Lymphadenectomy with retrieval of ≥ 16 nodes at gastrectomy in gastric cancer is recommended, but the minimum retrieval number after neoadjuvant chemotherapy is unclear. Using spline regression modeling, we identified that retrieval of ≥ 23 nodes may demonstrate a survival advantage, suggesting that lymphadenectomy should not be reduced for this population (<https://doi.org/10.1245/s10434-021-10803-7>).
