This prospective cohort study with the BREAST-Q questionnaire showed that both the aesthetic/surgery-related and psychological aspects are equally important in regard to “satisfaction with breasts” after breast-conserving therapy (BCT) (<https://doi.org/10.1245/s10434-021-10377-4>). Most patients reach their baseline levels of satisfaction and psychological well-being 1 year after surgery.
