Proportion of arm lymph flow above the level of the axillary vein (a protective factor for the occurrence of arm lymphedema) was incorporated with body mass index (BMI) at surgery, taxane-based chemotherapy, and radiotherapy to

construct an intraoperative predictive nomogram. High-risk patients who need preservation of arm lymphatics could be identified intraoperatively using this nomogram (https://doi. org/10.1245/s10434-021-09982-0).
