There is a formal mistake associated with the transition to a variable maximal section. Formula (1) should be read as

$$\begin{aligned} \zeta(u; \sigma, t') &= \sigma(t' + u) \exp((-T(u; \sigma, t')), \quad u > 0, \\ T(u; \sigma, t') &= \int_0^u \sigma(t' + s) ds \end{aligned} \tag{1}$$

with the expressions for f and T changed accordingly in the rest of the text. Additionally, the words 'independent identically' should be eliminated from the formulation of the algorithm (before formula (2)) on p. 671, left column, line 2 from the bottom.

G.A. Mikhailov and T.A. Averina
