  data collection,
    baseline and zeroing, 350
    cuvette cleaning, 350, 360
    linearity checking, 352
    parameter setting, 351
    path length selection, 349, 359, 360

reference beam, 349
signal-to-noise ratio optimization, 350, 351
wavelength range selection, 350
definition, 345
light absorption by proteins, 344
optical rotary dispersion relationship, 357
protein–ligand experiments, induced circular dichroism, 354, 355
peptide–peptide titration, 356, 360–362
protein–protein interactions, 354
solvent interactions, 353, 354
titration, 352, 353
sample preparation, 347, 357
sensitivity, 349
signal origin in proteins, 345, 346
units, 346, 347
vibrational circular dichroism, 357
Computer simulations, protein–ligand interactions, algorithms, 471
classical potential energy function, 455, 456, 478
conformational searching, 456–458
density functional theory, *see* Density functional theory
dihydrofolate reductase–trimethoprim interaction analysis using Monte Carlo-minimization, 471–475, 479
force probe simulation, *see* Force probe simulation
free energy estimation, free energy perturbation, 467–469
thermodynamic integration, 469
implicit solvent models, development, 458, 460
electrostatics, generalized Born models, 462, 463
Poisson–Boltzmann equation, 460–462
screened Coulomb potential implicit solvent model, 463, 464, 478, 479
hydrogen bonding, 464, 465
hydrophobic interactions, 465–467
ligand docking, 469–471
protein dynamics and ligand binding, 470, 471
solvent effects, 458–460
thermodynamics of binding, 452–455
trypsin–benzamidine complex analysis, 475–479
Confocal optics microscopy, high-throughput screening for G protein-coupled receptor–ligand interactions, binding assay, 378
fluctuation fluorescence spectroscopy, 374, 375
fluorescence correlation spectroscopy, 376–378
fluorescence intensity distribution analysis, 376, 378–381
instrumentation, 371, 373–375
materials, 370, 371, 380
overview, 370
photon counting histogram, 376, 378–381
sample cells, 375, 376
Critical hydrophobicity hydrophobic interaction chromatography, *see* Hydrophobic interaction chromatography

D

Dead time, stopped-flow rapid mixing, 324, 325, 332, 333, 340
Debye rotational relaxation time, equations, 305, 306
Density functional theory (DFT), algorithms, 521, 528, 544, 545

applications,
heme protein ligand binding, 520, 521
human immunodeficiency virus protease, 520
ion channel permeation, 520
methane monooxygenase binding of oxygen, 519
basic equations, 521, 522
basis sets, 525
Car–Parrinello molecular dynamics, 518, 520
catalase binding to formic acid,
calculation procedure, 543
data collection and analysis, 543
findings, 544
input file building, 541, 542
model building, 541
overview, 541
first principles molecular dynamics, 518, 526–528, 545
generalized gradient approximation, 523, 524
hardware, 528
Kohn–Sham equations, 524, 525
limitations, 518, 519
local density approximation, 522, 523
myoglobin binding of oxygen,
ab initio molecular dynamics simulation of bound oxygen dynamics,
calculation procedure, 537
data collection and analysis, 537, 538, 547
findings, 540
input file building, 537, 547
model building, 536
Car–Parrinello molecular dynamics calculations, 532, 533, 546
data collection and analysis,
binding energy, 534, 547
bonding analysis, 534, 535
energy and temperature evolution, 533, 547
spin density, 534, 536, 547
structure changes, 534, 535
input file building, 530, 532, 546
model building, 529, 530, 545
overview, 528, 529
overview, 517–519
DFT, *see* Density functional theory
DHFR, *see* Dihydrofolate reductase
Dihydrofolate reductase (DHFR), trimethoprim interaction analysis using Monte Carlo-minimization, 471–475, 479
Dimethyl sulfoxide (DMSO),
ligand solubility enhancement, 199
surface plasmon resonance calibration, 38, 39
Dissociation constant (K_d),
fluorescence correlation spectroscopy, 421
fluorescence polarization/anisotropy,
measurement error, 312
uncertainty modeling, 310–312, 319
Gibbs free energy relationship, 301, 302
protein/ligand concentration equation, 302
reflectometric interference spectroscopy determinations, 58, 59
steady-state spectroscopy, 217, 218
DMSO, *see* Dimethyl sulfoxide
DNA repair,
pathways, 387
protein–DNA interactions in DNA damage recognition, *see* Single-molecule fluorescence spectroscopy and imaging,

E

*Eco*SSB, c interaction studies with sedimentation velocity centrifugation, 106, 108

F

FCS, *see* Fluorescence correlation spectroscopy
FEP, *see* Free energy perturbation
Fibrinogen, critical hydrophobicity hydrophobic interaction chromatography, 93, 94
First principles molecular dynamics, *see* Density functional theory
First-order reaction,
  equations, 327
  followed by second-order reaction, 330
  pseudo first-order reactions, 328, 329
Flash photolysis, *see* Time-resolved crystallography; Time-resolved Fourier transform infrared difference spectroscopy; Ultraviolet/visible absorption spectroscopy
Fluorescence correlation spectroscopy (FCS),
  applications, 416, 417
  autocorrelation function, 419
  bound ligand equations, 421–423
  confocal optics microscopy, high-throughput screening for G protein-coupled receptor–ligand interactions, 376–378
  cross correlation spectroscopy, 377
  hapten–immunoglobulin G binding studies,
    binding reaction measurement, 421–425
    calibration,
      excitation volume determination, 428–430, 435
      protein standard evaluation, 430, 431
    data collection and analysis, 431–436
    fluorescein-labeled lysozyme preparation, 428, 435
    instrumentation, 425–427, 434, 435
    linearity checking, 431
    materials, 425, 434
    sample preparation, 431
  historical perspective, 376, 416
  instrumentation, 417
  stoichiometry of binding determination, 416
  theory, 417, 419–421
  time resolution, 417
Fluorescence intensity distribution analysis, *see* Confocal optics microscopy
Fluorescence microscopy, *see* Confocal optics microscopy; Single-molecule fluorescence spectroscopy and imaging
Fluorescence polarization/anisotropy,
  additivity, 306, 307, 320
  error sources,
    anisotropy uncertainties, bound ligand, 316, 317, 321
    free ligand, 315
    dissociation constant measurement, 312
    fluorescence enhancement factor uncertainty, 317, 318
    multiple uncertainty modeling, 318–320
    overview, 308, 310
    precision, 314
    systematic deviations, 312–314
    uncertainty modeling in dissociation constant determination, 310–312, 319
  high-throughput screening, 369, 370
  practical considerations, 307, 308, 321
  protein–ligand complex concentration equation, 302
  sensitivity, 357
  single-molecule fluorescence studies, 390, 392, 393
  theory, 303–306, 320

Fluorescence resonance energy transfer, *see* Single-molecule fluorescence spectroscopy and imaging
Flushing volume, stopped-flow rapid mixing, 325, 334, 335, 340
Force probe simulation,
  algorithms, 497, 506
  caveats, 498, 500, 509–511
  force comparison with energy, 499, 511
  force fields for protein dynamics, 495, 497, 498
  force profile and smoothing, 500, 509, 510
  hierarchical substrates, 494
  ligand-unbinding force probe simulation, 506–510
  nonequilibrium mechanics of enforced dissociation, 503–506
  overview, 493, 494
  pulling potential, 500
  steered molecular dynamics, 502
  torque exertion, 500
Formic acid, density functional theory analysis of catalase binding,
  calculation procedure, 543
  data collection and analysis, 543
  findings, 544
  input file building, 541, 542
  model building, 541
  overview, 541
Fourier transform infrared spectroscopy (FTIR), *see* Time-resolved Fourier transform infrared difference spectroscopy
Free energy perturbation (FEP), free energy estimation, 467–469
FTIR, *see* Fourier transform infrared spectroscopy

G

Generalized Born models, implicit solvent models, 462, 463
G protein-coupled receptors,
  abundance, 367, 368
  high-throughput screening of ligand,
    confocal optics microscopy,
      binding assay, 378
      fluctuation fluorescence spectroscopy, 374, 375
      fluorescence correlation spectroscopy, 376–378
      fluorescence intensity distribution analysis, 376, 378–381
      instrumentation, 371, 373–375
      materials, 370, 371, 380
      overview, 370
      photon counting histogram, 376, 378–381
      sample cells, 375, 376
    fluorescence polarization, 369, 370
    scintillation proximity assay, 368, 369
  structure, 368

H

Hapten–immunoglobulin G binding studies, *see* Fluorescence correlation spectroscopy
Heme proteins, *see* Resonance Raman spectroscopy; *specific heme proteins*; Time-resolved mid-infrared spectroscopy; Ultraviolet/visible absorption spectroscopy
Hemoglobin, *see* Resonance Raman spectroscopy; Time-resolved mid-infrared spectroscopy
HIC, *see* Hydrophobic interaction chromatography
High-throughput screening (HTS), automation and miniaturization, 367
  G protein-coupled receptor–ligand interactions,

confocal optics microscopy,
binding assay, 378
fluctuation fluorescence spectroscopy, 374, 375
fluorescence correlation spectroscopy, 376–378
fluorescence intensity distribution analysis, 376, 378–381
instrumentation, 371, 373–375
materials, 370, 371, 380
overview, 370
photon counting histogram, 376, 378–381
sample cells, 375, 376
fluorescence polarization, 369, 370
scintillation proximity assay, 368, 369
historical perspective, 366, 367

macromolecule concentration, 11, 12
titrant concentration, 11, 12
historical perspective, 1, 2
instrumentation, 2, 3
planning, 5, 6, 13
raw data correction, 7–9
ribonuclease ligand binding example, 9
simulations in optimization, 4, 5
solution preparation and handling, 6, 7
thermogram curvature dependence on c parameter, 4, 5
ITC, *see* Isothermal titration calorimetry

K

K_d, *see* Dissociation constant
Kohn–Sham equations, density functional theory, 524, 525

L

Langevin dynamics (LD), conformational searching, 457
Langmuir binding model,
quartz crystal microbalance, 54, 56
surface plasmon resonance, 37, 38, 41, 42
LD, *see* Langevin dynamics
Lectin–ganglioside interactions, *see* Quartz crystal microbalance
Leukocyte function-associated antigen-1 (LFA-1), atomic force microscopy of intercellular adhesion molecule-1 interactions,
adhesion molecule immobilization, 443, 446
cantilever,
calibration, 444, 447
tip functionalization, 443, 447
cell immobilization, 444, 445, 447
data analysis, 446–448
data collection, 445, 447
instrumentation, 440, 441, 446
materials, 440
setup, 444
specificity controls, 445
LFA-1, *see* Leukocyte function-associated antigen-1
Lipid bilayer–ligand interactions, *see* Quartz crystal microbalance

M

Magnetic tweezers, protein–DNA interaction application, 393
Mass spectrometry, amide exchange experiments for protein–protein interaction analysis,
data analysis, 74–76
deuteron incorporation into surface amides, 71, 72
experimental design, 67, 69
mass spectrometry, 70, 71
materials, 67
off-exchange rate measurements,
protein–protein interface, 72, 73
protein removal, 73, 74
pepsin digestion and peptide identification, 69, 70
pH of exchange mixtures, 71, 78
weakly interacting proteins, 77
Maximal velocity (V_{max}), manipulation with enzyme concentration, 324, 339, 340

MC, *see* Monte Carlo simulation
MCM, *see* Monte Carlo-minimization
MD, *see* Molecular dynamics
Metallogenomics, X-ray absorption spectroscopy, 189, 190
Molecular dynamics (MD),
  conformational searching, 457
  density functional theory, *see* Density functional theory
Monte Carlo-minimization (MCM),
  conformational searching, 457, 458
  dihydrofolate reductase–trimethoprim interaction analysis, 471–475, 479
Monte Carlo simulation (MC),
  conformational searching, 457
  force probe simulation, *see* Force probe simulation
  trypsin–benzamidine complex analysis, 477
Myoglobin, *see also* Ultraviolet/visible absorption spectroscopy,
  density functional theory analysis of oxygen binding,
    ab initio molecular dynamics simulation of bound oxygen dynamics,
      calculation procedure, 537
      data collection and analysis, 537, 538, 547
      findings, 540
      input file building, 537, 547
      model building, 536
    Car–Parrinello molecular dynamics calculations, 532, 533, 546
    data collection and analysis,
      binding energy, 534, 547
      bonding analysis, 534, 535
      energy and temperature evolution, 533, 547
      spin density, 534, 536, 547
      structure changes, 534, 535
      input file building, 530, 532, 546
      model building, 529, 530, 545
      overview, 528, 529
  structural change analysis with time-resolved crystallography, 142–144
  time-resolved mid-infrared spectroscopy,
    instrumentation, 244, 246, 247, 255
    ligand dynamics studies,
      carbon monoxide escape, 252, 254
      nitric oxide rebinding, 254, 255
    ligand orientation studies,
      polarization anisotropy theory, 248, 249
    protein preparation, 245

N

Neuroglobin, *see* Ultraviolet/visible absorption spectroscopy
NMR, *see* Nuclear magnetic resonance
Nuclear magnetic resonance (NMR),
  isotopically labeled proteins and ligand-induced conformational changes, 207, 209–211
  saturation transfer difference NMR,
    overview, 198
    ligand binding applications, 199
    ligand binding detection, 200, 201, 211
    ligand-binding orientation studies, 202
    ligand-binding site detection, 201, 202
  signal origins, 197, 198
  water-ligand optimized gradient spectroscopy,
    acquisition parameters, 212
    differential line broadening and ligand-binding orientation studies, 205, 206, 212
    diffusion edited techniques, 207, 212
    ligand binding applications, 199
    overview, 198, 199, 205

T_1r measurements, 206, 207, 212
transferred nuclear Overhauser effect, 207, 212

P

Photoactive yellow protein (PYP), photocycle analysis with time-resolved crystallography, 144, 145
Photon counting histogram, *see* Confocal optics microscopy
Poisson–Boltzmann equation, implicit solvent models, 460–462
Polarization anisotropy, *see* Fluorescence polarization/anisotropy; Time-resolved mid-infrared spectroscopy
Protein crystallography, *see* Time-resolved crystallography; X-ray absorption spectroscopy; X-ray crystallography
Protein–protein interface, *see* Solvent accessibility
PYP, *see* Photoactive yellow protein

Q

QCM, *see* Quartz crystal microbalance
Quartz crystal microbalance (QCM),
annexin A2t–lipid bilayer interaction studies,
calcium dissociation constant determinations, 58, 59
data collection, 57, 58
theory and data analysis, 59–61
applications, 48
data analysis, 50–52
historical perspective, 47, 48
lipid bilayer immobilization,
chemisorbed octanethiol monolayer preparation, 53, 61
second phospholipid monolayer formation, 53, 54
vesicle preparation, 52, 53
materials, 48, 49
peanut agglutinin–lipid ganglioside interaction studies,
binding constant determination, 54, 55
lectin ligand structure, 54
theory and data analysis, 55–57
Sauerbrey equation, 49, 50, 61
sensitivity, 49, 50
setup for active oscillator mode, 49, 61

R

Raman spectroscopy, *see* Resonance Raman spectroscopy
Reflectometric interference spectroscopy (RIFS),
applications, 23
instrumentation, 21–23
Resonance Raman spectroscopy,
hemoglobin studies,
sol-gel encapsulated proteins,
encapsulation, 294, 298
nonequilibrium species and reaction intermediate studies, 294–296
time-resolved spectroscopy, 296, 297
solution samples, time-resolved spectroscopy, 292, 293
instrumentation for time-resolved experiments, 291, 292, 297, 298
materials, 290, 297
photodissociation of heme–ligand complexes, 289, 290
protein bands, 289
protein relaxation overview, 287–289
pulse-probe technique, 290
Raman optical activity, 357
RIFS, *see* Reflectometric interference spectroscopy

S

Saturation transfer difference NMR, *see* Nuclear magnetic resonance

Sauerbrey equation, 49, 50, 61
Scintillation proximity assay (SPA), high-throughput screening, 368, 369
SCP-ISM, *see* Screened Coulomb potential implicit solvent model
Screened Coulomb potential implicit solvent model (SCP-ISM),
  overview, 463, 464, 478, 479
