The Comprehensive Cancer Centre of Nanjing Drum Tower Hospital, The Affiliated Hospital of Nanjing University Medical School and Clinical Cancer Institute of Nanjing University, Nanjing, China

This large population-based study and external validation (<https://doi.org/10.1245/s10434-021-10299-1>) proved the log odds of positive lymph nodes (LODDS) system superior to the N staging system and the lymph node ratio

(LNR) system. The LODDS system more precisely differentiates risk subgroups of postoperative radiotherapy and improves discrimination of the resected gastric adenocarcinoma prognosis.
