<https://doi.org/10.1140/epjc/s10052-019-7189-2>

1. The Eq. (45) should read

$$s = s_0 \rho^{1 - \frac{1}{2w_2}} r^{-\frac{1+w_2}{w_2}} \sqrt{\frac{1 - 2m/r}{1 - 2\bar{m}/r}}, \quad (1)$$

where $\bar{m} = m - M$.

2. Contrary to the Lagrangian (37) which is deduced from the first principle, there is no guarantee that the trial Lagrangian (39) represents the true entropy for $w_1 = -1$ although it matches well for $w_1 \neq -1$ cases.

The Lagrangian corresponding to a, b in Eq. (44) is

$$\mathcal{L} \propto (\bar{m}')^{1 - \frac{1}{2w_2}} r^{-1} / \sqrt{1 - 2\bar{m}/r}. \quad (2)$$

However, if the solutions are analytic around $w_1 = -1$, the $w_1 \rightarrow -1$ limit of the Lagrangian (37) gives

$$\lim_{w_1 \rightarrow -1} \mathcal{L} \propto (m')^{1 - \frac{1}{2w_2}} r^{-1}, \quad (3)$$

which is different from the above Lagrangian. Thus, one should be cautious in using the entropy density for $w_1 = -1$.

Therefore, the exact form of the entropy density for $w_1 = -1$ should be derived by taking $w_1 \rightarrow -1$ limit of the entropy function Eq. (47). The entropy density so obtained has the form

$$s = s_0 \rho^{1 - \frac{1}{2w_2}} r^{-\frac{1+w_2}{w_2}} \sqrt{1 - 2m/r}. \quad (4)$$
