Fig. 1 Differential cross-section distributions as a function of the ϕ_η^* , $d\sigma/d\phi_\eta^*$, for the Z boson process at 8 TeV. The predicted distributions at NNLO+NNLL and NNLO+N³LL are compared with the LHCb data [24] in the dielectron decay mode. The predictions include theoretical uncertainties due to the scales as discussed in Sect. 2.3. The uncertainty that is included for the data is obtained by adding all sources of experimental uncertainties in quadrature. In the lower inset, the ratios of the predictions to the data for the ϕ_η^* are provided
