

Liquid Crystals

S. Chandrasekhar

(Cambridge University Press, 1993,
450 pages).

ISBN: 0-521-417-473 (hardback);
0-521-427-41X (paperback)

Since the first edition of Chandrasekhar's book was published in 1977, liquid crystal devices have become ubiquitous and their use has increased to today's multibillion-dollar world market. Applications range from simple watch and calculator displays to large-area public display boards, and from pocket televisions to video recorders. Besides these technological advances, research on the physics and chemistry of liquid crystal materials has burgeoned, and the diversity of chemically stable materials has greatly increased the knowledge of the liquid crystal phase. Variations in the phases have been elucidated; for example, the discotic phases have been characterized, and new types of smectic phases have been discovered. Understanding of these materials has progressed but continues to be the subject of research in many laboratories worldwide. Therefore, this revised and updated edition of an already popular book is very welcome.

The book concentrates on the physics of thermotropic liquid crystal materials, a highly interdisciplinary field of research. Although readers are not exposed to the considerable research on the synthesis of these fascinating organic chemicals, chemical structures are presented where necessary. In addition, there is some mention of devices in which liquid crystals are used, but not a full description of liquid crystal applications since these are developing rapidly and detailed reference to them can quickly become dated. The book is comprehensive and self-contained in describing the physical properties of liquid crystals. Extensive references are included with each chapter, providing an invaluable source for researchers in the field, as well as an introduction for newcomers to liquid crystal research and for students wishing to read more on the subject. A minor criticism is that the contents page is rather difficult to read, making it hard to find a particular subject.

The most significant updates to the book were made on the previous version's final chapter on smectic liquid crystals, which has been substantially revised and now includes an additional chapter on discotic liquid crystals. The first chapters have been updated where necessary; for example, improvements in experiments using x-ray scattering now provide deeper understanding. The sec-

ond and third chapters describe the statistical theories of the nematic phase and the extremely successful continuum theory of the nematic state. Newly included in the third chapter is a description of additional elastic constants, which may help to describe their importance in the flexoelectric effect and surface anchoring to alignment layers. The fourth chapter on cholesteric liquid crystals has been extended slightly, with a short section on the blue phases. The revised chapters also include brief descriptions of the twisted nematic (TN) and supertwisted nematic (STN) displays.

The fifth and substantially revised chapter tackles the smectic liquid crystal phases, which have more order than the nematic phase. A feature of the increased order is the formation of layers. Classification of smectic mesophases has progressed considerably, with improvement in x-ray sources; therefore, a table has been included to provide the structural classifications. A section has been added on smectic-A polymorphism and the phenomena of reentrant phases, where a nematic phase occurs in the middle of a smectic phase. A newly identified phase is the twisted grain boundary phase predicted by de Gennes, who recognized an analogy with superconductors; however, the phase was discovered by Goodby et al. The section on the smectic-C phase has been expanded because of the great deal of work done on this phase, particularly since ferroelectricity was demonstrated by Meyer et al. in 1975. The defect structures are described, and there is a discussion of the continuum theory for smectic-C liquid crystals, although this is presently an area of active research. Applications are also mentioned briefly at the end of the chapter.

The final and new chapter describes the physics of the discotic mesophases, which have emerged only in the last decade. An understanding of the disklike molecules and their self-assembled structures owes much to the previous work, even though these molecules differ in shape from the rodlike calamitic liquid crystals described in the previous chapters. The new chapter describes the application of the continuum theory and the results of x-ray scattering and light scattering, and includes explanations of the defect structures that occur in the columnar phases, and a description of the nematic discotic phase. The chapter concludes with a section on biaxial nematic liquid crystals, which were predicted by Chandrasekhar himself.

Because the field of liquid crystals has expanded greatly since Chandrasekhar

first published his book in 1977, it is impossible to include all the exciting new areas of research, such as the nonlinear optical properties of liquid crystals. Nonetheless, the book is a useful, interesting, and thorough treatise on the physics of the many different liquid crystal phases.

Introduction to Mineral Sciences

A. Putnis

(Cambridge University Press, 1993,
450 pages).

ISBN: 0-521-419-220 (hardback);
0-521-429-471 (paperback)

In this excellent book, Putnis adopts a materials science approach to the study of minerals and focuses on their behavior in relation to geological processes, rather than using the traditional systematic treatment of the subject. The approach is more qualitative than quantitative, but the complex concepts of materials behavior are clearly explained and extremely well-illustrated.

The introductory chapters deal with the basic concepts of crystallography and symmetry. The ideas behind crystalline anisotropy are clarified, and the basis of the optical, elastic, and related tensorial properties of minerals is presented. An extensive chapter on diffraction and imaging techniques follows, including the reciprocal lattice, powder and single-crystal x-ray diffraction, electron diffraction, and imaging. A final methodology chapter on spectroscopy comprehensively covers the concepts involved in nuclear magnetic resonance spectroscopy, electron spin resonance spectroscopy, vibrational spectroscopy, inelastic neutron scattering, optical spectroscopy, x-ray spectroscopy, and the Mössbauer effect.

Most of the book, however, is devoted to the nature and behavior of minerals. This ranges from discussion of the basic principles of crystal architecture (i.e., close packing and polyhedral packing) to the structural features of major rock-forming phases such as the olivines, pyroxenes, and framework silicates. The concept of defects and their role in mineral behavior are introduced, illustrated by specific references to systems such as the plagioclase feldspars and spinels.

The basic ideas behind thermodynamics, which determine most aspects of mineral behavior, are clearly presented and include discussions of entropy, phase equilibria, and Landau theory. The nature of solid solutions is outlined, and

the processes of exsolution, spinodal decomposition, and ordering are reviewed. Kinetics are finally introduced, and the book concludes with excellent case studies of transformation processes and discussions of the incommensurate behavior in quartz, unmixing in the pyroxene system, and other geologically and materials-relevant processes.

In summary, this book illustrates the major advances in our understanding of the complex behavior of minerals and related phases. It could have been written only by a scientist who has an extensive and clear understanding of modern mineralogy. Andrew Putnis should be congratulated for writing this outstanding book, which will not be surpassed for many years.

Books

Since the *MRS Bulletin* receives many more publications than can be reviewed, starting this month the *Bulletin* will run a separate list of recently published books and new journals relevant to materials science that have come to our attention. Reviews of some of the books listed here may appear in future issues of the *Bulletin*.

Advances in Multi-Photon Processes and Spectroscopy—Volume 7, S.H. Lin, ed. World Scientific Publishing, Singapore, 1991. 311 pp, *hc*, ISBN 981-02-0718-2.

Biomaterials—Novel Materials from Biological Sources, D. Byrom, ed. Stockton Press, New York, 1991. 365 pp, *hc*, ISBN 1-56159-037-1.

Characterization of Advanced Materials, W. Altermatt and E. Henneke, eds. Plenum Press, New York, 1991. 183 pp, \$69.50 *hc*, ISBN 0-306-43837-2.

Compaction, Quality Control, and Training, Volume 1, Advances in Powder Metallurgy—1991, compiled by L.F. Pease III and R.J. Sansoucy. Metal Powder Industries Federation, New Jersey, 1991. 312 pp, *hc*, ISBN 1-878954-08-3.

Electrical and Magnetic Methods of Nondestructive Testing, J. Blitz. Adam Hilger imprint by Institute of Physics, United Kingdom. 237 pp, \$90.00 *hc*, ISBN 0-7503-0148-1.

Elementary Physicochemical Processes on Solid Surfaces, V.P. Zhdanov. Plenum Press, New York, 1991. 314 pp, \$85.00 *hc*, ISBN 0-306-43779-1.

MATERIALS LETTERS

Contents of Volume 16, number 6, June 1993

- Reaction Paths During Melt Texturing of $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$
S. Karabashev and Th. Wolf
- Studies on the Behavior of the Roughness of the Fracture Surfaces of Silica Glass
R. Ham-Su and V.M. Castañó
- Structural Properties of the System $\text{Al}_2\text{O}_3\text{-Cr}_2\text{O}_3$
M. Ristić, S. Popović and S. Musić
- Critical Current in Electrochemically Deposited Thick Films of YBCO Superconductor
D. Bhattacharya, S.N. Roy, R.N. Basu, A. Das Sharma and H.S. Maiti
- Preparation of High- T_c Superconducting $(\text{Bi,Pb})_2\text{Sr}_2\text{Ca}_2\text{Cu}_3\text{O}_y$ Phase via an Oxalate Route
H.S.W. Chang, S.R. Sheen, D.H. Chen, C.T. Chang, C.H. Kao, J.C. Huang, Y.C. Chou, Y.C. Hsieh, Y.H. Hsieh and M.K. Wu
- Characterization of the Microstructure in TiB-whisker Reinforced Ti Alloy Matrix Composite
D.X. Li, D.H. Ping, Y.X. Lu and H.Q. Ye
- Characterization of $\text{TiB}_2\text{-Ti(CN)-Ni}$ Ceramics by Transmission and Analytical Electron Microscopy
J.Y. Dai, D.X. Li, H.Q. Ye, G.J. Zhang and Z.Z. Jin
- Properties of Au/SiO₂/a-Si:H Solar Cells with Wet Oxide
H. Gleskova, V.A. Skryshevsky, J.N. Bullock, S. Wagner and J. Stuchlík
- Wavelength-selective Transmission in Transition Metal Containing Silica Gel Monoliths
S. Roy and D. Ganguli
- Interfacial Cracking During Thermal Oxidation in a 30 Vol% SiC-whisker Reinforced Alumina
W. Deqing and H.F. Lopez
- The Decomposition of $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$ at Low Oxygen Pressures
J.S. Kim and D.R. Gaskell
- Preparation and Crystal Structure of $\text{C}_{60}\text{S}_8\text{CS}_2$, a New Fullerene-containing Heteromolecular Solid
G. Roth, P. Adelman and R. Knitter
