Springer Orthopaedics

New and Recent Titles

W. Müller

The Knee

Form, Function, and Ligament Reconstruction

Translated from the German by T. C. Telger

Foreword by J. C. Hughston

Illustrations by R. Muspach

1983. 299 figures in 462 partially coloured separate illustrations.

VIII, 314 pages. ISBN 3-540-11716-4

"This is an excellent book which is addressed to the problems of ligament injury and reconstruction. Published by Springer-Verlag, to their usual high standard, the format is of beautiful illustrative diagrams, combined with operative photographs and where appropriate, dissected specimens. ... Part I deals with anatomy, kinematics and the examination of the injured knee. Part II describes injuries of the ligaments and capsule, general operative technique, primary repair, secondary repair, rehabilitation and results...

The book concludes with an excellent review of results. The bibliography is first rate, and the index adequate. The literature review throughout was easily the best I have ever read in this vast and complicated area of orthopaedic surgery."

British Journal of Sports Medicine

P. G. J. Maquet

Biomechanics of the Knee

With the Application to the Pathogenesis and the Surgical Treatment of Osteoarthritis

2nd edition, expanded and revised. 1984. 243 figures.

XVIII, 306 pages. ISBN 3-540-12489-6

Hailed the world over for its clarity and innovative scientific approach, Maquet's classic explanation of the biomechanical forces acting upon the knee and their application to the treatment of osteoarthritis is now in its second edition. For this revised and expanded edition, the author has updated the data on biomechanical stresses and analyzes the results of recently developed surgical procedures based on them.

Gamut Index of Skeletal Dysplasias

An Aid to Radiodiagnosis

Foreword by F. N. Silverman

1984. Approx. 150 pages. ISBN 3-540-12825-5

Gamut Index of Skeletal Dysplasias concerned with the radiological diagnosis of genetic disorders of the skeleton. It is presented in the form of 'gamut lists' which will enable the practising radiologist to reach a diagnosis following the observation of abnormalities in bone radiographs. The lists are constructed in two ways – in terms of specific types of bone abnormality and also on an anatomic basis. The final section of the book provides, together with key references, brief outlines of the manifestations of each genetic condition. Cross references are given for each section.

L. Jeanmart, A. L. Baert, A. Wackenheim

Computer Tomography of Neck, Chest, Spine, and Limbs

With the collaboration of M. Osteaux

1983. 545 figures. XI, 194 pages. (Atlas of Pathological Computer Tomography, Volume 3). ISBN 3-540-11439-4

Computer Tomography of Neck, Chest, Spine, and Limbs is the final volume in a highly successful radiology series. Like its predecessors, it provides clinicians with a wealth of information on the diagnostic advantages of CT. The authors illustrate the interpretation of CT findings in pathologic abnormalities in the lungs, mediastinum and pleura, in morphologic and traumatic malformations in the limbs and spine, and in the orthopedic evaluation of limb function.

J. Koebke

A Biomechanical and Morphological Analysis of Human Hand Joints

1983. 50 figures. VI, 85 pages. (Advances in Anatomy, Embryology and Cell Biology, Volume 80). ISBN 3-540-12438-1

Results of studies into the relationship between the morphology and the normal and pathologic function of three important joints of the human hand are recorded in this volume. The author's investigations of the proximal wrist joint focus on the transfer of kinetic energy from the arm to the hand, leading to a new understanding of degeneration and lesions of the articular disc and of typical radius fractures. Photoelastic experiments on the articular surfaces and capsular ligaments of the saddle joint of the thumb were studied in order to identify and characterize mechanical factors leading to the frequently observed arthrotic alterations of the joint. Finally, the author details his conclusion as to the special functions of the metacarpophalangeal joints as indicated by their particular morphologic features.

E. W. Somerville

Displacement of the Hip in Childhood

Aetiology, Management and Sequelae

1982. 262 figures. XIII, 200 pages. ISBN 3-540-10936-6

"Mr. Somerville's lucid arguments and well-selected case histories are a delight to read, his touch of evangelical zeal adding zest to our pleasure ... In all it forms a most stimulating monograph that needs no recommendation beyond the name of its author."

British Medical Journal

B. J. Cremin, P. Beighton

Bone Dysplasias of Infancy

A Radiological Atlas

Foreword by R. O. Murray

1978. 55 figures in 124 separate illustrations, 4 tables. XIII, 109 pages. ISBN 3-540-08816-4

"The recent explosion of publications on general skeletal dysplasias is continued in this admirable and profusely illustrated little book emanating from the Departments of Radiology and of Human Genetics in the University of Cape Town. ... a most successful venture and a useful reference book on a subject uncommonly seen outside specialists units; we look forward to further contributions from this very progressive school".

The Journal of Bone and Joint Surgery

J. M. Connor

Soft Tissue Ossification

Foreword by V. A. McKusick

1983. 50 figures. XIII, 146 pages. ISBN 3-540-12530-2

"... The merit of this monograph is that it brings together the orthopaedic, radiographic, and pathological aspects of these uncommon disorders under one cover in greater detail than in the standard textbook of these specialties.

Soft Tissue Ossification begins logically with a chapter devoted to the distinction between soft tissue calcification and ossification... The remainder of the book deals exclusively with soft tissue ossification, with chapters devoted to trauma, tumour, myositis (fibrodysplasia) ossificans progressiva, and neurological and other causes ...

It is clearly written, well laid out, and uses tables and illustrations wisely. It will be a useful addition to many hospital and department libraries, and to the shelves of those few specialists with a particular interest in such disorders."

British Medical Journal

P. Beighton, R. Grahame, H. Bird

Hypermobility of Joints

Foreword by E. Bywaters

1983. 101 figures. XIII, 178 pages. ISBN 3-540-12113-7

A wide ranging review of medically important aspects of hypermobility of joints is provided in this work. The authors bring together current knowledge in the light of their personal interest and experience and present it in a coherent form. Among the implications of hypermobility which are discussed are the basic pathogenesis, epidemiology and clinical significance, as well as the role of hypermobility in sport and the performing arts. In

the final section of the book, genetic syndromes in which hypermobility is a major component are described in detail.

H. A. Keim

The Adolescent Spine

With contributions by J. R. Denton, H. M. Dick

J. G. McMurty III, D. P. Roye, Jr

2nd edition. 1982. 366 pages. XV, 254 pages. ISBN 3-540-90612-6

"... a readable account in simple terms of the spinal problems encountered in adolescents.

The first half of the book deals with spinal embryology, anatomy, congenital lesions, tumours, infections and trauma. Two new chapters 'The cervical adolescent spine' and 'Biomechanics of the adolescent spine' have been added.

The whole of the second half is devoted to spinal deformities, probably the commonest spinal problem presenting in adolescence ...

The book is well illustrated with clear line diagrams and photographs. A comprehensive list of up-to-date references appears in each chapter. This second edition is a worthy successor to the very popular first edition."

F. Horan, P. Beighton

Orthopaedic Problems in Inherited Skeletal Disorders

Foreword by W. J. W. Sharrard

1982. 98 figures. XVI, 142 pages. ISBN 3-540-11311-8

"Although this is a small volume it contains a wealth of well presented concisely written material. Frank Horan and Peter Beighton have chosen the clinically important members of the rare group of inherited skeletal disorders and presented them mainly for the benefit of the busy practising orthopaedic surgeon. They have achieved their goal with distinction..."

Sclerosing Bone Dysplasias

Foreword by H. G. Jacobson

1980. 62 figures in 218 separate illustrations. IX, 191 pages. ISBN 3-540-09471-7

"Professors Beighton and Cremin have done it again! The University of Cape Town team of medical geneticist and radiologist have produced another excellent book, which is a worthy successor to their *Bone Dysplasias of Infancy* published in 1978 and widely acclaimed. No fewer than 17 sclerosing bone dysplasias are treated in separate chapters..."
