Peritoneal carcinomatosis is a difficult disease process to treat. Finding factors predictive of longer survival and unique targets for therapy in this disease process will help personalize the role of cytoreduction and systemic therapy

for these patients. The authors use the American Association of Cancer Research GENIE database (<https://doi.org/10.1245/s10434-021-10945-8>) and machine learning to identify novel genetic subtypes in appendiceal cancer.

This was previously presented at SSO's Advanced Cancer Therapies, February 2020, Orlando, FL.
