The role of metastasectomy in nasopharyngeal carcinoma patients with lung-only metastasis remains unknown. This study (<http://doi.org/10.1245/s10434-021-09597-5>) found that the 5-year survival rate differed between

nasopharyngeal carcinoma patients with and without pulmonary metastasectomy (75.53% and 47.81%, respectively). Hence, lung metastasectomy can be recommended in carefully selected patients.

Ze-Rui Zhao, Di-Han Liu and Yi-Zhi Wang have contributed equally to this work.
