For older patients (age ≥ 70 years) undergoing breast cancer surgery, risk of death within 90 days ranged from 1 to 30%. Key variables (age, gender, comorbidity score, facility type, facility location, clinical stage, and surgery type) can be used to predict this risk (<https://doi.org/10.1245/s10434-021-10496-y>).

Presentation: Poster presentation at the ASBS Annual Meeting in May 2021.
