A
Abdominal aortic aneurysm (AAAs)
  ECM
    collagen, 59, 60
    elastin, 60
    proteoglycan (PG), 60–61
  histomechanical constitutive models (*see* Constitutive modeling, AAA tissue)
Active myocardial mechanics
  crossbridge mechanics, 441–442
  FEM, 449–452
  fiber-sheet dispersion effects, 453–454
  hexagonal lattice model, 442–443
  histological measurements, 441
  lattice spacing, 447–449
  sheet angle, 448, 449
  strain dependence
    angle distributions, 454–459
    transverse stress, 453
  systolic stress
    angles, model, 443, 444
    equi-biaxial stretch, 446, 447
    finite element computational model, 446, 447
    finite element formulation, 445
    Guccione activation model, 443
    mean fiber orientation, 444
    pre-computable functions, 446
    sheet-sheet coupling, 443–444
    simplifying assumptions, 446
    von-Mises distribution, 445
  three-dimensional active stresses, 440
  tissue-scale models, 440
Adipose tissue
  active metabolism, 79
  biological structure, 80
  mechanical properties, 80, 81
  musculoskeletal/connective tissues, 80
  structure–function relationships, 80
  subcutaneous, dermal and intraperitoneal, 79
Adventitia model, 280–281
Angular integration
  compressive deformation, 23
  Green-Cauchy strain tensor, 23
  numerical solution, 24
  Piola–Kirchhoff stress tensor, 23
  planar fiber distributions, 23
  spatial density distribution function, 23
  strain energy, 23
  vs. structure tensor approach
    error percentage, 29, 30
    fiber distribution, graphical representation, 27
    numerical comparison, 26
    second Piola-Kirchhoff stresses, 28
    strain energy, 26
    Taylor expansion, 29
    transversely isotropic distribution, 28, 29
    uniaxial and biaxial tension, 27
    von Mises distribution, 27
  3D fiber distribution, 23
  unit sphere discretization, 24
Anisotropic viscoelastic distributed fiber model, 303–305
Arterial hyperelastic constitutive modeling, 278–279
Arterial wall, 226

stretch-induced fluidization, 50
Cell scale studies, 84–85
Charge-coupled device (CCD), 138–139
CNS tissues
age, 6
brain white matter, 5
disease processes, 6
macrostructure
brain, 2–3
spinal cord, 3
microstructure, 3–4
MRE, 5
neuronal kinematics, 5
relaxation behaviour, 5
structural rearrangements, 5
wave attenuation, 6
Collagen fibres, 136, 138
AAAs
azimuthal angle and elevation angle, 62, 64
Bingham distribution function, 62, 64, 65
imaging, 61, 62
PLM, 62, 63
remodeling and weakening, 60
anisotropy, cornea and sclera
limbus, 305–308
peripapillary sclera, 308–310
Collagenous tissues
load-bearing tissues, 15
mechanical load transmission, 15
mechanical models, 16
Collagen waviness, 258–259
Compressible Neo-Hookean model, 299
Computationally coupled two-scale analysis
FEM, 99
homogenization scheme, 99
of human eye, 107–108
human eye model, macro-level, 100–101
Lamina Cribrosa model, meso-level, 101–103
laminar beam structure, 105–107
mesoscopic deformation gradient, 100
numerical results
collagen fibrils, 108
in-plane stress, 113
maximum principal stress distribution, human eye, 110
meso- or macrostructure, lamina cribrosa, 109
strain- and stress-like quantities, 108
strain environment, axon bundles, 111
numerical two-scale model, human eye, 98
parameter identification, axon bundles, 104–105
Piola-Kirchhoff stress tensors, 99
scale transitions, 99
Conceptual fibre distribution model, 146–148
Constitutive modeling, AAA tissue
adaptation model
collagen turnover, 70–71
FE model, 72
isotropic collagen orientation density, 73
orthotropic distribution, 73
sensing model, 71
smoother wall stress distribution, 73
structure update model, 72
azimuthal orientation, 69
collagen fiber density and orientation, 66
inter-fiber and inter-fibril sliding, 70

passive histomechanical model
CFPG-complex, 67–68
finite strain kinematics, 66–67
parameter identification and model validation, 68–69
phenomenological approaches, 65
Contractile forces and traction microscopy, 42–43
Cornea and sclera biomechanics
collagen fiber anisotropy
limbus, 305–308
peripapillary sclera, 308–310
fully integrated distributed fiber model, 298–303
glaucoma, 288
inflation testing
development, 311–312
experimental setup, 290–293
strain analysis, 293–295
stress analysis, 295–297
vs. uniaxial strip testing, 289
mechanical properties, 285–286
viscoelastic distributed fiber model, 303–305
WAXS, 286–288, 300–302, 309
Coronary arterial media model
assumptions, 267, 269
descriptive power, 276–277
examination, 274–275
experimental database, 272
fibers, 270–271

semi-structural model, 275–276, 279
torsional stiffness, 272–274
2D-to-3D predictive power, 277
Coronary arterial tree, 3D reconstruction, 187–192
Coronary artery adventitia
finite-strain micromechanics model, fibrous tissue, 230
geometrical and mechanical features, 230–232
homogenization approach, 232–233
modeling predictions, comparison, 235–237
second-order microstructural model, 233–234
limitations, 244–245
microstructure-based constitutive model, 227–228
phenomenological constitutive model, 226–227
quantitative morphometric data
in situ deformation, 241–243
material and method, 238–239
morphometric data, 239–241
Coronary autoregulation, 219
Coronary vascular stiffness, 218–219
Coronary vasculature
architecture, 176–178
diameter asymmetry, 178–185
area expansion ratio, 180, 181
characterization, 178
diameter ratio, 180, 181
flow distribution, 182, 183
significance, 184
statistical morphometric data, 179
velocity ratio, 183, 184
wall shear stress, 184
network, morphometric models, 186–187
physiological significance, 3D model, 195–199
porcine coronary vasculature, 192–195
structure–function relations, 185, 186
3D reconstruction, arterial tree, 187–192

D

Digital image correlation (DIC), 291–293, 322, 324
Discrete fiber models, cornea and sclera, 297
Distributed fiber models, cornea and sclera, 297–298

E

Effective torsional stiffness, 274
Elastin fibres, 136
Electronic speckle pattern interferometry (ESPI), 291
EPCAs. *See* Epicardial coronary arteries (EPCAs)
Epicardial coronary arteries (EPCAs), 176, 177
Equal area model, fibrous tissues
error prediction, 341–343
fiber distribution, 340–341
structural tensors, 341
Equi-biaxial testing
finite element implementation, 354, 356
ventricular myocardium, 256

Extracellular matrix (ECM), 418, 420–421
collagen, 59, 60
elastin, 60
proteoglycan (PG), 60–61
Eyring model, 304

F
Fascia microcirculation
blood flow simulation
network, 406–407
rat spinotrapezius muscle fascia, 404–405
rheology, 405–406
spatial microhemodynamic display, 407–408
vessel elasticity, 405
hemodynamics, 408–411
Fast Fourier transformation (FFT), 18–19
Fat biomechanics
adipose tissue, 79–80
cell-level structure–function–adaptation relationships, 86–89
cell scale studies, 84–85
cell stiffness properties, 90
FEM. *See* Finite element method (FEM)

structural-based constitutive models
biaxial testing, 257
cardiac muscle, 251–252
fiber distribution, 255–256
fiber waviness, 253–254, 258–259
validation, 256–257
ventricular wall, 251
Ventricular wall stress, 249–250
Viscoelastic distributed fiber model
developments, 303–304
evolution equation, 304–305
time-dependent behavior, 305, 306
von Mises distribution function, 298–299

W
Wall shear stress, 184
Wide-angle X-ray scattering (WAXS), sclera and cornea, 286–288, 300–302, 309

Z
Zipper Network Model (ZNM), 427–430
