

## This week in therapeutics

Indication	Target/marker/ pathway	Summary	Licensing status	Publication and contact information
<b>Cancer</b>				
Cancer	c-Myc (MYC); microRNA-23a (miRNA-23a); miRNA-23b	<p>Studies in cell culture suggest that increasing miRNA-23a and miRNA-23b activity could be useful for treating cancer. In human B lymphoma and prostate cancer cells, increased activity of the oncogenic transcription factor c-Myc suppressed miRNA-23a and miRNA-23b and resulted in increased mitochondrial glutaminase and glutamine catabolism, which is necessary for cell proliferation. Next steps include evaluating the effects of miRNA-23a and miRNA-23b in preclinical models of cancer.</p> <p><b>SciBX 2(8); doi:10.1038/scibx.2009.307</b> Published online Feb. 26, 2009</p>	<p>Patent application filed for use in cancer; available for licensing from Johns Hopkins University Technology Transfer <b>Contact:</b> Johns Hopkins University Technology Transfer, Baltimore, Md. phone: 410-516-8300 e-mail: <a href="mailto:JHNT-Communications@jhu.edu">JHNT-Communications@jhu.edu</a></p>	<p>Gao, P. <i>et al.
