¹Division of Breast Services, Department of Breast Surgery, Cleveland Clinic, Cleveland, OH; ²Department of Plastic and Reconstructive Surgery, Cleveland Clinic, Cleveland, OH; ³Department of Quantitative Health, Cleveland Clinic, Cleveland, OH; ⁴Division of Breast Services, Department of General Surgery, Cleveland Clinic, Cleveland, OH

Perioperative antibiotic regimens, incidence and bacteriology of surgical site infections in nipple-sparing mastectomy with implant-based reconstruction were assessed ([https://doi.org/10.1245/s10434-021-10449-](https://doi.org/10.1245/s10434-021-10449-5)

5). Use of broader antibiotic coverage was not associated with improved outcomes. Patient and treatment factors predicted surgical site infections rather than prophylactic antibiotic regimens.
