

SEM President Sullivan and past-presidents Stu Swartz and Ian Allison holding one of many informal meetings during the conference.

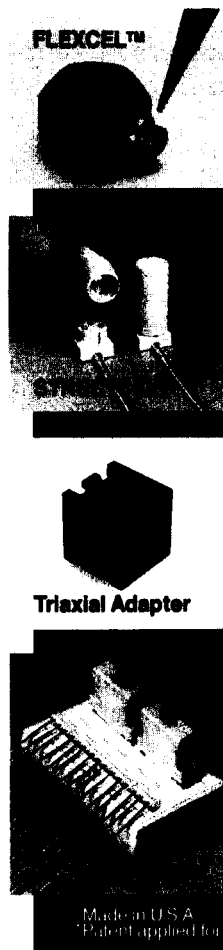

Complimenting the conference was a technical exhibit. Captured in this group photo at the Measurements Group, Inc. booth are: (L to R) James Dorsey, Measurements Group, Inc., USA; Reinhard Kaufmann, Measurements Group, Inc., Munich; Petra Kaufmann, Measurements Group, Inc., Munich; Wolfgang Kizler, Mercedes Benz, Stuttgart; Sven-Oluf Björklund, Welwyn-Nordiska, Stockholm; and Carl-Axel Karlander, Welwyn-Nordiska, Stockholm.

## CHICAGO SECTION MEETING

The Chicago Section of SEM held its first meeting of the 1990-91 term on September 20, 1990. The meeting began with a tour of the Advanced Photon Source (APS) facility at Argonne National Laboratory, Argonne, IL.

After dinner, Dr. G.K. Shenoy, Program Director of the Advanced Photon Source, talked about the facility. Dr. Shenoy explained that the APS is a high energy synchrotron X-ray radiation facility, being built at Argonne. It is the largest science project in the state. Upon completion in 1995, APS will provide the worlds brightest X-ray beam for applications ranging from chips manufacturing, to medical diagnostics to material sciences. The talk also focused on the present and future utility of synchrotron radiation in such fields as physics, chemistry, material science, biology, earth science, agricultural and medical sciences. Dr. Shenoy also gave an overview of the present R & D and engineering efforts in support of the construction of the facility.

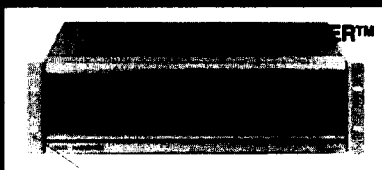

For information about the Chicago Section, contact Marshall Perlman, J.I. Case, 7 South 600 County Line Rd., Hinsdale, IL 60521.

## System Concepts Simplify Multipoint Modal Testing and Optimize Your Performance!

Solve your multipoint modal test requirements with economical STRUCTCEL™ or FLEXCEL™ Motion Sensing Systems featuring innovative alignment, mounting, wiring, signal conditioning and end-to-end calibration. Thousands of channels of STRUCTCEL Motion Sensors\* have proven performance on automotive, aircraft and aerospace structures. Lightweight FLEXCEL Accelerometers incorporate modal system conveniences and operate from standard ICP signal conditioners. The computer controlled Data Harvester™ conditions, filters, ranges and monitors the STRUCTCEL, FLEXCEL and other conventional ICP sensors. For full details, contact PCB today.
