After Fig. 14, the text should be as follows:

Figure 14 shows a system of controlling parameters for an electric drive of a hoisting plant. The lifting motor armature is power supplied by an irreversible thyristor rectifier and reversible exciter.

Figure 14a shows a system of controlling parameters for an electric drive of a hoisting plant. The lifting

motor armature is power supplied by a reversible thyristor rectifier and irreversible exciter.

The control systems of these two variants differ as follows: in the variant with an irreversible armature current, there is a unit for separating the armature current specification (SU) and the relay element (RE), which ensures the reversal of the excitation current.

Fig. 14a. The system of controlling parameters of an electric drive of a hoisting plant.
