

## This week in therapeutics

| Indication                | Target/marker/pathway                          | Summary  | Licensing status  | Publication and contact information  |
|---------------------------|--|--|---|--|
| <b>Autoimmune disease</b> |  |  |   |  |
| Multiple sclerosis (MS)   | Integrin $\alpha_4\beta_1$ (VLA-4; CD29/CD49d) | <p>A study in mice suggests that preventing integrin <math>\alpha_4\beta_1</math>-mediated T cell adhesion may be useful for preventing MS. In an experimental autoimmune encephalomyelitis (EAE) mouse model, none of the mice injected with integrin <math>\alpha_4\beta_1</math>-deficient encephalitis-inducing T cells showed signs of MS disease pathology at 20 days, whereas mice injected with encephalitis-inducing control T cells displayed disease symptoms. EAE mice with an inducible integrin <math>\alpha_4\beta_1</math> deficiency showed delayed development of MS disease symptoms compared with what was seen in wild-type EAE controls. The integrin <math>\alpha_4\beta_1</math>-deficient T cells were unable to adhere to the CNS endothelium, which is a known mechanism of disease progression. Next steps include identifying mechanisms of T cell infiltration into the CNS.</p> <p>Tysabri natalizumab, a humanized mAb against integrin <math>\alpha_4</math> from Elan Corp. plc and Biogen Idec Inc., is marketed to treat MS.</p> <p>At least seven other companies have integrin <math>\alpha_4</math> or integrin <math>\alpha_4\beta_1</math> inhibitors in Phase II or earlier development for MS.</p> <p><i>SciBX</i> 2(5); doi:10.1038/scibx.2009.173<br/>Published online Feb. 5, 2009</p> | <p>Work unpatented; available for licensing from Max Planck Innovation GmbH</p> | <p>Bauer, M. <i>et al.
