The Abstract section should read as follows:

The equilibria of the chelate formation and the ion-association of the ion-associated complex formed between the anionic chelate of Ge(IV) with 4-nitrocatechol (4-NC) and the cation of 2-(4-iodophenyl)-3-(4-nitrophenyl)-5-phenyl-2H-tetrazolium chloride (INT) in the liquid-liquid extraction system Ge(IV)–4-NC–INT–H₂O–CHCl₃ was studied. The optimum extraction conditions for the chelate formation were established and the extraction equilibria were investigated by the spectrophotometric method.

The equilibrium constants, the recovery factor and some analytical characteristics were calculated. The validity of Beer's law was checked. The molar ratio of the reagents in the ion-associated complex Ge(IV)–4-NC–INT was determined by independent methods. Based on this, a reaction scheme, a general formula and a structural formula of the complex were suggested.
