While preoperative radiation for resectable retroperitoneal sarcoma is controversial, it may be important for those with borderline resectable disease. This study (<https://doi.org/10.1245/s10434-022-12053-7>) reports the oncologic and toxicity outcomes of patients with primary

borderline resectable retroperitoneal sarcoma (RPS) treated with preoperative dose-painting intensity-modulated radiation therapy (IMRT) followed by planned resection.
