V. L. Indenbom
(1924–1998)

Vladimir Lvovich Indenbom was an outstanding theoretical physicist in the field of dislocation physics, the theories of electronic microscopy and X-ray diffraction, the theory of phase transformations, radiation materials science, and in other fields of the physics of real crystals.

Lev Markovich Utevskii was a pioneer in the field of applying transmission electronic microscopy to study the structure of steels and alloys, a talented scientist

L. M. Utevskii
(1919–1980)

who solved the most important problems of phase transformations and the dislocation theory of strength and plasticity. He was the founder of a famous scientific school of material engineers.

Vladimir Lvovich and Lev Markovich took part in the Second World War. They were friends and associates who did much to help us understand the nature of material strength and plasticity, and to make progress in developing new high-strength steels and alloys.
