As reported in our article (<https://doi.org/10.1245/s10434-021-10477-1>), radiation-associated angiosarcoma treatment at a sarcoma center was associated with more extensive surgery, multimodal treatments, and higher

3-year recurrence-free survival. Salvage after recurrence is possible, as 1/4 of patients were alive without disease after treatment for recurrence.

Sheena Guram and Andrea M. Covelli: Shared primary first authors.
