

## EDITORIAL

This issue of *Behavior Research Methods, Instruments, & Computers* contains papers that deal with research carried out over long periods of time. The contributions extend the special section printed in the February 1985 issue. Generally, research of this type is not published in the experimental journals used by most of our readers, so the major purpose of this issue is to provide a review of the methodologies which are used in this research. Karl E. Englund (Naval Health Research Center) and Gerald P. Krueger (Walter Reed Army Institute of Research) organized the effort.
