In the article, the curves describing the dependences of quantity $C_1(0, t)$ on $-C_{1x}(0, t)$ and on $V_1(t)$ (denoted for brevity as $C_{10}(-C_{1x0})$ and $C_{10}(V_1)$) were erroneously referred to as the phase trajectory of the dynamic system “binary melt experiencing directed crystallization.” In fact, the parametric curves $C_{10}(-C_{1x0})$ and $C_{10}(V_1)$ are only certain projections of the infinite-dimensional line (true phase trajectory of the above system) onto the 2D plane. For this reason, the terms “phase trajectory,” “phase plane,” and “phase pattern” used in the article should be treated as the projections of the phase trajectory, phase plane, and phase pattern onto the plane (C_{10}, C_{1x0}) or (C_{10}, V_1) . The same applies to return points, loops, nodes, and foci depicted in the figures. These are features not of phase curves, but their projections. However, this error does not in any way affect the results and conclusions drawn in this work.
