Victoria, NSW, Western Australia) research group was established to develop the methodology for a national prevalence study, submit a grant application, and lobby government, other key stakeholders and philanthropic agencies to raise the estimated \$2m AUD funds required. One of the concerns of this group was the high cost for a relatively low yield in national prevalence studies (2.6% UK Study). A nested three state study design was developed involving both an area based household survey and analysis of agency caseloads. The conceptual and methodological challenges in designing this study for maximum yield, has required close collaboration between clinicians, researchers and senior policy analysts around both how inclusive to be of different types of abuse, and the best way of accessing and understanding abuse phenomena. This paper will elaborate on some of the learnings from this process and the conceptual framework within which the study was finally operationalized.

**PD8 845 ETHNICITY AND 'ELDERLY IMMIGRANTS' IN SOCIAL POLICY FOR OLDER PEOPLE: THE CASE OF SWEDEN**  
L. MACHAT\* (Linköping university, Norrköping, Sweden)

International migration, brought on by globalisation, has been portrayed as a threat to Nordic welfare regimes. With ageing populations already undermining sustainability, the apparent growth in number of elderly immigrants has led to the discursive construction of this category as a social problem. How are ethnicity and 'elderly immigrants' thus portrayed in social policy for older people? Using a social constructionist perspective, a Swedish social policy document – SENIOR 2005 – has been analysed so as to examine the use of ethnicity and the depiction of 'elderly immigrants'. SENIOR 2005 is the final product of a parliamentary investigation of the ways in which future social policy can be developed to be sustainable in the long term; it can thus be regarded as one of the bases upon which policy is formed. The analysis has brought to light two contrasting ways in which 'elderly immigrants' are conceptualised. On the one hand, explicit discussions of ethnicity and 'elderly immigrants' focus on flux, diversity and heterogeneity – opposing the picture of a problematic, homogeneous group. On the other hand, ethnicity and 'elderly immigrants' are frequently mentioned in connection with a range of problems: poor health, psychological problems, lack of involvement in society, are just some of the qualities ascribed to 'elderly immigrants', which ultimately portrays them as a homogeneous group and social problem. In addition, the absence of questions of ethnicity in large parts of the text point to a frame of reference where Swedishness is the norm. Ultimately, 'elderly immigrants' are portrayed as a homogenous, marginalised, problematic group that is excluded from the national community of older people.

**PD8 846 CROSS-CULTURAL PROBLEMS BETWEEN THE CARE GIVER AND THE RESIDENT OF NURSING HOME**  
T. TAKEHIKO\* (Hokusei Gakuen University, Sapporo, Japan)  
K. ADACHI

Introduction: The aim of this study is to explore the way of enhancing the communication between the care giver and the resident of nursing home without psychological stress. Nowadays the number of Japanese populations of old people has been growing at the most rapid rates. To the contrary, the number of caregivers of nursing home is decreasing. Recently Japanese government has developed a policy getting care givers from other Asian countries, for example, Indonesia and Philippine. But Japanese people haven't been used to communicate the foreign people. So we investigated the problems to live the rest of life for old people and would like to find better way of cross-cultural communication. Methods and materials We asked 20 old people living in Vancouver in Canada with questionnaire about daily problems in the future of physical and psychological conditions. Research was done at April and May of 2008. Their anxiety were rated with 3 degree (from 0:without anxiety to 3:most worrying about). Results 20 Japanese old women replied to the questionnaire. Their averaged age was 65 years and duration of using English was 15 years. They worried about that their health will be failed and their daily life will be inconvenient. They think it depends on their physical and psychological conditions. Especially they worried about suffering dementia. Conclusion Almost Japanese old women have made up their mind to live in Canada as immigrant by themselves. But they were worrying about their ability of language when they communicate with medical doctor. Because when something is wrong with their health, they may think it seems very difficult to explain their accurate physical condition. We would like to continue the more research to clarify the factors of good conditions of communicating medical doctors and nursing home staff.

**PD8 847 LATE BLOOMERS: ELDERLY START-UPS AND ENTREPRENEURS IN GERMANY**  
A. FRANKE\* (TU Dortmund, Dortmund, Germany)

Introduction Most of the start-ups in Germany are founded from persons 35-45 years. But in 2003 in Germany a special kind of welfare instrument to promote start-ups from unemployed workers was implemented ("Me-PLC"/"Ich-AG"), which got a lot of stick, but the start-up-rate increased and figured a high proportion of women and elderly persons

(on average two years older than conventional entrepreneurs). There seems to be a wasted potential of elderly entrepreneurs particularly comparing with other countries (e.g. Iceland, Switzerland, UK). And there is a few of research about motives, experiences etc. Methods and materials In respect to the idea of "Ageing in place", I took a focus on the region of Bremen (Northern-Germany). The process steps included a literature review, a field research and 34 qualitative interviews with experts from banks etc. and elderly entrepreneurs 50 plus about motives, age discrimination and factors for fail/ success. Results By looking at the motives, interesting gender gaps were discovered. The social capital from the former job or private contacts is one of the most important success factors for elderly entrepreneurs. Their experiences with start-up promotion is quite good except with credit loaners (banks). Nearly all of them are very satisfied with their new situation and more than a half could image to work longer than 67. Conclusion Age discrimination and high ideals of an entrepreneur are still existing and important factors for the German lack of self-employed-culture. The welfare state has to implement instruments which allows start-ups for any age and phase of life (life course policy). There is still a lot of research to do about elderly entrepreneurs. Comparing studies with different countries would be interesting but also further research with a regional focus.

**PD8 848 INPATIENT CARE FOR PEOPLE WITH DEMENTIA: STAFF WELLBEING AND THE IMPLICATIONS FOR PERSON-CENTRED PRACTICE**  
**J. LLOYD\*** (University of Nottingham, Nottingham, United Kingdom)  
**S. BAILEY(1), K. SCALES(1) - (1)** University of Nottingham (Nottingham, United Kingdom)

Introduction Within older people's mental health services, the threshold for admission to inpatient care is rising and staff are working with increasingly dependent and frail populations. The physical demands of this role as well as its emotional impact are considerable. Cures are generally not expected yet end of life care is seldom mentioned; staff are frequently expected to rehabilitate a person to return to an environment where adequate support is not available and deaths are a relatively common occurrence. We are focussing on the experience of working in inpatient settings for older people with dementia from the perspective of the professional carers who work most directly with them. We are interested in staff's motivation for undertaking this challenging work, what sustains them day-to-day, the coping strategies they employ, the rewards they derive from the work, and the problems they encounter. Methods and Materials This study is ethnographic, with data gathered primarily through participant observation and supplemented by assessments of the care environments through dementia care mapping, carers' questionnaires, and qualitative data derived from focus groups and individual interviews. The research is being undertaken in three different inpatient wards for older people with dementia within the Nottinghamshire Healthcare Trust; this diversity will contribute to the generalisability of our findings to other settings. Results This paper will present preliminary findings from our analysis, derived through a collaborative process involving the academic researchers, NHS stakeholders, carers, and representatives of the local Alzheimer's Society and Inpatient forum. Conclusions With a primary focus on policy and practice, we aim to identify ways to improve staff well-being and to promote the implementation of person-centred care and positive patient outcomes. Opinions in this study are those of the researchers and not of the Department of Health or NIHR.

**PD8 849 IMPROVING SOCIAL SUPPORT OPTIONS FOR THE ELDERLY IN A RURAL COMMUNITY**  
**P. MELLOR\*** (Age Concern Pty Ltd, Ormond , Australia)  
**J. GREENHILL(1), K. DIX(1), T. MARTIN(2) - (1)** Flinders University Rural Clinical School (Renmark, Australia); (2) Renmark Paringa Hospital (Renmark, Australia)

INTRODUCTION It is now widely accepted that social networks and connections play an integral role to a person's sense of wellbeing, quality of life and their ability to cope with life stressors. The number and quality of links and connections individuals have within their community impact on their sense of isolation. Reducing social isolation is currently listed as one of the key challenges in addressing Australia's changing ageing population in the 21st century (Government of South Australia 2008). METHODS AND MATERIALS A steering group was established with community service staff enabling collaboration in the design, development and methodology of the project. Qualitative data was collected through a combination of semi structured interviews with 18 randomly selected HACC recipients and a focus group was held with community service providers. Thematic analysis of the data was undertaken. RESULTS This project identified that the social aspects of a person's life have not been considered a priority by HACC service providers and there are elderly people in the community who are isolated and largely reliant on services for social interaction and community involvement. The paper outlines the degree to which this collaborative research project enabled a paradigm shift in care provider consciousness and enabled movement from evidence to practice and ultimately better interventions. CONCLUSIONS The benefits of quality social support options to a person's health and wellbeing have not been adequately understood by community care providers. An awareness of the benefits of changing from a sole focus on ADL's (Activities of Daily Living) to incorporate a responsive consideration of social needs from the recipients' perspective has been a convergence of this project. The need for processes that enable

reflective practice and continual education for service workers is imperative to ensure services are supporting the social needs of elderly.

**PD8 850 MAINTAINING DIGNITY IN LATER LIFE: OLDER PEOPLE**  
**K. WHITE\*** (University of Bristol, Bristol, United Kingdom)  
**L. LLOYD(1) - (1)** University of Bristol (Bristol, United Kingdom)

Introduction: This research is funded by the UK New Dynamics of Ageing Programme. It focuses on the everyday lives of 40 people aged 75+ who receive ongoing support and care from others, including families and health and social care services. Our aim is to obtain participants perspectives on dignity and the effect that dependency on others has on this. We also aim to obtain participants thoughts about and preparation for the future and the end of life, when dignity is a major concern. Method A qualitative longitudinal method is used, with a series of face-to-face and telephone interviews over a period from June 2008 to September 2010. Face to face interviews are recorded verbatim. Interviews are open and exploratory so as to enable participants to speak freely and in their own time. There are three main areas of focus: 1. Participants everyday lives, routines and relationships 2. Their experiences of receiving help and care 3. Their thoughts about the future. This methodology enables us to capture changes in perceptions of dignity as circumstances change. Results Emerging findings reveal a range of experiences, including some humiliating experiences with health professionals as well as respectful practices. There are striking differences in participants ability to withstand assaults on their dignity. The findings highlight the value of a life-course perspective to understanding differences and similarities in participants perspectives and to understanding the significance of personal relationships in both negative and positive contexts. Conclusion The concept of dignity is complex, with both objective and subjective dimensions. This research offers a dynamic perspective that takes account of individuals life-course and the relationship between past, present and future in terms of individual identity, interpersonal relationships and perspectives on dignity in the context of service provision.

**PD8 851 EXPECTATIONS OF THE PEOPLE OF THE THIRD AGE WHEN THEY TRAVEL ON TOURISM BY BUS.**  
**H. RODRIGUES DE SOUZA\*** (Uninove University, São Paulo, Brazil)

Individuals of the third age are being considered more and more important for tourist activities. The specific biological, psychological and social characteristics of the individuals of the third age have to be considered when they travel. The knowledge of the preferences and liking of these people, for example, can help to improve the travel services. The aim of this paper is to research, through questionnaires and observation, the expectations of the people of the third age, belonging to the middle-and high/middle-class in the city of São Paulo, Brazil, when they travel on tourism by bus and the facts discovered en route. We analyzed these aspects under the fields of health, culture, social relations and personal satisfaction. The results show that most of those people, when they traveled, expected to make new friends, wanted a balanced diet and tea in the evenings. Some of them were looking forward to exercising, while others just wanted to rest. A lot of them wanted to visit cultural sites, but almost all were willing to stop at stores to go shopping. Most of them hoped for parties and balls and comfortable busses during their trips. Watching the results, we verified that the amount of women traveling was always larger than the one of men, so we tried to find out the reasons, interviewing several male individuals. The results of the interviews with those individuals showed that they travel little, because they don't find interesting activities during the trips, e.g., lectures on interesting subjects, games, contests or cultural visits. Based on these results, we offer suggestions in order to improve more and more the attention given to the traveling individuals of the third age and meet with the expectations of that segment, which is getting more important day after day.

**PD8 852 PERCEPTION AND EXPERIENCE OF SAFETY AMONG OLDER NEW ZEALANDERS: IMPLICATIONS FOR WELLBEING AND SOCIAL INCLUSION**  
**P. KING\*** (Family Centre Social Policy Research Unit, Lower Hutt, New Zealand)

Introduction Sen's capabilities based theory of wellbeing focuses on the quality of living people can achieve through their ability to convert opportunities into chosen ends with support from available instrumental freedoms. This paper examines relationships between the instrumental freedoms associated with older people's experiences and perceptions of safety, and their wellbeing in New Zealand. It identifies policy implications of disjunctions identified between the experience and perception of safety. Methods and materials Data are from a national survey of New Zealanders aged between 65 and 84 conducted in 2007. Results are based on bivariate analyses of responses to questions about experiences and perceptions of safety, personal income, overall satisfaction with life, loneliness, social participation, age, gender, marital status and residential location. Results Objective experiences of safety were very high, while subjective perceptions of safety were much lower; a finding shared with other research indicating no necessary link between the subjective fear of crime or victimisation and the objective risk of it happening. Perception of safety was positively related to personal income and participation in leisure and recreation activities, and inversely related to age and overall loneliness. Women's perceptions of safety were lower than men's. Negative perceptions of safety were inversely

related to social participation and wellbeing – even among those whose fear of victimisation outweighed their experience of it. Conclusion Distinctions between objectively and subjectively based evaluations of safety highlight the importance of measuring both in order to obtain a balanced view of the issues involved in older people's safety. Such a balanced view is a necessary basis for informing policy responses to older people's safety-related subjective needs that are consistent with both the nature of the safety-related conditions they face and their capacity to achieve inclusion, participation and integration communities.

**PD8 853 SOCIAL PARTICIPATION OF OLDER PEOPLE: DEVELOPMENT OF A NEW TYPOLOGY INFORMING SOCIAL POLICIES**

E. RAYMOND\* (Institut national de santé publique du Québec, Québec, Canada)  
A. SÉVIGNY(1), A. TOURIGNY(1), A. VÉZINA(2) - (1) Centre d'excellence sur le vieillissement de Québec (Québec, Canada); (2) Université Laval (Québec, Canada)

**Introduction** In view of socio-demographic transformations, social participation has come to be considered a crucial element within leading models on aging. Social participation is said to enhance seniors' capacity to adjust to transitions throughout the life course, and as a result is quickly transforming public discourse and practices related to the social role of older people. **Methods and Materials** While the importance of encouraging senior citizens' social participation is unanimously voiced, what is meant by social participation and the means by which to attain social participation are less clear. From a planning perspective, the data concerning interventions that foster seniors' social participation is limited and fractionated. **Results** This paper reports the findings of a qualitative literature review of 98 scientific publications and 12 focus groups conducted in order to identify interventions intended to foster seniors' social participation. Based on the data reviewed, a typology of five methods of intervention was conceptualized: 1- social interaction in an individual context; 2- social interaction in a group context; 3- community activities and initiatives; 4- volunteering and informal assistance; 5- social and political involvement and activism. The validity of this typology was then tested through twelve focus groups consisted of senior citizens and with people who interact with them. The focus groups served to enhance the model with fieldwork experiences. **Conclusion** The implications of this study were three-fold. The typology organized the data aimed to foster seniors' social participation in an unprecedented way. The process related to action and research priorities drew together researchers' and seniors' knowledge, thereby potentially strengthening political decision-makers' and seniors' actions regarding social participation. Finally, the typology and process created evaluation tools that better allow researchers and decision makers to evaluate existing and future initiatives on the social participation of older people.

**PD8 854 BRAINMATICS: CAN HAND-HELD TECHNOLOGIES AMELIORATE THE EARLY ONSET OF DEMENTIA? – A MODEL FOR A LONGITUDINAL INVESTIGATION OF PRE-DIAGNOSED BUT POTENTIALLY SUSCEPTIBLE DEMENTIA SUFFERS**

A. LIVINGSTONE\* (University of Southern Queensland, Toowoomba, Australia)  
J. SOAR(1), J. MULA(1), S. WANG(1) - (1) University of Southeren Queensland (Toowoomba, Australia)

Australia is typical of OECD countries experiencing rapid ageing of the population and increases in the incidence of dementia. Recent reports show Australians who have dementia and Alzheimer's diseases have been increasing over the last two to three decades. The real cost of dementia was estimated to be \$5.6 billion in 2002 with over 162,000 cases reported (Access Economics 2004). It was further estimated that by 2050 some 730,000 could be afflicted if prevention activities are not found (Access Economics 2005). The report concludes any preventative activities that can delay the onset of dementia will lead to a better quality of life and make significant savings in future health cost. This project aims to contribute to early intervention and management of dementia. The project involves evaluating the use of hand-held technology as an early intervention measure to identify if undertaking regular cognitive training reduces early onset of dementia. It employs research of Kawashima (2005) and others that encourages brain activities in people as a way of countering brain dysfunction. Through the use of game technology, the study tests various techniques that will provide enjoyable stimuli to people's brains. The longitudinal study measures the impact of 'brainmatics', ubiquitous small game machines on cognitive function. Research undertaken (Doidge 2008) shows that the more educated, and physically and socially active a person, the less likely he/she is to fall victim to the disease. However, studies have only been able to show an association but not causality. By capturing physical, educational, and social characteristics of participants and studying their activities and cognitive progress over an extended period (which appears not to have been undertaken before), this study may unlock some secrets to ameliorating the early onset of dementia. This paper reports the literature, conceptual model, research methodology

**PD8 855 THE CANADIAN NETWORK FOR PREVENTION OF ELDER ABUSE: AN NGO APPROACH TO MISTREATMENT OF OLDER ADULTS.**

C. SPENCER\* (Canadian Network for the Prevention of Elder Abuse, Vancouver, BC, Canada)  
A. LEANEY(1), M. YAFFE(1) - (1) Canadian Network for the Prevention of Elder Abuse (Canada)

**Introduction:** Senior abuse represents an important cause of morbidity and mortality in older adults. Only in the last 30 years has awareness of it gradually evolved, with W.H.O. international perspectives appearing in 2002. Most governments have been slow to provide leadership in this area. Canada, a bilingual (English/French) multicultural mosaic, extends almost 6000 kilometres from east to west. Its 10 provinces and 3 territories have their own mandates to address health and social services. This presentation describes the ten year experience and activities of the Canadian Network for Prevention of Elder Abuse (CNPEA), a national, non-profit, unfunded grassroots organization that has spanned a large, diverse country to address and prevent senior abuse. **Method:** Through word of mouth and email CNPEA has built a strong team of diverse stakeholders including seniors and seniors serving organizations, health and social service practitioners, academics/researchers, community developers, lawyers and police. In the absence of funding beyond in-kind contributions, initiatives undertaken by 22 members of an elected Board of Directors and a large membership is completely voluntary. Monthly 2 hour working meetings are conducted by teleconference, with detailed minutes to guide ad hoc work conducted outside of these gatherings. **Results:** CNPEA is a clearinghouse for promising approaches in the senior abuse field and a vehicle to promote awareness about mistreatment of older adults. It stimulates education on recognizing abuse and options for individual and community response. It promotes research including on tools that may better detect and respond to abuse. It encourages review of public policy at federal, provincial, and territorial levels. **Conclusions:** While an unscheduled encounter between Board members evoked the remark "Is that what you look like", CNPEA demonstrates that despite rarely meeting face to face and never as a whole group groundbreaking work can be accomplished

**PD8 856 A NEW AUSTRALIAN MODEL OF HOUSING AND CARE**

B. SQUIRES\* (The Benevolent Society, Paddington NSW, Australia)  
S. FOGG(1) - (1) The Benevolent Society (Paddington NSW, Australia)

**Introduction:** Australia's policies encourage older people to stay in their own homes for as long as possible, with the support of family and services. These policies assume secure, affordable and appropriate housing. However, while rates of home ownership among older Australians are high, inappropriate design and/or location can make staying in their own homes impossible. A premature move to residential aged care is expensive to the taxpayer and individual, is not what the majority of older people want and often jeopardises the social connections that are critical to their wellbeing. **Method:** The Benevolent Society has drawn on extensive research into Australian and overseas evidence (especially Humanitas's Apartments for Life in the Netherlands) to develop a new model of housing and care for older people. This included conducting a survey of people over 50 about their views on nursing homes, and the need for a new model. **Results:** The Apartments for Life Project is being trialled in Sydney. The key features of the model will be set out, with emphasis on what sets it apart from previous models of housing and/or care for older people in Australia i.e.: • 95% of residents able to stay in their own apartment to end of life, with community services when needed • design for a high level of adaptability • socio-economic and age diversity • provision of generous community facilities to encourage social participation and integration with the local community. The Project is in the detailed design phase. **Conclusion:** The model has the potential to overcome many of the limitations inherent in current provision by better integrating housing and care for older people, maximising their independence, autonomy and community participation, and minimising their need for high cost institutional care.

**PD8 857 LIFE QUALITY OF KOREAN OBESE ELDERLY: COMPARISON OF DEPRESSION AND LIFE SATISFACTION BETWEEN OBESE AND NON-OBESE**

E. PARK\* (Yonsei University, Seoul, Republic of Korea)  
K. DONG-BAE(1), L. JOO-YEUN(1) - (1) Yonsei University (Seoul, Republic of Korea)

**Introduction** In Korea population of obese people is growing due to various social changes such as an increase in elderly population or a more westernized diet. This study aims to examine the difference of life quality – level of depression and life satisfaction - between obese and non-obese elderly and analyze the influential factors. **Methods and materials** Research used the data of Korean Longitudinal Study of Ageing (2006), targeting 3,925 (65+). DVs were depression and life satisfaction. IVs were economic activities, social participation, health-improvement activities. CVs were gender, age, education, chronic diseases, economic status, residential areas. Subjects were divided into obese and non-obese group. SPSS 12.0 Package was used to analyze along with ANOVA and multi-regression. **Results** First, level of depression differed according to gender, age, chronic diseases, economic status, social participation while life satisfaction according to gender, age, education, chronic diseases, economic status, residential areas. Second, obese group showed a higher level of depression among those who were females, having lower education levels, chronic diseases, less social participation while non-obese group showed among those who were females, having older ages, lower education levels, lower social status, less economic activity, less social participation, more health-improvement activities. Third, obese group showed a higher level of life satisfaction among those who were males, having higher education levels, fewer chronic diseases, higher economic status, more social participation while non-obese group showed among those who were males, having younger ages, higher education levels,

fewer chronic diseases, higher economic status, rural residential areas, more economic activity, more social participation, less health-improvement activity. Conclusion First, there are diversified factors influencing differences of level of depression and life satisfaction. Second, influential factors of depression and life satisfaction were different between obese and non-obese group.

- PD8 858 GENDER DIFFERENCES IN THE PREFERENCE FOR PLACE OF DEATH AMONG COMMUNITY-DWELLING ELDERLY IN JAPAN**  
M. YAMASAKI\* (Tohoku university Institute of Development,Aging and cancer, Sendai, Japan)  
S. EBIHARA(1), T. EBIHARA(1), M. ASADA(1), S. YAMANDA(1), H. ARAI(1) - (1) Tohoku university Institute of Developement ,Aging and cancer (Aoba-ku,Sendai, Japan)

**Background:** The Ministry of Health, Labor, and Welfare in Japan is strongly promoting “death at home”. Research indicates that honoring the treatment preferences of terminally ill patients is critical for the provision of high quality care at the end of life. However, few studies have investigated the preference for place of death among the elderly in Japan. **Methods:** The survey was conducted from November 2006 to April 2007. Face-to-face questionnaires were given to all members older than 70 who lived in a village of Miyagi prefecture, northern Japan (n=126) and in an urban area of Kanagawa prefecture, central Japan (n=160). Subjects were aged 70 to 102 with a mean age of 77.0 + 6.1(SD). Questionnaires focused upon the place where the subjects want to be cared for when they die and demographic factors (housing status, personal medical history, degree of physical and mental independence). 150 males (average age 75.9 +5.3) and 136 females (average age 78.2 +6.6) responded. Results: 50% of respondents preferred to die at home, 33.6% in a hospital, and 5.2% in a nursing facility. No significant differences were found in the preferences of place to die among the number of family living together or by age. By gender, close to 60% of males preferred to die at home, whereas, the percentage of females who wanted to die at home and at hospital were both 40%. Conclusions: Even though an individual's personal values and the degree of physical and mental dependence can affect the desire of death at home or in a hospital, gender differences need to be taken into account. End-of-life care for elderly people should not be only home-based medical care but also other types of care.

- PD8 859 LONELINESS OF OLDER PEOPLE IN THE WELFARE STATE: THE MALE – FEMALE GRADIENT**  
B. MALMBERG\* (Institute of gerontology, Jönköping, Sweden)  
G. SUNDSTRÖM(1) - (1) Institute of gerontology, School of Health Sciences (Jönköping, Sweden)

**INTRODUCTION** A common Swedish stereotype about older people is that loneliness is typical for older women, rather than for ageing men. The problem with the stereotype is that feelings of loneliness are seldom reported either for aging men or women, although some studies show a higher prevalence for women and some indicate this to be a problem primarily among older men. **METHOD** We use several national and local surveys to analyze gender differences in perceived loneliness. Most of the surveys are longitudinal, which enable us to analyze changes during ageing. **RESULTS** Older Swedes living in the community are either married or live alone, and the latter group reports more loneliness. Two marriages out of three end with the death of the husband, and control for marital status will erase most gender differences in loneliness. Yet, in the age group 80+ men who live alone report higher loneliness than women who live alone. At that age, most men are still married, but most women live alone. Both these patterns are even more pronounced in the age group 90+. **CONCLUSIONS** We interpret the results as outcomes of selection mechanisms and reflections of male-female differences in adaptation to change in marital status. Surviving men who live alone may more often be working-class and of poor health, while women who live alone are socially and health-wise a more heterogeneous group. There may also be a difference in marital background, coloring the way men and women see their situation: men more often have had their wife as their only confidant, women have a broader social network and may even see their new solitary life as a relief.

- PD8 860 AN ANALYSIS OF THE INFLUENCE OF WORK ENVIRONMENT ON THE JOB RETENTION OF HOSPITAL NURSES IN JAPAN**  
Y. OGATA\* (Chiba University, Chiba, Japan)  
M. NAGANO(1), M. HASHIMOTO(2) - (1) Chiba University, Graduate School of Nursing (Chiba, Japan); (2) Yokohama City University (Yokohama, Japan)

**Introduction:** The graying of society is rapidly occurring in Japan. Nurses are one of the most important health professionals for continuous support of elderly care in the aging society. However, Japan is also facing nursing shortage like many other countries. In Japan, the high turnover rate of full-time nurses in hospitals is focused on, especially for newly graduated nurses (9.2% in their first year). It is urgently necessary to identify what factors affect their job retention. The purpose of this study was to examine how the work environment affects job retention of hospital nurses. **Methods:** A cross sectional mail survey was conducted using the Practice Environment Scale of the Nursing Work Index (PES-NWI) questionnaire among 2,211 nurses working at 5 hospitals in the Tokyo metropolitan area. In the questionnaire, nurses were also asked whether they would work at

the same hospitals next year. Logistic regression analysis was carried out, with “intention to retain or leave the workplace next year” as dependent variable, and the 5 sub-scale scores of the PES-NWI and other variables as independent variables. **Results:** Average age of the 1,067 respondents was 29.2 years old, 95.9% of them were women. About 30% of them intended to leave the hospitals in the next year. Cronbach's coefficient alphas of each sub-scale of the PES-NWI were from 0.77 to 0.85. In the logistic regression analysis, one of the 5 sub-scales, emotional exhaustion level of burnout and job satisfaction were associated with the nurses' intention to stay on, significantly. **Conclusion:** Work environment was also important factors in retaining nurses working at hospitals. In this study, we confirmed the reliability of the PES-NWI by the magnitude of alpha coefficient.

- PD8 861 SOCIAL WORK WITH OLDER PEOPLE AND PREVENTATIVE SERVICES: DEVELOPING INNOVATIVE MODELS OF ASSESSMENT AND SERVICE PROVISION FOR THE FUTURE GENERATION OF OLDER PEOPLE**  
C. BEECH\* (Swansea University, Swansea, United Kingdom)  
J. PHILLIPS(1) - (1) Swansea University (Swansea, United Kingdom)

Wales is at the forefront of major policy initiatives that acknowledge the importance of person-centred, community-level approaches that promote and maintain the independence of older people. A critical area in achieving these policy imperatives is the development of a portfolio of services, including a quality social work service, which will promote and maintain the independence of older people. A series of qualitative focus groups and individual interviews were conducted with groups of older people aged 65 and over and a younger cohort aged 45 to 65. Themes such as experiences of and expectations for ageing, independence, environment and transitions were explored along with their views on innovative models of service provision drawn from National and International examples. Focus groups with social work professionals were also conducted aimed at exploring ways in which social workers might be enabled to be more creative and innovative in meeting needs and in assessment. Analysis suggests older people view statutory services as a direct threat to their independence. A paucity of knowledge and information relating to role, function and available support was implicated in addition to parsimonious eligibility criteria and charging policies. Further, the role of the social worker in promoting and maintaining the independence of older people is unclear. Creative and innovative practice is an undefined concept which is at odds with the present culture of risk-aversion and defensive practice designed to protect the individual professional from censure and litigation.

- PD8 862 SOCIAL INTERACTIONS : A ROLE IN SUCCESSFUL AGING?**  
MULTICENTRIC-STUDY IN AGIRC-ARRCO PREVENTION CENTERS IN FRANCE  
F. MARTIN\* (CEDIP, Toulouse, France)  
V. BATAILLE(1), M. FERRY(2), P. DEJARDIN(3), J. AQUINO(4), A. SAINT-LAURENT(5) - (1) CEDIP (Toulouse, France); (2) CDPRV (Valence, France); (3) Observatoire de l'Age (75010, France); (4) Clinique de la Porte Verte (Versailles, France); (5) AGIRC-ARRCO, GIE (France)

**Introduction:** We describe relationships between social interactions and successful aging by a multicentric study conducted in France during 2008. **Methods:** 1172 men and women attended a checkup in one of the 10 participating prevention centers (supplementary pension institutions) located all-over the French territory. Subjects were classified into 3 groups according to their regular social interactions [RSI]: 1) RSI with parents, friends and associations (3 different types of contacts [TC]). 2) RSI with only 2 of these 3 TC. 3) RSI with only 1 or none of these 3 TC. They had to evaluate the quality of their own aging (scale from 0 to 10: successful aging). Subjects who reported less than 7/10 were considered as experiencing difficulties in aging ("unsuccessful aging"). A stepwise descendant logistic regression was used to test the independence of the relationships between social interactions and self-reported difficulties in aging. **Results:** Women were 58% (median age 66y (interquartile: 62-71)). According to the scale, 27% experienced difficulties in aging. This proportion grew with age ( $p<0.01$ ) and was higher in subjects living alone ( $p<0.01$ ), those perceiving their income as insufficient ( $p<0.01$ ), subjects reporting a low health status or currently taking several treatments ( $p<0.001$ ). Self-evaluated successful aging was strongly associated with social interactions: proportions of unsuccessful aging were respectively 17%, 25% and 41% in groups 1, 2 and 3 ( $p<0.001$ ). And, compared with group 1, odds-ratios for experiencing difficulties in aging were 1.46 [1.02-2.09] for group 2 and 3.10 [3.12-7.82] for group 3 (trend $<0.001$ ), independently of age and low health status. **Conclusions:** In this study, successful aging was strongly associated with social interactions, adding further evidence that elderly's socialisation is crucial in prevention.

- PD8 863 THE FRENCH NATIONAL ORGANIZATION AGAINST MISTREATMENT: THE FIRST SOFTWARE FOR GLOBAL VISION AND PREVENTION?**  
C. LEMOINE\* (AFBAH, Villejuif, France)  
B. DUPORTET(1), M. MAUGOURD(2), S. SAPIO(1) - (1) AFBAH (Villejuif, France); (2) Hôpital Georges Clémenceau (Champcueil, France)

**Introduction** This communication will present the French organization fighting mistreatment against elderly or disabled people, based on coordination between: - national phone number (3977); - local help and counsel; The system uses experience of long installed voluntary organizations and government services. All the mistreatment situations are registered with a software developped for the 3977, permitting data storage, securised exchanges and statistics based on the registered situations. Methods and materials This communication will present: - the organisation, from first call to help given with its call center and local structures, - security and confidentiality questions; - the different ways the software is used: for registering data regarding a call or exchanging datas between actors... - the analysis and statistics offered by the software. They are either local or national, based on all the situations integrated in the database. Results To fight mistreatment against elderly or disabled people, France is now creating a national network, using the same tools on all the territory for better knowing of mistreatment, better prevention, better action. French statistics for the 2008 year are based on 19 500 answered calls and 6 200 registered situations, which is one of the most important statistical series . Conclusion This system is using modern technologies to facilitate data exchanges between partners and to permit a global vision of mistreatments. The data collected are a unique source to know more about mistreatments and to improve politics of prevention. It's a significant contribution for international researches on these subjects. If the organisation is inherent to the administrative particularities of the country, the technology could be used by each country looking for a modern way to fight mistreatments.

**PD8 864 WELFARE STATE PERFORMANCE AND SOCIAL JUSTICE PREFERENCES IN AGEING SOCIETIES**  
O. JÜRGENS\* (German Center of Gerontology, Berlin, Germany)

**Introduction:** The challenges of an ageing society are exerting severe pressures on the economies of most European societies in terms of both an ageing workforce and a decreasing number of people of working age. The increasing life expectancy also imposes new restrictions on the pension system and on the welfare state. As a consequence, policy makers and voters alike are increasingly questioning the welfare state and its legitimacy. Thus, it is also the topic "Social Justice" which is attracting more and more attention. **Methods and materials:** The study evaluates in a cross-national perspective how the welfare state works with reference to empirical social justice principles on the one hand, and the living conditions of the elderly on the other. Referring to actual living conditions in several dimensions of social justice, it empirically evaluates both the social justice concepts and the welfare state's performance over time, using relevant survey and panel data. The welfare states are represented by Italy, Germany, Finland, and the UK. The justice conceptions are evaluated using the ISSP data (International Social Science Project). The welfare state performance over time is analyzed on the basis of the European Community Household Panel. **Results and Conclusion:** Preliminary results suggest that the Scandinavian model is the most successful in combating poverty and providing minimum social security standards. Thus, it comes closest to social justice conceptions. The performances of both the Southern European model and the conservative model vary considerably with reference to regional differences within the countries. Therefore they are only partly more successful in combating poverty than the liberal state; moreover, when considering other dimensions of distributive justice as labor market participation it becomes evident that their welfare state performance can be even worse.

**PD8 865 RETHINKING THE GENDER GAP IN HEALTH IN OLD AGE: CHANGING GENDER DIFFERENCE IN SELF-REPORTED HEALTH THROUGH COHORTS AND PERIODS**  
Y. SUEN\* (Oxford Institute of Ageing, Oxford, United Kingdom)

**Introduction:** The aim of this study is to examine the changes of gender differences in self-reported health in old age through cohorts in the UK from the 1970s to 2000s. Using a life course perspective, this paper discusses the process through historical and social developments that the definitions and meanings of gender in old age have changed. It challenges the conventional understanding that older women are 'sicker' and argues that more resources should be channeled for older men's health as well. **Methods and Materials:** Using the General Household Survey time-series data, this paper explores the changes in self-reported health status for men and women aged 65 and over through cohorts and historical time. **Results:** It is found that while there was significant gender difference in reporting poor health for those born between 1880 and 1920, the difference was not observed for those born between 1921 and 1940. It is also found that compared to the 1970s and 1980s, gender difference in reporting poor health in old age decreased in the 1990s and diminished to a negligible level in the 2000s. **Conclusions:** The results challenge the conventional understanding of comparative disadvantage of older women in the literature and it has shown that historical timing plays an important role in the relationship between gender and ageing. As a start, these findings imply that gender differences in old age are embedded in the historically different social environments in which individuals grew up. It is concluded that there is a need to examine gender differences in old age at

various historical timings. It implies that policies and government agencies shall reconsider its resource allocation on a more gender-sensitive basis.

**PD8 866 HOME CARE FOR SENIORS SUFFERING FROM MENTAL ILLNESS: DIMENSIONS OF THE DECISION-MAKING PROCESS**

S. PAQUET\* (Université Laval, Québec, Canada)  
B. DALLAIRE(1), A. SÉVIGNY(2) - (1) Université Laval, École de service social (Québec, Canada); (2) Hôpital St-Sacrement (CEVQ) (Québec, Canada)

**Introduction:** In Québec, the population aged over 65 years old will grow from 14% to 31% over the next forty years. As with the general population, life expectancy for people identified as mentally ill tends to improve. This new reality raises challenges for the health system which presently focuses on social reintegration and social measures facilitating patients' home follow-up care. One of these challenges relates to the nature of the care to be given. In order to identify the professional responsible for this care, the decision-making process adopted by stakeholders appears to be a determining factor. This presentation explores the organisational and expressive components at stake in determining the decisional trajectory. **Methods and materials:** This study is based on open-ended interviews with two groups of stakeholders working in an organisation offering home follow-up care to individuals suffering from severe mental disorders. The interviews were conducted following a qualitative content analysis as well as a literature review of stakeholders' practice guides. **Results:** Preliminary results indicate that the dimensions relevant to the structure of service (organisational component) and those linked to the stakeholders' representations (expressive component) interact during the decision-making process. This indicates the constructed nature of the concept of "needs". **Conclusion:** Our analysis shows that a senior's psychiatric pathology does not constitute a determining factor of his or her follow-up plan. Incapacities linked to aging seem to have a greater influence. This leads to a despecification of the modalities of care for older people suffering from mental disorders and to the development of a particular representation of insanity that likens it to a handicap, to a person's dysfunctional adjustment to his or her environment.

**PD8 867 POVERTY AND DISABILITY TRANSITIONS IN MIDDLE AND LATER LIFE: IMPACT ON SOCIAL ISOLATION**

S. CLOUSTON\* (University of Victoria, Victoria, Canada)  
M. PENNING(1) - (1) University of Victoria (Victoria, Canada)

**Introduction:** Recent research has focused on the impact of life course transitions on a variety of outcomes. In particular, studies have addressed the impact of poverty transitions on various health and disability outcomes, with some attention also given to the impact of disability transitions on other relevant outcomes, such as social isolation and participation. However, less attention has been given to intersecting transitions. As a result, little is known regarding the implications of becoming disabled when one has never been poor versus becoming disabled when one has always been poor. We know even less about the differential implications of experiencing both transitions together: becoming poor while becoming disabled. This is particularly evident in the Canadian context. **Methods and Materials:** This paper reports preliminary analyses conducted to address the impact of both poverty and disability transitions on social isolation and participation in late middle age and later life. Data are drawn from the Canadian National Population Health Survey (NPHS), Household Component, longitudinal data files (Cycles 1 to 7 (1994/95 to 2006/07). These include data obtained from a nationally representative sample of 5,404 respondents aged 50 and over when first interviewed in 1994/95. **Results and Conclusion:** Preliminary findings suggest that disability is worse for those who are always poor than those who are always rich, but that the transition is particularly difficult for those who experience transitions simultaneously. Research and policy implications are discussed.

**PD8 868 HEALTH PROMOTION AND PRIMARY PREVENTION FOR OLDER MIGRANTS: IMPROVING ACCESS AND EFFECTIVENESS**

E. OLBERMANN\* (Institute of Gerontology at the Technical University of Dortmund, Dortmund, Germany)

**Introduction:** Because older migrants are especially affected by health exposures and risks, prevention and health promotion would be of utmost importance to enhance their quality of life and to enable an independent living up to old age. Nevertheless, participation rates of older migrants in preventive and health promoting programs are rather low. The project "Health Promotion and Primary Prevention for Older Migrants" (funded by German Federal Ministry of Education and Research) aims to obtain deeper insights into the requirements concerning the access to and the effectiveness of preventive and health promoting activities and measures. **Methods and materials:** A qualitative research approach with three interview periods (in 2008, 2009, 2010) is used including 120 in-depth interviews with older migrants (40 attendants and non-attendants of prevention offers per period), 30 expert interviews (10 experts per period), and four workshops with older migrants and experts. **Results:** Results of the first research period show that social contacts, personal exchange, communication and activities with peers, especially those from the same country of origin, are of high importance for prevention and health promotion. Regular meetings and the possibility to communicate in native language promote the participation in and the sustainability of special health promoting measures (offers for

exercise, recreation and nutrition etc.). Conclusion: The results indicate that a more intensive and more target group-oriented cooperation between social service providers and health system on the community level would be an important step to improve access and effectiveness of health promotion for older migrants.

**PD8 869 INCIDENCE OF STROKE ACCORDING TO INCOME LEVEL IN AN ELDERLY COHORT: THE 3C STUDY**

O. GRIMAUD\* (French School of Public Health, Rennes, France)  
C. DUFOUIL(1), A. ALPÉROVITCH(1), F. PICO(1), K. RITCHIE(2), J. DARTIGUES(3), C. TZOURIO(1), P. CHAUVIN(4) - (1) INSERM U708 (Paris, France); (2) INSERM E361 (Montpellier, France); (3) INSERM U593 (Bordeaux, France); (4) INSERM U707 (Paris, France)

Introduction Under the age of 65, stroke like most other diseases has been shown to follow a gradient favouring those at higher socioeconomic levels. The majority of strokes however occur in older people and less is known about the social gradient and the risk of stroke in the elderly. Methods and materials Between 1999 and 2000, the "3-City" cohort enrolled 9294 non-institutionalised French residents aged 65 years or more. Baseline information included socioeconomic status and cardiovascular risk factors. Occurrence and type of stroke were ascertained during the 6 years follow-up period. We used Cox proportional hazards models to examine the relation between stroke incidence and income, adjusting for potential confounding factors. Results Complete data was available for 8087 participants, of which 2802 (35%) were in the high income category (> 2287€ per month). These were younger, more likely to be male and to live with a partner. They were less frequently overweighted, hypertensive or diabetic (all p values <0.05). Stroke incidence rate was 4.28 per 1000 person-years (95% CI: 3.68-4.98). Stroke incidence was higher among the high income group and this association was marginally significant in multivariable models (hazard ratio 1.37; 95% CI:0.99-1.89). High income was significantly associated with a higher incidence of ischemic stroke (age and sex adjusted hazard ratio 1.54; 95% CI:1.07-2.22). This association remained significant when potential confounders were taken into account (hazard ratio: 1.67; 95%CI: 1.15-2.41). Conclusions In this cohort of older adults, high income was associated with higher risk of ischemic stroke over 6-year follow-up, despite lower prevalence of risk factors. Selective survival could be one possible explanation for this unexpected finding.

**PD8 870 USING AUSTRALIA'S AGED CARE ASSESSMENT PROGRAM (ACAP) MINIMUM DATA SET TO INFORM POLICY AND PRACTICE**

Y. WELLS\* (La Trobe University, Bundoora, Australia)

Introduction The Aged Care Assessment Program (ACAP) is an integral part of Australia's aged care system. Its core objective is to assess the needs of frail older people comprehensively and to facilitate access to available care services appropriate to their needs. The National Data Repository was commissioned in 2004 to collect the ACAP Minimum Data Set and to report on the data using Key Performance Indicators. In this paper, examples of the role and value of the NDR will be presented. Specifically, the dataset was used to address the questions: whether provision of community services reduces the risk that older people will be admitted to residential care; and if so, for which groups. Methods and materials Data from the 2006-2007 MDS were used. Records were selected for clients who were living in the community at assessment. Multivariate logistic regression was used to compare clients recommended to the community with those recommended to residential care. Results Clients who used Home and Community Care (HACC) or packaged care services prior to assessment were more likely than those who did not to be recommended to the community rather than to residential care. HACC was particularly effective for clients with no carers or from non-English-speaking countries. However, use of residential respite increased the likelihood of being recommended to residential care. Conclusion Administrative by-product data can usefully be employed to address questions of theoretical and practical interest, as well as providing useful information to inform policy. The data sets are large enough to investigate subtle features of the data such as interaction effects. For example, the ACAP MDS demonstrates that community services are particularly effective in supporting specific subgroups of older people in the community, such as those who do not have family carers or are from culturally diverse backgrounds.

**PD8 871 SHEDDING THE LIGHT ON MEN: THE WOLLONGONG MEN'S PROJECT**

D. FILDES\* (University of Wollongong, Wollongong, Australia)

Introduction Men's sheds are community based organisations where men can enjoy each others company and where self-worth can be promoted. At the same time skills can be developed for both the individual and the community. For older men these sheds offers the opportunity to make new mates and to form a new retirement identity by offering many of the positive things that paid work offered them. They are seen as a positive approach to men's health and social needs and as a result many Australian State and Territory Health Services have funded and/or promoted them from a health promotion perspective. The Wollongong Men's Project has operated as a shed-based group program since October 2005. The aim of the project is to provide a group of retired and/or unemployed men from

a multicultural background with opportunities for developing practical skills with a view to reducing their social isolation and increasing their self-esteem and sense of purpose. The project provides a shed space, resources, a community cultural arts worker and a multicultural health worker who work with the men on a range of skilled based activities. Methods and materials Evaluation was carried out using a Participatory Action Research (PAR) process together with a range of data collection tools. Results The evaluation has shown that the men have an increased sense of purpose and self confidence as a direct result of their involvement in the project. They have also broadened their social networks and have increased their skill levels. Conclusion The evaluation of the Wollongong Men's Project has provided some valuable lessons. All-male social support networks, without the usual self destructive or hazardous behaviours associated with male bonding rituals, are an important development in health promotion programs that can do the preventive work that the mental health system has largely abandoned.

**PD8 872 DEVELOPING AGE FRIENDLY COMMUNITIES: PEOPLE, PROCESS AND PLANNING PROGRESS IN A NEW ZEALAND BEACHSIDE COMMUNITY.**

C. GORDON\* (Bay of Plenty District Health Board, Tauranga, New Zealand)

The Bay of Plenty is a high growth coastal region that traditionally attracts retirement settlement. Planning for ageing communities is a challenge for health board and local governments as an integral part of sustainable urban development. A Health Impact Assessment (HIA) project was commissioned to provide input to improving the built environment, town facilities and health service delivery planning at Waikite Beach. It is envisaged that this project will inform future regional planning initiatives in high ageing communities. The study engaged residents, local organizations and stakeholder service providers in processes to determine improvements needed to enable elders to 'age-in-place'. The methodology utilized a national evidence-based model for undertaking HIA processes. Community outcomes were further analysed based on the WHO Age-friendly Cities model to identify key socio-economic determinants of health actions. Participants indicated that there are major barriers such as transport, and health service contracts that limit their ability to remain socially connected or maintain independence within a caring and supportive community. The lack of integrated planning to date is also a barrier to local elder initiative and leadership. Maori people have concern over unresolved land issues that affect their wellbeing in the current urban growth environment. The study shows that planning for age friendly communities will require pro-active advocacy to achieve timely responsive planning by informed and age aware local government and health authorities. The study outcomes reflect a potential for collaboration to address key socio-economic determinants of health. The outcomes indicate a need to foster planning for participation in community activities to maintain elder wellbeing and independence. There is a need for further planning to address equity in the integration of primary health service delivery options to ensure quality care and support.

**PD8 873 LONELINESS, SOCIAL NETWORKS AND MORTALITY AT AGES 70, 77 AND 85**

E. IECOVICH\* (Hadassah Hebrew-University Medical center, Jerusalem, Israel)  
J. JACOBS(2), J. STESSMAN(2) - (2) Hadassah Hebrew University Medical Center (Jerusalem, Israel)

Introduction: We examined the influence of changes in loneliness and social support networks upon mortality during 18 years of follow-up among an elderly cohort and determined the gender-specific nature of this relationship. Materials and Method: The study is based on data collected from the Jerusalem Longitudinal Cohort Study (1990-2008), which has followed a representative sample of 605 community-dwelling elderly people. Subjects were randomly selected from an age homogenous cohort born 1920-1921 and were aged 70, 78 and 85 when data were collected at baseline in 1990 and at follow-up in 1998 and 2005. All-cause mortality from age 70-88 was determined according to the National Death Registry. Subjects underwent comprehensive assessment of numerous domains, including a single item question concerning sense of loneliness, as well as parameters of social networks. Results: At age 70, 78 and 85 the rates of subjects who reported being lonely were 33.1%, 31.6% and 35.8% respectively. Sense of loneliness was found to be stable throughout the period of follow up among the majority of the respondents. Among the 605 subjects followed from age 70 over 18 years, Kaplan-Meier survival charts showed a significant association between loneliness and reduced survival. Loneliness among men was found in bivariate analyses to be a risk factor for mortality. Although Cox proportional hazards models found that loneliness itself was not a significant predictor of mortality, nonetheless several social network factors (marital status at the baseline and living arrangements) were found to predict mortality among men. Conclusions: Loneliness and solitude among elderly men can be a risk factor of mortality. The findings imply that attention should be given to this high-risk group.

**PD8 874 RETIREMENT, ASSET OWNERSHIP, AND LIFE SATISFACTION AMONG OLDER ADULTS IN SOUTH KOREA: DO ASSETS MATTER IN LATER LIFE?**

S. HONG\* (National University of Singapore, Singapore, Singapore)  
C. HAN(1) - (1) National University of Singapore (Singapore, Singapore)

Introduction. Although retirement is a significant life-course event, many older adults retire without savings and assets enough to sustain economic security in later life. Economic

insecurity may hamper older adults' psychosocial well-being such as life satisfaction. In light of asset effects buffering economic hardships, this study examines (1) to what extent assets are positively associated with life satisfaction among Korean older adults, and (2) whether assets moderate the negative relationship between retirement and life satisfaction. Methods. This study analyzed the first two-wave (2005 and 2007) panel data from the Korean Retirement and Income Study with the nationally representative sample of older adults aged 50 and above (N=5,390). Retirement was measured as a dichotomous variable. Asset measures were decomposed into financial assets, home ownership, other real assets, and debt. Considering the multidimensionality of life satisfaction, a latent class analysis (LCA) was used to classify homogenous subgroups based on the associations among six items. We used a multiple imputation technique for missing values. Results. LCA found three-class models as the best classification at both waves: high life satisfaction class, moderate life satisfaction class, and low life satisfaction class. We also found dynamic patterns in the classes for the 2-year period. By and large, life satisfaction showed downward changes for the period. Retired older adults showed higher probabilities of being the low life satisfaction class. Homeownership and other real assets increased the likelihoods of being high life satisfaction class. In addition, we found that assets partially moderate the negative impacts of retirement on life satisfaction. Conclusion. This study supports activity theory for successful aging. The findings also suggest that asset ownership has significant effects on life satisfaction in later life and that asset-building programs should be developed to help people prepare later life after retirement.

**PD8 875 EXPECTATIONS OF NEW ZEALAND BABY BOOMERS AND POLICY ISSUES - VALUING OLDER AGE**

K. GLASGOW\* (Victoria University of Wellington, New Zealand, Paekakariki, New Zealand)

Introduction: New Zealand differs from other western developing countries in some significant ways. Population ageing is not as advanced, the total population is small, and policy responses are made in the context of a highly centralised political administration. The country now faces the prospects of a comparatively large baby boom cohort coming into older age and the challenge of how to accommodate their expectations. This paper will present findings from PhD research with baby boomers about those expectations and policy implications. Methods: A series of eleven focus groups were held around the country to explore older and younger boomers' attitudes to old age and lifestyle expectations. The resulting data was analysed to identify common beliefs and values, which were then contrasted with current policy values and paradigms. Results: New Zealand baby boomers expect to age differently from previous generations and are keen to pursue individualised alternative lifestyles as they age. Despite high expectations for their own active and healthy ageing, most felt they were not well prepared for older age. They commonly felt they had been a lucky generation, having benefited from a supportive welfare state and prosperous conditions that no longer existed. They were concerned about the level and quality of support available and were wary of policy that might reduce choice, autonomy and freedom. Conclusions: New Zealand baby boomers believe they have been at the forefront of social change and expect to draw on previous experience to collectively influence policy in the future. While it remains unclear on which issues they will converge, the boomer cohort has the potential and inclination to advocate for social change. Processes of policy development will need adaptation to effectively work with, and not against, this cohort.

**PD8 876 EFFECTS OF A CONSUMER-DIRECTED VOUCHER ON SATISFACTION, EMPOWERMENT, AND HEALTH & DISABILITY STATUS**

B. FRIEDMAN\* (University of Rochester, Rochester, United States)  
B. WAMSLEY(1), G. EGGERT(2) - (1) West Virginia State University (INstitute, WV, United States of America); (2) Monroe County Long Term Care Program, Inc. (ACCESS) (Rochester, NY, United States of America)

Introduction: While there has been increasing interest in the use of consumer-directed vouchers to finance long term care goods and services, few studies have examined the effects of such vouchers on patient satisfaction, empowerment, and health and disability status. Methods and Materials: The Medicare Primary and Consumer-Directed Care Demonstration was a 24-month randomized controlled trial that included a consumer-directed voucher intervention. The present study (N=803) compares the Voucher (n=419) and Control (n=384) groups. Generalized linear models for repeated measures, linear regression, and ordered logit regression were employed. Results: The study sample had a mean age of 77.9 years, one third was male, and 3.7% were members of racial or ethnic minorities. A total of 27.0% had evidence of definite cognitive impairment, and participants were dependent in a mean of 2.4 ADLs and 3.6 IADLs. In the Voucher group, 94.0% received reimbursement from the Voucher benefit for goods or services including 82.1% for adaptive and assistive equipment, 62.5% for consumable care goods, 44.6% for in-home workers, and 41.0% for environmental modifications. The average subject received a mean total of \$2,165 (SD=\$1,844) in Voucher payments. Patient and informal caregiver satisfaction with the Voucher program was very high, about 4.5 for each on a scale of 1 (not at all satisfied) to 5 (completely satisfied) at both 10 and 20 months postbaseline. Even so, the Voucher intervention had no impact at 22 months on five measures of empowerment including general self-efficacy, health self-efficacy, and chance, internal, and powerful others health locus of control, as well as on five health and

disability status measures including self-rated health status, SF-36 PCS score, SF-36 MCS score, number of ADL dependencies, and number of IADL dependencies. Conclusion: Despite very high satisfaction, the Voucher intervention appeared to have little effect on patient empowerment and health and disability status.

**PD8 877 REGULATION OF RESIDENTIAL AGED CARE IN AUSTRALIA - TURNING KNIGHTS INTO KNAVES?**

C. HAYTER \* (Macquarie University, Sydney , Sydney , Australia)

Introduction Residential aged care services in Australia have undergone a regulatory revolution with the introduction of the Aged Care Act in 1997. Services are accredited by an external agency every three years and must meet 44 Residential Aged Care Standards to receive government funding. This paper explores the economic assumptions that have underpinned these changes. It debates whether regulatory changes have resulted in improved care outcomes for older people living in residential aged care services. Method Le Grand (1997) argues there has been a fundamental shift in the assumptions about human behaviour that is reflected in policy design in human services, shifting from assumptions of altruism (knightly behaviour) to self interest (knavish behaviour). This paper explores whether the assumption of self interest as argued by Le Grand is embedded in the regulatory framework for residential aged care services in Australia introduced through the Aged Care Act 1997. Le Grand's research is used to analyse the relationship between changes in regulation of residential aged care services and economic theory, in particular the assumption of self interest. The paper analyses Accreditation outcomes for residential aged care services in Australia between 1997 and 2003. Results The research highlights how the regulatory changes have increased reporting and documentation requirements of residential aged care with little evidence of improved care outcomes for older people living in residential aged care services. The research highlights that regulatory changes have reduced staff time and availability to provide care. Conclusion There needs to be a more sophisticated debate about the purpose of regulation of residential aged care services in Australia focusing on ensuring high quality care outcomes for older people rather than on documentation and auditing processes. The economic assumption of self interest of all actors underpinning these changes need to be challenged.

**PD8 878 BETTER UNDERSTANDING AND ADDRESSING LONELINESS FOR OLDER AUSTRALIANS**

A. BALLATYNNE\* (University of South Australia, ADELAIDE, Australia)  
J. CHEEK(1), B. ALISON(1), O. DEBORAH(2), M. WENDY(3), S. MANDY(1), C. MEGAN(4), S. ANDREW(5), Y. BEVERLEY(6) - (1) University of South Australia (ADELAIDE, Australia); (2) RSL Care (FORTITUDE VALLEY, Australia); (3) Griffith University (5001, Australia); (4) Helping Hand Aged Care Inc. (NORTH ADELAIDE, Australia); (5) ECH Inc (Australia); (6) Southern Cross Care (SA) Inc (Australia)

Introduction For many older Australians, loneliness is a pressing social and health issue. As Australia's population ages, greater numbers of people aged 65 years and over are likely to experience negative social, emotional, and physical health problems associated with loneliness. Supported by an ARC grant in collaboration with industry partners in two Australian states this study provides in depth understandings of loneliness. Better understandings of what loneliness is has assisted service providers to develop more targeted interventions and strategies designed to address loneliness in older people. Methods This qualitative study involved 60 interviews with older people across two Australian states and four focus groups in each state with service providers. Sampling was purposive, and included people from metropolitan and rural areas and older people from a range of living situations. Data was analysed thematically. The analysis then informed the development of strategies to assist in the management of that loneliness. Such strategies were designed to strengthen existing practice and develop new practices where appropriate. Findings / Results There are five dimensions of loneliness which have emerged from the analysis: loneliness as private; relational; connectedness, temporal; and readjustment. While each dimension is distinct, all are intertwined. The dimensions demonstrate that loneliness is complex and diverse, bound to the context in which it is perceived, understood and experienced. While loneliness may be connected to social isolation it is distinct from it. Four demonstration projects will be discussed to show how these findings can be translated into, and impact on, practice. Conclusion Having an in-depth understanding of loneliness from the perspective of older people and service providers provides a conceptual basis for generating solutions to prevent loneliness or to enable older people to manage themselves.

**PD8 879 EFFECT OF NON-CONTRIBUTORY SOCIAL PENSION PROGRAM OVER DEPRESSION AMONG POOR AND RURAL MEXICAN ELDERLY. A DISCONTINUITY REGRESSION DESIGN**

A. SALINAS\* (National Institute of Public Health, Cuernavaca, Morelos, Mexico)  
M. TELLEZ-ROJO(1), B. MANRIQUE-ESPINOZA(1), L. MENDOZA-ALVARADO(1) - (1) National Institute of Public Health (Cuernavaca, Mexico)

Introduction. Recently (2007) a social pension program (70 y más) was implemented in Mexico, whose beneficiaries are older adults aged 70 and over. The program consists in an unconditional transfer of 50 dollars monthly, and actions of social promotion and

participation. Aspects evaluated includes economic, health (physic and mental), and nutritional outcomes. Also includes an application of Geriatric Depression Scale (GDS) to identify older adults with depressive symptoms (DS). Objective. To evaluate the effect of 70 y más over DS in a population of rural and poor older adults. Methods and materials. We applied a discontinuity regression design to evaluate the effect of 70 y más based on rules of operation of the program, which determines that older adults beneficiaries are those aged 70 over and lived in rural areas (less than 2,500 inhabitants). So that we have two control groups, one based on age (1,500 older adults aged 65-69) and other 1,500 (aged 70-74) based on non intervention areas. Intervention group includes 1,500 older adults aged 70-74. We have two measurements, the base-line (before program stars) and one follow-up eleven months later. Results. Prevalence of DS were 28% for intervention group, 28.5% for control group based on age, and 36% for control group based on residence area. For control group based on age, we didn't find effect of 70 y más over DS ( $OR=0.95$ ,  $p\text{-value}=0.30$ ), whereas for control group based on residence area, the program diminish the probability of having DS ( $OR=0.12$ ,  $p\text{-value}<0.001$ ). Conclusions. Although depressive symptoms were frequent in this population, the program 70 y más seems to have a positive effect on prevalence of depressive symptoms, especially when comparing older adults of the same age but with different places of residence.

**PD8 881 SOCIAL AND CULTURAL CONSTRUCTION OF ELDER MISTREATMENT: DEFINITION, PERCEPTION, AND HELP-SEEKING BEHAVIOR AMONG KOREAN OLDER PERSONS**

S. KANG\* (Hallym univ, Chuncheon, Republic of Korea)  
H. LEE(1) - (1) University of Minnesota (United States of America)

Elder mistreatment detrimentally affects an older person's physical, psychological, and social well-being. In contrast to a rapidly growing trend of elder mistreatment among older adults, research in this area has been sparse in Korea. The purpose of this study is to document socially and culturally-embedded definitions of elder mistreatment voiced by older persons. This study also aims to identify risk factors associated with perceptions of and help-seeking behavior for elder mistreatment. By using six hypothetical elder mistreatment scenarios representing five major types of elder mistreatment, a mixed-methods approach was employed with a sample of 124 Korean older persons drawn by a quota sampling strategy. Findings indicated that the vast majority of definitions generated by the sample were defined on the basis of their cultural and social contexts. Korean older persons showed less sensitivity to elder mistreatment, especially when perceiving problems of self-neglect, neglect, and physical mistreatment in a couple. A negative attitude toward seeking help was found with higher preference of seeking informal types of help rather than formal help. Korea older persons try to keep their family names and to protect their adult children even in painful elder mistreatment situations. Findings point to the importance of the incorporation of cultural and social contexts when formulating elder mistreatment prevention and intervention programs, and designing social welfare policies for Korean older persons.

**PD8 882 TRANSITIONS IN LIVING ARRANGEMENTS AND PSYCHOLOGICAL WELL-BEING OF THE KOREAN ELDERLY**

J. YOON\* (Hallym Univ, Chuncheon, Republic of Korea)

Relatively high prevalence of co-residence between older parents and adult children in Korea is generally interpreted as a structural manifestation of traditional family norms - filial piety. However, recent socioeconomic changes in Korea have called this into question. This study examines the relationship between transitions in living arrangements and psychological well-being among Korean older persons. Data came from a three-wave panel study of Hallym Aging Longitudinal Study. The baseline data of Wave 1 (2003) consisted of the 1,991 respondents aged 61 and over who had at least one living child, then became 987 for the third interval (2007). Living arrangements consists of five categories: living alone, living with spouse only, living with married children, living with unmarried children, and living with grandchildren. Psychological well-being was measured by the PGCMS developed by Lawton. The relationship between transitions in living arrangements and psychological well-being was analyzed by using multivariate OLS regression. More than quarter of the elderly made transitions in living arrangements from 2003 to 2007, indicating remarkable unstability over this time period. Transition from living with adult children to living alone, from living with spouse only to living alone, and from living with adult children to living with grandchildren were associated with worse psychological well-being. Associative factors of psychological well-being varied by gender, health status, and income.

**PD8 883 A COMPARATIVE STUDY ON LONELINESS OF ELDERLY IN SOUTH KOREA -FOCUSING ON URBAN AND RURAL-FISHING VILLAGES-**

S. CHOI\* (Pusan National University, Busan , Republic of Korea)  
K. RYU(1), B. SHIN (1), B. PARK (1), M. PARK (1), H. PARK(1) - (1) Pusan National University (Busan, Republic of Korea)

Race of aging are more faster rural fishing villages than urban in Korea. Also psychological emotional problems of elderly who suffered are getting serious because of industrialization and modernization. Loneliness is as opposite as urban and rural fishing villages, so we should deal with loneliness according to characteristic of areas. This study

made a comparative study of the facts affecting the loneliness of elderly according to urban and rural fishing villages of Korea. Data were collected from a survey of 289 older adults(urban 151, rural fishing villages 138), who are 65 years and over, residing in Korea, were interviewed through trained researchers. Predictor variable were personnel factors, health factors, and social environment factors. In result, first, means score of loneliness among respondents was 50.8(SD 5.1), urban 51.0(SD 5.9), and rural fishing villages 50.6(SD 4.2). Second, the results of urban areas found that there were significant differences among independent variable including age, education, self-esteem, life satisfaction of personnel factors. On the other hand, the results of rural fishing villages found that there were significant difference among independent variable including life satisfaction of personnel factors and level of social activity of social environment factors. Finally, the factors affecting on the loneliness in urban area were self-esteem and life satisfaction of personnel factors. On the other hand, the factors affecting on the loneliness in urban area were life satisfaction of personnel factors, physical activity status of health factors, and level of social activity of social environment factors. We going to suggest as follow to relieve the loneliness of elderly and to achieve the successful aging for elderly with psychological emotional problems. First, distinctive intervention should consider according to residential district. Second, services for elderly --must be extended to emotional and interpersonal perspectives from physical perspectives. Also, services for elderly need to change to departmentalization and specialization.

**PD8 884 THE ELDERLY IN SERVICE DEAD ZONE: A CASE STUDY OF A RURAL COMMUNITY IN SOUTH KOREA**

K. LEE\* (Pusan National University, Busan , Republic of Korea)  
M. PARK(1), Y. YOO (1), H. PARK (1), H. LEE (1) - (1) Pusan National University (Busan , Republic of Korea)

Introduction: As elderly people in rural communities in the world, those people in S. Korea are frequently excluded from health and social services. Long distance to the services, lack of resources and facilities within a community, and barriers of access to service information are a part of the problems they are experiencing. Their situation became more deteriorated as a long-term care program launched in 2008. Service agencies in private sector are shrinking in providing their extra resources voluntarily for the elderly, as it becomes more competitive for them to acquire financial subsidies from the government and to attract future clients. All of these make the rural elderly in S.Korea more difficult to be out of 'Service Dead Zone'. Methods and materials : This project selected a small town of 'Kee Jang Goon'(a county) for a case study. Focused group interviews were employed to collect data from the elderly in the town, influential service providers, and public officials in asking about problems, resources, and possible solutions. Researchers also visited the site and observed residential situations, transportsations, service facilities. Results : The elderly in 'Dead Zone' are found to be 1) those who are eligible for the long-term care, but not using the service due to a financial burden; 2) the elderly living alone, or living with their grandchildren, but no services from public or private agencies. These population have no inner resources(e.g., young neighbors) to help them in checking their daily life at close and responding for their urgent needs. Another problem is that service agencies in the community are scattered and not successful in making a collaboration. Conclusion: This project suggests an integrated service model by a public/private blending. In particular, participation of a local government in service management and recruitment of grass-root volunteers from the neighborhood are clearly stressed for successful implementation of the model. Further discussion about applicability of the practice implications from this project to other countries is presented.

**PD8 885 PRACTICE FOR ASSESSING SOCIAL FUNCTIONAL CAPACITY IN INTERVIEWS**

M. SIMONEN\* (University of Helsinki, Helsinki, Finland)

Introduction Measurements on physical functional capacity are well known, but the measurement of social functional capacity contains more assumptions. Social functional capacity is usually evaluated in research interviews. So far, there hasn't been a suitable research method for analysing the interaction between the interviewer and the respondent. The measurements have mainly been restricted to self-assessments. The presentation will study two social functional capacity assessment questions which originated from the national Health 2000 survey in Finland. The questions referred to taking care of matters together with other people and presenting matters to unknown people. This research aims to examine whether it is possible to find hints about the interviewers using the ongoing interview as an evidence of the respondent's social functional capacity. The objective is to describe the interactional practices of interviews. Methods and materials The data consisted of thirty-three videotaped interviews made during the years 2007-2008 in Finland. The interviewers were qualified healthcare personnel. The respondents were participants of projects related to functional capacity. Methodology was ethnomethodological Conversation Analysis. Videotaped interviews were transcribed and analysed in detail. Results The analysis identified several practices related to the social functional capacity assessment questions. Respondent and interviewer formulated their responses by drawing evidence from the ongoing interview. The respondent formulated an answer referring to the interview interaction between interviewer and respondent. The interviewer focused on the ongoing interview by uttering a suggestion of the respondent's social skills, an argument against the respondent's self-assessment, or an assessment of the

proceeding of the interview. Conclusion The results indicated that the interviewers considered the interview interaction as an evidence of the respondents' social functional capacity. However, the current measurements do not utilize this kind of evidence. For the development projects, the results will offer a basis for a new model of assessment practice.

**PD8 886 SOCIAL ISOLATION OF THE ELDERLY IN THE URBAN AREA OF TOKYO**

M. SAITO\* (Sophia University, Saitama, Japan)  
S. YUTAKA(1), Y. MAI(2), T. SACHIKO(1) - (1) Sophia University (Tokyo, Japan); (2) Japan Lutheran College (Tokyo, Japan)

**INTRODUCTION** The purpose of this paper is to estimate the prevalence rate of the socially isolated elderly in Tokyo, Japan and to describe their socio-demographic characteristics. **METHODS and MATERIALS** The subjects were 2,907 elderly who actually lived alone, randomly selected from residents' registration of Itabashi Ward of Tokyo. Home-visit interviews were completed for 1,391 elderly. They were asked to name up to 10 persons with whom they had intimate relationships, including relatives, friends and neighbors. Then they were asked to report the frequency of meeting and contacts by telephone, letter and e-mail with each one. Based on these responses, the "extremely isolated" was defined when they had no person with intimate relationships, and the "semi-isolated" was defined when they had at least one intimate person but the frequency of contacts with them was very limited. **RESULTS** 1) The prevalence rate of the socially isolated (extremely isolated + semi-isolated) elderly was 10.8 to 16.6% of the elderly living alone. 2) The majority of them were male and tended to be unmarried or childless and at the very low income level. 3) Approximately 80 to 90% of them had hardly perceived instrumental supports from other persons. **CONCLUSION** The results of this study suggest that the prevalence rate of the socially isolated elderly is very low in comparison with the previous studies either in Japan or other countries. It does not necessarily mean, however, that rate of those elderly in Tokyo is comparatively lower. We would rather say that our operational definition of social isolation is relatively more validate and reliable than those of the previous studies because of our data collection about detail social networks on the dyad-base. Concurrently, it is predicted that the socially isolated elderly will steadily increase according to the rapid increase of the elderly living alone in Japan.

**PD8 887 A DEPARTMENTAL IMPLEMENT OF PREVENTION OF MISTREATMENTS TOWARDS ELDERLY PEOPLE**

B. DUPORTET\* (Association Française pour la Bientraitance des Aînés et Adultes Handicapés, Champcueil, France)  
M. MAUGOURD(1), D. GUILLEMET(2) - (1) Hôpital Georges Clemenceau (Champcueil, France); (2) Association Gérontologique de l'Essonne (Champcueil, France)

Docteur Bernard Duportet (Président AGE 91), Delphine Guillemet, (Directrice AGE 91), Docteur Marie-France Maugourd (Gériatre, Chef de service, Hôpital G. Clemenceau, Assistance Publique-Hôpitaux de Paris). **Introduction** The fight against elder abuse needs detection and treatment of abuse cases but also prevention. Since 1999, in Essonne (France) an area of 1.200 000 inhabitants including more than 220 000 people over 60 years, a formation is conducted to the professionals of nursing homes and home care. This study describes this action of information, assesses impacts and gives some information about methods. **Methods and materials** This study describes the organization set up by the association, contracts signed with authorities, programs, training officers, methods of valuation. The objectives of action are specified: growing awareness of reality of mistreatments and risks represented by the Alzheimer's disease, phenomenon of abuses, offering professionals times to speak freely of their work and difficulties. From 1999 till 2008: 1 281 sessions of sensitization (950 on mistreatments, 331 on Alzheimer's disease) were given to 11 700 trainees. The upper rate of contentment (80 %) is analysed. Results A significant evolution was noticed in individual and collective behaviours as in organization of care: • better knowledge of the individual or group mechanisms driving to abuse and mistreatment. • location of risk factors in the family, and in social and professional situations, allowing professionals to construct tools of prevention and to manage crisis situations. • a positive attitude in professional practice **Conclusion** The departmental implement is specific by its length, its global character (detection, sensitization, education) on a determined territory and by the collaboration between public area and associative area. It is included in the French national program of prevention of mistreatments. It represents a model likely to be included into any local or national prevention of mistreatments policy.

**PD8 888 SEGMENTS: KNOWING THE NEEDS OF ELDERLY PEOPLE**

K. LUIJKX\* (Tilburg University, Tilburg, The Netherlands)  
J. SCHOLS(1) - (1) Maastricht University (Maastricht, The Netherlands)

**Introduction** Governments in most Western encourage a shift from supply-driven to demand-driven care provision. In aging societies, it therefore becomes increasingly important for providers of housing, welfare and care to gain insight in the needs of elderly. This is complicated since they obviously differ in several ways, which influences their needs and demands. Segmentation research is known for providing insight in classes of clients that share some common needs characteristics in combination with other

characteristics such as health, age, marital status etc. Creating segments gives insight in the multidimensional diversity among elderly and enables providers to approach their clients in a more demand-based manner. In this paper we address the needs of elderly by means of segments with the following research question: What are the needs of elderly in long-term care? **Methods and Materials** Long-term care segments have been constructed by means of a questionnaire on the use of and needs for services in housing and long-term care, which was filled out by 2,423 people aged 55 years and over. To unravel the segments, the method K-means was used in SPSS. Results Five long-term care segments have been characterized: 1. vital elderly barely need help; 2. future-oriented vital elderly resemble vital elderly, but prefer adaptations in their house; 3. lonely-coping elderly are mainly lonely combined with some need for assistance; 4. cognitive-restricted coping elderly are in need of many adaptations and care because of physical and cognitive restrictions; 5. needy elderly resemble the before-mentioned segment, but are additionally in need for physical care. **Conclusion** Segments give insight in the multidimensional diversity among elderly and can as such be analyzed as a holistic and complex dependent variable. For segment development several dimensions have to be taken into account, however, these dimensions might vary among different domains, such as long-term care or loneliness.

**PD8 889 THE SOCIAL WELL-BEING OF RESIDENTS IN EXTRA-CARE HOUSING IN ENGLAND**

L. CALLAGHAN\* (University of Kent, Canterbury, United Kingdom)  
A. NETTEN(1), R. DARTON(1) - (1) University of Kent (Canterbury, United Kingdom)

**INTRODUCTION** Extra-care housing is a development of sheltered housing that aims to meet the housing, care and support needs of older people, while helping them maintain independence in their own private accommodation. Schemes usually offer social activities, and provide communal and social facilities with the aim of addressing social isolation and building community. A consequence of moving into a care setting is that older people's levels of activity and social well-being are particularly reliant on that community; thus, a move into extra-care provides both challenges and opportunities for improvements in social well-being. This project focused on two extra-care villages and 13 smaller schemes during their first year of opening, and aimed to identify: • Schemes' approaches to developing social activities • Residents' experiences of these approaches • The effectiveness of these approaches in fostering individual social well-being and a supportive social climate. **METHODS** Six months after opening, four residents and two staff members were interviewed in each scheme about the development of the social life. At 12 months, a survey of 600 residents and interviews with a subsample of 175 identified individual views on the social life at each scheme, participation levels, well-being, and social climate. **RESULTS** All schemes took a resident-led approach to providing social activity, but there was considerable variation in the way this approach was implemented in terms of staff and resident involvement in organising social activities. This was associated with the size of the schemes and characteristics of the resident population – some smaller schemes had a larger proportion of people dependent on others for help. **CONCLUSIONS** Residents' experiences of extra-care depend on both their personal and the scheme's characteristics and approach to social activity. Implications of the results for the management of social activities and for wider social well-being within extra-care housing will be discussed.

**PD8 890 TITLE NOT RECEIVED**

N. BEKSAEVA\* (Saratov State Technical University, Saratov, Russian Federation)  
M. ELUTINA(1), A. BORSCHEV(1) - (1) SSTU (Saratov, Russian Federation)

1. Different periods of life fix age distinction in rhythms of biological and social time. Structural organization of age stages is not the attitude of hierarchy, or cyclic recurrence and "chain". 2. In the theoretical space of the general doctrine of man's life the old age is considered as a final stage focusing on value experience of a man. If age might be defined as a measure of immersing in life, then the old age is a deep immersing, a space for diverse senses fixed in human memories, which can be found in language, gestures, etiquette, household orientation, age "filters" and "amplifiers". 3. Ontological pressure of "old age" in the individual history of a man and demands the judgment in varying contexts of society. In the modern world the old age can not be perceived as irreversible replacement of a man on the periphery of social life and gradual way out from its use, on the contrary, it is possible to discover intensification of its importance and from that point of view of social functions, and by way of staying in space of limiting senses.

**PD8 891 IN THE THIRD AGE WITH PHYSICAL IMPAIRMENTS**

A. LARSSON\* (National Institute for the Study of Ageing and Later Life, Norrköping, Sweden)

**Introduction** In writings of scholars in the ageing field a relatively good health and functional state stands out as a prerequisite of a leisurely active pensioner life style. For example, in his theory of the Third Age Laslett argue that even if the conditions of a self-fulfilling Third-Age-life style often is most favourable when retired, it is not the chronological age as such that opens the door to the Third Age. What Laslett describes as crucial, however, is a person's health and functional state. According to Laslett's theory it is impossible to enter the Third Age with extensive impairments. Other scholars have pictured an active pensioner's ideal as a problem since it excludes disabled seniors. The

aim of this presentation is to contribute to the discussion about the relationship between health and function and the possibilities of "ageing successfully". Unlike previous interventions in this debate, not only the challenges, but also the opportunities of entering the Third Age with impairments will be considered. Methods and materials The presentation is based on a Swedish qualitative interview-study of 20 persons between 56-72 years. The period in which they had lived with physical impairment ranged between 30 and 66 years. Results The interviewees descriptions of their everyday lives shows that it is not unreasonable to surmise that a pensioner with extensive impairments can achieve a modern pensioner ideal, if only the necessary environmental conditions exists. General developments in welfare, technical improvements and improvements within the area of support are commented upon as changes that have contributed to the Third-Age-like lifestyle of the interview subjects. Conclusion The study displays the importance of considering the social and environmental context when formulating theories about the relationship between health and function and "successful ageing".

#### **PD8 892 UNIFIED ASSESSMENT – POLICY, IMPLEMENTATION AND PRACTICE**

D. SEDDON\* (Bangor University, Bangor, United Kingdom)

C. ROBINSON(1) - (1) School of Social Sciences, Bangor University (Bangor, United Kingdom)

Introduction The introduction of unified assessment (UA) processes in Wales heralds opportunities to develop more consistent approaches to the assessment and management of care that are underpinned by an agreed evidence base and inform the development of person-centred, outcome-focused support. This presentation considers the effects of UA from key stakeholder perspectives, including older people, family carers and staff working in health and social care organisations. Methods and materials We report findings from: a postal survey of older people (n=280) and their carers (n=280); in-depth interviews with older people (n=35) and separate interviews with their carers (n=35); semi-structured interviews with staff (n=87); and, three focus groups with staff. Quantitative data were analysed using SPSS Version 15. QSR Nvivo 7 supported analysis of the qualitative data. Results UA challenges traditional service-led approaches to supporting older people and has facilitated positive changes to practice. It encourages the development of person-centred, outcome-focused approaches. Assessment tools, developed in response to UA Guidance, place greater prominence on capturing information in the older persons' own words and making explicit a set of agreed outcomes to be achieved. The increased emphasis on problem-solving and maintaining independence, by drawing on older peoples' existing strengths, has improved care planning and service planning processes and prompted practitioners and service providers to think more creatively about support. Improvements in the ways practitioners consider and evidence risks to independence are noted. Set against these positive changes are problems relating to the definition and measurement of outcomes, as well as concerns about raising expectations amongst older people and unwieldy assessment documentation. Conclusion If the vision of outcome-focused support is to be fully realized, further training is needed to help practitioners: reflect on the definition and measurement of outcomes; allay fears about raising expectations; and, embrace the potential of wider community resources in achieving outcomes.

#### **PD8 893 METROPOLITAN VERSUS NONMETROPOLITAN VARIATION IN PLACE OF DEATH IN BELGIUM, THE NETHERLANDS AND ENGLAND**

D. HOUTTEKIER\* (Vrije Universiteit Brussel, Brussels, Belgium)

J. COHEN(1), J. BILSEN(1), J. ADDINGTON-HALL(2), B. ONWUTEAKA-PHILIPSEN(3), L. DELIENS(1) - (1) End-of-Life Care Research Group, Vrije Universiteit Brussel (Brussels, Belgium); (2) School of Health Sciences, University of Southampton (SO17 1BJ, United Kingdom); (3) Department of Public and Occupational Health, EMGO Institute for Health and Care Research and Expertise Center for Palliative Care, VU University Medical Center (The Netherlands)

Introduction Place of death is considered an indicator of good end-of-life care, with home death preferred by most terminally ill patients. Previous research suggests substantially more hospital death and less home death in the metropolitan versus non-metropolitan regions of Europe. This study therefore examines metropolitan versus nonmetropolitan variation in place of death in Belgium, the Netherlands and England. Methods and materials Death certificate data of all deaths in 2003 were linked to census data. Place of death of those dying of 7 conditions likely to benefit from palliative care (cancer, heart/renal/liver failure, respiratory/neurodegenerative disease, HIV/AIDS) living in 6 English, 3 Dutch and 2 Belgian metropolitan regions was compared to that of nonmetropolitan residents. When examining differences in place of death (home vs. hospital; care home vs. hospital), multivariate analysis was used to control for possible confounders: cause of death, sex, age, income, social support, and available hospital and care home beds. Results Those living in metropolitan regions less often died at home and more often in hospitals, compared to nonmetropolitan patients. In Belgium and the Netherlands they also more often died in care homes. Multivariate logistic regression analyses showed that, even after controlling for possible confounders, those in nonmetropolitan regions were more likely to die at home and less likely to die in hospitals than those in metropolitan regions (OR: Eng:1.26; NL:1.49; B:1.74). In England, those in nonmetropolitan regions were more likely to die in a care home and less likely to die in

hospital than metropolitan residents (OR: 1.34). Conclusion Dying in Europe's metropolitan regions is less likely to occur at home and more likely to occur in hospital than in nonmetropolitan regions. This inequality could point at different end-of-life care in metropolitan regions, and suggests the need for a metropolitan approach to end-of-life care in all care settings.

#### **PD8 894 SURVEY AMONG FINNISH GERIATRICIANS – COMPARISONS BETWEEN 2001 AND 2008**

T. STRANDBERG\* (University of Oulu, Oulu, Finland)

P. KOISTINEN(1), R. ANTIKAINEN(2), E. KYNSILEHTO(1), K. MÄÄTTÄ(1), M. NIEMELÄ(1), M. SEPPÄNEN(1), P. VIRAMO(1), K. PITKÄLÄ(2) - (1) Finnish Geriatricians (Oulu, Finland); (2) Finnish Gerontological Society (Helsinki, Finland)

Introduction: In order to get insight of geriatric care and its development in Finland, we organised a postal survey among geriatricians in 2001. The questionnaire included items about work positions, work satisfaction, and general views about geriatric care. Methods: A largely identical survey was renewed in 2008 and compared to those in 2001. Also new items were included. The survey was distributed to all Finnish geriatricians (n=167 in active work). Results: Response rate was 60% (101 with specialty in geriatrics, 11 in training) all respondents in active work. As compared to 2001, the proportion of women (74%) had increased and specialty profile changed: more geriatricians had a background in general practice in 2008 than in 2001. The working profile and views about geriatricians' work were largely similar to those in 2001. Half of respondents were occupied by communities either in open care or primary care hospitals, 19% were occupied by secondary or tertiary hospitals. Of all respondents, 44% were in leading positions. Geriatricians were considered to be needed especially in memory clinics and in rehabilitation, somewhat less so in acute care. Majority of responding geriatricians considered general practitioners with additional geriatric training to be most appropriate to treat older patients with common problems. In general, geriatricians in 2008 were satisfied with and optimistic about their work — even more than in 2001. Every respondent was happy to have chosen geriatrics, 81% reported to carry on very well or reasonably well in their work, and majority also reported to be able to influence the geriatric care in their community. Biggest challenge was to increase geriatric knowledge and skills in health care in general. Conclusions: According to geriatricians, geriatric care has developed favourably in Finland and geriatrics is a rewarding speciality. More geriatric education is, however, needed generally in health care.

#### **PD8 895 THE HEALTH CARE EXPERIENCE OF THE OLDEST OLD IN THE UNITED STATES**

J. BYNUM\* (Dartmouth Medical School, Lebanon, NH, United States)

Y. SONG(2), E. FISHER(2) - (2) The Dartmouth Institute for Health Policy & Clinical Practice (Lebanon, NH, United States of America)

Introduction: The oldest old are the fastest growing segment of the U.S. population, yet the medical literature provides us with scant information on health care for this population. In the setting of uncertainty about benefits and harms, we examine the health care experience including practice variation in delivery of screening for occult cancer and technologically aggressive end-of-life care among people 80 years old and older. Methods and Materials: Retrospective cohort study comparing utilization across Hospital Referral Regions (HRR) in the U.S. with focus on 8 regions in NY, FL, TX, and CA. Participants were 20% national sample of fee-for-service Medicare beneficiaries who are 80 or older in 2003 (n=1,548,836). Measures included testing for occult cancer, end of life care, costs, institutional use, care transitions and longitudinal care as determined by billing. Results: Across HRRs in the U.S., there was wide variation in the percent men 80 and older having a screening prostate specific antigen(PSA) test (5-54%), women having a screening mammogram (10-34%) and in the end-of-life experience among the oldest old (2-14% having mechanical ventilation and 2-14% having a feeding tube placed in the last 6 months of life). Among the 8 HRRs selected, regions with lower likelihood of aggressive end-of-life care and PSA testing in men 80 and older, relied more on primary care specialties with less fragmentation across physicians. Across all regions, frequent care transitions between institutions were common with 28-52% of elders having 5 or more transitions. Conclusions: The healthcare experience for the oldest old in many regions of the United States was fragmented and the care may not have been aligned with preferences or lead to clinical benefit in this vulnerable population. Improving health care for this vulnerable population will require local efforts to improve collaboration across providers and improved provider skills in supporting decision quality.

#### **PD8 896 THE DIFFICULT PROGRESS OF GERONTOLOGY AND GERIATRICS IN SLOVENIA**

J. RAMOVŠ\* (Anton Trstenjak Institute, Ljubljana, Slovenia)

B. VOLJC(1) - (1) Anton Trstenjak Institute (Ljubljana, Slovenia)

The history of gerontology and geriatrics in Slovenia reminds us that in order to function successfully, any specialized branch needs constant support from its own professional environment as well as from politics – or else even the best-launched project may come to a halt. At the initiative of the pioneer of Slovene gerontology and geriatrics, Dr. Bojan

Accetto, an Institute of Gerontology and Geriatrics was established in 1966. Till 1988, the Institute was a place that developed modern gerontology and geriatrics, trained a whole range of profiles, did research work, and participated in international exchange. After Accetto's departure the Institute was renamed a Clinic for Vascular Diseases. Every attempt to reinstall the geriatric profession ended in failure, for lack of adequate interest within the health service. This is quite paradoxical considering that due to increasing life spans and low fertility rate the number of older people has soared and that the elderly even have their own political party, which makes it to parliament at each general election and whose members hold ministerial offices. The push that has moved Slovenian gerontology and geriatrics from its standstill came not from within the health care services but from sociology. The Anton Trstenjak Institute for Gerontology and Intergenerational Coexistence has been promoting gerontological issues since 1992. Under its influence the spreading of gerontological and geriatric knowledge has acquired support from the Slovenian Medical Society, the Medical Chamber, and the Slovenian Academy of Sciences and Arts. Since 2008, preparations have been taking place to reintroduce gerontological/geriatric education into every medical school and university. Thus, after a twenty-year interruption, the clinical field may continue the legacy of the institute founded, forty-four years past, by Dr. Bojan Accetto.

**PD8 897 MANAGEMENT IN VERY OLD PATIENTS HOSPITALIZED FOR LOWER RESPIRATORY TRACT INFECTION A STUDY PATTERNS IN FRENCH HOSPITALS**

C. CATTENOZ\* (University Hospital , Rennes, France)

D. VEILLARD(1), C. MICHELET(1), F. RIOU(1) - (1) 1 (Rennes, France)

**Introduction:** In patients hospitalized with lower respiratory tract infection (LRTI), an older age is associated with a poor prognosis and may reduce physician adherence to practice guidelines. **Objectives:** To assess processes of care together with their agreement with national guidelines and outcomes in elderly patients hospitalized for LRTI in public hospitals of Brittany (France) and whether differences are observed in very old patients (VOP) ( $\geq 85$  years) compared to younger patients ( $< 85$  years). **Methods:** A retrospective cohort study of adults hospitalized in geriatric and internal medicine departments was conducted between October 1, 2004 and March 31, 2005. Patients included had an International Classification of Diseases, 10th Revision diagnosis of LRTI and no comorbidity with cancer or with other infectious diseases. **Results:** 531 patients were included and proportion of patients with community acquired pneumonia was similar in the 2 groups (55%). 195 were VOP and were more likely to be women ( $p < 0.01$ ) and to have suspected aspiration pneumonitis ( $p < 0.04$ ). 97% patients were admitted to the emergency department and 98.5% were prescribed antibiotic therapy during hospitalization. The lack of measurement of renal function before antibiotic administration was frequently (35%) and similarly observed in both groups. Initial inpatient antibiotic prescription was in agreement with guidelines (90%) in both groups. Parenteral route was less likely to be used in VOP than in younger patients (53% vs 72%,  $p = 0.05$ ). Referral to a specialist was less frequent in VOP group (8.7% vs 14.6%,  $p = 0.048$ ). VOP showed higher mean overall length of stay (15.3 d vs 12.7 d,  $p = .0009$ ) and higher in-hospital mortality (7.7% vs 2.1%,  $p = .0018$ ). **Conclusion:** Quality of inpatient care was similar in very old and younger patients with community-acquired LRTI. Lack of measurement of renal function before initiating antibiotic administration may result in potential worse outcomes in VOP due to higher frailty.
