PISA intervention to change resident attitudes. Given the paucity of studies on suicide prevention training, these data provide a starting point for developing and evaluating an interdisciplinary training model in suicide assessment and intervention. More rigorous studies examining the effects of the PISA intervention on suicidology knowledge and skills and the impact on clinical practice are needed to further clarify this intervention's educational impact.

We thank Drs. Paul Links and Bruce Ballon for their valuable feedback and thoughtful comments on previous drafts of this manuscript. This paper was presented at the Canadian Group Psychotherapy Association 28th Annual Meeting in Toronto, Ontario, on November 8, 2007.

At the time of submission, the authors reported no competing interests.

Facing Our Frustration

A black car is chasing me. When I leave the clinic, it will be outside, waiting for me to surrender. The government must be up to this, playing tricks on me, as if I'm some human experiment. I don't know why I came today for my appointment. No one can stop this. Not even you.
