This study (<https://doi.org/10.1245/s10434-022-11578-1>) demonstrates better sexual well-being after breast reconstruction with nipple-sparing mastectomy compared with skin-sparing mastectomy without nipple reconstruction

or tattoo. However, nipple reconstruction plus tattoo after skin-sparing mastectomy achieved similar satisfaction and sexual well-being compared with nipple-sparing mastectomy.
