The title should be as follows:

“Influence of Component Ratio in the (Mg,Fe)₃Si₂O₅(OH)₄ on the Formation of Nanotubular and Platy Particles”

and the abstract should be replaced by:

We synthesized nanoparticles of (Mg,Fe)₃Si₂O₅(OH)₄ by the hydrothermal treatment of a coprecipitated Mg(OH)₂, FeOOH, and amorphous SiO₂ mixture. Increase in Fe(III) content $x = \text{Fe}/(\text{Fe} + \text{Mg})$ yields: ($x < 7$ mol %) chrysotile nanotubes, ($10 < x < 22$ mol %) lizardite plates, ($22 < x < 46$ mol %) lizardite plates and α -Fe₂O₃ particles. Drastic change in the morphology versus slight change in the chemical composition ($7 < x < 10$ mol %) makes this Fe-doped hydrosilicate very promising for use in the heat-resistant polymer-inorganic composite materials with different mechanical and barrier properties.
