ERRATUM

Imada, H., Shuku, H., & Moriya, M. Can a rat count? (*Animal Learning & Behavior*, 1983, 11, 396-400)—In Figure 1, on page 397, the labels above the two bars on the right, which indicate the number of subjects used for the calculation of means for the Sig-V and Sig-F groups, were reversed. The correctly labeled figure is given below:

Figure 1. The means of the post-third-shock lick ratio for the four groups during the last 4 test days. The number of subjects used for the calculation of means is shown above each bar.

On page 398, the "F" in line 10, column 1, should be "V." The entire sentence should correctly read: "One rat from Group Unsig-V that showed only 183 licks on only 1 of the test days was also omitted as being an exceptional case, for the same reason."
