Pulmonary d	lisease			
Pulmonary fibrosis	Protein kinase A (PKA)	In vitro and mouse studies suggest noscapine could help treat pulmonary fibrosis. In human lung fibroblasts, noscapine inhibited transforming growth factor- $\beta$ (TGFB; TGF $\beta$ )-induced myofibroblast differentiation and activated antifibrotic PKA, whereas adenoviral-mediated expression of a PKA inhibitor prevented the effects on differentiation. In a mouse model of chemically induced pulmonary fibrosis, noscapine decreased fibrosis compared with vehicle control. Noscapine is a generic benzylisoquinoline alkaloid available over the counter in some countries in anticough products. In 2009, KineMed Inc. filed a patent covering the use of the compound to treat pulmonary fibrosis; its development status is unavailable.	Patent and licensing status unavailable	Kach, J. et al. J.
