

This week in therapeutics

Indication	Target/marker/ pathway	Summary	Licensing status	Publication and contact information
Hepatic disease				
Liver fibrosis	Peroxisome proliferation- activated receptor- δ (PPAR δ ; PPAR δ)	<p>Cell culture and mouse studies suggest PPARδ agonists could help treat liver fibrosis. In mouse models of chemical-induced liver fibrosis and cholestasis-induced liver fibrosis, the PPARδ agonist KD3010 decreased levels of liver fibrosis compared with the PPARδ agonist GW501516 or vehicle. Next steps could include a Phase II trial of KD3010 to treat liver fibrosis in HCV nonresponders.</p> <p>KD3010 from Kalypsys Inc. has completed Phase I testing in endocrine/metabolic and hepatic indications.</p> <p>GlaxoSmithKline plc discontinued GW501516 after a Phase II trial in dyslipidemia due to safety concerns.</p> <p>At least three other companies have PPARδ agonists in Phase I or Phase II trials for endocrine/metabolic or cardiovascular indications.</p> <p>SciBX 5(19); doi:10.1038/scibx.2012.494 Published online May 10, 2012</p>	Patent and licensing status undisclosed	<p>Iwaisako, K. <i>et al.
